General Notices

General Statements

The General Notices provide the basic guidelines for the interpretation and application of the standards, tests, assays, and other specifications of the Indian Pharmacopoeia (IP), as well as to the statements made in the monographs and other texts of the Pharmacopoeia.

A monograph is to be constructed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this Pharmacopoeia and that is applicable to that monograph. All statements contained in the monograph, except where a specific general notice indicates otherwise and with the exceptions given hereafter, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated.

Exceptions to the General Notices do exist, and where they do, the wording in the individual monograph or an appendix takes precedence and specifically indicates directions or the intent. Thus, the specific wording of standards, tests, assays and other specifications is binding wherever deviations from the General Notices exist. Likewise, where there is no specific mention to the contrary, the General Notices apply.

Name. The full name or title of this book, including addenda thereto, is Indian Pharmacopoeia 2022, abbreviated to IP 2022. In the texts, the term "Pharmacopoeia" or "IP" without qualification means the Indian Pharmacopoeia 2022 and any amendments and thereto.

Official and Official Articles. The word 'official' wherever used in this Pharmacopoeia or with reference thereto, is synonymous with 'pharmacopoeial', with 'IP' and with 'compendial'. The designation IP in conjunction with the official title on the label of an article is an indication that the article purports to comply with IP standards.

The following terms are used where the articles for which monographs are provided are to be distinguished.

An official substance is a single drug or a drug entity or a pharmaceutical aid for which the monograph title includes no indication of the nature of a dosage form.

An official preparation is a drug product (dosage form) and is the finished or partially finished preparation or product of one or more official substances formulated for use on the patient.

An article is an item for which a monograph is provided, whether an official substance or an official preparation.

Official Standards. The requirements stated in the monographs apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes.

An article is not of Pharmacopoeial quality unless it complies with all the requirements stated in the monograph. This does not imply that performance of all the tests in a monograph is necessarily a prerequisite for a manufacturer in assessing compliance with the Pharmacopoeia before release of a product.

Pharmacopoeial requirements for articles used in veterinary medicine are established on the same basis as those used in human medicine. It should be noted that no requirement in the pharmacopoeia can be taken in isolation. A valid interpretation of any particular requirement depends upon it being read in context of the monograph as a whole, the specified method of analysis, the relevant General Notices and where appropriate the General Monographs.

Where a preparation that is the subject of a monograph in the Indian Pharmacopoeia is supplied for use in veterinary medicine, the standards of Indian Pharmacopoeia apply unless otherwise justified and authorized.

The active pharmaceutical ingredients (drug substances), excipients (pharmaceutical aids), pharmaceutical preparations (dosage forms) and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses). It may be noted, however, that in the event of doubt of interpretation in any text of Veterinary monographs of IP, Indian Pharmacopoeia Commission (IPC) should be consulted.

The requirements given in the monographs are not framed to provide against all possible impurities, contaminants or adulterants; they provide appropriate limitation of potential impurities only.

A preparation must comply with the requirements specified, throughout its shelf-life assigned to it by the manufacturer. For opened or broached containers, the maximum period of validity for use will be as may be stated in the individual monograph. Nevertheless, the responsibility for assigning the period of validity shall be with the manufacturer.

Added Substances. An official substance, as distinguished from an official preparation, contains no added substances except when specifically permitted in the individual monograph. Unless otherwise specified in the individual monograph, or elsewhere in the General Notices, suitable substances may be added to an official preparation to enhance its stability, preserve its properties, usefulness or elegance, or to facilitate its preparation. Such auxiliary substances shall be harmless in the amounts used, shall not exceed the minimum quantity required to provide their intended effect, shall not impair the therapeutic efficacy or the bioavailability or safety of the preparation and shall not interfere with any of the tests and assays prescribed for determining compliance with the official

https://nhathuocngocanh.com/

standards. Particular care should be taken to ensure that such substances are free from harmful organisms. The freedom to the manufacturers to add auxiliary substances imposes on them the responsibility of satisfying the licensing authorities on the purpose of the addition and the innocuity of such substances. No substance shall be added to conceal any defect or damage or deficiency in the substance or formulation.

Alternative Methods. The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. Alternative methods of analysis may be used for control purposes, provided that the methods used are shown to give results of equivalent accuracy and enable an unequivocal decision to be made as to whether compliance with the standards of the monographs would be achieved if the official methods were used. Automated procedures utilising the same basic chemistry as the test procedures given in the monograph may also be used to determine compliance. Such alternative or automated procedures must be validated and are subject to approval by the authority competent to authorised manufacturer of substance or product.

In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative and only the result obtained by the procedure given in this Pharmacopoeia is conclusive.

Meanings of Terms

Alcohol. The term "alcohol" without qualification means ethanol (95 per cent). Other dilutions of ethanol are indicated by the term "ethanol" or "alcohol" followed by a statement of the percentage by volume of ethanol (C_2H_6O) required.

Desiccator. A tightly-closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or phosphorus pentoxide or other suitable desiccant.

Drying and ignition to constant weight. Two consecutive weighings after the drying or igniting operations do not differ by more than 0.5 mg, the second weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.

Ethanol. The term "ethanol" without qualification means anhydrous ethanol or absolute alcohol.

Filtration. Unless otherwise stated, filtration is the passing of a liquid through a suitable filter paper or equivalent device until the filtrate is clear.

Freshly prepared. Made not more than 24 hours before it is used.

Label. Any printed packing material, including package inserts that provide information on the article.

Negligible. A quantity not exceeding 0.50 mg.

Solution. Where the name of the solvent is not stated, "solution" implies a solution in water. The water used complies with the requirements of the monograph on Purified Water.

Temperature. The symbol ° used without qualification indicates the use of the Celsius thermometric scale.

Water. If the term is used without qualification it means Purified Water of the Pharmacopoeia. The term 'distilled water' indicates Purified Water prepared by distillation.

Water-bath. A bath of boiling water unless water at another temperature is indicated. Other methods of heating may be used provided the required temperature is approximately maintained but not exceeded.

Provisions Applicable To Monographs and Test Methods

Expression of Contents. Where the content of a substance is defined, the expression "per cent" is used according to circumstances with one of two meanings:

— per cent w/w (percentage, weight in weight) expressing the number of grams of substance in 100 grams of final product,

— per cent v/v (percentage, volume in volume) expressing the number of millilitres of substance in 100 millilitres of final product.

The expression "parts per million" refers to the weight in weight, unless otherwise stated.

Where the content of a substance is expressed in terms of the chemical formula for that substance an upper limit exceeding 100 per cent may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_6O_2$ implies that the result of the assay is not less than 99.0 per cent and not more than 101.0 per cent, calculated in terms of the equivalent content of $C_7H_6O_2$.

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous, ignited substance, or the substance free from solvent, the determination of loss on drying, water content, loss on ignition, content of the specified solvent, respectively is carried out by the method prescribed in the relevant test in the monograph.

Expression of Concentrations. The following expressions in addition to the ones given under Expression of Content are also used:

— per cent w/v (percentage, weight in volume) expressing the number of grams of substance in 100 millilitres of product,

— per cent v/w (percentage, volume in weight) expressing the number of millilitres of substance in 100 grams of product.

https://nhathuocngocanh.com/

Usually, the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume, of solids in semi-solid bases (e.g. creams) and of gases in liquids as percentage weight in weight.

When the concentration of a solution is expressed as parts of dissolved substance in parts of solution, it means parts by weight (g) of a solid in parts by volume (ml) of the final solution; as parts by weight (g) of a gas in parts by weight (g) of the final solution.

When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

Abbreviated Statements. Incomplete sentences are employed in parts of the monographs for directness and brevity (for example, Iodine Value. Not more than ……; Relative Density. …….to……..) Where the tests are abbreviated, it is to be understood that the test method referred to in brackets provides the method to be followed and that the values specified are the applicable limits.

Weights and Measures. The metric system of weights and measures is employed in the Pharmacopoeia. All measures are required to be graduated at 25° and all measurements in tests and assays, unless otherwise stated, are to be made at that temperature. Graduated glass apparatus used in analytical operations shall comply with the requirements stated in Chapter 2.1.6.

Monographs

General Monographs

General monographs on dosage forms include requirements of general application and apply to all preparations within the scope of the Introduction section of the general monograph, except where a preamble limits the application. The requirements are not necessarily comprehensive for a given specific preparation; additional requirements may sometimes be given in the individual monograph for it.

Production. Statements given under the heading Production relate to particular aspects of the manufacturing process and are not necessarily comprehensive. However, they are mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process and its validation and control, to any in-process testing that is to be carried out by the manufacturer on the final product either on selected batches or on each batch prior to release. All this cannot be verified on a sample of the final product by an independent analyst. It is for the licensing authority to verify that the instructions have been followed.

The absence of a section on Production does not imply that attention to features such as those given above is not required. An article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with the requirements of the Drugs and Cosmetics Rules, 1945. The general principles applicable to the manufacture and quality assurance of drugs and preparations meant for human use apply equally to veterinary products as well.

Manufacture of Drug Products. The opening definitive statement in certain monographs for drug products is given in terms of the active ingredient(s) only. Any ingredient(s) other than those included in the statement, must comply with the general notice on Excipients and the product must conform to the Pharmacopoeial requirements.

Official preparations are prepared only from ingredients that comply with the requirements of the pharmacopoeial monographs for those individual ingredients for which monographs are provided.

Excipients. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence in the therapeutic efficacy of the active ingredients and shall not interfere with the tests and assays of the Pharmacopoeia. Care should be taken to ensure that such substances are free from harmful organisms.

Individual Monographs

Drug products that are the subject of an individual monograph are also required to comply with the tests given in the general monographs.

Titles. The main title for a drug substance is the International Non-proprietary Name (INN) approved by the World Health Organization. Subsidiary names and synonyms have also been given in some cases; where included, they have the same significance as the main title.

The main titles of drug products are the ones commonly recognised in practice. Synonyms drawn from the full non-proprietary name of the active ingredient or ingredients have also been given. Where, however, a product contains one or the other of different salts of an active molecule, the main title is based on the full name of the active ingredient. For example, Chloroquine Phosphate Tablets and Chloroquine Sulphate Tablets.

Chemical Formulae. When the chemical structure of an official substance is known or generally accepted, the graphic and molecular formulae are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statement of purity and strength and in descriptions of

https://nhathuocngocanh.com/

processes of assay, it will be evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry, the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

Atomic and Molecular Weights. The atomic weight or molecular weight is shown, as and when appropriate at the top right hand corner of the monograph. The atomic and molecular weights and graphic formulae do not constitute analytical standards for the substances described.

Definition. The opening statement of a monograph is one that constitutes an official definition of the substance, preparation or other article that is the subject of the monograph. In certain monographs for pharmaceutical preparations the statement is given in terms of the principal ingredient(s).

In monographs on vegetable drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form.

Certain pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article is prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance may be prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are not permissible.

Statement of content. The limits of content stated are those determined by the method described under Assay.

Category. The statement of category is provided for general information only and is indicative of the medical or pharmaceutical basis for recognition in the Pharmacopoeia. It generally represents an application of the best known pharmacological action of the article or of its active ingredient. The statement under the heading 'Category' are also subject to regulations under the D&C Act 1940 and rules theirunder. In the case of pharmaceutical aids it may indicate the more common usage of the article. The statement is not intended to limit in any way the choice or use of the article nor to indicate that it has no other activity or use.

Usual strength. The statement on the usual strength(s) of a preparation given in the individual monograph indicates the strength(s) usually marketed for information of the pharmacist and the medical practitioner. It does not imply that a strength other than the one(s) mentioned in the individual monograph meeting all the prescribed requirements cannot be manufactured and marketed with the approval of the appropriate authority.

Description. The statements under the heading Description are not to be interpreted in a strict sense and are not to be regarded as official requirements.

Solubility. Statements on solubility are given in Chapter 2.4.26 and are intended as information on the approximate solubility at a temperature between 15° and 30°, unless otherwise stated, and are not to be considered as official requirements. However, a test for solubility stated in a monograph constitutes part of the standards for the substance that is the subject of that monograph.

Residual solvents. The requirements, guidance and information on residual solvents for pharmaceutical use are given in the chapter entitled Residual Solvents (5.4).

All IP articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration and the solvents limited according to the principles defined and the requirements specified in Chapter 5.4. Residual Solvent, using the general methods presented therein or other suitable methods.

Test Methods

References to general methods of testing are indicated by test method numbers in brackets immediately after the heading of the test or at the end of the text.

Identification. The tests given under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material under examination is in accordance with the label on the container.

In certain monographs alternative series of identification tests are given; compliance with either one or the other set of tests is adequate to verify the identity of the article.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

Tests and Assays

The tests and assays are the official methods upon which the standards of the Pharmacopoeia depend. The requirements are not framed to take into account all possible impurities. It is

https://nhathuocngocanh.com/

not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated. Material found to contain such an impurity is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

Pharmacopoeial methods and limits should be used merely as compliance requirements and not as requirements to guarantee total quality assurance. Tests and assays are prescribed for the minimum sample available on which the attributes of the article should be measured. Assurance of quality must be ensured by the manufacturer by the use of statistically valid sampling and testing programmes.

Tests. Unless otherwise stated, the assays and tests are carried out at a temperature between 20° and 30°.

Where it is directed that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a procedure is directed to be performed 'protected from light' precautions should be taken to exclude actinic light by the use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for a test or an assay is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

Other Tests. In the monographs on dosage forms and certain preparations, under the sub-heading 'Other tests' it is stated that the article complies with the tests stated under the general monograph of the relevant dosage form or preparation. Details of such tests are provided in the general monographs.

Limits. The limits given are based on data obtained in normal analytical practice. They take into account normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent that is acceptable. No further tolerances are to be applied to the limits for determining whether or not the article under examination complies with the requirements of the monograph.

Quantities. Unless otherwise stated, the quantities to be taken for assays, limit tests and other tests are of the substance under examination.

In tests with numerical limits and assays, the quantity stated to be taken for testing is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result of analysis is calculated from this exact quantity. In tests where the limit is not numerical but usually depends upon comparison with the behaviour of a reference in the same conditions, the stated quantity is taken for testing. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision is plus or minus 5 units after the last figure stated. For example, 0.25 g is to be interpreted as 0.245 g to 0.255 g. For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero, e.g. 10.0 ml or 0.50 ml, the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; in other cases, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

The term 'transfer' is used generally to indicate a quantitative operation.

Apparatus. Measuring and weighing devices and other apparatus are described in the chapter entitled 'Apparatus for Tests and Assays'. A specification for a definite size or type of container or apparatus in a test or assay is given merely as a recommendation.

Unless otherwise stated, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base, commonly known as Nessler cylinders.

Reagents and Solutions. The reagents required for the tests and assays of the Pharmacopoeia are defined in the various chapters showing their nature, degree of purity and the strengths of the solutions to be made from them. The requirements set out are not intended to imply that the materials are suitable for use in the test concerned; reagents not covered by monographs in the pharmacopoeia shall not be claimed to be of IP quality.

The term 'analytical reagent grade of commerce' implies that the chemical is of a high degree of purity wherein the limits of various impurities are known. Where it is directed to use a 'general laboratory reagent grade of commerce' it is intended that a chemically pure grade material, not necessarily required to be tested for limiting or absence of certain impurities, is to be used.

Indicators. Where the use of an indicator solution is mentioned in an assay or test, approximately 0.1 ml of the solution shall be added, unless otherwise directed.

Reference Substances. Certain monographs require the use of a chemical reference substance or a biological reference preparation or a reference spectrum These are authentic specimens chosen and verified on the basis of their suitability for intended use as prescribed in the Pharmacopoeia and are not necessarily suitable in other circumstances.

IP Reference Substances, abbreviated to IPRS are issued by the Indian Pharmacopoeia Commission (IPC). They are the official standards to be used in cases of arbitration.

Biological Reference Substances, also abbreviated to IPRS and Standard Preparations of antibiotics are issued by

https://nhathuocngocanh.com/

agencies authorised by the IPC. They are standardized against the International Standards and Reference Preparations established by the World Health Organization (WHO). The potency of these preparations is expressed in International Units.

Reference spectra are published by the IPC and they are accompanied by information concerning the conditions used for sample preparation and recording of the spectra.

Test Animals. The animal experiments are carried out in accordance with the provisions of 'The Prevention of Cruelty to Animals Act, 1960' and 'CPCSEA Guidelines' so as to prevent the infliction of unnecessary pain, suffering and prevention of cruelty to animals. Unless otherwise directed, animals used in a test or an assay shall be healthy and are drawn from a uniform stock, and have not previously been treated with any material that will interfere with the test or the assay.

Rounding Rules for Calculation of Results. The observed or calculated values should be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded up or down until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is 4 or smaller, it is eliminated and the preceding digit is left unchanged. If this digit is 5 to 9, it is eliminated and the preceding digit is increased by 1.

Table 1 – Illustration of Rounding Numerical values for comparison with Requirements

Pharmacopoeial Requirement	Unrounded Value (per cent)	Rounded Result (per cent)	Conforms
Assay limit	97.96	98.0	Yes
≥ 98.0 per cent	97.92	97.9	No
	97.95	98.0	Yes
Assay limit	101.55	101.6	No
≤ 101.5 per cent	101.46	101.5	Yes
	101.45	101.5	Yes
Limit test	0.025	0.03	No
≤ 0.02 per cent	0.015	0.02	Yes
	0.027	0.03	No
Limit test ≤ 3 ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

Storage. Statements under the side-heading 'Storage' constitute non-mandatory advice. The articles of the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in the individual monograph.

Specific directions are given in some monographs with respect to the temperatures at which Pharmacopoeial articles should be stored, where it is considered that usage at a lower or higher temperature may produce undesirable results. The storage conditions are defined by the following terms:

— Store in a dry, well-ventilated place at a temperature not exceeding 30°
— Store in a refrigerator (2° to 8°). Do not freeze
— Store in a freezer (-2° to -18°)
— Store in a deep freezer (Below -18°)

Storage conditions not related to temperature are indicated in the following terms:

— Store protected from light
— Store protected from light and moisture

Where no specific storage directions or limitations are given in the monograph or in the D&C rules 1945 or by the manufacturer, it is to be understood that the storage conditions include protection from moisture, direct sunlight, freezing and excessive heat (any temperature above 40°).

Storage Containers. The requirements, guidance and information on containers for pharmaceutical use are given in the chapter entitled Containers (6.2).

In general, an article should be packed in a well-closed container i.e. one that protects the contents from contamination by extraneous solids, liquids, moisture or vapours and from loss of the article under normal conditions of handling and storage and preserves the properties of the drug. Containers, unless otherwise specified, or of the nature such as capsule shall, foils of strips etc, shall allow examination of the contents inside. Closures used shall also of suitable properties and quality to protect the drug from any contamination and shall not be the source of contamination by themselves. Notices as may be needed in respect of Radiopharmaceuticals may also be incorporated.

Where, additionally, loss or deterioration of the article from effervescence, deliquescence or evaporation under normal conditions of storage is likely, the container must be capable of being tightly closed, and re-closed after use.

In certain cases, special requirements of pack have been indicated in some monographs under Storage, using expressions that have been defined in chapter 6.2.

https://nhathuocngocanh.com/

Labelling. The labelling of drugs and pharmaceuticals is governed by the Drugs and Cosmetics Rules, 1945. The statements that are given in the monographs under the side-heading 'Labelling' are not comprehensive. Only those that are necessary to demonstrate compliance or otherwise with the monograph have been given and they are mandatory. For example, in the monograph on Betamethasone Sodium Tablets the labelling statement is "The label states the strength in terms of the equivalent amount of betamethasone".

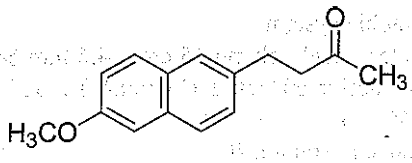
Nabumetone



$C_{15}H_{16}O_2$ Mol. Wt. 228.3

Nabumetone is 4-(6-methoxynaphthalen-2-yl)butan-2-one.

Nabumetone contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{15}H_{16}O_2$, calculated on the anhydrous basis.

Category. Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nabumetone IPRS* or with the reference spectrum of nabumetone.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 25.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 5.0 ml with *acetonitrile*.

Reference solution (a). A 0.004 per cent w/v solution of *nabumetone IPRS* in *acetonitrile*.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with *acetonitrile*.

Reference solution (c). A 0.0015 per cent w/v solution of *nabumetone impurity F IPRS (6,6'-dimethoxy-2,2'-binaphthalenyl IPRS)* in *acetonitrile*.

Reference solution (d). A 0.004 per cent w/v solution of *nabumetone impurity D IPRS ((E)-4-(6-methoxynaphthalen-2-yl)but-3-en-2-one IPRS)* in *acetonitrile*. To 5.0 ml of the solution, add 5.0 ml of test solution (b).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 12 volumes of *tetrahydrofuran*, 28 volumes of *acetonitrile* and 60 volumes of a 0.1 per cent v/v solution of *glacial acetic acid* in *carbon dioxide-free water*,

  B. a mixture of 24 volumes of *tetrahydrofuran*, 56 volumes of *acetonitrile* and 20 volumes of a 0.1 per cent v/v solution of *glacial acetic acid* in *carbon dioxide-free water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
12	100	0
28	0	100
33	0	100
35	100	0

The retention time of the nabumetone peak is about 11 minutes.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to nabumetone and nabumetone impurity D is not less than 1.5.

Inject reference solution (b), (c) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak corresponding to nabumetone impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks other than nabumetone impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.2 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (b).

https://nhathuocngocanh.com/

Calculate the content of $C_{15}H_{16}O_2$.

Storage. Store protected from light.

Nabumetone Tablets

Nabumetone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of nabumetone, $C_{15}H_{16}O_2$.

Usual strengths. 500 mg; 750mg.

Identification

Disperse a quantity of the powdered tablets containing about 0.1 g of nabumetone in 25 ml of *acetone*, with the aid of ultrasound for about 30 minutes and filter. Evaporate the filtrate to dryness on a water-bath and dry the residue in an oven at 60° for about half an hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nabumetone IPRS* or with the reference spectrum of nabumetone.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 2 per cent w/v solution of *sodium lauryl sulphate*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 270 nm and minima at about 296 nm (2.4.7). Calculate the content of $C_{15}H_{16}O_2$ in the medium from the difference of absorbance obtained at 270 nm and 296 nm by using a solution of known concentration of *nabumetone IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{16}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.25 g of Nabumetone with *acetontrile* and dilute to 50.0 ml with *acetonitrile*, filter.

Reference solution (a). A 0.0025 per cent w/v solution of *nabumetone IPRS* in *acetonitrile*.

Reference solution (b). A 0.0015 per cent w/v solution of *nabumetone impurity F IPRS (6,6'-dimethoxy-2,2'-binaphthalenyl IPRS)* in *acetonitrile*.

Reference solution (c). A solution containing 0.002 per cent w/v, each of, *nabumetone IPRS* and *nabumetone impurity D IPRS ((E)-4-(6-methoxynaphthalen-2-yl)but-3-en-2-one IPRS)* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 12 volumes of *tetrahydrofuran*, 28 volumes of *acetonitrile* and 60 volumes of a 0.1 per cent v/v solution of *glacial acetic acid* in *carbon dioxide-free water*,
  B. a mixture of 24 volumes of *tetrahydrofuran*, 56 volumes of *acetonitrile* and 20 volumes of a 0.1 per cent v/v solution of *glacial acetic acid* in *carbon dioxide-free water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
12	100	0
28	0	100
33	0	100
34	100	0

The retention time of the nabumetone peak is about 11 minutes.

Inject reference solution (c). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to nabumetone impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of the areas of all the secondary peaks other than nabumetone impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.5 g of Nabumetone in 40 ml of *acetonitrile*, with the aid of ultrasound for 15 minutes, allow to cool and dilute to 50.0 ml with *acetonitrile*, filter. Dilute 5.0 ml of the filtrate to 100.0 ml with the mobile phase. Further dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution. Dilute 5.0 ml of a 0.1 per cent w/v solution of *nabumetone IPRS* in *acetonitrile* to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 18 volumes of *tetrahydrofuran*, 40 volumes of a 0.1 per cent v/v solution of *glacial acetic acid* in *carbon dioxide-free water* and 42 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

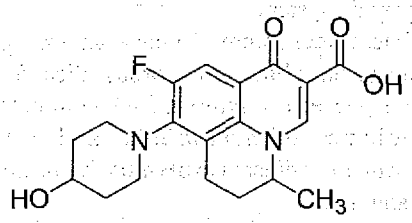
The retention time of the nabumetone peak is about 4 minutes.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{16}O_2$ in the tablets.

Nadifloxacin



$C_{19}H_{21}FN_2O_4$ Mol.Wt. 360.4

Nadifloxacin is 9-Fluoro-8-(4-hydroxy-piperidin-1-yl)-5-methyl-1-oxo-6,7-dihydro-1*H*,5*H*-pyrido[3,2,1-ij]quinoline-2-carboxylic acid.

Nadifloxacin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{21}FN_2O_4$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. An off–white to pale yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nadifloxacin IPRS* or with the reference spectrum of nadifloxacin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of a buffer solution prepared by dissolving 1.927 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 3.6 with *orthophosphoric acid* and 70 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 15 ml of the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: a mixture of equal volumes of a buffer solution prepared by dissolving 1.927 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 3.6 with *orthophosphoric acid* and *acetonitrile*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 0.25 g.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Dissolve 25 mg of the substance under examination in about 70 ml of the solvent mixture with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{21}FN_2O_4$

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Nadifloxacin Cream

Nadifloxacin Cream contains Nadifloxacin in a suitable cream base.

Nadifloxacin Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nadifloxacin, $C_{19}H_{21}FN_2O_4$.

Usual strength. 1 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile.*

Test solution. Disperse a quantity of the cream containing 10 mg of Nadifloxacin in 70 ml of the solvent mixture, heat on a water-bath at 60° for 20 minutes with shaking to obtain a uniform dispersion. Mix with the aid of ultrasound for 15 minutes with intermittent swirling, dilute to 100.0 ml with the solvent mixture and filter, discarding first few ml of filtrate.

Reference solution. A 0.00005 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *triethylamine* adjusted to pH 4.0 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile.*

Test solution. Disperse a quantity of the cream containing 10 mg of Nadifloxacin in 70 ml of the solvent mixture, heat on a water bath at 60° for 20 minutes with shaking to obtain a uniform dispersion. Mix with the aid of ultrasound for 15 minutes with intermittent swirling, dilute to 100.0 ml with solvent mixture and filter, discarding the first few ml of the filtrate. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *triethylamine* adjusted to pH 4.0 with *orthophosphoric acid* and filter.,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{21}FN_2O_4$ in the cream.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Nadifloxacin Gel

Nadifloxacin Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Nadifloxacin, $C_{19}H_{21}FN_2O_4$.

https://nhathuocngocanh.com/

Usual strength. 1 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*.

Test solution. Disperse a quantity of the gel containing about 10 mg of Nadifloxacin in 70 ml of the solvent mixture, heat on a water-bath at 60° for 10 minutes with shaking to obtain a uniform dispersion. Mix with the aid of ultrasound for 5 minutes with intermittent swirling and dilute to 100.0 ml with the solvent mixture and filter, discarding the first few ml of the filtrate.

Reference solution. A 0.00005 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *triethylamine* adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Gels.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of the gel containing 10 mg of Nadifloxacin in 70 ml of the solvent mixture, heat on a water-bath at 60° for 10 minutes with shaking to obtain a uniform dispersion. Mix with the aid of ultrasound for 5 minutes with intermittent swirling dilute to 100.0 ml with the solvent mixture and filter, discarding first few ml of the filtrate. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *nadifloxacin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *triethylamine* adjusted to pH 4.0 with *orthophosphoric acid* and filter.
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

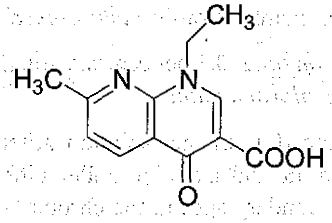
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution and the test solution.

Calculate the content of $C_{19}H_{21}FN_2O_4$ in the gel.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Nalidixic Acid



$C_{12}H_{12}N_2O_3$ Mol. Wt. 232.2

Nalidixic Acid is 1-ethyl-1,4-dihydro-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid.

Nalidixic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to slightly yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

https://nhathuocngocanh.com/

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalidixic acid IPRS* or with the reference spectrum of nalidixic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 258 nm and 334 nm; ratio of the absorbance at about 258 nm to that at about 334 nm, 2.2 to 2.4.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Dissolve 0.1 g in 2 ml of *hydrochloric acid* and add 0.5 ml of 10 per cent w/v solution of *2-naphthol* in *ethanol (95 per cent)*; an orange-red colour develops.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 20 volumes of *dichloromethane* and 10 volumes of *5 M ammonia*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *dichloromethane*.

Test solution (b). A 0.1 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (a). A 0.002 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (b). A 0.0008 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (c). A 0.1 per cent w/v solution of *nalidixic acid IPRS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18) Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.15 g, dissolve in 10 ml of *dichloromethane*, add 30 ml of *2-propanol* and 10 ml of *carbon dioxide-free water* and titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25) and using a glass electrode as the indicator electrode and a silver-silver chloride reference electrode with a sleeve diaphragm or a capillary tip filled with a saturated solution of *lithium chloride* in *ethanol*. Throughout the titration keep the temperature of the solution between 15° and 20° and pass a current of nitrogen through the solution.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02322 g of $C_{12}H_{12}N_2O_3$.

Storage. Store protected from light and moisture.

Nalidixic Acid Tablets

Nalidixic Acid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of nalidixic acid, $C_{12}H_{12}N_2O_3$.

Usual strengths. 250 mg; 500 mg.

Identification

To a quantity of the powdered tablets containing 1 g of Nalidixic Acid add 50 ml of *chloroform*, shake for 15 minutes, filter and evaporate the filtrate to dryness. The residue, after drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalidixic acid IPRS* or with the reference spectrum of nalidixic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 258 nm and 334 nm; ratio of the absorbance at about 258 nm to that at about 334 nm, 2.2 to 2.4.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 900 ml of methanolic phosphate buffer pH 8.6 prepared by mixing 230 ml of *0.2 M sodium hydroxide*, 250 ml of *0.2M potassium dihydrogen orthophosphate* and 200 ml of *methanol* and dilute to 1000 ml with *water*, adjusted to pH 8.6 using *1M sodium hydroxide*.

Speed and time. 60 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maximum at about 334 nm. (2.4.7). Calculate the content of $C_{12}H_{12}N_2O_3$ in the medium taking 494 as the specific absorbance at 334 nm.

Q. Not less than 70 per cent of the stated amount of $C_{12}H_{12}N_2O_3$.

https://nhathuocngocanh.com/

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 20 volumes of *dichloromethane* and 10 volumes of *5 M ammonia*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Nalidixic Acid with 50 ml of *chloroform* for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *chloroform*.

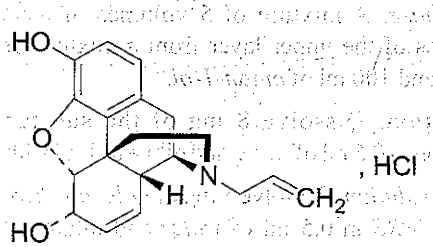
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Nalidixic Acid, add 150 ml of *1 M sodium hydroxide*, shake for 3 minutes, dilute to 200.0 ml with *1 M sodium hydroxide*, mix and allow to stand for 15 minutes. Dilute 2.0 ml of the solution to 100.0 ml with water and measure the absorbance of the resulting solution at the maximum at about 334 nm (2.4.7), using *0.01 M sodium hydroxide* as the blank. Calculate the content of $C_{12}H_{12}N_2O_3$ taking 494 as the specific absorbance at 334 nm.

Storage. Store protected from light and moisture.

Nalorphine Hydrochloride



$C_{19}H_{21}NO_3,HCl$ Mol. Wt. 347.8

Nalorphine Hydrochloride is 17-allyl-7,8-didehydro-4,5α-epoxymorphinan-3,6α-diol hydrochloride.

Nalorphine Hydrochloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{19}H_{21}NO_3,HCl$, calculated on the dried basis.

Category. Narcotic antagonist.

Description. A white or almost white, crystalline powder. It slowly darkens on exposure to air and light.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests C and D may be omitted if tests A, B and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalorphine hydrochloride IPRS* or with the reference spectrum of nalorphine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum only at about 298 nm; absorbance at about 298 nm, about 0.6.

C. To 10 ml of a 2 per cent w/v solution add 0.05 ml of *dilute ammonia solution*; a white precipitate soluble in sodium hydroxide solution is produced.

D. Dissolve 2 mg in 2 ml of *water*, add 0.15 ml of *potassium ferricyanide solution* containing, in each ml, 0.05 ml of *ferric chloride solution*; a deep bluish green colour is produced immediately.

E. It gives reaction (A) of chlorides (2.3.1).

Tests

Melting range (2.4.21). 260° to 263°.

Acidity. Dissolve 0.2 g in 10 ml of freshly boiled and cooled *water* and titrate with *0.02 M sodium hydroxide* using *methyl red solution* as indicator; not more than 0.2 ml of *0.02 M sodium hydroxide* is required to change the colour of the solution.

Specific optical rotation (2.4.22). – 125° to – 122°, determined in a 2.0 per cent w/v solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. Dissolve 25 mg in sufficient *water* to produce 250 ml. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO_3,HCl$ from the absorbance obtained by repeating the operation with *nalorphine hydrochloride IPRS* in place of the substance under examination.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Nalorphine Injection

Nalorphine Hydrochloride Injection

Nalorphine Injection is a sterile solution of Nalorphine Hydrochloride in Water for Injections containing suitable buffering agents.

Nalorphine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nalorphine hydrochloride, $C_{19}H_{21}NO_3,HCl$.

Usual strength. 10 mg per ml.

Identification

A. To a volume containing 50 mg of Nalorphine Hydrochloride add *dilute ammonia solution* until the solution is alkaline and extract with 25 ml of a mixture of 1 volume of *ethanol (95 per cent)* and 3 volumes of *chloroform* and evaporate the extract to dryness. Dry the residue at a pressure not exceeding 2 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalorphine hydrochloride IPRS* treated in the same manner or with the reference spectrum of nalorphine.

B. To a volume containing 0.1 g of Nalorphine Hydrochloride add 0.05 ml of *dilute ammonia solution*; a white precipitate soluble in *sodium hydroxide solution* is produced.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 6.0 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 11.6 Endotoxin Units per mg of nalorphine hydrochloride.

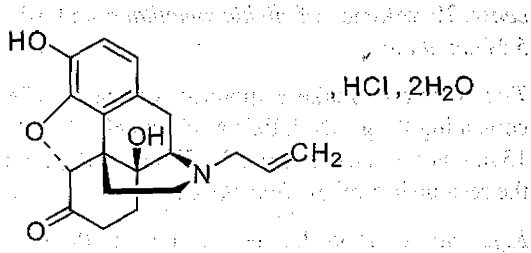
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer a measured volume containing about 10 mg of Nalorphine Hydrochloride to a separating funnel, add 1 ml of *dilute hydrochloric acid* and dilute to 10 ml with *water*. Extract with five successive quantities, each of 5 ml, of *chloroform*, allowing the layers to separate before drawing off each chloroform extract and discard the chloroform extracts. Transfer the aqueous layer to a 100-ml volumetric flask with the aid of small quantities of *water* and dilute to volume with *water*. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO_3,HCl$ from the absorbance obtained by repeating the operation with *nalorphine hydrochloride IPRS*.

Storage. Store protected from light.

Naloxone Hydrochloride

Naloxone Hydrochloride Dihydrate



$C_{19}H_{21}NO_4,HCl,2H_2O$ Mol. Wt. 399.9

Naloxone Hydrochloride is 17-allyl-4,5-α-epoxy-3,14-dihydroxymorphinan-3-one hydrochloride dihydrate.

Naloxone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{22}ClNO_4$, calculated on the anhydrous basis.

Category. Antidote for opioids poisoning.

Description. A white to almost white, hygroscopic, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *naloxone hydrochloride dihydrate IPRS* or with the reference spectrum of naloxone hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *ammonia* and 100 ml of *butan-1-ol*.

Test solution. Dissolve 8 mg of the substance under examination in 0.5 ml of *water* and dilute to 1 ml with *methanol*.

Reference solution. Dissolve 8 mg of *naloxone hydrochloride dihydrate IPRS* in 0.5 ml of *water* and dilute to 1 ml with *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and spray with a freshly prepared 0.5 per cent w/v solution of *potassium ferricyanide* in *ferric chloride solution* and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

https://nhathuocngocanh.com/

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* (Solution A) is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.05 ml of *methyl red solution*. Not more than 0.2 ml of *0.02 M sodium hydroxide* or *0.02 M hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.4.22). – 181° to – 170°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.125 g of the substance under examination in 25 ml of *0.1 M hydrochloric acid*.

Reference solution (a). Dissolve 5 mg of *naloxone for peak identification IPRS* (containing naloxone impurity A (4,5α -epoxy-3,14-dihydroxymorphinan-6-one) (noroxymorphone), naloxone impurity B (4,5α-epoxy-14-hydroxy-17-(prop-2-enyl)-3-(prop-2-enyloxy)morphinan-6-one) (3-*O*-allylnaloxone), naloxone impurity C (4,5α -epoxy-3,10α,14-trihydroxy-17-(prop-2-enyl)morphinan-6-one) (10α -hydroxynaloxone), naloxone impurity D (7,8-didehydro-4,5α -epoxy-3,14-dihydroxy-17-(prop-2-enyl)morphinan-6-one) (7,8-didehydronaloxone), naloxone impurity E (4,5 α:4',5' α-diepoxy-3,3',14,14'-tetrahydroxy-17,17'-bis(prop-2-enyl)-2,2'-bimorphinanyl-6,6'-dione) (2,2'-bisnaloxone) and naloxone impurity F (4,5α-epoxy-3,10β,14-trihydroxy-17- (prop-2-enyl)morphinan-6-one) (10α-hydroxynaloxone) in 1 ml of *0.1 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20 ml with *0.1 M hydrochloric acid*. Dilute 1.0 ml of the solution to 25.0 ml with *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 2 volumes of *acetonitrile*, 40volumes of *tetrahydrofuran* and 94 volumes of the solution prepared by dissolving 1.1 g of *sodium octanesulphonate* in 1000 ml of *water*, adjusted to pH 2.0 with 50 per cent v/v solution of *orthophosphoric acid*,

  B. a mixture of 4 volumes of *tetrahydrofuran*, 17 volumes of *acetonitrile* and 79 volumes of the solution prepared by dissolving 1.1 g of *sodium octanesulphonate* in 1000 ml of *water*, adjusted to pH 2.0 with a 50 per cent v/v solution of *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
40	0	100
50	0	100
52	100	0

Inject reference solution (a). Adjust the sensitivity of the system so that the peak-to-valley ratio is minimum 2.0, where H_p is height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to naloxone.

The relative retention time with reference to naloxone, for naloxone impurity C, naloxone impurity A, naloxone impurity F, naloxone impurity D, naloxone impurity E and naloxone impurity B is about 0.6 minute, 0.8 minute, 0.9 minute, 1.1 minutes, 3.0 minutes and 3.2 minutes respectively.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of each secondary peak corresponding to naloxone impurities A, B, C, E, F multiplied with correction factor 0.5 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Multiply the area of the peak corresponding to naloxone impurity E with correction factor 0.5. The area of secondary peak corresponding to naloxone impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other impurities is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all other secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 0.5 g.

Water (2.3.43), 7.5 per cent to 11.0 per cent, determined on 0.2 g.

Assay. Weigh 0.3 g, dissolve in 50 ml of *ethanol (95 per cent)* and add 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.03638 g of $C_{19}H_{22}ClNO_4$.

Storage. Store protected from light.

https://nhathuocngocanh.com/

Naloxone Injection

Naloxone Injection is a sterile solution of Naloxone Hydrochloride in Water for Injections.

Naloxone Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naloxone hydrochloride, $C_{19}H_{21}NO_4,HCl$.

Usual strength. 400 µg per ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *M ammonia* and 100 ml of *butan-1-ol*.

Test solution. Add 1 ml of *ammonia buffer pH 10.0* to a volume of the injection containing the equivalent of 2 mg of anhydrous naloxone hydrochloride, extract with three 20 ml quantities of a mixture of 1volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol*. Dilute 1 ml of the solution to 20 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *naloxone hydrochloride IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm, protecting the plate from light. After development, dry the plate in a current of air, spray with a freshly prepared 0.5 per cent w/v solution of *potassium hexacyanoferrate (III)* in *iron(III) chloride solution* and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *2 M ammonia* and 100 ml of *butan-1-ol*.

Test solution. Transfer a volume of the injection containing about 2 mg of Naloxone Hydrochloride in 1 ml of *ammonia buffer pH 10.0*, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol*.

Reference solution. Dilute 0.5 ml of the test solution to 100.0 ml with *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm, protecting the plate from light. After development, dry the plate in a current of air, spray with a freshly prepared 0.5 per cent w/v solution of *potassium hexacyanoferrate(III)* in *iron(III) chloride solution* and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any spot remaining on the line of application.

Bacterial endotoxins (2.2.3). Not more than 70 Endotoxin Units per ml of the injection, diluted if necessary, with *water BET* to give a solution containing 0.04 per cent w/v of anhydrous Naloxone Hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.1 volume of *orthophosphoric acid*, 45 volumes of *methanol* and 55 volumes of *water*.

Test solution. Dilute the injection equivalent to 0.001 per cent w/v of Naloxone Hydrochloride with the solvent mixture.

Reference solution (a). A 0.001 per cent w/v solution of *naloxone hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 0.001 per cent w/v solution of *naloxone hydrochloride IPRS* and 0.0005 per cent w/v solution of *noroxymorphone* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 to 10 µm) (Such as Zorbax C18),
- mobile phase: a solution containing 0.068 per cent w/v of *sodium octanesulphonate* and 0.1 per cent w/v of *sodium chloride* in the solvent mixture,
- flow rate: 1 ml per minute,
- spectrophotometer set at 229 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naloxone and noroxymorphone in the chromatogram obtained with reference solution (b) is not less than 1.3.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{21}NO_4,HCl$ in the injection.

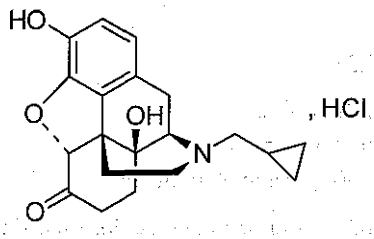
https://nhathuocngocanh.com/

Storage. Store protected from light.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of anhydrous naloxone hydrochloride.

When naloxone is prescribed for neonatal use, Neonatal Naloxone Injection (containing the equivalent of 20 micrograms per ml of anhydrous naloxone hydrochloride) shall be dispensed.

Naltrexone Hydrochloride



$C_{20}H_{24}ClNO_4$ Mol. Wt. 377.9

Naltrexone Hydrochloride is 17-(cyclopropylmethyl)-4,5α-epoxy-3,14-dihydroxymorphinan-6-one hydrochloride.

Naltrexone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{24}ClNO_4$, calculated on the anhydrous and ethanol free basis.

Category. Antidote for opioids poisoning.

Description. A white or almost white powder, very hygroscopic.

Identification

A. Dissolve 20 mg of the substance under examination in 5 ml of *water* and make alkaline with *dilute ammonia*. Shake with 10 ml of *dichloromethane*, separate the organic layer and evaporate the solvent. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naltrexone hydrochloride IPRS* treated in the same manner or with the reference spectrum of naltrexone.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon-dioxide free water* is clear (2.4.1) and not more intensely coloured than reference solution YS5 or BS5 (2.4.1).

Acidity or alkalinity. To 10 ml of 2.0 per cent w/v solution in *carbon-dioxide free water*, add 0.05 ml of *methyl red solution*. Not more than 0.2 ml of *0.02 M sodium hydroxide* or *0.02 M hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.4.22). – 195° to – 187°, determined in a 2.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of *0.1 M hydrochloric acid*.

Reference solution (a). Dissolve 5 mg of *17-but-3-enyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one IPRS (naltrexone impurity C IPRS)* in 2.5 ml of *0.1 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of the test solution and 1.0 ml of reference solution (a) to 100.0 ml with *0.1 M hydrochloric acid*. Dilute 1.0 ml of the solution to 10.0 ml with *0.1 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a 0.11 per cent w/v solution of *sodium octanesulphonate*, adjusted to pH 2.3 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
45	55	45
47	90	10
55	90	10

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naltrexone and naltrexone impurity C is not less than 2.0. The relative retention time with reference to naltrexone for 17-formyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one (naltrexone impurity A) is about 0.4, for 4,5α-epoxy-3,14-dihydroxymorphinan-6-one (noroxymorphone) (naltrexone impurity B) is about 0.7, For 17-(cyclopropylmethyl)-4,5α-epoxy-3,10α,14-trihydroxymorphinan-6-one (naltrexone impurity F) is about 0.8, for 17-(cyclopropylmethyl)-4,5α-epoxy-3,10β,14-trihydroxymorphinan-6-one (naltrexone impurity G) is about 0.9, for 17-but-3-enyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one

https://nhathuocngocanh.com/

(naltrexone impurity C) is about 1.05, for 17-butyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one (naltrexone impurity H) is about 1.1, for 17-(cyclopropylmethyl)-4,5α-epoxy-3,14-dihydroxymorphinan-6,10-dione (naltrexone impurity I) is about 1.2, for 7-(cyclopropylmethyl)-4,5α-epoxy-14-hydroxy-3-methoxymorphinan-6-one (naltrexone impurity J) is about 1.3, for 17,17′-bis(cyclopropylmethyl)-4,5α:4′,5′-α-diepoxy-3,3′,14,14′-tetrahydroxy-2,2′-bimorphinanyl-6,6′-dione (pseudonaltrexone) (naltrexone impurity D) is about 1.4, for 3-(cyclopropylmethoxy)-17-(cyclopropylmethyl)-4,5α-epoxy-14-hydroxymorphinan-6-one (naltrexone impurity E) is about 1.7.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area any peak corresponding to naltrexone impurity C, D, E, F and G, each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to naltrexone impurity A, B, H, I and J, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ethanol (2.3.45). Not more than 3.0 per cent, determined by Method I using the following solutions.

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *water.*

Reference solution. Dilute 0.75 g of *anhydrous ethanol* to 1000 ml with *water.*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 10.0 per cent, determined on 0.2 g.

Assay. Weigh 0.2 g of the substance under examination, dissolve in 60 ml of *ethanol (95 per cent)* and add 1.0 ml of *0.1 M hydrochloric acid.* Titrate with *0.1 M sodium hydroxide,* determining the end-point potentiometrically (2.4.25). The curve shows 3 points of inflexion. Read the volume added between the first 2 points of inflexion. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03779 g of $C_{20}H_{24}ClNO_4$.

Storage. Store protected from light and moisture.

Naltrexone Tablets

Naltrexone Hydrochloride Tablets

Naltrexone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naltrexone hydrochloride, $C_{20}H_{23}NO_4.HCl$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *water.*

Reference solution. A solution of *naltrexone hydrochloride IPRS* in *water* to obtain the same concentration as given in the test solution.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 600 volumes of 0.05 M buffer solution prepared by dissolving 7 g of *monobasic sodium phosphate* in 1000 ml of *water*, add 1.1 g of *sodium 1-octane sulphonate monohydrate* and 400 ml of *methanol*, adjusted to pH 6.7 with *dilute sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 100 µl.

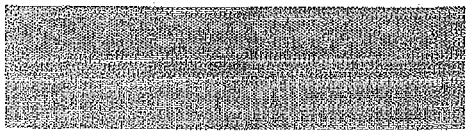
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{23}NO_4.HCl$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{23}NO_4.HCl$.

Other tests. Comply with the tests stated under Tablets.



https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablets containing about 250 mg of Naltrexone with 80 ml of *0.1 M orthophosphoric acid*, sonicate for 30 minutes and dilute to 100.0 ml with the same solvent, filter.

Reference solution (a). Dissolve 22.5 mg of *naltrexone IPRS* in 1.5 ml of *methanol* and 0.6 ml of *0.1 M hydrochloric acid.* Dilute to 10.0 ml with *0.1 M orthophosphoric acid.*

Reference solution (b). Dissolve about 3 mg of *N-(3-butenyl)-noroxymorphone hydrochloride IPRS (naltrexone impurity A IPRS)* in 3.0 ml of *methanol* and dilute to 10 ml with *0.1 M orthophosphoric acid.* To 0.5 ml of the solution, add 5.0 ml of reference solution (a) and dilute to 10.0 ml with *0.1 M orthophosphoric acid.*

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. dissolve 1.08 g of *sodium 1-octanesulphonate* and 23.8 g of *sodium acetate* in 800 ml of *water*. Add 1.0 ml of *triethylamine* and 200 ml of *methanol*, adjusted to pH 6.5 with *glacial acetic acid*, B. dissolve 1.08 g *sodium 1-octanesulphonate* and 23.8 g *sodium acetate* in 400 ml of *water*. Add 1.0 ml of *triethylamine* and 600 ml of *methanol*, adjusted to pH 6.5 with *glacial acetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

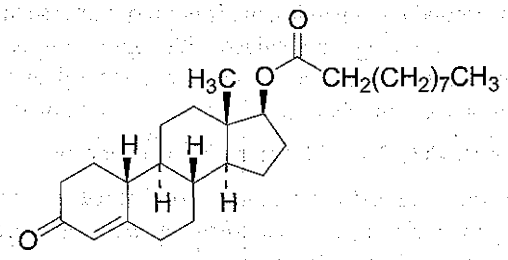
Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
1	100	0
35	0	100
50	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naltrexone and naltrexone impurity A is not less than 2.0, the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention time with reference to naltrexone for noroxymorphone is about 0.55, for 10-hydroxynaltrexone is about 0.7, for naltrexone impurity A is about 1.26, for 2,2α-bisnaltrexone is about 1.80 and for 10-ketonaltrexone is about 1.99.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{23}NO_4.HCl$ in the Tablets.

Nandrolone Decanoate



$C_{28}H_{44}O_3$ Mol. Wt. 428.7

Nandrolone Decanoate is 3-oxo-4-estren-17β-yl decanoate.

Nandrolone Decanoate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{28}H_{44}O_3$, calculated on the dried basis.

Category. Anabolic steroid.

Description. A white to creamy-off white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nandrolone decanoate IPRS* or with the reference spectrum of nandrolone decanoate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 239 nm is about 0.41.

C. Dissolve 25 mg in 1 ml of *methanol*, add 2 ml of *semicarbazide acetate solution*, heat under a reflux condenser for 30 minutes and cool; the precipitate, after recrystallisation from *ethanol (95 per cent)*, melts at about 175° (2.4.21).

Tests

Specific optical rotation (2.4.22). +32.0° to +36.0°, determined in a 2.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of *nandrolone IPRS* in *chloroform*.

https://nhathuocngocanh.com/

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to nandrolone is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh 10 mg and dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml. Dilute 5.0 ml of the solution to 50.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{28}H_{44}O_3$ taking 407 as the specific absorbance at 239 nm.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°.

Nandrolone Decanoate Injection

Nandrolone Decanoate Injection is a sterile solution of Nandrolone Decanoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these.

Nandrolone Decanoate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nandrolone decanoate, $C_{28}H_{44}O_3$.

Usual strength. 25 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone*.

Test solution. Dilute a suitable volume of the injection with *chloroform* to give a solution containing 0.5 per cent w/v solution of Nandrolone Decanoate.

Reference solution. A 0.5 per cent w/v solution of *nandrolone decanoate IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable, spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol (95 per cent)*, heat at 105° for 30 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Ignore any subsidiary spots due to the vehicle.

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with *ethanol* to obtain a solution containing 0.02 per cent w/v of Nandrolone Decanoate.

Reference solution. Dissolve a quantity of *nandrolone decanoate IPRS* in *ethanol* to obtain a solution containing 0.02 per cent w/v of nandrolone decanoate.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 90 volumes of *methanol* and 10 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

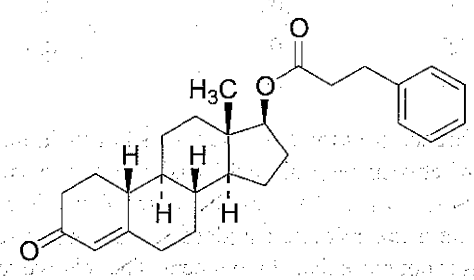
Calculate the content of $C_{28}H_{44}O_3$.

Storage. Store protected from light.

Labelling. The label states that the preparation is for intramuscular injection only.

Nandrolone Phenylpropionate

Nandrolone Phenpropionate



$C_{27}H_{34}O_3$ Mol.Wt. 406.6

Nandrolone Phenylpropionate is 3-oxo-4-estren-17β-yl 3-phenylpropionate.

Nandrolone Phenylpropionate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{27}H_{34}O_3$, calculated on the dried basis.

https://nhathuocngocanh.com/

Category. Anabolic steroid.

Description. A white to creamy-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nandrolone phenylpropionate IPRS* or with the reference spectrum of nandrolone phenylpropionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 240 nm is about 0.43.

C. Dissolve 25 mg in 1 ml of *methanol*, add 2 ml of *semicarbazide acetate solution*, heat under a reflux condenser for 30 minutes and cool; the precipitate, after recrystallisation from *ethanol (95 per cent)* melts at about 182° (2.4.21).

Tests

Specific optical rotation (2.4.22). +48.0° to +51.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of *nandrolone IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to nandrolone is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh 10 mg, dissolve in sufficient *ethanol* to produce 100.0 ml, dilute 5.0 ml to 50.0 ml with *ethanol* and measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{27}H_{34}O_3$ taking 430 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Nandrolone Phenylpropionate Injection

Nandrolone Phenylpropionate Injection is a sterile solution of Nandrolone Phenylpropionate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in a mixture of these.

Nandrolone Phenylpropionate Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of nandrolone phenylpropionate, $C_{27}H_{34}O_3$.

Usual strengths. 25 mg per ml; 50 mg per ml.

Identification

Dissolve a volume of the injection containing 50 mg of Nandrolone Phenylpropionate in 8 ml of *light petroleum (40° to 60°)* and extract with three 8-ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand for 2 hours in ice and filter. The precipitate, after washing with *water* and drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa, complies with the following test.

Determine by thin-layer chromatography (2.4.17), using a *silica gel GF254* precoated plate the surface of which has been modified by chemically-bonded octadecylsilyl groups.

Mobile phase. A mixture of 20 volumes of *water*, 40 volumes of *acetonitrile* and 60 volumes of *propan-2-ol*.

Test solution. A 0.5 per cent w/v solution of the dried precipitate in *chloroform*.

Reference solution (a). A 0.5 per cent w/v solution of *nandrolone phenylpropionate IPRS* in *chloroform*.

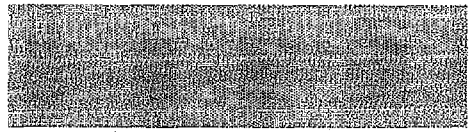
Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the solvent has evaporated and heat it at 100° for 10 minutes. Allow to cool and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 0.1 g of Nandrolone Phenylpropionate add sufficient *chloroform* to produce 100.0 ml. Dilute 3.0 ml of the solution to 50.0 ml with *chloroform*.



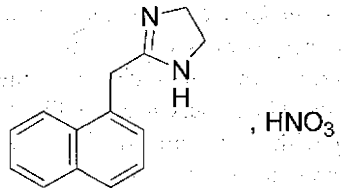
https://nhathuocngocanh.com/

To 5.0 ml of the resulting solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the solution at the maximum at about 380 nm (2.4.7), using as blank 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{27}H_{34}O_3$ from the absorbance obtained from a 0.006 per cent w/v solution of *nandrolone phenylpropionate IPRS* treated in the same manner.

Storage. Store protected from light.

Labelling. The label states that the preparation is for intramuscular injection only.

Naphazoline Nitrate



, HNO_3

$C_{14}H_{14}N_2,HNO_3$ Mol. Wt. 273.3

Naphazoline Nitrate is 2-(1-napthylmethyl)-2-imidazoline nitrate.

Naphazoline Nitrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_4H_{14}N_2,HNO_3$ calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or almost white crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naphazoline nitrate IPRS* or with the reference spectrum of naphazoline nitrate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 270 nm, 280 nm, 287 nm and 291 nm; absorbances at these maxima are about 0.43, 0.50, 0.35 and 0.34 respectively.

C. To 1 ml of 0.05 per cent w/v in *methanol,* add 0.5 ml of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside* and 0.5 ml of a 2 per cent w/v solution of *sodium hydroxide*, allow to stand for 10 minutes and add 1 ml of a 8 per cent w/v solution of *sodium bicarbonate;* a violet colour is produced.

D. Dissolve about 10 mg in 5 ml of *water,* add 0.2 g of *magnesium oxide,* shake mechanically for 30 minutes, add 10 ml of *chloroform* and shake vigorously. Allow to stand, separate the chloroform layer, filter and evaporate the aqueous layer to dryness. The residue gives reaction (A) for nitrates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg of *1-naphthylacetic acid* in the mobile phase, add 5 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *naphazoline impurity A IPRS* in 100 ml of the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: dissolve 1.1 g of *sodium octanesulphonate* in a mixture of 5 volumes of *glacial acetic acid,* 300 volumes of *acetonitrile* and 700 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to naphazoline and naphazoline impurity B is not less than 5.0. The relative retention time with reference to naphazoline for naphthylacetylethylenediamine (naphazoline impurity A) is about 0.76, for 1-naphthylacetic acid (naphazoline impurity B) is about 1.27, for 1-naphthylacetonitrile (naphazoline impurity C) is about 2.8, for ß-naphazoline (naphazoline impurity D) is about 1.28.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak corresponding to naphazoline impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.5 times the area

https://nhathuocngocanh.com/

of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Chlorides (2.3.12). To 0.75 g, add 30 ml of *water* and 1 ml of *nitric acid*, heat at 50° for 10 minutes. This solution complies with the limit test for chlorides (330 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

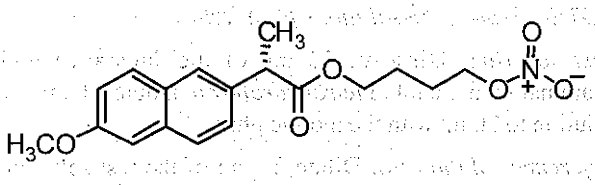
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02733 g of $C_{14}H_{14}N_2,HNO_3$.

Storage. Store protected from light.

Naproxcinod



$C_{18}H_{21}NO_6$ Mol Wt. 347.4

Naproxcinod is 4-Nitrooxybutyl (2*S*)-2-(6-methoxy-2-naphthyl)propanoate.

Naproxcinod contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{21}NO_6$, calculated on the anhydrous basis.

Category. Analgesic.

Description. A light yellow to yellow liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxcinod IPRS* or with the reference spectrum of naproxcinod.

Tests

Specific optical rotation (2.4.22). +32° to +36°, determined on 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution. A 0.005 per cent w/v solution of *naproxcinod IPRS* and *naproxcinod impurity A IPRS [2(S)-(-methoxy-napthalen-2-yl) propionic acid 4-(chloro) butyl ester]* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 60 volumes of a buffer solution prepared by mixing 1.0 ml of *orthophosphoric acid* in 1000 ml of *water* and 40 volumes of *acetonitrile*,
  B. a mixture of 85 volumes of *acetonitrile* and 15 volumes of buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
35	30	70
47	30	70
47.1	60	40
52	60	40

The relative retention time for naproxcinod impurity A with respect to naproxcinod is 1.15.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to naproxcinod impurity A is not more than 0.25 per cent, the area of any other secondary peak is not more than 0.5 per cent and sum of the area of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of mobile phase A. Dilute 5.0 ml of the solution to 100.0 ml with mobile phase A.

Reference solution. A 0.005 per cent w/v solution of *naproxcinod IPRS* in mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 60 volumes of buffer solution prepared by mixing 1.0 ml of *orthophosphoric acid* in 1000 ml of *water* and 40 volumes of *acetonitrile*, B. a mixture of 85 volumes of *acetonitrile* and 15 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	30	70
10	30	70
11	0	100
15	0	100
15.1	30	70
20	30	70

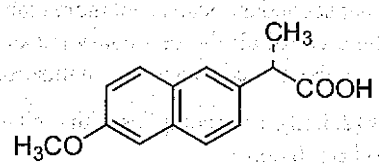
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{21}NO_6$

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Naproxen



$C_{14}H_{14}O_3$ Mol. Wt. 230.3

Naproxen is (2*S*)-2-(6-methoxynaphthalen-2-yl)propionic acid.

Naproxen contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{14}O_3$, calculated on the dried basis.

Category. Nonsteroidal antiinflammatory.

Description. A white or almost white crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen IPRS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* shows absorption maxima at about 262 nm, 271 nm, 316 nm and 331 nm. The specific absorbance at the maxima are 216 to 238, 219 to 241, 61 to 69 and 79 to 87 respectively.

C. Melting range (2.4.21). 154° to 158°.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). + 59° to + 62°, determined in a 2.0 per cent w/v solution in *ethanol (95 per cent)*.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 25 mg of the substance under examination in 50 ml of *tetrahydrofuran*. Dilute 2.0 ml of the solution to 20 ml with the mobile phase.

Reference solution (a). Dilute 2.5 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *racemic naproxen IPRS* in 10 ml of *tetrahydrofuran*, dilute to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel π-acceptor/π-donor for chiral separations (5 µm),
- column temperature: 25°,
- mobile phase: a mixture of 5 volumes of *glacial acetic acid*, 50 volumes of *acetonitrile*, 100 volumes of *2-propanol* and 845 volumes of *hexane*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to (2*R*)-2-(6-methoxynaphthalen-2-yl) propanoic acid (naproxen impurity G) ((*R*)-enantiomer) and naproxen is not less than 3.0.

https://nhathuocngocanh.com/

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. The area of the peak corresponding to naproxen impurity G is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 12 mg of the substance under examination in 20.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 6 mg of *2-bromo-6-methoxynaphthalene IPRS (Naproxen impurity N IPRS)*, 6 mg of *1-(6-methoxynaphthalen-2-yl)ethanone IPRS (Naproxen impurity L IPRS)* and 6 mg of *(1RS)-1-(6-methoxynaphthalen-2-yl)ethanol IPRS (Naproxen impurity K IPRS)* in 10 ml of *acetonitrile*. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 50 ml with the mobile phase. Dilute 1.0 ml of the solution to 20 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a 0.136 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 2.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naproxen impurity K and naproxen is not less than 2.2. The relative retention time with reference to naproxen for naproxen impurity K is about 0.9, for naproxen impurity L is about 1.4 and naproxen impurity N is about 5.3.

Inject reference solution (a), (b) and the test solution . Run the chromatogram 1.5 times the retention time of naproxen impurity N. The area of the peak corresponding to naproxen impurity L is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all impurities is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in a mixture of 25 ml of *water* and 75 ml of *methanol*. Titrate with *0.1 M sodium hydroxide* using 1 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02303 g of $C_{14}H_{14}O_3$.

Storage. Store protected from light.

Naproxen Oral Suspension

Naproxen Oral Suspension is an aqueous suspension of Naproxen in a suitable flavoured vehicle.

Naproxen Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 25 mg per ml.

Identification

Evaporate 50 ml of solution A obtained in the Assay, to dryness using a rotary evaporator. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *naproxen IPRS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

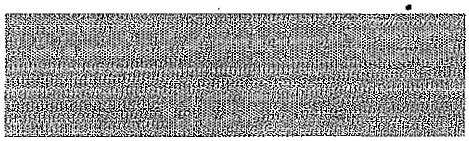
Tests

pH (2.4.24). 2.1 to 4.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene*.

Test solution. Evaporate solution A obtained in the Assay to dryness on a rotary evaporator and dissolve the residue in sufficient *methanol* to produce a solution containing 5.0 per cent w/v of naproxen.



https://nhathuocngocanh.com/

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To a quantity of the oral suspension containing 0.5 g of Naproxen add 20 ml of *3.5 M hydrochloric acid*, mix, extract with three 50 ml quantities of *chloroform*, filter each extract through *anhydrous sodium sulphate*, combine the filtrates and add sufficient *chloroform* to produce 200.0 ml (solution A). Dilute 5.0 ml of solution A add sufficient *methanol* to produce 250.0 ml and measure the absorbance of the resulting solution at the maximum at about 331 nm (2.4.7).

Calculate the content of $C_{14}H_{14}O_3$ taking 81 as the specific absorbance at 331 nm.

Naproxen Suppositories

Naproxen Suppositories contain Naproxen in a suitable suppository base.

Naproxen Suppositories contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 500 mg.

Identification

Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25 ml quantities of *methanol (80 per cent)*. To the combined extracts add 100 ml of a 2 per cent w/v solution of *sodium chloride*, extract with four 25 ml quantities of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter and add sufficient *chloroform* to produce 200 ml (solution A). Evaporate 100 ml of solution A to dryness using a rotary evaporator. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen IPRS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene.*

Test solution. Weigh 20 suppositories and cut into small pieces. Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25-ml quantities of *methanol (80 per cent).* Combine the extracts, add 100 ml of a 2 per cent w/v solution of *sodium chloride*, extract with four 25-ml quantities of *chloroform* filtering each extract through a layer of *anhydrous sodium sulphate* on an absorbent cotton plug moistened with *chloroform*. Evaporate the combined filtrates to dryness using a rotary evaporator with the aid of gentle heat. Shake the residue with 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution. Dilute1.0 ml of the test solution to 200.0 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Suppositories.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse ten suppositories in 500 ml of *methanol* on a water-bath for 40 minutes with the aid of ultrasound and by swirling the flask. Cool at 5° for 1 hour, centrifuge and use the clear, supernatant liquid; if the solution is still cloudy filter through glass-fibre paper (such as Whatman GF/C). To 5 ml of the filtrate add sufficient of the mobile phase to produce a solution containing 0.01 per cent w/v of naproxen.

Reference solution (a). A 0.01 per cent w/v solution of *naproxen IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v each of *naproxen IPRS* and *2-naphthylacetic acid* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 1 volume of a 0.52 per cent w/v solution of *sodium acetate*, adjusted to pH 5.8 with *glacial acetic acid* and 1 volume of *methanol,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naproxen and 2-naphthyl-

https://nhathuocngocanh.com/

acetic acid in the chromatogram obtained with the reference solution (b) is more than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{14}O_3$ in the suppositories.

Storage. Store protected from light.

Naproxen Prolonged-release Tablets

Naproxen Sustained-release Tablets; Naproxen Extended-release Tablets

Naproxen Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Naproxen Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 375 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (b).

Tests

Dissolution (2.5.2). Complies with the test stated under tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture A: 90 volumes of *acetonitrile* and 10 volumes of *water*.

Solvent mixture B. Equal volumes of *acetonitrile* and *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 250 mg of Naproxen in 70 ml of solvent mixture B, sonicate for 15 minutes and dilute to 100.0 ml with solvent mixture B and filter. Dilute 2.0 ml of the filtrate to 50 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *naproxen IPRS* in solvent mixture A.

Reference solution (b). Dilute 10 ml of reference solution (a) to 50 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of 1.0 per cent v/v solution of *acetic acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the tailing factor of the principal peak is not more than 1.5 per cent and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{14}O_3$ in the tablet.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Naproxen Tablets

Naproxen Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strengths. 250 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 20 mg of Naproxen with 100 ml of *methanol* and filter. Evaporate and dry the residue at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen IPRS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a phosphate buffer prepared by dissolving 2.62 g of *sodium dihydrogen orthophospate monohydrate* and 11.5 g of *anhydrous disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml, adjusted to pH 7.4 with *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 332 nm (2.4.7). Calculate the content of $C_{14}H_{14}O_3$, in the medium from the absorbance obtained from a solution of known concentration of *naproxen IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_{14}O_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene*.

https://nhathuocngocanh.com/

Test solution. Shake a quantity of the powdered tablets containing about 0.5 g of Naproxen with 10 ml of *methanol* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

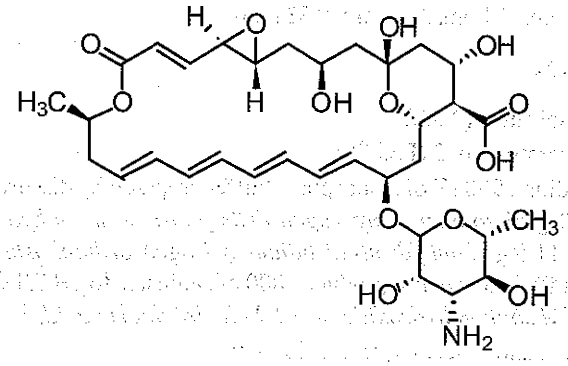
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Naproxen with 70 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *methanol* and measure the absorbance at the maximum at about 331 nm (2.4.7) using *methanol* as blank.

Calculate the content of $C_{14}H_{14}O_3$ in the tablets, from the absorbance obtained from a solution containing 0.01 per cent w/v solution of *naproxen IPRS* in *methonol.*

Storage. Store protected from light.

Natamycin



$C_{33}H_{47}NO_{13}$ Mol. Wt. 665.7

Category. Antibacterial.

Natamycin is stereoisomer of (1*R*,3*S*,5*R*,7*R*,8*E*,12*R*,14*E*,16*E*,18*E*,20*E*,22*R*,24*S*,25*R*,26*S*)-22-[(3-Amino-3,6-dideoxy-*D*-mannopyranosyl)oxy]-1,3,26-trihydroxy-12-methyl-10-oxo-6,11,28-trioxatricyclo[22.3.1.05,7]octacosa8,14,16,18,20-pentaene-25-carboxylic acid.

Natamycin contains not less than 90.0 per cent and not more than 102.0 per cent of $C_{33}H_{47}NO_{13}$, calculated on the anhydrous basis.

Description. A white to yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *natamycin IPRS* or with the reference spectrum of natamycin.

B. To 50 mg, add 5 ml of *water* and 100 ml of 0.1 per cent v/v solution of *glacial acetic acid* in *methanol* and dilute with 0.1 per cent v/v solution of *glacial acetic acid* in *methanol* to obtain a solution containing 0.0005 per cent w/v of Natamycin. When examined in the range 230 nm to 380 nm (2.4.7), the solution exhibits maximum and minimum absorption at the same wavelengths with that obtained with *natamycin IPRS.*

NOTE — Carry out the procedure protected from light.

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 1.0 per cent w/v solution.

Water (2.3.43). 6.0 to 9.0 per cent.

Assay. Determined by liquid chromatography (2.4.14).

NOTE—Carry out the following procedure protected from direct light.

Test solution. Dissolve 20 mg of the substance under examination in 5.0 ml of *tetrahydrofuran* with aid of ultrasound for 10 minutes, add 60 ml of *methanol*, add 25 ml of *water*, and mix. Dilute to 100.0 ml with *water* and filter.

Reference solution (a). Weigh a quantity of 20 mg of *Natamycin IPRS,* add 5.0 ml of *tetrahydrofuran* and dissolve with aid of ultra sound for 10 minutes, add 60 ml of *methanol*, add 25 ml of *water*, and mix. Dilute to 100.0 ml with *water* and filter.

Reference solution (b). Dissolve 20 mg of *Natamycin* in 1.0 per cent of *0.1 M hydrochloric acid* in *methanol* and allow to stand for 2 hours.

NOTE—Use this solution within 1 hour.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (10µm).
- mobile phase: a mixture of 760 volumes of a buffer solution containing 3.0 g of *ammonium acetate* and 1.0 g of *ammonium chloride* in *water*, 240 volumes of *acetonitrile* and 5 volumes of *tetrahydrofuran*, mix and filter,
- flow rate: 3 ml per minute,
- spectrophotometer set at 303 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not less than 0.8 and not more than 1.3 and

https://nhathuocngocanh.com/

the relative standard deviation for replicate injection is not more than 1.0 per cent in the chromatogram obtained with reference solution (a). The resolution between the peaks due to natamycin and its methyl ester is not less than 2.5 in the chromatogram obtained with reference solution (b) and the relative retention times are about 0.7 for natamycin and 1.0 for its methyl ester.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{33}H_{47}NO_{13}$.

Storage. Store protected from light and moisture.

Natamycin Ophthalmic Suspension

Natamycin Ophthalmic Suspension is a sterile aqueous solution of Natamycin in a suitable aqueous vehicle.

Natamycin Ophthalmic Suspension contains not less than 90.0 per cent and not more than 125.0 per cent of the labeled amount of $C_{33}H_{47}NO_{13}$. It contains one or more suitable preservatives.

Usual strengths. 5.0 per cent w/v.

Identification

Take a volume of ophthalmic suspension equivalent to 50 mg, add 5 ml *water* and add 100 ml of *glacial acetic acid* in *methanol* (1:1000). Dilute to 200 ml with *glacial acetic acid* and *methanol* solution. Dilute 2.0 ml of the solution to 100.0 ml with same solution. Compare the UV absorption spectrum (2.4.7) of the solution so obtained exhibits maxima and minima at the same wavelengths with that obtained with *Natamycin IPRS.*

Tests

pH (2.4.24). 5.0 to 7.5.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determined by liquid chromatography (2.4.14).

NOTE—Carry out the following procedure protected from direct light.

Test solution. Measure a volume of Ophthalmic Suspension containing 50 mg of Natamycin, add 12.5 ml of *tetrahydrofuran,* and dissolve with the aid of ultrasound for 10 minutes, allow to cool to room temperature. Add 150 ml of *methanol,* add 60 ml of *water,* mix and dilute with *water* to produce 250.0 ml, mix and filter.

Reference solution (a). Weigh a quantity of 20 mg of *Natamycin IPRS,* add 5.0 ml *of tetrahydrofuran* and dissolve with the aid of ultrasound for 10 minutes, add 60 ml of *methanol* and add 25 ml of *water,* and mix. Dilute to 100.0 ml with *water* and filter.

Reference solution (b). Dissolve 20 mg of *Natamycin* in 1.0 per cent of *0.1 M hydrochloric acid* in *methanol* and allow to stand for 2 hours.

NOTE—Use this solution within 1 hour.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (10 µm).
- mobile phase: a mixture of 760 volumes of a buffer solution containing 3.0 g of *ammonium acetate* and 1.0 g of *ammonium chloride* in *water,* 240 volumes of *acetonitrile* and 5 volumes of *tetrahydrofuran,* mix and filter,
- flow rate: 3 ml per minute,
- spectrophotometer set at 303 nm,
- injection volume: 20 µl.

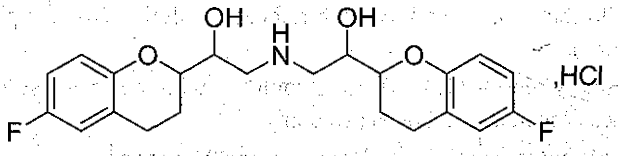
Inject reference solution (a) and (b). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not less than 0.8 and not more than 1.3 and the relative standard deviation for replicate injection is not more than 1.0 per cent in the chromatogram obtained with reference solution (a). The resolution between the peaks due to natamycin and its methyl ester is not less than 2.5 in the chromatogram obtained with reference solution (b) and the relative retention times are about 0.7 for natamycin and 1.0 for its methyl ester.

Inject reference solution (a) and the test solution.

Calculate the quantity in mg, of $C_{33}H_{47}NO_{13}$ in Ophthalmic Suspension.

Storage. Store protected from light and moisture in container. The container should be sterile, tamper evident and sealed so as to exclude microorganism.

Nebivolol Hydrochloride



$C_{22}H_{25}F_2NO_4$, HCl Mol. Wt. 441.9

Nebivolol Hydrochloride is (1*RS*,1'*RS*)-1, 1'-[(2*RS*,2'*SR*)-bis (6-flurochroman-2-yl)]-2,2'-iminodiethanol hydrochloride.

Nebivolol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{25}F_2NO_4$,HCl, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Antihypertensive.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nebivolol hydrochloride IPRS* or with the reference spectrum of nebivolol hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 30 mg of *nebivolol hydrochloride IPRS* in 5 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica with bonded phenyl groups (5 µm),
- mobile phase: a mixture of 28 volumes of *acetonitrile*, 72 volumes of a buffer solution prepared by dissolving 3.4 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water* and 0.3 volume of *diethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 35 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. Dissolve 35 mg of *nebivolol hydrochloride IPRS* in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Use the chromatographic system described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{22}H_{25}F_2NO_4$, HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Nebivolol Tablets

Nebivolol Hydrochloride Tablets

Nebivolol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nebivolol, $C_{22}H_{25}F_2NO_4$.

Usual strength. 5 mg

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml *0.1 M hydrochloric acid,*

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions and a flow rate of 1.5 ml per minute.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *nebivolol hydrochloride IPRS* in *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{25}F_2NO_4$.

Uniformity of content. Complies with the test stated under Tablets.

https://nhathuocngocanh.com/

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and the reference solution described under Assay.

Test solution. Disperse one tablet in the mobile phase, dilute to obtain a solution containing 0.005 per cent w/v of nebivolol in the mobile phase and filter.

Calculate the content of $C_{22}H_{25}F_2NO_4$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of nebivolol, disperse in 100.0 ml of the mobile phase and filter.

Reference solution. A solution containing *nebivolol hydrochloride IPRS* equivalent to 0.005 per cent w/v of nebivolol, in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adding 2 ml of *triethylamine* and adjusted to pH 3.0 with 10 per cent v/v *orthophosphoric acid*, 25 volumes of *acetonitrile* and 30 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 281 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

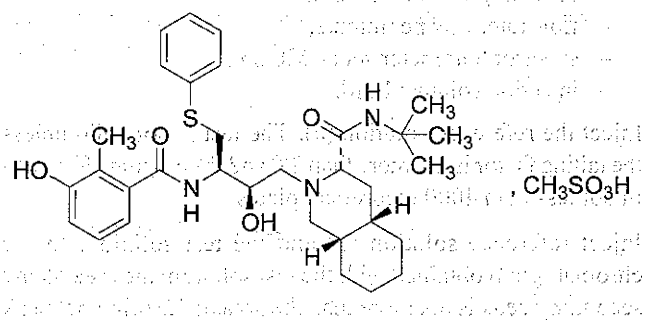
Inject the reference solution the test solution.

Calculate the content of $C_{22}H_{25}F_2NO_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of nebivolol.

Nelfinavir Mesylate



$C_{32}H_{45}N_3O_4S,CH_4O_3S$ Mol. Wt. 663.9

Nelfinavir Mesylate is (3*S*,4a*S*,8a*S*)-*N*-(*tert*-butyldecahydro-2-[(2*R*,3*R*)-3-(3-hydroxy-*o*-toluamido)-hydroxy-4-phenylthio) butyl]isoquinoline-3-carboxamide methyl sulphonate.

Nelfinavir Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{32}H_{45}N_3O_4S,CH_4O_3S$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nelfinavir mesylate IPRS* or with the reference spectrum of nelfinavir mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 120° to – 105°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. A 0.1 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *nelfinavir mesylate IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *methanesulphonic acid* in the mobile phase.

Inject reference solution (a). The test is not valid unless the column efficiency determined from the nelfinavir peak is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than half of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak due to methanesulphonic acid corresponding to the retention time of the principal peak in the chromatogram obtained with reference solution (b).

Methanesulphonic acid. 13.5 per cent to 15.5 per cent w/w, calculated on the anhydrous basis, determined by the following

https://nhathuocngocanh.com/

method. Weigh 0.6 g, dissolve in 50 ml of *dimethylformamide* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00961 g of CH_3SO_3H.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.01 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *nelfinavir mesylate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 45 volumes of *acetonitrile*, 20 volumes of *methanol* and 35 volumes of a buffer prepared by dissolving 4.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, to which 1 ml of *dimethylamine* solution and 1 g of *sodium octanesulphonate* are added and mixed to dissolve,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{45}N_3O_4S,CH_4O_3S$.

Storage. Store protected from light.

Nelfinavir Mesylate Oral Powder

Nelfinavir Mesylate Oral Powder contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nelfinavir, $C_{32}H_{45}N_3O_4S$.

Usual strength. 50 mg per g.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and, if necessary, dilute with the dissolution medium.

Reference solution. A 0.065 per cent w/v solution of *nelfinavir mesylate IPRS* in *methanol*. Dilute 10.0 ml of the solution to 100.0 ml with the dissolution medium.

Use the chromatographic system as described under Assay.

Inject the reference solution the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{32}H_{45}N_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the oral powder containing 50 mg of Nelfinavir Mesylate, disperse in 10 ml of *methanol*, dilute to 50.0 ml with the mobile phase and filter.

Reference solution (a). Dissolve 10 mg of *nelfinavir mesylate IPRS* in 2 ml of *methanol* and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 28 volumes of a buffer solution prepared by dissolving 4.88 g of *anhydrous sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.4 with *orthophosphoric acid* and filter, 27 volumes of *acetonitrile*, 20 volumes of *methanol* and 25 volumes of *water*. Adjusted to pH 4.8 with *0.1 M sodium hydroxide* or *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 4000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b)

https://nhathuocngocanh.com/

(1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 12.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Oral Powder.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Disperse a quantity of the powder containing 50 mg of Nelfinavir Mesylate in 50 ml of *0.1 M hydrochloric acid* and dilute to 250.0 ml with the solvent mixture.

Reference solution. Dissolve 10 mg of *nelfinavir mesylate IPRS* in 10 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 4 g of *sodium dihydrogen phosphate dihydrate* and 1g of *1-octane sulphonic acid sodium salt* into 1000 ml of *water*, adding 1ml of *dimethylamine* and filtering, 45 volumes *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{32}H_{45}N_3O_4S$ in the oral powder.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of nelfinavir.

Nelfinavir Tablets

Nelfinavir Mesylate Tablets

Nelfinavir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nelfinavir, $C_{32}H_{45}N_3O_4S$.

Usual strengths. 250 mg; 625 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.1 g of Nelfinavir Mesylate with 80 ml of *methanol* for 10 minutes, add sufficient *methanol* to produce 100 ml, mix and filter. Dilute 5 ml of the filtrate to 100 ml with *methanol*.

When examined in the range 200 nm to 300 nm the resulting solution shows an absorption maximum only at about 254 nm (2.4.7).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{32}H_{45}N_3O_4S$ from the absorbance of a solution of known concentration of *nelfinavir mesylate IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{32}H_{45}N_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 100 mg of Nelfinavir Mesylate, add about 20 ml of *methanol*, mix with the aid of ultrasound for 10 minutes and dilute to 100 ml with the mobile phase.

Reference solution. Weigh 10 mg of *nelfinavir mesylate IPRS*, add about 10 ml of *methanol*, shake for 10 minutes and dilute to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica particles (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 4.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, add 1 ml of *dimethylamine solution* and 1 g of *sodium octanesulphonate* and mixing

https://nhathuocngocanh.com/

to dissolve, 45 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir mesylate peak is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject the diluent (10 ml of *methanol* diluted to 50 ml with the mobile phase) and the test solution and continue the chromatography for 4 times the retention time of the principal peak. Examine the diluent chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 1.0 per cent and the sum of the areas of all the secondary peaks should not be more than 2.0 per cent when calculated by area normalisation. Inhibit integration of peak due to methanesulphonic acid.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 200 mg of Nelfinavir Mesylate, add about 20 ml of *methanol*, mix with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the mobile phase. Filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Further dilute 5.0 ml of the filtrate to 100.0 ml with the mobile phase.

Reference solution. Weigh 50 mg of *nelfinavir mesylate IPRS*, add about 10 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Use the chromatographic system as described under Related substances.

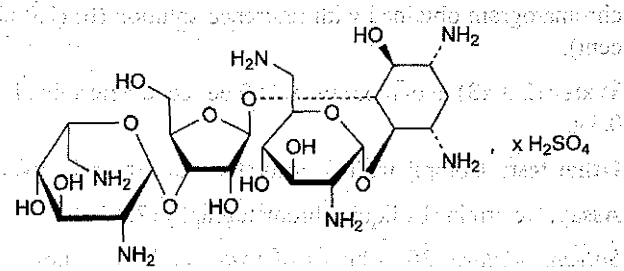
Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir mesylate peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{45}N_3O_4S$ in the tablets.

Storage. Store protected from light.

Neomycin Sulphate



$C_{23}H_{46}N_6O_{13},xH_2SO_4$ Mol. Wt. 615 (base)

Neomycin Sulphate is a mixture of the sulphates of substances obtained by the growth of certain selected strains of *Streptomyces fradiae*.

Neomycin Sulphate has a potency of not less than 680 Units per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white or yellowish-white powder; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A freshly prepared 3.85 per cent w/v solution of *ammonium acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *water*.

Reference solution. A 2.0 per cent w/v solution of *neomycin sulphate IPRS* in *water*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air for 10 minutes, heat at 100° for 1 hour and spray with a 0.1 per cent w/v solution of *ninhydrin* in *1-butanol* saturated with *water*. Heat again at 100° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dissolve about 10 mg in 5 ml of *water*, add 0.1 ml of *pyridine* and 2 ml of a 0.1 per cent w/v solution of *ninhydrin* and heat on a water-bath at a temperature of about 70° for 10 minutes; a deep violet colour is produced.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 53.5° to + 59.0°, determined in a 10.0 per cent w/v solution.

https://nhathuocngocanh.com/

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane.*

Test solution. Dissolve 0.25 g of the substance under examination in 10.0 ml of *water.*

Reference solution. A 0.05 per cent w/v solution of *neamine IPRS* in *water.*

Apply to the plate as 5-mm bands 5 µl of each solution. Dry the bands; allow the mobile phase to rise at least 8 cm. Dry the plate in a current of warm air, heat at 110° for 10 minutes, spray the plate with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any band corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel of a suitable grade.

Mobile phase. A mixture of 80 volumes of a 20 per cent w/v solution of *sodium chloride* and 20 volumes of *methanol.*

Test solution. Dissolve 40 mg of the substance under examination in *water* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *framycetin sulphate IPRS* in *water* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with *water.*

Reference solution (c). Dissolve 40 mg of *neomycin sulphate IPRS* in *water* and dilute to 5.0 ml with the same solvent.

Apply to the plate as 5 mm bands 5 µl of each solution. Dry the bands; allow the mobile phase to rise at least 12 cm. Dry the plate at 100° to 105° for 10 minutes. Spray the plate with *ethanolic ninhydrin solution* and heat at 100° to 105° for 10 minutes. In the chromatogram obtained with the test solution the principal band corresponds to the principal band in the chromatogram obtained with reference solution (c) and the band due to neomycin C with R_f value slightly less than that of the principal band is not more intense than the band obtained with reference solution (a) (15 per cent) but is more intense than the band in the chromatogram obtained with reference solution (b) (3 per cent). The test is not valid unless in the chromatogram obtained with reference solution (c) a band appears with R_f value slightly less than that of the principal band.

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.5 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of Units of neomycin per mg.

Neomycin Eye Drops

Neomycin Sulphate Eye Drops

Neomycin Sulphate Eye Drops are a sterile solution of Neomycin Sulphate in Purified Water.

Neomycin Sulphate Eye Drops contain not less than 90.0 per cent and not more than 115.0 per cent w/v of the stated amount of neomycin sulphate.

Usual strength. 0.35 per cent w/v of neomycin.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel.*

Mobile phase. A mixture of 60 volumes of *methanol*, 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform.*

Test solution. Dilute if necessary a volume of the eye drops to produce a solution containing 0.5 per cent w/v of Neomycin Sulphate in *water.*

Reference solution (a). A 0.5 per cent w/v solution of *neomycin sulphate IPRS* in *water.*

Reference solution (b). A mixture of equal volumes of the eye drops and reference solution (a).

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with 1 per cent w/v solution of *ninhydrin* in *1-butanol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the principal red spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane.*

https://nhathuocngocanh.com/

Test solution. A volume of the eye drops containing 5 µg (3.5 Units).

Reference solution. The same volume of water containing 0.1 µg of *neamine IPRS*.

Apply to the plate each solution. After development, dry the plate in a current of warm air, heat at 110° for 10 minutes, spray the plate with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any spot corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops with *0.02 M borax* to contain 1 mg (700 Units) per ml. To 0.5 ml of the diluted solution add 1.5 ml of a freshly prepared 2 per cent w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, dilute to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Reference solution. Add 1.5 ml of the 1-fluoro-2,4-dinitrobenzene solution to 0.5 ml of 0.1 per cent w/v solution of *neomycin sulphate IPRS* in *0.02 M borax*, heat in a water-bath at 60° for 1 hour and cool; dilute the solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (5 µm) (Such as Nucleosil 100-5),
- mobile phase: a mixture of 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* diluted with sufficient of 2.0 per cent v/v solution of *ethanol* in *ethanol-free chloroform* to produce 250 ml,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 350 nm,
- injection volume: 10 µl.

If necessary the tetrahydrofuran and water content of the mobile phase may be adjusted so that the chromatogram obtained with the reference solution shows resolution similar to that in the specimen chromatogram supplied with framycetin sulphate. The mobile phase should be passed through the column for several hours before the solutions are injected. Continue the chromatography for 1.4 times the retention time of the peak due to neomycin B.

The column efficiency, determined using the peak due to Neomycin B in the chromatogram obtained with the test solution, should be not less than 13,000 theoretical plates.

In the chromatogram obtained with the test solution the area of the peak corresponding to neomycin C is not less than 3.0 per cent and not more than 15.0 per cent of sum of the areas of the peaks corresponding to Neomycin B and Neomycin C.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Measure a quantity containing 5 mg of Neomycin Sulphate and dilute to 50.0 ml with sterile *phosphate buffer pH 8.0* and mix. Dilute 10.0 ml of the solution to 100.0 ml with the same solvent.

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light.

Labelling. The strength is stated in terms of number of Units per ml.

Neomycin Eye Ointment

Neomycin Sulphate Eye Ointment

Neomycin Sulphate Eye Ointment is a sterile preparation containing Neomycin Sulphate in a suitable base.

Neomycin Sulphate Eye Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of neomycin sulphate.

Usual strength. 0.35 per cent w/v of neomycin.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 60 volumes of *methanol*, 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform*.

Test solution. Disperse a quantity of the eye ointment containing 20 mg of Neomycin Sulphate in 20 ml of *chloroform*, extract with 5 ml of *water* and use the aqueous extract.

Reference solution (a). A 0.4 per cent w/v solution of *neomycin sulphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with a 1 per cent w/v solution of *ninhydrin* in *1-butanol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the principal red spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

https://nhathuocngocanh.com/

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the eye ointment containing 20 mg of Neomycin Sulphate in 20 ml of *chloroform*, shake gently with 8 ml of *water*, allow the layers to separate and use the aqueous layer.

Reference solution. A 0.005 per cent w/v solution of *neamine IPRS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in a current of warm air, heat at 110° for 10 minutes, spray with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any spot corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by liquid chromatography (2.4.17)

Test solution. Disperse a quantity of the eye ointment containing 5 mg of Neomycin Sulphate in 20 ml of *light petroleum (120° to 160°)*, add 5 ml of *0.02 M borax*, shake, separate the aqueous layer and centrifuge. To 0.5 ml of the separated aqueous layer add 1.5 ml of a freshly prepared 2 per cent w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat on a water-bath at 60° for 1 hour and cool. Dilute the resulting solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Reference solution. Add 1.5 ml of the *1-fluoro-2,4-dinitrobenzene solution* to 0.5 ml of a 0.1 per cent w/v solution of *neomycin sulphate IPRS* in *0.02 M borax* and proceed as for the test solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (5 µm),
- mobile phase: 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* with sufficient of 2.0 per cent v/v solution of *ethanol* in *ethanol-free chloroform* to produce 250 ml,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 350 nm,
- injection volume: 10 µl.

If necessary the tetrahydrofuran and water content of the mobile phase may be adjusted so that the chromatogram obtained with reference solution shows resolution similar to that in the specimen chromatogram supplied with framycetin sulphate. The mobile phase should be passed through the column for several hours before the solutions are injected. Continue the chromatography for 1.4 times the retention time of the peak due to neomycin B.

The column efficiency, determined using the peak due to Neomycin B in the chromatogram obtained with the test solution, should be not less than 13,000 theoretical plates.

In the chromatogram obtained with the test solution the area of the peak corresponding to neomycin C is not less than 3.0 per cent and not more than 15.0 per cent of the sum of the areas of the peaks corresponding to Neomycin B and Neomycin C.

Other tests. Comply with the tests stated under Eye Ointments.

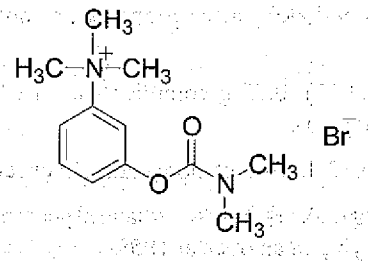
Assay. Weigh a quantity containing 5 mg of Neomycin Sulphate, dissolve in 25 ml of *chloroform*, extract with four quantities, each of 20 ml, of sterile *phosphate buffer pH 8.0*, combine the extracts and add sufficient of the buffer solution to produce 100.0 ml.

Carry out the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light.

Labelling. The strength is stated in terms of number of Units per g.

Neostigmine Bromide



$C_{12}H_{19}BrN_2O_2$ Mol. Wt. 303.2

Neostigmine Bromide is 3-(dimethylcarbamoyloxy) trimethylanilinium bromide.

Neostigmine Bromide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{12}H_{19}BrN_2O_2$, calculated on the dried basis.

Category. Anticholinesterase.

Description. Colourless crystals or a white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neostigmine*

https://nhathuocngocanh.com/

bromide IPRS or with the reference spectrum of neostigmine bromide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.02 per cent w/v solution in *0.5 M sulphuric acid* shows absorption maxima at about 260 nm and 266 nm.

C. Warm about 50 mg with 1 ml of *dilute sodium hydroxide solution*; an odour of dimethylamine develops slowly.

D. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes, replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

E. It gives the reactions of bromides (2.3.1).

Tests

Appearance of solution. A 0.5 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

Acidity. Dissolve 0.2 g in 20 ml of *carbon dioxide-free water* and titrate to pH 7.0 with *0.02 M sodium hydroxide* (carbonate-free); not more than 0.1 ml is required.

3-Hydroxytrimethylanilinium bromide. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution* and 9 ml of *water*. Absorbance of the resulting solution at about 294 nm, measured immediately after preparation, not more than 0.25 (2.4.7).

Sulphates (2.3.17). 0.75 g complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.5 g in 20 ml of *anhydrous glacial acetic acid*, add 5 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03032 g of $C_{12}H_{19}BrN_2O_2$.

Storage. Store protected from light and moisture.

Neostigmine Tablets

Neostigmine Bromide Tablets

Neostigmine Bromide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of neostigmine bromide, $C_{12}H_{19}BrN_2O_2$.

Usual strength. 15 mg.

Identification

Triturate a quantity of the powdered tablets containing about 0.3 g of Neostigmine Bromide with three quantities, each of 5 ml of *ether* and discard the ether. Macerate the residue with several quantities, each of 10 ml of *ethanol (95 per cent)*, filtering after each maceration. Evaporate the combined filtrates on a water-bath and dry the residue at 105° for 1 hour. The residue melts at about 167°, with decomposition. The residue complies with the following tests.

A. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes, replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

B. It gives the reactions of bromides (2.3.1).

Tests

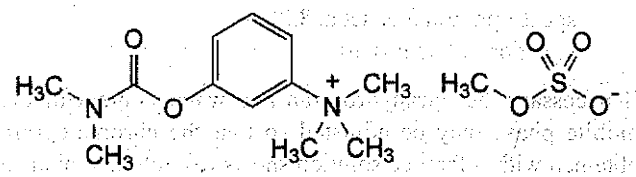
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.15 g of Neostigmine Bromide, transfer to a semi-micro ammonia-distillation apparatus, add 20 ml of a 50 per cent w/v solution of *sodium hydroxide* and 0.5 ml of a 2 per cent w/v solution of *2-octanol* in *liquid paraffin*. Pass a current of steam through the mixture, collect the distillate in 50 ml of *0.01 M sulphuric acid* until the volume is about 200 ml and titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sulphuric acid required to neutralise the dimethylamine produced.

1 ml of *0.01 M sulphuric acid* is equivalent to 0.006064 g of $C_{12}H_{19}BrN_2O_2$.

Storage. Store protected from light and moisture.

Neostigmine Methylsulphate



$C_{13}H_{22}N_2O_6S$ Mol. Wt. 334.4

Neostigmine Methylsulphate is 3-(dimethylcarbamoyloxy)-trimethylanilinium methyl sulphate.

https://nhathuocngocanh.com/

Neostigmine Methylsulphate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{22}N_2O_6S$, calculated on the dried basis.

Category. Anticholinesterase.

Description. Colourless crystals or a white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neostigmine methylsulphate IPRS* or with the reference spectrum of neostigmine methylsulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.05 per cent w/v solution in *0.5 M sulphuric acid* shows absorption maxima, at about 261 nm and 267 nm. The ratio of the absorbance at the maximum at about 267 nm to that at the maximum at 261 nm is 0.84 to 0.87.

C. Dissolve 0.1 g in 5 ml of *distilled water* and add 1 ml of a 6 per cent w/v solution of *barium chloride*; no precipitate is produced. Add 2 ml of *hydrochloric acid* and heat in a water-bath for 10 minutes; a white precipitate is produced.

D. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes, replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *distilled water* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 4.0 ml of a 5.0 per cent w/v solution in *distilled water* add 6.0 ml of *water* and 0.1 ml of *phenolphthalein solution*; the solution is colourless. Add 0.3 ml of *0.01 M sodium hydroxide*; the solution becomes red. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution becomes colourless. Add 0.1 ml of *methyl red solution*; the solution becomes red or yellowish-red.

3-Hydroxytrimethylanilinium methyl sulphate. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution* and 9 ml of *water*. Absorbance of the resulting solution at about 294 nm, measured immediately after preparation, not more than 0.20 (2.4.7).

Chlorides (2.3.12). 1.0 g complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 0.75 g complies with the limit test for sulphates (200 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Dissolve 0.3 g in 150 ml of *water*. Add 100 ml of *2 M sodium hydroxide*, distill and collect the distillate in 50 ml of 4 per cent w/v solution of *boric acid* until a total volume of 250 ml is reached. Titrate the distillate with *0.1 M hydrochloric acid* using 0.25 ml of *methyl red-methylene blue solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.03344 g of $C_{13}H_{22}N_2O_6S$.

Storage. Store protected from light and moisture.

Neostigmine Injection

Neostigmine Methylsulphate Injection

Neostigmine Injection is a sterile solution of Neostigmine Methylsulphate in Water for Injections.

Neostigmine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of neostigmine methylsulphate, $C_{13}H_{22}N_2O_6S$.

Usual strengths. 0.5 mg per ml; 2.5 mg per ml.

Identification

A. Dilute, if necessary, a volume of the injection containing 2.5 mg of Neostigmine Methylsulphate to 5 ml with *water*, shake with three quantities, each of 10 ml, of *ether* and discard the ether extracts.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 260 nm and 267 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. A mixture of 50 volumes of *chloroform*, 35 volumes of *methanol*, 10 volumes of *formic acid* and 5 volumes of *water*.

Test solution. Dilute the injection under examination, if necessary, with *water* to produce a solution containing 0.05 per cent w/v of Neostigmine Methylsulphate.

Reference solution (a). A 0.05 per cent w/v solution of *neostigmine methylsulphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

https://nhathuocngocanh.com/

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. To 1 ml add 0.5 ml of *sodium hydroxide solution* and evaporate to dryness on a water-bath. Heat quickly in an oil-bath to about 250° and maintain at this temperature for about 30 seconds. Cool, dissolve the residue in 1 ml of *water*, cool in ice water and add 1 ml of *diazobenzenesulphonic acid solution*; an orange-red colour is produced.

Tests

pH. (2.4.24) 4.5 to 6.5.

3-Hydroxy trimethylanilinium methyl sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection if necessary, with *water* to contain a 0.05 per cent w/v solution of Neostigmine Methylsulphate.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *water*.

Reference solution (b). Add 0.05 ml of *5 M sodium hydroxide* to 1 ml of the test solution and allow to stand for 5 minutes. Add 0.1 ml of *5 M hydrochloric acid* and use immediately.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane chemically bonded to porous silica particles (5 µm) (Such as Lichrosphere 60 RP-select B),
- mobile phase: *0.0015 M solution of sodium heptanesulphonate* in a mixture of 15 volumes of *acetonitrile* and 85 volumes of *0.05 M potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

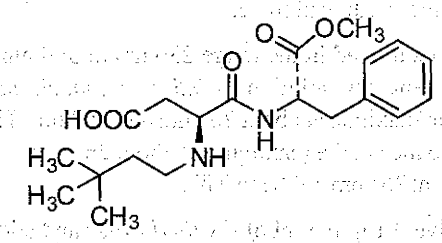
In the chromatogram obtained with reference solution (b) the principal peak has a retention time of about 6.8 minutes (neostigmine methylsulphate) and there is a peak with a relative retention time of about 0.5 (3-hydroxy) trimethylanilinium methylsulphate. In the chromatogram obtained with the test solution, the area of any secondary peak with a retention time corresponding to that of the peak due to (3-hydroxy) trimethylanilinium methylsulphate in the chromatogram obtained with reference solution (b) is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a measured volume containing about 25 mg of Neostigmine Methylsulphate to 50.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 260 nm (2.4.7). Calculate the content of $C_{13}H_{22}N_2O_6S$ taking 14.35 as the specific absorbance at 260 nm.

Storage. Store protected from light.

Neotame



$C_{20}H_{30}N_2O_5$ Mol.Wt. 378.4

Neotame is *N*-(3,3-dimethylbutyl)-L-α-aspartyl-D-phenylalanine 2-methyl ester.

Neotame contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{20}H_{30}N_2O_5$, calculated on the anhydrous basis.

Category. Non-nutritive sweetener.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neotame IPRS* or with the reference spectrum of neotame.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −43.4° to −40°, determined in a 0.5 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of substance under examination in 50.0 ml of the mobile phase.

https://nhathuocngocanh.com/

Reference solution (a). A 0.002 per cent w/v solution of *neotame IPRS* in the mobile phase.

Reference solution (b). A 0.003 per cent w/v solution of *neotame impurity A IPRS* in the mobile phase.

Use the chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a), reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to *neotame impurity A (N-[3,3-Dimethylbutyl)-L-á-aspartyl]-L-phenylalanine)* is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and the sum of the areas of all other secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in 25.0 ml of mobile phase. Dilute 5.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *neotame IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: dissolve 3 g of *sodium 1-heptane-sulphonate* and 3.8 ml of *triethylamine* in 750 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid*. Add 250 ml of *acetonitrile*, adjusted to pH 3.7 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

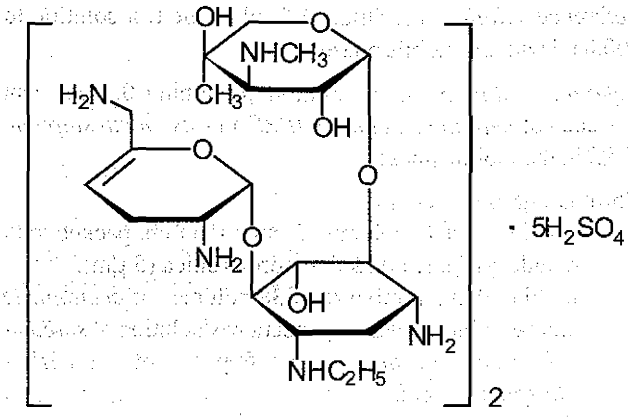
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{20}H_{30}N_2O_5$.

Storage. Store protected from moisture.

Netilmicin Sulphate



$C_{42}H_{82}N_{10}O_{14}, 5H_2SO_4$ Mol. Wt. 1441.6

Category. Aminoglycoside antibacterial.

Netilmicin Sulphate is 4-*O*-[(2*R*,3*R*)-*cis*-3-Amino-6-aminomethyl-3,4-dihydro-2*H*-pyran-2-yl]-2-deoxy-6-*O*-(3-deoxy-4-*C*-methyl-3-methylamino--β-L-arabino-pyranosyl)-3*N*-ethylstreptamine sulphate.

Netilmicin sulphate is obtained by synthesis from sisomicin. Semi-synthetic product derived from a fermentation product.

Netilmicin sulphate has a potency of not less than 595 µg per mg of netilmicin ($C_{21}H_{41}N_5O_7$), calculated on the dried basis.

Description. A white or yellowish-white powder; very hygroscopic.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. It gives reaction of (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5, determined in 4.0 per cent w/v solution in *carbon dioxide-free water.*

Appearance of solution. A 4.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and when examined at about 400 nm (2.4.7) shows maximum absorbance of 0.08.

Specific optical rotation (2.4.22). + 88.0° to + 96.0°, determined in a 5.0 per cent w/v solution in *carbon dioxide- free water.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use low-actinic glassware.

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.1 per cent w/v each of *netilmicin sulphate IPRS* and *sisomicin sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase. a mixture of 38 volumes of *acetonitrile* and 62 volumes of 2.02 per cent w/v solution of *sodium-1-heptane sulphonate* in 0.5 per cent v/v *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to netilmicin sulphate and sisomicin sulphate is not less than 1, in the chromatogram obtained with reference solution (b). The column efficiency is not less than 3000 theoretical plates and tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent).

Sulphates. 31.5 to 35.0 per cent calculated on dried basis.

Dissolve 0.12 g in 100 ml of *water* and adjusted to pH 11 with *concentrated ammonia*. Add 30.0 ml of *0.1 M barium chloride* and 0.5 mg of *phthalein purple* and titrate with *0.1M sodium edetate*, adding 50 ml of *ethanol (95 per cent)* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of SO_4.

Sulphated ash (2.3.18). Not more than 1.0 per cent, determined on 0.5 g.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.5 g by drying in an oven at 110° under high vaccum for 3 hours.

Netilmicin sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxin complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Unit per mg of netilmicin sulphate.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Reference solution (a). A 0.1 per cent w/v solution of *netilmicin sulphate IPRS* in the mobile phase.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to netilmicin sulphate and sisomicin sulphate is not less than 1, in the chromatogram obtained with reference solution (b). The column efficiency is not less than 3000 theoretical plates, tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{41}N_5O_7$.

Storage. Store protected from light and moisture in container. If the material is sterile, store in a sterile, airtight, tamper-proof container.

Netilmicin Injection

Netilmicin Sulphate Injection

Netilmicin Injection is a sterile solution of Netilmicin Sulphate in Water for Injections.

Netilmicin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of netilmicin, $C_{21}H_{41}N_5O_7$.

Usual strengths. 10 mg per ml; 25 mg per ml; 50 mg per ml; 100 mg per ml.

Identification

In the Assay the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.5 to 6.0.

Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Units per mg of netilmicin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14)

https://nhathuocngocanh.com/

Test solution. Dilute a volume of injection with the mobile phase to obtain a solution containing 0.1 per cent w/v of netilmicin.

Reference solution (a). A solution of *netilmicin sulphate IPRS* equivalent to 0.1 per cent w/v of netilmicin in the mobile phase.

Reference solution (b). A solution containing 0.1 per cent w/v each of *netilmicin sulphate IPRS* and *sisomicin sulphate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase. a mixture of 38 volumes of *acetonitrile* and 62 volumes of 2.02 per cent w/v solution of *sodium-1-heptane sulphonate* in 0.5 per cent v/v *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

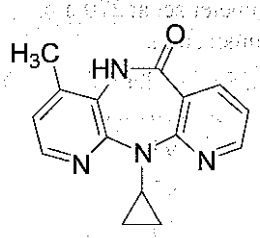
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to netilmicin sulphate and sisomicin sulphate is not less than 1.0 in the chromatogram obtained with reference solution (b) and the column efficiency is not less than 3000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{41}N_5O_7$.

Storage. Store in single dose or multiple dose containers, preferably of Type-1 glass.

Nevirapine



$C_{15}H_{14}N_4O$ Mol. Wt. 266.3
(anhydrous)

$C_{15}H_{14}N_4O.\ ½H_2O$ Mol. Wt. 275.3
(hemihydrate)

Nevirapine is 11-cyclopropyl-5,11-dihydro-4-methy-6*H*-dipyrido[3,2-*b*:2′,3′-*e*][1,4]diazepin-6-one.

Nevirapine is anhydrous or contains one-half molecule of water of hydration. It contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{14}N_4O$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nevirapine IPRS* or with the reference spectrum of nevirapine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol.*

Reference solution. Dilute 1 ml of the test solution to 100 ml with *methanol.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter, 20 volumes of *methanol* and 20 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency for nevirapine peak is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than half of the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all such peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

https://nhathuocngocanh.com/

Water (2.3.43). Not more than 0.2 per cent for Nevirapine anhydrous and 3.1 per cent to 3.9 per cent for Nevirapine hemihydrates.

Assay: Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in *methanol.*

Reference solution. A 0.005 per cent w/v solution of *nevirapine IPRS* in *methanol.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter, 20 volumes of *methanol* and 20 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency for nevirapine peak is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{14}N_4O$.

Storage. Store protected from moisture.

Labelling. The label states whether the material is anhydrous or hemihydrates.

Nevirapine Oral Suspension

Nevirapine Oral Suspension is a suspension of Nevirapine in a suitable flavoured vehicle.

Nevirapine Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nevirapine, $C_{15}H_{14}N_4O$.

Usual strength. 50 mg in 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 40 volumes of *1-butanol*, 30 volumes of *heptane*, 30 volumes of *acetone* and 10 volumes of *strong ammonia solution.*

Test solution. Dilute the preparation under examination with *methanol* to obtain a solution containing 1 mg of Nevirapine per ml.

Reference solution. A 0.1 per cent w/v solution of *nevirapine IPRS* in a mixture of 75 volumes of *methanol* and 25 volumes of *water.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. To a measured volume of the preparation under examination containing about 25 mg of Nevirapine add about 10 ml of *methanol*, mix with the aid of ultrasound for 10 minutes, dilute to 50 ml with *water*, mix and filter.

Reference solution. Weigh 25 mg of *nevirapine IPRS*, add about 10 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to 50 ml with *water.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilyl silica gel for chromatography (5 µm) (Such as Hypersil C8),
- mobile phase: A. *0.1 M ammonium acetate*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
40	95	5

Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

https://nhathuocngocanh.com/

Inject the diluent (dilute 10 ml of *methanol* to 50 ml with *water*) and the test solution. Examine the diluent chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution. Ignore any peaks due to preservatives also.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 1.0 per cent and the sum of the areas of all the secondary peaks should not be more than 2.0 per cent when calculated by area normalisation.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the preparation under examination containing 25 mg of Nevirapine, add about 10 ml of *methanol*, mix with the aid of ultrasound for 10 minutes, dilute to 50.0 ml with *water*, mix and filter. Further dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Weigh 50 mg of *nevirapine IPRS*, add about 20 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to 100.0 ml with *water*. Dilute 10.0 ml of the solution to 25.0 ml with *water*.

Use the chromatographic system described under the test for Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{15}H_{14}N_4O$ weight in volume.

Storage. Store protected from light.

Nevirapine Tablets

Nevirapine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nevirapine, $C_{15}H_{14}N_4O$.

Usual strength. 200 mg.

Identification

A. When examined in the range 220 nm to 400 nm (2.4.7) a 0.001 per cent w/v solution in *methanol*, shows an absorption maximum at about 283 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute suitably, if necessary. Measure the absorbance of the resulting solution, at the maximum at about 313 nm (2.4.7).

Calculate the content of $C_{15}H_{14}N_4O$ from the absorbance obtained from a solution of known concentration of *nevirapine IPRS* in *0.1 M hydrochloric acid*.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{14}N_4O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets with a suitable quantity of the mobile phase to obtain a mixture containing 0.05 per cent w/v of Nevirapine and filter through a membrane filter disc with an average diameter not exceeding 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.05 per cent w/v solution of *nevirapine IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter, 20 volumes of *methanol* and 20 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency for nevirapine peak is not less than 7500 theoretical plates and the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2 per cent.

Inject the test solution and continue the chromatography for at least five times the retention time of the principal peak. Determine the amount of related substances by the area normalisation method. Any individual impurity is not more than 1.0 per cent and the sum of all impurities is not more than 2.0 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 100 mg of Nevirapine with sufficient of the mobile phase to obtain a mixture containing 0.05 per cent w/v of Nevirapine. Mix and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.05 per cent w/v solution of *nevirapine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter, 20 volumes of *methanol* and 20 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

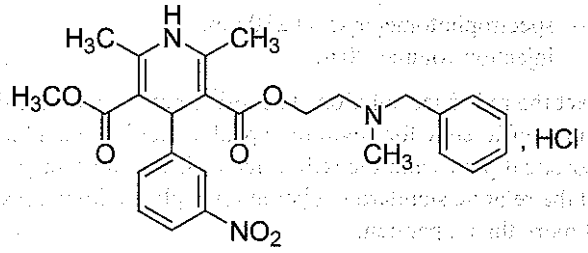
Inject the reference solution. The test is not valid unless the column efficiency for nevirapine peak is not less than 7500 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{14}N_4O$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Nicardipine Hydrochloride



$C_{26}H_{29}N_3O_6,HCl$ Mol.Wt.516.0.

Nicardipine Hydrochloride is 3, 5-pyridinedicarboxylic acid, 1, 4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-,methyl2-[methyl(phenylmethyl)amino]ethyl ester,monohydrochloride.

Nicardipine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{26}H_{29}N_3O_6,HCl$ calculated on the dried basis.

Category. Antihypertensive.

Description. A greenish yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicardipine hydrochloride IPRS* or with the reference spectrum of nicardipine hydrochloride.

B. When examined in the range 230 nm to 400 nm (2.4.7), a 0.05 per cent w/v solution in *ethanol* shows an absorption maximum at 355 nm.

C. A 0.25 per cent w/v solution in *methanol* gives the reaction of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 60 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 60 mg of *nicardipine hydrochloride IPRS* in 10 ml of the mobile phase, mix with the aid of ultrasound, add 10.0 ml of a 10 per cent *hydrogen peroxide solution*, allow to stand for 30 minutes and dilute to 100.0 ml with the mobile phase.

NOTE— Nicardipine Hydrochloride degrades to produce nicardipine pyridine analog, nicardipine dimethyl ester analog, and nicardipine bis analog. Use a freshly prepared sample to avoid further degradation for analysis.

Reference solution (b). A 0.0003 per cent w/v solution of *nicardipine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane chemically bonded to totally porous silica particles (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 6.8 of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 4.8 with *potassium hydroxide solution* and 40 volumes of a mixture of 82 volumes of *acetonitrile* and 18 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 50 µl.

https://nhathuocngocanh.com/

Name	Relative retention time
Nicardipine impurity A[1]	0.67
Nicardipine (Retention time about 10 minutes)	1.0
Nicardipine impurity B[2]	1.2
Nicardipine impurity C[3]	1.3

[1]3-{2-[benzyl(methyl)amino]ethyl} 5-methyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate dihydrochloride,

[2]dimethyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate,

[3]bis{2-[benzyl(methyl)amino]ethyl} 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate dihydrochloride.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to nicardipine and nicardipine impurity A is not less than 1.5 and the resolution between the peaks due to nicardipine impurity C and nicardipine impurity B is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to nicardipine impurity A is not more than 0. 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak due to nicardipine impurity B and nicardipine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

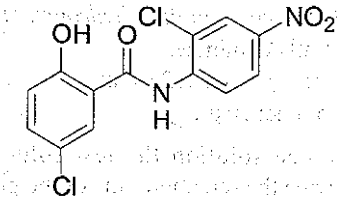
Assay. Dissolve 0.3 g in 50 ml of *glacial acetic acid* and add 10 ml of *mercuric acetate solution* by warming if necessary, allow to cool. Titrate with *0.1 M perchloric acid*, determining the end- point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0516 g of $C_{26}H_{29}N_3O_6$,HCl.

Storage. Store protected from light.

Niclosamide

Anhydrous Niclosamide



$C_{13}H_8Cl_2N_2O_4$ Mol. Wt. 327.1

Niclosamide is 2′,5-dichloro-4′-nitrosalicylanilide.

Niclosamide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_8Cl_2N_2O_4$, calculated on the dried basis.

Category. Anthelmintic.

Description. A yellowish white to yellowish, fine crystals or powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *niclosamide IPRS* or with the reference spectrum of niclosamide.

B. Heat 50 mg with 5 ml of *1 M hydrochloric acid* and 0.1 g of *zinc powder* in a water-bath for 10 minutes, cool and filter. To the filtrate add 1 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 2 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 2 ml of a 0.5 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; a violet colour is produced.

C. Heat the substance under examination on a copper wire in a non-luminous flame; a green colour is imparted to the flame.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 20.0 ml with *acetonitrile*.

Chromatographic system

– a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of a solution containing 0.2 per cent w/v of *potassium dihydrogen orthophosphate*, 0.1 per cent w/v of *disodium hydrogen phosphate* and 0.2 per cent w/v of *tetrabutylammonium hydrogen sulphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than 10 per cent of the area of the principal peak in the chromatogram obtained with the reference solution.

Chlorides (2.3.12). To 2.0 g add a mixture of 40 ml of *water* and 1.2 ml of *5 M acetic acid*, boil for 2 minutes, cool and filter; 10 ml of the filtrate diluted to 15 ml with *water* complies with the limit test for chlorides (500 ppm).

2-Chloro-4-nitroaniline. Not more than 100 ppm, determined by the following method. Boil 0.25 g with 5 ml of *methanol*, cool, add 45 ml of *1 M hydrochloric acid*, heat to boiling, cool, filter and dilute the filtrate to 50.0 ml with *1 M hydrochloric acid*. To 10.0 ml of the solution add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 1.0 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 1.0 ml of a 0.5 per cent w/v solution of N-*(1-naphthyl) ethylenediamine dihydrochloride*. Any pinkish violet colour produced is not more intense than that obtained in a solution prepared at the same time and in the same manner using 10.0 ml of a solution prepared by diluting 2.0 ml of a 0.00050 per cent w/v solution of *2-chloro-4-nitroaniline* in *methanol* to 20 ml with *1 M hydrochloric acid* and beginning at the words "add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite*.....".

5-Chlorosalicylic acid. Not more than 60 ppm, determined by the following method. Boil 1.0 g with 15 ml of *water* for 2 minutes, cool, filter through a membrane filter (pore size 0.45 µm), wash the filter and dilute the combined filtrate and washings to 20 ml with *water* (solution A). Dissolve 30 mg of *5-chlorosalicylic acid* in 20 ml of *methanol* and add sufficient *water* to produce 100.0 ml. Dilute 1.0 ml of the solution to 100.0 ml with *water* (solution B). To 10.0 ml of each of solutions A and B add separately 0.1 ml of *ferric chloride solution*; any violet colour produced in solution A is not more intense than that obtained in solution B.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.3 g in 80 ml of a mixture of equal volumes of *acetone* and *methanol*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03271 g of $C_{13}H_8Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Niclosamide Tablets

Niclosamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of niclosamide, $C_{13}H_8Cl_2N_2O_4$. The tablets may contain sweetening and flavouring agents.

Usual strength. 500 mg.

Identification

Heat a quantity of the powdered tablets containing 0.5 g of Niclosamide with 25 ml of hot *ethanol (95 per cent)*, filter while hot and evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *niclosamide IPRS* or with the reference spectrum of niclosamide.

B. Heat 50 mg with 5 ml of *1 M hydrochloric acid* and 0.1 g of *zinc powder* in a water-bath for 10 minutes, cool and filter. To the filtrate add 1 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 2 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 2 ml of a 0.5 per cent w/v solution of N-*(1-naphthyl) ethylenediamine dihydrochloride*; a violet colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing about 100 mg of anhydrous nicolsamide with 80 ml of *methanol* for 15 minutes and dilute to 100.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile* and further dilute 1.0 ml of the solution to 20.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of a solution containing about 0.2 per

https://nhathuocngocanh.com/

cent w/v of *potassium dihydrogen orthophosphate*, 0.2 per cent w/v of *tetrabutylammonium hydrogen sulphate* and 0.1 per cent w/v of *disodium hydrogen ortho-phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. Adjust the sensitivity so that the height of the principal peak is not less than 20 per cent of full scale of the recorder.

Inject the reference solution the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than 10 per cent of the area of the principal peak in the chromatogram obtained with the reference solution.

2-Chloro-4-nitroaniline. Not more than 100 ppm.

Boil a quantity of the powdered tablets containing 0.1 g of Niclosamide with 20 ml of *methanol*, cool, and dilute to 50.0 ml with *1 M hydrochloric acid*, filter. To 10.0 ml of the solution add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 1.0 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 1.0 ml of a 0.5 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*. Any pinkish violet colour produced is not more intense than that obtained in a solution prepared at the same time and in the same manner using 10.0 ml of a solution prepared by diluting 2.0 ml of a 0.0005 per cent w/v solution of *2-chloro-4-nitroaniline* in *methanol* to 50 ml with *1 M hydrochloric acid* and beginning at the words "add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite* .....".

5-Chlorosalicylic acid. Not more than 60 ppm, determined by the following method. Boil a quantity of powdered tablets containing 0.5 g of niclosamide with 15 ml of *water* for 2 minutes, cool, filter through a membrane filter (pore size 0.45 µm), wash the filter and dilute the combined filtrate and washings to 20 ml with *water* (solution A). Dissolve 15 mg of *5-chlorosalicylic acid* in 20 ml of *methanol* and add sufficient *water* to produce 100.0 ml. Dilute 1.0 ml of the solution to 100.0 ml with *water* (solution B). To 10.0 ml of each of solution A and B add separately 0.1 ml of *ferric chloride solution; any* violet colour produced in solution A is not more intense than that obtained in solution B.

Other tests. Comply with the tests stated under Tablets.

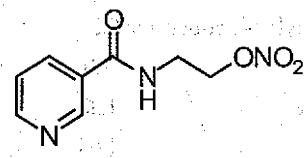
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing about 0.3 g of Niclosamide dissolved in 60 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03271 g of $C_{13}H_8Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Labelling. The label states that the tablets should be chewed thoroughly before swallowing.

Nicorandil



$C_8H_9N_3O_4$ Mol. Wt. 211.2

Nicorandil is 2-(3-Pyridinecarboxamido)ethyl nitrate.

Nicorandil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_9N_3O_4$, calculated on the anhydrous basis.

Category. Selective ATP dependent potassium channel opener.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicorandil IPRS* or with the reference spectrum of nicorandil.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Disperse 15 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.00003 per cent w/v solution of *nicorandil IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, 22 volumes of *methanol* and 8 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Relative response factor
Nitrate	0.22	1.77
Nicotinic acid	0.26	1.1
2-amino ethyl nicotinate	0.29	1.15
N-[2-Hydroxy ethyl]-nicotinamide	0.34	1.15
Nicorandil	1.0	–
Methyl nicotinate	1.38	1.53
Oxazoline	1.68	1.01

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphates (2.3.17). To 7.5 ml of 5 per cent w/v solution of the substance under examination in *1 M hydrochloric acid*, add 7.5 ml of *water* and mix. The solution complies with the limit test for sulphates (0.04 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.3 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 0.1 g of the substance under examination in 70 ml of the mobile phase with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase. Further dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *nicorandil IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9N_3O_4$.

Storage. Store protected from moisture, at a temperature between 2° to 8°.

Nicorandil Prolonged-release Tablets

Nicorandil Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Nicorandil Prolonged-release Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nicorandil, $C_8H_9N_3O_4$.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Nitrate. Not more than 2.5 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 5 tablets in 180 ml of *methanol* with the aid of ultrasound for 45 minutes and dilute to 250.0 ml with *methanol*, filter. Dilute the filtrate with *methanol* to obtain a solution containing 0.004 per cent w/v of Nicorandil.

Reference solution. Disperse 33 mg of *potassium nitrate* (equivalent to 20 mg of nitrate) with 5 ml of *water* and dilute to 100.0 ml with *methanol*. Further dilute the solution with *methanol* to obtain a solution of 0.0001 per cent w/v of nitrate.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with aminopropylsilane bonded to porous silica (3 µm) (Such as APS-2 Hypersil),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen*

https://nhathuocngocanh.com/

orthophosphate in 1000 ml of *water*, 30 volumes of *methanol*, adjusted to pH 5.2 with *potassium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of nitrate.

1 g of potassium nitrate is equivalent to 0.61 g of nitrate.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *methanol*.

Test solution. Disperse 5 tablets in 180 ml of *methanol* with the aid of ultrasound for 45 minutes and dilute to 250.0 ml with *methanol*. Dilute the solution with the solvent mixture to obtain a solution containing 0.004 per cent w/v of Nicorandil.

Reference solution. A 0.0002 per cent w/v solution of *nicorandil IPRS* in *methanol*. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 73 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, 25 volumes of *methanol* and 2 volumes of *acetonitrile*, adjusted to pH 5.7 with *potassium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Nitrate	0.16	—
Nicotinic acid	0.20	0.88
2-amino ethyl nicotinate	0.25	0.95
N-[2-hydroxy ethyl]-nicotinamide	0.32	0.95
Nicorandil	1.0	—
Methyl nicotinate	1.64	0.64
Oxazoline	2.30	0.92

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to nicotinic acid and methyl nicotinate, each of, is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any secondary peak corresponding to 2-amino ethyl nicotinate nitrate and oxazoline, each of, is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any secondary peak corresponding to N-[2-hydroxy ethyl]-nicotinamide is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all other secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 12 times the area of the principal peak in the chromatogram obtained with the reference solution (6.0 per cent). Ignore any peak due to nitrate.

Uniformity of content. Complies with the test stated under Tablets as described under Assay using the following test solution.

Test solution. Disperse 1 tablet in 180 ml of *methanol* with the aid of ultrasound for 45 minutes and dilute to 250.0 ml with *methanol*, filter. Dilute the filtrate to obtain a solution containing 0.004 per cent w/v of Nicorandil.

Calculate the content of $C_8H_9N_3O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 40 mg of Nicorandil in 70 ml of *methanol* with the aid of ultrasound for 45 minutes and dilute to 100.0 ml with *methanol*, filter. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution. A 0.004 per cent w/v solution of *nicorandil IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as zorbax Rx C8),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and 30 volumes of *methanol*, adjusted to pH 5.2 with *dilute potassium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the

https://nhathuocngocanh.com/

tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not be more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9N_3O_4$ in the tablets.

Storage. Store protected from moisture at a temperature between 2° to 8°.

Nicorandil Tablets

Nicorandil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Nicorandil, $C_8H_9N_3O_4$.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with *water*.

Reference solution. Dissolve a suitable quantity of *nicorandil IPRS* in *water* and dilute with *water* in such manner to obtain a similar concentration to that of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9N_3O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_8H_9N_3O_4$.

Uniformity of content. Complies with the test stated under Tablets.

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol*.

Test solution. Disperse one tablet in the solvent mixture and sonicate for about 5 minutes and dilute with the solvent mixture to obtain a solution containing 0.005 per cent w/v of Nicorandil and filter.

Reference solution. Dissolve a suitable quantity of *nicorandil IPRS* in the solvent mixture and dilute with the solvent mixture in such a manner to get similar concentration to that of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9N_3O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Nicorandil and dissolve in 150 ml of the solvent mixture, sonicate for about 5 minutes and dilute to 250.0 ml with the solvent mixture, filter.

Reference solution. A 0.004 per cent w/v solution of *nicorandil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 80 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.2 with *1 M potassium hydroxide solution* and 20 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

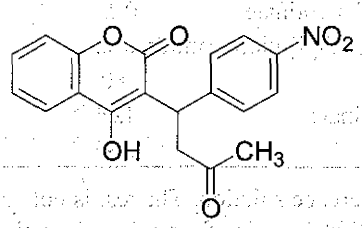
Inject the reference solution and the test solution.

Calculate the content of $C_8H_9N_3O_4$ in tablets.

Storage. Store protected from moisture, at a temperature 2° to 8°.

Nicoumalone

Acenocoumarol



$C_{19}H_{15}NO_6$ Mol. Wt. 353.3

Nicoumalone is (*RS*)-4-hydroxy-3-[1-(4-nitrophenyl)-3-oxobutyl]coumarin.

https://nhathuocngocanh.com/

Nicoumalone contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{19}H_{15}NO_6$, calculated on the dried basis.

Category. Anticoagulant.

Description. A white to brownish-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicoumalone IPRS* or with the reference spectrum of nicoumalone.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a mixture of 9 volumes of *methanol* and 1 volume of *1 M hydrochloric acid* shows absorption maxima at about 283 nm and 306 nm; absorbances at the maxima, about 0.65 and about 0.52, respectively.

C. Heat 50 mg with 2.5 ml of *glacial acetic acid*, 0.5 ml of *hydrochloric acid* and 0.2 g of *zinc powder* on a water-bath for 5 minutes, cool and filter. To the filtrate add 0.05 ml of *sodium nitrite solution* and add the mixture to 10 ml of a 1 per cent w/v solution of *2-naphthol* containing 3 ml of *5 M sodium hydroxide*; a bright red precipitate is produced.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *acetone* is clear (2.4.1).

B. A 2.0 per cent w/v solution in *0.1 M sodium hydroxide* is clear (2.4.1), and yellow.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 50 volumes of *cyclohexane* and 20 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.002 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and immediately examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.75 g in 50 ml of *acetone* and titrate with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03533 g of $C_{19}H_{15}NO_6$.

Storage. Store protected from light.

Nicoumalone Tablets

Acenocoumarol Tablets

Nicoumalone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nicoumalone, $C_{19}H_{15}NO_6$.

Usual strengths. 1 mg; 2 mg; 3 mg; 4 mg.

Identification

A. Heat a quantity of the powdered tablets containing 50 mg of Nicoumalone with 30 ml of *acetone* under a reflux condenser for 5 minutes, filter and wash the residue with two quantities, each of 10 ml, of *acetone*. Evaporate the combined filtrate and washings to 5 ml, add *water* dropwise until the solution becomes turbid, heat on a water-bath until the solution is clear and allow to stand. Filter, wash the crystals with a mixture of equal volumes of *acetone* and *water* and dry at 100° at a pressure of 2 kPa for 30 minutes.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicoumalone IPRS* or with the reference spectrum of nicoumalone.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 283 nm and 306 nm.

C. Heat 50 mg of the residue obtained in test A, with 2.5 ml of *glacial acetic acid*, 0.5 ml of *hydrochloric acid* and 0.2 g of *zinc powder* on a water-bath for 5 minutes, cool and filter. To the filtrate add 0.05 ml of *sodium nitrite solution* and add the mixture to 10 ml of a 1 per cent w/v solution of *2-naphthol* containing 3 ml of *5 M sodium hydroxide*; a bright red precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 50 volumes of *cyclohexane* and 20 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Nicoumalone with 5 ml of *acetone*, centrifuge and use the supernatant liquid.

https://nhathuocngocanh.com/

Reference solution. Dilute 1.0 volume of the test solution to 200.0 volumes with *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and immediately examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Tablets.

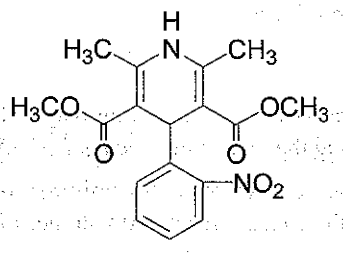
Finely crush one tablet, add 30 ml of *methanol*, stir the mixture for 30 minutes and filter through sintered glass, washing the residue with three quantities, each of 15 ml, of *methanol*. To the combined filtrate and washings add 10 ml of *1 M hydrochloric acid* and sufficient *methanol* to produce 100.0 ml. If necessary, dilute further with a solvent prepared by diluting 1 volume of *1 M hydrochloric acid* to 10 volumes with *methanol* to produce a solution containing about 0.001 per cent w/v solution of Nicoumalone. Measure the absorbance of the resulting solution at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the specific absorbance at 306 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of Nicoumalone, add 30 ml of *methanol*, stir the mixture for 30 minutes and filter through sintered-glass, washing the residue with three quantities, each of 15 ml, of *methanol*. To the combined filtrate and washings add 10 ml of *1 M hydrochloric acid* and sufficient *methanol* to produce 100.0 ml. Dilute 5.0 ml of the solution to 50.0 ml with a solvent prepared by diluting 1 volume of *1 M hydrochloric acid* to 10 volumes with *methanol* and measure the absorbance of the resulting solution at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the specific absorbance at 306 nm.

Storage. Store protected from light and moisture.

Nifedipine



$C_{17}H_{18}N_2O_6$ Mol. Wt. 346.3

Nifedipine is dimethyl 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate.

Nifedipine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{18}N_2O_6$, calculated on the dried basis.

Category. Antianginal (calcium channel blocker).

Description. A yellow, crystalline powder; readily affected by exposure to light.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nifedipine IPRS* or with the reference spectrum of nifedipine.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to nifedipine in the chromatogram obtained with the reference solution (a).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *cyclohexane* and 40 volumes of *ethyl acetate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 0.1 per cent w/v solution of *nifedipine IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 25 mg add 10 ml of a mixture of 5 volumes of *ethanol (95 per cent)*, 3.5 volumes of *water* and 1.5 volumes of *hydrochloric acid* and dissolve with gentle heating. Add 0.5 g of granulated zinc and allow to stand for 5 minutes, swirling occasionally. Filter, add 5 ml of a 1 per cent w/v solution of *sodium nitrite* to the filtrate and allow to stand for 2 minutes. Add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate*, shake vigorously with care and add 2 ml of a 0.5 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; an intense red colour develops which persists for more than 5 minutes.

https://nhathuocngocanh.com/

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 20 ml of *methanol* and dilute to 50 ml with the mobile phase.

Reference solution (a). Dissolve a weighed quantity of *nifedipine IPRS* in sufficient *methanol* to produce a 1.0 per cent w/v solution and dilute quantitatively with the mobile phase to obtain a 0.4 per cent w/v solution.

Reference solution (b). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicaboxylate IPRS* (nitrophenylpyridine analogue) in *methanol*.

Reference solution (c). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5-dicarboxylate IPRS* (nitroso-phenylpyridine analogue) in *methanol*.

Reference solution (d). Mix 1 volume of each of reference solution (b) and (c) and 0.1 volume of the test solution, dilute to 10 volumes with the mobile phase and then dilute 2 volumes of the resulting solution to 10 volumes with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *water*, 36 volumes of *methanol* and 9 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (d). The peaks appear in the order nitrophenylpyridine analogue, nitrosophenylpyridine analogue and nifedipine (retention time about 15.5 minutes). The test is not valid unless, in the chromatogram obtained with reference solution (d), (a) the resolution factor between the peaks due to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue is greater than 1.5, (b) the resolution between the peaks due to the nitrosophenylpyridine analogue and nifedipine is greater than 1.5, and (c) the height of the peak due to the nitrophenyl-pyridine analogue is at least 20 per cent of the full-scale deflection.

Inject reference solution (a), (d) and the test solution and record the chromatograms for twice the retention time of nifedipine. In the chromatogram obtained with the test solution no secondary peak other than any peaks corresponding to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue has an area greater than that of the peak due to nifedipine in the chromatogram obtained with reference solution (d) and the areas of any peaks corresponding to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue are not greater than the areas of the corresponding peaks in the chromatogram obtained with reference solution (d) (0.2 per cent). The total amount of related substances is not greater than 0.3 per cent. Ignore any peak with an area less than 10 per cent of the area of the peak due to nifedipine in the chromatogram obtained with reference solution (d).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 0.13 g, dissolve in a mixture of 25 ml of *2-methyl-2-propanol* and 25 ml of *1 M perchloric acid* and titrate with *0.1 M ceric ammonium sulphate*, using 0.1 ml of *ferroin solution* as indicator until the pink colour is discharged, titrating slowly towards the end-point. Carry out a blank titration.

1 ml of *0.1 M ceric ammonium sulphate* is equivalent to 0.01732 g of $C_{17}H_{18}N_2O_6$.

Storage. Store protected from light.

Nifedipine Capsules

Nifedipine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

Usual strengths. 5 mg; 10 mg.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of equal volumes of *ethyl acetate* and *cyclohexane*.

Test solution. Transfer a quantity of the contents of the capsules containing 30 mg of Nifedipine into a centrifuge tube containing *0.1 M sodium hydroxide*, add 25 ml of *dichloromethane*, stopper the tube and shake gently for 1 hour. Centrifuge for 10 minutes at 2000 to 2500 rpm. Remove the supernatant aqueous layer by aspiration with a syringe and transfer 5 ml of the clarified lower layer to a suitable vial.

https://nhathuocngocanh.com/

Reference solution (a). A 0.12 per cent w/v solution of *nifedipine IPRS* in *dichloromethane.*

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 500 µl of each solution as bands 20 mm by 3 mm. After development, dry the plate in air until the odour of the solvent is not detectable and immediately examine under ultraviolet light at 254 nm. The principal band, appearing as a dark blue band, in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a). Spray with a solution prepared in the following manner. Dissolve 3 g of *bismuth subnitrate* and 30 g of *potassium iodide* in 10 ml of *3 M hydrochloric acid* and dilute with *water* to 100 ml; dilute 10 ml to 100 ml with *0.3 M hydrochloric acid.* In the chromatogram obtained with test solution the principal band, appearing as a compact light orange band against a yellow background, corresponds to that in the chromatogram obtained with reference solution (a). The band obtained with reference solution (b) appears as a single band under both visualisation procedures.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium, if necessary, at the maximum at about 340 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ in the medium from the absorbance obtained from a solution of known concentration of *nifedipine IPRS* prepared by dissolving weighed quantity of *nifedipine IPRS* completely in *methanol* to prepare the first dilution and further dilute with dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{18}N_2O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of mixed contents of capsules containing 10 mg nifedipine in 100-ml volumetric flask. Dissolve in minimum quantity of *methanol*, shake, and further dilute to volume with the mobile phase. Mix and filter.

Reference solution (a). A 0.1 per cent w/v solution of *nifedipine IPRS* in methanol. Further dilute suitably with mobile phase to produce a solution containing 0.03 per cent w/v solution of nifedipine.

Reference solution (b). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate IPRS* (nitrophenypyridine analogue) in *methanol.* Further dilute suitably with mobile phase to produce a solution containing 0.0006 per cent w/v of nitrophenylpyridine analogue.

Reference solution (c). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5 dicarboxylate IPRS* (nitrosophenylpyridine analogue) in *methanol.* Further dilute suitably with mobile phase to produce a solution containing 0.00015 per cent w/v of nitrosophenylpyridine analogue.

Reference solution (d). Mix equal volume of *reference solution (b),(c)* and *mobile phase.*

Reference solution (e). Mix equal volume of *reference solution (a), (b) and (c).*

Chromatographic system.

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A mixture of 50 volumes of *water*, 25 volumes of *methanol* and 25 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 25 µl.

Inject reference solution (e). The peaks appear in the order of nitrophenylpyridine analogue, nitrosophenylpyridine analogue and nifedipine. The test is not valid unless, in the chromatogram obtained with reference solution (e), the resolution between the peaks due to nitrophenylpyridine analogue and nitrosophenylpyridine analogue is not less than 1.5, and the resolution between the peaks due to nitrosophenylpyridine analogue and nifedipine is not less than 1.0. The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution (d) and the test solution. In the chromatogram obtained with the test solution, area of any peak corresponding to nitrophenylpyridine analogue is not more than the corresponding peak obtained with reference solution (d) (2.0 per cent) and area of any peak corresponding to nitrosophenylpyridine analogue is not more than the corresponding peak obtained with reference solution (d) (0.5 per cent).

Uniformity of content. Complies with the test stated under Capsules.

Transfer the contents of a capsule with *methanol* and dilute to obtain a solution containing 0.005 per cent w/v of Nifedipine. Complete the Assay beginning at the words "Measure the absorbance...." and calculate the content of $C_{17}H_{18}N_2O_6$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Transfer the contents of capsules containing about 50 mg of Nifedipine quantitatively to a 200-ml volumetric flask

https://nhathuocngocanh.com/

with the aid of small quantities of *methanol*. Dilute to volume with *methanol* and mix. To 20.0 ml add sufficient *methanol* to produce 100.0 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ in the capsules from the absorbance obtained by repeating the operation with a 0.005 per cent w/v solution of *nifedipine IPRS* in *methanol*.

Storage. Store protected from light.

Nifedipine Prolonged-release Capsules

Nifedipine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Nifedipine Prolonged-release Capsules contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

Usual strengths. 10 mg; 20 mg.

NOTE — Carry out all the following procedures in the dark or under long-wavelength light (greater than 420 nm). Prepare solutions immediately before use and protect them from light.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane*.

Solvent mixture. Equal volumes of *dichloromethane* and *methanol*.

Test solution. Shake a quantity of the contents of the capsules containing 20 mg of Nifedipine with solvent mixture and dilute to 100 ml with the solvent mixture, filter through a Whatman GF/C filter.

Reference solution (a). A 0.02 per cent w/v solution of *nifedipine IPRS* in the solvent mixture.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 20 µl of each solution.Allow the mobile phase to rise 15 cm.After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (b).

B. In the Assay, the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution. Complies with the tests stated under Capsules.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered contents of the capsules containing 50 mg of Nifedipine in 15 ml of *methanol* and dilute to 25 ml with the *methanol*, filter. Dilute 1 volume of resulting solution with 1 volume of the mobile phase.

Reference solution (a). Dilute 1.0 ml of test solution to 100.0 ml with mobile phase and further dilute 1.0 ml of the resulting solution to 5.0 ml with mobile phase.

*Reference solution (b).*A 0.0005 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicaboxylate IPRS* in the mobile phase.

Reference solution (c). A 0.0005per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5-dicarboxylate IPRS* in the mobile phase.

Reference solution (d). Dilute 1 ml of the test solution to 100 ml with mobile phase and further dilute 1 volume of the resulting solution with 1 volume of reference solution (b) and 1 volume of reference solution (c).

Reference solution (e). Dilute 1 volume of reference solution (a) to 4 volume with mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrosorb RP18),
- mobile phase: a mixture of 55 volumes of *water*, 36 volumes of *methanol* and 9 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless, the resolution between the peaks due to dimethyl-2,6-dimethyl-4-(2- nitrophenyl)pyridine-3,5-dicarboxylate and dimethyl-2,6-dimethyl-4-(2- nitrosophenyl)pyridine-3,5-dicarboxylate is not less than 1.5 and the resolution between the peaks due to dimethyl-2,6-dimethyl-4-(2- nitrosophenyl) pyridine-3,5-dicarboxylate and nifedipine is not less than 1.5.

Inject reference solution (a), (b), (c), (e) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine- 3,5-dicarboxylate* is not more than the

https://nhathuocngocanh.com/

area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),the area of any peak corresponding to *dimethyl-2,6-dimethyl-4-(2- nitrosophenyl) pyridine-3,5-dicarboxylate* is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not morethan the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent)and the sum of the areas of any other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of mixed content of 20 capsules containing about 0.05 g of nifedipine in 15 ml of *methanol* and dilute to 50 ml with the *methanol* and filter. Dilute 1 volume of resulting solution to 5 volume of the mobile phase.

Reference solution (a).A 0.02 per cent w/v solution of *nifedipine IPRS* in the mobile phase.

Reference solution (b).A solution containg 0.0003 per cent w/v of *nifedipine IPRS* and 0.002 per cent w/v each of*dimethyl-2,6-dimethyl-4-(2- nitrophenyl)pyridine-3,5-dicarboxylate IPRS* and *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl) pyridine-3,5-dicarboxylate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless, the resolution between the peaks due to dimethyl-2,6-dimethyl-4-(2- nitrophenyl)pyridine-3,5-dicarboxylate and dimethyl-2,6-dimethyl-4-(2- nitrosophenyl)pyridine-3,5-dicarboxylate is not less than 1.5 and the resolution between the peaks due to dimethyl-2,6-dimethyl-4-(2- nitrosophenyl)pyridine-3,5-dicarboxylate and nifedipine is not less then 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}N_2O_6$ in the capsule.

Nifedipine Prolonged-release Tablets

Nifedipine Sustained-release Tablets; Nifedipine Extended-release Tablets

Nifedipine Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and the assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Usual strengths. 10 mg; 20 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of equal volumes of *ethyl acetate* and *cyclohexane*.

Test solution. Transfer a quantity of the powdered tablets containing 30 mg of Nifedipine into a centrifuge tube containing *0.1 M sodium hydroxide*, add 25 ml of *dichloromethane*, stopper the tube and shake gently for 1 hour. Centrifuge for 10 minutes at 2000 rpm to 2500 rpm. Remove the supernatant aqueous layer by aspiration with a syringe and use 5 ml of the clarified lower layer.

Reference solution. A 0.12 per cent w/v solution of *nifedipine IPRS* in *dichloromethane*.

Apply to the plate 500 µl of each solution as bands 20 mm by 3 mm. After development, dry the plate in air until the odour of the solvent is not detectable and immediately examine under ultraviolet light at 254 nm. The principal band, appearing as a dark blue band, in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Spray with a solution prepared in the following manner. Dissolve 3 g of *bismuth subnitrate* and 30 g of *potassium iodide* in 10 ml of *3 M hydrochloric acid* and dilute to 100 ml with *water*; dilute 10 ml of the solution to 100 ml with *0.3 M hydrochloric acid*. In the chromatogram obtained with the test solution the principal band, appearing as a compact light orange band against a yellow background, corresponds to that in the chromatogram obtained with reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 150 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium, if necessary, at the maximum at about 340 nm (2.4.7).

Calculate the content of $C_{17}H_{18}N_2O_6$ in the medium from the absorbance obtained from a solution of known concentration

https://nhathuocngocanh.com/

of *nifedipine IPRS* prepared by dissolving weighed quantity of *nifedipine IPRS* completely in *methanol* and diluting further with the dissolution medium.

Not less than 25 per cent and not more than 45 per cent of the stated amount of $C_{17}H_{18}N_2O_6$.

B. Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer pH 6.8 prepared by dissolving 30 g of *sodium lauryl sulphate*, 24.8 g of *disodium hydrogen phosphate anhydrous*, 2.85 g of *citric acid monohydrate* and 0.75 ml of *orthophosphoric acid* in sufficient *water* to produce 6000 ml. Adjusted to pH 6.8, if necessary,

Replace *0.1 M hydrochloric acid* with phosphate buffer pH 6.8 and run the apparatus at 150 rpm for 6 hours. Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium, if necessary, at the maximum at about 340 nm (2.4.7).

Calculate the content of $C_{17}H_{18}N_2O_6$ in the medium from the absorbance obtained from a solution of known concentration of *nifedipine IPRS* prepared by dissolving weighed quantity of *nifedipine IPRS* completely in *methanol* and diluting further with the dissolution medium.

Q. Not less than 60 per cent cumulative of both the medium of the stated amount of $C_{17}H_{18}N_2O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of tablet powder containing 10 mg of nifedipine in 100-ml volumetric flask. Dissolve in minimum quantity of *methanol*, dilute to volume with the mobile phase, mix and filter.

Reference solution (a). A 0.1 per cent w/v solution of *nifedipine IPRS* in methanol. Further dilute suitably with mobile phase to produce a solution containing 0.03 per cent w/v solution of nifedipine.

Reference solution (b). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate IPRS* (nitrophenypyridine analogue) in *methanol*. Further dilute suitably with mobile phase to produce a solution containing 0.0006 per cent w/v of nitrophenylpyridine analogue.

Reference solution (c). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5 dicarboxylate IPRS* (nitrosophenylpyridine analogue) in *methanol*. Further dilute suitably with mobile phase to produce a solution containing 0.00015 per cent w/v of nitrosophenylpyridine analogue.

Reference solution (d). Mix equal volume of *reference solution (b),(c)* and *mobile phase.*

Reference solution (e): Mix equal volume of *reference solution (a), (b) and (c).*

Chromatographic system.

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A mixture of 50 volumes of *water*, 25 volumes of *methanol* and 25 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 25 µl.

Inject reference solution (e). The peaks appear in the order of nitrophenylpyridine analogue, nitrosophenylpyridine analogue and nifedipine. The test is not valid unless, in the chromatogram obtained with reference solution (e), the resolution between the peaks due to nitrophenylpyridine analogue and nitrosophenylpyridine analogue is not less than than 1.5, and the resolution between the peaks due to nitrosophenylpyridine analogue and nifedipine is not less than 1.0. The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution (d) and the test solution. In the chromatogram obtained with the test solution, area of any peak corresponding to nitrophenylpyridine analogue is not more than the corresponding peak obtained with reference solution (d) (2.0 per cent), and area of any peak corresponding to nitrosophenylpyridine analogue is not more than the corresponding peak obtained with reference solution (d) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Nifedipine, disperse in *methanol*, shake and dilute to 100.0 ml with *methanol*, filter. Dilute 20.0 ml of the filtrate to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ from the absorbance obtained with a 0.005 per cent w/v solution of *nifedipine IPRS* in *methanol*.

Storage. Store protected from light and moisture.

Nifedipine Tablets

Nifedipine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

Usual strengths. 5 mg; 10 mg.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

https://nhathuocngocanh.com/

Identification

Uniformity of content. Complies with the test stated under Tablets

Shake one tablet with *methanol* in a 200-ml volumetric flask, dilute to volume with *methanol*, mix and filter. Complete the Assay beginning at the words "Measure the absorbance...." and calculate the content of $C_{17}H_{18}N_2O_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

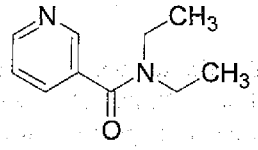
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Nifedipine into a 200-ml volumetric flask. Dissolve with the aid of 50 ml of *methanol*. Dilute to volume with *methanol*, mix and filter. Dilute 20.0 ml of

https://nhathuocngocanh.com/

the solution to 100.0 ml with *methanol* and mix. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ from the absorbance obtained by repeating the operation with a 0.005 per cent w/v solution of *nifedipine IPRS* in *methanol*.

Storage. Store protected from light and moisture.

Nikethamide



$C_{10}H_{14}N_2O$ Mol. Wt. 178.2

Nikethamide is *N,N*-diethylpyridine-3-carboxamide.

Nikethamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{14}N_2O$, calculated on the anhydrous basis.

Category. CNS and Respiratory stimulant.

Description. A colourless or slightly yellowish, oily liquid or crystalline mass.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nikethamide IPRS* or with the reference spectrum of nikethamide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution shows an absorption maximum at about 263 nm is about 0.57.

C. Heat 0.1 g with 1 ml of *2 M sodium hydroxide*; *diethylamine*, recognisable by its odour, is evolved progressively; the fumes turn red litmus paper blue.

D. To 2 ml of a 0.1 per cent w/v solution add 2 ml of *cyanogen bromide solution* and 3 ml of a 2.5 per cent w/v solution of *aniline* and mix; a yellow colour is produced.

Tests

Appearance of solution. The substance, in liquid form or liquefied by gentle heating, is clear (2.4.1), and not more intensely coloured than reference solution YS5 (2.4.1).

pH (2.4.24). 6.0 to 7.8, determined in 25.0 per cent w/v solution.

Congealing temperature (2.4.10). 23° to 24.5°.

Refractive index (2.4.27). 1.522 to1.526.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform* and 25 volumes of *1-propanol*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of *ethylnicotinamide IPRS* in *methanol*.

Reference solution (b). A 0.004 per cent w/v solution of *ethylnicotinamide IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any spot corresponding to ethylnicotinamide in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.3 per cent, determined on 2.0 g.

Assay. Weigh 0.15 g, dissolve in 20 ml of *anhydrous glacial acetic acid* and 5 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01782 g of $C_{10}H_{14}N_2O$.

Storge. Store protected from light.

Nikethamide Injection

Nikethamide Injection is a sterile solution containing 25 per cent w/v solution of Nikethamide in Water for Injections.

Nikethamide Injection contains not less than 24.0 per cent and not more than 26.0 per cent w/v solution of nikethamide, $C_{10}H_{14}N_2O$.

Identification

A. Make 1 ml alkaline with *5 M sodium hydroxide*, extract with 5 ml of *dichloromethane* and evaporate the solvent.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nikethamide IPRS* or with the reference spectrum of nikethamide.

https://nhathuocngocanh.com/

B. Gives a voluminous precipitate with *alkaline potassium mercuri-iodide solution* and a greyish-brown flocculent precipitate with *tannic acid solution*. Gives no precipitate with *iodine solution* or with *potassium mercuri-iodide solution*.

C. Heat 1 ml with 0.2 g of *sodium hydroxide*; diethylamine, recognisable by its odour, is evolved.

Tests

pH (2.4.24). 6.0 to 8.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform* and 25 volumes of *1-propanol*.

Test solution. Dilute 1 ml of the injection to 5 ml with *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *ethylnicotinamide IPRS* in *methanol*.

Reference solution (b). A 0.005 per cent w/v solution of *ethylnicotinamide IPRS* in *methanol*.

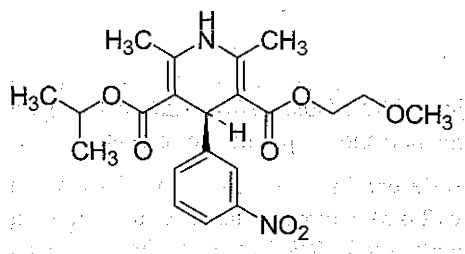
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any spot corresponding to ethylnicotinamide in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute 5.0 ml to 500.0 ml with *water*. To 5.0 ml of the solution add 5 ml of *1 M hydrochloric acid* and sufficient *water* to produce 500.0 ml. Measure the absorbance of the resulting solution at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{10}H_{14}N_2O$ taking 282 as the specific absorbance at 263 nm.

Storage. Store protected from light, in single dose containers.

Nimodipine



and enantiomer

$C_{21}H_{26}N_2O_7$ Mol.Wt.418.4

Nimodipine is 2-methoxyethyl 1-methylethyl (4*RS*)-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate.

Nimodipine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{21}H_{26}N_2O_7$, calculated on the dried basis.

Category. Calcium channel blocker.

Description. A light yellow or yellow, crystalline powder. It shows polymorphism (2.5.11). Exposure to ultraviolet light leads to the formation of a nitrophenylpyridne derivative.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nimodipine IPRS* or with the reference spectrum of nimodipine. If the spectra obtained in the solid state show differences, dissolve the substance under examination and the reference substance separately in the 2.0 per cent w/v solution of *methylene chloride* and using 0.2 mm cell for recording new spectra.

B. Specific optical rotation. See test.

Tes.ts

NOTE — Prepare solutions immediately before use either protected from light or under long-wavelength light (> 420 nm).

Appearance of solution. A 5.0 per cent w/v solution in *acetone* (Solution A) is clear (2.4.1).

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in 2.5 ml of *tetrahydrofuran* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 8 mg of *nimodipine for peak identification IPRS* (containing impurity C) [*bis(2-methoxyethyl) 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate*] in 0.5 ml of *tetrahydrofuran* and dilute to 5.0 ml with the mobile phase.

Reference solution (c). Dilute 0.5 ml of the test solution to 25.0 ml with the mobile phase. Mix 0.5 ml of the solution with 0.5 ml of *nimodipine impurity A IPRS [2-methoxyethyl 1-methylethyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate]* and dilute to 10.0 ml with the mobile phase.

Chromatographic system

– a stainless steel column 12.5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- column temperature: 40°,
- mobile phase: a mixture of 20 volumes of *methanol*, 20 volumes of *tetrahydrofuran* and 60 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

The relative retention time with reference to nimodipine (retention time about 7 minutes) for nimodipine impurity C is about 0.5 and for nimodipine impurity A is about 0.9.

Inject reference solution (c). The test is not valid unless the peak to valley ratio is not less than 4.0, where Hp is the height above the baseline of the peak due to nimodipine impurity A and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to nimodipine.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 4.5 times the retention time of the principal peak for the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to nimodipine impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh accurately about 0.18 g and dissolve with gentle heating in a mixture of 25 ml of *2-methyl-2-propanol* and 25 ml of *perchloric acid solution*. Add 0.1 ml of *ferroin solution* and titrate with *0.1 M ceric ammonium sulphate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration. *[NOTE — Prepare solutions immediately before use either protected from light or under long-wavelength light (> 420 nm)].*

1 ml of *0.1 M ceric ammonium sulphate sulphate* is equivalent to 0.02092 g of $C_{21}H_{26}N_2O_7$.

Storage. Store protected from light.

Nimodipine Tablets

Nimodipine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of nimodipine, $C_{21}H_{26}N_2O_7$. The tablets are coated.

Usual strength. 30 mg.

NOTE —Carry out the following procedures protected from light or under long-wavelength light (greater than 420 nm). Prepare the solutions immediately before use and protect them from light.

Identification

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane*.

Test solution. Disperse a quantity of the powdered tablets containing 60 mg of nimodipine with 10 ml of *ethyl acetate* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.6 per cent w/v solution of *nimodipine IPRS* in *ethyl acetate*.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 2 µl of each solution. Allow the mobile phase to raise 15 cm. Dry the plate in air and examine under the ultraviolet light at 254 nm. Spray the plate with a freshly prepared 0.1 per cent w/v solution of *2,6-dichloroquinone-chlorimide* in *ethanol* and heat at 110° for about 3 minutes. The principal spot in the chromatogram obtained with the test solution correspond in position and colour to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *acetate buffer pH 4.5* prepared by dissolving 3.0 g of *sodium acetate* in 50 ml of *water*, add 1.75 g of *glacial acetic acid* and dilute to 1000.0 ml with *water*, containing 0.3 per cent w/v solution of *sodium dodecyl sulphate*,

Speed and time. 75 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 340 nm (2.4.7). Calculate the content of nimodipine, $C_{21}H_{26}N_2O_7$ in the medium from the absorbance obtained from a solution of known concentration of *nimodipine IPRS* in the dissolution medium.

https://nhathuocngocanh.com/

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{26}N_2O_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 60 mg of nimodipine with 50 of *methanol* with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with *methanol*. Centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase and further dilute 2.0 ml of this resulting solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.0003 per cent w/v solution of *nimodipine impurity A IPRS* [(2-methoxyethyl 1-methylethyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate] in the mobile phase.

Reference solution (c). A 0.0002 per cent w/v solution of *nimodipine IPRS* and *nimodipine impurity A IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 13 volumes of *acetonitrile*, 26 volumes of *tetrahydrofuran* and 60 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to nimodipine and nimodipine impurity A is not less than 1.5 and the tailing factor for nimodipine peak is not more than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to nimodipine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all secondary peaks other than nimodipine impurity A is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of Nimodipine with 50 ml of *methanol*, mix with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with *methanol*. Centrifuge and use the supernatant liquid.

Reference solution (a). A 0.06 per cent w/v solution of *nimodipine IPRS* in *methanol*.

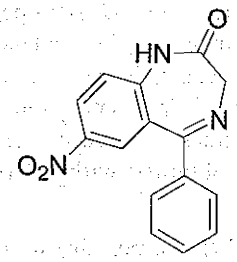
Reference solution (b). A solution containing 0.002 per cent w/v each of *nimodipine IPRS and nimodipine impurity A IPRS* in *methanol*.

Inject reference solution (b). The test is not valid unless the resolution between nimodipine and nimodipine impurity A is not less than 1.5 and the tailing factor for nimodipine peak is not more than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{26}N_2O_7$ in the Tablets.

Nitrazepam



$C_{15}H_{11}N_3O_3$ Mol. Wt. 281.3

Nitrazepam is 1,3-dihydro-7-nitro-5-phenyl-2*H*-1,4-benzodiazepin-2-one.

Nitrazepam contains not less than 99.0 per cent and not more than 101.0 per cent $C_{15}H_{11}N_3O_3$, calculated on the dried basis.

Category. Hypnotic; sedative.

Description. A yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nitrazepam IPRS* or with the reference spectrum of nitrazepam.

B. *Carry out the following procedure in subdued light.*

When examined in the range 230 nm to 360 nm (2.4.7), a freshly prepared 0.0005 per cent w/v solution in a 0.5 per cent w/v

https://nhathuocngocanh.com/

solution of *sulphuric acid* in *methanol* shows an absorption maximum only at about 280 nm; absorbance at about 280 nm, about 0.45.

C. Dissolve 10 mg in 1 ml of *methanol*, warming if necessary, and add 0.05 ml of *2 M sodium hydroxide*; an intense yellow colour is produced.

D. Dissolve 20 mg in a mixture of 5 ml of *hydrochloric acid* and 10 ml of *water*, boil for 5 minutes, cool and add 2 ml of a 0.1 per cent w/v solution of *sodium nitrite*. Allow to stand for 1 minute, add 1 ml of a 0.5 per cent w/v solution of *sulphamic acid*, mix, allow to stand for 1 minute, add 1 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*; a red colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light.

Test solution. Dissolve 50 mg of the substance under examination in *acetonitrile* and dilute to 20.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution (b). A 0.002 per cent w/v solution of *clonazepam IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 10.0 ml with the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
3	65	35
10	50	50
20	50	50
22	65	35

The relative retention time with reference to nitrazepam (retention time is about 9 minutes) for clonazepam is about 1.1.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 4.0 where H_p is the height above the baseline of the peak due to clonazepam and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to nitrazepam.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh 0.25 g, dissolve in 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02813 g of $C_{15}H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Nitrazepam Tablets

Nitrazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nitrazepam, $C_{15}H_{11}N_3O_3$.

Usual strengths. 5 mg; 10 mg.

Identification

Carry out the following procedure in subdued light.

A. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum at about 280 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 5 mg of Nitrazepam per ml, allow to settle and decant the supernatant liquid.

https://nhathuocngocanh.com/

Reference solution. A 0.5 per cent w/v solution of *nitrazepam IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray it with *ethanolic sulphuric acid (10 per cent v/v)*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. To a quantity of the powdered tablets containing 5 mg of Nitrazepam add 5 ml of *hydrochloric acid* and 10 ml of *water*, heat on a water-bath for 15 minutes, filter and cool. To the clear filtrate add 1 ml of a 0.1 per cent w/v solution of *sodium nitrite*, allow to stand for 3 minutes and add 1 ml of a 0.5 per cent w/v solution of *sulphamic acid*. Allow to stand for 3 minutes and add 1 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; a red colour is produced.

Tests

Dissolution (2.5.2).

NOTE — Carry out the following procedure in subdued light.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$, in the medium from the absorbance obtained from a solution of known concentration of *nitrazapam IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{11}N_3O_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *nitromethane*, 40 volumes of *toluene* and 20 volumes of *chloroform*.

Test solution. Shake a quantity of the powdered tablets containing 40 mg of Nitrazepam with 25 ml of *chloroform*, filter, carefully evaporate the filtrate to dryness and dissolve the residue in 2 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *chloroform*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Tablets.

NOTE — Carry out the following procedure in subdued light.

Powder 1 tablet, add 5 ml of *water*, mix and allow to stand for 15 minutes protected from light. Add 70 ml of a 0.5 per cent v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes protected from light, add sufficient of the *hydrochloric acid solution* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate with sufficient of the *hydrochloric acid solution* to produce a solution containing 0.0005 per cent w/v solution of Nitrazepam. Measure the absorbance of the resulting solution immediately at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$ in the tablet taking 910 as the specific absorbance at 280 nm.

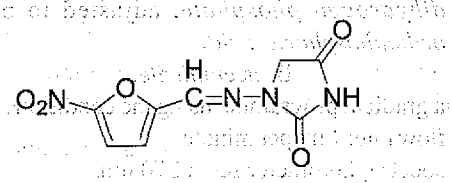
Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure in subdued light.*

Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of Nitrazepam, add 5 ml of *water*, mix and allow to stand for 15 minutes protected from light. Add 70 ml of a 0.5 per cent v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes protected from light, add sufficient of the *hydrochloric acid solution* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with the same solvent and measure the absorbance of the resulting solution immediately at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$ taking 910 as the specific absorbance at 280 nm.

Storage. Store protected from light and moisture.

Nitrofurantoin



$C_8H_6N_4O_5$ Mol. Wt. 238.2 (anhydrous)
$C_8H_6N_4O_5,H_2O$ Mol. Wt. 256.2 (hydrous)

Nitrofurantoin is 1-(5-nitrofurfurylideneamino)hydantoin. It is anhydrous or contains one molecule of water of hydration.

Nitrofurantoin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_6N_4O_5$, calculated on the anhydrous basis.

NOTE —Nitrofurantoin and solutions of it are discolored by alkali and by exposure to light and are decomposed upon contact with metals other than stainless steel and aluminium.

https://nhathuocngocanh.com/

Category. Antibacterial.

Description. Lemon yellow crystals or a crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nitrofurantoin IPRS* or with the reference spectrum of nitrofurantoin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Limit of Nitrofurfural Diacetate. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel G.

Spray reagent. Dissolve 0.75 g of *phenylhydrazine hydrochloride* in 50 ml of *water*, and decolorize with activated charcoal. Add 25 ml of *hydrochloric acid*, and mix with water to produce 200 ml.

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Dissolve 100 mg of *nitrofurantoin* in 1 ml of *dimethylformamide*, and dilute to 10.0 ml with *acetone*.

Reference solution. Dissolve 10 mg of *nitrofurfurral diacetate IPRS* in 10 ml of *dimethylformamide* and dilute to 100.0 ml with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 105° for 5 minutes, while it is still warm, spray with spray reagent and examine in day light. Any secondary spot in the chromatogram obtained with the test solution, at R_f value of 0.7, is not more intense than the spot in the chromatogram obtained with the reference solution at the same Rf value (1.0 per cent).

Limit of Nitrofurazone. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 2.0 ml of *dimethylformamide*, and add 20.0 ml *water*. Mix, and allow to stand for 15 minutes to allow a precipitate to form. Filter the solution through 0.45 µm nylon filter paper.

Reference solution (a). A 0.0005 per cent w/v solution of *nitrofurazone IPRS* in *dimethylformamide*. To 2.0 ml of the solution in 25-ml volumetric flask and add 20.0 ml of *water*.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *nitrofurantoin IPRS* and *nitrofurazone IPRS* in *dimethylformamide*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 90 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, add 30 ml of *1M sodium hydroxide*, adjusted to pH 7.0 with *1M sodium hydroxide* and dilute to 1000 ml with *water* and 10 volumes of *tetrahydrofuran*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 375 nm,
- injection volume: 60-100 µl.

NOTE — Adjust the operating parameters so that the nitrofurazone peak has a retention time of about 10.5 minutes and its height is about 0.1 full-scale.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to nitrofurantoin and nitrofurazone is not less than 4.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent, determined from the peak height, in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the height of any peak corresponding to nitrofurazone is not more than the height of the peak in the chromatogram obtained with the reference solution (a) (0.01 per cent).

Water (2.3.43). Not more than1.0 per cent (anhydrous form) and 6.5 to 7.5 per cent (hydrous form), using method 3, determined on sample previously dried at 140° for 30 minutes.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

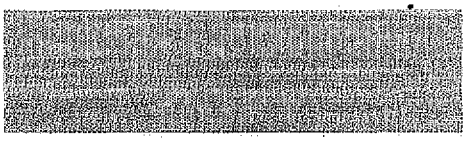
Internal standard solution. A 0.1 per cent w/v solution of *acetanilide* in *water*.

Test solution. Dissolve 50 mg of the substance under examination in 40.0 ml of *dimethylformamide*, and add 50.0 ml of internal standard solution.

Reference solution. Dissolve 50 mg of *nitrofurantoin IPRS* in 40.0 ml of *dimethylformamide*, and add 50.0 ml of internal standard solution.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 88 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, add 30 ml of *1M sodium hydroxide*, adjusted to pH 7.0 with *1M sodium hydroxide* and dilute to 1000 ml with *water* and 12 volumes of *acetonitrile*,



https://nhathuocngocanh.com/

– spectrophotometer set at 254 nm,
– injection volume: 5-10 µl.

NOTE —Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 minutes and the peak heights is about half full-scale.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to acetanilide and nitrofurantoin is not less than 3.0, and the relative standard deviation from the ratio of the peak responses for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_6N_4O_5$.

Storage. Store protected from light and moisture.

Labelling. The label states whether the material is anhydrous or hydrous.

Nitrofurantoin Tablets

Nitrofurantoin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nitrofurantoin, $C_8H_6N_4O_5$.

Usual strengths. 50 mg;100 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 100 mg of nitrofurantoin in 10 ml of *6 M glacial acetic acid*. Boil for few minutes and filter while hot, cool to room temperature and dry the nitrofurantoin precipitate for 1 hour at 105°. The precipitate complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6) in mineral oil. Compare the spectrum with that obtained with *nitrofurantoin IPRS*, treated in the same manner or with the spectrum of nitrofurantoin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *phosphate buffer pH 7.2*,
Speed and time. 100 rpm, 60 minutes and 120 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 375 nm (2.4.7). Calculate the content of $C_8H_6N_4O_5$ in the medium from the absorbance obtained from a solution of known concentration of *nitrofurantoin IPRS* prepared by dissolving in minimum amount of *dimethylformamide* and diluted with the dissolution medium.

Q. Not less than 25 per cent of the stated amount of $C_8H_6N_4O_5$ in 60 minutes, and Not less than 85 per cent of the stated amount of $C_8H_6N_4O_5$ in 120 minutes.

Limit of Nitrofurazone. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of Nitrofurantoin in 2.0 ml of *dimethylformamide*, and add 20.0 ml *water*. Mix, and allow to stand for 15 minutes to allow a precipitate to form. Filter the solution through 0.45 µm nylon filter paper.

Reference solution (a). A 0.0005 per cent w/v solution of *nitrofurazone IPRS* in *dimethylformamide*. To 2.0 ml of the solution in 25-ml volumetric flask and add 20.0 ml of *water*.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *nitrofurantoin IPRS* and *nitrofurazone IPRS* in *dimethylformamide*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
– a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
– mobile phase: a mixture of 90 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, add 30 ml of *1M sodium hydroxide*, adjusted to pH 7.0 with *1M sodium hydroxide* and dilute to 1000 ml with *water* and 10 volumes of *tetrahydrofuran*,
– flow rate: 1.6 ml per minute,
– spectrophotometer set at 375 nm,
– injection volume: 60-100 µl.

NOTE — Adjust the operating parameters so that the nitrofurazone peak has a retention time of about 10.5 minutes and its height is about 0.1 full-scale.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to nitrofurantoin and nitrofurazone is not less than 4.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent, determined from the peak height, in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the height of any peak corresponding to nitrofurazone is not more than the height of the peak in the chromatogram obtained with the reference solution (a) (0.01 per cent).

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.1 per cent w/v solution of *acetanilide* in *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Nitrofurantoin in 40.0 ml of *dimethylformamide,* and add 50.0 ml of internal standard solution.

Reference solution. Dissolve 50 mg of *nitrofurantoin IPRS* in 40.0 ml of *dimethylformamide,* and add 50.0 ml of internal standard solution.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 88 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 900 ml of *water*, add 30 ml of *1M sodium hydroxide*, adjusted to pH 7.0 with *1M sodium hydroxide* and dilute to 1000 ml with *water* and 12 volumes of *acetonitrile*,
- spectrophotometer set at 254 nm,
- injection volume: 5-10 µl.

NOTE — Adjust the operating parameters so that the retention time of the nitrofurantoin peak is about 8 minutes and the peak heights is about half full-scale.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to acetanilide and nitrofurantoin is not less than 3.0, and the relative standard deviation from the ratio of the peak responses for replicate injections is not more than 2.0 per cent.

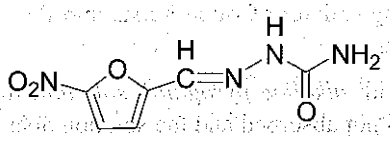
Inject the reference solution and the test solution.

Calculate the content of $C_8H_6N_4O_5$ in the tablets.

Storage. Store protected from light and moisture.

Nitrofurazone

Nitofural



$C_6H_6N_4O_4$ Mol. Wt. 198.1

Nitrofurazone is 5-nitro-2-furaldehyde semicarbazone.

Nitrofurazone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_6H_6N_4O_4$, calculated on the dried basis.

Category. Antibacterial.

Description. A yellow to brownish-yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nitrofurazone IPRS* or with the reference spectrum of nitrofurazone.

B. Dissolve 1 mg in 1 ml of *dimethylformamide* and add 0.05 ml of *1 M ethanolic potassium hydroxide*; a ruby red colour is produced.

Tests

pH (2.4.24). 5.0 to 7.0, determined in the filtrate obtained by shaking 1.0 g with 100 ml of *carbon dioxide-free water* and filtering.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.0005 per cent w/v solution of *(5-nitro-2-furyl)methylene diacetate* (Nitrofurazone impurity B) in the mobile phase.

Reference solution (b). Dissolve 10 mg each of *nitrofural IPRS* and *nitrofurantoin* in 100.0 ml of the mobile phase. Dilute 5 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 310 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to nitrofural and nitrofurantoin is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 10 times the retention time of nitrofural. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peaks with the area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *Carry out the following procedure in subdued light.*

Weigh 60 mg, add 20.0 ml of *dimethylformamide*, swirl to dissolve and add sufficient *water* to produce 500.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 375 nm (2.4.7). Calculate the content of $C_6H_6N_4O_4$ taking 822 as the specific absorbance at 375 nm.

Storage. Store protected from light and moisture.

Nitroglycerin Injection

Diluted Glyceryl Trinitrate Injection

Nitroglycerin Injection is a sterile solution of Diluted Nitroglycerin, which may contains alcohol and propylene glycol in Water for Injections.

Nitroglycerin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nitroglycerin, $C_3H_5N_3O_9$.

Description. A clear colourless solution.

Usual strengths. 5 mg per 5 ml; 5 mg per 10 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 6.5, the solution prepared by diluting 5 ml of the injection with 5 ml of *water* and 1 drop of *saturated potassium chloride solution*.

Ethanol (2.3.45). Not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ethanol, determined by method I.

Bacterial endotoxins (2.2.3). Not more than 100 Endotoxin units per mg of nitroglycerin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 5.0 mg of Nitroglycerin in 75 ml of mobile phase, shake well and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *diluted nitroglycerin IPRS* to obtain 0.005 per cent w/v of nitroglycerin in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *methanol* and *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.5 and the relative standard deviation is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_5N_3O_9$.

Storage. Store protected from light at a temperature between 15° and 30°.

Labelling. It is to be diluted before use where necessary.

Nitrous Oxide

N_2O Mol. Wt. 44.0

Nitrous Oxide contains not less than 98.0 per cent v/v of N_2O.

NOTE — Carry out the following tests on a full cylinder from which no gas has been withdrawn. The cylinder from which the gas is taken should be kept at room temperature for not less than 6 hours before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost and deliver the gas at a rate of 4 litres per hour, unless otherwise directed. The test for Carbon monoxide should be carried out on the first portion of gas drawn from the cylinder and that for Nitric oxide and nitrogen dioxide immediately thereafter.

Category. General anaesthetic.

Description. A colourless gas.

Identification

A. A glowing splinter of wood bursts into flame on contact with the gas.

B. Shake with *alkaline pyrogallol solution*; the gas being examined is not absorbed and the solution does not become brown.

Tests

Acidity or alkalinity. Use hermetically-closed, flat-bottomed, glass cylinders with dimensions such that 50 ml of liquid reaches a height of 12 to 14 cm, fitted with an outlet tube and

https://nhathuocngocanh.com/

with an inlet tube with an orifice of 1 mm in internal diameter reaching to within 2 mm of the bottom of the cylinder. For solution (1) pass 2.0 litres of the gas under examination through a mixture of 0.1 ml of *0.01 M hydrochloric acid* and 50 ml of *carbon dioxide-free water*. For solution (2) use 50 ml of *carbon dioxide-free water*. For solution (3) add 0.2 ml of *0.01 M hydrochloric acid* to 50 ml of *carbon dioxide-free water*. To each solution add 0.1 ml of 0.02 per cent w/v solution of *methyl red* in *ethanol (70 per cent)*. The intensity of the colour of solution (1) is between those of solution (2) and (3).

Arsine and phosphine. Through a *mercuric chloride paper* attached to a glass tube as in the limit test for arsenic (2.3.10), pass 2.0 litres of the gas; no visible stain is produced.

Carbon dioxide. Not more than 300 ppm v/v determined by the following method. Use the apparatus describedunder test for Acidity or alkalinity. Pass 1.0 litre through 50 ml of clear *barium hydroxide solution*. Any turbidity produced in the resulting solution is not more than that obtained in a reference solution prepared at the same time by adding 1 ml of 0.11 per cent w/v solution of *sodium bicarbonate* in *carbon dioxide-free water* to 50 ml of *barium hydroxide solution*.

Carbon monoxide. Not more than 10 ppm v/v, determined by the following method. Connect in series a U-tube containing *silica gel* impregnated with *chromium trioxide*, a drechsel bottle containing 100 ml of a 40 per cent w/v solution of *potassium hydroxide*, a U-tube containing pellets of *potassium hydroxide*, a U-tube containing *phosphorus pentoxide* dispersed on previously granulated, fused pumice, a tube containing *iodine pentoxide* in granules, previously dried at 200° and kept at a temperature of 120°, packed in 1-cm columns separated by 1-cm columns of glass wool giving an effective length of 5 cm, and a flask containing 2.0 ml of *1 M potassium iodide* and 0.15 ml of *starch solution*.

Flush the apparatus with 5.0 litres of carbon dioxide-free air and, if necessary, discharge the blue colour in the iodide solution by adding a small quantity of freshly prepared *0.002 M sodium thiosulphate*. Continue flushing until not more than 0.045 ml of *0.002 M sodium thiosulphate* is required after passing 5.0 litres of carbon dioxide-free air. Pass 5.0 litres of the gas under examination through the apparatus and flush the last traces of liberated iodine into the reaction flask by passing through the apparatus 1.0 litre of carbon monoxide-free air. Titrate the liberated iodine with *0.002 M sodium thiosulphate*. Carry out a blank titration under the same conditions, using 5.0 litres of carbon dioxide-free air. The difference between the volumes of *0.002 M sodium thiosulphate* used in the two titrations is not greater than 1.0 ml.

Halogens and hydrogen sulphide. Pass a volume containing 1.0 litre measured at 25° and at 101.3 kPa through a mixture of 100 ml of *water* and 1 ml of *silver nitrate solution*; neither opalescence nor darkening is produced.

Nitric oxide and nitrogen dioxide. Not more than 2 ppm v/v in both the liquid and gaseous phases, determined by the following method. Use two of the cylinders described under test for Acidity or alkalinity connected in series. Examine separately both the liquid and gaseous phases of the gas under examination. To obtain the liquid phase invert the cylinder. The liquid vaporises on leaving the valve.

For solution A dissolve 1 g of *sulphanilic acid* in a mixture of 10 ml of *glacial acetic acid* and 180 ml of *water*. For solution B dissolve 0.2 g of *N-(1-naphthyl)ethylenediamine dihydrochloride* in 10 ml of a 50 per cent v/v solution of *glacial acetic acid*, heating gently, and dilute to 200 ml with *water*. Mix 9 volumes of solution A with 1 volume of solution B (reagent A).

In the first cylinder place 15 ml of a solution containing 2.5 per cent w/v solution of *potassium permanganate* and 1.2 per cent v/v of *sulphuric acid (96 per cent)*. Place 20 ml of reagent A in the second cylinder and connect the outlet tube of the first cylinder to the inlet tube of the second cylinder. Pass 2.5 litres of the gas under examination through the reagents at a rate of 15 litres per hour. Prepare a reference solution by adding 0.25 ml of a 0.00616 per cent w/v solution of *sodium nitrite* to 20 ml of reagent A. Allow both the sample and reference solutions to stand for 10 minutes. For both liquid and gaseous phases, any red colour in the sample solution is not more intense than that in the reference solution.

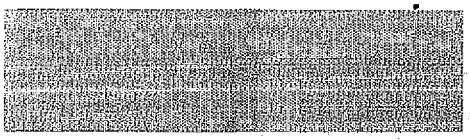
Oxidising substances. Pass a volume containing 2.0 litres measured at 25° and at 101.3 kPa through a freshly prepared solution of 0.5 g of *soluble starch* and 0.5 g of *potassium iodide* in 100 ml of *water* containing 0.05 ml of *glacial acetic acid*; the colour of the liquid is not changed.

Water. Pass a measured quantity at a rate of 6 litres per hour through an absorption tube containing *magnesium perchlorate*; the increase in weight of the tube does not exceed 2 mg per litre of gas, the initial and final weighings of the tube being made when the air in it has been displaced by the nitrous oxide.

Assay. Carry out the assay of nitrous oxide (2.3.32), using 100 ml of the gas under examination. Use a cylinder of the gas under examination from which at least 1 per cent w/w of the contents have been removed.

Storage. Store under pressure in metal cylinders of the type conforming to the appropriate safety regulations and at a temperature not exceeding 37°.

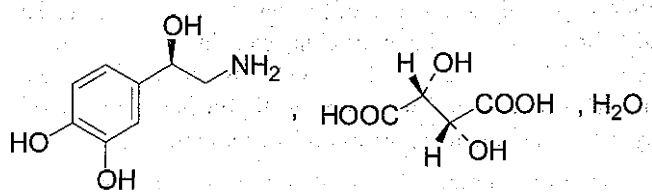
Labelling. The cylinder is painted blue and carries a label stating "Nitrous Oxide". In addition, "Nitrous Oxide" or the symbol "N_2O" should be stencilled in paint on the shoulder of the cylinder.



https://nhathuocngocanh.com/

Noradrenaline Bitartrate

Noradrenaline Acid Tartrate; Levarterenol Bitartrate; Norepinephrine Bitartrate



$C_8H_{11}NO_3,C_4H_6O_6,H_2O$ Mol. Wt. 337.3

Noradrenaline Bitartrate is (*R*)-2-amino-1-(3,4-dihydroxyphenyl) ethanol tartrate monohydrate.

Noradrenaline Bitartrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{11}NO_3,C_4H_6O_6$, calculated on the anhydrous basis.

Category. Sympathomimetic.

Description. A white or almost white, crystalline powder. It gradually darkens on exposure to air and light.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests C, D, E may be omitted if tests A, B and F are carried out.

A. Dissolve 0.2 g in 2 ml of *water* containing about 10 mg of *sodium sulphite* and add sufficient *dilute ammonia solution* to give an alkaline reaction. Keep the mixture at about 4° for 1 hour and filter.

On the residue (residue R) determine by infrared absorption spectrophotometry (2,4,6). Compare the spectrum with that obtained with *noradrenaline acid tartrate IPRS* treated in the same manner.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum at about 279 nm; absorbance at about 279 nm, about 0.40.

C. Wash residue R obtained in test A with three quantities, each of 2 ml, of *water*, followed by 5 ml of *ethanol (95 per cent)* and 5 ml of *ether* and dry the precipitate under pressure of 1.5 to 2.5 kPa for 3 hours. The specific optical rotation (2.4.22), determined in a 2.0 per cent w/v solution of the dried precipitate in *0.5 M hydrochloric acid* is – 48° to – 44°.

D. To 1 ml of a 1 per cent w/v solution, add 0.05 ml of *ferric chloride solution*; an intense green colour is produced. Add, drop by drop, *sodium bicarbonate solution*; the colour changes to blue and then red.

E. To 1 ml of a 0.1 per cent w/v solution add 10 ml of *phthalate buffer pH 3.6*, add 1 ml of *0.05 M iodine*, set aside for 5 minutes and add 2 ml of *0.1 M sodium thiosulphate*; not more than a faint red colour is produced. Repeat the test using *buffer solution pH 6.6* instead of *phthalate buffer pH 3.6*; a strong reddish violet colour is produced (distinction from adrenaline and isoprenaline).

F. The filtrate obtained in test A gives the reactions of tartrates (2.3.1).

Tests

Appearance of solution. A freshly prepared 2.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BY*S5* (2.4.1).

Melting range (2.4.21). 100° to 106°, with decomposition.

Adrenaline. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *acetone*, 50 volumes of *dichloromethane* and 0.5 volume of *anhydrous formic acid*.

NOTE—Prepare the following solutions immediately before use.

Test solution. Dissolve 0.25g of the substance under examination in 10 ml of *water*.

Reference solution (a). A 0.125 per cent w/v solution of *adrenaline tartrate IPRS* in *water*.

Reference solution (b). A 0.025 per cent w/v solution of *adrenaline tartrate IPRS* in *water*.

Reference solution (c). A mixture of equal volumes of the test solution and reference solution (b).

Apply to the plate 6 µl of each of test solution, reference solution (a) and (b) and 12 µl of reference solution (c) as bands 20 mm by 2 mm. Allow the applied bands to dry in air, spray them with a saturated solution of *sodium bicarbonate*, allow to dry in air and spray the bands twice with *acetic anhydride*, drying between the two sprayings. Heat the plate at 50° for 90 minutes and develop the chromatograms. After removal of the plate, allow it to dry in air and spray with a freshly prepared mixture of 8 volumes of *methanol*, 2 volumes of *ethylenediamine* and 2 volumes of a 0.5 per cent w/v solution of *potassium ferricyanide*. Dry the plate at 60° for 10 minutes and examine under ultraviolet light at 254 and 365 nm. In the chromatogram obtained with the test solution any band with a slightly higher R_f value than the principal band is not more intense than the corresponding band in the chromatogram obtained with reference solution (b). The chromatogram obtained with reference solution (c) shows a clearly separated band corresponding to the most intense band in the chromatogram obtained with reference solution (a) at a higher R_f value than the most intense band.

https://nhathuocngocanh.com/

Noradrenalone. Absorbance of a 0.2 per cent w/v solution in *0.01 M hydrochloric acid* at 310 nm, not more than 0.40 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.5 to 5.8 per cent, determined on 0.5 g.

Assay. Weigh 0.6 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, warming if necessary. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a bluish green colour is obtained. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03193 g of $C_8H_{11}NO_3,C_4H_6O_6$.

Storage. Store protected from moisture.

Noradrenaline Bitartrate Injection

Noradrenaline Acid Tartrate Injection; Noradrenaline Injection; Levarterenol Bitartrate Injection; Norepinephrine Bitartrate Injection

Noradrenaline Bitartrate Injection is a sterile solution of Noradrenaline Bitartrate. It is prepared by diluting Sterile Noradrenaline Concentrate to 250 times its volume with Sodium Chloride and Dextrose Injection or with Dextrose Injection (5 per cent w/v) immediately before use.

Noradrenaline Bitartrate Injection contains in 1 ml 8 µg of Noradrenaline Bitartrate equivalent to approximately 4 µg of noradrenaline.

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Sterile Noradrenaline Concentrate

Sterile Noradrenaline Concentrate is a sterile, isotonic solution containing 0.2 per cent w/v of Noradrenaline Bitartrate in Water for Injections.

Sterile Noradrenaline Concentrate contains not less than 0.18 per cent and not more than 0.23 per cent w/v of noradrenaline bitartrate, $C_8H_{11}NO_3,C_4H_6O_6,H_2O$.

Identification

Mix 0.5 ml with 10 ml of *phthalate buffer pH 3.6*, add 1 ml of *0.05 M iodine*, allow to stand for 5 minutes and add 2 ml of *0.1 M sodium thiosulphate*; not more than a very faint red colour is produced. Repeat the test using *phosphate buffer pH 6.6* instead of *phthalate buffer pH 3.6*; a strong reddish violet colour is produced.

Tests

pH (2.4.24). 3.0 to 4.6.

Bacterial endotoxins (2.2.3). Not more than 83.4 Endotoxin Units per mg of noradrenaline.

Other tests. Comply with the tests stated under Parenteral Preparations (Concentrated Solutions for Injection).

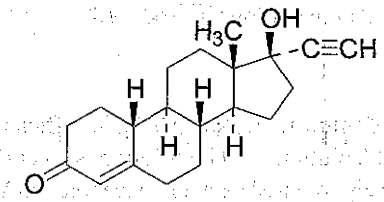
Assay. Dilute 5.0 ml to 200.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 279 nm (2.4.7). Calculate the content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ taking 80 as the specific absorbance at 279 nm.

Storage. Store protected from light, in single dose containers.

Labelling. The label states (1) "Sterile Noradrenaline Concentrate"; (2) that 1 volume of the solution diluted to 250 volumes with Sodium Chloride and Dextrose Injection or with Dextrose Injection (5 per cent w/v) produces Noradrenaline Bitartrate Injection, which must be used immediately after preparation; (3) that if the solution is brown it should not be used.

Norethisterone

Norethindrone



$C_{20}H_{26}O_2$ Mol. Wt. 298.4

Norethisterone is 17β-hydroxy-19-nor-17α-pregn-4-en-20-yn-3-one.

Norethisterone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{26}O_2$, calculated on the dried basis.

Category. Progestogen.

Description. A white or yellowish-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norethisterone IPRS* or with the reference spectrum of norethisterone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

https://nhathuocngocanh.com/

Mobile phase. A mixture of 40 volumes of *hexane* and 10 volumes of *dioxan*.

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of *chloroform*.

Reference solution. Dissolve 10 mg of *norethisterone IPRS* in 10 ml of *chloroform*.

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to and exhibits fluorescence similar to that in the chromatogram obtained with the reference solution.

C. Dissolve about 2 mg in 2 ml of *ethanol (95 per cent)* and add 1 ml of a 1 per cent w/v solution of *butylated hydroxytoluene* in *ethanol (95 per cent)* and 2 ml of *1 M sodium hydroxide*. Heat in a water-bath for 30 minutes and cool; a yellowish pink colour is produced.

Tests

Appearance of solution. Dissolve 0.2 g in sufficient *dioxan* to produce 10 ml (solution A). The solution is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). – 37.0° to – 33.0°, determined in a solution prepared by diluting 5.0 ml of solution A to 10.0 ml with *dioxan*.

Light absorption. Dissolve 10 mg in sufficient *ethanol (95 per cent)* to produce 100.0 ml, dilute 10.0 ml of the solution to 100.0 ml with *methanol (98 per cent)*. Absorbance of the resulting solution at the maximum at about 240 nm, 0.55 to 0.59 (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end capped octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	63	37
20	63	37
25	20	80
35	20	80
36	63	37
50	63	37

Inject the reference solution the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (0.3 per cent). Ignore any peaks with the area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.4 g, dissolve in 40 ml of *tetrahydrofuran*, add 10 ml of a 10 per cent w/v solution of *silver nitrate* and titrate with *0.1 M sodium hydroxide* using 2 ml of *bromocresol green solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of *sodium hydroxide* required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02984 g of $C_{20}H_{26}O_2$.

Storage. Store protected from light and moisture.

Norethisterone Tablets

Norethindrone Tablets

Norethisterone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norethisterone, $C_{20}H_{26}O_2$.

https://nhathuocngocanh.com/

Usual strength. 5 mg.

Identification

Place a quantity of the powdered tablets containing 25 mg of Norethisterone on a small filter, wash with three quantities, each of 5 ml, of *light petroleum (60° to 80°)* and discard the washings. Extract the residue with 15 ml of *chloroform*, evaporate the extract to dryness and recrystallise from aqueous *methanol*. The residue complies with the following test.

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *norethisterone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Carry out the procedure described under Assay but using the following test solution.

Test solution. Powder one tablet and dissolve as completely as possible in 2 ml of *water* with the aid of ultrasound for 15 minutes and dilute to 5.0 ml with *methanol*. Centrifuge for 15 minutes and use the clear supernatant liquid.

Calculate the content of $C_{20}H_{26}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 5 mg of Norethisterone in 10 ml of *water*; sonicate for 15 minutes and dilute to 25.0 ml with *methanol*, filter.

Reference solution. A 0.02 per cent w/v solution of *norethisterone IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 28 volumes of *water* and 72 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{26}O_2$ in the tablets.

Storage. Store protected from light and moisture.

Norethisterone and Ethinyl Estradiol Tablets

Northindrone and Ethinyl Estradiol Tablets

Norethisterone and Ethinyl Estradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of norethisterone $C_{20}H_{26}O_2$ and ethinyl estradiol $C_{20}H_{24}O_2$.

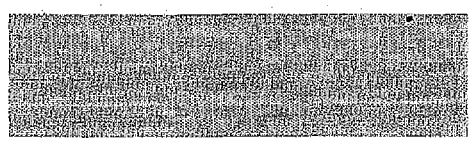
Usual strengths. Ethinyl Estradiol, 35 mcg and Norethisterone, 0.5 mg; Ethinyl Estradiol, 35 mcg and Norethisterone, 0.75 mg; Ethinyl Estradiol, 35 mcg and Norethisterone, 1.0 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *toluene* and 10 volumes of *ethyl acetate*.

Test solution. Powder one tablet, mix with 2 ml of *ethanol* in a centrifuge tube, and warm to 50° for 10 minutes with gentle swirling. Cool and centrifuge to obtain a clear solution.



https://nhathuocngocanh.com/

Reference solution. A solution containing 0.05 per cent w/v of *norethisterone IPRS* and 0.005 per cent w/v of *ethinyl estradiol IPRS* in *ethanol.*

Apply to the plate 40 µl of each solution. Allow the mobile phase to rise 10 cm, dry the plate in air and spray the plate with *sulphuric acid-methanol*, prepared by cautiously adding 70 ml of *sulphuric acid* in small increments to 30 ml of *methanol* chilled in an ice-bath, and mixing. The two principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

NOTE — Exercise care in filtering and handling solutions containing ethinyl estradiol to prevent adsorptive loss of the drug. Centrifugation may be used instead of filtration with non adsorptive membrane filters. Withdraw dissolution aliquots with glass or polytef pipets or syringes that have been checked for adsorptive loss. Use glass dissolution vessels and polytef-coated or solid polytef paddles.

Apparatus No. 2 (Paddle),
Medium. 500 ml of a buffer solution prepared by dissolving 0.45 g of *sodium lauryl sulphate* in 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm, 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *norethisterone IPRS* and *ethinyl estradiol IPRS* in the medium to obtain a solution having a known concentration similar to the test solution.

NOTE — A volume of methanol not exceeding 4.0 per cent of the total final volume of the reference solution may be used in preparing the reference solution.

Chromatographic system
- a stainless steel column 8.3 cm x 5 mm, packed with octadecyl silane bonded to porous silica (3µm),
- mobile phase: a mixture of 65 volumes of *0.02 M phosphate buffer* pH 6.0, and 35 volumes of *acetonitrile.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 100 µl.

The relative retention time with respect to ethinylestradiol for norethisterone is 0.9.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to norethisterone and ethinyl estradiol is not less than 1.5, the theoretical plates for the ethinyl estradiol peaks is not less than 7000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent for both peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{26}O_2$, and $C_{20}H_{24}O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{26}O_2$, and $C_{20}H_{24}O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions as described under Assay.

Test solution. Transfer one tablet to a 10.0 ml volumetric flash, add 0.4 ml *water*, allow the tablet to stand for 2 minutes and swirl to disperse the tablet. Add 8 ml of *acetonitrile* and mix with the aid of ultrasound for 10 minutes. Cool and dilute to volume with *acetonitrile*. Shake to mix and centrifuge. Dilute 5.0 ml of the solution to 10.0 ml with solvent mixture and mix.

Reference solution (a). A 0.0035 per cent w/v solution of *ethinyl estradiol IPRS* in the *acetonitrile.*

Reference solution (b). A 0.05 per cent w/v solution of *norethisterone IPRS* in the *acetonitrile.*

Reference solution (c). Dilute reference solution (a) and reference solution (b) with the solvent mixture to obtain a solution having a known concentration similar to the test solution.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{20}H_{26}O_2$, and $C_{20}H_{24}O_2$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 45 volumes of *acetonitrile* and 55 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.35 mg of ethinyl estradiol in *acetonitrile*, mix with the aid of ultrasound for 3 minutes. Cool and add 10.0 ml reference solution (a) and dilute to 100.0 ml with the same solvent. Centrifuge and dilute 5.0 ml with the solvent mixture to 10.0 ml.

Reference solution (a). Dissolve 15 mg of valerophenone in 125 ml of *acetonitrile,* and dilute to 250.0 ml with *water* and mix.

Reference solution (b). A 0.035 per cent w/v solution of *ethinyl estradiol IPRS in acetonitrile.*

Reference solution (c). A 0.05 per cent w/v solution of *norethisterone IPRS in acetonitrile.*

https://nhathuocngocanh.com/

Reference solution (d). Transfer 5.0 ml of each reference solution (a), reference solution (b) and reference solution (c) into a 100-ml volumetric flask to make a concentration similar to the test solution. Add (26 - X) ml of *acetonitrile*, X being the total volume of the, reference solution (b) and reference solution (c) taken. Dilute with the solvent mixture to volume, and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecyl silane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 25 µl.

The relative retention time with respect to ethinylestrodiol for norethisterone is 0.9.

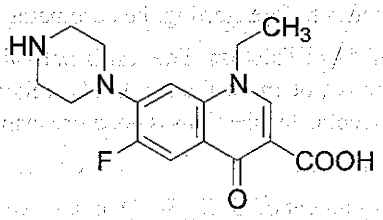
Inject reference solution (a) and (d). The test is not valid unless the resolution between the peaks due to norethisterone and ethinylestradiol is not less than 2.0 in the chromatogram obtained with reference solution (d), the theoretical plates are not less than 8000 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate peaks is not more than 2.0 per cent for both the peaks in the chromatogram obtained with reference solution (d).

Inject reference solution (d) and the test solution.

Calculate the content of $C_{20}H_{26}O_2$, and $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from light and moisture.

Norfloxacin



$C_{16}H_{18}FN_3O_3$ Mol. Wt. 319.3

Norfloxacin is 1-ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.

Norfloxacin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{18}FN_3O_3$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norfloxacin IPRS* or with the reference spectrum of norfloxacin.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum at about 273 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. A mixture of 95 volumes of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and 5 volumes of *acetonitrile*.

Test solution. Dissolve 20 mg of the substance under examination in 50.0 ml of solution A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with solution A. Dilute 1.0 ml of the solution to 10.0 ml with solution A.

Reference solution (b). Dissolve 4 mg of *norfloxacin for system suitability IPRS* (containing norfloxacin impurities A, E and H) in 10.0 ml of solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped hexadecylamidylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: A. *water*, adjusted to pH 2.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- flow rate: 1.4 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
7	93	7
10	87	13
15	47	53
20	10	90
22	95	5

The relative retention time with reference to norfloxacin for norfloxacin impurity E (7-chloro-1-ethyl-4-oxo-6-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid)is about 0.97, for norfloxacin impurity A (7-chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid) is about 1.5 and for

https://nhathuocngocanh.com/

norfloxacin impurity H (7-[4-(ethoxycarbonyl)piperazin-1-yl]-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid) is about 1.6.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to norfloxacin impurity A and norfloxacin impurity H is not less than 3.0 and peak-to-valley ratio is not less than 5.0, where H_p is the height above the baseline of the peak due to norfloxacin impurity E and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to norfloxacin.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to norfloxacin impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.33 g complies with the limit test for heavy metals, Method B (15 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Weigh 0.3 g and dissolve in 100 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25) and using a suitable anhydrous electrode system. (The electrode system may be rendered anhydrous by filling the electrode with *0.1 M lithium perchlorate* in *acetic anhydride* after removing any aqueous solution contained in it). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03193 g of $C_{16}H_{18}FN_3O_3$.

Storage. Store protected from light and moisture.

Norfloxacin Eye Drops

Norfloxacin Eye Drops are a sterile solution of Norfloxacin in Purified water.

Norfloxacin Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norfloxacin, $C_{16}H_{18}FN_3O_3$.

Usual strength. 0.3 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.6 to 5.5.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops with a 0.1 per cent v/v solution of *orthophosphoric acid* to produce a solution containing 0.005 per cent w/v of Norfloxacin.

Reference solution. A 0.005 per cent w/v solution of *norfloxacin IPRS* in 0.1 per cent v/v solution of *orthophosphoric acid*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Bondapack C18),
- column temerature. 50°,
- mobile phase: a mixture of 300 volumes of *methanol* and 700 volumes of 0.1 per cent v/v *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Precondition the column using *0.01 M anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*, at a flow rate of 0.5 ml per minute for 8 hours. Equilibrate the column with the mobile phase for about 30 minutes before starting the chromatography.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the eye drops.

Storage. Store protected from light.

Norfloxacin Tablets

Norfloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norfloxacin, $C_{16}H_{18}FN_3O_3$.

Usual strengths. 200 mg; 400 mg; 800 mg.

https://nhathuocngocanh.com/

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *chloroform*, 40 volumes of *methanol*, 20 volumes of *toluene*, 14 volumes of *diethylamine* and 8 volumes of *water*.

Test solution. Shake a quantity of the finely powdered tablets containing 75 mg of Norfloxacin with 50 ml of a mixture of equal volumes of acidified *methanol* (containing 0.9 per cent v/v of *hydrochloric acid*) and *dichloromethane*, centrifuge and use the clear supernatant solution.

Reference solution. A 0.15 per cent w/v solution of *norfloxacin IPRS* in the same solvent mixture.

Apply to the plate 50 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to norfloxacin in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 750 ml of *acetate buffer pH 4.0*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with *acetate buffer pH 4.0*, if necessary, at the maximum at about 278 nm (2.4.7). Concomitantly measure the absorbance of a solution of known concentration of *norfloxacin IPRS* in the same medium. Calculate the total content of $C_{16}H_{18}FN_3O_3$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{18}FN_3O_3$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Add 80 ml of the mobile phase to a weighed quantity of the powdered tablets containing about 100 mg of Norfloxacin, mix with the aid of ultrasound for 10 minutes, dilute with a 0.1 per cent v/v solution of *orthophosphoric acid* to 200.0 ml and mix. Dilute 10.0 ml of the solution to 25.0 ml with the mobile phase, mix and filter.

Reference solution. A 0.02 per cent w/v solution of *norfloxacin IPRS* in the mobile phase.

Chromatographic system

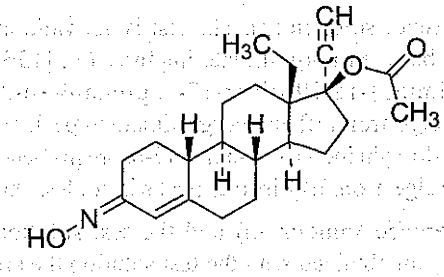
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 85 volumes of a 0.1 per cent v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- temperature. column 40° ± 1°, after preconditioning with degassed *0.01 M sodium dihydrogen phosphate* adjusted to pH 4.0 with *phosphoric acid* flowing at a rate of 0.5 ml per minute for 8 hours,
- flow rate: 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Inject the reference solution the test solution. The assay is not valid unless the capacity factor is not less than 2, the column efficiency is not less than 1500 theoretical plates, the tailing factor for the norfloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the tablets.

Storage. Store protected from light and moisture.

Norgestimate



$C_{23}H_{31}NO_3$ Mol. Wt. 369.5

Norgestimate is (3EZ)-13α-Ethyl-3-(hydroxyimino)-18, 19-dinor-17α-pregn-4-en-20-yn-17-yl acetate.

Norgestimate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{23}H_{31}NO_3$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norgestimate IPRS* or with the reference spectrum of norgestimate.

https://nhathuocngocanh.com/

Tests

Specific optical rotation (2.4.22). +42° to +50°, determined in a 1.0 per cent w/v solution in *methylene chloride*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *water* and 4 volumes of *methanol*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 20.0 ml with the same solvent.

Reference solution (b). Dissolve 2 mg of *norgestimate impurity A IPRS* [13β-ethyl-3-oxo-18,19-dinor-17-α-pregn-4-en-20yn-17-yl acetate (levonorgestrel acetate)] in 4 ml of solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with end capped octadecylsilane silica gel (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 18 volumes of *acetonitrile*, 25 volumes of *tetrahydrofuran* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 244 nm,
- injection volume: 25 µl.

Inject reference solution (b). The test is not valid unless the resolution between norgestimate impurity (E) [13β-ethyl-3-(hydroxyimino)-18,19-dinor-17-α-pregn-4-en-20yn-17-ol((E))norelgestromin)] and norgestimate impurity (Z) [13β-ethyl-3-(hydroxyimino)-18,19-dinor-17-α-pregn-4-en-20yn-17-ol((Z)) norelgestromin)]- isomer peaks is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of the peak corresponding to norgestimate impurity A is not more than twice the area of the corresponding peak norgestimate (E) and (Z) isomer multiplied with correction factor 1.33 in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the corresponding peak norgestimate (E) and (Z) isomer multiplied with correction factor 1.33 in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the corresponding peak norgestimate (E) and (Z) isomer multiplied with correction factor 1.33 in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the corresponding peak norgestimate (E) and (Z) isomer multiplied with correction factor 1.33 in the chromatogram obtained with reference solution (a) (0.05 per cent).

Ratio of (E) to (Z) isomer. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Inject the test solution . Calculate the (E) to (Z) isomer ratio by dividing the area of the peak corresponding to the (E) isomer by 1.33 times the area of the peak due to the (Z) isomer. The ratio is 1.27 to 1.78.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.3 g and dissolve in a mixture of 40.0 ml of *tetrahydrofuran* and 10 ml of *silver nitrate (10 per cent w/v)* and titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25). Record the volume used between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03695 g of $C_{23}H_{31}NO_3$.

Norgestimate and Ethinyl Oestradiol Tablets

Norgestimate and Ethinyl Estradiol Tablets

Norgestimate and Ethinyl Oestradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of norgestimate, $C_{23}H_{31}NO_3$, and ethinyl estradiol, $C_{20}H_{24}O_2$.

Category. Oral contraceptive.

Usual strengths. Norgestimate, 180 µg and Ethinyl Oestradiol, 35 µg; Norgestimate, 215 µg and Ethinyl Oestradiol, 35 µg; Norgestimate, 250 µg and Ethinyl Oestradiol, 35 µg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Use mobile phase, test solution and reference solution (b) as described under Assay.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

https://nhathuocngocanh.com/

Name	Relative retention time
Ethinyl Estradiol	0.5
(Z)- norgestimate	1.0
(E)- norgestimate	1.2

Inject reference solution (b). The test is not valid unless the resolution between the (z)- norgestimate and (e)- norgestimate peaks is not less than 1.5, and the relative standard deviation for replicate injections is not more than 2.0.

Inject the test solution. In the chromatogram obtained with the test solution the sum of the areas of impurity having relative retention of about 0.2 and 0.4 peaks is not more than 4.0 per cent multiplying 1.54 as correction factor calculated by area normalization.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 20.0 ml of the *water*, with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with *methanol*.

Reference solution (a). A 0.00018 per cent w/v solution of *norgestimate IPRS* in a 100-ml volumetric flask in a mixture of 20 ml of *water* and 80 ml of *methanol*.

Reference solution (b). A 0.000035 per cent w/v solution of *ethinyl oestradiol IPRS* in a 100-ml volumetric flask in a mixture of 20 ml of *water* and 80 ml of *methanol*.

Reference solution (c). Mix reference solution (a) and reference solution (b) to produce a solution having similar concentration to that of test solution in a mixture of 20 ml of *water* and 80 ml of *methanol*.

Chromatographic system as described under Assay.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{23}H_{31}NO_3$ and $C_{20}H_{24}O_2$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.35 mg of Ethinyl Estradiol in a 50-ml volumetric flask, add 10 ml of *water* and 40 ml of reference solution (a), mix. Sonicate for 5 minutes and filter.

Reference solution (a). A 0.005 per cent w/v solution of *dibutyl phthalate IPRS* in *methanol*.

Reference solution (b). Weigh a quantity of *ethinyl estradiol IPRS* and *norgestimate IPRS* in reference solution (a) equivalent to 80 per cent of final volume and 20 per cent of *water*. Mix to obtain a known concentration of about 0.0007 per cent w/v solution of ethinyl estradiol and a known concentration of norgestimate similar to the expected concentration of test solution.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *tetrahydrofuran*, 2 volumes of *methanol* and 13 volumes of *water*,
- flow rate: 2.1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 25 µl.

Name	Relative retention time
Ethinyl Estradiol	0.5
(Z)- norgestimate	1.0
(E)- norgestimate	1.2
Dibutyl phthalate	1.5

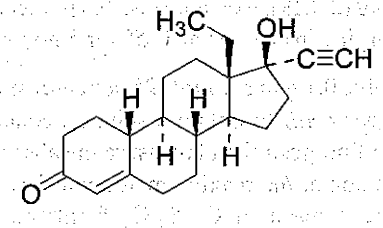
Inject reference solution (b). The test is not valid unless the resolution between the (z)- norgestimate and (e)- norgestimate peaks is not less than 1.5, and the relative standard deviation for replicate injections is not more than 2.0.

Inject reference solution (b) and the test solution.

Calculate the contents of $C_{23}H_{31}NO_3$ and $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from moisture.

Norgestrel



$C_{21}H_{28}O_2$ Mol. Wt. 312.5

Norgestrel is *rac*-13-ethyl-17-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one.

Norgestrel contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Category. Progestogen.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norgestrel IPRS* or with the reference spectrum of norgestrel.

https://nhathuocngocanh.com/

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 240 nm.

C. Melting range (2.4.21). 205° to 212°, but the range between beginning and end of melting does not exceed 4°.

Tests

Optical rotation (2.4.22). −0.1° to + 0.1°, determined in a 5.0 per cent w/v solution in *chloroform*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *dichloromethane* and 20 volumes of *ethyl acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.01 per cent w/v solution of *norgestrel IPRS* in *chloroform*.

Reference solution (b). A 0.004 per cent w/v solution of *norgestrel IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *phosphomolybdic acid solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash. (2.3.18) Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Assay. Dissolve 0.1 g in *ethanol (95 per cent)* and dilute with *ethanol (95 per cent)* to obtain a solution containing 0.001 per cent w/v of norgestrel and measure the absorbance of the resulting solution at the maximum at about 241 nm, (2.4.7). Calculate the content of $C_{21}H_{28}O_2$ from the absorbance obtained with a 0.001 per cent w/v solution of *norgestrel IPRS* in *ethanol (95 per cent)*.

Storage. Store protected from moisture.

Norgestrel and Ethinyloestradiol Tablets

Norgestrel and Ethinyloestradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of norgestrel, $C_{21}H_{28}O_2$ and ethinyloestradiol, $C_{20}H_{24}O_2$.

Category. Oral contraceptive.

Usual strength. Norgestrel, 300 µg and Ethinyloestradiol, 30 µg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 96 volumes of *dichloromethane* and 4 volumes of *ethanol (95 per cent)*.

Test solution. Powder 20 tablets finely, triturate with 20 ml of *dichloromethane*, allow the solids to sediment and use the clear supernatant liquid.

Reference solution. A solution containing 0.06 per cent w/v solution of *norgestrel IPRS* and 0.006 per cent w/v solution of *ethinyloestradiol IPRS*.

Apply to the plate 40 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (80 per cent v/v)*, heat at 110° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spots in the chromatogram obtained with the test solution correspond to the spots for norgestrel (red fluorescence) and ethinylo-estradiol (orange-yellow fluorescence) in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of 0.0005 per cent w/v of polysorbate 80,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through 0.7-µm borosilicate microfiber filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *norgestrel IPRS* and *ethinyloestradiol IPRS* in *ethanol* (not more than 2 per cent of total volume) and dilute with the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 247 nm for norgestrel,

https://nhathuocngocanh.com/

– spectrofluorometer detector with an excitation wavelength of 285 nm and emission wavelength of 310 nm for ethinyloestradiol,
– injection volume: 100 µl.

The relative retention time with reference to norgestrel for ethinyloestradiol is about 0.7.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent for both the peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{28}O_2$ and $C_{20}H_{24}O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Carry out the procedure described under Assay but using the following test solution.

Test solution. Add 2.0 ml of *methanol (70 per cent)* and 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* (internal standard solution) to one tablet, shake for 20 minutes, centrifuge, filter the supernatant liquid through a membrane filter with a pore size of not more than 0.2 mm and use the filtrate.

Calculate the contents of norgestrel $C_{21}H_{28}O_2$, and ethinyloestradiol, $C_{20}H_{24}O_2$, in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) using the chromatographic system described under Uniformity of content.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder equivalent to one tablet add 2.0 ml of *methanol (70 per cent)* and 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* (internal standard solution), shake for 20 minutes, centrifuge, filter the supernatant liquid through a membrane filter with a pore size of not more than 0.2 mm and use the filtrate.

Reference solution. A solution in *methanol (70 per cent)* containing 0.15 mg per ml of *norgestrel IPRS* and 0.015 mg per ml of *ethinyloestradiol IPRS*. Take 2.0 ml of the solution and add 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* and use the resulting solution.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 to 7 µm),
– mobile phase: a mixture of 35 volumes of *acetonitrile*, 15 volumes of *methanol* and 45 volumes of *water*,
– flow rate: 1 to1.5 ml per minute,
– spectrophotometer set at 215 nm,
– injection volume: 20 µl.

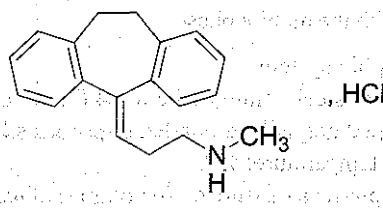
Inject the reference solution. The resolution between the two major peaks is not less 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution the test solution. The relative retention times are about 0.7 for ethinyloestradiol and about 1.0 for norgestrel.

Calculate the contents of norgestrel, $C_{21}H_{28}O_2$, and ethinyloestradiol, $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from light.

Nortriptyline Hydrochloride



$C_{19}H_{21}N,HCl$ Mol. Wt. 299.8

Nortriptyline Hydrochloride is 3-(10,11-dihydro-5*H*-dibenzo[*a*,*d*]cyclohept-5-ylidene)propyl(methyl)amine hydrochloride.

Nortriptyline Hydrochloride contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{19}H_{21}N,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. A white to off-white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and, D are carried out.

A. Dissolve 0.1 g in 10 ml of *water*, make alkaline with *1 M sodium hydroxide*, extract with 5 ml of *chloroform* and evaporate to dryness using a current of nitrogen.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nortriptyline hyrdochloride IPRS* treated in the same manner or with the reference spectrum of nortriptyline.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 239 nm; absorbance at about 239 nm, about 0.48.

https://nhathuocngocanh.com/

C. To about 50 mg dissolved in 3 ml of warm *water*, add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; a red colour is produced after a few minutes (distinction from amitriptyline).

D. It gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of a solution prepared by dissolving 3.25 ml of 40 per cent w/v solution of *tetrabutylammonium hydroxide* and 0.68 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 7.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Nortriptyline impurity A[1]	0.5	—
Nortriptyline impurity D[2]	0.8	1.7
Nortriptyline impurity B[3]	0.9	-
Nortriptyline (Retention time: about 13 minutes)	1.0	---

[1]dibenzosuberone,

[2]5-[3-(dimethylamino)propyl]-10,11-dihydro-5*H*-dibenzo[*a*,*d*][7]annulen-5-ol,

[3]norcyclobenzaprine.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to nortriptyline impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak corresponding to nortriptyline impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.25 g and dissolve in 25 ml of *anhydrous glacial acetic acid*, warm slightly, if necessary, to effect solution. Cool, add 5 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02998 g of $C_{19}H_{21}N,HCl$.

Storage. Store protected from light and moisture.

Nortriptyline Tablets

Nortriptyline Hydrochloride Tablets

Nortriptyline Tablets contain Nortriptyline Hydrochloride equivalent to less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nortriptyline, $C_{19}H_{21}N$. The tablets are coated.

Usual strengths. 10 mg; 25 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 5 mg of nortriptyline with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5 per cent w/v solution of *sodium bicarbonate*, 1 ml of a 2 per cent w/v solution of *sodium periodate* and 1 ml of a 0.3 per cent w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with *1 M sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*.

https://nhathuocngocanh.com/

When examined in the range 230 nm to 360 nm (2.4.7), the resulting trimethylpentane solution shows an absorption maximum only at about 265 nm.

B. Triturate a quantity of the powdered tablets containing 0.1 g of nortriptyline with 10 ml of *chloroform*, filter and evaporate the filtrate to a low volume. Add *ether* until a turbidity is produced and allow to stand. Dissolve 50 mg of the precipitate in 3 ml of warm *water*, cool and add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; a red colour is produced after a few minutes (distinction from amitriptyline).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *cyclohexane*, 15 volumes of *ethyl acetate* and 3 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 20 mg of nortriptyline with 5 ml of a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *2 M hydrochloric acid*, centrifuge and use the supernatant liquid.

Reference solution. A 0.001 per cent w/v solution of *dibenzosuberone IPRS* in *ethanol (95 per cent)* prepared in subdued light.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 14 cm in an unsaturated tank protected from light. Dry the plate in air, spray with a freshly prepared solution of *sulphuric acid* containing 4 per cent v/v of *formaldehyde solution* and examine immediately under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Transfer one tablet to 100.0 ml volumetric flask, add about 5 ml of *water* and disperse with the aid of ultrasound. Add about 50.0 ml of *methanol*, mix with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with *water*. Centrifuge and use the supernatant liquid, dilute if necessary.

Reference solution. A 0.01 per cent w/v solution of *nortriptyline hydrochloride IPRS* in *methanol (50 per cent)*.

Follow the procedure given in the Assay. Calculate the content of $C_{19}H_{21}N$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake vigorously 20 tablets with 50 ml of *water* until the tablets disintegrate completely, add 100.0 ml of *methanol* and shake for 30 minutes. Add sufficient *water* to produce 200.0 ml, filter and dilute a volume of the filtrate containing about 25 mg of nortriptyline to 100.0 ml with *methanol (50 per cent)*.

Reference solution. A 0.025 per cent w/v solution of *nortriptyline hydrochloride IPRS* in *methanol (50 per cent)*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a 0.56 per cent w/v solution of *sodium hexanesulphonate* in a mixture of equal volumes of *water* and *acetonitrile* adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution the test solution.

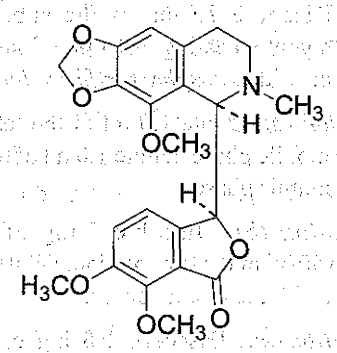
Calculate the content of $C_{19}H_{21}N$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of equivalent amount of nortriptyline.

Noscapine

Narcotine



$C_{22}H_{23}NO_7$ Mol. Wt. 413.4

Noscapine is (3*S*)-6,7-dimethoxy-3-[(5*R*)-5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]phthalide, an alkaloid obtained from opium.

Noscapine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{22}H_{23}NO_7$, calculated on the dried basis.

Category. Cough suppressant.

Description. Colourless crystals or a white crystalline powder.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *noscapine IPRS* or with the reference spectrum of noscapine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *methanol* shows absorption maxima at about 291 nm and 310 nm; ratio of absorbance at the maximum at about 310 nm to that at the maximum at about 291 nm, 1.2 to 1.3.

C. To 0.1 g in a porcelain dish add a few drops of *sulphuric acid* and stir; a greenish-yellow solution is formed which on warming becomes red and finally violet.

D. Dissolve 50 mg in 5 ml of *5 M hydrochloric acid*, add 10 ml of a mixture of equal volumes of *ethanol (95 per cent)* and a saturated solution of *sodium acetate*, mix and allow to stand for about 3 minutes; shining crystals separate.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *acetone* examined immediately after preparation is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). + 42.0° to + 48.0°, determined at 20° in a solution prepared by dissolving 0.5 g in sufficient *0.1 M hydrochloric acid* to produce 25.0 ml.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination with gentle heating in 14 ml of *methanol*, cool, and dilute to 20 ml with *phosphate buffer solution pH 6.0*.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *papaverine hydrochloride* in 50 ml of the test solution. Dilute 1.0 ml of the solution to 20 ml with the mobile phase.

Reference solution (c). Dissolve 1.5 mg of *papaverine hydrochloride* in 10 ml of the test solution and dilute to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of *phosphate buffer pH 6.0*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to noscapine and papaverine (noscapine impurity A) is not less than 2.0. The relative retention time with reference to noscapine for noscapine impurity A is about 1.3.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak corresponding to noscapine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of the any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), and the sum of the areas of secondary peaks other than noscapine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Morphine. Dissolve 0.1 g in 10 ml of *0.1 M hydrochloric acid*. To 1 ml of the resulting solution add a mixture of 1 ml of *potassium ferricyanide solution*, 0.05 ml of *ferric chloride test solution* and 4 ml of *water*; no blue or dark green colour develops within 1 minute.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.35 g, dissolve in 40 ml of *anhydrous glacial acetic acid*, warming gently. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04134 g of $C_{22}H_{23}NO_7$.

Storage. Store protected from light and moisture.

Noscapine Linctus

Narcotine Linctus

Noscapine Linctus is a solution of Noscapine in a suitable flavoured vehicle. It may contain up to 1 per cent w/v solution of Citric Acid.

Noscapine Linctus contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of noscapine, $C_{22}H_{23}NO_7$.

Usual strength. 7 mg per 5 ml.

https://nhathuocngocanh.com/

Identification

To a quantity containing 60 mg of Noscapine add 20 ml of *water*, 2 g of *sodium chloride* and 2 ml of *5 M sodium hydroxide*. Extract with successive quantities of 50, 50, 25 and 25 ml of *ether*. Combine the extracts, wash with three quantities, each of 5 ml, of *water* and evaporate to dryness. Dissolve the residue in 20 ml of *chloroform*. Wash with three quantities, each of 20 ml, of *water*, dry the chloroform layer with *anhydrous sodium sulphate*, filter and evaporate the solvent. If necessary, induce crystallisation by scratching with a glass rod. The crystals comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *noscapine IPRS* or with the reference spectrum of noscapine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *methanol* shows absorption maxima at about 291 nm and 310 nm; ratio of absorbance at the maximum at about 310 nm to that at the maximum at about 291 nm, 1.2 to 1.3.

Tests

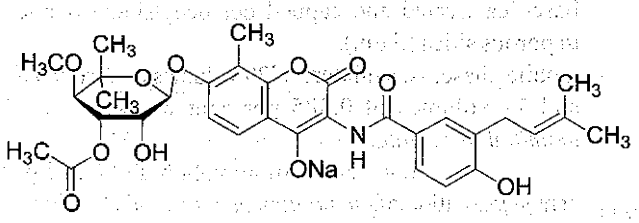
Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh a quantity containing 60 mg of Noscapine, add 20 ml of *water*, 2 g of *sodium chloride* and 2 ml of *5 M sodium hydroxide* and extract with successive quantities of 50, 50, 25 and 25 ml of *ether*. Combine the extracts, wash with three quantities, each of 5 ml, of *water* and evaporate to dryness. To the residue add 50.0 ml of *0.1 M hydrochloric acid*, warm on a water-bath to dissolve and to remove any traces of ether and dilute to 100.0 ml with *water*. Dilute 3.0 ml to 50.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{22}H_{23}NO_7$ taking 90.7 as the specific absorbance at 310 nm.

Determine the weight per ml of the linctus (2.4.29), and calculate the content of $C_{22}H_{23}NO_7$, weight in volume.

Storage. Store protected from light and moisture.

Novobiocin Sodium



$C_{31}H_{35}N_2NaO_{11}$ Mol. Wt. 634.6

Novobiocin Sodium is the monosodium salt of novobiocin, *N*-[7-{3-*O*-(aminocarbonyl)-6-deoxy-5-*C*-methyl-4-*O*-methyl-β-L-*lyxo*-hexopyranosyl}-oxy-4-hydroxy-8-methyl-2-oxo-2*H*-1-benzopyran-3-yl]-4-hydroxy-3-(3-methyl-2- butenyl)-benzamide, an antimicrobial substance produced by the growth of certain strains of *Streptomyces niveus* or related organisms or by other means.

Novobiocin Sodium contains the equivalent of not less than 850 µg of novobiocin per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white or yellowish white, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G F254*.

Mobile phase. A mixture of 75 volumes of *chloroform*, 25 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve a quantity of the substance under examination in *methanol* so as to obtain a solution containing 0.1 per cent w/v solution of novobiocin.

Reference solution. A 0.1 per cent w/v solution of *novobiocin IPRS* in *methanol*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydroxide* shows an absorption maximum only at about 307 nm.

C. The residue obtained by igniting it gives the tests for sodium salts (2.3.1).

Tests

pH (2.4.24). 6.6 to 8.5, determined in a 2.5 per cent w/v solution.

Specific optical rotation (2.4.22). −58.0° to −50.0°, determined in a 5.0 per cent w/v solution in *methanol* containing 1 per cent v/v of *hydrochloric acid*.

Loss on drying (2.4.19). Not more than 6 per cent, determined on 0.2 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the results in µg of novobiocin per mg.

https://nhathuocngocanh.com/

Novobiocin Sodium intended for use in the manufacture of Parenteral Preparations complies with the following additional requirements.

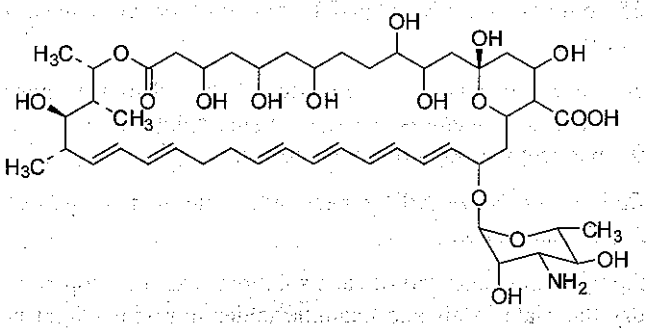
Bacterial endotoxins (2.2.3). Not more than 0.7 Endotoxin units per mg.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from light and moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Nystatin



$C_{47}H_{75}NO_{17}$ Mol. Wt. 926.1

Nystatin is an antifungal substance produced by the growth of certain strains of *Streptomyces noursei* or by any other means. It consists mainly of polyenes, the principal component being nystatin A_1.

Nystatin has a potency of not less than 4400 Units per mg, calculated on the dried basis.

Category. Antifungal.

Description. A yellow to slightly brown powder; hygroscopic.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the final solution obtained in the test for Light absorption shows absorption maxima at about 230 nm, 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared in the same manner without the substance under examination.

B. Shake 30 mg with 5 ml of *water* for 2 minutes, add 2 ml of *sodium molybdotungstophosphate solution*, and allow to stand for 1 hour; the green colour produced is darker than that produced by repeating the test without the substance under examination.

C. Shake 30 mg with 5 ml of *water* for 2 minutes, add 2 ml of a solution prepared by dissolving 0.1 g of *pyrogallol* in 100 ml of *decolorised magenta solution*, heat on a water-bath until a dark pink colour is produced, cool and allow to stand for 1 hour; the pink colour is retained.

D. To 2 mg add 0.1 ml of *hydrochloric acid*; a brown colour is produced.

E. To 2 mg add 0.1 ml of *sulphuric acid*; a brown colour is produced which becomes violet on standing.

Tests

pH (2.4.24). 6.5 to 8.0, determined in a 3.0 per cent w/v suspension in *water*.

Light absorption (2.4.7). Dissolve 0.1 g in a mixture of 5.0 ml of *glacial acetic acid* and 50 ml of *methanol*, add sufficient *methanol* to produce 100.0 ml and dilute 1.0 ml of the resulting solution to 100.0 ml with *methanol*. Absorbance of the resulting solution, measured within 30 minutes of preparation, at the maximum at about 305 nm, not less than 0.60. Use as the blank a solution prepared in the same manner without the substance under examination.

Composition. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light.

Test solution. Dissolve 20 mg of the substance under examination in 50 ml of *dimethylsulphoxide*.

Reference solution (a). A 0.04 per cent w/v solution of *nystatin IPRS* in *dimethylsulphoxide*.

Reference solution (b). Dissolve 20 mg of the substance under examination in 25 ml of the *methanol* and dilute to 50 ml with *water*. To 10.0 ml of the solution add 2.0 ml of *dilute hydrochloric acid*. Allow to stand at room temperature for 1 hour.

Reference solution (c). Dilute 1.0 ml of reference solution (a) in 100.0 ml with *dimethylsulphoxide*. Dilute 1.0 ml of the solution to 10.0 ml with *dimethylsulphoxide*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base-deactivated end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 29 volumes of *acetonitrile* and 71 volumes of 0.385 per cent w/v solution of *ammonium acetate*,

  B. a mixture of 40 volumes of 0.385 per cent w/v solution of *ammonium acetate* and 60 volumes of *acetonitrile*.
- a gradient programme using the conditions given below,

https://nhathuocngocanh.com/

- flow rate: 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	100	0
25	100	0
35	0	100
45	0	100
50	100	0
55	100	0

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.5.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution the area of the peak due to nystatin A1 is not less than 85 per cent the area of the principal peak in the chromatogram obtained with reference solution (a), the area of the any other compound is not more than 4.0 per cent the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 3.5 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay *NOTE— Protect the solution from light throughout the assay.*

Weigh 75 mg and dissolve in sufficient *dimethylformamide* to produce 50.0 ml; dilute 10.0 ml of the resulting solution to 200.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin per mg.

Nystatin Ointment

Nystatin Ointment is a dispersion of Nystatin in microfine powder in a suitable ointment base.

Nystatin Ointment contains not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin.

Usual strength. 100,000 Units per g.

Identification

Disperse a quantity containing 25,000 Units in 10 ml of *chloroform*, add 40 ml of *methanol* and shake. Filter and dilute 1 ml of the filtrate to 25 ml with *methanol*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. *Protect the solution from light throughout the assay.*

Weigh a quantity containing 400,000 Units, disperse in 20 ml of *ether* in a stoppered flask, add 70 ml of *dimethylformamide*, shake for a few minutes, add 10 ml of *water*, shake vigorously for a few minutes and add sufficient *dimethylformamide* to produce 100.0 ml. Mix well, filter and dilute 10.0 ml of the filtrate to 100.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin per g.

Nystatin Pessaries

Nystatin Vaginal Tablets

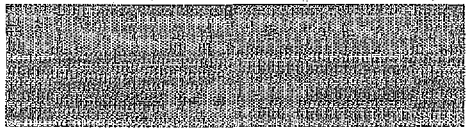
Nystatin Pessaries contain not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin.

Usual strength. 100,000 Units.

Identification

Extract a quantity of the powdered pessaries containing 300,000 Units with a mixture of 50 ml of *methanol* and 5 ml of *glacial acetic acid*, add sufficient *methanol* to produce 100 ml and filter. Dilute 1 ml of the filtrate to 100 ml with *methanol*. The resulting solution complies with the follwing test.

Disperse a quantity containing 25,000 Units in 10 ml of *chloroform*, add 40 ml of *methanol* and shake. Filter and dilute 1 ml of the filtrate to 25 ml with *methanol*.



https://nhathuocngocanh.com/

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Other tests. Comply with the tests stated under Pessaries.

Loss on drying (2.4.19). Not more than 5 per cent, determined on 1.0 g of the powdered pessaries by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *NOTE— Protect the solution from light throughout the assay.*

Weigh and powder 20 pessaries. Weigh a quantity of the powder containing 200,000 Units and shake with 50.0 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10.0 ml of the clear, supernatant liquid to 200.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin.

Nystatin Tablets

Nystatin Tablets contain not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin. The tablets are coated.

Usual strength. 500,000 Units.

Identification

Extract a quantity of the powdered tablets containing 300,000 Units with a mixture of 50 ml of *methanol* and 5 ml of *glacial acetic acid*, add sufficient *methanol* to produce 100 ml and filter. Dilute 1 ml of the filtrate to 100 ml with *methanol*. The resulting solution complies with the follwing test.

When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Disintegration (2.5.1). 30 minutes, but using a 0.6 per cent v/v solution of *hydrochloric acid* in place of *water*. If the tablets fail to disintegrate, wash them rapidly by immersion in *water* and continue the test using *phosphate buffer pH 6.8*; the tablets then disintegrate within a further 30 minutes.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g of the powdered tablets by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 200,000 Units and shake with 50.0 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10.0 ml of the clear, supernatant liquid to 200.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin.

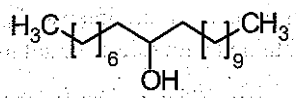
Octyldodecanol



$C_{20}H_{42}O$ Mol. Wt. 298.6

Octyldodecanol is 2-octyl-1-dodecanol.

Octyldodecanol contains not less than 90 per cent of $C_{20}H_{42}O$, the remainder consisting mainly of related alcohols.

Category. Pharmaceutical aid.

Description. A clear, colourless or yellowish, oily liquid.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *ethyl acetate* and 95 volumes of *toluene*.

Test solution. Dissolve 0.2 g of the substance under examination in *toluene* and dilute to 20.0 ml with *toluene*.

Reference solution. A 1.0 per cent w/v solution of *octyldodecanol IPRS* in *toluene*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and spray with about 7 ml of a mixture of 1 volume of a 2.5 per cent w/v solution of *vanillin* in *ethanol (95 per cent)* and 4 volumes of *sulphuric acid* and heat at 130° for 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Acidity or alkalinity. Mix 5.0 g thoroughly for 1 minute with a mixture of 0.1 ml of *bromothymol blue solution*, 2 ml of *heptane* and 10 ml of *water*. If the aqueous layer is blue, not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow. If the aqueous layer is yellow, add 0.45 ml of *0.01 M sodium hydroxide* and shake vigorously. After standing to ensure complete separation, the aqueous layer is blue.

Relative density (2.4.29). About 0.84.

Refractive index (2.4.27). About 1.455.

Optical rotation (2.4.22). – 0.10° to + 0.10°, determined in a 10.0 per cent w/v solution in *ethanol (95 per cent)*.

Hydroxyl value (2.3.27). 175 to 190, using Method A.

Iodine value (2.3.28). Not more than 8.0, using Method A.

Peroxide value (2.3.35). Not more than 5.0.

Saponification value (2.3.37). Not more than 5.0.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 0.4 g of *tetradecane* in *hexane* and dilute to 100.0 ml with *hexane*.

Test solution. Dissolve 0.1 g of the substance under examination in the internal standard solution and dilute to 10.0 ml with the internal standard solution.

Reference solution. A 1.0 per cent w/v solution of *octyldodecanol IPRS* with internal standard solution.

Chromatographic system

- a stainless steel column 60 m x 0.25 mm, packed with poly(dimethyl)(diphenyl)(divinyl)siloxane (film thickness 0.25 µm),
- temperature:
- temperature:

column	Time (in min.)	Temperature (°)
	0 - 2	180
	2 - 22	180→280
	22 - 52	280

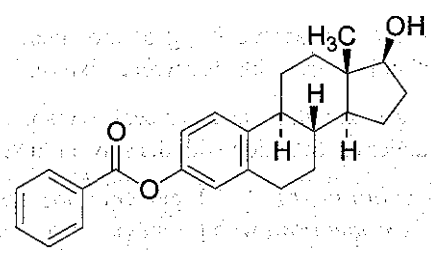
- inlet port at 290° and detector at 300°,
- flame ionization detector,
- flow rate: 0.68 ml per minute, using helium or nitrogen as the carrier gas.
- split ratio: 1:50.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{42}O$.

Storage. Store protected from light.

Oestradiol Benzoate



$C_{25}H_{28}O_3$ Mol. Wt. 376.5

Oestradiol Benzoate is 17β-hydroxyestra-1,3,5(10)-trien-3-yl benzoate.

https://nhathuocngocanh.com/

Oestradiol Benzoate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{25}H_{28}O_3$, calculated on the dried basis.

Category. Oestrogen.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oestradiol benzoate IPRS* or with the reference spectrum of oestradiol benzoate.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b) when examined in daylight and under ultraviolet light at 365 nm.

C. To about 1 mg add 0.5 ml of a 5 per cent w/v solution of *ammonium molybdate* in *sulphuric acid*; a yellowish green colour develops which exhibits an intense green fluorescence when examined under ultraviolet light at 365 nm. Add 1 ml of *sulphuric acid* and 9 ml of *water*; the solution becomes pink with a yellowish fluorescence.

Tests

Specific optical rotation (2.4.22). + 57.0° to + 63.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10.0 ml with the solvent mixture.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100.0 ml with the solvent mixture.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination with the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *oestradiol benzoate IPRS* with the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until odour of the solvent is no longer detectable, heat at 110° for 10 minutes, spray the plate while hot with *ethanolic sulphuric acid (20 per cent)*, heat again at 110° for 10 minutes and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 0.5 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 25 mg in sufficient *ethanol (95 per cent)* to produce 250.0 ml. Dilute 10.0 ml to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 231 nm (2.4.7). Calculate the content of $C_{25}H_{28}O_3$ taking 500 as the specific absorbance at 231 nm.

Storage. Store protected from light and moisture.

Oestradiol Injection

Oestradiol Benzoate Injection

Oestradiol Injection is a sterile solution of Oestradiol Benzoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these. It may contain suitable alcohols.

Oestradiol Benzoate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oestradiol benzoate, $C_{25}H_{28}O_3$.

Usual strength. 1 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *ethyl acetate*.

Test solution. Add 10 ml of *2,2,4-trimethylpentane* to a volume of the injection containing 2 mg of Oestradiol Benzoate and extract with three quantities, each of 10 ml, of *ethanol (70 per cent)*. Wash the combined extracts with 15 ml of *2,2,4-trimethylpentane*, evaporate the ethanolic extract to dryness using a rotary evaporator and dissolve the residue in 2 ml of *chloroform*.

Reference solution. A 0.1 per cent w/v solution of *oestradiol benzoate IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Dilute a measured quantity of the injection containing about 1 mg of Oestradiol Benzoate to 10.0 ml with a mixture of 90 volumes of *cyclohexane* and 10 volumes of *dioxan*.

Test solution (b). Add 1 ml of a solution prepared by dissolving 15 mg of *4-hydroxybenzaldehyde* (internal standard) in 10.0 ml of *dioxan*, adding sufficient *cyclohexane* to produce 100.0 ml (solution A), to a measured quantity of the injection containing about 1 mg of Oestradiol Benzoate and dilute to 10.0 ml with sufficient of a mixture of 90 volumes of *cyclohexane* and 10 volumes of *dioxan*.

Reference solution. Add 10 ml of solution A to 10 mg of *oestradiol benzoate IPRS*, weighed, and dilute to 100.0 ml with the same solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with porous silica particles (10 µm),
- mobile phase: a mixture of 90 volumes of *cyclohexane* and 10 volumes of *dioxan*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject test solution (a) for identification of oestradiol benzoate peak.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to oestradiol benzoate and the internal standard is not less than 1.5.

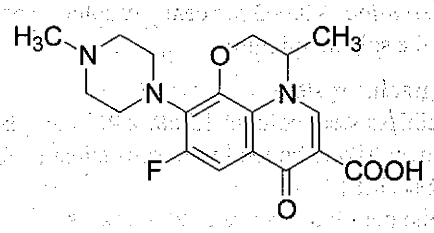
Inject the reference solution and test solution (b).

Calculate the content of $C_{25}H_{28}O_3$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) the nature and composition of the solvent; (2) that it is meant for intramuscular injection only; (3) that any solid matter that may have separated on standing should be redissolved by warming before use.

Ofloxacin



$C_{18}H_{20}FN_3O_4$ Mol. Wt. 361.4

Ofloxacin is (*RS*)-9-fluoro-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7*H*-pyrido[1,2,3,-*de*]-1,4-benzoxazine-6-carboxylic acid.

Ofloxacin contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{18}H_{20}FN_3O_4$, calculated on the dried basis.

Category. Antibacterial.

Description. A pale yellow or bright yellow, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ofloxacin IPRS* or with the reference spectrum of ofloxacin.

Tests

Light absorption. Absorbance at 440 nm (2.4.7), of 0.5 per cent w/v solution in *0.1 M hydrochloric acid* is not more than 0.25.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *ofloxacin IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *phosphate buffer pH 2.4* prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.4 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the column efficiency in not less than 1400 theoretical plates.

Inject reference solution (b) and the test solution. Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

https://nhathuocngocanh.com/

Heavy Metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.3 g in 100 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03614 g of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light and moisture.

Ofloxacin Infusion

Ofloxacin Infusion is a sterile solution of Ofloxacin in 5 per cent Dextrose Injection or in Sodium Chloride Injection.

Ofloxacin Infusion contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 25 mg; 50 mg; 100 mg; 200 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.8 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 0.88 Endotoxin Units per mg of Ofloxacin.

Other tests. Comply with the tests stated under Parenteral Preparation (Infusions).

Assay. Determine by liquid chromatography (2.4.14).

NOTE —Protect the solutions from the light.

Test solution. Measure a volume containing 50 mg of Ofloxacin in 100.0 ml with mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase.

Reference solution. A 0.005 per cent w/v solution of *ofloxacin IPRS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.47 g *sodium 1-hexane sulphonate* in 1000 ml of *water*, add 1 ml of *triethylamine* and adjusted to pH 3.0 with *orthophosphoric acid* and 20 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in infusion.

Ofloxacin Ophthalmic Solution

Ofloxacin Ophthalmic Solution is a sterile aqueous solution of Ofloxacin.

Ofloxacin Ophthalmic Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strength. 0.3 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.2.

Sterility (2.2.11). Comply with the test for sterility.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Phosphate buffer pH 7.3 prepared by dissolving 3.56 g of *disodium hydrogen phosphate* in 1000 ml *water,* adjusted to pH 7.3 using *orthophosphoric acid* or *sodium hydroxide solution.*

Test solution. Dilute a volume of Opthalmic Solution containing 30 mg of Ofloxacin in 100.0 ml of solvent mixture. Dilute 1.0 ml of the solution to 10.0 with the solvent mixture.

Reference solution. A 0.003 per cent w/v solution of *ofloxacin IPRS* with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as TSK GEL),
- mobile phase: a mixture of 20 volumes of *acetonitrile,* 80 volumes of phosphate buffer pH 7.25 prepared by

https://nhathuocngocanh.com/

dissolving 2.54 g of *tetrabutyl ammonium hydrogen sulphate* and 3.56 g of *disodium hydrogen phosphate* in 1000 ml *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light.

Ofloxacin Oral Suspension

Ofloxacin Oral Suspension is a suspension of Ofloxacin in a suitable aqueous vehicle.

Ofloxacin Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 50 mg per 5 ml; 100 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the oral suspension containing 50 mg of Ofloxacin in 25 ml of *glacial acetic acid* with the aid of ultrasound and dilute to 50.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Reference solution. Disperse 50 mg of *ofloxacin IPRS* in 25 ml of *glacial acetic acid* with the aid of ultrasound and dilute to 50.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* anhydrous in 1000 ml of *water*, adjusted to pH 2.4 with *orthophosphoric acid* and 10 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 294 nm,
- Injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{18}H_{20}FN_3O_4$, in the oral suspension.

Storage. Store protected from light and moisture.

Ofloxacin Tablets

Ofloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 200 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloride acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 294 nm (2.4.7). Calculate the content of $C_{18}H_{20}FN_3O_4$ in the medium from the absorbance obtained from a solution of known concentration of *ofloxacin IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{20}FN_3O_4$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Ofloxacin, disperse in 60 ml of *methanol* and dilute to 100.0 ml with *methanol* and filter.

Reference solution (a). A 0.1 per cent w/v solution of *ofloxacin IPRS* in *methanol*.

https://nhathuocngocanh.com/

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *acetonitrile* and 92 volumes of *phosphate buffer* prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.4 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency in not less than 1400 theoretical plates.

Inject reference solution (b) and the test solution. Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of Ofloxacin in 60 ml of *methanol* and dilute to 100 ml with *methanol* and filter.

Reference solution. A 0.025 per cent w/v solution of *ofloxacin IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 92 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusted to pH 2.4 with *orthophosphoric acid* and 8 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light and moisture.

Ofloxacin and Ornidazole Tablets

Ofloxacin and Ornidazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Ofloxacin, $C_{18}H_{20}FN_3O_4$ and Ornidazole $C_7H_{10}ClN_3O_3$.

Usual strength. Ofloxacin 200 mg and Ornidazole 500 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter, discarding the first few ml of filtrate.

Determine by liquid chromatography (2.4.14)

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Weigh about 55 mg of *ornidazole IPRS* and 22 mg of *ofloxacin IPRS* into a 100-ml volumetric flask, add about 60.0 ml of solvent mixture and sonicate to dissolve, make the volume up to the mark with solvent mixture and mix. Dilute 5.0 ml of the solution to 50.0 ml with the dissolution medium.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ and $C_7H_{10}ClN_3O_3$.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{20}FN_3O_4$ and $C_7H_{10}ClN_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of the powdered tablets containing 200 mg of Ofloxacin into a 100-ml volumetric flask add about 10.0 ml *0.1M hydrochloric acid* and sonicate for 15 minutes with shaking and add 30.0 ml of solvent mixture and sonicate for 60 minutes, after sonication cool to room temperature and make the volume up to the mark with solvent mixture and mix. Filter through 0.45 mm filter. Dilute 5.0 ml of the solution to 25.0 ml with solvent mixture.

https://nhathuocngocanh.com/

Reference solution. Weigh and transfer about 50 mg of *ornidazole IPRS* and 20 mg of *ofloxacin IPRS* into a 100-ml volumetric flask. Add about 5.0 ml *0.1M hydrochloric acid* and 50.0 ml of solvent mixture and sonicate to dissolve, make the volume up to the mark with solvent mixture and mix. Dilute 5.0 ml of the solution to 50.0 ml with the *solvent mixture* and mix. Dilute 5.0 ml of the solution to 25.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 15cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 87 volumes of a buffer solution prepared by dissolving 3.07 g *ammonium acetate* and 5.38 g *sodium perchlorate* in 1000 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*, and 13 volumes of *acetonitrile*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency for both the analytes is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 for ofloxacin peak and is not more than 2.5 for ornidazole peak and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram three times the retention time of ofloxacin peak. In the chromatogram obtained with test solution the area of any secondary peak due to ornidazole at Relative retention time about 0.23 and 0.75 is not more than 0.5 times the area of the ornidazole peak in the chromatogram obtained with reference solution (0.5 per cent) and sum of the areas of all the secondary peaks due to ornidazole is not more than the area of the ornidazole peak in the chromatogram obtained with reference solution (1.0 per cent). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the ofloxacin peak in the chromatogram obtained with reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area for the ofloxacin peak in the chromatogram obtained with reference solution (2.0 per cent). Ignore any peak with an area 0.05 times the area of the ofloxacin peak in the chromatogram obtained with reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water*.

Test solution. Weight and powder 20 tablets. Transfer powder containing 200 mg of Ofloxacin into 100-ml volumetric flask add about 10 ml *0.1M hydrochloric acid* and sonicate for 15 minutes with occasional shaking and add 30 ml of solvent mixture and sonicate for 60 minutes, after sonication cool to room temperature and make the volume up to the mark with solvent mixture and mix. Filter through 0.45 µm filter. Dilute 2.0 ml of the solution to 200.0 ml with solvent mixture.

Reference solution. Weigh and transfer accurately about 25 mg of *ofloxacin IPRS* and 62.5 mg of *ornidazole IPRS* into a 250-ml volumetric flask. Add about 5.0 ml *0.1M hydrochloric acid* and 50.0 ml of solvent mixture, sonicate to dissolve. Make the volume up to the mark with solvent mixture and mix. Dilute 5.0 ml of the solution to 25.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column, 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm), (Such as Inertsil ODS-2)
- column temperature: 40°.
- mobile phase: a mixture of 87 volumes of a buffer solution prepared by dissolving 3.07 g *ammonium acetate* and 5.38 g *sodium perchlorate* in 1000 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 13 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

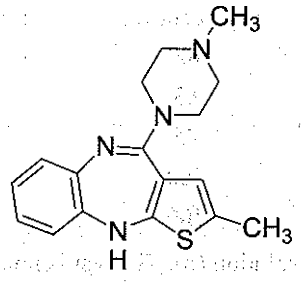
Inject the reference solution. The test is not valid unless the column efficiency for both the principal peaks is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ and $C_7H_{10}ClN_3O_3$ in the tablets.

Storage. Store protected from light and moisture.

Olanzapine



$C_{17}H_{20}N_4S$ Mol. Wt. 312.4

Olanzapine is 2-methyl-4-(4-methyl-1-piperazinyl)-10*H*-thieno[2,3-*b*][1,5]benzodiazepine.

https://nhathuocngocanh.com/

Olanzapine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{20}N_4S$, calculated on the anhydrous basis.

Category. Antipsychotic.

Description. A yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *olanzapine IPRS* or with the reference spectrum of olanzapine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *water* and 60 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 25 ml of solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *olanzapine IPRS* with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 80 volumes of *buffer solution pH 6.8* prepared by dissolving 4.83 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 6.8 with 10 per cent w/v of *sodium hydroxide* and 20 volumes of *acetonitrile*,
  B. *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	63	37
30	45	55
32	100	0
38	100	0

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b)(0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Dissolve 0.2 g in 40 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01562 g of $C_{17}H_{20}N_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Olanzapine Tablets

Olanzapine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olanzapine, $C_{17}H_{20}N_4S$.

Usual strengths. 2.5 mg; 5 mg; 7.5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

NOTE — Protect all the solutions from light.

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Weigh 16 mg of *olanzapine IPRS*, dissolve in about 2.5 ml of *acetonitrile* and dilute to 25 ml with *0.01 M hydrochloric acid*. Dilute suitably to get 0.00016 per cent w/v in dissolution medium.

https://nhathuocngocanh.com/

Chromatographic system as described under Assay, using Injection volume 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency is not less than 2500 theoretical plates.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{20}N_4S$.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{20}N_4S$ in the medium.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in suitable volume of *acetonitrile* (25 per cent of the final volume) and dilute with *0.01 M hydrochloric acid* to obtain a 0.01 per cent w/v solution of Olanzapine.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer 10 intact tablets to a suitable volumetric flask, disperse in a mixture of 25 volumes of *acetonitrile* and 75 volumes of *0.01M hydrochloric acid* and dilute with the same mixture to obtained a solution containing 0.01 per cent w/v of Olanzapine.

Reference solution. Dissolve 10 mg of *olanzapine IPRS* in 25 ml of *acetonitrile* and dilute to 100.0 ml with *0.01 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 3 g of *ammonium dihydrogen orthophosphate* in 900 ml *water*, add 2 ml of *triethylamine* and dilute to 1000 ml with *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 30 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2500 theoretical plates. The relative standard deviation for replicate injections is not more than 2 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{20}N_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Olanzapine and Fluoxetine Tablets

Olanzapine and Fluoxetine Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olanzapine, $C_{17}H_{20}N_4S$ and fluoxetine, $C_{17}H_{18}F_3NO$.

Usual strengths. 5 mg olanzapine and 20 mg fluoxetine;10 mg olanzapine and 20 mg fluoxetine,

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a *sodium acetate* buffer prepared by dissolving 4.1g of *sodium acetate* in 1000 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Dissolve an accurately weighed amount of *olanzapine IPRS* and *fluoxetine hydrochloride IPRS* with the dissolution medium having similar concentration of the test solution.

Use the chromatographic system as described under Assay except injection volume 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

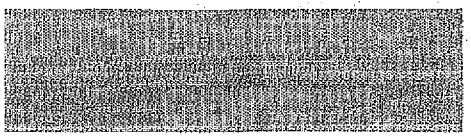
Calculate the content of $C_{17}H_{20}N_4S$ and $C_{17}H_{18}F_3NO$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $C_{17}H_{20}N_4S$ and $C_{17}H_{18}F_3NO$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Disperse one tablet in 60 ml of mobile phase, sonicate for 25 minutes, centrifuge at 2500 rpm for 10 minutes and dilute to 100.0 ml with the mobile phase. Dilute a volume of the solution with the mobile phase to obtain a solution containing 0.002 per cent w/v of olanzapine.



https://nhathuocngocanh.com/

Reference solution (a) A 0.002 per cent w/v solution of *olanzapine IPRS* in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{20}N_4S$ in the tablet.

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, mobile phase, and test solution as described under Assay.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Olanzapine add 60 ml of mobile phase, sonicate for 25 minutes, centrifuge at 2500 rpm for 10 minutes and dilute to 100.0 ml in the mobile phase. Dilute a volume of the solution with the mobile phase to obtain a solution containing 0.002 per cent w/v of olanzapine.

Reference solution (a). A 0.1 per cent w/v solution of *olanzapine IPRS* in the mobile phase.

Reference solution (b). A 0.45 per cent w/v solution of *fluoxetine hydrochloride IPRS* in the mobile phase.

Reference solution (c). Dilute reference solution (a) and (b) with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 7.09 g of *disodium hydrogen phosphate* in 1000 ml of *water*, 30 volumes of *acetonitrile*, 20 volumes of *methanol* and 0.1 volume of *triethylamine* and adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 227 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{17}H_{20}N_4S$ and $C_{17}H_{18}F_3NO$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of fluoxetine.

Oleic Acid

$C_{18}H_{34}O_2$ Mol. Wt. 282.5

Oleic Acid consists mainly of (*Z*)-octadec-9-enoic acid, $C_{18}H_{34}O_2$, together with varying amounts of saturated and other unsaturated fatty acids and is obtained by the hydrolysis of fats or fixed oils and separation of the liquid acids by expression or other suitable means. It may contain a suitable antioxidant.

Category. Pharmaceutical aid (emulsion adjuvant).

Description. A clear, yellowish to pale brown, oily liquid. On exposure to air it darkens in colour.

Identification

A. To 1 ml add 1 ml of *ethanol (95 per cent);* the solution is clear. It turns orange or red on addition of 0.1 ml of *methyl orange solution.*

B. Take a mixture of 1 ml of *nitric acid* and 1 ml of *water* in a test-tube with an internal diameter of about 12.5 mm and add 1 ml of the substance under examination on the surface of the mixture. Introduce 0.5 g of *copper* turnings into the lower layer and allow to stand under a hood for 4 hours; the upper layer solidifies.

C. Complies with the test for Iodine value (2.3.28).

Tests

Weight per ml (2.4.29). 0.889 g to 0.895 g.

Peroxide value (2.3.35). Not more than 10.0.

Acid value (2.3.23). 195 to 202, determined on 0.5 g.

Iodine value (2.3.28). 85 to 95, determined by Method A.

Water-soluble acids. Shake 5 ml with 5 ml of *water* for 2 minutes, allow the liquids to separate and filter the aqueous layer through paper moistened with *water*. To the filtrate add 0.05 ml of *methyl orange solution*; the liquid does not become red.

Neutral fats and mineral oils. Boil 1 ml with 5 ml of *0.5 M sodium carbonate* and 25 ml of *water* in a large flask. The solution, while still hot, is not more opalescent than opalescence standard OS2 (2.4.1).

https://nhathuocngocanh.com/

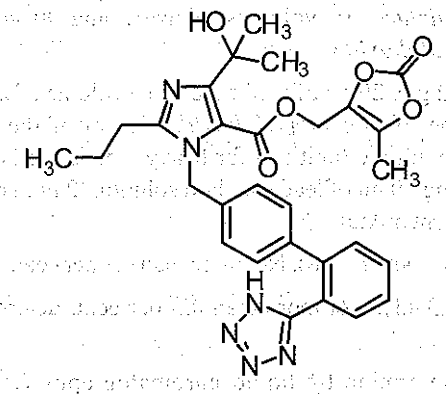
Congealing point. Dry about 10 ml by heating to 110° with frequent stirring, transfer to a test-tube about 20 mm in diameter, cool and when at 15° immerse the tube in a suitable water-bath so that the cooling takes place at the rate of 2° per minute. Stir the sample with a thermometer; it does not become cloudy until the temperature has fallen to 10°. On further cooling it congeals to a white solid or semi-solid mass at about 4°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture in a refrigerator (8° to 15°).

Labelling. The label states the name and concentration of any added antioxidant.

Olmesartan Medoxomil



$C_{29}H_{30}N_6O_6$ Mol.Wt. 558.6

Olmesartan Medoxomil is (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl 4-(1-hydroxy-1-methylethyl)-2-propyl-1-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-1*H*-imidazole-5-carboxylate.

Olmesartan Medoxomil contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{29}H_{30}N_6O_6$, calculated on the anhydrous basis.

Category. Antihypertensive

Production

As Nitrosamines are classified as probable human carcinogens, their presence in olmesartan medoxomil should be avoided or limited as much as possible. For this reason, manufacturers of olmesartan medoxomil for human use are expected to perform an assessment of the risk of *N*-nitrosamine formation and contamination during their manufacturing process; if this assessment identifies a potential risk, the manufacturing process should be modified to minimise contamination and a control strategy implemented to detect and control *N*-nitrosamine impurities in olmesartan medoxomil. The general chapter 5.11. Nitrosamine Impurities is available to assist manufacturers.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *olmesartan medoxomil IPRS* or with the reference spectrum of olmesartan medoxomil.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve about 25 mg of the substance under examination in *acetonitrile* and dilute to 25.0 ml with *acetonitrile*.

Test solution (b). Dissolve 25 mg of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 50.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution (b). A 0.05 per cent w/v solution of *olmesartan medoxomil IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture 80 volumes of buffer solution prepared by dissolving 2.04 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 3.4 with *orthophosphoric acid* and 20 volumes of *acetonitrile*,

  B. a mixture of 20 volumes of buffer solution and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	75	25
35	0	100
45	0	100
48	75	25

https://nhathuocngocanh.com/

Name	Relative retention time
Olmesartan medoxomil impurity A[1]	0.2
Olmesartan medoxomil impurity B[2]	0.7
Olmesartan medoxomil (Retention time about 10 minutes)	1.0
Olmesartan medoxomil impurity C[3]	1.5

[1]4-(1-hydroxy-1-methylethyl)-2-propyl-1-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-1*H*-imidazole-5-carboxylic acid (olmesartan),

[2]6,6-dimethyl-2-propyl-3-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-3,6-dihydro-4*H*-furo[3,4-*d*]imidazol-4-one,

[3](5-methyl-2-oxo-1,3-dioxol-4-yl)methyl 4-(1-methylethenyl)-2-propyl-1-[[2'-(1*H*- tetrazol-5-yl)biphenyl-4-yl]methyl]-1*H*-imidazole-5-carboxylate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak due to olmesartan medoxomil impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any peak corresponding to olmesartan medoxomil impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a). (0.3 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Acetone. Not more than 0.6 per cent.

Determine by gas chromatography (2.4.13).

Internal standard solution. Dilute 1.0 ml of *butanol* to 100.0 ml with *dimethylsulphoxide*.

Test solution. Dissolve 0.25 g the substance under examination in *dimethylsulphoxide*, add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *dimethylsulphoxide*.

Reference solution. Dilute 0.5 ml of *acetone* to 200.0 ml with *dimethylsulphoxide*. Dilute 15.0 ml of the solution to 100.0 ml with *dimethylsulphoxide*. To 25.0 ml of the solution add 10.0 ml of the internal standard solution and dilute to 50.0 ml with *dimethylsulphoxide*.

Chromatographic system

- a fused silica column 30 m x 0.53 mm, coated with macrogol 20 000 (1 µm),
- temperature:

column	time (in min.)	temperature (°)
	5	50
	5 – 18	50-180
	18 – 23	180

- inlet port at 200° and detector at 200°,
- split ratio: 1:5,
- flow rate: 4 ml per minute, using nitrogen or helium as the carrier gas.

Head-space injection conditions:

- equilibration time: 30 minutes,
- equilibration temperature: 80°,

Inject 1 ml of each solution.

Calculate the content of acetone, taking its relative density to be 0.79 at 20°.

Heavy metals (2.3.13).

Solvent mixture. 10 volumes of *water* and 90 volume of *dimethylsulphoxide*

Dissolve 2 g in 20 ml of a mixture of 10 volume of *water* and 90 volume of *dimethylsulphoxide*. 12 ml of the solution complies with the limit test for heavy metals Method D (20 ppm), using 10 ml of lead standard solution (2 ppm pb) in the same solvent mixture.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Chromatographic system

- mobile phase. a mixture of 75 volumes of mobile phase A and 25 volume of mobile phase B.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{29}H_{30}N_6O_6$.

Olmesartan Medoxomil Tablets

Olmesartan Medoxomil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olmesartan medoxomil, $C_{29}H_{30}N_6O_6$.

Usual strengths. 20 mg; 40 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution correspond to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Dissolution (2.5.2)

NOTE — Prepare the solution immediately before use.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Dissolve a quantity of *olmesartan medoxomil IPRS* in *acetonitrile* and dilute with the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{30}N_6O_6$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{29}H_{30}N_6O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared test solution.

Solvent mixture. Equal volumes of *acetonitrile* and buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* add 1 ml of *triethylamine,* adjusted to pH 2.5 with *orthophosphoric acid.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Olmesartan Medoxomil in 100 ml of the solvent mixture, with the aid of ultrasound for 20 minutes, and dilute to 200.0 ml with the solvent mixture and filter.

Reference solution. A 0.00025 per cent w/v solution of *olmesartan medoxomil IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS 3V),
- mobile phase: a mixture of 65 volumes of buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* add 1 ml of *triethylamine,* adjusted to pH 2.5 with *orthophosphoric acid* and 35 volumes of *acetonitrile.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The relative retention time of olmesartan with respect to olmesartan medoxomil is 0.26 and the correction factor is 0.83.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to olmesartan impurity A is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks other than olmesartan impurity A peak is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* add 1 ml of *triethylamine.* adjusted to pH 2.5 with *orthophosphoric acid* .

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 200 mg of Olmesartan Medoxomil in 150 ml of the solvent mixture, with the aid of ultrasound for 20 minutes, and dilute to 250.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *olmesartan medoxomil IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS 3V),
- mobile phase: a mixture of 55 volumes of buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* add 1 ml of *triethylamine.* adjusted to pH 2.5 with *orthophosphoric acid* and 45 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_{29}H_{30}N_6O_6$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Olmesartan Medoxomil and Hydrochlorothiazide Tablets

Olmesartan Medoxomil and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olmesartan medoxomil, $C_{29}H_{30}N_6O_6$ and hydrochlorothiazide $C_7H_8ClN_3O_4S$.

Usual strengths. Olmesartan Medoxomil 20 mg and Hydrochlorothiazide 12.5 mg; Olmesartan Medoxomil 40 mg and Hydrochlorothiazide 12.5 mg; Olmesartan Medoxomil 40 mg and Hydrochlorothiazide 25 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

NOTE — The solutions should be used within 3 hours of preparation.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 50 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 2.2 with *orthophosphoric acid* and 50 volumes of *acetonitrile.*

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution (a). Dissolve a quantity of *olmesartan medoxomil IPRS* in the solvent mixture and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Reference solution (b). Dissolve a quantity of *hydrochlorothiazide IPRS* in the solvent mixture and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Reference solution (c). Dilute a volume of reference solution (a) and reference solution (b) with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 2.2 with *orthophosphoric acid,* 30 volumes of *acetonitrile* and 5 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Q. Not less than 75 per cent of the stated amount of olmesartan medoxomil, $C_{29}H_{30}N_6O_6$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of hydrochlorothiazide in 160 ml of the mobile phase, with the aid of ultrasound for 25 minutes and dilute to 200.0 ml with the mobile phase, centrifuge at 2500 rpm for 15 minutes. Dilute 5.0 ml of supernatant to 50.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *olmesartan medoxomil IPRS* in the mobile phase.

Reference solution (b). A 0.07 per cent w/v solution of *hydrochlorothiazide IPRS* in the mobile phase.

Reference solution (c). Dilute 4.0 ml of reference solution (a) and 2.0 ml of reference solution (b) to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 1 ml of *triethylamine* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

The retention time of hydrochlorothiazide peak is about 4.2 minutes and olmesartan medoxomil is about 15 minutes.

https://nhathuocngocanh.com/

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 50 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid* and 50 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 125 mg of Hydrochlorothiazide in to 200-ml volumetric flask, add about 120 ml of the solvent mixture and sonicate for about 30 minutes with occasional shaking. Cool the solution to room temperature and make the volume up to the mark with solvent mixture and mix. Filter the test solution with 0.45 µ Nylon membrane filter. Dilute 2.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution (a). A 0.04 per cent w/v solution of *olmesartan medoxomil IPRS* in solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *hydrochlorothiazide IPRS* in solvent mixture.

Reference solution (c). Dilute a volume of reference solution (a) and (b) with solvent mixture to obtain a solution having known concentration similar to the concentration of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.2 with *orthophosphoric acid*, 30 volumes of *acetonitrile* and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl

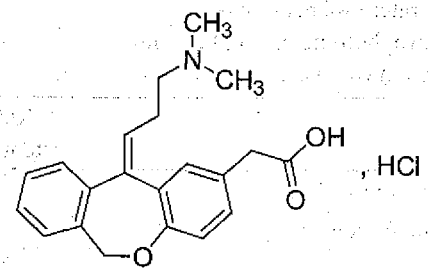
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{29}H_{30}N_6O_6$ and $C_7H_8ClN_3O_4S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Olopatadine Hydrochloride



$C_{21}H_{23}NO_3,HCl$ Mol. Wt. 373.9

Olopatadine Hydrochloride is 11-[(*Z*)-3-(Dimethylamino) propylidene]-6,11-dihydrodibenz[*b*,*e*]oxepin-2-acetic acid, hydrochloride.

Olopatadine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{23}NO_3,HCl$, calculated on dried basis.

Category. Antihistamine.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *olopatadine hydrochloride IPRS* or with the reference spectrum of olopatadine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 4.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A solution containing 0.02 per cent w/v of *olopatadine hydrochloride IPRS* and 0.002 per cent w/v of *olopatadine impurity B IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 72 volumes of a buffer solution prepared by dissolving 13.6 g of *monobasic potassium phosphate* in *water* and dilute to 1000 ml with same solvent, add 1 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 28 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 299 nm,
- injection volume: 30 µl.

Name	Relative retention time
α-Hydroxy olopatadine[1]	0.4
Olopatadine *E*-isomer[2]	0.7
Olopatadine	1.0
Olopatadine Impurity B[3]	1.2

[1](Z)-2-{11-[3-(Dimethylamino)propylidene]-6,11-dihydrodibenz[b,e]oxepin-2-yl}-2-hydroxyacetic acid,

[2][11-[(E)-3-(Dimethylamino)propylidene]-6,11-dihydrodibenz[b,e]oxepin-2-acetic acid,

[3](Z)-3-{2-(Carboxymethyl)dibenzo[b,e]oxepin-11(6H)-ylidene}-*N*,*N*-dimethylpropan-1-amine oxide.

Inject the reference solution. Run the chromatogram 2.5 times the retention time of principal peak. The test is not valid unless the resolution between the peaks due to olopatadine and olopatadine impurity B is not less than 2.0, the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent for the principal peak.

Inject the test solution. The area of peak corresponding to α-hydroxy olopatadine is not more than the 0.2 per cent, the area of peak corresponding to olopatadine *E*-isomer, multiplied with correction factor 0.77 is not more than 0.1 per cent. The area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 0.25 per cent, calculated by area normalization.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.3 per cent, determined by drying in an oven at 105° for 1 hour.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances test with the following modifications.

Test solution. Dissolve about 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *olopatadine hydrochloride IPRS* in the mobile phase.

Inject the reference solution.The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_3$,HCl.

Storage. Store protected from light, at a temperature not exceeding 30°.

Olopatadine Ophthalmic Solution

Olopatadine Hydrochloride Ophthalmic Solution

Olopatadine Hydrochloride Ophthalmic Solution is a sterile aqueous solution of olopatadine hydrochloride. It may contain suitable antimicrobial agents.

Olopatadine Hydrochloride Ophthalmic Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olopatadine, $C_{21}H_{23}NO_3$.

Usual strengths. 0.1 per cent w/v; 0.2 per cent w/v; 0.5 per cent w/v; 1.0 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 8.0.

Related substances. A. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of ophthalmic solution to obtain a solution containing 0.02 per cent w/v of olopatadine in the mobile phase.

Reference solution (a). A solution containing 0.022 per cent w/v of *olopatadine hydrochloride IPRS* and 0.002 per cent of *olopatadine impurity B IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.022 per cent w/v of *olopatadine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 28 volumes of *acetonitrile*, 72 volumes of buffer prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1000 ml *water*, add 1 ml of *triethylamine* and mix, adjusted to pH 3.0 with *orthophosphoric acid*
- flow rate: 1 ml per minute,
- spectrophotometer set at 299 nm,
- injection volume: 30 µl.

Inject reference solution (a) and (b). Run the chromatogram 1.6 times the retention time of the principal peak. The test is not valid unless the resolution between the peaks due to olopatadine and olopatadine impurity B is not less than 2.0 obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for principal peak obtained with reference solution (b).

Inject the test solution. In the chromatogram obtained with the test solution, the area of any peak due to olopatadine *E*-isomer is not more than 0.5 per cent. The area of any peak due to olopatadine impurity B is not more than 2.0 per cent. The area of any peak due to olopatadine carbaldehyde is not more than 0.5 per cent and area of any other secondary peak is not more than 0.5 per cent calculated by area normalisation. Ignore any peak at relative retention time more than 1.5.

Name	Relative retention time	Correction factor
Olopatadine *E*-isomer[1]	0.7	0.77
Olopatadine	1.0	---
Olopatadine Impurity B[2]	1.2	1.0
Olopatadine carbaldehyde[3]	1.3	0.22

[1]11-[(E)-3-(Dimethylamino)propylidene]-6,11-dihydrodibenz[b,e] oxepin-2-acetic acid,

[2](Z)-3-{2-(Carboxymethyl)dibenzo[b,e]oxepin-11(6H)-ylidene}-*N*,*N*-dimethylpropan-1-amine oxide,

[3](Z)-11-[3-(Dimethylamino)propylidene]-6,11-dihydrodibenzo[b,e] oxepine-2-carbaldehyde.

B. Determine by liquid chromatography (2.4.14), as described under Related substances test (A) with the following modifications.

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of ophthalmic solution to obtain a solution containing 0.02 per cent w/v of olopatadine in the mobile phase.

Reference solution (a). A solution containing 0.0022 per cent w/v of *olopatadine hydrochloride IPRS* and 0.001 per cent *olopatadine impurity C IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v of *olopatadine impurity C IPRS* (11-Oxo-6,11-dihydrodibenzo[b,e] oxepin-2-yl acetic acid) in the mobile phase.

- mobile phase: equal volumes of *acetonitrile* and buffer prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1000 ml *water*, add 1 ml of *triethylamine* and mix, adjusted to pH 3.0 with *orthophosphoric acid.*

Inject reference solution (a) and (b). Run the chromatogram 3 times the retention time of the olopatadine impurity C. The test is not valid unless the resolution between the peaks due to olopatadine and olopatadine impurity C is not less than 7.0 obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for principal peak obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to olopatadine impurity C is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of olopatadine impurity C, olopatadine *E*-isomer, olopatadine carbaldehyde and all other impurities found in the related substances test A and related substances test B is not more than 3.0 per cent. Ignore any peak at a relative retention time less than 0.7 with respect to the principal peak in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances test (A) with the following modifications.

NOTE — Protect the solutions from light.

Test solution. Dilute a volume of ophthalmic solution to obtain a solution containing 0.01 per cent w/v of Olopatadine in the mobile phase.

Reference solution. A solution containing 0.011 per cent w/v of *olopatadine hydrochloride IPRS* in the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_3$.

Storage. Store protected from light and moisture, at a temperature between 4° to 25°.

Labelling. The label states the strength in terms of the equivalent amount of olopatadine.

https://nhathuocngocanh.com/

Olopatadine Tablets

Olopatadine Hydrochloride Tablets

Olopatadine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olopatadine hydrochloride, $C_{21}H_{23}NO_3$,HCl.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Dissolve a quantity of *olopatadine hydrochloride IPRS* in the dissolution medium to obtain a solution of concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 72 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* or *triethylamine* and 28 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{21}H_{23}NO_3$,HCl.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 60 ml of the mobile phase, with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with the mobile phase. Dilute further, if necessary, with the mobile phase, centrifuge at 2500 rpm for 10 minutes and use the supernatant liquid.

Calculate the content of $C_{21}H_{23}NO_3$,HCl in the tablet.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powder containing 25 mg of Olopatadine Hydrochloride with 60 ml of mobile phase, ultrasound for 10 minutes, and dilute to 100.0 ml with the mobile phase. Centrifuge at about 2500 rpm for 10 minutes, and dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Use the chromatographic conditions as described under Dissolution.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of area of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Olopatadine Hydrochloride with 60 ml of mobile phase, ultrasound for 10 minutes, and dilute to 100.0 ml with the mobile phase. Centrifuge at about 2500 rpm for 10 minutes, and dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. Dissolve 25 mg of *olopatadine hydrochloride IPRS* in 15 ml of mobile phase and dilute to 50.0 ml with mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Use the chromatographic condition as described under Dissolution.

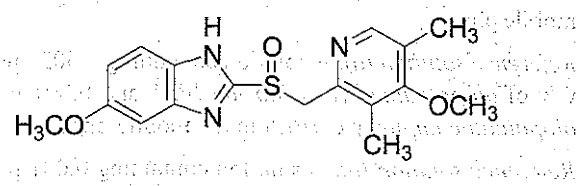
Inject the reference solution. The test is not valid unless the column efficiency in not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_3$,HCl in tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Omeprazole



$C_{17}H_{19}N_3O_3S$ Mol. Wt. 345.4

https://nhathuocngocanh.com/

Omeprazole is 5-methoxy-2-[[(4-methoxy-3,5-dimethyl-pyridin-2-yl)methyl]sulfinyl]-1*H*-benzimidazole.

Omeprazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{19}N_3O_3S$, calculated on the dried basis.

NOTE — Perform the tests and assay in subdued light and use low-actinic glassware.

Category. Antiulcerative (proton pump inhibitor).

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *omeprazole IPRS* or with the reference spectrum of omeprazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 276 nm and 305 nm; the ratio of the absorbance at about 305 nm to that at about 276 nm, 1.6 to 1.8.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *dichloromethane* is clear (2.4.1).

Light absorption (2.4.7). Absorbances of a freshly prepared 2.0 per cent w/v solution in *dichloromethane* at 400 nm, 500 nm and 600 nm are not more than 0.25, 0.10 and 0.10 respectively.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 3 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.01 per cent w/v each of *omeprazole IPRS* and *omeprazole sulphone IPRS (omeprazole impurity A IPRS)* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of and 73 volumes of a buffer solution prepared by dissolving 0.14 per cent w/v solution of *disodium hydrogen phosphate*, previously adjusted to pH 7.6 with *orthophosphoric acid* and 27 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 40 µl.

The relative retention time with reference to omeprazole for omeprazole impurity E (4-methoxy-2-[[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulphinyl]methyl]-3,5- dimethylpyridine 1-oxide) is about 0.6 and for omeprazole impurity D is about 0.8.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to omeprazole impurity D and the principal peak is not less than 3.0.

Inject reference solution (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to omeprazole impurities D and E, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent) and the sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). The residue obtained in the test for Sulphated ash, complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

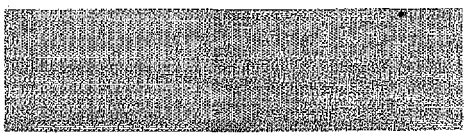
Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *omeprazole IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate buffer pH 7.4* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.



https://nhathuocngocanh.com/

Inject the reference solution. Repeat the procedure at least five times and measure the peak responses of the peak due to omeprazole. The relative standard deviation of the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$.

Storage. Store protected from light and moisture in a refrigerator (2° to 8°).

NOTE — A combination of elevated temperatures (37° to 50°) and high humidity degrades Omeprazole. It rapidly degrades under acidic conditions.

Omeprazole Gastro-resistant Capsules

Omeprazole Capsules

Omeprazole Gastro-resistant Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of omeprazole, $C_{17}H_{19}N_3O_3S$. They are made gastro-resistant by enteric-coating or by other means.

NOTE — Perform the tests and assay in subdued light and use low-actinic glassware.

Usual strength. 20 mg.

Identification

A. To a quantity of the contents of the capsules containing 50 mg of Omeprazole in a 100-ml volumetric flask add about 70 ml of *0.1 M sodium hydroxide*. Mix in an ultrasonic bath for about 5 minutes and heat on a water-bath for 10 minutes. Cool, make up to volume with *0.1 M sodium hydroxide* and filter. Dilute 2.0 ml of the filtrate to 100.0 ml with *0.1 M sodium hydroxide*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 276 nm and 305 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to omeprazole in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely without any loss of residue. Transfer the residue into 100-ml volumetric flask, dissolve in 20 ml of *0.1M sodium hydroxide*, with the aid of ultrasound and make up the volume with *0.1M sodium hydroxide*. Centrifuge at about 3000 rpm for 10 minutes. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *omeprazole IPRS* in *0.1M sodium hydroxide*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ released in the acid medium by subtracting the content of $C_{17}H_{19}N_3O_3S$ in the test solution from the total content of Omeprazole $C_{17}H_{19}N_3O_3S$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 45 minutes.

Transfer another 6 capsules and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the residue, add phosphate buffer pH 6.8 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. To 5.0 ml of the filtrate, add immediately 1.0 ml of *0.1M sodium hydroxide*.

Reference solution. A 0.055 per cent w/v solution of *omeprazole IPRS* in *0.1M sodium hydroxide*. Dilute 2.0 ml of the solution to 50.0 ml with the dissolution medium. To 5.0 ml of the solution, add immediately 1.0 ml of *0.1M sodium hydroxide*.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$.

Other tests. Comply with the tests stated under Capsules.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 0.5 g of the contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Weigh and transfer the granules containing about 20 mg of Omeprazole to a 100-ml volumetric flask, add 20 ml of *0.1 M sodium*

https://nhathuocngocanh.com/

hydroxide, mix with the aid of ultrasound and dilute to volume with *0.1 M sodium hydroxide*. Centrifuge for 5 minutes and dilute 5.0 ml of the clear supernatant liquid to 50.0 ml with the mobile phase.

Reference solution. Take 20 mg of *omeprazole IPRS* in 100-ml volumetric flask, add 20.0 ml of *0.1 M sodium hydroxide*, shake vigorously for 5 minutes and dilute to volume with *0.1 M sodium hydroxide*. Dilute 5.0 ml of the solution with the mobile phase to produce 50.0 ml.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate buffer pH 7.4* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation of the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the capsules.

Storage. Store protected from light and moisture.

Omeprazole and Domperidone Capsules

Omeprazole and Domperidone Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of omeprazole $C_{17}H_{19}N_3O_3S$ and domperidone $C_{22}H_{24}ClN_5O_2$.

Usual strength. Domperidone, 10 mg and Omeprazole, 20 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Domperidone —

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Weigh 20 mg of *domperidone IPRS*, transfer to a 200-ml volumetric flask, dissolve and dilute to volume with *methanol*. Dilute 2.0 ml of the solution to 20.0 ml with the dissolution medium.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{24}ClN_5O_2$.

Omeprazole —

A. Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely without any loss of residue. Transfer the residue into 100-ml volumetric flask, dissolve in 20 ml of *0.1 M sodium hydroxide*, with the aid of ultrasound and make up the volume with *0.1 M sodium hydroxide*. Centrifuge at about 3000 rpm for 10 minutes. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *omeprazole IPRS* in *0.1 M sodium hydroxide*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ released in the acid medium by subtracting the content of $C_{17}H_{19}N_3O_3S$ in the test solution from the total content of Omeprazole $C_{17}H_{19}N_3O_3S$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

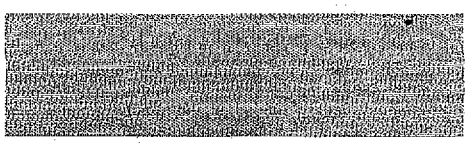
B. Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 45 minutes.

Transfer another 6 capsules and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the residue, add phosphate buffer pH 6.8 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. To 5.0 ml of the filtrate, add immediately 1.0 ml of *0.1 M sodium hydroxide*.

Reference solution. A 0.055 per cent w/v solution of *omeprazole IPRS* in *0.1 M sodium hydroxide*. Dilute 2.0 ml of



https://nhathuocngocanh.com/

the solution to 50.0 ml with the dissolution medium. To 5.0 ml of the solution, add immediately 1.0 ml of *0.1M sodium hydroxide*.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$.

Uniformity of content. Complies with the test stated under capsules.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Assay.

Test solution. Disperse one capsules in 60 ml of solvent mixture, sonicate for 45 minutes, and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *domperidone IPRS* in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}ClN_5O_2$ in the capsule.

Other tests.Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14)

Solvent mixture.A mixture of 20 volumes of *water*, 40 volumes of *methanol* and 40 volumes of *acetonitrile*.

Test solution. Shake a quantity of the mixed contents of 20 capsules containing 40 mg of Omeprazole in 50 ml of the solvent mixture for 10 minutes and dilute to 100.0 ml with the solvent mixture and filter. Dilute 5.0 ml of the filtrate to 10.0 ml with the solvent mixture.

Reference solution. Weigh 40 mg of *omeprazole IPRS* and 20 mg of *domperidone IPRS*, transfer to a 200-ml volumetric flask, dissolve in the solvent mixture and dilute to volume with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 1.4 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

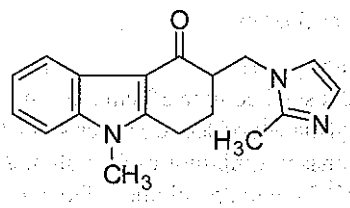
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{17}H_{19}N_3O_3S$ and $C_{22}H_{24}ClN_5O_2$ in the capsules.

Storage. Store protected from light and moisture.

Ondansetron



$C_{18}H_{19}N_3O$ Mol. Wt. 293.4

Ondensetron is 1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-4*H*-carbazol-4-one.

Ondansetron contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{19}N_3O$, calculated on the anhydrous basis.

Category. Antiemetic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ondansetron IPRS* or with the reference spectrum of ondansetron.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Ondansetron impurity D. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.00005 per cent w/v solution of *1, 2, 3, 9-tetrahydro-9- methyl-3-methylene-4H-carbazol-4-one IPRS (ondansetron impurity D IPRS)* in the mobile phase.

Reference solution (b). A solution containing 0.00005 per cent w/v of *ondansetron impurity D IPRS* and 0.0001 per cent w/v of *1,2,3,9-tetrahydro-9-methyl-4H –carbazol-4-one IPRS (ondansetron impurity C IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (3 to 10 µm),

https://nhathuocngocanh.com/

- column temperature: 30°,
- mobile phase: a mixture of 80 volumes of phosphate buffer pH 5.4 prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 5.4 with *1 M sodium hydroxide* and dilute to 1000ml with *water* and 20 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 328 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between ondansetron impurity C and ondansetron impurity D is not less than 1.5. The relative retention time with reference to ondansetron impurity D for ondansetron impurity C is about 0.8.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to ondansetron impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), including ondansetron impurity D.

Chlorides (2.3.12). To 1 g of substance under examination, add 30 to 40 ml of *water* and warm gently, if necessary. Mix and pass through a filter paper that gives a negative test for chloride. Add 1 ml of *nitric acid* and 1 ml of *silver nitrate TS*. Dilute with *water* to 50 ml. Mix and allow to stand for 5 minutes protected from direct sunlight. Any turbidity formed is not more than that produced in a similarly treated control solution containing 0.3 ml of *0.02 M hydrochloric acid* (0.02 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 45 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.009 per cent w/v solution of *ondansetron IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.009 per cent w/v of *ondansetron IPRS* and 0.005 per cent w/v of *ondansetron impurity A IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (3 to 10 µm),
- column temperature: 30°,
- mobile phase: a mixture of 52 volumes of phosphate buffer pH 5.4 prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 5.4 with *1M sodium hydroxide* and 48 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

The relative retention times with reference to ondansetron for ondansetron impurity A is about 1.1.

Inject reference solution (b). The test is not valid unless the resolution between ondansetron impurity A and ondansetron is not less than 1.5.

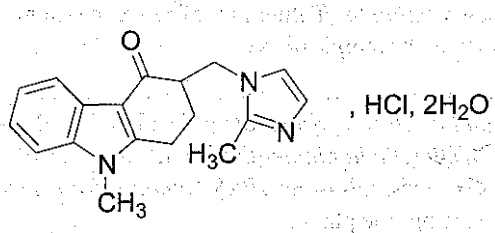
Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$.

Storage. Store protected from light, at a temperature not exceeding 30°.

Ondansetron Hydrochloride



$C_{18}H_{19}N_3O, HCl, 2H_2O$ Mol. Wt. 365.9

Ondansetron Hydrochloride is (*RS*)-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-1,2,3,9-tetrahydro-4*H*-carbazol-4-one hydrochloride dihydrate.

Ondansetron Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{19}N_3O,HCl$, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Antiemetic. (5-HT_3 receptor antagonist)

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *ondansetron hydrochloride IPRS* or with the reference spectrum of ondansetron hydrochloride.

B. It gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, as described under Assay using the test solution, reference solution (b), reference solution (c) and system suitability criteria for resolution.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 9.0 to 10.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride IPRS* and 0.002 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one IPRS* (*ondansetron impurity A IPRS*) in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) with chemically bonded nitrile groups (Such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to pH 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$,HCl.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ondansetron Injection

Ondansetron Hydrochloride Injection

Ondansetron Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strength. 2 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.3 to 4.0.

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, test solution and reference solution (b) described under Assay.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (b) (1.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 9.9 Endotoxin Units per mg of ondansetron.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer a measured volume of the injection containing about 2 mg of ondansetron to a 25-ml volumetric flask, dilute to volume with the mobile phase and mix.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride IPRS* and 0.005 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one IPRS (ondansetron impurity A IPRS)* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with porous silica (5 µm) bonded to nitrile groups (Such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to pH 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ondansetron.

Ondansetron Orally Disintegrating Tablets

Ondansetron Orally Disintegrating Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strengths. 4 mg; 8 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). Not more than 30 seconds.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid.*
Speed and time. 50 rpm and 10 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{18}H_{19}N_3O$ in the medium from the absorbance obtained by using a solution of known concentration of *ondansetron IPRS* in same medium.

Q. Not less than 80 per cent of the stated amount of $C_{18}H_{19}N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 40 mg of ondansetron with 100.0 ml of the mobile phase. Centrifuge a portion of the solution at 3000 rpm for 10 minutes. Use the supernatant.

Reference solution (a). A 0.004 per cent w/v solution of *1,2,3,9-tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one IPRS (ondansetron impurity D IPRS)* in *acetonitrile.*

Reference solution (b). A 0.004 per cent w/v solution of *2-methylimidazole* in *acetonitrile.*

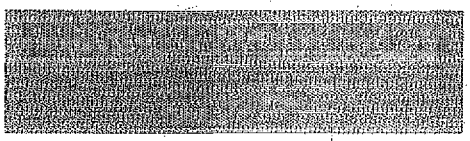
Reference solution (c). A 0.004 per cent w/v solution of *ondansetron IPRS* in *acetonitrile.*

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 10.0 ml of reference solution (d) to 100.0 ml with the mobile phase.

Reference solution (f). Transfer 5.0 ml of each reference solution (a), (b) and (c) to a 100-ml volumetric flask, dilute to volume with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica chemically bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 80 volumes of phosphate buffer prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 5.4 with *1 M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,



https://nhathuocngocanh.com/

- spectrophotometer set at 216 nm,
- injection volume: 20 µl.

The relative retention time with reference to ondansetron for 2-methylimidazole is about 0.16 and for ondansetron impurity D is about 0.45.

Inject reference solution (e) and (f). The test is not valid unless the resolution between ondansetron and adjacent peak is not less than 1.5, the theoretical plates is not less than 8000 for ondansetron and tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (f). In the chromatogram obtained with reference solution (e), the signal to noise ratio for the ondansetron peak is not less than 15.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to 2-methylimidazole, multiplied with correction factor 1.89, is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.15 per cent), the area of the peak corresponding to ondansetron impurity D, multiplied with correction factor 0.77, is not more than 0.24 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.12 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent) and sum of areas of all the secondary peaks is not more than the area of principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Carry out the procedure described under Assay but using the following test solution.

Test solution. Disperse 1 tablet in *0.01 M hydrochloric acid* and filter, dilute if necessary, to 100.0 ml with *0.01 M hydrochloric acid* and filter.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablet.

Other tests. Comply with the tests stated under tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 40 mg of ondansetron with about 60 ml of 0.01 *M hydrochloric acid* with the aid of ultrasound for about 10 minutes and dilute to 100.0 ml. Filter through polypropylene membrane of 0.45 µm pore size. Discard first few ml of the filtrate. Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.004 per cent w/v solution of *ondansetron IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.014 per cent w/v solution of *3[Dimethylamino methyl]-1,2,3,9-tetrahydro-9-methyl-H-carbozol-4-one-IPRS (ondansetron impurity A IPRS)* in *0.01 M hydrochloric acid*.

Reference solution (c). Transfer 8.0 ml each of reference solution (a) and (b) to 50-ml volumetric flask and dilute to volume with *0.01 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 52 volumes of 0.272 per cent w/v solution of *monobasic potassium phosphate*, adjusted to pH 5.4 with *1 M sodium hydroxide* and 48 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

The relative retention time with reference to ondansetron for ondansetron impurity A is about 1.1.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to ondansetron and ondansetron impurity A is not less than 1.5 and the tailing factor is not more than 2.0 for ondansetron peak.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablets.

Storage. Store protected form light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the active ingredient in terms of equivalent amount of ondansetron.

Ondansetron Oral Solution

Ondansetron Hydrochloride Oral Solution

Ondansetron Oral Solution is a solution of Ondansetron Hydrochloride in a suitable vehicle.

Ondansetron Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strengths. 2 mg per 5 ml; 4 mg per 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 50 volumes of *ethyl acetate*, 40 volumes of *methanol* and 1 volume of *ammonium hydroxide*.

Test solution. Dilute a measured volume of the oral solution containing about 20 mg of ondansetron to 100.0 ml in a mixture of 50 volumes of *methanol* and 50 volumes of *water*.

https://nhathuocngocanh.com/

Reference solution. A 0.025 per cent w/v solution of *ondansetron hydrochloride IPRS* in *methanol*.

Apply 10 µl of each solution. Allow the solvent front to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The chromatogram obtained with the test solution corresponds to that obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.3 to 4.0.

Ondansetron impurity D. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of oral solution to obtain a solution having a concentration of 0.02 per cent w/v of ondansetron in the mobile phase.

Reference solution (a). A 0.000025 per cent w/v solution of *1,2,3,9-tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one IPRS* (*ondansetron impurity D IPRS*) in the mobile phase.

Reference solution (b). A solution containing 0.000025 per cent w/v of *ondansetron impurity D IPRS* and 0.0001 per cent w/v of *N-methyl[2-(2-methylbenzhydryloxy)ethyl]amine hydrochloride IPRS (ondansetron impurity C IPRS)* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 80 volumes of *0.02 M monobasic potassium phosphate*, previously adjusted to pH 5.4 and 20 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 328 nm,
- injection volume: 40 µl.

Inject reference solution (b). The test is not valid unless the resolution between ondansetron impurity D and ondansetron impurity C is not less than 2.0, the tailing factor for ondansetron impurity D is not more than 2.0 and the relative standard deviation for replicate injections is not more than 4.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of ondansetron impurity D in the oral solution.

Related substances. Determined by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Dilute a volume of oral solution containing 4 mg of Ondansetron to 50.0 ml with the mobile phase and mix.

The relative retention time with reference to ondansetron for ondansetron impurity D is about 0.34, for imidazole is about 0.4, for 2-methyl imidazole is about 0.53, for des-C-methyl ondansetron hydrochloride is about 0.62, for *N*-desmethyl ondansetron maleate is about 0.83, for ondansetron impurity A is about 1.2.

Inject reference solution (b) and (c). The test is not valid unless the resolution between ondansetron impurity A and ondansetron is not less than 1.5 in the chromatogram obtained with reference solution (c) and in the chromatogram obatined with reference solution (b), the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to imidazole, 2-methyl imidazole, des-(-methyl) ondansetron hydrochloride, N- desmethyl ondansetron maleate, ondansetron impurity A is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and sum of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

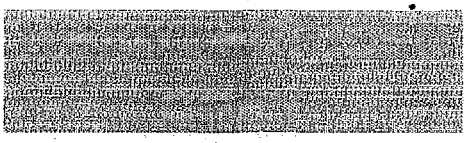
Test solution. Dilute a volume of the oral solution containing 8 mg of ondansetron to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride IPRS* and 0.002 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one IPRS* (*ondansetron impurity A IPRS*) in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) with chemically bonded nitrile groups (Such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to pH 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.



https://nhathuocngocanh.com/

Inject reference solution (c). The test is not valid unless the relative retention time for ondansetron is about 1.0 and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$ in the oral solution.

Microbial contamination (2.2.9). The total viable count is not more than 100 CFU per g, *Enterobacteriaceae* count is not more than 10 CFU per g and the total combined molds and yeasts count is not more than 50 CFU per g.

Storage. Store protected from light, at a temperature not exceeding 30°.

Ondansetron Tablets

Ondansetron Hydrochloride Tablets

Ondansetron Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strengths. 2 mg; 4 mg; 8 mg

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obt d with the reference solution (a).

Tests

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),

Medium. 500 ml of *water,*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter having an average pore size not more than 0.45 µm. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{18}H_{19}N_3O$ in the medium from the absorbance obtained from a solution of known concentration of *ondansetron hydrochloride IPRS* in the same medium.

1 mg of $C_{18}H_{19}N_3O$ is equivalent to 1.25 mg of $C_{18}H_{19}N_3O,HCl,2H_2O$.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{19}N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Ondansetron in 70 ml of the mobile phase, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the mobile phase, centrifuge.

Reference solution (a). A 0.0005 per cent w/v solution of *ondansetron hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v of ondansetron impurity A RS and 0.01 per cent w/v of *ondansetron hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of buffer solution prepared by dissolving 2.7 g of *monobasic potassium phosphate* in 1000 ml of *water,* adjusting to pH 5.4 with *1M sodium hydroxide,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
2-methyl-imidazole	0.22	1.89
Ondansetron impurity C[1]	0.40	0.83
Ondansetron impurity D[2]	0.47	0.77
Ondansetron impurity A[3]	0.87	1.11
Desmethylondansetron[4]	0.90	1.1
Ondansetron	1.0	---

[1]1,2,3,9-tetrahydro-9-methyl-4*H*-carbazol-4-one,

[2]1,2,3,9-tetrahydro-9-methyl-3-methylene-4*H*-carbazol-4-one,

[3]3[(dimethylamino)methyl]- 1,2,3,9-tetrahydro-9-methyl-4*H*-carbazol-4-one,

[4]1,2,3,9-tetrahydro-9-methyl-3-[(1*H*-imidazol-yl-)methyl]-4*H*-carbazol-4-one.

Inject reference solution (b). The test is not valid unless the resolution between the ondansetron impurity A and ondansetron is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak due to 2-methyl imidazole, desmethyl-ondansetron, ondansetron impurity A and ondansetron impurity C is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any secondary peak due to ondansetron impurity D is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than 0.2 times the area of the principal peak in

https://nhathuocngocanh.com/

the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and the reference solution described under Assay.

Test solution. Disperse one tablet in the solvent mixture and dilute to obtain a solution containing 0.005 per cent w/v of Ondanseteron Hydrochloride and filter.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and buffer solution prepared by dissolving 2.7 g of *monobasic potassium phosphate* in 1000 ml of *water* adjusted to pH 5.4 with *1M sodium hydroxide.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of ondansetron in 100.0 ml with the solvent mixture and dilute to filter. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *ondansetron hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of buffer solution prepared by dissolving 2.7 g of *monobasic potassium phosphate* in 1000 ml of *water,* adjusted to pH 5.4 with *1M sodium hydroxide,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ondansetron.

Oral Rehydration Salts

ORS Powder

Oral Rehydration Salts are dry, homogeneously mixed powders containing Dextrose, Sodium Chloride, Potassium Chloride and either Sodium Bicarbonate or Sodium Citrate for use in oral rehydration therapy after being dissolved in the requisite amount of water.

They may contain suitable flavouring agents and, where necessary, suitable flow agents in the minimum quantity required to achieve a satisfactory product but may not contain artificial sweetening agents like mono- and/or poly-saccharides. If saccharin/saccharin sodium or aspartame is used in preparations meant for paediatric use, the concentration of saccharin should be such that its daily intake is not more than 5 mg/kg of body weight and that of aspartame should be such that its daily intake is not more than 40 mg/kg of body weight.

Category: Replacement solution for diarrhoeal rehydration.

Usual strength. A formulation of reduced osmolarity (given below) recommended by the World Health Organization (WHO) for the Diarrhoeal Diseases Control Programme, and of the United Nations Children's Emergency Fund (UNICEF).

Composition of the formulation in terms of the amount, in g, to be dissolved in sufficient water to produce 1000 ml.

Sodium Chloride	2.6
Dextrose (anhydrous)	13.5
or	
Dextrose Monohydrate	14.85
Potassium Chloride	1.5
Sodium Citrate	2.9

The molar concentrations of sodium, potassium, chloride and citrate ions in terms of millimoles per litre are given below:

	mmol/l
Sodium	75
Potassium	20
Chloride	65
Citrate	10
Dextrose	75

The total osmolar concentration of the solution in terms of mOsmol per litre is 245.

Oral Rehydration Salts contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Dextrose (anhydrous) or Dextrose Monohydrate (as appropriate) and of the requisite amounts of sodium, Na, potassium, K, chloride, Cl, citrate, $C_6H_5O_7$ and bicarbonate, HCO_3, calculated from the stated amounts of the relevant constituents.

https://nhathuocngocanh.com/

Description. A white to creamy-white, amorphous or crystalline powder.

Identification

A. When heated, melting and charring occurs and an odour of burnt sugar is produced.

B. Add a few drops of the solution prepared as directed in the label to 5 ml of *potassium cupri-tartrate solution*; a copious red precipitate is produced on boiling.

C. Gives reaction A of sodium salts, reaction (A) of potassium salts and reaction (A) of chlorides (2.3.1).

D. A quantity containing about 50 mg of *citric acid* gives the reactions of citrates (2.3.1).

Tests

Uniformity of weight. Complies with the test for contents of packaged dosage forms (2.5.6).

Seal test (*only for sachets*). Loosely bundle 10 sachets with a rubber band and submerge the bundle under water in a vacuum desiccator maintained at a pressure not exceeding 18 kPa for one minute. Examine the bundle for any fine stream of bubbles. Re-establish normal pressure and open the bundle. No penetration of water is observed in any sachet.

Other tests. Comply with the tests stated under Oral Powders.

Assay. Carry out the following assays on the well-mixed contents of an individual sachet or on a suitable sample from the well-mixed contents of a bulk container. Where the amount in an individual sachet is insufficient to carry out all the assays, take a separate sachet for the Assay for citrate and for the Assay for dextrose. For the Assays for total sodium, for potassium, for bicarbonate and for total chloride weigh about 8.0 g and dissolve in sufficient *water* to produce 500.0 ml (solution A).

For total sodium — Dilute a suitable volume of solution A with a sufficient volume of a solution of *strontium chloride* such that the final solution contains a 1500 to 2000-fold excess of strontium ions and determine by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution AAS*, suitably diluted with the *strontium chloride solution*, for the standard solutions or, alternately by Method A for flame photometry (2.4.4).

1 g of Sodium Chloride, and of Sodium Citrate is equivalent to 0.3934 and 0.2345 g of Na respectively.

For potassium — Dilute a suitable volume of solution A with a sufficient volume of solution of *strontium chloride* such that the final solution contains a 1500 to 2000-fold excess of strontium ions and determine by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution AAS*, suitably diluted with the *strontium chloride solution*, for the standard solutions or, alternatively by Method A for flame photometry (2.4.4).

1 g of Potassium Chloride is equivalent to 0.5245 g of K.

For total chloride — Titrate 50 ml of solution A with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

1 g of Sodium Chloride, and of Potassium Chloride is equivalent to 0.6066 and 0.4756 g of Cl respectively.

For citrate — Dissolve 2.0 g in 50 ml of *anhydrous glacial acetic acid* by heating at about 50°. Cool, allow to stand for 10 minutes. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.006303 g of $C_6H_5O_7$.

1 g of Sodium Citrate is equivalent to 0.6430 g of $C_6H_5O_7$.

For bicarbonate — Titrate 200.0 ml of solution A with *0.1M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *0.1M hydrochloric acid* is equivalent to 0.006101 g of HCO_3.

1 g of Sodium Bicarbonate is equivalent to 0.7263 g of HCO_3.

For dextrose — Dissolve 7.5 g in 40 ml of *water*, add 0.5 ml of *dilute ammonia solution*, and dilute to 100.0 ml with *water*. Mix well, allow to stand for 30 minutes, filter the solution, if turbid, and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation, in degrees, multiplied by 0.9477 or 1.0424 represents the weight in g of $C_6H_{12}O_6$ or $C_6H_{12}O_6,H_2O$ respectively, as appropriate, in the weight taken for the Assay.

Storage. Store protected from moisture in sachets, preferably made of aluminum foil, containing sufficient powder for a single dose or for a day's treatment or for use in hospitals, in bulk containers containing sufficient quantity to produce a volume of solution appropriate to the daily requirements of the hospital concerned.

Labelling. The label states (1) for sachets, the total weights, in g, of each constituent; (2) for bulk containers, the weights, in g, of each constituent in a stated quantity, in g, of the oral powder; (3) the molar concentration in millimoles per litre of sodium, potassium, chloride and citrate ions, and of dextrose as well as the total osmolar concentration in mOsmol per litre of the solution prepared from the oral powder; (4) the total weight of the contents of the container; (5) the directions for use; (6) that any portion of the solution prepared from the oral powder that remains unused for 24 hours after preparation should be discarded; (7) the storage conditions. g, of the oral powder.

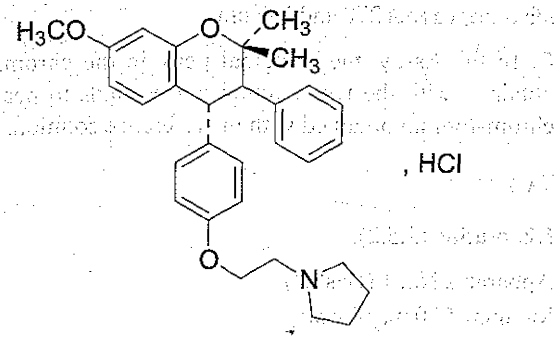
Ormeloxifene Hydrochloride

Centchroman Hydrochloride; Centchroman



$C_{30}H_{35}NO_3,HCl$ Mol. Wt. 493.5

Ormeloxifene Hydrochloride is *trans*-7-methoxy-2,2-dimethyl-3-phenyl-4[4-(2-pyrrolidino-thoxy)phenyl]chroman hydrochloride.

Ormeloxifene Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{30}H_{35}NO_3,HCl$, calculated on the dried basis.

Category. Antifertility agent (female oral contraceptive).

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ormeloxifene hydrochloride IPRS* or with the reference spectrum of ormeloxifene hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* shows absorption maxima at about 278 and 282 nm.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of mobile phase A and 70 volumes of mobile phase B.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the same solvent.

Reference solution. A 0.0004 per cent w/v solution of *ormeloxifene hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: A. a buffer solution pH 2.5 prepared by dissolving 0.63 g of *ammonium formate* in 1000 ml of *water*, add 2 ml of *triethylamine*, adjusted to pH 2.5 with *formic acid*,

  B. a mixture of 20 volumes of *acetonitrile* and 80 volumes of *methanol*,
- a gradient programme using the conditions given blow,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
20	30	70
40	30	70
42	40	60
55	40	60

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore the peak due to cis-isomer at relative retention time of about 0.9 and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

***cis*-Isomer.** Not more than 1.5 per cent of the total content of hydrochlorides of *trans*-and *cis*-isomers determined in the Assay.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.004 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A solution containing 0.004 per cent w/v of *trans-ormeloxifene hydrochloride IPRS* and 0.0006 per cent w/v of *cis-ormeloxifene hydrochloride IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 80 volumes of *acetonitrile* and 20 volumes of *water* containing 0.04 per cent w/v solution of *tetramethylammonium hydroxide*, adjusted to pH 7.6 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and use an attenuation such that the response for the principal peak due to *trans*-ormeloxifene hydrochloride is more than 50 per cent of the full-scale deflection of the recorder. Make a total of six injections. When the chromatograms are recorded under the conditions described above, trans-ormeloxifene hydrochloride is eluted before *cis*-ormeloxifene hydrochloride.The test is not valid unless the relative standard deviation of six replicate injections is not more than 6 per cent and the resolution between the peaks due to *cis*-ormeloxifene hydrochloride and *trans*-ormeloxifene hydrochloride is more than 1. If necessary, adjust the proportions and the flow rate of the mobile phase to obtain proper resolution. Inject a suitable volume of test solution. From the average peak areas of the six replicate analyses calculate the content of *trans*-ormeloxifene hydrochloride and *cis*-ormeloxifene hydrochloride in the substance under examination by comparing with the peak responses for *trans*-ormeloxifene hydrochloride and *cis*-ormeloxifene hydrochloride respectively obtained with reference solution.

Storage. Store protected from moisture.

Ormeloxifene Tablets

Ormeloxifene Hydrochloride Tablets; Centchroman Hydrochloride Tablets; Centchroman Tablets

Ormeloxifene Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Ormeloxifene hydrochloride, $C_{30}H_{35}NO_3$,HCl.

Usual strength. 30 mg.

Identification

Shake a quantity of the powdered tablets containing 0.1 g of Ormeloxifene Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness at a pressure not exceeding 0.7 kPa. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ormeloxifene hydrochloride IPRS* or with the reference spectrum of ormeloxifene hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* shows absorption maxima at about 278 and 282 nm.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{30}H_{35}NO_3$,HCl in the medium from the absorbance obtained from a solution of known concentration of *Ormeloxifene hydrochloride IPRS* in *water*.

Q. Not less than 70 per cent of the stated amount of $C_{30}H_{35}NO_3$,HCl in the medium.

***cis-Isomer**. Not more than 1.5 per cent of the total content of ormeloxifene hydrochlorides of trans- and cis-isomers determined under Assay.*

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.17).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Ormeloxifene Hydrochloride with three quantities, each of 5 ml, of *methanol*, centrifuge each extract, dilute the combined extracts to 25 ml with *methanol* and then dilute 250 µl of the resulting solution to 25 ml with the mobile phase.

Reference solution. A solution containing 0.004 per cent w/v of *trans-ormeloxifene hydrochloride IPRS* and 0.0006 per cent w/v of *cis-ormeloxifene hydrochloride IPRS* in the mobile phase.

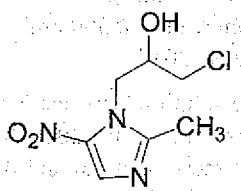
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 80 volumes of *acetonitrile* and 20 volumes of *water* containing 0.04 per cent w/v solution of *tetramethylammonium hydroxide*, adjusted to pH 7.6 with *phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the relative standard deviation of six replicate injections is not more than 6 per cent and the resolution between the peaks due to *cis*-ormeloxifene hydrochloride and *trans*-ormeloxifene hydrochloride is more than 1. If necessary, adjust the proportions and the flow rate of the mobile phase to obtain proper resolution. Inject a suitable volume of test solution and record the response. From the average peak areas of the six replicate analyses calculate the content of *trans*-ormeloxifene hydrochloride and *cis*-ormeloxifene hydrochloride in the substance under examination.

Storage. Store protected from moisture.

Ornidazole



$C_7H_{10}ClN_3O_3$ Mol. Wt. 219.6

Ornidazole is (*RS*)-1-chloro-3-(2-methyl-5-nitroimidazol-1-yl)propan-2-ol.

Ornidazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_{10}ClN_3O_3$, calculated on the anhydrous basis.

Category. Antiamoebic.

Description. A white to yellowish white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ornidazole IPRS* or with the reference spectrum of ornidazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 277 nm; absorbance at 277 nm, 0.580 to 0.630.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *ornidazole IPRS* in the mobile phase.

Reference solution (c). Dilute 20.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *0.01M potassium dihydrogen orthophosphate* and 30 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to 2-methyl-5-nitroimidazole and ornidazole is at least 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-methyl-5-nitroimidazole is not more than 0.2 times the area of the principal peak obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.15 g in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent of 0.02196 g of $C_7H_{10}ClN_3O_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ornidazole Injection

Ornidazole Injection is a sterile solution of Ornidazole in propylene glycol or other suitable glycol, in a suitable mixture of these. It contains suitable alcohols.

Ornidazole Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ornidazole, $C_7H_{10}ClN_3O_3$.

Usual strength. 500 mg per 3 ml.

Description. A clear, light yellow coloured solution.

https://nhathuocngocanh.com/

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with reference solution.

Tests

Appearance of solution. A solution containing 0.5 g Ornidazole per 3 ml in a mixture of equal volumes of *propylene glycol* and *ethanol* is clear (2.4.1) and not more than intensely coloured than YS5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions and carry out the test protected from light.

Test solution. Dilute a volume of injection with the mobile phase to obtain a solution containing 0.1 per cent w/v of Ornidazole.

Reference solution (a). A 0.5 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* with the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *ornidazole IPRS* with the mobile phase.

Reference solution (c). Dilute 20.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *0.01 M potassium dihydrogen phosphate* and 30 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to 2-methyl-5-nitroimidazole and ornidazole is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-methyl-5-nitroimidazole is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.7 Endotoxin Unit per mg of ornidazole.

Other tests. Comply with the tests stated under Parenteral Preparation (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water*.

Test solution. Dilute a volume of injection with the solvent mixture to obtain a solution containing 0.0033 per cent w/v of Ornidazole.

Reference solution. A 0.0033 per cent w/v solution of *ornidazole IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of a 0.136 per cent w/v solution of *potassium dihydrogen orthophosphate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 10 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{10}ClN_3O_3$ in the injection.

Storage. Store protected from light and moisture.

Labelling. The label states (1) the nature and composition of the solvent; (2) that it is meant for intramuscular injection only.

Ornidazole Tablets

Ornidazole Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ornidazole, $C_7H_{10}ClN_3O_3$.

Usual strength. 500 mg.

Identification

Extract a quantity of the powdered tablets containing 0.1 g of Ornidazole with 40 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ornidazole IPRS* or with the reference spectrum of ornidazole.

B. Heat a quantity of the powdered tablets containing 0.1 g of Ornidazole with 10 mg of *zinc powder*, 1 ml of *water* and

https://nhathuocngocanh.com/

0.25 ml *hydrochloric acid* for 5 minutes, cool in ice, add 0.5 ml of *sodium nitrite solution* and remove the excess of nitrite with *sulphuric acid*. Add 0.5 ml of *2-naphthol solution* and 2 ml of *5 M sodium hydroxide solution*. An orange-red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly, rejecting the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of ornidazole, $C_7H_{10}ClN_3O_3$ in the medium from the absorbance obtained from a solution of known concentration of *ornidazole IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_7H_{10}ClN_3O_3$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of ornidazole in 25.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *2-methyl-5-nitroimidazole IPRS* in the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *ornidazole IPRS* in the mobile phase.

Reference solution (c). Dilute 20.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *0.01M potassium dihydrogen orthophosphate* and 30 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to 2-methyl-5-nitroimidazole and ornidazole is at least 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-methyl-5-nitroimidazole is not more than 0.2 times the area of the principal peak obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

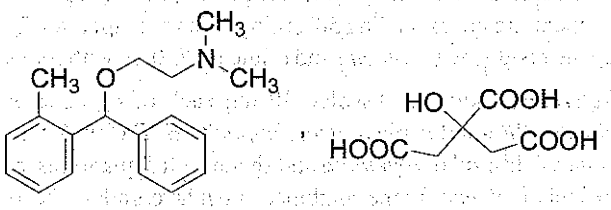
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.2 g of Ornidazole, transfer to a sintered-glass crucible and extract with 10 ml of hot *acetone*. Repeat the extraction 6 times with hot *acetone*. Cool, add to the combined extracts 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02196 g of $C_7H_{10}ClN_3O_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Orphenadrine Citrate



$C_{18}H_{23}NO,C_6H_8O_7$ Mol. Wt. 461.5

Orphenadrine Citrate is (*RS*)-dimethyl[2-(2-methylbenzhydryloxy)ethyl]amine dihydrogen citrate.

Orphenadrine Citrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO$, $C_6H_8O_7$, calculated on the dried basis.

Category. Skeletal muscle relaxant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *orphenadrine citrate IPRS*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.06 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at 258 nm, 264 nm and 271 nm; absorbances at the maxima are about 0.68, 0.72 and 0.47 respectively.

C. Dissolve 50 mg in 10 ml of *ethanol (50 per cent)*, add 10 ml of *picric acid solution* and allow to stand. The precipitate

https://nhathuocngocanh.com/

after recrystallisation from *ethanol (95 per cent)*, melts at about 89° or at about 107° (2.4.21).

D. Dissolve 5 mg in 2 ml of *sulphuric acid*; an orange-red colour is produced.

E. To 1 g add 10 ml *water* and 2 ml of *5 M sodium hydroxide*, shake with two quantities, each of 10 ml, of *chloroform* and discard the chloroform. Heat the aqueous solution to boiling with an excess of *mercuric sulphate solution*, filter if necessary and boil the resulting solution with 0.2 ml of *dilute potassium permanganate solution*; the solution is decolorised and a white precipitate is produced.

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.5 g of the substance under examination in *water* and dilute to 50 ml with *water*. Add 2 ml of *ammonia* and shake with 3 quantities, each of 10 ml of *toluene*. To the combined upper layers add *anhydrous sodium sulphate*, shake, filter and evaporate the filtrate, at a temperature not exceeding 50°, using a rotary evaporator. Take up the residue with *toluene* and dilute to 20.0 ml with *toulene*.

Reference solution. Dissolve 30 mg each of *orphenadrine citrate IPRS* and *orphenadrine impurity E IPRS* in 20 ml of *water*. Add 1 ml of *ammonia* and shake with 3 quantities, each of 5 ml of *toluene*. To the combined upper layers add *anhydrous sodium sulphate*, shake, filter and evaporate the filtrate, at a temperature not exceeding 50°, using a rotary evaporator. Take up the residue with *toluene* and dilute to 20.0 ml with *toluene*.

Chromatographic system
- a capillary column 60 m x 0.32 mm packed with poly(dimethyl)(diphenyl)siloxane (film thickness 1.0 µm),
- temperature:
  column. 240°,
  inlet port and detector at 290°,
- flame ionization detector,
- split ratio. 1: 25,
- flow rate: 1 ml per minute using nitrogen as the carrier gas.

Name	Relative retention time
Orphenadrine impurity B[1]	0.5
Orphenadrine impurity A[2]	0.6
Orphenadrine impurity D[3]	0.8
Orphenadrine impurity C[4]	0.9
Orphenadrine impurity E[5]	0.98
Orphenadrine (Retention time: about 13 minutes)	1.0
Orphenadrine impurity F[6]	1.1

[1]2-methylbenzophenone,
[2]2-methylbenzhydrol,
[3]diphenhydramine,
[4](*RS*)-2-[(2-methylphenyl)phenylmethoxy]ethanamine,
[5]meta-methylbenzyl isomer,
[6]para-methylbenzyl isomer.

Inject 2 µl of the reference solution. The test is not valid unless the resolution between the peaks due to orphenadrine impurity E and orphenadrine is not less than 1.5.

Inject 2 µl of the reference solution and the test solution. Run the chromatogram 1.3 times the retention time of the principal peak, the area of any peak corresponding to orphenadrine impurities A, B, C, D, E, F, each of, is not more than 0.3 per cent. The area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent. Ignore any peak with an area less than 0.05 per cent, calculated by area normalization.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm). Use 2 ml of lead standard solution (*10 ppm Pb*) to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

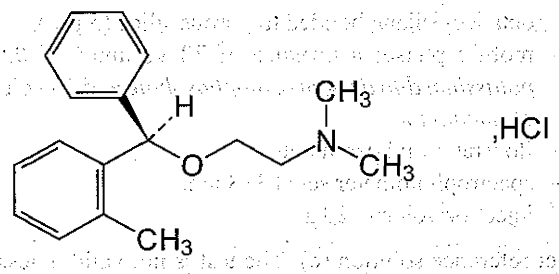
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 1.0 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04615 g of $C_{18}H_{23}NO$, $C_6H_8O_7$.

Storage. Store protected from light.

Orphenadrine Hydrochloride



$C_{18}H_{23}NO,HCl$ Mol. Wt. 305.8

Orphenadrine Hydrochloride is (*RS*)-dimethyl [2-(2-methyl-benzhydryloxy) ethyl]amine hydrochloride.

Orphenadrine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO,HCl$, calculated on the dried basis.

https://nhathuocngocanh.com/

Category. Antiparkinsonian.

Description. A white or almost white, crystalline powder.

Identification

Tests A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if tests A is carried out.

A. Determine by infrared absorption spectrophotometry,(2.4.6). Compare the spectrum with that obtained with *orphenadrine hydrochloride IPRS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.06 per cent *w/v* solution in *ethanol (95 per cent)* shows three absorption maxima at about 258 nm,264 nm and 271 nm; absorbances at the maxima, about 1.07, 1:13 and 0.73 respectively.

C. Dissolve about 5 mg in 2 ml of *sulphuric acid;* an orange-red colour is produced.

D. Dissolve about 50 mg in 10 ml of *ethanol (95per cent),* add 10 ml of *picric acid solution* and allow to stand. The precipitate, after recrystallisation from *ethanol (95 per cent)* melts at about 89° or at about 107°(2.4.21).

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.3 g of the substance under examination in *water* and dilute to 50 ml with *water.* Add 2 ml of *ammonia* and shake with 3 quantities, each of 10 ml of *toluene.* To the combined upper layers add *anhydrous sodium sulphate,* shake, filter and evaporate the filtrate, at a temperature not exceeding 50°, using a rotary evaporator. Take up the residue with *toluene* and dilute to 20.0 ml with *toulene.*

Reference solution. Dissolve 20 mg each of *orphenadrine hydrochloride IPRS* and *orphenadrine impurity E IPRS* in 20 ml of *water.* Add 1 ml of *ammonia* and shake with 3 quantities, each of 5 ml of *toluene.* To the combined upper layers add *anhydrous sodium sulphate,* shake, filter and evaporate the filtrate, at a temperature not exceeding 50°, using a rotary evaporator. Take up the residue with *toluene* and dilute to 20.0 ml with *toluene.*

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm). Use 2 ml of lead standard solution (*10 ppm Pb*) to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 1.0 g in 20 ml of *anhydrous glacial acetic acid,* add 20 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid* using *1-naphtholbenzene solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03058 g of $C_{18}H_{23}NO,HCl$.

Storage. Store protected from light.

Orphenadrine Tablets

Orphenadrine Hydrochloride Tablets

Orphenadrine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of orphenadrine hydrochloride, $C_{18}H_{23}NO,HCl$.

https://nhathuocngocanh.com/

Usual strength. 50 mg.

Identification

Extract a quantity of the powdered tablets containing about 0.15 g of Orphenadrine Hydrochloride with *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Dissolve 5 mg in 2 ml of *sulphuric acid;* an orange-red colour is produced.

B. Dissolve 50 mg in 10 ml of *ethanol (50 per cent)*, add 10 ml of *picric acid solution* and allow to stand. The precipitate after recrystallisation from *ethanol (95 per cent)*, melts at about 89° or at about 107° (2.4.21).

C. A 5.0 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

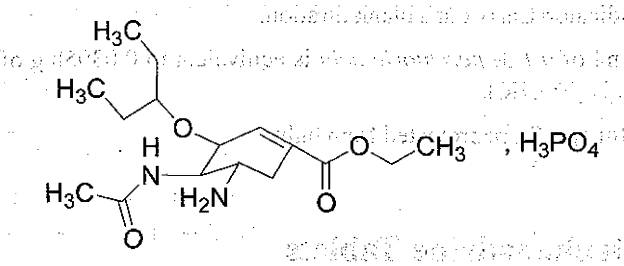
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 70 mg Orphenadrine Hydrochloride and dissolve as completely as possible in a mixture of 5 ml of *water* and 5 ml of *2 M hydrochloric acid.* Without delay extract with four quantities, each 15 ml, of *chloroform*, filter the combined extracts and evaporate to about 20 ml. Add 30 ml of *anhydrous glacial acetic* and 2 ml of *mercuric acetate solution* and titrate with *0.02 M perchloric acid* determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.02 M perchloric acid* is equivalent to 0.006117 g of $C_{18}H_{23}NO,HCl$.

Storage. Store protected from light and moisture.

Oseltamivir Phosphate



$C_{16}H_{28}N_2O_4,H_3PO_4$ Mol. Wt. 410.4

Oseltamivir Phosphate is phosphoric acid salt of ethyl (3*R*,4*R*,5*S*)-4-(acetylamino)-5-amino-3-(1-ethylpropoxy)-1-cyclohexene-1-carboxylate.

Oseltamivir Phosphate contain not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{28}N_2O_4,H_3PO_4$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white or off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oseltamivir phosphate IPRS* or with the reference spectrum of oseltamivir phosphate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −48.0° to −42.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 25 mg of the substance under examination in 25 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *oseltamivir phosphate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC pack PRO C8),
- column temperature 50°,
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of all the secondary peaks is not more

https://nhathuocngocanh.com/

than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Phosphoric acid. 23.4 to 24.4 per cent, calculated on a anhydrous basis.

Dissolve 0.2 g in 40 ml of distilled *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0049 g of phosphoric acid.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method A (20 ppm).

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *oseltamivir phosphate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC pack PRO C8),
- column temperature: 50°,
- mobile phase: a mixture of 66 volumes of *buffer solution* prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{28}N_2O_4,H_3PO_4$.

Storage. Store protected from light and moisture.

Oseltamivir Capsules

Oseltamivir Phosphate Capsules

Oseltamivir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oseltamivir, $C_{16}H_{28}N_2O_4$.

Usual strength. 75 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with dissolution medium.

Reference solution. Dissolve 50 mg of *oseltamivir phosphate IPRS* in 20 ml of the mobile phase and dilute to 100 ml with the dissolution medium. Dilute 5.0 ml of the solution to 25.0 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{28}N_2O_4$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

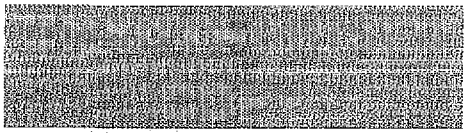
Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 50 mg of oseltamivir, disperse in 50 ml of mobile phase and filter.

Reference solution (a). Dissolve a quantity of *oseltamivir phosphate IPRS* in the mobile phase to obtain a solution equivalent to 0.1per cent w/v of oseltamivir.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC pack PRO C8),
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.



https://nhathuocngocanh.com/

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 200 mg of oseltamivir, disperse in 100.0 ml of the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *oseltamivir phosphate IPRS* in the mobile phase to obtain a solution equivalent to 0.02 per cent w/v of oseltamivir.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{28}N_2O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of oseltamivir.

Oseltamivir Oral Suspension

Oseltamivir Phosphate Oral Suspension

Oseltamivir Oral Suspension is a mixture consisting of Oseltamivir Phosphate with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Oseltamivir Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oseltamivir $C_{16}H_{28}N_2O_4$.

The contents of the sealed container comply with the following requirement.

Usual strength. 15 mg per ml.

Water (2.3.43). Not more than 2.5 per cent, determined on 1.0 g.

The constituted suspension complies with the requirements stated under Oral liquids and with the following requirements.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. To 2 ml of the reconstituted suspension, add 2 ml of *dilute nitric acid* and 4 ml of a 10 per cent w/v solution of *ammonium molybdate* and warm the solution. A bright yellow precipitate is formed.

Tests

pH (2.4.24). 3.0 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh a quantity of the suspension containing 25 mg of oseltamivir, dissolve in 25.0 ml of the mobile phase and filter.

Reference solution (a). Dissolve a quantity of *oseltamivir phosphate IPRS* in the mobile phase to obtain a solution equivalent to 0.1 per cent w/v of oseltamivir.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: 70 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute sodium hydroxide*, 15 volumes of *methanol* and 15 volumes of *acetonitrile*,

https://nhathuocngocanh.com/

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogra tained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh a quantity of the suspension containing 60 mg of oseltamivir, dissolve in 250.0 ml of the mobile phase and filter. Dilute 10.0 ml of the solution to 25.0 ml with the mobile phase and filter.

Reference solution. A 0.0125 per cent w/v solution of *oseltamivir phosphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

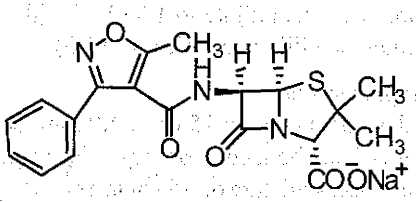
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{28}N_2O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of oseltamivir; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Oxacillin Sodium



$C_{19}H_{18}N_3NaO_5S,H_2O$ Mol. Wt. 441.4

Oxacillin Sodium is Sodium 6-(5-methyl-3-phenyl-1,2-oxazole-4-carboxamido)penicillanate.

Oxacillin Sodium contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{19}H_{18}N_3NaO_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxacillin sodium monohydrate IPRS* or with the reference spectrum of oxacillin sodium monohydrate.

B. It gives reaction (A) of sodium salt (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and its absorbance at 430 nm (2.4.7) is not more than 0.1, determined on 10.0 per cent w/v solution in *water*.

pH (2.4.24). 4.5 to 7.5, determined on 3.0 per cent w/v solution.

Specific optical rotation (2.4.22). +196° to +212°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *oxacillin sodium monohydrate IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of test solution (b) to 50.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v each of *oxacillin impurity E IPRS* (*cloxacillin sodium IPRS*) and *oxacillin sodium monohydrate IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Reference solution (d). Dissolve 25 mg of the substance under examination in 1 ml of *0.05 M sodium hydroxide,* allow to stand for 3 minutes, then dilute to 100.0 ml with the mobile phase (generates oxacillin impurities B and D).

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 5.0 with *sodium hydroxide solution* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Name	Relative retention time
Oxacillin impurity A[1]	0.3
Oxacillin impurity B[2]	0.4
Oxacillin impurity B[3]	0.5
Oxacillin impurity C[4]	0.65
Oxacillin impurity D[5]	0.9
Oxacillin (Retention time: about 5 minutes)	1.0
Oxacillin impurity E[6]	1.5
Oxacillin impurity F[7]	1.9
Oxacillin impurity G[8]	2.1
Oxacillin impurity H[9]	3.5
Oxacillin impurity I[10]	3.8
Oxacillin impurity J[11]	5.8

[1]6-aminopenicillanic acid,
[2]isomer 1: penicilloic acid of oxacillin,
[3]isomer 2: penicilloic acid of oxacillin,
[4]5-methyl-3-phenylisoxazole-4-carboxylic acid,
[5]2 isomers: Penilloic acids of oxacillin,
[6]cloxacillin,
[7]thiooxacillin,
[8]cloxacillin isomer,
[9]penillic acid of oxacillin,
[10]6-APA oxacillin amide,
[11]ozolamide of 6-APA dimer.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to oxacillin and oxacillin impurity E is not less than 2.5.

Inject reference solution (d). The two principal peaks eluting before oxacillin peak are due to oxacillin impurities B and D.

Inject reference solution (b) and test solution (a). Run the chromatogram 7 times the retention time of principal peak.In the chromatogram obtained with test solution (a), the sum of the areas of 2 isomer peaks of oxacillin impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). The area of the peak corresponding to oxacillin impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of 2 isomer peaks of oxacillin impurity D, oxacillin impurities F, G, I and J, each of, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ethyl acetate and butyl acetate. Not more than 1.0 per cent of ethyl acetate and not more than 1.0 per cent of butyl acetate.

Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.2 g of the substance under examination in 6.0 ml of *water*.

Reference solution. Dissolve 83 mg of *ethyl acetate* and 83 mg of *butyl acetate* in *water* and dilute to 250.0 ml with *water*. Use 6.0 ml of the solution.

NOTE — Close the vials immediately with a rubber membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap. Mix to obtain a homogeneous solution.

Chromatographic system
- a fused silica column 50 m x 0.32 mm, packed with poly(dimethyl)siloxane (film thickness 5 µm),
- temperature:

column	time (min)	temperature (°)
	0-6	70
	6-16	70 → 220
	16-18	220

- inlet port at 140° and detector at 250°,
- flow rate: 2 ml per minute using nitrogen as carrier gas.

Head-space conditions:
- equilibration temperature: 80°,
- equilibration time. 60 minutes,
- transfer line temperature. 140°,
- pressurization time. 30 seconds.
- flame ionization detector.

The retention time of ethyl acetate is about 10 minutes and of butyl acetate is about 15.5 minutes.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution.

Calculate the content of ethyl acetate and butyl acetate.

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by method B.

2-Ethylhexanoic acid (2.3.51). Not more than 0.8 per cent.

Water (2.3.43). 3.0 per cent to 5.0 per cent, determined on 0.3 g.

Oxacillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of oxacillin sodium.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modification.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{19}H_{18}N_3NaO_5S$.

Oxacillin Capsules

Oxacillin Capsules contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of oxacillin, $C_{19}H_{19}N_3O_5S$.

Usual strengths. 250 mg; 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance of the solution at the maxima at about 225 nm (2.4.7). Calculate the content of $C_{19}H_{19}N_3O_5S$ in the medium from the absorbance obtained from a solution of known concentration of *oxacillin sodium IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{19}N_3O_5S$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the contents of 20 capsules containing 100 mg of Oxacillin in *water* and dilute to 100.0 ml with *water*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: dissolve 1.9 g of *monobasic potassium phosphate* in 700 ml of *water*, add 300 ml of *acetonitrile* and 100 ml of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 100 mg of Oxacillin with *water* with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with *water*, filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water*.

Reference solution. A 0.011 per cent w/v solution of *oxacillin sodium IPRS* in *water*.

Use chromatographic system as described under Related substances.

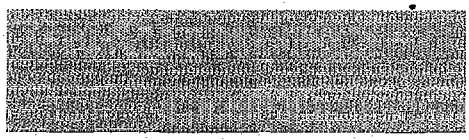
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{19}N_3O_5S$ in the capsules.

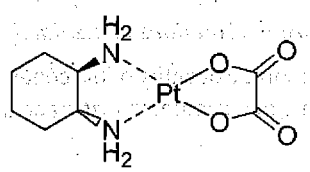
Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of the active ingredient in terms of the equivalent amount of oxacillin.



https://nhathuocngocanh.com/

Oxaliplatin



$C_8H_{14}N_2O_4Pt$ Mol. Wt. 397.3

Oxaliplatin is *cis*-[(1*R*, 2*R*)-1,2-cyclohexanediamine-*N*,*N*']][oxalato(2-)-*O*,*O*']platinum.

Oxaliplatin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{14}N_2O_4Pt$, calculated on the dried basis.

Category. Anticancer

Description. A white to off white, crystalline powder.

CAUTION — Oxaliplatin is potentially cytotoxic; Great care should be taken in handling the powder and preparing solutions.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxaliplatin IPRS* or with the reference spectrum of oxaliplatin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (f).

Tests

Acidity. Dissolve 100.0 mg in 50 ml of *carbon dioxide-free water* and add 0.5 ml of *phenolphthalein solution*. The solution is colourless. Not more than 0.6 ml of *0.01M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). +74.5° to +78.0°, determined in a 0.5 per cent w/v solution in *water*, measured at 20°.

Related substances. A. Determine by liquid chromatography (2.4.14).

NOTE — Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 minutes of preparation. Polypropylene autosampler vials should be used.

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of *water*.

Reference solution (a). 0.006 per cent solution of *oxaliplatin related compound A IPRS* (oxalic acid dihydrate) in *water*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with *water*.

Reference solution (c). Transfer 25.0 ml of reference solution (a) into 100-ml volumetric flask and add 2.0 ml of 0.005 per cent w/v solution of *sodium nitrate* and dilute to volume with *water*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: 20 volumes of *acetonitrile*, and 80 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in about 100.0 ml of *water*, add 10.0 ml of 10 per cent *tetrabutylammonium hydroxide* in *water* and dilute with *water* to 1000 ml, adjusted to pH 6.0 with *orthophosphoric acid*.
- flow rate: 2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to oxalic acid dihydrate and sodium nitrate in the chromatogram obtained with reference solution (c) is not less than 2.0. In the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 3.0 per cent. The signal-to-noise ratio for the oxaliplatin related compound A peak in the chromatogram obtained with reference solution (d) is not less than 10.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to oxalic acid dihydrate is not more than 0.133 times the area of the peak due to oxalic acid dihydrate in the chromatogram obtained with reference solution (b) (0.1 per cent).

B. Determine by liquid chromatography (2.4.14).

NOTE — Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 minutes of preparation. Polypropylene glassware should be used.

Buffer Solution. Dissolve 2.72 g of *monobasic potassium phosphate* (anhydrous) and 1.80 g of *1-pentanesulfonic acid sodium salt* in 2000 ml of *water*. Add 0.5 ml of *triethylamine* to the solution, and mix thoroughly. Adjusted to pH 4.3 with *orthophosphoric acid*.

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of *water*.

Reference solution (a). 0.05 per cent w/v solution of *oxaliplatin IPRS* in *water*.

Reference solution (b). Dissolve 12.5 mg of *oxaliplatin related compound B IPRS* [(*SP*-4-2-(1*R*-*trans*)-(1,2-Cyclohexan-

https://nhathuocngocanh.com/

ediamine-*N,N'*) dinitratoplatinum(II)] in 25.0 ml *methanol* and sonicate for 2 minutes. Add 65.0 ml of *0.001 M nitric acid* and sonicate for additional 30 minutes. Cool and dilute to 100.0 ml.

NOTE — Oxaliplatin Related Compound B IPRS is converted to (SP-4-2)-diaqua[(1R ,2R)-cyclohexane-1,2-diamine-N,N'] platinum during preparation of the solution.

Reference solution (c). A 0.01 per cent w/v solution of *oxaliplatin related compound C IPRS* in *water.*

Reference solution (d). A 0.2 per cent w/v solution of *oxaliplatin IPRS* in *0.005 M sodium hydroxide solution.* Allow it to stand at room temperature for at least 5 days. Transfer 10.0 ml of the solution, 10.0 ml of reference solution (b) and 5.0 ml of reference solution (c) into a 100-ml volumetric flask and dilute with *water* to the volume.

NOTE— The preparation of the reference solution (d) forms diaquodiaminocyclohexaneplatinum dimer.

Reference solution (e). Transfer 1.0 ml of reference solution (a), 4.0 ml of reference solution (b) and 2.0 ml of reference solution (c) into a 50-ml volumetric flask and dilute with *water* to the volume.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A mixture of 15 volumes of *methanol* and 85 volumes of a buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Oxaliplatin related compound C[1]	0.8	—
Oxaliplatin	1.0	—
(*SP*-4-2)-Diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N,N* ']platinum	2.7	—
Diaquodiaminocyclohexaneplatinum dimer	6.0	0.4

[1][1*R-trans*-(1,2-Cyclohexanediamine-*N,N'*)]-*trans*-dihydroxido-[oxalato(2-)-*O,O'*]platinum(IV).

Inject reference solution (d) and (e). The test is not valid unless the tailing factor is between 0.8 and 2.0 for oxaliplatin and the resolution between the peaks due to oxaliplatin and oxaliplatin related compound C is not less than 2.0 in the chromatogram obtained with reference solution (d). The relative standard deviation for replicate injections is not more than 3.0 per cent for oxaliplatin, oxaliplatin related compound B, and oxaliplatin related compound C in the chromatogram obtained with reference solution (e).

Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution the area of (*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N,N'*]platinum is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.1 per cent) and oxaliplatin related compound C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.1 per cent). The area of diaquodiaminocyclohexaneplatinum dimer, multiplied with correction factor 0.4 is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.1 per cent). The area of any secondary peak, multiplied by correction factor 0.25 is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent) and the sum of the areas of all the secondary peaks including oxalic acid is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent).

C. *Oxaliplatin related compound D.* Not more than 0.1 per cent, determine by liquid chromatography (2.4.14).

NOTE — Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 minutes of preparation. Polypropylene auto sampler vials should be used.

Test solution. Dissolve 15.0 mg of the substance under examination in 25.0 ml of *methanol.*

Reference solution (a). A 0.005 per cent w/v solution of *oxaliplatin related compound D IPRS (cis-[(1S, 2S)-1,2-Cyclohexanediamine-N,N'][oxalato(2-)-O,O']platinum)* in *methanol.*

Reference solution (b). Dilute reference solution (a) with *methanol* to obtain a 0.0015 per cent w/v solution of oxaliplatin related compound D.

Reference solution (c). A 0.075 per cent w/v solution of *oxaliplatin IPRS* in *methanol.*

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 20.0 ml with *methanol.*

Reference solution (e). Transfer 40 ml of reference solution (c) to a 50-ml volumetric flask, and dilute with *methanol* to volume.

Reference solution (f). Transfer 40 ml of reference solution (c) to separate 50-ml volumetric flasks. Add 1.0, 3.0, and 5.0 ml of reference solution (b) to each flask, and dilute with *methanol* to volume. The concentration of oxaliplatin in these solutions is 0.6 mg per ml. The concentrations of oxaliplatin related compound D in these solutions are 0.3, 0.9, and 1.5 µg per ml, respectively.

https://nhathuocngocanh.com/

Reference solution (g). Transfer 5.0 ml of reference solution (d) and 4.0 ml of reference solution (a) to a 50-ml volumetric flask, and dilute with *methanol* to volume.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with cellulose tris (phenylcarbamate) (5µm),
- column temperature: 40°,
- mobile phase: 30 volumes of *ethanol,* and 70 volumes of *methanol,*
- flow rate: 0.3 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (f) containing 0.9 µg per ml of oxaliplatin related compound D, and reference solution (g). The test is not valid unless the resolution between the peaks due to oxaliplatin and oxaliplatin related compound D is not less than 1.5 in the chromatogram obtained with reference solution (g) and relative standard deviation is not more than 3.0 per cent for the peak height ratio of oxaliplatin related compound D to the sum of oxaliplatin and oxaliplatin related compound D in the chromatogram obtained with reference solution (f).

Inject reference solution (f), and the test solution. Subtract the oxaliplatin related compound D peak height obtained in reference solution (e) from the oxaliplatin related compound D peak height obtained in reference solution (f). Plot a calibration curve for reference solution (f) with the peak height ratios of oxaliplatin related compound D to the sum of oxaliplatin and oxaliplatin related compound D on the *y*-axis and the concentration ratios of oxaliplatin related compound D, in µg per ml, to the sum of oxaliplatin and oxaliplatin related compound D concentrations, in mg per ml, on the *x*-axis. Read the concentration ratio of oxaliplatin related compound D, in µg per ml, to the sum of oxaliplatin and oxaliplatin related compound D, in mg per ml, in the test solution from the calibration curve.

Calculate the percentage of oxaliplatin related compound D by

$$\frac{R}{10}$$

where, R = concentration ratio of oxaliplatin related compound D, in µg per ml, to the sum of oxaliplatin and oxaliplatin related compound D, in mg per ml, in the test solution from the calibration curve

NOTE— Oxaliplatin IPRS may contain a small amount of oxaliplatin related compound D.

Silver. Not more than 5 ppm, determine by atomic absorption spectrophotometry (2.4.2), measuring at 328 nm using a silver hollow cathode light as a radiation source, a fuel-lean air-acetylene flame, preferably a spectral width of 0.5 nm.

Test solution. Dissolve 0.5 g of the substance under examination in 15 ml of *nitric acid* by heating up to 80°. Cool and dilute to 25.0 ml with *water.*

Reference solutions. Add 50 ml of *nitric acid* to suitable volumes (1 to 3 ml) of *silver solution AAS (5 ppm)* and dilute to 100.0 ml with *water.*

Carry out a blank determination.

Platinum. Not less than 48 per cent and not more than 50.0 per cent, calculated on dried basis.

Weigh 200 mg of the oxaliplatin in a porcelain crucible and ignite in a furnace by stepwise increments as follows. Introduce the sample into the furnace, and increase the temperature to 200° within 15 minutes,then to 400° within 15 minutes, then to 600° within 15 minutes, then finally to 800° within 15 minutes. Allow to remain in the furnace at 800° for further 30 minutes. Remove, cool in a desiccator and weigh.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Units per mg of oxaliplatin.

Assay. Determine by liquid chromatography (2.4.14). As described under Related Substances B with following modifications.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of *water.*

Reference solution (f). Dilute 10.0 ml of reference solution (a) to 50.0 ml with *water.*

The relative retention times, with reference to oxaliplatin are 0.8 for oxaliplatin related compound C, 2.7 for oxaliplatin related compound B and 6 for diaquodiaminocyclohexaneplatinum dimer respectively.

Inject reference solution (d) and (f). The test is not valid unless the tailing factor is not between 0.8 and 2.0 for oxaliplatin and the resolution between the peaks due to oxaliplatin and oxaliplatin related compound C is not less than 2.0 in the chromatogram obtained with reference solution (d). The relative standard deviation for replicate injections is not more than 2.0 per cent for oxaliplatin peak obtained with reference solution (f).

Inject reference solution (f) and the test solution.

Calculate the content of $C_8H_{14}N_2O_4Pt$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Oxaliplatin Injection

Oxaliplatin Injection is a sterile solution of Oxaliplatin in Water for Injections.

Oxaliplatin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of $C_8H_{14}N_2O_4Pt$.

Usual strength. 5 mg per ml.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), a 0.01 per cent w/v solution in *water* shows an absorption maxima and minima at the same wavelength as that of *oxaliplatin IPRS* solution prepared in the same manner.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH. (2.4.24). 4.0 to 7.0.

Oxalic acid. Not more than 0.6 per cent, determine by liquid chromatography (2.4.14).

NOTE— Use auto sampler vials made of polypropylene.

Test solution. A 0.2 per cent w/v solution of oxaliplatin.

Reference solution (a). A 0.0035 per cent w/v solution of *oxaliplatin related compound A IPRS* (Oxalic acid dihydrate) in *water.*

Reference solution (b). A 0.01 per cent w/v solution of *succinic acid* in reference solution (a).

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 100.0 ml with *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: 20 volumes of *acetonitrile,* and 80 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 10 ml of 10 per cent *tetrabutylammonium hydroxide* in *water* and dilute with *water* to 1000 ml, ajusted to pH 6.0 with *orthophosphoric acid.*
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

The relative retention time with respect to oxalic acid for succinic acid is 0.8.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to oxalic acid and succinic acid is not less than 2.0 and tailing factor is between 0.5 to 2.0 with reference solution (b). In the chromatogram obtained with reference solution (c), the peak for oxaliplatin related compound A, the signal to noise ratio is not less than 10. The relative standard deviation for replicate injections is not more than 3.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to oxaliplatin related compound A is not more than 0.34 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use auto sampler vials made of polypropylene.

Buffer Solution. Dissolve 1.36 g of *monobasic potassium phosphate* and 0.55 g of *sodium heptanesulfonate* in 1000 ml of *water.* Adjusted to pH 3.0 with *orthophosphoric acid.*

Test solution. A 0.2 per cent w/v solution of oxaliplatin.

Reference solution (a). A 0.2 per cent w/v solution of *oxaliplatin IPRS* in *0.005 M sodium hydroxide.* Allow this solution to stand at room temperature for 5 days. Transfer 5.0 ml of the solution into a 50-ml volumetric flask, and dilute with *water* to volume.

NOTE— The preparation of the reference solution (a) forms (SP-4-2)-diaqua[(1R ,2R)-cyclohexane-1,2-diamine-N,N']platinum and diaquodiaminocyclohexaneplatinum dimer.

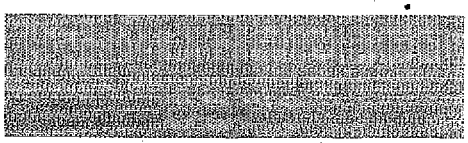
Reference solution (b). Transfer 12.5 mg of *oxaliplatin related compound B IPRS* ([*SP*-4-2-(1*R-trans*)]-(1,2-Cyclohexanediamine-*N,N'*) dinitratoplatinum(II)) in to a 100-ml volumetric flask, add 25.0 ml *methanol* and sonicate for 2 minutes. Add 65.0 ml of *0.01 M nitric acid* and sonicate for additional 30 minutes. Cool and dilute to 100.0 ml with *0.01 M nitric acid.*

Reference solution (c). dilute 5.0 ml of reference solution (b) to 20.0 ml with *0.01 M nitric acid.*

NOTE — Oxaliplatin Related Compound B IPRS is converted to (SP-4-2)-diaqua[(1R ,2R)-cyclohexane-1,2-diamine-N,N']platinum during preparation of the solution.

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 10°,
- mobile phase: A. a mixture of 19 volumes of *methanol* and 81 volumes of a buffer solution,
  B. a mixture of 50.5 volumes of *methanol* and 49.5 volumes of a buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.



https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
45	0	100
45.5	100	0
53.0	100	0

Name	Relative retention time	Correction factor
(*SP*-4-2)-Diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N* ']platinum	1.0	---
Diaquodiaminocyclohexaneplatinum dimer[1]	1.4	0.4

[1](*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N* ']platinum and diaquodiaminocyclohexaneplatinum dimer.

Inject reference solution (a) and (c). The test is not valid unless the tailing factor is not more than 2.0 for (*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N*']platinum peak and resolution between the peaks due to (*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N*']platinum and (*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N*'] platinum and diaquodiaminocyclohexaneplatinum dimer is not less than 8.0 with reference solution (a). The relative standard deviation for replicate injections is not more than 3.0 per cent with reference solution (c).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution the area of *SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N*']platinum is not more than 0.42 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.65 per cent) and Diaquodiaminocyclohexaneplatinum dimer, multiplied with correction factor is not more than 0.32 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Any secondary peak, multiplied with correction factor 0.25 is not more than 0.13 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all the secondary peaks including oxalic acid and (*SP*-4-2)-diaqua[(1*R* ,2*R*)-cyclohexane-1,2-diamine-*N*,*N*']platinum is not more than 1.57 times the area of the principal peak in the chromatogram obtained with reference solution (c) (2.45 per cent).

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Units per mg of oxaliplatin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use auto sampler vials made of polypropylene.

Acidified water. adjust to pH 3.0 with *orthophosphoric acid.*

Test solution. Dilute a measured volume of the injection to obtain a solution containing 0.01 per cent w/v oxaliplatin in *water.*

Reference solution (a). A 0.01 per cent w/v solution of *oxaliplatin IPRS* and *[SP-4-2-(1R -trans)]-(1,2-cyclohexanediamine-N, N') dichloridoplatinum(II)* in *water.*

Reference solution (b). A 0.01 per cent w/v solution of *oxaliplatin IPRS in* water.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: 1 volume of *acetonitrile* and 99 volumes of *acidified water,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with reference to oxaliplatin peak for *[SP-4-2-(1R -trans)]-(1,2-cyclohexanediamine-N,N') dichloridoplatinum(II)* is 0.9.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 for oxaliplatin peak and the resolution between the peaks due to oxaliplatin and [SP-4-2-(1R -trans)]-(1,2-cyclohexanediamine-*N*,*N'*) dichloridoplatinum(II) is not less than 2.0 obtained with reference solution (a). The relative standard deviation for replicate injections is not more than 1.0 per cent for oxaliplatin peak obtained with reference solution (b).

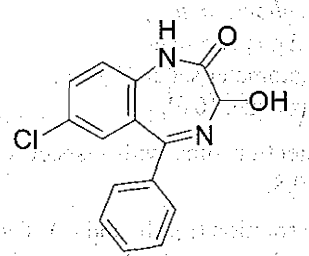
Inject reference solution (b) and the test solution.

Calculate the content of $C_8H_{14}N_2O_4Pt$.

Storage. Store in single-dose or multiple-dose containers, preferably of Type I glass, protected from light, at a temperature below 30°.

Labelling. Label it to state that it is to be diluted with a 5 per cent dextrose solution. Oxaliplatin Injection must not be diluted in sodium chloride solutions or in chloride-containing solutions.

Oxazepam



$C_{15}H_{11}ClN_2O_2$ Mol. Wt 286.7

https://nhathuocngocanh.com/

Oxazepam is 7-chloro-3-hydroxy-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Oxazepam contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{15}H_{11}ClN_2O_2$, calculated on the dried basis.

Category. Anxiolytic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxazepam IPRS* or with the reference spectrum of oxazepam.

B. Dissolve about 20 mg in sufficient *ethanol (95 per cent)* to produce 100 ml. Dilute 10.0 ml of the solution to 50.0 ml with *ethanol (95 per cent)* (solution A). Dilute 5.0 ml of solution A to 20.0 ml with *ethanol (95 per cent)* (solution B). (*NOTE — Prepare the solutions immediately before use, protected from light).*

When examined in the range 230 nm to 360 nm (2.4.7), solution A shows an absorption maximum at about 316 nm. When examined in the range 220 nm to 250 nm, solution B shows an absorption maximum at about 229 nm, is 1.220 to 1.300.

C. Dissolve about 20 mg in a mixture of 5 ml of *hydrochloric acid* and 10 ml of *water*. Heat to boiling for 5 minutes and cool. Add 2 ml of a 0.1 per cent *w/v* solution of *sodium nitrite* and allow to stand for 1 minute. Add 1 ml of a 0.5 per cent w/v solution of *sulphamic acid*, mix and allow to stand for 1 minute. Add 1 ml of 0.1 per cent w/v solution of a *N-(1-naphthyl) ethylenediamine dihydrochloride*; a red colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. A mixture of equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve 40 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 2.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 3.48 g of *dipotassium hydrogen phosphate* in 900 ml of *water*, adjusted to pH 10.5 with a 4.0 per cent w/v *dilute sodium hydroxide solution*, diluted to 1000 ml with *water*,

  B. *acetonitrile*,
- flow rate: 1ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 235 nm,
- injection volume:10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
4	75	25
34	25	75
45	25	75
50	75	25
60	75	25

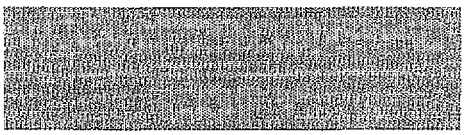
The relative retention time with reference to oxazepam for oxazepam impurity E (7-chloro-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one 4-oxide) is about 0.7, for oxazepam impurity A ((5*RS*)-7-chloro-5-phenyl-4,5-dihydro-1*H*-1,4-benzodiazepine-2,3-dione) is about 0.8, for oxazepam impurity B (7-[(2-aminoethyl)amino]-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid) is about 1.2, for oxazepam impurity C (1-ethyl-4-oxo-6,7-bis(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid) is about 1.4 and for oxazepam impurity D (1-ethyl-6-fluoro-7-(piperazin-1-yl)quinolin-4(1*H*)-one) is about 2.0.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Correction factor for oxazepam impurity A is 4.0 and for oxazepam impurity B is 1.1.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to oxazepam impurity A, B, C, D, E, each of, is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.



https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.002 per cent w/v solution of *oxazepam IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *methanol*, 40 volumes of *water* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{11}ClN_2O_2$.

Storage. Store protected from light and moisture.

Oxazepam Tablets

Oxazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oxazepam, $C_{15}H_{11}ClN_2O_2$.

Usual strengths. 10 mg; 15 mg; 30 mg.

Identification

A. Extract a quantity of the powdered tablets containing 20 mg of Oxazepam with 25 ml of *chloroform*, filter, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxazepam IPRS or* with the *reference spectrum* of oxazepam.

B. When examined in the range 210 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 230 nm and 316 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maximum at about 236 nm (2.4.7). Calculate the content of $C_{15}H_{11}ClN_2O_2$ in the medium taking 1080 as the specific absorbance at 236 nm.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{11}ClN_2O_2$.

Related substances. *Carry out the test protected from light.*

Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF 254*.

Wash the plate with *methanol* before use.

Mobile phase. A mixture of 100 volumes of *dichloromethane* and 10 volumes of *methanol*.

Test solution. Shake a quantity of powdered tablets containing 30 mg of Oxazepam with 6 ml of *acetone* and centrifuge.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetone*.

Reference solution (b). Dilute 1.0 ml of the test solution to 500.0 ml with *acetone*.

Reference solution (c). A solution containing 0.1 per cent w/v each of *oxazepam IPRS* and *bromazepam IPRS*.

Apply to the plate 20 µl of each of the solutions. Allow the mobile phase to rise 17 cm in the same direction as in the washing with methanol. Dry in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

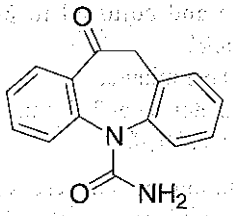
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Oxazepam and shake with 150 ml of *ethanol (95 per cent)* for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 250.0 ml and centrifuge. Dilute 5.0 ml of the supernatant liquid to 100.0 ml with the same solvent and measure the absorbance of the resulting solution at the maximum at about 230 nm (2.4.7). Calculate the content of $C_{15}H_{11}ClN_2O_2$ taking 1250 as the specific absorbance at 230 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Oxcarbazepine



$C_{15}H_{12}N_2O_2$ Mol. Wt. 252.3

Oxcarbazepine is 10,11-dihydro-10-oxo-5*H*-dibenz[*b*,*f*]azepine-5-carboxamide.

Oxcarbazepine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{12}N_2O_2$, calculated on the dried basis.

Category. Anticonvulsants.

Description. An off-white to yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxcarbazepine IPRS* or with the reference spectrum of oxcarbazepine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *oxcarbazepine IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil C18),
- column temperature 50°,
- mobile phase: a mixture of 22 volumes of *methanol*, 16 volumes of *acetonitrile* and 62 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adding 2 ml of *triethylamine* and adjusted to pH 6.0 with *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatograms for about 80 minutes. The relative retention times with reference to oxcarbazepine are 1.7 for dibenz[b,f] azepine-5-carboxylic acid amide (oxcarbazepine impurity A), 7.9 for 10-methoxy-5H-dibenz[b,f]azepine (oxcarbazepine impurity B), and 2.5 for 10-methoxy-5H-dibenz [b,f]azepine-5-carboxylic acid amide (oxcarbazepine impurity C).

Calculate the contents of the impurities in the test solution using the correction factors, 0.68 for oxcarbazepine impurity A, 0.76 for oxcarbazepine impurity B and 0.80 for oxcarbazepine impurity C. Not more than 1.0 per cent of oxcarbazepine impurity A and not more than 0.1 per cent, each of, oxcarbazepine impurity B and oxcarbazepine impurity C and not more than 0.1 per cent of any other impurity is found and the sum of all the impurities is not more than 1.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under related substances using the following solution.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *oxcarbazepine IPRS* in the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{12}N_2O_2$.

Storage. Store protected from moisture.

Oxcarbazepine Tablets

Oxcarbazepine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oxcarbazepine, $C_{15}H_{12}N_2O_2$.

Usual strengths. 150 mg; 300 mg; 450 mg; 600 mg.

https://nhathuocngocanh.com/

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

B. Extract a quantity of the powdered tablets containing about 50 mg of oxcarbazepine with 100 ml with *methanol* and filter. Dilute 2.0 ml of the solution to 100.0 ml with *methanol*. When examined in the range 200 nm to 350 nm (2.4.7), the solution shows an absorption maximum at about 254 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 0.75 per cent w/v solution of *sodium lauryl sulphate* in *water*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{15}H_{12}N_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *oxcarbazepine IPRS* prepared by dissolving in minimum volume of *methanol* and then diluting with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{12}N_2O_2$ in the medium.

Related substances. Determine by liquid chromatography (2.4.14).

Note — Use freshly prepared solutions.

Test solution (a). Weigh a quantity of the powdered tablets containing 50 mg of Oxcarbazepine add 15 ml *methanol*, mix with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *methanol*. Mix and centrifuge.

Test solution (b). Dilute 5.0 ml of test solution (a) to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *oxcarbazepine IPRS* in *methanol* with the aid of ultrasound and dilute to 50.0 ml with *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- column temperature 50°,
- mobile phase: a mixture of 66 volumes of *0.05M potassium dihydrogen phosphate*, 14 volumes of *acetonitrile* and 20 volumes of *methanol*, add 0.1 ml of *triethylamine* and adjusted to pH 6.0 with *ortho-phosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject test solution (a) and reference solution (c). Run the chromatograms for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

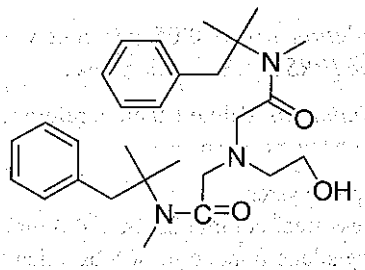
Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject test solution (b) and reference solution (b).

Calculate the content of $C_{15}H_{12}N_2O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Oxetacaine



$C_{28}H_{41}N_3O_3$ Mol. Wt. 467.6

Oxetacaine is 2,2′-(2-hydroxyethylimino)bis[*N*-(α,α-dimethylphenethyl)-*N*-methylacetamide].

Oxetacaine contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{28}H_{41}N_3O_3$ calculated on the dried basis.

Category. Local Anaesthetic.

Description. A white or almost white powder.

https://nhathuocngocanh.com/

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxetacaine IPRS* or with the reference spectrum of oxetacaine.

Tests

Melting point (2.4.21). 100° to 104°.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *18 M ammonia*, 20 volumes of *ethanol* and 79 volumes of *toluene*.

Test solution. Dissolve 1.0 g of the substance under examination in 10.0 ml of *ethyl acetate*.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *ethyl acetate*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with *ethyl acetate*.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air and spray with a solution containing 6 per cent w/v of *ammonium thiocyanate* and 2 per cent w/v of *cobalt (II) chloride*, allow to dry in air for 10 minutes. In the chromatogram obtained with the test solution, any secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one secondary spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

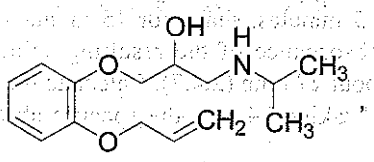
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60°, at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Dissolve 1.0 g in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04676 g $C_{28}H_{41}N_3O_3$.

Oxprenolol Hydrochloride



$C_{15}H_{23}NO_3,HCl$ Mol. Wt. 301.8

Oxprenolol Hydrochloride is (*RS*)-1-(2-allyloxyphenoxy)-3-isopropylaminopropan-2-ol hydrochloride.

Oxprenolol Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{23}NO_3,HCl$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist (antihypertensive; antianginal; antiarrhythmic).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxprenolol hydrochloride IPRS* or with the reference spectrum of oxprenolol hydrochloride.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to spot in the chromatogram obtained with reference solution (c).

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution GYS6 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a freshly prepared 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 88 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 0.5 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (c). A 0.5 per cent w/v solution of *oxprenolol hydrochloride IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 13 cm. Dry the plate in warm air for 10 minutes, allow to cool, spray with *anisaldehyde solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 6 hours.

Assay. Dissolve 0.25 g in 60 ml of *anhydrous glacial acetic acid*, add 5 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25).Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03018 g of $C_{15}H_{23}NO_3$,HCl.

Storage. Store protected from light and moisture.

Oxprenolol Tablets

Oxprenolol Hydrochloride Tablets

Oxprenolol Hydrochloride Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of oxprenolol hydrochloride, $C_{15}H_{23}NO_3$,HCl. The tablets are coated.

Usual strengths. 40 mg; 80 mg.

Identification

A.To a quantity of the powdered tablets containing 50 mg of Oxprenolol Hydrochloride add 10 ml of *water* and 2 ml of *dilute sodium hydroxide solution*, extract with 10 ml of *chloroform* and reserve the aqueous layer for test C. Dry the chloroform extract over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxprenolol hydrochloride IPRS* treated in the same manner or with the reference spectrum of oxprenolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 273 nm.

C. The aqueous layer obtained in test A gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maximum at about 272 nm (2.4.7). Calculate the content of $C_{15}H_{23}NO_3$,HCl in the medium from the absorbance obtained from a solution of known concentration of *oxprenolol hydrochloride IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{15}H_{23}NO_3$,HCl.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 88 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Extract a quantity of the powdered tablets containing 0.25 g of Oxprenolol Hydrochloride with 5 ml of *water*, centrifuge and use the supernatant liquid.

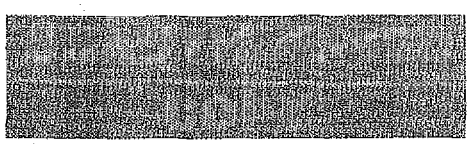
Reference solution. Dilute 1.0 volume of the test solution to 200.0 volumes with *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 13 cm. Dry the plate in warm air for 10 minutes, allow to cool, spray with *anisaldehyde solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 20 mg of Oxprenolol Hydrochloride, add 25 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 250.0 ml. Mix with the aid of ultrasound for 5 minutes, shake for 15 minutes and filter. Measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7). Calculate the content of $C_{15}H_{23}NO_3$,HCl taking 74.5 as the specific absorbance at 273 nm.

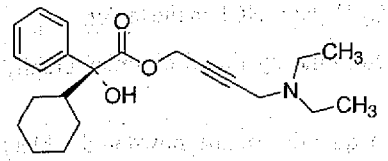
Storage. Store protected from moisture.



https://nhathuocngocanh.com/

Oxybutynin Hydrochloride

Oxybutynin Chloride



, HCl and enantiomer

$C_{22}H_{31}NO_3,HCl$ Mol. Wt. 394.0

Oxybutynin is 4-(Diethylamino)but-2-ynyl (*RS*)-2-cyclohexyl-2-hydroxy-2-phenylacetate hydrochloride.

Oxybutynin Hydrochloride contains not less than 99.0 per cent and not more than 102.0 per cent of $C_{22}H_{31}NO_3,HCl$, calculated on the dried basis.

Category. Anticholinergic.

Identification

Test B and C may be omitted if tests A and D are carried out. Tests A may be omitted if tests C, B and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxybutynin hydrochloride IPRS* or with reference spectrum of oxybutynin hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. *Methanol*.

Test solution. Dissolve 50 mg of the substance under examination in *ethanol (95 per cent)* and dilute to 10.0 ml with the *ethanol (95 per cent)*.

Reference solution. A 0.5 per cent w/v solution of *oxybutynin hydrochloride IPRS* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air. Expose the plate to the vapour of iodine for 30 minutes and examine the plate again. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

C. Melting point (2.4.21). 124° to 129°.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Solution A. A 5.0 per cent w/v solution in *water*.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely colored than reference solution BYS5 (2.4.1).

Optical rotation (2.4.22). - 0.10° to + 0.10°, determined on *Solution A*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *oxybutynin hydrochloride IPRS* and 5.0 mg of *oxybutynin impurity A IPRS (4-(diethylamino)but-2-ynyl (RS)-2-(cyclohex-3-enyl)-2-cyclohexyl-2- hydroxyacetate)* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b) Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system

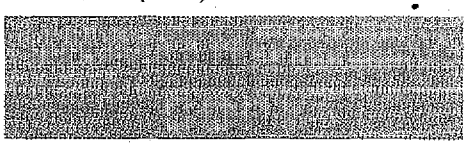
- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to silica gel (5 µm),
- mobile phase: a mixture of 49 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen phosphate* and 4.36 g of *di potassium hydrogen phosphate* in 1000 ml of *water* and 51 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

The retention time of oxybutynin peak is about 15 minutes and impurity A peak is about 24 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to oxybutynin and oxybutynin impurity A is not less than 11.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak corresponding to impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all secondary peaks other than impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (20 ppm), using 10.0 ml of *lead standard solution (1 ppm Pb)*.



https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Sulphated ash (2.3.18). Not more than 0.1 per cent

Assay. Dissolve 0.300 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50.0 ml of *ethanol (95 per cent)* and and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0394 g of $C_{22}H_{31}NO_3$,HCl.

Storage. Store protected from moisture.

Oxybutynin Prolonged-release Tablets

Oxybutynin Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Oxybutynin Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oxybutynin hydrochloride, $C_{22}H_{31}NO_3$,HCl.

Usual strengths. 5 mg; 10 mg.

Identification

Disperse a quantity of the powdered tablets containing 25 mg of oxybutynin hydrochloride in 20 ml of *water* add sufficient *2M sodium hydroxide* to adjusted to pH 12.0 and extract with four quantities, each of 20 ml *hexane*. Filter the collected hexane layers through *anhydrous sodium sulphate* (Whatman GF/C is suitable). Evaporate the filtrate to dryness under a current of nitrogen, to yield a clear, sticky liquid residue. Prepare a thin film from the residue to be held between two plates or in cell of suitable path length constructed of material transparent to infrared radiation. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxybutynin hydrochloride IPRS* treated in the same manner or with the reference spectrum of oxybutynin.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Uniformity of content. Complies the test stated under tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic condition as described under Assay.

To one tablet, add 50 ml of *0.01 M hydrochloric acid*, disperse with the aid of ultrasound for 20 minutes and dilute to volume with *0.01 M hydrochloric acid* to produce a solution containing 0.005 per cent w/v of oxybutynin hydrochloride.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{31}NO_3$,HCl. in the tablet.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of oxybutynin hydrochloride in 40 ml of *0.01 M hydrochloric acid* with the aid of ultrasound for 15 minutes, add sufficient *0.01 M hydrochloric acid* to produce 50.0 ml, mix and filter.

Reference solution (a). A 0.0015 per cent w/v solution of *oxybutynin impurity A (4-(diethylamino)but-2-ynyl (RS)-2-(cyclohex-3-enyl)-2-cyclohexyl-2- hydroxyacetate)* in *0.01 M hydrochloric acid.*

Reference solution (b). A 0.0014 per cent w/v solution of *phenylcyclohexylglycolic acid IPRS* in *0.01M hydrochloric acid.*

Reference solution (c). Dilute 1.0 ml of test solution to 200.0 ml with *0.01 M hydrochloric acid.*

Reference solution (d). A 0.001 per cent w/v solution of *oxybutynin impurity A (4-(diethylamino)but-2-ynyl (RS)-2-(cyclohex-3-enyl)-2-cyclohexyl-2- hydroxyacetate)* in reference solution (c).

Chromatographic system

- a stainless steel column, 15 cm x 4.6 mm, packed with octadecylsilyl silica gel (5 µm),
- mobile phase: A. a solution contaning 0.34 per cent w/v solution of *potassium dihydrogen orthophosphate* and 0.436 per cent w/v solution of *dipotassium hydrogen orthophosphate* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
5	70	30
6	45	55
50	45	55
51	70	30
60	70	30

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to oxybutynin

https://nhathuocngocanh.com/

hydrochloride and oxybutynin impurity A is not less than 10.0.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to oxybutynin impurity A is not more than the area of the area of principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). The area of any peak corresponding to phenylcyclohexylglycolic acid is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent), the area of any other secondary peak, other than the peak corresponding to oxybutynin impurity A and phenylcyclo-hexylglycolic acid is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 10 tablets in 400 ml of *0.01 M hydrochloric acid* for 20 minutes with the aid of ultrasound, cool, add sufficient *0.01 M hydrochloric acid* to produce 500 ml, mix and filter (Whatman GF/C is suitable). Dilute a volume of the solution with sufficient *0.01M hydrochloric acid* to produce a solution containing 0.005 per cent w/v of oxybutynin hydrochloride.

Reference solution. A 0.005 per cent w/v solution of *oxybutynin hydrochloride IPRS* in *0.01M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with nitrile silica gel (5 µm),
- column temperature 40°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 4.8 g of anhydrous *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH between 3.0 to 3.5 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{31}NO_3$,HCl in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Oxybutynin Tablets

Oxybutynin Hydrochloride Tablets; Oxybutynin Chloride Tablets

Oxybutynin Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of oxybutynin hydrochloride, $C_{22}H_{31}NO_3$, HCl.

Usual strengths. 2.5 mg; 5.0 mg.

Identification

To a quantity of the powdered tablets containing 25 mg of Oxybutynin Hydrochloride, add sufficient *2 M sodium hydroxide* adjust to pH 12.0 and extract with four 20-ml quantities of *hexane.* Filter the collected hexane layers through *anhydrous sodium sulphate* and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *oxybutynin hydrochloride IPRS* treated in the same manner or with the reference spectrum of oxybutynin.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, diluted if necessary, with the dissolution medium, discard the first few ml of filtrate.

Reference solution. A 0.0005 per cent w/v solution of *oxybutynin hydrochloride IPRS* in the dissolution medium, diluted further if necessary.

Use the chromatographic system as described under Assay.

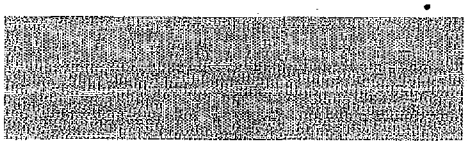
Calculate the content of $C_{22}H_{31}NO_3$,HCl.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{31}NO_3$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing about 50 mg of Oxybutynin Hydrochloride in 40 ml of *0.01 M hydrochloric acid* with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with same solvent and filter.

Reference solution (a). A 0.0015 per cent w/v solution of *oxybutynin impurity A IPRS [4-(diethylamino)but-2-ynyl (RS)-2-(cyclohex-3-enyl)-2-cyclohexyl-2-hydroxyacetate]* in *0.01 M hydrochloric acid.*



https://nhathuocngocanh.com/

Reference solution (b). A 0.001 per cent w/v solution of *phenylcyclohexylglycolic acid IPRS [(RS)-2-cyclohexyl-2-hydroxy-2-phenylacetic acid (phenylcyclohexylglycolic acid)]* in *0.01 M hydrochloric acid.*

Reference solution (c). Dilute 1.0 ml of the test solution to 200.0 ml with *0.01 M hydrochloric acid.*

Reference solution (d). A 0.001 per cent w/v solution of *oxybutynin impurity A IPRS* in reference solution (c).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm)
- mobile phase: A. a mixture of 0.34 per cent w/v solution of *potassium dihydrogen orthophosphate* and 0.436 per cent w/v solution of *dipotassium hydrogen orthophosphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
5	70	30
6	45	55
50	45	55
51	70	30
60	70	30

The retention time are about 31 minutes for the peaks due to oxybutynin hydrochloride and about 47 minutes for oxybutynin impurity A.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to oxybutynin hydrochloride and oxybutynin impurity A is not less than 10.0

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to oxybutynin impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the area of any peak corresponding to phenylcyclohexylglycolic acid is not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of areas of all other secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solutions.

Test solution. Disperse one tablet in *0.01 M hydrochloric acid,* sonicate and dilute if necessary to obtain a solution containing 0.005 per cent w/v of Oxybutynin Hydrochloride in *0.01 M hydrochloric acid.*

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of Oxybutynin Hydrochloride with 400 ml of *0.01M hydrochloric acid,* with the aid of ultrasound for 20 minutes and dilute to 500.0 ml with *0.01 M hydrochloric acid* mix and filter.

Reference solution. A 0.005 per cent w/v solution of *oxybutynin hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 300 volumes of *acetonitrile* and 700 volumes of 0.48 per cent w/v solution of *anhydrous potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 to 3.5 with *orthophosphoric acid.*
- flow rate: 2 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{31}NO_3,HCl$ in the tablets.

Oxygen

O_2 Mol. Wt. 32.0

Oxygen contains not less than 99.0 per cent v/v of O_2.

This monograph applies to oxygen for medicinal use only.

Oxygen should be stored in approved metal cylinders, the shoulder of the metal cylinder should be painted white and the remainder black. The cylinder should carry a label stating "Oxygen". In addition, "Oxygen" or the symbol "O_2" should be stencilled in paint on the shoulder of the cylinder.

When Oxygen is intended for use in a room in which magnetic resonance imaging (MRI) is being performed, the cylinder and fittings should be made from suitable non- ferromagnetic materials and labelled accordingly.

https://nhathuocngocanh.com/

Description. A colourless gas.

Identification

A. Shake with *alkaline pyrogallol solution;* the gas under examination is absorbed and the solution becomes dark brown.

B. It complies with the limits of the Assay.

Tests

Carbon dioxide. Not more than 300 ppm v/v, determined by using a carbon dioxide detector tube (2.1.1).

Carbon monoxide. Not more than 5 ppm v/v, determined by using a carbon monoxide detector tube (2.1.1).

Water vapour. Not more than 67 ppm v/v, determined by using a water vapour detector tube (2.1.1).

Assay. Determine the concentration of oxygen using a paramagnetic analyser (2.3.33).

Storage. Storeas a compressed gas or store in liquid form in appropriate containers, complying with the legal regulations. Oils and grease are not to be used unless they are oxygen-compatible.

Labelling. The label states 1) Oxygen containers should carry a label stating "Oxygen" and "for medicinal use"; 2) "liquid" if oxygen was produced by the air liquefaction process 3). Where it is piped directly from the cylinder or storage tank to the patient point of use, label each outlet "Oxygen".

Oxygen 93 Per Cent

Oxygen 93 Per Cent contains not less than 90.0 per cent and not more than 96.0 per cent, v/v of O_2, the remainder consisting mostly of argon and nitrogen. It is produced from air by the molecular sieve process.

This monograph applies to oxygen 93 Per Cent for medicinal use. It does not apply to gas produced using individual concentrators for domiciliary use.

Description. A colourless gas.

Identification

A. Shake with *alkaline pyrogallol solution;* the gas under examination is absorbed and the solution becomes dark brown.

B. It complies with the limits of the Assay.

Tests

Carbon dioxide. Not more than 300 ppm v/v, determined by using a carbon dioxide detector tube (2.1.1).

Carbon monoxide. Not more than 5 ppm v/v, determined by using a carbon monoxide detector tube (2.1.1).

Nitrogen monoxide and nitrogen dioxide. Not more than 2 ppm v/v in total, determined by using a nitrogen monoxide and nitrogen dioxide detector tube (2.1.1).

Sulfur dioxide. Not more than 1 ppm v/v, determined by using a sulfur dioxide detector tube (2.1.1).

Oil. Not more than 0.1 mg per m^3, determined by using an oil detector tube (2.1.1).

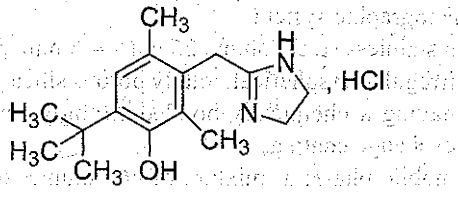
Water vapour. Not more than 67 ppm v/v, determined by using a water vapour detector tube (2.1.1).

Assay. Determine the concentration of oxygen using a paramagnetic analyser (2.3.33).

Storage. Oxygen 93 per cent obtained from an oxygen concentrator is normally used on site, where it is produced. It is fed directly into a medicinal gas pipeline or administration system. Where authorised by the competent authority, it may be stored in appropriate containers complying with the legal regulations. Oils and grease are not to be used unless theyare oxygen-compatible.

Labelling. The label state 1) The cylinder should carry a label stating"Oxygen 93 Per Cent" and "For medicinal use"; 2) Where it is piped directly from the cylinder or storage tank to the patient point of use, label each outlet "Oxygen 93 Per Cent"; 3) If it is stored in cylinders, the shoulder of the cylinder should be painted white and the remainder black.

Oxymetazoline Hydrochloride



$C_{16}H_{24}N_2O,HCl$ Mol. Wt. 296.8

Oxymetazoline Hydrochloride is Phenol, 3-[(4,5-dihydro-1H -imidazol-2-yl)methyl]-6-(1,1-dimethylethyl)-2,4-dimethyl-, monohydrochloride. 6-tert-Butyl-3-(2-imidazolin-2-ylmethyl)-2,4-dimethylphenol monohydrochloride.

Oxymetazoline Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{16}H_{24}N_2O,HCl$, calculated on the dried basis.

Description. A white or almost white powder.

Category. Sympathomimetic amine.

https://nhathuocngocanh.com/

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxymetazoline hydrochloride IPRS* or with the reference spectrum of oxymetazoline hydrochloride.

B. When examined in the range of 220 nm to 360 nm (2.4.7). A 0.01 per cent w/v solution of the substance under examination in *water*, shows absorption maxima at about 279 nm. The specific absorbance of the substance under examination, calculated on the dried basis, does not differ by more than 3.0 per cent from the specific absorbance of *oxymetazoline hydrochloride IPRS* prepared in the same manner.

C. To a solution of about 50 mg in 3 ml of *water*, add 1 ml of *6 M ammonium hydroxide*, filter and acidify the filtrate with *nitric acid*, the filtrate gives to the test for chloride (2.3.1)

Test

pH (2.4.24). 4.0 to 6.5, determined in a 5.0 per cent w/v solution.

Heavy metals (2.3.13). 2 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *oxymetazoline hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with irregular or spherical, totally porous silica gel (10 µm) having a chemically bonded strongly acidic cation-exchange coating,
- mobile phase: a mixture of 46 volumes of *water*, 40 volumes of *methanol*, 10 volumes of *1 M sodium acetate* and 4 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{24}N_2O,HCl$.

Storage. Store in tightly closed containers.

Oxymetazoline Hydrochloride Nasal Solution

Oxymetazoline Hydrochloride Nasal Solution is a solution of Oxymetazoline Hydrochloride in *water* adjusted to a suitable tonicity.

Oxymetazoline Hydrocloride Nasal Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the oxymetazoline hydrochloride, $C_{16}H_{24}N_2O,HCl$.

Usual strength. 0.05 per cent.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.5.

Other tests. Comply with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Use the Nasal Solution under examination.

Reference solution. Dissolve a suitable quantity of *oxymetazoline hydrochloride IPRS* in mobile phase to obtain a solution containing the same concentration of oxymetazoline hydrochloride as that stated on the label of the nasal solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with irregular or spherical, totally porous silica gel (10 µm) having a chemically bonded strongly acidic cation-exchange coating,
- mobile phase: a mixture of 46 volumes of *water*, 40 volumes of *methanol*, 10 volumes of *1 M sodium acetate* and 4 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{24}N_2O,HCl$ in the nasal solution.

Storage. Store in tightly closed containers.

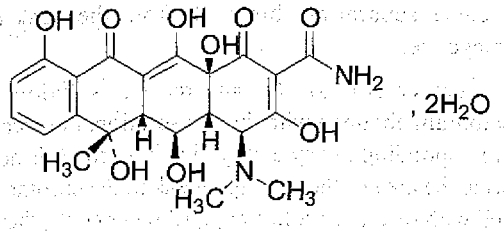
Oxytetracycline

Oxytetracycline Dihydrate



$C_{22}H_{24}N_2O_9,2H_2O$ Mol. Wt. 496.5

Oxytetracycline is (4*S*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-4-dimethyl amino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide dihydrate, a substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means. It contains a variable quantity of water.

Oxytetracycline contains not less than 94.5 per cent and not more than 102.0 per cent of, $C_{22}H_{24}N_2O_9$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A tan yellow or light yellow (with or without a greenish tinge), crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS*, *oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

Tests

pH (2.4.24). 4.5 to 7.5, determined in a 1.0 per cent w/v suspension in freshly boiled and cooled *water*.

Specific optical rotation (2.4.22). −216° to −203°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*, after allowing the solution to stand protected from light for 30 minutes before measurement.

Light absorption. Absorbance of a 0.002 per cent w/v solution in *buffer solution pH 2.0* at the maximum at about 353 nm, 0.58 to 0.62 (2.4.7).

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within 1 hour of preparing the solution, not more than 0.25, calculated on the anhydrous basis (2.4.7).

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 20 mg of the substance under examination in *0.01 M hydrochloric acid* and dilute to 25.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.008 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid*. Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (b). A 0.08 per cent w/v solution of *oxytetracycline for system suitability IPRS* (containing impurity A, B, C, D and E) in *0.01 M hydrochloric acid*.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. a 0.05 per cent v/v solution of *trifluoroacetic acid*,
  B. a mixture of 80 volumes of *acetonitrile*, 15 volumes of *methanol* and 5 volumes of *tetrahydrofuran*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

[1](4*R*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-4-(dimethylamino)-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epioxytetracycline),

[2](4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (tetracycline),

[3](4*S*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-2-acetyl-4-(dimethylamino)-3,5,6,10,12,12a-hexahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione (2-acetyl-2-decarbamoyloxy-tetracycline),

[4](3*S*,4*S*,5*S*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-ene-1-carboxamide,

[5](3*S*,4*S*,5*R*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-ene-1-carboxamide.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where *Hp* is the height above the baseline of the peak due to oxytetracycline impurity A and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to oxytetracycline and not less than 3.0, where *Hp* is the height above the baseline of the peak due to oxytetracycline impurity B and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to oxytetracycline.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to oxytetracycline impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any peak corresponding to oxytetracycline impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to oxytetracycline impurity A is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent), the area of any peak corresponding to oxytetracycline impurity D and oxytetracycline impurity E is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 0.4 g complies with limit the test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 6.0 per cent to 9.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *0.01M hydrochloric acid* and dilute to 25.0 ml with *0.01M hydrochloric acid*. Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*.

Reference solution. A 0.008 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid*.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_9$.

Oxytetracycline intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of Oxytetracycline.

Oxytetracycline intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytetracycline Injection

Oxytetracycline Dihydrate Injection

Oxytetracycline Injection is a sterile solution of oxytetracycline with or without one or more suitable buffering agents, anaesthetics, preservatives, antioxidants, complexing agents and solvents.

Oxytetracycline Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of anhydrous oxytetracycline, $C_{22}H_{24}N_2O_9$.

Usual strengths. 50 mg per ml; 125 mg per ml.

Description. A clear, yellow to tan yellow solution. It may have a greenish tinge.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Shake a quantity containing 10 mg of anhydrous oxytetracycline with 20 ml of *methanol*, centrifuge if necessary and use the clear supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS*, *oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Add 0.1 ml to 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

Tests

pH (2.4.24). 8.0 to 9.0.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of Oxytetracycline.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.5. A mixture of 85 volumes of 0.33 M *dibasic potassium phosphate* and 15 volumes of 0.33 M *monobasic sodium phosphate*, adjusted to pH 7.5.

Test solution. Dilute a volume of the injection containing 100 mg of oxytetracycline to 500.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.02 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.02 per cent w/v solution of *tetracycline hydrochloride IPRS* in *0.01 M hydrochloric acid*. To 3.0 ml of the solution, add 1.5 ml of reference solution (a) and dilute to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (5 to10 µm),
- column temperature: 60°,
- mobile phase: a solution prepared by mixing 50 g of *tertiary butyl alcohol* with 200 ml of *water* in 1000-ml volumetric flask, add 60 ml of phosphate buffer pH 7.5, 50 ml of 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*, adjusted to pH 7.5 with *1M sodium*

https://nhathuocngocanh.com/

hydroxide and 10 ml of a 0.04 per cent w/v solution of *disodium edetate*, adjusted to pH 7.5 with *2 M sodium hydroxide* and dilute to volume with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to tetracycline for oxytetracycline is about 0.6.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peak due to oxytetracycline and tetracycline is not less than 5.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.25 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

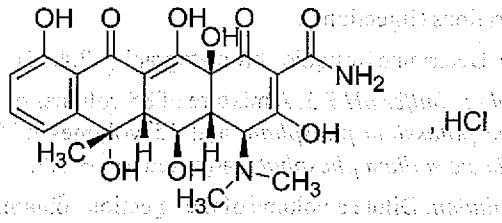
Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_9$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) the strength in mg of anhydrous oxytetracycline per ml; (2) that the contents are to be used for intramuscular use only; (3) the names of any preservatives used.

Oxytetracycline Hydrochloride



$C_{22}H_{24}N_2O_9,HCl$ Mol. Wt. 496.9

Oxytetracycline Hydrochloride is (4*S*,4a*R*,5*S*,5a*R*,6*S*, 12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide hydrochloride, a substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means.

Oxytetracycline Hydrochloride contains not less than 94.5 per cent and not more than 102.0 per cent of, $C_{22}H_{24}N_2O_9$, HCl, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A pale yellow, crystalline powder; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS*, *oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

D. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). – 200° to – 188°, determined at 20° in a 1 per cent w/v solution in *0.1 M hydrochloric acid*.

Light absorption (2.4.7). Absorbance of a 0.002 per cent w/v solution in *chloride buffer solution pH 2.0* at the maximum at about 353 nm, 0.54 to 0.58.

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within 1 hour of preparing the solution, not more than 0.50, calculated on the anhydrous basis (2.4.7).

https://nhathuocngocanh.com/

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 20 mg of the substance under examination in *0.01 M hydrochloric acid* and dilute to 25.0 ml with *0.01 M hydrochloric acid.*

Reference solution (a). A 0.008 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid.* Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid.*

Reference solution (b). A 0.08 per cent w/v solution of *oxytetracycline for system suitability IPRS* (containing impurity A, B, C, D and E) in *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,

[4](3*S*,4*S*,5*S*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-ene-1-carboxamide,

[5](3*S*,4*S*,5*R*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-ene-1-carboxamide,

[6](4*S*,4a*R*,5*R*,12a*S*)-4-(dimethylamino)-3,5,10,11,12a-pentahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (anhydro-*oxytetracycline*).

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where *Hp* is the height above the baseline of the peak due to oxytetracycline impurity A and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to oxytetracycline and not less than 3.0, where *Hp* is the height above the baseline of the peak due to oxytetracycline impurity B and *Hv* is the height above the baseline of the lowest point of the curve separating this peak from the peak due to oxytetracycline.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to oxytetracycline impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any peak corresponding to oxytetracycline impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to oxytetracycline impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to oxytetracycline impurity D and oxytetracycline impurity E, each of, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of the areas of the peaks due to oxytetracycline impurity D, E and F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

https://nhathuocngocanh.com/

Heavy metals (2.3.13). 0.4 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 2.0 per cent w/w, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *0.01M hydrochloric acid* and dilute to 25.0 ml with *0.01M hydrochloric acid.* Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid.*

Reference solution. A 0.008 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid.*

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_9$,HCl. 1 mg of $C_{22}H_{24}N_2O_9$ is equivalent to 1.079 mg of $C_{22}H_{24}N_2O_9$,HCl.

Oxytetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg.

Oxytetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with test for sterility (2.2.11).

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytetracycline Capsules

Oxytetracycline Hydrochloride Capsules

Oxytetracycline Capsules contain not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Usual strengths. 250 mg; 500 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution.* After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate,* 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution.*

Test solution. Extract a quantity of the contents of the capsules containing 10 mg of Oxytetracycline Hydrochloride with 20 ml *methanol*, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *methanol.*

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS, oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol.*

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To 0.5 mg of the contents of the capsules add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg of the contents of the capsules in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; a light brown colour is produced.

D. The contents of the capsules give the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

https://nhathuocngocanh.com/

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 353 nm (2.4.7). Calculate the content of $C_{22}H_{24}N_2O_9$,HCl in the medium taking 282 as the specific absorbance at 353 nm.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{24}N_2O_9$,HCl in the medium.

Light-absorbing impurities. Dissolve a portion of the mixed contents of five capsules as completely as possible in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce two solutions of Oxytetracycline Hydrochloride containing (1) 0.2 per cent w/v and (2) 1.0 per cent w/v and filter each solution. Absorbance of the filtrate obtained from solution (1) at about 430 nm, when measured within 1 hour of preparing the solution, not greater than 0.75 and of the filtrate obtained from solution (2) at about 490 nm, not more than 0.40 (2.4.7).

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g of the mixed contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.5. A mixture of 85 volumes of 0.33 M *dibasic potassium phosphate* and 15 volumes of 0.33 M *monobasic sodium phosphate*, adjusted to pH 7.5.

Test solution. Disperse a quantity of mixed content of 20 capsules containing 100 mg of oxytetracycline hydrochloride in *0.01 M hydrochloric acid* and dilute to 500.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.02 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.02 per cent w/v solution of *tetracycline hydrochloride IPRS* in *0.01 M hydrochloric acid*. To 3.0 ml of the solution, add 1.5 ml of reference solution (a) and dilute to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (5 to10 µm),
- column temperature: 60°,
- mobile phase: a solution prepared by mixing 50 g of *tertiary butyl alcohol* with 200 ml of *water* in 1000-ml volumetric flask, add 60 ml of phosphate buffer pH 7.5, 50 ml of 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*, adjusted to pH 7.5 with *1 M sodium hydroxide* and 10 ml of a 0.04 per cent w/v solution of *disodium edetate*, adjusted to pH 7.5 with *2 M sodium hydroxide* and dilute to volume with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to tetracycline for oxytetracycline is about 0.6.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peak due to oxytetracycline and tetracycline is not less than 5.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.25 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_9$,HCl in the capsules.

Storage. Store protected from light and moisture.

Oxytetracycline Eye Ointment

Oxytetracycline Hydrochloride Eye Ointment

Oxytetracycline Eye Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Usual strength. 1 per cent w/w.

Identification

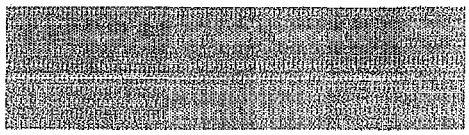
Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. A solution prepared by heating a quantity containing 20 mg of Oxytetracycline Hydrochloride with 20 ml of *methanol* for 20 minutes, cooling in ice, filtering, carefully evaporating the filtrate to dryness and dissolving the residue in 20 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS*, *oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.



https://nhathuocngocanh.com/

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

Tests

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Eye Ointments.

Assay. Weigh 1.0 g and transfer to a separating funnel. Add 25 ml of *peroxide-free ether*, shake well and extract with five quantities, each of 20 ml, of *0.1 M hydrochloric acid*. Combine the extracts and dilute to 200.0 ml with *0.1 M hydrochloric acid*. Dilute a suitable volume of the resulting solution with *buffer solution No 3* (2.2.10), to produce a solution containing 1 µg of oxytetracycline per ml.

Determine by the microbiological assay of antibiotics, Method B (2.2.10), and express the results as a percentage of oxytetracycline hydrochloride taking each mg of oxytetracycline to be equivalent to 1.079 mg of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9,HCl$.

Storage. Store protected from light and moisture.

Oxytetracycline Hydrochloride Injection

Oxytetracycline Hydrochloride Injection is a sterile material consisting of Oxytetracycline Hydrochloride with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution may be used within three days of preparation when stored in a refrigerator (2° to 8°).

Oxytetracycline Hydrochloride Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of oxytetracycline, $C_{22}H_{24}N_2O_9$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. The equivalent of 250 mg and 500 mg of oxytetracycline.

Description. A pale yellow, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride IPRS*, *oxytetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and yellow.

pH (2.4.24). 2.0 to 3.0, determined in a 1.0 per cent w/v solution.

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within

https://nhathuocngocanh.com/

1 hour of preparing the solution, not more than 0.50, calculated on the anhydrous basis (2.4.7).

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg.

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.5. A mixture of 85 volumes of 0.33 M *dibasic potassium phosphate* and 15 volumes of 0.33 M *monobasic sodium phosphate*, adjusted to pH 7.5.

Test solution. Reconstitute 5 vials and pool the sample. Dilute a volume of the injection in *0.01 M hydrochloric acid* to obtain a solution containing 0.02 per cent w/v of oxytetracycline.

Reference solution (a). A 0.02 per cent w/v solution of *oxytetracycline IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.02 per cent w/v solution of *tetracycline hydrochloride IPRS* in *0.01 M hydrochloric acid*. To 3.0 ml of the solution, add 1.5 ml of reference solution (a) and dilute to 25.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (5 to10 µm),
- column temperature: 60°,
- mobile phase: a solution prepared by mixing 50 g of *tertiary butyl alcohol* with 200 ml of *water* in 1000-ml volumetric flask, add 60 ml of phosphate buffer pH 7.5, 50 ml of 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*, adjusted to pH 7.5 with *1 M sodium hydroxide* and 10 ml of a 0.04 per cent w/v solution of *disodium edetate*, adjusted to pH 7.5 with *2 M sodium hydroxide* and dilute to volume with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to tetracycline for oxytetracycline is about 0.6.

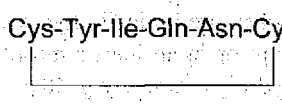
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peak due to oxytetracycline and tetracycline is not less than 5.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.25 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Calculate the content of $C_{22}H_{24}N_2O_9$ in the injection.

Storage. Store protected from light and moisture.

Labelling. The label states (1) the quantity of Oxytetracycline Hydrochloride contained in it in terms of the equivalent amount of oxytetracycline; (2) that the contents are to be used for intravenous injection only; (3) the names of the buffering agents used.

Oxytocin



$C_{43}H_{66}N_{12}O_{12}S_2$ Mol. Wt.1007.2

Oxytocin is a cyclic nonapeptide hormone obtained by a process of fractionation from the posterior lobe of the pituitary gland of healthy oxen or other mammals or by synthesis that has the property of stimulating contraction of the uterus and milk ejection in receptive animals. It may be presented as a solid or as a solution in a solvent containing an appropriate antimicrobial preservative such as 0.2 per cent w/v solution of chlorbutol.

If it is derived from animal species, Oxytocin contains not less than 95.0 per cent and not more than 105.0 per cent of the stated number of Units of oxytocic activity. If it is a synthetic product presented as a solid, it contains not less than 560 Units per mg, calculated with reference to the peptide content and when presented as a liquid, it contains not less than 150 Units per ml.

By convention, for the purpose of labeling oxytocin preparations, 1 mg of oxytocin peptide ($C_{43}H_{66}O_{12}S_2$) is equivalent to 600 IU of biological activity.

Category. Uterine stimulant.

Description. When presented as a solid, a white or almost white powder. When presented as a liquid, a clear colourless liquid.

Identification

Test B may be omitted if tests A and C are carried out. Test C may be omitted if tests A and B are carried out.

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Amino acid analysis.

For hydrolysis—Acid hydrolysis using *hydrochloric acid* containing phenol is the most common procedure used for

https://nhathuocngocanh.com/

protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis solution. 6 M hydrochloric acid containing 0.1 per cent to 1.0 per cent of *phenol*.

Procedure

Liquid phase hydrolysis. Place the protein or peptide sample in a hydrolysis tube, and dry (the sample is dried so that water in the sample will not dilute the acid used for the hydrolysis). Add 200 µl of hydrolysis solution per 500 µg of lyophilised protein. Freeze the sample tube in a dry ice-acetone bath, and flame seal in vacuum. Samples are typically hydrolysed at 110° for 24 hours in vacuum or in an inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g. 48 hours and 72 hours) are investigated if there is a concern that the protein is not completely hydrolysed.

Vapour phase hydrolysis. This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimised by using vapour phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of hydrolysis solution. The hydrolysis solution does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110° for a 24 hours hydrolysis time. Acid vapour hydrolysis the dried sample. Any condensation of the acid in the sample vials is to be minimised. After hydrolysis, dry the test sample in vacuum to remove any residual acid.

For analysis—Post-column ninhydrin derivatisation : Ion-exchange chromatography with post-column ninhydrin derivatisation is one of the most common methods employed for quantitative amino acid analysis. As a rule, a lithium-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster sodium-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

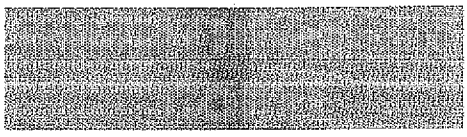
When the amino acid reacts with *ninhydrin*, the reactant has a characteristic purple or yellow colour. Amino acids, except imino acid, give a purple colour, and show an absorption maximum at 570 nm. The imino acids such as proline give a yellow colour, and show an absorption maximum at 440 nm. The post-column reaction between *ninhydrin* and amino acids eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

The detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for the proline derivative. Response linearity is obtained in the range of 20-500 pmol with correlation coefficients exceeding 0.999. To obtain good composition data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking 1/6 of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, isoleucine and leucine as equal to 1.

The values fall within the following limits: aspartic acid: 0.90 to 1.10; glutamic acid: 0.90 to 1.10; proline: 0.90 to 1.10; glycine: 0.90 to 1.10; leucine: 0.90 to 1.10; isoleucine: 0.90 to 1.10; tyrosine: 0.7 to 1.05; half-cystine: 1.4 to 2.1. Not more than traces of other amino acids are present.

C. For biological response, dissect out the uterus from a virgin female rat weighing between 120 to 200 g and in diestrus stage. Immediately before injection confirm the uterine stage of the rat by vaginal smear. Suspend one horn of the uterus in a organ bath containing 9.0 g of *sodium chloride*, 0.42 g of *potassium chloride*, 0.16 g of *calcium chloride*, 0.50 g of *sodium bicarbonate*, 0.25 g of *dextrose*, and 0.0053 g of *magnesium chloride* per litre of the solution. Maintain the bath temperature at 32° or any other suitable temperature at which spontaneous contractions of the uterus are abolished and the preparations maintain its sensitivity. Oxygenate the bath solution with a mixture of 95 per cent *oxygen* and 5 per cent *carbon dioxide*. Record the contractions of the uterine muscle on a recorder, using a suitable instrument producing linear response (for example an isotonic liver with a load of not exceeding 2 g or isotonic and linear transducer). Add to the bath two appropriate dilutions of the oxytocin reference solution, and record the contraction of the muscle following each dilution. The appropriate dilutions (doses) are those dilutions of the reference solution which produce clearly distinctive submaximal contractions. The required dilution normally lies between 0.1 to 5 micro units per ml of the bath solution. When maximal contraction is reached, replace the bath solution by a fresh solution and wait until the muscle is relaxed completely and the pointer of the recorder returns to the base line. The doses of the different reference solutions should be added at regular intervals depending upon the rate of the recovery of the uterine muscle. Dissolve or dilute the preparation to be tested in a suitable diluent (preferably using bath solution) to obtain responses on the addition of two dilutions similar to the one used with the oxytocin reference solution. The two selected dilutions of the reference solution and preparation under examination should be applied according to a randomised block or Latin square design and



https://nhathuocngocanh.com/

at least three responses to each dilution should be recorded. The magnitude of contractions obtained with the reference solution is comparable to the contractions obtained with the test solution.

Tests

Peptide. 90.0 to 110.0 per cent of the stated amount of oxytocin, $C_{43}H_{66}N_{12}O_{12}S_2$ expressed per mg for the solid, and in mg per ml for the liquid.

Determine by liquid chromatography (2.4.14).

Test solution. A 0.035 per cent w/v solution of the substance under examination in 1.56 per cent w/v solution of *sodium dihydrogen phosphate*.

Reference solution. A 0.035 per cent w/v solution of *oxytocin IPRS* in 1.56 per cent w/v solution of *sodium dihydrogen phosphate*.

Chromatographic system
- a stainless steel column 12 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: appropriate proportions of a 1.56 per cent w/v solution of *sodium dihydrogen phosphate* (mobile phase A) and a mixture of equal volumes of *acetonitrile* and *water* (mobile phase B),
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl

Equilibrate the column with a mixture of 70 volumes of mobile phase A and 30 volumes of mobile phase B and record the chromatograms as follows. Operate by gradient elution increasing continuously and linearly the proportion of mobile phase B by 1.0 per cent v/v per minute for 30 minutes. Finally elute using the same mixture for 15 minutes to re-equilibrate the column.

Calculate the content of the peptide, $C_{43}H_{66}N_{12}O_{12}S_2$.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.025 per cent w/v solution of the substance under examination in mobile phase A.

Reference solution. Dissolve the contents of one vial of *oxytocin IPRS* in mobile phase A to produce a solution containing the same concentration as in test solution.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 1.6 per cent w/v solution of *sodium dihydrogen phosphate*,
  B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 25 µl.

45	70	30

Inject the reference solution and the test solution.

Calculate the units of the oxytocic activity or the potency.

Oxytocin intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per Unit of oxytocin.

Oxytocin intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°. If the substance is sterile, store in sterile airtight, tamper-proof container.

Labelling. The label states (1) the number of Units of oxytocic activity per mg (for solid) or per ml (for liquid); (2) either the animal species from which it is obtained or whether it is synthetic, as appropriate; (3) whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytocin Injection

Oxytocin Injection is a sterile solution of Oxytocin in Water for Injections.

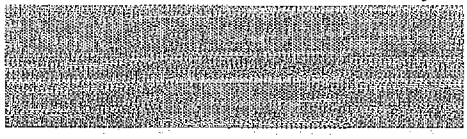
Oxytocin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated number of Units of oxytocin activity.

Usual strengths. 5 Units per ml; 10 Units per ml.

Description. A clear colourless liquid.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.



https://nhathuocngocanh.com/

Tests

pH (2.4.24). 3.0 to 5.0

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per Unit of oxytocin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Use the injection under examination.

Reference solution. Dissolve the contents of one vial of *oxytocin IPRS* in a 1.65 per cent w/v solution of *sodium dihydrogen orthophosphate* to produce a solution containing the same concentration in µg of oxytocin as that stated on the label of the injection.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- column temperature: 40°,
- mobile phase: a mixture of 85 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2,000.

Inject the reference solution and the test solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ in the injection.

Oxytocin Injection containing Oxytocin of natural origin obtained by extraction and purification complies with the following additional requirement.

Vasopressin impurity. Not more than 0.5 Unit per ml.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.0 g of chlorobutanol in 5.0 ml of *glacial acetic acid*, add 1.1 g of *sodium acetate*, 5.0 g of *ethanol*, and dilute to 1000 ml with *water* and mix.

Test solution. Dilute 2.0 ml of injection under examination to 25 ml with 0.25 per cent w/v of *glacial acetic acid* and mix.

Reference solution. Dissolve the contents of one vial of *vasopressin IPRS* in a known volume of solvent mixture. If necessary dilute the prepared solution to a working concentration range.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 87 volumes of 6.6 per cent v/v solution of *dibasic ammonium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 13 volumes of *acetonitrile*, filter through 0.45 µm nylon membrane,
- flow rate: 1 ml per minute,
- spectrophometer set at 220 nm,
- injection volume: 20 µl.

Equilibrate the column at least for one hour. Run the chromatogram minimum of 60 minutes.

Inject the reference solution. The test is not valid unless the resolution between vasopressin and the adjacent peak is not less than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Storage. Store protected from light and unless otherwise indicated on the label, at a temperature between 2°to 8°.

Labelling. The label states (1) the number of Units of oxytocic activity per ml; (2) either the animal spieces from which it is obtained or whether it is synthetic, as appropriate.

Oxytocin Nasal Solution

Oxytocin Nasal Solution is a solution of Oxytocin in a suitable solvent containing an appropriate antimicrobial preservative.

Oxytocin Nasal Solution contains not less than 85.0 per cent and not more than 120.0 per cent of the stated number of Units of oxytocic activity.

Usual strength. 40 Units per ml.

Description. A clear, colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0.

Other tests. Comply with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Use the nasal solution under examination.

Reference solution. Dissolve the contents of one vial of *oxytocin IPRS* in a 1.65 per cent w/v solution of *sodium dihydrogen orthophosphate* to produce a solution containing

https://nhathuocngocanh.com/

the same concentration in µg of oxytocin as that stated on the label of the nasal solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- column temperature: 40°,
- mobile phase: a mixture of 85 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 50,000.

Inject the reference solution and the test solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ in the nasal solution.

Oxytocin Nasal Solution containing Oxytocin of natural origin obtained by extraction and purification complies with the following additional requirement.

Vasopressin impurity. Not more than 0.5 Unit per ml.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.0 g of *chlorobutanol* in 5.0 ml of *glacial acetic acid*, add 1.1 g of *sodium acetate*, 5.0 g of *ethanol*, and dilute to 1000 ml with *water* and mix.

Test solution. Dilute 2.0 ml of injection under examination to 25 ml with 0.25 per cent w/v of *glacial acetic acid* and mix.

Reference solution. Dissolve the contents of one vial of *vasopressin IPRS* in a known volume of solvent mixture. If necessary dilute the prepared solution to a working concentration range.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 87 volumes of 6.6 per cent v/v solution of *dibasic ammonium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 13 volumes of *acetonitrile*, filter through 0.45 µm nylon membrane,
- flow rate: 1 ml per minute,
- spectrophometer set at 220 nm,
- injection volume: 20 µl.

Equilibrate the column at least for one hour. Run the chromatogram minimum of 60 minutes.

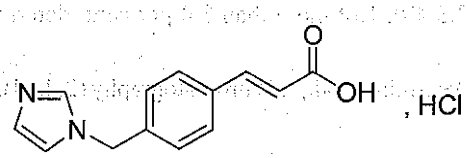
Inject the reference solution. The test is not valid unless the resolution between vasopressin and the adjacent peak is not less than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Storage. Store protected from light and unless otherwise indicated on the label, at a temperature between 2°to 8°.

Labelling. The label states (1) the number of Units of oxytocic activity per ml; (2) either the animal species from which it is obtained or whether it is synthetic, as appropriate; (3) that the preparation is intended for intranasal administration only.

Ozagrel Hydrochloride



$C_{13}H_{13}ClN_2O_2$ Mol. Wt. 264.7

Ozagrel Hydrochloride is (2*E*)-3-[4-(1*H*-imidazol-1-ylmethyl)phenyl]-2-Propenoic acid hydrochloride.

Ozagrel Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{13}ClN_2O_2$, calculated on the anhydrous basis.

Category. Antithrombotic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ozagrel hydrochloride IPRS* or with the reference spectrum of ozagrel hydrochloride.

Tests

pH (2.4.24). 2.0 to 5.0, determined in a 0.1 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 2.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *ozagrel hydrochloride IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{13}ClN_2O_2$.

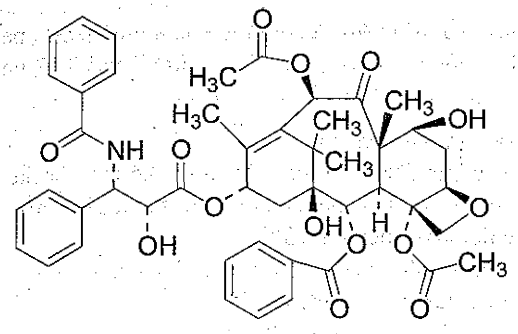
Paclitaxel

Taxol



$C_{47}H_{51}NO_{14}$ Mol. Wt. 853.9

Paclitaxel is 5β,20-epoxy-1,2α,4,7β,10β,13α-hexahydroxytax-11-en-9-one 4,10-diacetate 2-benzoate 13-ester with(2*R*,3*S*)-*N*-benzoyl-3-phenylisoserine.

A taxane derivative first isolated from the bark of the Pacific yew tree, *Taxus brevifolia*.

Paclitaxel contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{47}H_{51}NO_{14}$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white or almost white powder.

CAUTION — Paclitaxel is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paciltaxel IPRS* or with the reference spectrum of paclitaxel.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 55.0° to – 49.0° at 20°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of substance under examination in 10 ml of *acetonitrile*.

Reference solution (a). A 0.001 per cent w/v solution of *paclitaxel IPRS* in *acetonitrile*.

Reference solution (b). A solution containing 0.008 per cent w/v of 10-deacetyl-7-epipaclitaxel and 0.1 per cent w/v of *paclitaxel IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
  B. *acetonitrile*,
- flow rate: 1.2 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 227nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
60	10	90
62	100	0
70	100	0

The relative retention time for 10-deacetyl-7-epipaclitaxel is about 0.94 in respect to paclitaxel.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to paclitaxel and 10-deacetyl-7-epipaclitaxel is not less than 1.2.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.1 g by coloumetry method.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of paclitaxel.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g. 1 g is free from *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa*. 10 g is free from *Salmonella* and *Shigella*.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 200 µl of *glacial acetic acid* in 1000 ml of *methanol*.

https://nhathuocngocanh.com/

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml in solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *paclitaxel IPRS* in solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with pentafluoro phenyl groups bonded to porous silica (5 µm),
- column temperature 35°,
- mobile phase: a mixture of 55 volumes of *water* and 45 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 227nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{47}H_{51}NO_{14}$.

Storage. Store protected from light, at a temperature not exceeding 25°.

Paclitaxel Injection

Paclitaxel Injection is a sterile solution of Paclitaxel suitable for dilution, for intravenous use.

Paclitaxel Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paclitaxel, $C_{47}H_{51}NO_{14}$.

Usual strengths. 30 mg; 100 mg; 260 mg; 300 mg.

Description. A clear colourless to slight yellow viscous solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

pH (2.4.24). 3.0 to 7.0, determined in a 10 per cent v/v solution in *water.*

Light absorption (2.4.7). Absorbance of the injection at about 425 nm, not more than 0.1.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Accurately measure the volume of injection containing 12 mg of Paclitaxel, dilute to 10 ml with *acetonitrile.*

Reference solution (a). A 0.0012 per cent w/v solution of *paclitaxel IPRS* in *acetonitrile.*

Reference solution (b). A solution containing 0.006 per cent w/v of *10-deacetyl -7-epipaclitaxel IPRS* and 0.12 per cent w/v of *paclitaxel IPRS* in *acetonitrile.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
  B. *acetonitrile*,
- flow rate: 1.2 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 227 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
26	100	0
66	17	83
67	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peak due to paclitaxel and 10-deacetyl-7-epipaclitaxel is not less than 1.2. The relative retention time for 10-deacetyl-7-epipaclitaxel is about 0.94 in respect to paclitaxel.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.8 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.8 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of paclitaxel.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 200 µl of *glacial acetic acid* in 1000 ml of *methanol.*

Test solution. Accurately measure the volume of injection containing 6 mg of Paclitaxel and dissolve in 10 ml of solvent

https://nhathuocngocanh.com/

mixture.

Reference solution. A 0.06 per cent w/v solution of *paclitaxel IPRS* in solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with penta fluro phenyl group chemically bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 55 volumes of *water* and 45 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 227nm,
- injection volume: 10 µl.

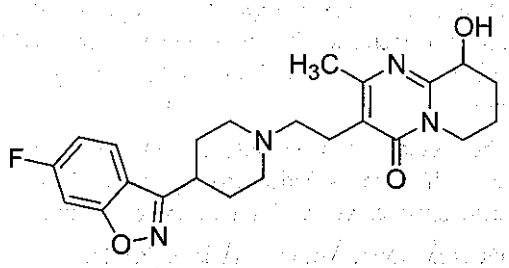
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{47}H_{51}NO_{14}$.

Storage. Store protected from light, at a temperature not exceeding 25°.

Paliperidone



$C_{23}H_{27}FN_4O_3$ Mol. Wt. 426.5

Paliperidone is *(9RS)*-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)-piperidin-1-yl]ethyl]-9-hydroxy-2-methyl -6,7,8,9-tetrahydro-4*H*-pyrido[1,2-a]pyrimidin-4-one.

Paliperidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{27}FN_4O_3$, calculated on the anhydrous basis.

Category. Antipsychotic.

Description. A white to yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paliperidone IPRS* or with the reference spectrum of paliperidone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light. And use freshly prepared solutions.

Solvent mixture. Dissolve 0.71 g of *disodium hydrogen phosphate* and 0.62 g *sodium dihydrogen phosphate* in 1000 ml of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the *methanol* and dilute to 100.0 ml with solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *paliperidone IPRS* in equal volume of *methanol* and solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture. Further dilute 5.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution (c). A solution containing 0.05 per cent w/v of *paliperidone resolution mixture IPRS* (paliperidone is major, paliperidone related compound B, paliperidone related compound C, paliperidone hydroxybenzoyl analog and paliperidone ketone as minor components) in 50.0 ml of the *methanol* and dilute with solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 100 volumes of *methanol* and 900 volumes of a buffer solution prepared by dissolving 9.5 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume. 10 µl.

Name	Relative retention time	Correction factor
Paliperidone related compound C[1]	0.57	1.0
Paliperidone related compound B[2]	0.83	1.0
Paliperidone	1.0	—
Paliperidone hydroxybenzoyl analog[3]	1.1	1.0
Paliperidone ketone[4]	1.27	1.7

[1]3-(2-chloroethyl) -9-hydroxy-2-methyl -6,7,8,9-tetrahydro-4*H*-pyrido[1,2-a]pyrimidin-4-one,

[2]6-fluoro-3-(piperidin-4-yl)benzisoxazole,

[3]3-{2-[4-(4-fluoro-2-hydroxybenzoyl)-piperidin-1-yl]ethyl}-9-hydroxy-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2a]pyrimidin-4-one,

[4]3-{2-[4-(6-fluorobenzo[d] isoxazol-3-yl)-piperidin-1-yl]ethyl}-2-methyl-,7,8-dihydro-4*H*-pyrido [1,2-a]pyrimidine-4,9(6*H*)-dione.

Inject reference solution (c). The test is not valid unless the resolution between paliperidone impurities B and paliperidone is not less than 2.0 and resolution between paliperidone and paliperidone hydroxybenzyl analog peaks is not less than 2.0.

Inject reference solution (b). The test is not valid unless the signal-to-noise ratio of the principal peak is not less than 10 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with test solution, the area of any peak due to paliperidone impurities B, C and paliperidone-hydroxy benzyl analog is not more than 0.1 per cent, the area of any peak due to paliperidone ketone is not more than 0.5 per cent, the area of any secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 0.7 per cent, calculated by area nomalization procedure. Ignore any peak with an area less than 0.05 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Use chromatography system, reference solution (a) and test solution as described under Related substances.

Inject reference solution (a). The test is not valid unless the tailing factor of the principal peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1 per cent.

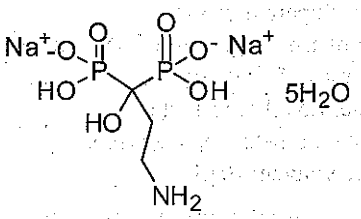
Inject the test solution and reference solution (a).

Calculate the content of $C_{23}H_{27}FN_4O_3$.

Storage. Store in tight containers protected from moisture at room temperature.

Pamidronate Disodium

Pamidronate Disodium Pentahydrate



$C_3H_9NNa_2O_7P_2, 5H_2O$ Mol. Wt. 369.1

Pamidronate Disodium is phosphonic acid, (3-amino-1 -hydroxypropylidene) bisdisodium salt, pentahydrate.

Pamidronate Disodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_3H_9NNa_2O_7P_2$, calculated on the anhydrous basis.

Category. Antiosteoporotic.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pamidronate disodium IPRS* or with the reference spectrum of pamidronate disodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution (2.4.1). Dissolve 1 g of the substance under examination in 50 ml of *water* with gentle warming (solution A) and 1 g in 25 ml of *2 M sodium hydroxide* with gentle warming (solution B) then cool to room temperature. The solutions are clear (2.4.1). Measure the absorbance of the solutions at 420 nm (2.4.7), using *water* as the blank for solution (A) and *2 M sodium hydroxide* for solution (B), the absorbance of each solution is not more than 0.10.

pH (2.4.24). 7.8 to 8.8, determined in 1.0 per cent w/v solution.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *methanol*, 80 volumes of *diisopropyl ether*, and 40 volumes of 25 per cent v/v *ammonia*.

https://nhathuocngocanh.com/

Spray reagent. Dissolve 0.2 g of *ninhydrin* in 100 ml of a mixture of 95 volumes of *butyl alcohol* and 5 volumes of *2 M acetic acid.*

Test solution. Dissolve 30 mg of the substance under examination in *water* and dilute to 10.0 ml with *water.*

Reference solution . A 0.0006 per cent w/v solution of *beta alanine IPRS* in *water.*

Apply to the plate 10 µl of each solution. After development, dry the plate at 100° until the *ammonia* disappears completely. Spray with spray reagent, and heat again at 100° for about 15 minutes and examine the plate under white light. In the chromatogram obtained with the test solution, the spot having RF value of about 0.5 is not more intense than the spot obtained with the reference solution (0.2 per cent).

B. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution (a). A 0.03 per cent w/v solution of *orthophosphoric acid* in *water.*

Reference solution (b). A 0.025 per cent w/v solution of *phosphorous acid* in *water.*

Reference solution (c). Dilute 2 ml each of reference solution (a) and reference solution (b) to 50.0 ml with *water.*

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to phosphate and phosphite is not less than 2.5 (phosphate peak elutes first), and the relative standard deviation for replicate injections for phosphate peak is not more than 10 per cent and for phosphite peak is not more 20 per cent.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to phosphate (as phosphoric acid) is not more than 3.33 times the area of the phosphate peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of any peak corresponding to phosphite (as phosphorous acid) is not more than 4 time the area of phosphite peak in the chromatogram obtained with reference solution (c) (0.5 per cent), and total phosphate and phosphite combined is not more than 0.5 per cent. The area of any other peak is not more than the area of the phosphate peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of the areas of all the secondary peaks, other than beta alanine, phosphate as orthophosphoric acid and phosphite as phosphorous acid, is not more than the area of the phosphate peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). 23.0 per cent to 25.5 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 50.0 ml with *water.*

Reference solution. A 0.2 per cent w/v solution of *pamidronate disodium IPRS* in *water.*

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with anion exchange resin made of porous polymethacrylate or polyacrylate gel with quaternary ammonium group (10 µm),
- column temperature: 35°,
- mobile phase: A 0.47 ml of anhydrous *formic acid* in 2500 ml of *water,* adjusted to pH 3.5 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- refractive index detector,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is between 0.3 to 1.2 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_9NNa_2O_7P_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Pamidronate Disodium Injection

Pamidronate Disodium Pentahydrate Injection

Pamidronate Disodium Injection is a freeze dried sterile mixture of Pamidronate Disodium and suitable excipients.

Pamidronate Disodium Injection contains not less than 93.0 per cent and not more than 108.0 per cent of the stated amount of pamidronate disodium, $C_3H_9NNa_2O_7P_2$.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Usual strengths. 30 mg per vial; 60 mg per vial; 90 mg per vial.

Description. A white or almost white powder.

https://nhathuocngocanh.com/

The content of the sealed container comply with the requirements stated under Parenteral Preparation (Powder for Injection) and with the following requirement.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.0, determined in a solution constituted as described in labelling.

Beta alanine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 90 volumes of *methanol,* 80 volumes of *diisopropyl ether* and 40 volumes of 25 per cent v/v *ammonia.*

Spray reagent. Dissolve 0.2 g of *ninhydrin* in 100 ml of a mixture of 95 volumes of *butyl alcohol* and 5 volumes of *2 M acetic acid.*

Test solution. Dilute a suitable volume of reconstituted solution with *water*, to obtain a solution containing 0.3 per cent w/v of anhydrous pamidronate disodium.

Reference solution. A 0.00075 per cent w/v solution of *beta alanine IPRS* in *water.*

Apply to the plate 10 µl of each solution. After development, dry the plate at 100° until the odour of *ammonia* disappears completely. Spray with spray reagent and heat again at 100° for about 15 minutes and examine under day light. In the chromatogram obtained with test solution, the spot having RF value of about 0.5 is not more intense than the spot obtained with the reference solution (0.25 per cent).

Water (2.3.43). Not more than 5.0 per cent.

Sterility (2.2.11). Complies with the test for sterility.

Bacterial endotoxins (2.2.3). Not more than 3.88 Endotoxin Unit per mg of anhydrous Pamidronate Disodium.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Re-constitute 5 vials with *water,* and mix. Dilute a suitable volume with *water* to obtain a solution containing 0.2 per cent w/v of anhydrous Pamidronate Disodium.

Reference solution. A 0.25 per cent w/v solution of *pamidronate disodium IPRS* in *water.*

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with anion exchange resin made up of porous polymethacrylate or polyacrylate gel with quaternary ammonium group (10 µm),
- column temperature: 35°,
- mobile phase: A 0.47 ml of anhydrous *formic acid* in 2500 ml of *water,* adjusted to pH 3.5 with *2 M sodium hydroxide,*
- flow rate: 1 ml per minute,
- refractive index detector,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_9NNa_2O_7P_2$ in the injection.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states the quantity of pamidronate disodium pentahydrate in the terms of the equivalent amount of pamidronate disodium.

Pancreatin

Pancreatin is a preparation of mammalian pancreas containing protease, lipase and amylase activity. It may contain Sodium Chloride.

Pancreatin contains not less than the minimum protease activity, amylase activity and lipase activity determined under the conditions of the Assay.

Category. Digestive enzyme.

Description. A white or buff-coloured, amorphous powder.

Identification

A. Triturate 0.5 g with 10 ml of *water* and adjusted to pH 8.0 by the addition of *1 M sodium hydroxide* using *cresol red solution* as indicator. Divide the resulting solution into two equal portions. Boil one portion [solution (1)] and leave the other untreated [solution (2)]. To each add a few shreds of *congo red fibrin*, warm to 39° ± 1° and maintain at this temperature for 1 hour. Solution (2) is stained red and solution (1) is colourless or not more than slightly pink.

B. Triturate 0.25 g with 10 ml of *water* and adjusted to pH 8.0 by the addition of *1 M sodium hydroxide* using *cresol red solution* as indicator. Divide the resulting solution into two equal portions. Boil one portion [solution (1)] and leave the other untreated [solution (2)]. Dissolve 0.1 g of *soluble starch* in 100 ml of boiling *water*, boil for 2 minutes, cool and dilute to 150 ml with *water*. Add solution (1) to half the starch mucilage and solution (2) to the remainder and maintain the mixtures at 39° ± 1° for 5 minutes. To 1 ml of each mixture add 10 ml of *iodinated potassium iodide solution*. The liquid containing solution (2) retains the colour of the solution of iodine and the liquid containing solution (1) acquires an intense blue colour.

https://nhathuocngocanh.com/

Tests

Fat. Not more than 5.0 per cent, determined by the following method. Extract 1 g with *light petroleum (40° to 60°)* for 3 hours in an apparatus for the continuous extraction of drugs (2.1.8), evaporate the extract and dry the residue at 105° for 2 hours.

Microbial contamination (2.2.9). 1 g is free from *Escherichia coli*; 10 g is free from *Salmonellae* and *Shigella*.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 0.5 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. *For protease activity* — Weigh 4.0 g of purified casein and dissolve in 90 ml of *water* containing 3 ml of *1 M sodium hydroxide*, adjusted to pH 8.7 and add sufficient *water* to produce 100.0 ml. Weigh 0.5 g of the substance under examination, triturate with *water* and add sufficient *water* to produce 300.0 ml to give the test solution. Dilute 15.0 ml of the *casein solution* with 30 ml of *water*, warm to 55° and add 10.0 ml of the unfiltered test solution. Heat rapidly to 55° and keep at this temperature for 20 minutes. Cool rapidly to room temperature. Dilute a further portion of 15.0 ml of the casein solution with 30 ml of *water*, add 10.0 ml of the unfiltered test solution, previously boiled and cooled, heat rapidly to 55° and keep at this temperature for 20 minutes. Cool to room temperature. To each solution add 0.75 ml of *phenolphthalein solution* and 10 ml of *formaldehyde solution*. Titrate each solution with *0.1 M sodium hydroxide* until the colour of the solution matches that produced by mixing 10 ml of *buffer solution pH 8.7* and 0.15 ml of *phenolphthalein solution*. The difference between the two titrations is not less than 4.5 ml.

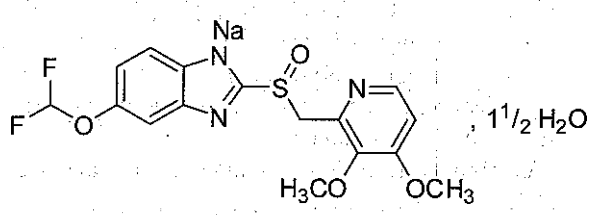
For lipase activity — To 95 ml of *water*, add 6.5 ml of *triacetin* and 0.2 ml of a 0.1 per cent w/v solution of *bromocresol purple*, neutralise with *0.5 M sodium hydroxide* and add sufficient *water* to produce 110 ml. Place 50 ml of the solution in each of two large tubes 3 cm x 20 cm A and B contained in a thermostat at 30°. Insert in each tube a rubber stopper having two holes, one for the tip of a burette and the other for a short glass tube through which passes a thread operating a glass stirring coil. Stir the contents of the tube until they attain the temperature of the thermostat. Prepare a solution of 0.1 g of the substance under examination in 10.0 ml of *water*. To tube A add 1.0 ml of the solution, to tube B add 1.0 ml of the solution previously boiled. Adjust and maintain the pH of the solutions in the two tubes to 6.2 to 6.4 by the addition of *0.05 M sodium hydroxide* dropwise, stirring frequently. After 30 minutes, the difference between the volumes of *0.05 M sodium hydroxide* added to the two tubes is not less than 1.0 ml.

For amylase activity — Not less than 100 Units per g. Dissolve 0.1 g or a quantity containing 10 Units, weighed, in sufficient *buffer solution pH 6.8* to produce 1000.0 ml. Filter if necessary (1 ml of the test solution should be capable of digesting about 10 mg of dry soluble maize or corn starch). Into each of six stoppered test-tubes add 5.0 ml of *starch substrate* without touching the sides of the test-tube. Place the test-tubes in a *water*-bath maintained at 40° ± 0.1°. When the temperature of the solution in the tubes has reached 40°, add 0.35 ml, 0.4 ml, 0.45 ml, 0.5 ml, 0.55 ml and 0.6 ml of the test solution to each of the test-tubes marked 1 to 6 respectively and record the time of addition. Mix thoroughly and replace the tubes in the *water*-bath. After exactly 60 minutes remove the tubes and cool rapidly in cold water. Add to each tube 0.05 ml of *0.02 M iodine* and mix well. Note the tube containing the lowest volume of test solution, which does not show a bluish or violet tinge (if there is doubt, warm the solution slightly, when the colour distinction is prominent). From this volume calculate the number of grams of dry soluble maize or corn starch digested by 1.0 g of the substance under examination. This represents the number of Units of amylase activity per g.

Storage. Store protected from moisture.

Labelling. The label states the name of any added substance.

Pantoprazole Sodium



$C_{16}H_{14}F_2N_3NaO_4S, 1½\,H_2O$ Mol. Wt. 432.4

Pantoprazole Sodium is sodium 5-(difluromethoxy)-2[[(3,4 dimethoxy-pyridin-2-yl)methyl]sulphinyl]-benzimidazol-1-ide, sesquihydrate.

Pantoprazole Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{14}F_2N_3NaO_4S$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to off-white powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pantoprazole sodium IPRS* or with the reference spectrum of pantoprazole sodium.

https://nhathuocngocanh.com/

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. It gives the reaction (A) of sodium salts (2.3.1).

Tests

Optical rotation (2.4.22). -0.40° to +0.40°, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *0.001 M sodium hydroxide*.

Test solution. Dissolve about 23 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *pantoprazole sodium IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- column temperature: 40°,
- mobile phase: A. dissolve 1.74 g of *dibasic potassium phosphate* to 1000 ml with *water*, adjusted to pH 7.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm and for impurity C, at 305 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
40	20	80
45	20	80
55	80	20

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of the peak due to pantoprazole impurity C determined at wavelength 305 nm at relative retention time about 0.6 is not more than 0.077 times the area of the principal peak at 290 nm in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 0.077 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 0.15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not less than 5.0 per cent and not more than 8.0 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture (a). Dilute 25.0 ml of *ammonium hydroxide* to 500.0 ml with *water*.

Solvent mixture (b). Equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve about 20 mg of the substance under examination 10.0 ml of solvent mixture (b) and dilute to 50.0 ml with solvent mixture (a). Dilute 3.0 ml of the solution to 20.0 ml with solvent mixture (a).

Reference solution. Dissolve 20 mg of *pantoprazole sodium IPRS* in 10.0 ml of solvent mixture (b) and dilute to 50.0 ml with solvent mixture (a). Dilute 3.0 ml of the solution to 20.0 ml with solvent mixture (a).

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (4 µm) (Such as Inertsil ODS-3),
- column temperature: 30°,
- sample temperature: 4°,
- mobile phase: A. a mixture of 85 volumes of buffer solution prepared by dissolving 1.32 g of *dibasic ammonium phosphate* to 1000 ml with *water*, adjusted to pH 7.5 with *orthophosphoric acid* and 15 volumes of *acetonitrile*,
  B. a mixture of 70 volumes of *acetonitrile* and 30 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	86	14
10	86	14
35	42	58
36	86	14
46	86	14

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{14}F_2N_3NaO_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Pantoprazole Gastro-resistant Tablets

Pantoprazole Tablets; Pantoprazole Sodium Gastro-resistant Tablets; Pantoprazole Sodium Tablets

Pantoprazole Gastro-resistant Tablets contain an amount of Pantoprazole sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pantoprazole, $C_{16}H_{15}F_2N_3O_4S$. They are made gastro-resistant by enteric-coating or by other means.

Usual strenth. 20 mg; 40 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at about 289 nm.

Tests

Dissolution (2.5.2).

NOTE — Prepare the solutions immediately before use. Protect the solutions from light.

A. Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely and disperse the intact tablet in 100 ml of the mobile phase and filter.

Reference solution. Dissolve a weighed quantity of *pantoprazole sodium IPRS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ released in the acid medium by subtracting the content of $C_{16}H_{15}F_2N_3O_4S$ in the test solution from the total content of Pantoprazole $C_{16}H_{15}F_2N_3O_4S$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 1000 ml of *phosphate buffer pH 6.8*,
Speed and time. 75 rpm and 45 minutes.

Transfer another 6 tablets and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the tablets, add phosphate buffer pH 6.8 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *phosphate buffer 6.8* and *0.5 M sodium hydroxide*.

Test solution. Dilute 5.0 ml of the filtrate to 10.0 ml with *0.5M sodium hydroxide*.

Reference solution. Dissolve 20 mg of *pantoprazole sodium IPRS* in 30 ml of *0.02M sodium hydroxide*, with the aid of ultrasound, add 2 ml of *acetonitrile* and dilute to 50.0 ml with *0.02M sodium hydroxide*. Dilute a portion of the solution with the solvent mixture to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{15}F_2N_3O_4S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Protect the solutions from light.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powder containing about 20 mg of Pantoprazole Sodium, disperse in 100 ml of the mobile phase and filter.

Reference solution. A 0.02 per cent w/v solution of *pantoprazole sodium IPRS* in the mobile phase.

Chromatographic system
- stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 1 g of *hexane sulphonic acid sodium salt* in 1000 ml of *water*, adjusted to pH 7.3 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 10 µl.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of equivalent amount of Pantoprazole.

Pantoprazole Gastro-resistant and Domperidone Prolonged-release Capsules

Pantoprazole Sodium Gastro-resistant and Domperidone Prolonged-release Capsules

Pantoprazole Sodium Gastro-resistant and Domperidone maleate Prolonged release Capsules manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Pantoprazole Gastro-resistant and Domperidone Prolonged-release Capsules contains an amount of pantoprazole sodium equivalent to pantoprazole and domperidone not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pantoprazole, $C_{16}H_{15}F_2N_3O_4S$ and of domperidone, $C_{22}H_{24}ClN_5O_2$.

Usual strength. Pantoprazole 40 mg and Domperidone 30 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Pantoprazole Sodium —

NOTE — Prepare the solutions immediately before use. Protect the solutions from light.

A. Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely without any loss of residue. Transfer the residue into 50-ml volumetric flask, dissolve in 20 ml of *0.1M sodium hydroxide*, with the aid of ultrasound and make up the volume with *0.1M sodium hydroxide*. Centrifuge at about 3000 rpm for 10 minutes. Dilute 2.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.08 per cent w/v solution of *pantoprazole sodium IPRS* in *0.1M sodium hydroxide*. Dilute 2.0 ml of the solution to 25.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 2.72 g *potassium dihydrogen orthophosphate* and 0.525 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.4 with *dilute potassium hydroxide solution* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 289 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ released in the acid medium by subtracting the content of $C_{16}H_{15}F_2N_3O_4S$ in the test solution from the total content of Pantoprazole $C_{16}H_{15}F_2N_3O_4S$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 1000 ml of a buffer solution prepared by dissolving 19.0 g of *trisodium orthophosphate* in 1000 ml of *water*, adjusted to pH 6.8 with *hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Transfer another 6 capsules and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the residue, add buffer solution pH 6.8 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium and filter.

Reference solution. A 0.1 per cent w/v solution of *pantoprazole sodium IPRS* in *0.1M sodium hydroxide*. Dilute 1.0 ml of the solution to 50.0 ml with the dissolution medium.

Use chromatographic system as described under Acid stage.

Inject the reference solution and the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{15}F_2N_3O_4S$.

For Domperidone — Complies with the test stated under Capsules.

Related substances. *For Pantoprazole* — Determine by liquid chromatography (2.4.14).

NOTE — Reference solution and test solution is stable up to 48 hours at 2° to 8°.

Solvent mixture. Equal volumes of *0.001M sodium hydroxide* and *acetonitrile*.

Test solution. Weigh a quantity of the mixed content of 20 capsules containing about 100 mg of pantoprazole into 250-ml volumetric flask. Add 150.0 ml of solvent mixture and sonicate and make up the volume with same solvent.

Reference solution. A 0.00004 per cent w/v solution of *pantoprazole sodium IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm packed with octadecylsilane bonded to porous silica (5 µm), (Such as Purosphere® STAR RP- 18e),
- column temperature: 40°,
- sample temperature: 8°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 1.74 g *anhydrous dipotassium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and 5 volumes of *acetonitrile*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
40	25	75
45	85	15
50	85	15

Name	Relative retention time	Correction factor
Related Compound A[1]	0.89	1.12
Pantoprazole	1.00	---
Related Compound D and F[2, 3]	1.17	0.85
Related Compound B[4]	1.56	0.64

[1]5-(Difluoromethoxy)-2-[[(3,4-dimethoxy- 2-pyridyl) methyl] sulfonyl]-1H- benzimidazole,

[2]5-(Difluoromethoxy)-2-[(RS)-[(3, 4-dimethoxypyridin-2-yl)methyl] sulfinyl]-1-methyl-1H- benzimidazole,

[3]6-(Difluoromethoxy)-2-[(RS)-[(3, 4-dimethoxypyridin-2-yl)methyl] sulfinyl]-1-methyl-1H- benzimidazole,

[4]5-(Difluoromethoxy)-2-[[(3,4-dimethoxy-2-pyridyl) methyl] thio]-1H benzimidazole.

NOTE — Related compound D and F peak observed in doublet peak.

Inject the reference solution. The test not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injection is not more than 5.0 per cent.

Inject the reference solution and the test solution, In the chromatogram obtained with the test solution, the area of any other secondary peak is not more than 5 times the area of the principle peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of impurity A is not more than 5 times the area of principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of impurity B should not more than 3 times the area of principal peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of impurity D and F should not more than 7.5 times the area of principal peak in the chromatogram obtained with the reference solution (0.75 per cent), and the sum of the areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

For Domperidone — Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.1 M Methanolic sodium hydroxide prepared by dissolving 4.0 g of *sodium hydroxide* in 1000-ml volumetric flask, add 25.0 ml *water* and sonicate to dissolve the pellets then make up the volume with *methanol* and mix.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 150 mg of Domperidone into volumetric flask, add 75.0 ml of solvent mixture and sonicate for 15 minutes with intermittent shaking and make up to 100.0 ml with solvent mixture and mix.

NOTE—Use freshly prepared solution, maintain the sonicator temperature about 20 ± 5°.

Reference solution. 0.00045 per cent w/v solution of *domperidone IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Inertsil, ODS-3V),
- column temperature: 25°,
- mobile phase: A. a mixture of 75 volumes of a buffer solution prepared by dissolving 6.8g *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted

https://nhathuocngocanh.com/

to pH 7.2 with *0.2M sodium hydroxide* and 25 volumes of *acetonitrile*,

B. a mixture 45 volumes of a buffer solution prepared by dissolving 6.8 g *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 7.2 with *0.2 M sodium hydroxide* and 55 volumes of *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
30	25	75
40	25	75
50	100	0
55	100	0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 6.66 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE -- Prepare the solutions immediately before use.

Solvent mixture. A mixture of 55 volumes of *water* and 45 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the mixed content of 20 capsules containing about 200 mg of Pantoprazole dissolved in 200.0 ml of *methanol* and sonicate for 30 minutes with intermittent shaking and make up the volume to 250.0 ml with *methanol*, mix and filter. Further dilute 5.0 ml of the solution to 100.0 ml with solvent mixture and mix.

Reference solution. Weigh and transfer accurately *pantoprazole sodium sesquihydrate IPRS* equivalent to 40 mg of *pantoprazole IPRS* and 30.0 mg of *domperidone IPRS* into a volumetric flask, add 70 ml of *methanol* and sonicate to dissolve and make up the volume to 100.0 ml with *methanol*. Further dilute 5.0 ml of the solution to 50.0 ml with solvent mixture and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated, end capped octadecylsilane silica gel bonded to porous silica (5 µm), (Such as Hypersil BDS),
- column temperature: 35°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 2.75 g of *potassium dihydrogen orthophosphate* and 0.53 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.4 with *potassium hydroxide solution* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 284 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

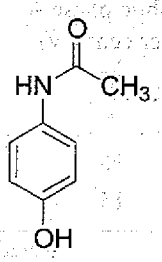
Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ and $C_{22}H_{24}ClN_5O_2$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of equivalent amount of pantoprazole and of domperidone.

Paracetamol

Acetaminophen



$C_8H_9NO_2$ Mol. Wt. 151.2

Paracetamol is 4-hydroxyacetanilide.

Paracetamol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_9NO_2$, calculated on the dried basis.

Category. Analgesic; antipyretic.

Description. White crystals or a white, crystalline powder.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paracetamol IPRS* or with the reference spectrum of paracetamol.

B. Dissolve 50 mg in sufficient *methanol* to produce 100 ml. To 1 ml of the solution add 0.5 ml of *0.1 M hydrochloric acid* and dilute to 100 ml with *methanol*. Protect the resulting solution from bright light and immediately measure the absorbance at the maximum at about 249 nm; absorbance at 249 nm, about 0.44 (2.4.7).

C. Boil 0.1 g in 1 ml of *hydrochloric acid* for 3 minutes, add 10 ml of *water* and cool; no precipitate is produced. Add 0.05 ml of *0.0167 M potassium dichromate*; a violet colour develops which does not turn red.

D. It gives the reaction of acetyl groups (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 2.5 ml of *methanol* containing 0.46 per cent w/v of *tetrabutylammonium hydroxide solution* (40 per cent w/v) and dilute to 10.0 ml with the solution containing equal volumes of 1.79 per cent w/v of *disodium hydrogen phosphate* and 0.78 per cent w/v of *sodium dihydrogen phosphate*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.025 per cent w/v each of *4-aminophenol IPRS*, *paracetamol IPRS* and *chloroacetanilide IPRS* in *methanol*. Dilute 1.0 ml of the solution to 250.0 ml with the mobile phase.

Reference solution (d). Dissolve 20 mg of *4-nitrophenol IPRS* in 50.0 ml of *methanol*. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5µm) (Such as Zorbax C8),
- column temperature: 35°,
- mobile phase: a mixture of 37.5 volumes of a 1.79 per cent w/v solution of *disodium hydrogen phosphate*, 37.5 volumes of a 0.78 per cent w/v solution of *sodium dihydrogen phosphate* and 25 volumes of *methanol* containing 0.46 per cent v/v of *tetrabutylammonium hydroxide solution (40 per cent w/v)*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

The relative retention time with reference to paracetamol for 4-aminophenol is about 0.8, for 4-nitrophenol is about 3.0 and for chloroacetanilide is about 7.0.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to 4-aminophenol and paracetamol is not less than 4.0 and the signal-to-noise ratio of the peak due to chloroacetanilide is not less than 50.

Inject reference solution (a), (b), (c), (d) and the test solution. Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to chloroacetanilide is not more than 0.2 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 ppm) and the area of the peak due to 4-aminophenol is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50 ppm), the area of peak due to 4-nitrophenol is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and the sum of areas of other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

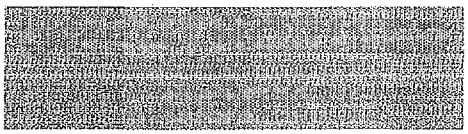
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.5 g in a mixture of 10 ml of *water* and 50 ml of *1 M sulphuric acid*. Boil under a reflux condenser for 1 hour, cool and dilute to 100.0 ml with *water*. To 20.0 ml of the solution add 40 ml of *water*, 40 g of *water* in the form of ice, 15 ml of *2 M hydrochloric acid* and 0.1 ml of *ferroin solution* and titrate with *0.1 M ceric ammonium sulphate* until a yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M ceric ammonium sulphate* is equivalent to 0.00756 g of $C_8H_9No_2$.

Storage. Store protected from light and moisture.



https://nhathuocngocanh.com/

Paracetamol Infusion

Acetaminophen Infusion

Paracetamol Infusion is a sterile isotonic buffered solution for intravenous infusion consisting of paracetamol with the aid of a suitable auxiliary substances and alkali or acid.

Paracetamol Infusion contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paracetamol $C_8H_9NO_2$.

Usual strength. 10 mg per ml.

Description. A clear, colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

pH (2.4.24). 4.5 to 6.5.

Light absorption. The absorbance of the infusion at 500 nm (2.4.7) is not more than 0.04.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Use the infusion.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v each of *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Reference solution (c). A 0.00002 per cent w/v solution of *4- chloroacetanilide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 25 volumes of *methanol* containing 0.115 g of *tetrabutylammonium hydroxide solution* (40 per cent w/v), with 37.5 volumes of *0.05 M disodium hydrogen orthophosphate* and 37.5 volumes of *0.05 M sodium dihydrogen orthophosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-aminophenol is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to 4- chloroacetanilide is not more than 0.001 times the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm) and the area of any other secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparation (Infusions).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection with the mobile phase to obtain a solution containing 0.01 per cent w/v of Paracetamol.

Reference solution. A 0.01 per cent w/v solution of *paracetamol IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9NO_2$ in the infusion.

Storage. Store protected from light.

Paracetamol Oral Suspension

Acetaminophen Oral Suspension

Paracetamol Oral Suspension is a suspension of Paracetamol in a suitable flavoured vehicle.

Paracetamol Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paracetamol, $C_8H_9NO_2$.

https://nhathuocngocanh.com/

Usual strength. 500 mg per 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *acetone*, 50 volumes of *toluene* and 1 volume of *glacial acetic acid.*

Test solution. Shake a quantity of the oral suspension containing about 125 mg of Paracetamol in 25 ml of *methanol* and dilute to 50 ml with *methanol*.

Reference solution. A 0.25 per cent w/v solution of *paracetamol IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light.

Test solution. Shake a quantity of the suspension containing 0.5 g of Paracetamol in the mobile phase and dilute with the mobile phase to obtained a concentration of 0.5 per cent w/v of Paracetamol and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Reference solution (c). A 0.000005 per cent w/v solution of *4-chloroacetanilide IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 250 volumes of *methanol* containing 1.15 g of a 40 per cent v/v solution of *tetrabutylammonium hydroxide* , 375 volumes of *0.05M disodium hydrogen orthophosphate* and 375 volumes of *0.05 M sodium dihydrogen orthophosphate,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 100 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 15 times the retention time of the principal peak. The area of any peak corresponding to 4-aminophenol is not more than 5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to 4-chloroacetanilide is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (10 ppm) and the area of any other secondary peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent).

Other tests. Comply with the tests stated under Oral Suspension.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.4 volume of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water.*

Test solution. Shake a quantity of the oral suspension containing about 25 mg of Paracetamol in 60 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture

Reference solution. A 0.005 per cent w/v solution of *paracetamol IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: *0.01M sodium butanesuphonate* in the solvent mixture,
- flow rate: 1 ml per minute,
- spectrophotometer set at 243 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9NO_2$.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_8H_9NO_2$, weight in volume.

Storage. Store protected from light.

Paracetamol Paediatric Oral Suspension

Acetaminophen Paediatric Oral Suspension; Paediatric Paracetamol Oral Suspension

Paracetamol paediatric oral suspension is a suspension of Paracetamol in a suitably flavoured vehicle. It should not be diluted.

Paracetamol Paediatric Oral Suspension contains not less than 95 per cent and not more than 105 per cent of the stated amount of paracetamol, $C_8H_9NO_2$.

Usual strengths. 125 mg per 5ml; 250 mg per 5 ml. In case of Paediatric drops 100 mg per ml and 150 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 0.5 volume of *glacial acetic acid*, 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *dichloromethane*.

Test solution. Dilute the suspension under examination with *methanol* to produce a solution containing 0.24 per cent w/v of Paracetamol and filter.

Reference solution. A 0.24 per cent w/v solution of *paracetamol IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light.

Test solution. Shake a quantity of the suspension containing 0.5 g of Paracetamol in the mobile phase and dilute with the mobile phase to obtained a concentration of 0.5 per cent w/v of Paracetamol and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Reference solution (c). A 0.000005 per cent w/v solution of *4-chloroacetanilide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 250 volumes of *methanol* containing 1.15 g of a 40 per cent v/v solution of *tetrabutylammonium hydroxide*, 375 volumes of *0.05M disodium hydrogen orthophosphate* and 375 volumes of *0.05 M sodium dihydrogen orthophosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 100 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 15 times the retention time of the principal peak. The area of any peak corresponding to 4-aminophenol is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to 4-chloroacetanilide is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (10 ppm), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), and the sum of the areas of other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix a weighed quantity of the suspension under examination containing 24 mg of Paracetamol with 100 ml of the mobile phase, dilute to 200.0 ml with the mobile phase and filter.

Reference solution. A 0.012 per cent w/v solution of *paracetamol IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Determine the weight per ml of the suspension (2.4.29) and Calculate the content of $C_8H_9NO_2$ in the suspension.

https://nhathuocngocanh.com/

Paracetamol Paediatric Syrup

Paracetamol Paediatric Oral Solution; Acetaminophen Paediatric Syrup

Paracetamol Paediatric Syrup is a solution of Paracetamol in a suitable flavoured vehicle.

Paracetamol Paediatric Syrup contains not less than 95.0 per cent and not more than 105.0 per cent w/v solution of the stated amount of paracetamol, $C_8H_9NO_2$.

Usual strength. 125 mg per 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *chloroform*, 25 volumes of *acetone*, 10 volumes of *toluene* and 0.5 volumes of *glacial acetic acid*.

Test solution. Dilute a volume containing 25 mg of Paracetamol to 10 ml with *methanol* and filter if necessary.

Reference solution. A 0.25 per cent w/v solution of *paracetamol IPRS* in *methanol*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air, examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

4-Aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Shake 5 ml of the preparation under examination with 15 ml of the mobile phase, dilute to 25 ml with the mobile phase and filter if necessary.

Reference solution. A 0.0025 per cent w/v solution of *4-aminophenol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-aminophenol is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent). Peaks with a long retention time may occur due to preservatives in the preparations.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix a weighed quantity of the preparation under examination containing 50 mg of Paracetamol in 70 ml of the mobile phase, dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference Solution. A 0.0125 per cent w/v solution of *paracetamol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 243 nm,
- injection volume: 20 µl.

Determine the weight per ml (2.4.29) of the syrup and calculate the content of $C_8H_9NO_2$, weight in volume.

Storage. Store protected from light and moisture.

Paracetamol Tablets

Acetaminophen Tablets

Paracetamol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of paracetamol, $C_8H_9NO_2$.

Usual strengths. 500 mg; 650 mg.

Identification

Extract a quantity of the powdered tablets containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter, evaporate the filtrate to dryness and dry at 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paracetamol IPRS* or with the reference spectrum of paracetamol.

B. Boil 0.1 g in 1 ml of *hydrochloric acid* for 3 minutes, add 10 ml of *water* and cool; no precipitate is produced. Add 0.05 ml of *0.0167 M potassium dichromate*; a violet colour develops which does not turn red.

https://nhathuocngocanh.com/

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 5.8*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 243 nm (2.4.7). Similarly measure the absorbance of a solution of known concentration of *paracetamol IPRS*. Calculate the content of $C_8H_9NO_2$.

Q. Not less than 80 per cent of the stated amount of $C_8H_9NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 0.2 g of Paracetamol in 10.0 ml of the mobile phase, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v each of *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Reference solution (c).) A 0.00002 per cent w/v solution of *4- chloroacetanilide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Zorbax Rx C8),
- column temperature: 35 °,
- mobile phase: a mixture of 250 volumes of *methanol* containing 1.15 g of *tetrabutylammonium hydroxide solution* (40 per cent w/v), 375 volumes of *0.05M disodium hydrogen orthophosphate* and 375 volumes of *0.05M sodium dihydrogen orthophosphate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak corresponding to 4-aminophenol is not more than the area of the corresponding peak in reference solution (b) (0.1 per cent), the area of peak corresponding to 4-chloroacetanilide is not more than the area of the principal peak in reference solution (c) (10 ppm) and the area of any other secondary peak is not more than the area of the principal peak obtained with reference solution (a) (0.25 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.15 g of Paracetamol, add 50 ml of *0.1 M sodium hydroxide*, dilute with 100 ml of *water*, shake for 15 minutes and add sufficient *water* to produce 200.0 ml. Mix, filter and dilute 10.0 ml of the solution to 100.0 ml with *water*. To 10.0 ml of the solution add 10 ml of *0.1 M sodium hydroxide*, dilute to 100.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 257 nm (2.4.7). Calculate the content of $C_8H_9NO_2$ taking 715 as the specific absorbance at 257 nm.

Storage. Store protected from light and moisture.

Paracetamol and Caffeine Tablets

Paracetamol and CaffeineTablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of paracetamol, $C_8H_9NO_2$, and caffeine, $C_8H_{10}N_4O_2$.

Usual strengths. Paracetamol 650 mg and Caffeine 50 mg; Paracetamol 500 mg and Caffeine 25 mg .

Identification

A. Dissolve a quantity of the powdered tablets containing 500 mg of Paracetamol with 20 ml of *acetone*, filter and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *paracetamol IPRS* or with the reference spectrum of paracetamol.

B. Dissolve a quantity of the powder tablets containing 0.1 g of caffeine with 10 ml of *water*, shake for 5 minutes, filter and add 10 ml of *1M sodium hydroxide*. Extract with three 30 ml quantity of *dichloromethane*, washing each extract with the same 10 ml of *water*. Filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate*, evaporate to dryness in a porcelain dish and expose to *ammonia vapour*. A pink colour is observed.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 5.8*,

https://nhathuocngocanh.com/

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system described under Assay of Paracetamol and Caffeine.

Test solution. Use the filtrate, dilute 10.0 ml of the solution to 100.0 ml with mobile phase.

Reference solution. A 0.0072 per cent w/v solution of *paracetamol IPRS* and 0.00055 per cent w/v solution of *caffeine IPRS* in the mobile phase .

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9NO_2$ and $C_8H_{10}N_4O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_8H_9NO_2$ and $C_8H_{10}N_4O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light.

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of paracetamol with 50.0 ml of mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution each of *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *4-chloroacetanilide IPRS* in *methanol* and further dilute to obtain a solution of 0.00001 per cent w/v solution in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 250 volumes of *methanol* containing 1.15 g of a 40 per cent w/v solution of *tetrabutylammonium hydroxide,* 375 volumes of *0.05M disodium hydrogen orthophosphate* and 375 volumes of *0.05M sodium dihydrogen orthophosphate,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak corresponding to 4-aminophenol is not more than the area of the corresponding peak in reference solution (b) (0.1 per cent), the area of peak corresponding to 4- chloroacetanilide is not more than the area of the principal peak in reference solution (c) (0.001 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the total area of any other secondary peak is not more than 5 times the area of the peak due to paracetamol in the chromatogram obtained with reference solution (a) (0.5 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay for caffeine using following modifications.

Test solution. Disperse one tablet in 60 ml of the mobile phase and dilute to 100.0 ml with the same solvent and filter. Dilute a suitable volume of the solution with the mobile phase, to obtain a solution having concentration similar to the reference solution.

Reference solution. A 0.0025 per cent w/v solution of *caffeine IPRS* in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}N_4O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

For Paracetamol —

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 250 mg of Paracetamol with 75 ml of mobile phase, ultrasound for 10 minutes, dilute to 100.0 ml with same solvent and mix. Filter, rejecting the first 5.0 ml of the filtrate. Dilute 1.0 ml of the solution to 50-ml volumetric flask and dilute with same solvent.

Reference solution. A 0.005 per cent w/v solution of *paracetamol IPRS* in the mobile phase .

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 1.74 g of *sodium pentanesulfonate* in 220 volumes of *methanol* and 780 volumes of *water* and adjusted to pH 2.8 using *2 M hydrochloric acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 243 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution.

Calculate the content of $C_8H_9NO_2$ in the tablets.

For Caffeine—

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of Caffeine with 100.0 ml of mobile phase. Filter, dilute 5.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution. A 0.003 per cent w/v solution of *caffeine IPRS* in the mobile phase .

Use the chromatographic system as described under Assay of paracetamol using a detection wavelength of 220 nm.

Calculate the content of $C_8H_{10}N_4O_2$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength of paracetamol and caffeine.

Hard Paraffin

Hard Paraffin is a purified mixture of solid hydrocarbons obtained from petroleum or from shale oil.

Category. Pharmaceutical aid (stiffening agent).

Description. A white or colourless, translucent mass, frequently showing a crystalline structure; slightly greasy to the touch. Burns with a luminous flame. When melted, the liquid is free from fluorescence by daylight.

Tests

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Congealing range (2.4.10). 50° to 65°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Liquid Paraffin

White Mineral Oil; Liquid Petrolatum

Liquid Paraffin is a purified mixture of liquid hydrocarbons obtained from petroleum to which not more than 10 ppm of tocopherol or of butylated hydroxytoluene may be added.

Category. Laxative; faecal softener.

Description. A transparent, colourless, oily liquid, free from fluorescence by daylight.

Tests

Weight per ml (2.4.29). 0.860 g to 0.904 g.

Viscosity (2.4.28). 110 mPas to 230 mPas.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

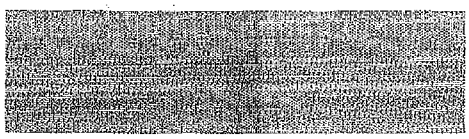
Light absorption. When examined in the range 240 nm to 280 nm (2.4.7), a 2.0 per cent w/v solution in *2,2,4-trimethylpentane* shows an absorption of not more than 0.1.

Readily carbonisable substances. Place 5 ml in a dry, heat-resistant glass-stoppered test-tube (125 mm x 18 mm) previously rinsed with chromic acid solution, then with *water* and dried. Add 5 ml of *nitrogen-free sulphuric acid* (containing 94.5 per cent to 95.5 per cent w/w of H_2SO_4), insert the stopper and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. Loosen the stopper, immediately place the tube in a bath of boiling *water*, supporting it so as to prevent contact of the tube with the bottom or side of the bath and heat for 10 minutes. At the end of the second, fourth, sixth, and eighth minutes, remove the tube from the bath and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. At the end of 10 minutes from the time the tube was placed in the bath remove the tube and allow to stand for 10 minutes. The lower acid layer is not more intensely coloured than a mixture of 3 ml of FCS, 1.5 ml of CCS and 0.5 ml of CSS (2.4.1), overlaid with 5 ml of liquid paraffin. If the sulphuric acid remains dispersed in the molten paraffin, the colour of the emulsion is not darker than that of the standard mixture when shaken vigorously.

Solid paraffins. Place a suitable quantity, previously dried by heating at 100° for 2 hours and cooled in a desiccator over sulphuric acid, in a glass cylindrical vessel having an internal diameter of approximately 25 mm. Close the vessel and immerse in a mixture of ice and *water*; after 4 hours the liquid is sufficiently clear that a black line, 0.5 mm in width, held vertically behind the vessel is easily seen.

Sulphur compounds. Mix 4 ml with 2 ml of *ethanol (95 per cent)*, and 2 drops of a clear, saturated solution of *lead monoxide* in *sodium hydroxide solution* and heat at 70° for 10 minutes with frequent shaking; the mixture remains colourless.

Storage. Store protected from light.



https://nhathuocngocanh.com/

Light Liquid Paraffin

Light Mineral Oil; Light Liquid Petrolatum

Light Liquid Paraffin is a purified mixture of liquid saturated hydrocarbons obtained from petroleum. It may contain a suitable stabiliser.

Category. Pharmaceutical aid (vehicle).

Description. A transparent, colourless, oily liquid, free from fluorescence by daylight.

Tests

Weight per ml (2.4.29). 0.820 g to 0.880 g.

Viscosity (2.4.28). 25 mPas to 80 mPas.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Light absorption. When examined in the range 240 nm to 280 nm (2.4.7), a 2.0 per cent w/v solution in *2,2,4-trimethylpentane* shows an absorption of not more than 0.1.

Readily carbonisable substances. Place 5 ml in a dry, heat-resistant glass-stoppered test-tube (125 mm x 18 mm) previously rinsed with chromic acid solution, then with *water* and dried. Add 5 ml of *nitrogen-free sulphuric acid* (containing 94.5 per cent to 95.5 per cent w/w of H_2SO_4), insert the stopper and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. Loosen the stopper, immediately place the tube in a bath of boiling *water*, supporting it so as to prevent contact of the tube with the bottom or side of the bath and heat for 10 minutes. At the end of the second, fourth, sixth, and eighth minutes, remove the tube from the bath and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. At the end of 10 minutes from the time the tube was placed in the bath remove the tube and allow to stand for 10 minutes. The lower acid layer is not more intensely coloured than a mixture of 3 ml of FCS, 1.5 ml of CCS and 0.5 ml of CSS (2.4.1), overlaid with 5 ml of liquid paraffin. If the sulphuric acid remains dispersed in the molten paraffin, the colour of the emulsion is not darker than that of the standard mixture when shaken vigorously.

Solid paraffins. Place a suitable quantity, previously dried by heating at 100° for 2 hours and cooled in a desiccator over sulphuric acid, in a glass cylindrical vessel having an internal diameter of approximately 25 mm. Close the vessel and immerse in a mixture of ice and water; after 4 hours the liquid is sufficiently clear that a black line, 0.5 mm in width, held vertically behind the vessel is easily seen.

Sulphur compounds. Mix 4 ml with 2 ml of *ethanol (95 per cent)* and 2 drops of a clear, saturated solution of *lead monoxide* in *sodium hydroxide solution* and heat at 70° for 10 minutes with frequent shaking; the mixture remains colourless.

Storage. Store protected from light.

Liquid Paraffin Emulsion

Liquid Paraffin Oral Emulsion

Liquid Paraffin Emulsion is an oral emulsion of Liquid Paraffin in Purified Water.

Liquid Paraffin Emulsion contains not less than 44.0 per cent and not more than 49.0 per cent w/w of liquid paraffin.

Category. Laxative; faecal softener.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh 5.0 g, add 10 ml of *water*, extract with two quantities, each of 40 ml, of a mixture of 2 volumes of *ethanol (95 per cent)*, 3 volumes of *light petroleum (40° to 60°)* and 3 volumes of *ether* and then with 30 ml of a mixture of equal volumes of *light petroleum (40° to 60°)* and *ether*. Wash the combined extracts with 15 ml of *0.5 M sodium hydroxide* and then with 15 ml of *water*, evaporate the solvent, add 5 ml of *acetone* and evaporate again. Repeat the addition and evaporation of acetone until the residue is free from *water*, dry at 105° for 15 minutes and weigh.

Storage. Store protected from moisture.

White Soft Paraffin

White Petroleum Jelly

White Soft Paraffin is a purified, semi-solid mixture of hydrocarbons obtained from petroleum and bleached.

Category. Pharmaceutical aid (ointment base).

Description. A white, translucent, soft unctuous mass, retaining these characteristics on storage and when melted and allowed to cool without stirring; not more than slightly fluorescent by daylight, even melted.

Tests

Melting range (2.4.21). 38° to 56°, determined by Method IV.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute,

https://nhathuocngocanh.com/

cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Light absorption (2.4.7). Absorbance of a 0.05 per cent w/v solution in *2,2,4-trimethylpentane* at about 290 nm, not more than 0.5.

Fixed oils, fats and resin. Digest 10 g with 50 ml of *sodium hydroxide solution* at 100° for 30 minutes and allow the aqueous layer to separate. On acidifying the aqueous layer with *dilute sulphuric acid*, no precipitate or oily matter is produced.

Foreign organic matter. Volatilises when heated, without emitting an acrid odour.

Consistency. 100 to 300, determined by the following method.

Apparatus. The apparatus is essentially in agreement with IS 4887:1980 and comprises a penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g having a detachable steel tip of the following dimensions. The tip of the cone has an angle of 30°, the point being truncated to a diameter of 0.38 ± 0.08 mm, the base of the tip is 8.38 ± 0.13 mm in diameter and the length of the tip is 15 ± 0.25 mm. The remaining portion of the cone has an angle of 90°, is 28 to 29 mm in height, and has a maximum diameter of 65.1 mm at the base. The containers of the test are flat-bottomed metal or glass cylinders that are 102 ± 6 mm in diameter and not less than 60 mm in height.

Procedure. Melt a sufficient quantity at a temperature below 85° and pour into one or more of the containers filling to within 6 mm of the rim. Cool to 25°± 2.5° over a period of not less than 16 hours, protected from drafts. Two hours before the test, place the containers in a water-bath at 25° ± 0.5°. If the room temperature is below 23.5° or above 26.5°, adjust the temperature of the cone to 25° ± 0.5° by placing it in a water-bath.

Without disturbing the surface of the substance under examination, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25 mm to 38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 seconds. Secure the plunger and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm. Calculate the average of the three or more readings and conduct further trials to a total of 10 if the individual results differ from the average by more than ± 3 per cent. The final average of the trials is not less than 10.0 mm and not more than 30.0 mm indicating a consistency value between 100 and 300.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture.

Yellow Soft Paraffin

Yellow Petroleum Jelly

Yellow Soft Paraffin is a purified, semi-solid mixture of hydrocarbons obtained from petroleum.

Category. Pharmaceutical aid (ointment base).

Description. A pale yellow to yellow, translucent, soft unctuous mass, retaining these characteristics on storage and when melted and allowed to cool without stirring; not more than slightly fluorescent by daylight, even melted.

Tests

Melting range (2.4.21). 38° to 56°, determined by Method IV.

Light absorption (2.4.7). Absorbance of a 0.05 per cent w/v solution in *2,2,4-trimethylpentane* at about 290 nm, not more than 0.75.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Fixed oils, fats and resin. Digest 10 g with 50 ml of *sodium hydroxide solution* at 100° for 30 minutes and allow the aqueous layer to separate. On acidifying the aqueous layer with *dilute sulphuric acid*, no precipitate or oily matter is produced.

Foreign organic matter. Volatilises when heated, without emitting an acrid odour.

Consistency. 100 to 300, determined by the following method.

Apparatus. The apparatus is essentially in agreement with IS 4887:1980 and comprises a penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g having a detachable steel tip of the following dimensions. Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture.

Paraffin Ointment

Category. Pharmaceutical aid (ointment basis).

White Beeswax	20 g
Hard Paraffin	30 g
Cetostearyl Alcohol	50 g
White Soft Paraffin*	900 g

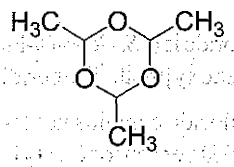
*May be replaced by Yellow Soft Paraffin if other medicaments to be incorporated are coloured.

Mix the ingredients, heat gently with stirring until homogeneous and stir until cold.

Tests

Paraffin Ointment complies with the tests stated under Ointments.

Paraldehyde



$C_6H_{12}O_3$ Mol. Wt. 132.7

Paraldehyde is 2,4,6-trimethyl-1,3,5-trioxane, the cyclic trimer of acetaldehyde. It may contain a suitable amount of antioxidant.

Category. Anticonvulsant in status epilepticus; hypnotic; sedative.

Description. A colourless or slightly yellow, transparent liquid. Solidifies at low temperature to form a crystalline mass.

Identification

A. Heat 5 ml with 0.1 ml of *1 M sulphuric acid*; acetaldehyde, recognisable by its odour, is evolved.

B. To 5 ml of a 10 per cent v/v solution add 5 ml of *ammoniacal silver nitrate solution* in a test-tube and heat on a water-bath; metallic silver is deposited as a mirror on the sides of the tube.

C. A 10 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), but becomes turbid on warming.

Tests

Congealing range (2.4.10). 10° to 13°.

Distillation range (2.4.8). Not more than 10 per cent distils below 123° and not less than 95 per cent distils below 126°.

Refractive index (2.4.27). 1.403 to 1.406.

Relative density (2.4.29). 0.991 to 0.996.

Acetaldehyde. Shake 5 ml with a mixture of 5 ml of *ethanol (60 per cent)*, 5 ml of *hydroxylamine hydrochloride reagent in ethanol (60 per cent)* and 2 drops of *methyl orange solution* and titrate with *0.5 M sodium hydroxide* to full yellow colour; not more than 0.8 ml of *0.5 M sodium hydroxide* is required.

Acidity. Mix 5 ml with 45 ml of *carbon dioxide-free water* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator; not more than 1.5 ml is required.

Chlorides. To 5 ml of a 1 per cent v/v solution add one drop of *nitric acid* and three drops of *silver nitrate solution*; no opalescence is produced immediately.

Sulphates. To 5 ml of a 1 per cent v/v solution add one drop of *hydrochloric acid* and three drops of *barium chloride solution*; no turbidity is produced.

Peroxides. In a stoppered vessel, dissolve 5 ml in sufficient of recently boiled and cooled *water* to produce 50 ml, add 5 ml of *dilute sulphuric acid* and 10 ml of *potassium iodide solution*. Close the flask and set aside in the dark for 15 minutes. Titrate with *0.1 M sodium thiosulphate* using *starch solution* as indicator; set aside for 5 minutes and, if necessary, complete the titration. Not more than 2.0 ml of *0.1 M sodium thiosulphate* is required.

https://nhathuocngocanh.com/

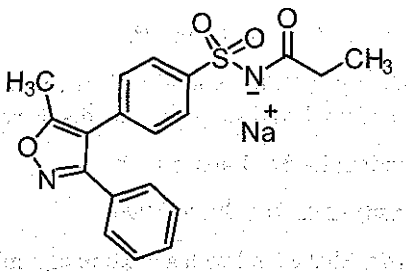
Non-volatile matter. Heat 5 ml in a small dish on a water-bath and dry at 105° for 1 hour; the residue weighs not more than 3 mg (0.06 per cent w/v).

Storage. Store protected from moisture, in complete darkness and at a temperature of 8° to 15°. If solidified, the whole of the contents of the container should be liquified by warming before use.

NOTE — Do not use Paraldehyde if it has a brownish colour or an odour of acetic acid. Avoid contact with rubber and plastics.

Labelling. The label states (1) the nature and the proportion of any antioxidant added; (2) that it may decompose on standing to form potentially harmful substances.

Parecoxib Sodium



$C_{19}H_{18}N_2O_4SNa$ Mol. Wt. 392.4

Parecoxib Sodium is *N*-[4-(5-Methyl-3-phenyl-1,2-oxazol-4-yl)phenylsulfonyl]propanamide sodium salt.

Parecoxib Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{18}N_2O_4SNa$, calculated on the anhydrous basis.

Category. Non steroidal anti-inflammatory drug.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *parecoxib sodium IPRS* or with the reference spectrum of parecoxib sodium.

B. It gives the reaction (A) of sodium salts (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *0.05M ammonium acetate*, adjusted to pH 5.0 with *acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject the test solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

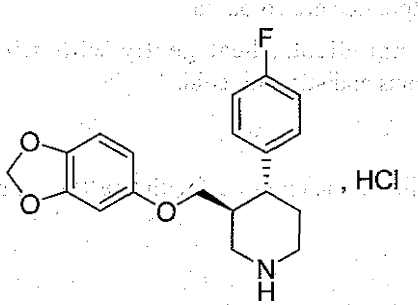
Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g, using Method 1.

Assay. Dissolve 0.3 g in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid* and determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.039241 of $C_{19}H_{18}N_2O_4SNa$.

Paroxetine Hydrochloride



$C_{19}H_{20}FNO_3,HCl$ Mol. Wt. 365.8

Paroxetine Hydrochloride is (3*S*,4*R*)-4-(4-Fluorophenyl)-3-[(3,4-methylenedioxy)phenoxy]methyl]piperidine hydrochloride.

Paroxetine Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{19}H_{20}FNO_3,HCl$, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Antidepressant.

Description. A white or almost white, hygroscopic, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paroxetine hydrochloride IPRS* or with the reference spectrum of paroxetine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Impurity D. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 5 ml of *methanol* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *paroxetine impurity D IPRS ((3R,4S)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine ((+)-trans-paroxetine) IPRS)* in 2 ml of *methanol* and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.0 mm, packed with silica gel AGP for chiral chromatography (5 µm),
- mobile phase: a mixture of 93 volumes of buffer solution prepared by dissolving 8.7 g of *dipotassium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 with *orthophosphoric acid* and 7 volumes of *acetonitrile*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to paroxetine hydrochloride impurity D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *tetrahydrofuran* and 90 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 5.0 ml of the test solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *paroxetine hydrochloride impurity H IPRS* in 25 ml of *tetrahydrofuran* and dilute to 50.0 ml with *water*.

Reference solution (c). Dissolve 5 mg of *paroxetine hydrochloride impurity C IPRS* in 25 ml of *tetrahydrofuran* and dilute to 50.0 ml with *water*.

Reference solution (d). To 5.0 ml of reference solution (a), add 1.0 ml of reference solution (b) and dilute to 100.0 ml with the solvent mixture.

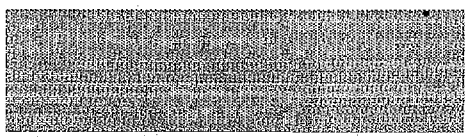
Reference solution (e). To 5.0 ml of reference solution (a), add 5.0 ml of reference solution (b) and 5.0 ml of reference solution (c), dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (f). Dissolve 2.5 mg of *paroxetine impurity E IPRS* in the solvent mixture, add 2.5 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Reference solution (g). Dissolve 5 mg of *paroxetine impurity A IPRS* in the solvent mixture and dilute to 50 ml with the solvent mixture. (Use this solution to identify the peak due to impurity A).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 0.5 volume of *trifluoroacetic acid*, 10 volumes of *tetrahydrofuran* and 90 volumes of *water*,
  B. a mixture of 0.5 volume of *trifluoroacetic acid*, 10 volumes of *tetrahydrofuran* and 90 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
30	80	20
50	20	80
55	20	80
60	80	20
65	80	20



https://nhathuocngocanh.com/

Name	Relative retention time	Correction factor
Paroxetine impurity A[1]	0.8	—
Paroxetine impurity E[2]	0.9	—
Paroxetine impurity F[3] (with reference to impurity C)	0.97	1.7
Paroxetine (Retention time: about 28 minutes)	1.0	—
Paroxetine impurity J[4] (with reference to impurity C)	1.02	1.3
Paroxetine impurity C[5]	1.5	1.6

[1]desfluoroparoxetine,

[2]*cis*-paroxetine,

[3]*N*-benzyldesfluoroparoxetine,

[4](3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4'-fluorobiphenyl-3-yl)piperidine,

[5]*N*-benzylparoxetine.

Inject reference solutions (e) and (f). The test is not valid unless the resolution between the peaks corresponding to paroxetine impurity E and paroxetine in the chromatogram obtained with reference solution (f) is not less than 3.5. The signal-to-noise ratio for the principal peak in the chromatogram obtained with reference solution (e) is not less than 3.

Inject reference solution (d), (e) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to paroxetine impurity A is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.3 per cent), the area of any peaks corresponding to paroxetine impurities C, F, J, each of, is not more than 0.2 times the area of the peak due to paroxetine in the chromatogram obtained with reference solution (d) (0.1 per cent), the area of any other secondary peak is not more than 0.2 times the area of the peak due to paroxetine in the chromatogram obtained with reference solution (d) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent). Ignore any peak with the area less than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

Impurities H and I. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

- spectrophotometer set at 263 nm,

Name	Relative retention time
Paroxetine hydrochloride impurity I[1]	0.2
Paroxetine hydrochloride impurity H[2]	0.4
Paroxetine hydrochloride (Retention time: about 28 minutes)	1.0

[1][(3*S*,4*R*)-4-(4-fluorophenyl)piperidin-3-yl]methanol,

[2][(3*S*,4*R*)-1-benzyl-4-(4-fluorophenyl)piperidin-3-yl]methanol.

Inject reference solution (e). The test is not valid unless, the signal-to-noise ratio for the peak due to paroxetine impurity H is not less than 3.0.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to paroxetine impurities H and I is not more than the area of the peak corresponding to paroxetine impurity H in the chromatogram obtained with reference solution (d) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined in platinum crucible.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.0512 per cent w/v solution of *paroxetine hydrochloride hemihydrate IPRS* in *water*.

Reference solution (b). A solution containing 0.05 per cent w/v of *paroxetine hydrochloride hemihydrate IPRS* and *paroxetine impurity A IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with trimethylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 3.85 g of *ammonium acetate* in 500 ml of *water*, adjusted to pH 5.5 with *anhydrous acetic acid* and dilute to 600 ml with *water*, add 400 ml of *acetonitrile* slowly add with stirring, 10 ml of *triethylamine* and adjusted to pH 5.5 with *anhydrous acetic acid* ,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to paroxetine and paroxetine impurity A is not less than 2.0.

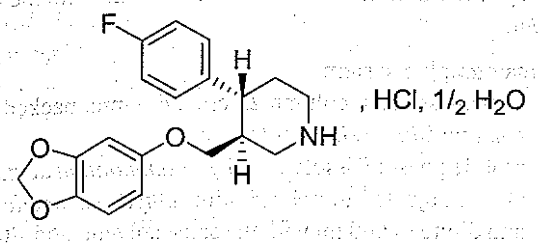
Inject reference solution (a) and the test solution. Run the chromatograms twice the retention time of the principal peak.

Calculate the content of $C_{19}H_{21}ClFNO_3$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Paroxetine Hydrochloride Hemihydrate



$C_{19}H_{21}ClFNO_3,½H_2O$ Mol.Wt. 374.8

Paroxetine Hydrochloride Hemihydrate is (3*S*,4*R*)-3-[(1,3-Benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine hydrochloride hemihydrate.

Paroxetine Hydrochloride Hemihydrate contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{19}H_{21}ClFNO_3$, calculated on the anhydrous basis.

Category. Antidepressant.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paroxetine hydrochloride hemihydrate IPRS* or with the reference spectrum of paroxetine hydrochloride hemihydrate.

If the spectra obtained show differences, dissolve 1 part of the substance under examination and 1 part of the reference substance separately in 10 parts of a mixture of 1 volume of *water* and 9 volumes of *2-propanol* and heat to 70 ° to dissolve. Recrystallise and record new spectra using the residue.

B. It gives reaction (B) of chlorides (2.3.1).

C. In the test for impurity D, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (c).

Tests

Impurity D. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 20 ml of *methanol* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *paroxetine impurity D IPRS ((3R,4S)-3-[(1,3-benzodioxol-5-yloxy) methyl]-4-(4-fluorophenyl)piperidine ((+)-trans-paroxetine))* and 5.0 mg of *paroxetine hydrochloride hemihydrate IPRS* in 2.0 ml of *methanol* and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *paroxetine hydrochloride hemihydrate IPRS* in 2 ml of *methanol* and dilute to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.0 mm, packed with silica gel AGP for chiral chromatography (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol,* 80 volumes of *sodium chloride* solution prepared by dissolving 5.8 g *sodium chloride* in 1000 ml of *water*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.

The retention time of paroxetine is about 30 minutes. Run the chromatogram 2.5 times the retention time of paroxetine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to paroxetine impurity D and paroxetine is not less than 2.2.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of paroxetine impurity D is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 10 volumes of *tetrahydrofuran and* 90 volumes of *water*.

Test solution. Dissolve 50.0 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the same solvent mixture.

Reference solution (a). Dilute 5.0 ml of the test solution to 50.0 ml with the solvent mixture. Dilute 2.0 ml of the solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dissolve 2.0 mg of *paroxetine IPRS* containing *impurity C IPRS ((3S,4R)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-ethoxyphenyl)piperidine)* in the solvent mixture and dilute to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10 ml with the solvent mixture.

Reference solution (c). Dissolve 2.0 mg of *paroxetine impurity A IPRS ((3S,4R)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenylpiperidine) or desfluoroparoxetine)* in the solvent mixture and dilute to 20 ml with the same solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,

https://nhathuocngocanh.com/

– mobile phase: A. mix 5 volumes of *trifluoroacetic acid*, 10 volumes of *tetrahydrofuran* and 90 volumes of *water*, B. mix 5 volumes of *trifluoroacetic acid*, 10 volumes of *tetrahydrofuran* and 90 volumes of *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 295 nm,
– injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
30	80	20
50	20	80
60	20	80
65	80	20
70	80	20

The relative retention time with reference to paroxetine for paroxetine impurity A is about 0.8.

Inject reference solution (b).The test is not valid unless the resolution between the peaks due to paroxetine impurity C and paroxetine is not less than 3.5.

Inject reference solution (c) to identify peak of impurity A.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of paroxetine impurity A is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 2.2 per cent to 2.7 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in *water* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *paroxetine hydrochloride hemihydrate IPRS* in *water* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of *paroxetine hydrochloride hemihydrate IPRS* and 5.0 mg of *paroxetine impurity A IPRS* in *water* and dilute to 10.0 ml with the same solvent.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with *trimethylsilane silica gel* (5 µm),
– mobile phase: Dissolve 3.85 g of *ammonium acetate* in *water*, adjusted to pH 5.5 with *anhydrous acetic acid* and dilute to 600 ml with the same solvent; add 400 ml of *acetonitrile*; slowly add, with stirring, 10 ml of *triethylamine* and read just to pH 5.5 with *anhydrous acetic acid*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 295 nm,
– injection volume: 10 µl.

Inject reference solution (b). Run the chromatogram twice the retention time of paroxetine peak. The test is not valid unless the resolution between the peaks due to impurity A and paroxetine is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{21}ClFNO_3$.

Storage. Store protected from light.

Paroxetine Prolonged-release Tablets

Paroxetine Sustained-release Tablets; Paroxetine Extended-release Tablets

Paroxetine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same..

Paroxetine Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paroxetine, $C_{19}H_{20}FNO_3$.

Usual strengths. 12.5 mg; 25mg; 37.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water.*

Test solution. Disperse a quantity of the powdered tablets containing 75 mg of Paroxetine in 75 ml of solvent mixture and sonicate for 45 minutes, cool and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.000375 per cent w/v solution of *paroxetine hydrochloride hemihydrates IPRS* equivalent to Paroxetine in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Inertsil C8-3),
- column temperature: 40°,
- mobile phase: A. a mixture of 900 volumes of *water*, 100 volumes of *tetrahydrofuran* and 5 volumes of *trifluroacetic acid,*
  B. a mixture of 900 volumes of *acetonitrile*, 100 volumes of *tetrahydrofuran* and 5 volumes of *trifluroacetic acid,*
- a gradient programme using the conditions given below,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
30	80	20
40	20	80
50	80	20
60	80	20

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with the reference solution.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water.*

*Test solution .*Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 37.5 mg of Paroxetine, add 75 ml of solvent mixture and sonicate for 45 minutes,cool and dilute to 100.0 ml with the solvent mixture Centrifuge to obtain a clear solution. Dilute 10.0 ml of the solution to 100.0 ml with solvent mixture.

Reference solution. A 0.00375 per cent w/v solution of *paroxetine hydrochloride hemihydrates IPRS* equivalent to Paroxetine in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Zorbax TMS),
- mobile phase: a mixture of 45 volumes of buffer solution prepared by dissolving 3.854 g of *ammonium acetate* in 1000 ml of *water*, add 1 ml of *triethylamine*, adjusted to pH 4.5 with *glacial acetic acid*, and 55 volumes of *acetonitrile,* adjusted to pH 5.5 with *glacial acetic acid,*
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{20}FNO_3$ in the tablets.

Storage. Store at a temperature not exceeding 30°, protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent of amount of Paroxetine.

Paroxetine Tablets

Paroxetine Hydrochloride Tablets

Paroxetine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paroxetine, $C_{19}H_{20}FNO_3$.

Usual strengths. 10 mg; 20 mg; 30 mg.

Identification

Disperse a quantity of the powdered tablets containing 90 mg of Paroxetine with 100 ml of *0.1 M hydrochloric acid*, and stir for 1 hour. Transfer the mixture to a separating funnel, and add 1.5 ml of *ammonium hydroxide* to make the solution alkaline. Add 100 ml of *ethyl ether* to the funnel, and shake for 2 minutes. Transfer the organic layer into the necessary number

https://nhathuocngocanh.com/

of centrifuge tubes, and centrifuge for 10 minutes. Recombine the clarified extracts, add 1 drop of *water* and 0.5 ml of *hydrochloric acid*, stir and evaporate to dryness under a stream of nitrogen. Dry the residue in an oven at 90° for 1 hour. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paroxetine hydrochloride IPRS*, treated in same manner or with the reference spectrum of paroxetine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of simulated gastric juice, artificial (without enzyme),
Speed and time. 60 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.063 per cent w/v solution of *paroxetine hydrochloride IPRS* prepared by dissolving in minimum quantity of *methanol* and diluted with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Use chromatographic system as described under Assay, using 20 µl injection volume:

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{20}FNO_3$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{20}FNO_3$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solution.

Test solution. Disperse one tablet in 0.7 per cent v/v solution of *hydrochloric acid* and dilute with *methanol* to obtain a solution containing 0.01 per cent w/v of paroxetine and centrifuge.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of paroxetine in *methanol* and dilute to 200 ml with *methanol*. Centrifuge a portion of the solution for 6 minutes. Dilute 20.0 ml of the supernatant liquid to 100.0 ml with *methanol*.

Reference solution. A 0.011 per cent w/v solution of *paroxetine hydrochloride IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 3.3 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 70 volumes of buffer solution prepared by mixing 100 ml of *water*, 0.6 ml of *orthophosphoric acid*, and 0.3 ml of *triethylamine* and 30 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 295 nm,
- Injection volume: 5 µl.

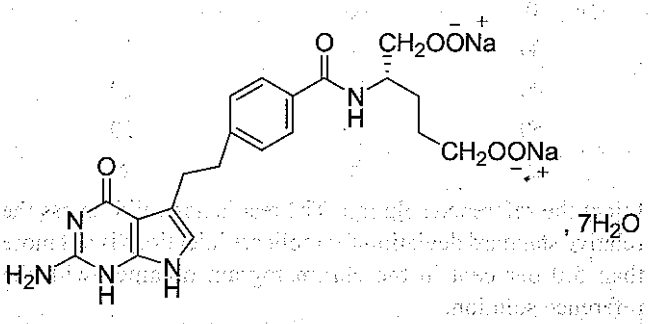
Inject the reference solution. The test is not valid unless the column efficiency is not less than 750 theoretical plates, the tailing factor is not more than 4.0 and and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{20}FNO_3$ in the tablets.

Storage. Store protected from moisture.

Pemetrexed Disodium Heptahydrate



$C_{20}H_{19}N_5Na_2O_6,7H_2O$ Mol. Wt. 597.5

Pemetrexed Disodium Heptahydrate is a disodium (2*S*)-2-[[4-[2-(2-amino-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl]benzoyl]amino]pentanedioate heptahydrate.

Pemetrexed Disodium Heptahydrate contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{20}H_{19}N_5Na_2O_6$, calculated on the anhydrous basis.

Category. Thymidylate synthetase inhibitor; cytostatic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pemetrexed*

https://nhathuocngocanh.com/

disodium heptahydrate IPRS or with the reference spectrum of pemetrexed disodium heptahydrate.

B. It gives reaction (A) of sodium salts (2.3.1).

C. Enantiomeric purity (see Tests).

D. Water (see Tests).

Tests

Appearance of solution. A 5.6 per cent w/v solution in *carbon dioxide-free water* (Solution A) is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution GYS_4 or YS_4 (2.4.1).

pH (2.4.24). 7.5 to 8.4 for solution A.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use or store them at 2-8° for not more than 24 hours.

Test solution. Dissolve 12 mg of the substance under examination in *water* and dilute to 50.0 ml with *water*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 3.0 ml of the solution to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) with a pore size of 12 nm,
- column temperature: 40°,
- mobile phase: a mixture of 5 volumes of *acetonitrile* and 95 volumes of a solution prepared by dissolving 8 g of *β-cyclodextrin* in 900 ml of *water*, add 15 ml of *triethylamine* and 6 ml of *phosphoric acid*, adjusted to pH 6.0 with *orthophosphoric acid*, dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

The relative retention time with reference to pemetrexed (retention time : about 30 minutes) for pemetrexed impurity E is about 0.94.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to (2*R*)-2-[[4-[2-(2-amino-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl]benzoyl]amino] pentanedioic acid (pemetrexed disodium impurity E) is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use or store them at 2 to 8° for not more than 24 hours.

Test solution. Dissolve 20 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (b). In order to prepare impurities B and C in situ, dissolve 30 mg of the substance under examination in 10.0 ml of a 0.4 per cent w/v solution of *sodium hydroxide*, heat at 70° for 40 minutes and allow to cool. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of buffer solution containing 0.145 per cent w/v solution of *ammonium formate* in *water*, adjusted to pH 3.5 with *anhydrous formic acid*,
  B. a mixture of 30 volumes of *acetonitrile* and 70 volumes of buffer solution containing 0.145 per cent w/v solution of *ammonium formate* in *water*, adjusted to pH 3.5 with *anhydrous formic acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
45	0	100
48	100	0

Name	Relative retention time
Pemetrexed impurity A[1]	0.82
Pemetrexed impurity B[2]	0.87
Pemetrexed impurity C[3]	0.88
Pemetrexed impurity D[4]	0.90
Pemetrexed (Retention time: about 26 minute)	1.0

[1](2*S*)-2-[[4-[2-(2-amino-1-methyl-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-*d*]pyrmidin-5 yl)ethyl]benzoyl]amino]- pentanedioic acid,

[2](2*S*, 2'*S*)-2,2'-[[(5*R*)- 2,2'- diamino- 4,4'6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*, 5*H*-5,6'-bipyrollol[2,3-*d*]pyrimidine-5,5'-diyl] bis (ethylenebenzene-4,1diylcarbonylimin)]dipentanedioic acid,

https://nhathuocngocanh.com/

[3](2*S*, 2'*S*)-2,2'-[[(5*S*)- 2,2'-diamino-4,4'6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*, 5*H*-5,6'-bipyrrollol[2,3-*d*]pyrimidine-5,5'-diyl] bis (ethylenebenzene-4,1diylcarbonylimin)]dipentanedioic acid,

[4](2S)-2-[[(4S)-4-[[4-[2-(2-amino-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-d]pyrimidin-5-yl)ethyl]benzoyl]amino]-4-carboxybutanoyl]amino] pentanedioic acid.

Inject the reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to pemetrexed impurity A and pemetrexed impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore any peak with an area less than 0.5 times of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). 19.5 per cent to 22.1 per cent, determined on 0.05 g.

Bacterial endotoxins (2.2.3). Not more than 0.17 Endotoxin Units per mg of pemetrexed.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use or store them at 2-8° for not more than 24 hours.

Test solution. Dissolve 30 mg of the substance under examination in *water* and dilute to 200.0 ml with *water*.

Reference solution. Dissolve 30 mg of *pemetrexed disodium heptahydrate IPRS* in *water* and dilute to 200.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with base deactivated octylsilane bonded to porous silica (3.5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 11 volumes of *acetonitrile* and 89 volumes of buffer solution prepared by diluting 1.7 ml of *glacial acetic acid* to 900 ml of *water*, adjusted to pH 5.3 with a 76.0 per cent w/v solution of *sodium hydroxide* in *water* and dilute to 1000 ml with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{19}N_5Na_2O_6$.

Pemetrexed Injection

Pemetrexed Injection is a sterile material consisting of pemetrexed Disodium heptahydrate with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections or with suitable diluents immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Pemetrexed Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pemetrexed, $C_{20}H_{21}N_5O_6$.

Usual strengths. 100 mg; 500 mg.

The contents of the sealed container comply with the requirements stated under Parental Preparations (Powder for Injections) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponding to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.6 to 7.8.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.17 per cent v/v of *glacial acetic acid* in *water* adjusted to pH 5.5 with *50 per cent sodium hydroxide solution*.

Test solution. Dilute the injection with *water* to produce a solution containing 0.02 per cent w/v of pemetrexed.

Reference solution (a). A solution of *pemetrexed disodium IPRS* in *water* containing 0.00001 per cent w/v solution of pemetrexed.

Reference solution (b). Dissolve 28 mg of *pemetrexed disodium IPRS* in 3 per cent *hydrogen peroxide* equivalent to 10 per cent of the final volume and diluted with *water* to 10.0 ml, heat this solution for 2-5 hours at 75°, allow it to cool at room temperature, dilute 5.0 ml of the solution to 50.0 ml with

https://nhathuocngocanh.com/

water.(NOTE — The solution preparation forms ketopemetrexed(4-{2-[(RS)-2-Amino-4,6-dioxo-4,5,6,7-tetrahydro-3H-pyrrolo[2,3-d]pyrimidin-5yl]ethyl}benzoyl)-L-glutamic acid, pemetrexed R-dimer and pemetrexed S-dimer.)

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 35°,
- sample temperature: 2° to 8°,
- mobile phase: A. a mixture of 97 volumes of buffer solution and 3 volumes of *acetonitrile*,
  B. a mixture of 87.5 volumes of buffer solution and 12.5 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
40	0	100
45	0	100
47	100	0

The relative retention time with reference to pemetrexed for ketopemetrexed is about 0.31, for pemetrexed R- dimer about 0.67 and for pemetrexed S- dimer peaks is 0.71.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the pemetrexed R-dimer and pemetrexed S-dimer obtained with reference solution (b) is not less than 2.0. The signal to noise ratio for the principal peak in the chromatogram obtained with reference solution (a) is not less than 10.

Inject the test solution. The area of any peak due to ketopemetrexed multiplied with correction factor of 1.64 is not more than 0.6 per cent, the area of any secondary peak is not more than 0.24 per cent and the sum of the areas of all the secondary of such peaks is not more than 1.50 per cent, calculated by area normalisation. Ignore any peak with an area less than 0.05 per cent of that of the principal peak.

Other tests. Comply with the tests stated under Parenteral Preparation (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.17 per cent v/v of *glacial acetic acid* in *water* adjusted to pH 5.3 with *50 per cent sodium hydroxide solution*.

Test solution. Dilute the injection with *water* to produce a solution containing 0.01 per cent w/v of pemetrexed.

Reference solution. A 0.014 per cent w/v solution of *pemetrexed disodium IPRS* in *water*.

Chromatographic system
- a stainless steel column 7.5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 11 volumes of *acetonitrile* and 89 volumes of buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}N_5O_6$ in the injection.

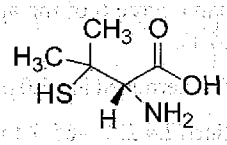
Bacterial endotoxins (2.2.3). Not more than 0.17 Endotoxin Units per mg of pemetrexed.

Sterlity (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture and at a temperature not exceeding 30°.

Penicillamine

D-Penicillamine



$C_5H_{11}NO_2S$ Mol. Wt. 149.2

Penicillamine is 3-mercapto-D-valine.

Penicillamine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_5H_{11}NO_2S$, calculated on the dried basis.

Category. Chelating agent in copper and lead poisoning; antirheumatoid arthritic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if test B, C and D carried out. Test D may be omitted if test A, B and C are carried out.

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *1-butanol*, 10 volumes of *glacial acetic acid* and 10 volumes of *water*.

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of *water*.

https://nhathuocngocanh.com/

Reference solution. A 0.25 per cent w/v solution of *penicillamine IPRS* in *water.*

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 5 to 10 minutes and expose to iodine vapour for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dissolve 0.5 g in a mixture of 0.5 ml of *hydrochloric acid* and 4 ml of warm *acetone*, cool in ice and scratch the inside of the tube with a glass rod to initiate crystallisation; a white precipitate is produced. Filter under vacuum, wash the precipitate with *acetone* and dry with suction. A 1 per cent w/v solution of the dried material is dextrorotatory.

C. To 4 ml of a 1 per cent w/v solution add 2 ml of *phosphotungstic acid solution* and heat nearly to boiling; a blue colour is produced.

D. In the test for Penicillamine disulphide, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak due to penicillamine in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solution (2.4.1).

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). −65.0° to −61.0°, determined in a 5.0 per cent w/v solution in *1 M sodium hydroxide.*

Heavy metals (2.3.13). 12.0 ml of solution A, complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb)* to prepare the standard.

Mercuric salts. Determine by atomic absorption spectrophotometry (2.4.2), using a solution prepared in the following manner. To 1.0 g of the substance under examination add 10 ml of *water* and 0.15 ml of *perchloric acid* and swirl until dissolution is complete. Add 1 ml of *ammonium pyrrolidinedithiocarbamate solution* that has been washed three times immediately before use, each time with an equal volume of *4-methyl-2-pentanone*. Mix, add 2 ml of *4-methyl-2-pentanone*, shake for 1 minute, dilute to 25 ml with *water*, allow the layers to separate and use the 4-methyl-2-pentanone layer. Measure the absorbance at 254 nm using a mercury hollow-cathode lamp and an air-acetylene flame and setting the zero using a 4-methyl-2-pentanone layer obtained by repeating the procedure described above but omitting the substance under examination. For the standard solution dissolve 0.108 g of *yellow mercuric oxide* in the minimum volume of *2 M hydrochloric acid*, add sufficient *water* to produce 1000.0 ml and treat suitable volumes in the same manner as the solution of the substance under examination (10 ppm).

Penicillamine disulphide. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in mobile phase and dilute to 10 ml with the mobile phase and mix.

Reference solution (a). A 0.4 per cent w/v solution of *penicillamine IPRS* in the mobile phase.

Reference solution (b). A 0.004 per cent w/v solution of *penicillamine disulphide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 5 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: an equal volume of 0.2 per cent w/v solution of *methanesulphonic acid* and 0.01 per cent w/v solution of *disodium edetate,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

In the chromatogram obtained with test solution , the area of any peak corresponding to penicillamine disulphide is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Penicillin. Carry out the following procedure in a penicillin-free atmosphere and with equipment reserved for the test. Sterilise the equipment at 180° for 3 hours and the buffer solutions at 121° for 20 minutes before use.

Liquefy a suitable nutrient medium such as that described below and inoculate at a suitable temperature with a culture of *Micrococcus flavus* (ATCC 9341) to give 5 x 10^4 micro-organisms per ml or a quantity necessary to obtain the required sensitivity and formation of clearly defined inhibition zones of suitable diameter. Immediately pour the inoculated medium into five Petri dishes (10 cm in diameter) to give uniform layers 2 to 5 mm in depth. Alternatively, the medium may consist of two layers, only the upper layer being inoculated. Store the dishes so that no appreciable growth or death of micro-organisms occurs before use and so that the surface of the medium is dry at the time of use. In each dish, place five stainless steel hollow cylinders (6 mm in diameter) on the surface of the medium evenly spaced on a circle with a radius of about 25 mm and concentric with the dish. For each dish, place in separate cylinders 0.15 ml of each of the following five solutions.

For solution (1) dissolve 1.0 g of the substance under examination in 8 ml of *phosphate buffer pH 2.5*, add 8 ml of *ether* and shake vigorously for 1 minute. Repeat the extraction

https://nhathuocngocanh.com/

and combine the ether layers. Add 8 ml of *phosphate buffer pH 2.5*, shake for 1 minute, allow to settle and separate the ether layer quantitatively, taking care to eliminate the aqueous phase completely. *(Penicillin is unstable at pH 2.5; carry out the operations at this pH within 6 to 7 minutes)*. Add 8 ml of *phosphate buffer pH 6.0*, shake for 5 minutes, allow to settle, separate the aqueous layer and check that the pH is 6.0. For solution (2) add 20 µl of *penicillinase solution* to 2 ml of solution (1) and incubate at 37° for 1 hour. For solution (3) dissolve 5 mg of *benzylpenicillin sodium* in 500 ml of phosphate buffer pH 6.0 and dilute 0.25 ml of the solution to 200 ml with *phosphate buffer pH 2.5*. Carry out the extraction procedure described under solution (1) using 8 ml of the solution and beginning at the words "add 8 ml of *ether*...". For solution (4) add 20 ml of *penicillinase solution* to 2 ml of solution (3) and incubate at 37° for 1 hour. Prepare solution (5) in the same manner as solution (1) but omitting the substance under examination.

Maintain the dishes at 30° for at least 24 hours. Measure the diameters of the zones of inhibition to within 0.1 mm. The test is not valid unless solution (3) gives a clear zone of inhibition and solution (4) and (5) give no zones of inhibition. If solution (1) gives a zone of inhibition it is caused by penicillin provided solution (2) gives no zone of inhibition. If this is the case, the average diameter of the zones of inhibition given by solution (1) for the five Petri dishes is less than that given by solution (3) (0.1 ppm).

Nutrient medium

Peptone	5 g
Yeast extract	1.5 g
Meat extract	1.5 g
Sodium chloride	3.5 g
Agar	15 g
Distilled water	1000 ml
Adjusted to pH	6.0

Penilloic acid. Absorbance of a 0.2 per cent w/v solution at about 268 nm, not more than 0.07 (2.4.7) (about 0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.1 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01492 g of $C_5H_{11}NO_2S$.

Storage. Store protected from moisture.

Penicillamine Tablets

D-Penicillamine Tablets

Penicillamine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of penicillamine, $C_5H_{11}NO_2S$. The tablets are coated.

Usual strengths. 50 mg; 125 mg; 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Penicillamine with 4 ml of *water* and filter. Add to the filtrate 2 ml of *phosphotungstic acid solution* and allow to stand for 5 minutes; a blue colour is produced.

B. Dissolve a quantity of the powdered tablets containing 10 mg of Penicillamine in 5 ml of *water* and add 0.3 ml of *5 M sodium hydroxide* and 20 mg of *ninhydrin*; an intense blue or violet-blue colour is produced immediately.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of a solution containing 0.5 per cent w/v solution of *disodium edetate* and 0.05 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *penicillamine IPRS* in dissolution medium to obtain a solution of a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 60 volumes of *0.01 M dibasic sodium phosphate* and 40 volumes of *0.01 M monobasic potassium phosphate*, adjusted to pH 7.0 with *0.01 M dibasic sodium phosphate* or *0.01 M monobasic potassium phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 80 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_5H_{11}NO_2S$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_5H_{11}NO_2S$.

Mercuric salts. Disperse a quantity of the powdered tablets containing 1 g of Penicillamine in 10 ml of *water* in a stoppered flask, add 0.2 ml of *9 M perchloric acid* and swirl to dissolve. Add 1 ml of *ammonium pyrrolidinedithiocarbamate solution*, mix, add 2 ml of *4-methyl-2-pentanone*, shake for 1 minute and add sufficient *water* to produce 25 ml. Determine by atomic absorption spectrophotometry (2.4.2), using a mercury hollow-cathode lamp and an air-acetylene flame and setting the zero using a *4-methyl-2-pentanone* layer obtained by repeating the procedure described above but omitting the substance under examination, measuring at 254 nm. Use *mercury solution AAS*, suitably diluted with *water*, for the standard solutions, adjusted to contain the same concentrations of *9 M perchloric acid, ammonium pyrrolidinedithiocarbamate solution* and *4-methyl-2-pentanone* as the solution under examination (10 ppm).

Penicillamine disulphide. Determine by liquid chromatography (2.4.14).

Test solution. Shake quantity of the powdered tablets containing 40 mg of Penicillamine with 10 ml of the mobile phase, filter and use the filtrate.

Reference solution. A 0.004 per cent w/v solution of *penicillamine disulphide IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: an equal volume of 0.2 per cent w/v solution of *methanesulphonic acid* and 0.01 per cent w/v solution of *disodium edetate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

In the chromatogram obtained with the test solution the area of any peak corresponding to penicillamine disulphide is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.5 per cent w/v solution of *disodium edetate* in *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.25 g of Penicillamine in 150 ml of the solvent mixture, shake for 5 minutes, allow to stand for 90 minutes and dilute to 200.0 ml with the solvent mixture.

Reference solution (a). A 0.125 per cent w/v solution of *penicillamine IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.1 per cent w/v of *penicillamine IPRS* and 0.01 per cent w/v of *penicillamine disulfide IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.9 g of *monobasic sodium phosphate* and 0.2 g of *sodium 1-hexanesulphonate*, in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with reference to penicillamine disulfide for penicillamine is about 0.7.

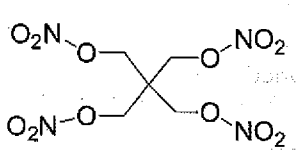
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to penicillamine and penicillamine disulfide is not less than 3.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injection is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_5H_{11}NO_2S$ in the tablets.

Storage. Store protected from moisture.

Diluted Pentaerythritol Tetranitrate



$C_5H_8N_4O_{12}$ Mol. Wt. 316.1

Diluted Pentaerythritol Tetranitrate is a dry mixture of 2,2-bis(hydroxymethyl)propane-1,3-diol tetranitrate with Lactose or Mannitol or a mixture of Lactose and Starch or any other suitable inert excipients which permit safe handling.

Diluted Pentaerythritol Tetranitrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentaerythritol tetranitrate, $C_5H_8N_4O_{12}$.

Category. Antianginal.

Description. A white or almost white, powder.

Identification

A. Transfer a quantity of powder containing 10 mg of pentaerythritol tetranitrate to a medium porosity sintered-glass filter, add 5 ml of dry *acetone* and collect the filtrate. Repeat

https://nhathuocngocanh.com/

with two further quantities, each of 5 ml, of dry *acetone* and evaporate the combined filtrate at a temperature not exceeding 60°, with the aid of a gentle current of air, and dry the residue at 60° for 4 hours; the residue melts at 138° to 142° (2.4.21).

B. Suspend 10 mg of the residue obtained in test A in a mixture of 2 ml of *sulphuric acid* and 1 ml of *water;* cool and carefully overlay with 3 ml of *ferrous sulphate solution*; a reddish brown colour is produced at the interface of the two liquids.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

Test solution. Dissolve a quantity of the substance under examination containing about 10 mg of Pentaerythritol Tetranitrate in 10 ml of *ethanol (95 per cent)*, filter.

Reference solution. Shake a quantity of *diluted pentaerythritol tetranitrate IPRS* containing about 10 mg of Pentaerythritol Tetranitrate with 10 ml of *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine at 254 nm, The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

Test solution. Shake a quantity of powder containing 0.1 g of pentaerythritol tetranitrate in 5.0 ml of *ethanol (95 per cent)*, filter.

Reference solution. Dissolve about 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and spray with freshly prepared *potassium iodide* and *starch solution* and examine at 254 nm. The spot due to nitrate in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Shake a quantity of powder containing 25 mg of pentaerythritol tetranitrate in 20 ml of the mobile phase for 15 minutes and dilute to 25.0 ml with the mobile phase, filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve a quantity of *diluted pentaerythritol tetranitrate IPRS* containing about 25 mg of Pentaerythritol Tetranitrate in 20 ml of the mobile phase, sonicate for 15 minutes and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 0.3 ml of reference solution (b) to 10.0 ml with the mobile phase.

Reference solution (d). Dilute 200 µl of *glyceryl trinitrate solution IPRS* to 25.0 ml with the mobile phase.

Reference solution (e). To 1 ml of reference solution (b), add 1 ml of reference solution (d) and dilute to 10.0 ml with the mobile phase.

Reference solution (f). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase. Dilute 0.5 ml of the solution to 50.0 ml with the mobile phase.

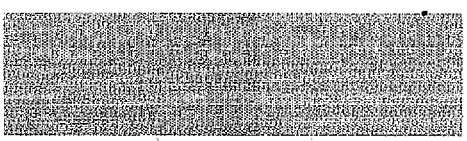
Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *water* and 65 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (e). The test is not valid unless the resolution between the peaks due to glyceryl trinitrate and pentaerythritol tetranitrate is not less than 3.0. The relative retention time with reference to pentaerythritol tetranitrate for pentaerythritol tetranitrate impurity B is about 0.7 and for pentaerythritol tetranitrate impurity C is about 3.0.

Inject reference solution (c), (f) and test solution (a). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a) the area of the peak due to pentaerythritol tetranitrate impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than not more than twice the area of the principal peak in the chromatogram obtained with reference solution (f) (0.1 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).



https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_5H_8N_4O_{12}$.

Storage. Store protected from light and moisture.

NOTE — Undiluted pentaerythritol tetranitrate is a powerful explosive. It can be exploded with percussion or excessive heat. Great care and appropriate precautions should be taken in handling and only exceedingly small amounts should be isolated.

Labelling. The label states the content of pentaerythritol tetranitrate.

Pentaerythritol Tetranitrate Tablets

Pentaerythritol Tetranitrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pentaerythritol tetranitrate, $C_5H_8N_4O_{12}$.

Usual strengths. 10 mg; 30 mg.

Identification

A. Transfer a quantity of powder containing 10 mg of pentaerythritol tetranitrate to a medium porosity sintered-glass filter, add 5 ml of dry *acetone* and collect the filtrate. Repeat with two further quantities, each of 5 ml, of dry *acetone* and evaporate the combined filtrate at a temperature not exceeding 60°, with the aid of a gentle current of air, and dry the residue at 60° for 4 hours; the residue melts at 138° to 142° (2.4.21).

Tests

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet and transfer to a 50-ml volumetric flask with the aid of 15 ml of *acetone*. Add sufficient *acetone* to produce 25 ml, heat the mixture on a water-bath at a temperature not exceeding 60° and boil gently, with occasional swirling, for 5 minutes. Cool, dilute to volume with *acetone* and mix. Transfer a portion of the mixture to a glass-stoppered centrifuge tube and centrifuge at 1500 rpm for 5 minutes. Transfer 2.5 ml of the supernatant solution to a 100-ml volumetric flask and evaporate at 35° with the aid of a current of air to dryness. To the residue add 1.0 ml of *glacial acetic acid* and swirl to dissolve. Add 2 ml of *phenoldisulphonic acid solution*, mix and allow to stand for 5 minutes. Add 25 ml of *water* and 10 ml of *strong ammonia solution*, cool, dilute to volume with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 409 nm (2.4.7), using *water* as the blank.

Weigh 0.130 g of *potassium nitrate*, previously dried at 105° for 4 hours, dissolve in 3 ml of *water*, dilute with sufficient *glacial acetic acid* to produce 200.0 ml and mix well. Using 1.0 ml of the solution repeat the procedure beginning at the words "Add 2 ml of *phenoldisulphonic acid solution*,.....". Calculate the content of $C_5H_8N_4O_{12}$ in the tablet.

1 ml of the potassium nitrate solution is equivalent to 0.000503 g of $C_5H_8N_4O_{12}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of pentaerythritol tetranitrate and transfer to a 100-ml volumetric flask with the aid of about 30 ml of *acetone*. Add sufficient *acetone* to produce 50 ml and warm on a water-bath at a temperature not exceeding 60° and boil gently, with occasional swirling, for 5 minutes. Cool, dilute to volume with *acetone* and mix. Transfer a portion of the mixture to a glass-stoppered centrifuge tube and centrifuge at 1500 rpm for 5 minutes. Transfer 1.0 ml of the supernatant solution to a 100-ml volumetric flask and evaporate at 35° with the aid of a current of air to dryness. To the residue add 1.0 ml of *glacial acetic acid* and swirl to dissolve. Add 2 ml of *phenoldisulphonic acid solution*, mix and allow to stand for 5 minutes. Add 25 ml of *water* and 10 ml of *strong ammonia solution*, cool, dilute to volume with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 409 nm (2.4.7), using *water* as the blank.

Weigh 0.13 g of *potassium nitrate*, previously dried at 105° for 4 hours, dissolve in 3 ml of *water*, dilute with sufficient *glacial acetic acid* to produce 200.0 ml and mix well. Using 1.0 ml of the solution repeat the procedure beginning at the words "Add 2 ml of *phenoldisulphonic acid solution*,.....".

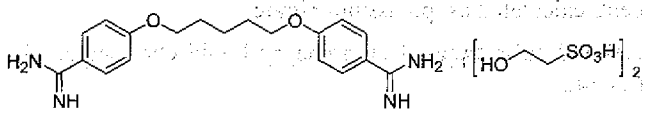
Calculate the content of $C_5H_8N_4O_{12}$ from the values of the absorbances so obtained.

1 ml of the potassium nitrate solution is equivalent to 0.000503 g of $C_5H_8N_4O_{12}$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of pentaerythritol tetranitrate.

Pentamidine Isethionate



$C_{19}H_{24}N_4O_2,2C_2H_6O_4S$ Mol. Wt. 592.7

Pentamidine Isethionate is 4,4′-[pentane-1,5-diylbis(oxy)] bisbenzenecarboximidamide di(2-hydroxyethanesulphonate).

https://nhathuocngocanh.com/

Pentamidine Isethionate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{24}N_4O_2$, $2C_2H_6O_4S$, calculated on the dried basis.

Category. Antiprotozoal.

Description. A white or almost white powder or crystals; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentamidine isethionate IPRS* or with the reference spectrum of pentamidine isethionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 262 nm; absorbance at about 262 nm, about 0.46).

C. To 10 ml of a 0.05 per cent w/v solution add 1 ml of a 0.1 per cent w/v solution of *glyoxal sodium bisulphite* and 1 ml of a solution prepared by dissolving 4 g of *boric acid* in a mixture of 27 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. Heat on a water-bath for 10 minutes; a magenta colour is produced.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). To 0.1 g in a conical flask, add 40 ml of *water* and glass beads, adjusted to pH 10.5 with dilute *sodium hydroxide solution* and boil under reflux for 20 minutes. Cool and dilute to 50 ml with *water.* Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of 3 per cent w/v solution of *ammonium acetate*, adjusted to pH 7.5 with *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the 2 principal peaks is not less than 2.0. Inject reference solution (a) and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Ammonium isethionate. To 1.0 g in a test-tube (about 4 cm in diameter) add 10 ml of *water* and 20 ml of *1 M sodium hydroxide.* Immediately attach a bung carrying a splash head and an aspirator tube (about 5 mm in diameter). Connect the splash head to two test-tubes in series, each containing 20 ml of *0.01 M sulphuric acid.* Heat the tube containing the substance under examination in a water-bath at 45° to 50° and, maintaining this temperature, draw a current of air, previously passed through *1 M sulphuric acid*, through the liquids in a series of tubes for 3 hours at such a rate that the bubbles are just too rapid to count. Titrate the combined solutions from the two absorption tubes with *0.02 M sodium hydroxide* using *methyl red-methylene blue solution* as indicator; not less than 36.5 ml of *0.02 M sodium hydroxide* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.250 g in 50 ml of *dimethylformamide.* Add 0.25 ml of *thymol blue solution* and titrate with *0.1 M tetrabutylammonium hydroxide*, under a current of *nitrogen*, until the colour of the indicator changes to blue. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02963 g of $C_{23}H_{36}N_4O_{10}S_2$.

Storage. Store protected from moisture.

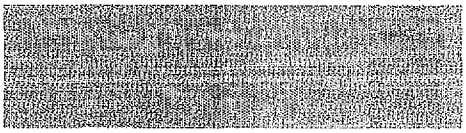
Pentamidine Injection

Pentamidine Isethionate Injection

Pentamidine Injection is a sterile material consisting of Pentamidine Isethionate with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).



https://nhathuocngocanh.com/

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Pentamidine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentamidine isethionate, $C_{19}H_{24}N_4O_2, 2C_2H_6O_4S$.

Usual strength. 200 mg.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentamidine isethionate IPRS* or with the reference spectrum of pentamidine isethionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 262 nm; absorbance at about 262 nm, about 0.46.

C. To 10 ml of a 0.05 per cent w/v solution add 1 ml of a 0.1 per cent w/v solution of *glyoxal sodium bisulphite* and 1 ml of a solution prepared by dissolving 4 g of *boric acid* in a mixture of 27 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. Heat on a water-bath for 10 minutes; a magenta colour is produced.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 0.1 g of substance under examination in 40 ml of *water*, adjusted to pH 10.5 with *2 M sodium hydroxide*, heat under a reflux condenser for 20 minutes, cool and dilute to 50 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 130 volumes of *methanol* and 70 volumes of 3 per cent w/v solution of *ammonium acetate*, adjusted to pH 7.5 with *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent).

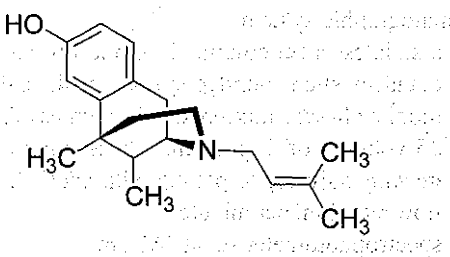
Ammonium isethionate. To 1.0 g in a test-tube (about 4 cm in diameter) add 10 ml of *water* and 20 ml of *1 M sodium hydroxide*. Immediately attach a bung carrying a splash head and an aspirator tube (about 5 mm in diameter). Connect the splash head to two test-tubes in series, each containing 20 ml of *0.01 M sulphuric acid*. Heat the tube containing the substance under examination in a water-bath at 45° to 50° and, maintaining this temperature, draw a current of air, previously passed through *1 M sulphuric acid*, through the liquids in a series of tubes for 3 hours at such a rate that the bubbles are just too rapid to count. Titrate the combined solutions from the two absorption tubes with *0.02 M sodium hydroxide* using *methyl red-methylene blue solution* as indicator; not less than 36.5 ml of *0.02 M sodium hydroxide* is required.

Assay. Dissolve 0.25 g of the mixed contents of 10 containers in 50 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02963 g of $C_{19}H_{24}N_4O_2, 2C_2H_6O_4S$.

Storage. Store in single dose containers.

Pentazocine



$C_{19}H_{27}NO$ Mol. Wt. 285.4

Pentazocine is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol.

https://nhathuocngocanh.com/

Pentazocine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. A white or pale cream powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine IPRS* or with the reference spectrum of pentazocine.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. Dissolve 5 mg in 5 ml of *sulphuric acid*, add 0.05 ml of *ferric chloride solution* and mix; a yellow colour is produced which deepens slightly in intensity on warming. On the addition of *0.05 ml of nitric acid* the yellow colour is unchanged.

Tests

Light absorption (2.4.7). To 0.1 g add 20 ml of *water* and 10 ml of *1 M hydrochloric acid*, shake to dissolve and add sufficient *water* to produce 100 ml. Dilute 10 ml to 100 ml with *water*. The absorbance of the resulting solution at the maximum at about 278 nm, 0.67 to 0.71.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

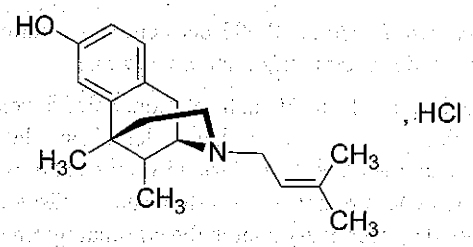
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Dissolve 0.6 g in 50 ml of *anhydrous glacial acetic acid* and titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02854 g of $C_{19}H_{27}NO$.

Storage. Store protected from light and moisture.

Pentazocine Hydrochloride



$C_{19}H_{27}NO,HCl$ Mol. Wt. 321.9

Pentazocine Hydrochloride is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol hydrochloride.

Pentazocine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. A white or pale cream-coloured, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine hydrochloride IPRS* or with the reference spectrum of pentazocine hydrochloride.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 1.0 per cent w/v solution.

https://nhathuocngocanh.com/

Light absorption (2.4.7). Dissolve 0.1 g in 10 ml of *1 M hydrochloric acid* and add sufficient *water* to produce 100 ml; dilute 10.0 ml of the solution to 100.0 ml with *water*. Absorbance of the resulting solution at the maximum at about 278 nm, 0.59 to 0.63.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.5 g in 50 ml of *anhydrous glacial acetic acid*, add 10.0 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03219 g of $C_{19}H_{27}NO,HCl$.

Storage. Store protected from light and moisture.

Pentazocine Tablets

Pentazocine Hydrochloride Tablets

Pentazocine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pentazocine hydrochloride, $C_{19}H_{27}NO,HCl$.

Usual strength. 25 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Pentazocine Hydrochloride with 10 ml of *water*, filter, add 1 ml of *1 M sodium hydroxide* and shake the resulting solution with 20 ml of *chloroform*. Wash the chloroform extract with 5 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform using a rotary evaporator and dry the oily residue at a temperature not exceeding 25° at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine IPRS* or with the reference spectrum of pentazocine.

B. To a quantity of the powdered tablets containing 50 mg of Pentazocine Hydrochloride add 70 ml of *water*, shake for 15 minutes, add sufficient *water* to produce 100 ml and filter. To 10 ml of the filtrate add 10 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 238 nm and 298 nm.

C. Shake a quantity of the powdered tablets containing 25 mg of Pentazocine Hydrochloride with 5 ml of *water* and 0.5 ml of *2 M nitric acid* for 1 minute and filter. The filtrate gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Pentazocine Hydrochloride with 10 ml of *0.1 M methanolic ammonia* for 10 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1 volume of test solution to 100 volumes with *0.1 M methanolic ammonia*.

Reference solution (b). Dilute 1 volume of test solution to 200 volumes with *0.1 M methanolic ammonia*.

Reference solution (c). Dilute 1 volume of test solution to 400 volumes with *0.1 M methanolic ammonia*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a), not more than one such spot is more intense than the spot in the

https://nhathuocngocanh.com/

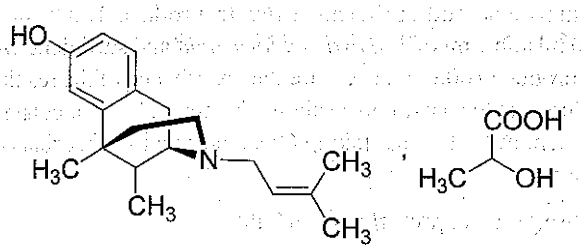
chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 25 mg of Pentazocine Hydrochloride, shake with 100 ml of *water* for 15 minutes, add 2.5 ml of *1 M hydrochloric acid* and sufficient *water* to produce 250.0 ml and filter. Measure the absorbance of the filtrate at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{19}H_{27}NO,HCl$ taking 61.2 as the specific absorbance at 278 nm.

Storage. Store protected from light and moisture.

Pentazocine Lactate



$C_{19}H_{27}NO,C_3H_6O_3$ Mol. Wt. 375.4

Pentazocine Lactate is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol lactate.

Pentazocine Lactate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO,C_3H_6O_3$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. A white or pale cream-coloured, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine lactate IPRS* or with the reference spectrum of pentazocine lactate.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. It gives reaction (A) of lactates (2.3.1).

Tests

pH (2.4.24). 5.5 to 6.5, determined in a 1.0 per cent w/v solution.

Light absorption (2.4.7). Dissolve 0.1 g in 10 ml of *1 M hydrochloric acid* and add sufficient *water* to produce 100 ml; dilute 10 ml to 100 ml with *water*. Absorbance of the resulting solution at the maximum at about 278 nm, 0.50 to 0.54.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 25 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 16 hours.

Assay. Weigh 0.75 g of the substance under examination, dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03754 g of $C_{19}H_{27}NO,C_3H_6O_3$.

Storage. Store protected from light and moisture.

Pentazocine Injection

Pentazocine Lactate Injection

Pentazocine Injection is a sterile solution in Water for Injections of either Pentazocine Lactate or pentazocine lactate prepared by the interaction of Pentazocine and Lactic Acid.

https://nhathuocngocanh.com/

Pentazocine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentazocine, $C_{19}H_{27}NO$.

Usual strength. The equivalent of 30 mg of pentazocine per ml; the equivalent of 60 mg of pentazocine per ml.

Description. A clear, colourless or almost colourless liquid.

Identification

A. To a volume containing 90 mg of pentazocine add 5 ml of *0.1 M sodium hydroxide* and shake the resulting solution with 5 ml of *chloroform*. Wash the chloroform extract with 2 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform without applying heat and dry the oily residue at a temperature not exceeding 25° and at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine IPRS* or with the reference spectrum of pentazocine (form B).

B. Dilute a volume containing 30 mg of pentazocine to 100 ml with *water*. To 10 ml add 10 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima, at about 238 nm and 298 nm.

C. To a volume containing 30 mg of pentazocine add 2 ml of *0.1 M sodium hydroxide*, extract with 2 ml of *chloroform* and evaporate 0.1 ml of the *chloroform* extract to dryness in a porcelain crucible. Add to the residue 0.5 ml of a 1 per cent w/v solution of *ammonium molybdate* in *sulphuric acid*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

Tests

pH (2.4.24). 4.0 to 5.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dilute a volume of the injection with sufficient *ethanol (95 per cent)* to produce a solution containing 2.0 per cent w/v solution of pentazocine.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *ethanol (95 per cent)*.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with *ethanol (95 per cent)*.

Reference solution (c). Dilute 1 volume of the test solution to 400 volumes with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a), not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Bacterial endotoxins (2.2.3). Not more than 5.8 Endotoxin Units per mg of pentazocine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

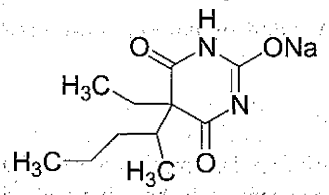
Assay. To a measured volume containing about 0.15 g of pentazocine add sufficient *water* to produce 100.0 ml. To 5.0 ml add 1 ml of *1 M hydrochloric acid* and sufficient *water* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{19}H_{27}NO$, taking 69 as the specific absorbance at 278 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of pentazocine in a suitable dose-volume.

Pentobarbitone Sodium

Soluble Pentobarbitone; Pentobarbital Sodium



$C_{11}H_{17}N_2NaO_3$ Mol. Wt. 248.3

Pentobarbitone Sodium is sodium 5-ethyl-5-[(1*RS*)-1-methylbutyl]barbiturate.

Pentobarbitone Sodium contains not less than 99.0 per cent and not more than 101.5 per cent of $C_{11}H_{17}N_2NaO_3$, calculated on the dried basis.

Category. Hypnotic.

Description. A white, crystalline powder or granules; hygroscopic.

https://nhathuocngocanh.com/

Identification

A. To 10 ml of a 10 per cent w/v solution add 5 ml of *2 M acetic acid*; a white, crystalline precipitate is produced. Filter, wash the precipitate with *water* and dry at 105°. Determine the melting point of the dried precipitate (2.4.21). Mix equal parts of the dried precipitate and *pentobarbitone IPRS* and determine the melting point (2.4.21).. The difference between the melting points (which are about 131°) is not greater than 2°.

B. Complies with the test for identification of barbiturates (2.3.1), using the dried precipitate obtained in test A for preparing the test solution.

C. To 10 mg add 10 mg of *vanillin* and 2 ml of *sulphuric acid*, mix and heat on a water-bath for 2 minutes; a reddish-brown colour is produced. Cool and add 5 ml of *ethanol*; the colour changes to violet and then blue.

D. Ignite 1 g; the residue gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Prepare freshly a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A). Solution A is clear (2.4.1).

pH (2.4.24). 9.6 to 11.0, determined in solution A.

Related substances. Complies with the test for related substances in barbiturates (2.3.4), but applying 10 µl of each of the following solutions.

Test solution. A 2.0 per cent w/v solution of the substance under examination.

Reference solution. A 0.01 per cent w/v solution of the substance under examination.

Do not ignore any spot remaining on the line of application.

Free pentobarbitone. Not more than 3.5 per cent, determined by the following method. Weigh 2.0 g and dissolve in 75 ml of *dimethylformamide*, heating gently if necessary. Add 0.25 ml of a 1 per cent w/v solution of *thymol blue* in *dimethylformamide* and titrate with *0.1 M sodium methoxide* to a blue end-point. Carry out a blank titration.

1 ml of *0.1 M sodium methoxide* is equivalent to 0.02263 g of pentobarbitone.

Isomer. Dissolve 0.3 g in 5 ml of a 5 per cent w/v solution of *anhydrous sodium carbonate* and add 0.3 g of *4-nitrobenzyl bromide* dissolved in 10 ml of *ethanol (95 per cent)*. Heat under a reflux condenser for 30 minutes, cool to 25° scratch the side of the vessel with a glass rod if necessary to induce crystallisation and filter. Wash the residue with five quantities, each of 5 ml, of *water*. Transfer the residue as completely as possible to a small flask, add 25 ml of *ethanol (95 per cent)* and heat under a reflux condenser for 10 minutes; the solid dissolves completely. Cool to 25° and scratch the side of the flask with a glass rod to induce crystallisation. Filter, wash the residue with two quantities, each of 5 ml, of *water* and dry at 105° for 30 minutes. The dried residue melts at 136° to 148° (2.4.21).

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.4 g in 25 ml of a 12.75 per cent w/v solution of *silver nitrate* in *pyridine* and titrate with *0.1 M ethanolic sodium hydroxide* using 0.5 ml of *thymolphthalein solution* as indicator, until a pure blue colour is obtained. Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02483 g of $C_{11}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Pentobarbitone Tablets

Pentobarbitone Sodium Tablets; Pentobarbital Sodium Tablets

Pentobarbitone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pentobarbitone sodium, $C_{11}H_{17}N_2NaO_3$.

Usual strength. 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Pentobarbitone Sodium with 10 ml of a 10 per cent w/v solution of *pyridine* and filter. Add to the filtrate 1 ml of *cupric sulphate* with *pyridine solution* and set aside for 10 minutes; a reddish violet precipitate is produced.

B. Shake a quantity of the powdered tablets containing 0.1 g of Pentobarbitone Sodium with 10 ml of *water* and filter. To the filtrate add 2 ml of *hydrochloric acid*; a white precipitate is produced (distinction from pentobarbitone).

C. The residue obtained in the Assay melts at 127° to 130°(2.4.21).

D. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Isomer. Dissolve a quantity of the powdered tablets containing 0.3 g of Pentobarbitone Sodium in 5 ml of a 5 per cent w/v

https://nhathuocngocanh.com/

solution of *anhydrous sodium carbonate* and add 0.3 g of *4-nitrobenzyl bromide* dissolved in 10 ml of *ethanol (95 per cent)*. Heat under a reflux condenser for 30 minutes, cool to 25° scratch the side of the vessel with a glass rod if necessary to induce crystallisation and filter. Wash the residue with five quantities, each of 5 ml, of *water*. Transfer the residue as completely as possible to a small flask, add 25 ml of *ethanol (95 per cent)* and heat under a reflux condenser for 10 minutes; filter the hot solution. Cool to 25° and scratch the side of the flask with a glass rod to induce crystallisation. Filter, wash the residue with two quantities, each of 5 ml, of *water* and dry at 105° for 30 minutes. The dried residue melts at 136° to 148° (2.4.21).

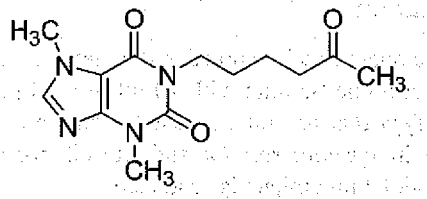
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.3 g of Pentobarbitone Sodium, dissolve as completely as possible in 10 ml of a 2 per cent w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue to constant weight at 105°.

1 g of residue is equivalent to 1.097 g of $C_{11}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Pentoxifylline



$C_{13}H_{18}N_4O_3$ Mol. Wt. 278.3

Pentoxifylline is 1 *H*-purine-2,6-dione, 3,7-dihydro-3,7-dimethyl-1-(5-oxohexyl).

Pentoxifylline contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{18}N_4O_3$, calculated on the dried basis.

Category. Vasodilator.

Description. A white to almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentoxifylline IPRS* or with the reference spectrum of pentoxifylline.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water*, is clear (2.4.1) and colourless (2.4.1).

Acidity. A 2.0 per cent w/v solution in *carbon dioxide free water*, add 1 drop of *bromothymol blue solution*.

Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to produce a colour change to blue.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Dissolve 35 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.00007 per cent w/v of *caffeine* and 0.035 per cent w/v of *pentoxifylline IPRS* in the mobile phase.

Reference solution (b). A 0.00007 per cent w/v solution of *pentoxifylline IPRS* in the mobile phase.

Chromatographic system

– injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to caffeine and pentoxyfylline is not less than 10 with reference solution (a) and the relative standard deviation for replicate injections is not more than 5.0 with reference solution (b).

Inject reference solution (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak for the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy Metals (2.3.13). 2.0 g complies with the limit test for heavy metals, method B (10 ppm).

Chlorides (2.3.12). 2.5 g complies with the limit test for chlorides (100 ppm).

Sulphates (2.3.17). 0.75 g complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, by drying under vaccum at 60° for 3 hours.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase and dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.0024 per cent w/v of *caffeine* and 0.0048 per cent w/v of *pentoxifylline IPRS* in the mobile phase.

Reference solution (b). A 0.005 per cent w/v solution of *pentoxifylline IPRS in* the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2 volumes of *methanol*, 2.5 volumes of *tetrahydrofuran*, 15 volumes of *acetonitrile* and 80 volumes of 0.1 per cent w/v solution of *perchloric acid*,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to caffeine and pentoxyfylline is not less than 10 with reference solution (a) and the relative standard deviation for replicate injections is not more than 2.0 with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{13}H_{18}N_4O_3$.

Storage: Store protected from moisture.

Pentoxifylline Prolonged-release Tablets

Pentoxifylline Extended-release Tablets; Pentoxifylline Sustained-release Tablets.

Pentoxifylline Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Pentoxifylline Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentoxifylline, $C_{13}H_{18}N_4O_3$.

Usual strength. 400 mg.

Identification

A. Weigh and powder five tablets (a coarse screen may be used to separate the powder from the tablet film-coating if necessary). Weigh a quantity of powder containing 200 mg of pentoxifylline to a 15 ml centrifuge tube, add about 10 ml of *methanol*, cap the tube, and shake vigorously for about 5 minutes. Centrifuge for about 5 minutes to allow undissolved material to settle. Decant the supernatant into a suitable beaker, and evaporate the solution with the aid of a current of air to dryness at about 35°. Dissolve the residue in about 15 ml of *methylene chloride*, transfer to a separatory funnel, add about 10 ml of *water* and shake. Allow the layers to separate, transfer the methylene chloride layer, and pass through *anhydrous sodium sulphate*, collecting the filtrate in a small beaker. Evaporate the solution with the aid of a current of air to dryness at about 35°. Dissolve the residue in 8 to 10 ml of *ether*, and then chill in an ice bath, if necessary, to induce crystallization. Collect the crystals on filter paper, wash with about 2 ml of cold *ether*, and allow to dry in air. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentoxifylline IPRS* or with the reference spectrum of pentoxifylline.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Chromatographic purity. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Transfer a quantity of powder containing 40 mg of pentoxifylline to a 50-ml volumetric flask. Add 0.4 ml of *methanol* and swirl for at least 1 minute. Add about 30 ml of solvent mixture and sonicate for 60 minutes with occasional swirling of the flask. Add an additional 15 ml of solvent mixture, allow cooling to room temperature, diluting with solvent mixture to volume, mix and centrifuging. Dilute 10.0 ml of the solution to a 25-ml volumetric flask, with solvent mixture to volume and mix to obtain a solution containing 0.032 per cent w/v of pentoxifylline.

Reference solution. Dissolve an accurately weighed quantity of *pentoxifylline IPRS* in solvent mixture containing an amount of *methanol* equal to 0.8 per cent of the total volume, and dilute with solvent mixture to obtain a solution containing 0.000096 per cent w/v of pentoxfylline.

Inject the reference solution. The test is not valid unless the relative standard deviation is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram five times the retention time of the principal peak. In the chromatogram obtained with the test solution the

https://nhathuocngocanh.com/

area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Perchloric acid solution. Dissolve 1g of *perchloric acid* in 1000 ml of *water* and mix.

Solvent mixture. 70 volumes of *water* and 30 volumes of *ethanol.*

Test solution. Weigh and powder 20 tablets. Transfer a quantity of powder containing 40 mg of Pentoxifylline to a 50-ml volumetric flask. Add 0.4 ml of *methanol*, and swirl for at least 1 minute. Add about 30 ml of the solvent mixture, and sonicate for 60 minutes with occasional swirling of the flask. Add an additional 15 ml of the solvent mixture, allow cooling to room temperature, diluting with the solvent mixture to volume and mix and centrifuging Dilute 3.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution (a). Dissolve 20 mg of *pentoxifylline IPRS* and 10 mg of *caffeine IPRS* in 0.2 ml of *methanol,* and dilute to 25.0 ml with the solvent mixture, and mix. Dilute 3.0 ml of the solution to 50 ml with the solvent mixture and mix.

Reference solution (b). Dissolve a quantity of *pentoxifylline IPRS* in solvent mixture containing an amount of *methanol* equal to 0.8 per cent of the total volume and dilute with solvent mixture to obtain a solution containing 0.0048 per cent w/v of pentoxfylline.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *perchloric acid solution,*15 volumes of *acetonitrile,* 2.5 volumes of *tetrahydrofuran* and 2 volumes of *methanol,*
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between pentoxifylline and caffeine is not less than 10 with reference solution (a) and the relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (b).

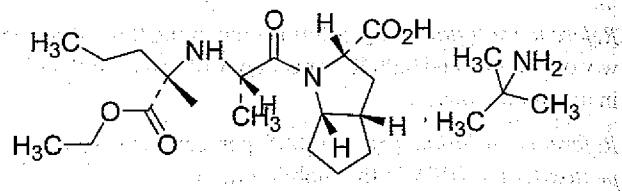
Inject reference solution (b) and the test solution.

Calculate the content of $C_{13}H_{18}N_4O_3$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Perindopril Erbumine

Perindopril tert-Butylamine



$C_{23}H_{43}N_3O_5$ Mol. Wt. 441.6

Perindopril Erbumine is 2-methylpropan-2-amine(2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1(ethoxycarbonyl)butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylate.

Perindopril Erbumine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{23}H_{43}N_3O_5$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white or almost white, slightly hygroscopic, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *Perindopril erbumine IPRS* or with the reference spectrum of perindopril erbumine.

If the spectra obtained show differences, dissolve the substance under examination and the reference substance separately in *methylene chloride*, evaporate to dryness and record new spectra using the residues.

B. Specific optical rotation. See Test

Tests

Specific optical rotation. (2.4.22). – 69° to – 66°, determined on 1.0 per cent w/v solution in *ethanol (95 per cent)*, calculated on anhydrous basis at 20°.

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 1 volume of *glacial acetic acid,* 40 volumes of *toluene* and 60 volumes of *methanol.*

Test solution. Dissolve 200 mg of the substance under examination in *methanol* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *perindopril impurity A IPRS (2S,3aS,7aS)-octahydro-1H-indole-2-carboxylic acid)* in *methanol* and dilute to 25.0 ml with the same solvent.

https://nhathuocngocanh.com/

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with *methanol*.

Reference solution (c). To 5.0 ml of reference solution (a), add 5 ml of a 2 per cent w/v solution of *1,1-dimethylethylamine* in *methanol*.

Apply to the plate 10 µl of the test solution, reference solution (b) and reference solution (c). Allow the mobile phase to rise 8 cm, dry the plate in a current of warm air and expose to iodine vapour for at least 20 hours. Any spot due to perindopril impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Stereochemical purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *ethanol (95 per cent)* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *ethanol (95 per cent)*. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *perindopril for stereochemical purity IPRS* (containing perindopril impurity I (2*RS*,3a*RS*,7a*RS*)-1-[(2*RS*)-2-[[(1*SR*)-1-(ethoxycarbonyl) butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid ((±)-13 -*epi*-perindopril)) in *ethanol (95 per cent) R* and dilute to 5.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with spherical octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 21.7 volumes of *acetonitrile*, 0.3 volumes of *1-pentanol* and 78 volumes of a 0.15 per cent w/v solution of *sodium heptanesulphonate* previously adjusted to pH 2.0 with a mixture of equal volumes of *perchloric acid* and *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 215 nm,
- equilibration time 240 minutes,
- injection volume: 10 µl.

Run the chromatogram 1.5 times the retention time of principal peak.

The relative retention time with reference to perindopril (retention time is about 100 minutes): perindopril impurity I is about 0.9.

Inject reference solution (a). The signal to noise ratio is not less than 3 for the principal peak.

Inject reference solution (b) the peak to valley ratio is not less than 3, where H_p = height above the baseline of the peak due to perindopril impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to perindopril.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of perindopril impurity I is not more than the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with a relative retention with reference to the principal peak of less than 0.6 or more than 1.4.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the solutions immediately before use or maintain at a temperature below 10 .

Test solution. Dissolve 60 mg of the substance under examination in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dissolve 3 mg of *perindopril for peak identification IPRS* (containing impurities B, E, F, H and K) in 1 ml of mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 15 cm × 4.0 mm, spherical end-capped octylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: A. *water* adjusted to pH 2.5 with a mixture of equal volumes of *perchloric acid* and *water*,
  B. 0.03 per cent v/v solution of *perchloric acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[1](2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-carboxybutyl] amino]propanoyl] octahydro-1*H*-indole-2-carboxylic acid (perindoprilat),

[2](3*S*,5a*S*,9a*S*,10a*S*)-3-methyldecahydropyrazino[1,2-*a*]indole-1,4-dione,

[3](2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-[(1-methylethoxy)carbonyl] butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid,

[4]ethyl (2*S*)-2-[(3*S*,5a*S*,9a*S*,10a*S*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoate,

[5](2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[(5*RS*)-3-cyclohexyl-2-(cyclohexylimino)-4-oxo-5-propylimidazolidin-1-yl]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

Inject reference solution (a). The peak to valley ratio between the peaks due to perindopril impurity B and perindopril impurity K is not less than 3.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to perindopril impurity E is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of any peak due to perindopril impurity B is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to perindopril impurity F and H for each impurity is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0 per cent). Ignore any peak with an area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent determined on 0.5 g.

Assay. Dissolve 0.16 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02208 g of $C_{23}H_{43}N_3O_5$.

Storage. Store protected from moisture.

Perindopril Erbumine Tablets

Perindopril Erbumine Tablets contain not less than 92.5 per cent and not more than 105.0 per cent of the stated amount of perindopril erbumine, $C_{19}H_{32}N_2O_5,C_4H_{11}N$.

Usual strength. 8 mg.

Identification

A. Dissolve a quantity of the powdered tablets containing 20 mg of perindopril erbumine in 10 ml of *dichloromethane* and centrifuge for 5 minutes, filter. Extract the filtrate with 10 ml of *water* and wash the upper aqueous layer with two 10 ml quantities of *hexane*. Evaporate the aqueous layer to dryness on a water bath and dry the residue at 60° at a pressure not exceeding 0.7 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *perindopril erbumine IPRS* or with the reference spectrum of perindopril erbumine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *0.05 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *0.05 M hydrochloric acid*, to produce a solution containing 0.0004 per cent w/v of Perindopril Erbumine.

Reference solution. A 0.0004 per cent w/v solution of *perindopril erbumine IPRS* in *0.05 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Nucleosil 3 C18),
- column temperature: 40°,
- mobile phase: a mixture of 34 volumes of *acetonitrile* and 66 volumes of *water*, adjusted to pH 2.0 with a mixture equal volume of *perchloric acid* and *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 40 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{32}N_2O_5,C_4H_{11}N$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{32}N_2O_5,C_4H_{11}N$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use or maintain at a temperature below 10°.

Test solution. Disperse a quantity of powdered tablets containing 16 mg of Perindopril Erbumine in 7 ml of mobile phase A with the aid of ultrasound, dilute to 10.0 ml with mobile phase A and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A.

Reference solution (b). A 0.16 per cent w/v solution of *perindopril IPRS* for peak identification in the mobile phase A.

Reference solution (c). A 0.01 per cent w/v solution of *perindopril impurity IPRS* in mobile phase A.

Reference solution (d). Dilute 2.0 ml of reference solution (a) to 10.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, spherical octylsilane bonded to porous silica (5 µm) (Such as Inersil C 8),
- column temperature: 60°,
- mobile phase: A. *water* adjusted to pH 2.5 with a mixture of equal volumes of *perchloric acid* and *water*; B. A 0.03 per cent v/v solution of *perchloric acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

[4](2*S*)-2-[(3*S*,5a*S*,9a*S*,10a*S*)-3-methyl-1,4-dioxodecahydropyrazino [1,2-*a*]indol-2(1*H*)-yl]pentanoic acid,

[5](2*S*)-2-[(3*S*,5a*S*,9a*S*,10a*R*)-3-methyl-1,4-dioxodecahydropyrazino [1,2-*a*]indol-2(1*H*)-yl]pentanoic acid,

[6]ethyl (2*S*)-2-[(3*S*,5a*S*,9a*S*,10a*S*)-3-methyl-1,4-dioxodecahydropyrazino [1,2-*a*]indol-2(1*H*)-yl]pentanoate,

[7](2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[(5*RS*)-3-cyclohexyl-2-(cyclohexylimino)-4-oxo-5-propylimidazolidin-1-yl]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

Inject reference solution (b). In the chromatogram obtained with reference solution (b) the peak to valley ratio between the peaks due to perindopril impurity B and perindopril impurity K is not less than 3.

Inject reference solution (c) for identification of peak due to perindopril impurity C and D.

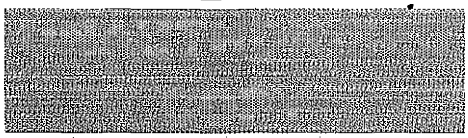
Inject reference solution (a), (d) and the test solution. In the chromatogram obtained with the test solution, the area of the any peak due to perindopril impurity E is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any peak due to perindopril impurity B or F is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). The area of any peak due to perindopril impurity C or D is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks, other than the peak due to perindopril impurities B, C, D, E and F is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 tablet in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.004 per cent w/v of perindopril erbumine.

Calculate the content of $C_{19}H_{32}N_2O_5$,$C_4H_{11}N$ in the tablet.



https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 20 mg of Perindopril Erbumine in 100.0 ml of mobile phase with the aid of ultrasound and filter. Dilute with the same solvent to get 0.004 per cent w/v of perindopril erbumine.

Reference solution. A 0.004 per cent w/v solution of *Perindopril erbumine IPRS* in the mobile phase.

Use chromatographic system as described under Dissolution, using 20 µl injection volume.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{32}N_2O_5,C_4H_{11}N$ in the Tablets.

Peritoneal Dialysis Solutions

Intraperitoneal Dialysis Fluids

Peritoneal Dialysis Solutions are sterile preparations for intraperitoneal use containing electrolytes with a concentration close to the electrolytic composition of plasma. They contain dextrose in varying concentrations and/or other suitable osmotic agents. They do not contain antioxidants such as metabisulphite salts.

Peritoneal Dialysis Solutions contain not less than 97.5 per cent and not more than 102.5 per cent of the stated amount of sodium, Na, not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of potassium, K, calcium, Ca, magnesium, Mg, chloride, Cl, acetate, $C_2H_3O_2$, lactate, $C_3H_5O_3$, sodium bicarbonate, $NaHCO_3$, bicarbonate, HCO_3 and dextrose, $C_6H_{12}O_6$.

Usual strengths: Several formulations are used. The concentrations of the components per litre of solution are usually in the following range.

	Concentration in mmol/litre
Sodium	125 – 150
Potassium	0 – 4.5
Calcium	0 – 2.5
Magnesium	0.25 – 1.5
Acetate and/or Lactate and/or Bicarbonate	30 – 60
Chloride	90 – 120
Dextrose	25 – 250

When bicarbonate is present, the solution of sodium bicarbonate is supplied in a separate container or a separate compartment and is added to the electrolyte solution immediately before use.

Unless otherwise justified and authorised, antioxidants such as metabisulphite salts are not added to the solutions.

Description. Clear, colourless or faintly straw-coloured solutions.

Identification

A. To 5 ml of the solution under examination, add 2 ml of *dilute sodium hydroxide solution* and 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling; a copious red precipitate is formed.

B. 20 ml gives reactions of chlorides, sodium salts, potassium salts and calcium salts (2.3.1).

C. To 5 ml add 1 ml of *hydrochloric acid* in a test-tube fitted with a stopper and a bent tube, heat and collect a few ml of the distillate. The distillate gives reaction (C) of acetates (2.3.1).

D. To 0.1 ml of *titan yellow solution* add 10 ml of *water*, 2 ml of the solution under examination and 1 ml of *1 M sodium hydroxide*; a pink colour is produced if magnesium salts are present.

E. Lactates and bicarbonates are identified together with the Assay for lactate and bicarbonate.

Tests

Appearance of solution. The solution under examination is clear (2.4.1), and not more intensely coloured than reference solution YS4 (2.4.1).

pH (2.4.24). 4.5 to 6.5. If the solution contains bicarbonate, 6.5 to 8.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 250.0 ml with *water* and measure the absorbance of the resulting solution (2.4.7) at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25.

Aluminium. Adjust the pH of 400 ml of the solution under examination to pH 6.0 and add 10 ml of *acetate buffer pH 6.0*. Extract the resulting solution with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50.0 ml with *chloroform*. Use as the blank a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner and as the standard solution a mixture of 2.0 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 90 ml of *water* treated in the same manner. Measure the fluorescence of the test solution (I_1), of the standard solution (I_2) and of the blank (I_3), (2.4.5), using an excitation wavelength of 392 nm and a secondary filter with a

https://nhathuocngocanh.com/

transmission band centred at 518 nm, or a monochromator set to transmit at this wavelength. The fluorescence of the test solution ($I_1 - I_3$) is not greater than that of the standard solution ($I_2 - I_3$).

Particulate contamination (2.5.9). Carry out the test using 50 ml of the solution under examination.

The preparation meets the requirements of the test if it contains particles within the maximum limits shown below.

Particle size in µm (Equal to or larger than)	Maximum number of particles per ml
10	25
25	3

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per ml.

Pyrogens (2.2.8). Solutions for which a validated test for bacterial endotoxins cannot be carried out, comply with the test for pyrogens, injecting 10 ml of the solution per kg of the rabbit's body weight.

Sterility (2.2.11). Complies with the test for sterility.

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using sodium solution FP, or sodium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using potassium solution FP or potassium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For calcium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm and using calcium solution FP or calcium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For magnesium — To 50.0 ml add 50 ml of *water* and 5 ml of *strong ammonia-ammonium chloride solution* and titrate with *0.005 M disodium edetate* using 50 mg of *eriochrome black T mixture* as indicator.

1 ml of *0.005 M disodium edetate* is equivalent to 0.1215 mg of Mg.

For total chloride — Dilute a measured volume containing about 60 mg of chloride to 50.0 ml with *water*. Add 25.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For acetate (if present) — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 1.0 mg of acetate per ml.

Reference solution. Dissolve a weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of *sodium acetate*.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm),
- mobile phase: a filtered and degassed *0.1 M sulphuric acid*,
- flow rate: 0.8 ml per minute,
- column temperature: 60°,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution and record the chromatograms. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test and standard solutions and record the chromatograms. Measure the responses for the major peak and calculate the content of acetate in the preparation under examination.

For lactate (if present) — Determine by liquid chromatography (2.4.14).

Test solution. Use the preparation under examination.

Reference solution(a). A 0.2 per cent w/v solution of *sodium lactate IPRS* in *water*.

Reference solution (b). Prepare a solution in *water* containing about 3 mg of *anhydrous sodium acetate* and 3 mg of *sodium lactate IPRS* per ml.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles (3 to 10 µm),
- mobile phase: a filtered and degassed solution in *water* containing about 1 ml of *formic acid* and 1 ml of *dicyclohexylamine* in 1000 ml,

https://nhathuocngocanh.com/

- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject separately reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to acetate and lactate is not less than 2.0, the tailing factor for the analyte peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test solution and reference solution (a), and record the chromatograms. Measure the responses for the major peak and calculate the content of lactate in the preparation under examination.

For sodium bicarbonate — Titrate with *0.1 M hydrochloric acid* a volume of the preparation under examination containing about 0.1 g of *sodium bicarbonate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

For lactate and bicarbonate — Determine by liquid chromatography (2.4.14).

Test solution. Use the preparation under examination.

Reference solutions. Dissolve weighed quantities of lactates and bicarbonates in order to obtain solutions having concentrations of about 90 per cent, 100 per cent and 110 per cent of the claim in 100 ml of *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a cation-exchange resin (9 µm),
- column temperature: 85°,
- mobile phase: a filtered and degassed *0.005 M sulphuric acid*,
- flow rate: 0.6 ml per minute,
- differential refractometer detector,
- injection volume: 20 µl.

Inject separately the test solution and the reference solutions in duplicate, and record the chromatograms in the prescribed conditions. The peaks elute in the following order, lactates, then bicarbonates. Determine the concentration of lactates and bicarbonates in the test solution by interpolating the peak area for lactate and the peak height for bicarbonate from the linear regression curve obtained with the solutions prepared as reference solutions.

For dextrose — Transfer a volume of the preparation under examination containing about 25 mg of Dextrose to a 250-ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 minutes and boil for exactly 10 minutes. Cool and add 3 g of *potassium iodide* dissolved in 3 ml of *water*. Carefully add, in small amounts, 25 ml of a 25 per cent w/w solution of *sulphuric acid*. Titrate with *0.1 M sodium thiosulphate* using *starch solution* as indicator. Carry out a blank titration using 25 ml of *water*.

Calculate the content of anhydrous dextrose, $C_6H_{12}O_6$, from the following Table.

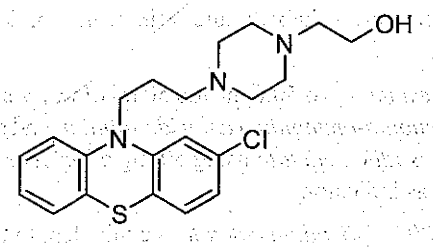
Volume of *0.1 M sodium thiosulphate* consumed (ml)	Anhydrous dextrose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

Storage. Peritoneal Dialysis Solutions are supplied in rigid or semi-rigid plastic containers, in flexible plastic containers fitted with a special connecting device (these are generally filled to a volume below their nominal capacity and presented in closed protective envelopes) or in glass containers. Store at a temperature not exceeding 30°.

CAUTION — Exposure to temperatures below 4° may cause crystallisation and separation of solid particles rendering the preparation unsuitable for use.

Labelling. The label states (1) the formula of the solution for peritoneal dialysis, expressed in grams per litre and in millimoles per litre; (2) the total osmolar concentration in mOsmol per litre; (3) the nominal volume of the solution in the container; (4) that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic; (5) that the solution is not to be used for intravenous infusion; (6) that any unused portion of the solution is to be discarded; (7) that the solution containing visible particles should not be used; (8) the storage conditions.

Perphenazine



$C_{21}H_{26}ClN_3OS$ Mol. Wt. 404.0

Perphenazine is 2-[4-[3-(2-chloro-10*H*-phenothiazin-10-yl)propyl]piperazin-1-yl]ethanol.

https://nhathuocngocanh.com/

Perphenazine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{26}ClN_3OS$, calculated on the dried basis.

Category. Dopamine receptor antagonist; neuroleptic.

Description. A white or yellowish-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *perphenazine IPRS* or with the reference spectrum of perphenazine.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*.

Mobile phase. A mixture of 2 volumes of *diethylamine* and 100 volumes of *light petroleum*, saturated with *phenoxyethanol* (add 6 volumes *phenoxyethanol* to 8 volumes of the above mixture until there is a persistent cloudiness after shaking, decant, and use the supernatant liquid, even if it is cloudy).

Test solution. Dissolve 20 mg of the substance under examination in 10 ml of *chloroform*.

Reference solution. A 0.2 per cent w/v solution of *perphenazine IPRS* in *chloroform*.

Impregnate the plate by placing it in a closed tank containing the necessary quantity of the impregnation mixture containing 2.5 per cent v/v of *phenoxyethanol* and 7.5 per cent v/v of *formamide* in *acetone* so that the plate dips about 5 mm beneath the surface of the liquid. When the impregnation mixture has risen at least 17 cm from the lower edge of the plate, remove the plate and use immediately. Carry out the chromatography in the same direction as the impregnation.

Apply to the plate 2 µl of each solution. Develop in the dark and allow the mobile phase to rise 15 cm. Expose the plate to ultraviolet light at 365 nm and examine after a few minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Dry the plate at 120° for 20 minutes, allow to cool and spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol (95 per cent)*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. When examined in the range 230 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at 257 nm and 313 nm. The ratio of the absorbance measured at the maximum at 313 nm to that measured at the maximum at 257 nm is 0.120 to 0.128.

D. Melting range (2.4.21). 96° to 100°.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Carry out the test protected from light.

Test solution. Dissolve 20 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 35 volumes of *acetonitrile* and 65 volumes of a 0.7 per cent w/v solution of *sodium dihydrogen phosphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

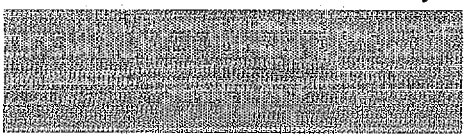
Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
10	80	20
33	30	70
48	100	0

Name	Relative retention time	Correction factor
Perphenazine impurity A[1]	0.3	0.6
Perphenazine impurity B[2]	0.8	—
Perphenazine (Retention time is about 12 minutes)	1.0	—

[1]2-[4-[3-(2-chloro-5-oxido-10*H*-phenothiazin-10-yl)propyl]piperazin-1-yl]ethanol,

[2]2-[4-[3-(10*H*-phenothiazin-10-yl)propyl]piperazin-1-yl]ethanol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.



https://nhathuocngocanh.com/

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to perphenazine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to perphenazine impurity B is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 65° for 4 hours.

Assay. Weigh 0.15 g and dissolve in 25 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0202 g of $C_{21}H_{26}ClN_3OS$.

Calculate the content of $C_{21}H_{26}ClN_3OS$.

Storage. Store protected from light.

Perphenazine Tablets

Perphenazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of perphenazine, $C_{21}H_{26}ClN_3OS$.

Usual strengths. 2 mg; 4 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Perphenazine, add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether layer with 5 ml of *water*, dry with *anhydrous sodium sulphate* and evaporate the *ether* to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *perphenazine IPRS* or with the reference spectrum of perphenazine.

B. Extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of *methanol*, pour into a 4.0 per cent w/v solution of *picric acid* in *methanol* at 50°, cool and allow to stand for 4 hours. After recrystallisation from *methanol*, the precipitate melts at about 248° (2.4.21) with decomposition.

C. To a quantity of the powdered tablets containing 5 mg of Perphenazine, add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 257 nm (2.4.7). Calculate the content of $C_{21}H_{26}ClN_3OS$ in the medium from the absorbance obtained from a solution of known concentration of *perphenazine IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{26}ClN_3OS$.

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5) with the following modifications.

Use mobile phase (c) and applying to the plate 50 µl of each of the following freshly prepared solutions.

Test solution. Extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *ethanol* (*95 per cent*) and filter.

Reference solution. Dilute 1 ml of the test solution to 200 ml with the *ethanol* (*95 per cent*).

Uniformity of content. Complies with the test stated under Tablets.

NOTE — Carry out the test protected from light.

Transfer one tablet to a 100-ml volumetric flask and add 5 ml of *water*, mix with the aid of ultrasound for 15 minutes or until the tablet has completely disintegrated, heat on a water-bath for 3 minutes, swirling continuously and cool. Add 50 ml of *ethanol* (*95 per cent*), mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 100 ml with *ethanol* (*95 per cent*) and filter through a glass microfibre filter paper. Dilute a volume of the solution with sufficient *ethanol* (*95 per cent*) to produce a solution containing 0.001 per cent w/v of Perphenazine. Record the second-derivative ultraviolet absorption spectra of the resulting solution in the range 210 to 290 nm (2.4.7). Measure the amplitude from the peak at 265 nm to the trough at 255 nm.

Calculate the content of $C_{21}H_{26}N_3OS$ in the tablet from the absorbance obtained by repeating the operation using

https://nhathuocngocanh.com/

perphenazine IPRS in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

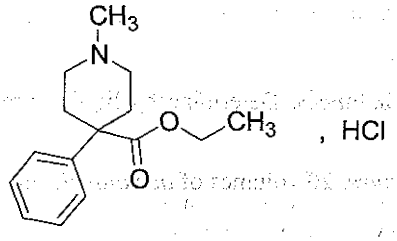
Assay. *NOTE—Carry out the test protected from light.*

Shake 10 whole tablets with 50 ml of *water* and mix with the aid of ultrasound for 15 minutes or until the tablets have completely disintegrated, heat on a water-bath for 3 minutes, swirling continuously, cool, add 400 ml of *ethanol (95 per cent)*, mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 500 ml with *ethanol (95 per cent)* and filter through a glass microfibre filter paper. Dilute the filtrate with *ethanol (95 per cent)* to produce a solution containing 0.001 per cent w/v of Perphenazine. Record second-derivative ultraviolet absorption spectra of the solutions in the range 210 to 290 nm (2.4.7). Measure the amplitude from the peak at 265 nm to the trough at 255 nm.

Calculate the content of $C_{21}H_{26}N_3OS$ in the tablet from the absorbance obtained by repeating the operation using *perphenazine IPRS* in place of the substance under examination.

Pethidine Hydrochloride

Meperidine Hydrochloride



$C_{15}H_{21}NO_2,HCl$ Mol. Wt. 283.8

Pethidine Hydrochloride is ethyl 1-methyl-4-phenylpiperidine-4-carboxylate hydrochloride.

Pethidine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{21}NO_2,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine hydrochloride IPRS* or with the reference spectrum of pethidine hydrochloride.

B. To 5 ml of a 1 per cent w/v solution add a few drops of *potassium mercuri-iodide solution*; a cream-coloured precipitate is produced.

C. Dissolve 5 mg in 0.5 ml of *water* and add 0.1 ml of *formaldehyde solution* and 2 ml of *sulphuric acid*; an orange-red colour is produced.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of a 2.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is yellow. Add 0.3 ml of *0.01 M hydrochloric acid*; the solution is red.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution (a). Dissolve about 0.1 g of the substance under examination in 25.0 ml of the solvent mixture.

Test solution (b). Dissolve about 0.125 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *1-methyl-4-phenylpiperidine IPRS (pethidine impurity A IPRS)* to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 12.5 mg of *1-methyl-4-phenyl-1,2,3,6- tetrahydropyridine IPRS (pethidine impurity B IPRS)* in 10.0 ml of the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (d). Dilute 5.0 ml of reference solution (b) and 1.0 ml of reference solution (c) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS2),
- mobile phase: A. a mixture of equal volumes of 4.2 per cent w/v solution of *sodium perchlorate* and 1.2 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 2.0 with *triethylamine*,

B. *acetonitrile*,

https://nhathuocngocanh.com/

– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
15	75	25
31	55	45
40	55	45
41	80	20
50	80	20

The relative retention time with reference to pethidine for pethidine impurity B is about 0.66 and for pethidine impurity A is about 0.68.

Inject reference solution (c). The test is not valid unless the signal-to-noise ratio for the first peak is not less than 10 and peak-to-valley ratio where *Hp* is height above the baseline, and *Hv* is height above the baseline of the lowest point of the curve separating this peak from the peak due to pethidine impurity A is not less than 4.0.

Inject reference solution (a), (d) and test solution (a) and (b). In the chromatogram obtained with test solution (b), the area of the peak corresponding to pethidine impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (10 ppm). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.5 g in 30 ml of *anhydrous glacial acetic acid*, add 12 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02838 g of $C_{15}H_{21}NO_2,HCl$.

Storage. Store protected from light and moisture.

Pethidine Injection

Pethidine Hydrochloride Injection; Meperidine Hydrochloride Injection

Pethidine Injection is a sterile solution of Pethidine Hydrochloride in Water for Injections.

Pethidine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of pethidine hydrochloride, $C_{15}H_{21}NO_2,HCl$.

Usual strength. 50 mg per ml; 100 mg per ml.

Identification

A. To a volume containing 50 mg of Pethidine Hydrochloride add sufficient *1 M sodium hydroxide* to make strongly alkaline to litmus paper and extract with two quantities, each of 10 ml, of *chloroform*. Wash the combined extracts with 5 ml of *water*, dry over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Remove the last traces of chloroform by drying the residual oil at 60° at a pressure not exceeding 0.7 kPa. On the oily residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine hydrochloride IPRS* treated in the same manner or with the reference spectrum of pethidine.

B. To 0.5 ml add 0.1 ml of *formaldehyde solution* and 2 ml of *sulphuric acid*; an orange-red colour is produced.

C. It gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dilute a volume of the injection containing 0.1 g of Pethidine Hydrochloride with 25.0 ml of the solvent mixture.

Reference solution. Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
– a stainless steel column 25 cm x 4.0 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),
– mobile phase: A. a mixture of equal volumes of 4.2 per cent w/v solution of *sodium perchlorate* and 1.2 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 2.0 with *triethylamine*,
B. *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
15	75	25
31	55	45
40	55	45
41	80	20
50	80	20

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Determine by liquid chromatography* (2.4.14).

Test solution. Dilute a volume of the injection containing about 0.1 g of Pethidine Hydrochloride with 100.0 ml of the *water*. Dilute 3.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *pethidine hydrochloride IPRS*. Dilute 3.0 ml of the solution to 25.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS1),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 10 ml *triethylamine*, adjusted to pH 7.0 with *orthophosphoric acid* and 55 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{21}NO_2$,HCl in the injection.

Storage. Store protected from light.

Pethidine Tablets

Pethidine Hydrochloride Tablets; Meperidine Hydrochloride Tablets

Pethidine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pethidine hydrochloride, $C_{15}H_{21}NO_2$,HCl.

Usual strengths. 25 mg; 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pethidine Hydrochloride with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and dry the residue at a pressure of 2 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine hydrochloride IPRS* or with the reference spectrum of pethidine hydrochloride.

B. Shake a quantity of the powdered tablets containing 0.2 g of Pethidine Hydrochloride with 20 ml of *water* and filter. To 5 ml of the filtrate add 10 ml of picric acid solution. The crystals so obtained, after washing with *water* and drying, melt at about 190° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*.

Mobile phase. The upper layer obtained by shaking together 100 volumes of *light petroleum (50° to 70°)*, 8 volumes of *2-phenoxyethanol* and 1 volume of *diethylamine*.

Test solution. The upper layer obtained by shaking a quantity of the powdered tablets containing 0.1 g of Pethidine Hydrochloride with 5 ml of *water*, filtering, shaking the filtrate with 0.5 ml of *5 M sodium hydroxide* and 2 ml of *ether* and allowing the layers to separate.

Reference solution. Dilute 0.5 ml of the test solution to 50 ml with *ether*.

Impregnate the dry plate by placing it in a closed tank containing a mixture of 90 volumes of *acetone* and 10 volumes of *2-phenoxyethanol* so that the plate dips about 5 mm beneath the surface of the liquid, allowing the impregnating solvent to ascend at least 15 cm, removing the plate from the tank and drying in a current of air. Use immediately, with the flow of the mobile phase in the same direction as the impregnation.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air for 10 minutes, return the plate to the tank and repeat the development. Remove the plate, allow it to dry in air for 10 minutes and spray with a

https://nhathuocngocanh.com/

0.2 per cent w/v solution of *2,7-dichlorofluorescein* in *methanol*. Allow to stand for 5 minutes and spray with *water* until the background is white to pale yellow. Examine in daylight. The chromatograms show red or orange spots. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Examine without delay under ultraviolet light at 365 nm. The chromatograms show spots with intense yellow fluorescence. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.3 g of Pethidine Hydrochloride in 40 ml of *water*, add 2 ml of *5 M sodium hydroxide* and extract immediately with successive quantities of 25, 10 and 10 ml of *chloroform*. Wash each extract with the same 15 ml of *water* and filter into a dry flask. Combine the extracts (which should be clear and free from droplets of *water*). Titrate with *0.05 M perchloric acid*, using 0.15 ml of *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.01419 g of $C_{15}H_{21}NO_2,HCl$.

Storage. Store protected from light and moisture.

Petrolatum

Petrolatum is a purified mixture of semisolid hydrocarbons obtained from petroleum. It may contain a suitable stabilizer.

Category. Pharmaceutical aid.

Tests

Melting range (2.4.21). 38° to 60°.

Alkalinity. To 35 g, add 100 ml of boiling *water* in a suitable beaker, cover, and place on a stirring hot-plate maintained at the boiling point of water. After 5 minutes, allow the phases to separate. Draw off the separated water into a casserole, wash the petrolatum further with two 50-ml portions of boiling water, and add the washings to the casserole. To the pooled washings, add 1 drop of *phenolphthalein TS*, and boil; the solution does not acquire a pink colour.

Acidity. If the addition of *phenolphthalein TS* in the test for alkalinity produces no pink colour, add 0.1 ml of *methyl orange TS*; no red or pink colour is produced.

Consistency. A penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g, having a detachable steel tip of the following dimensions: the tip of the cone has an angle of 30°, the point of the tip is truncated to a diameter of 0.381 mm, the base of the tip is 8.38 mm in diameter, and the length of the tip is 14.94 mm.

The remaining portion of the cone has an angle of 90°, is 28 mm in height, and has a maximum diameter at the base of 65 mm. The containers for the test are flat-bottom metal cylinders that are 100 mm in diameter and not less than 65 mm in height. They are constructed of at least 1.6 mm (16-gauge) metal, and are provided with well-fitting, water-tight covers.

Place the required number of containers in an oven, bring them and a quantity of the sample to a temperature of 82°, and pour the sample into one or more of the containers, filling to within 6 mm of the rim. Cool to 25° over a period of not less than 16 hours, protected from drafts. Two hours before the test, place the containers in a water-bath at 25°. If the room temperature is below 23.5° or above 26.5°, adjust the temperature of the cone to 25° by placing it in the water-bath without disturbing the surface of the substance under test, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25 to 38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 seconds. Secure the plunger, and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm. Calculate the average of three or more readings, and conduct further trials to a total of 10 if the individual results differ from the average by more than ±3 per cent.

Final average of the trials is not less than 10.0 mm and not more than 30.0 mm, indicating a consistency value of 100 to 300.

Organic acids. Dissolve 20.0 g in 100 ml of a mixture of 10 volumes of *ethanol (95 per cent)* and 20 volumes of *water*. Agitate thoroughly, and heat to boiling. Add 1 ml of *phenolphthalein TS* and titrate rapidly with *0.1 M sodium hydroxide*, with vigorous agitation to the production of a sharp pink endpoint, noting the colour change in the alcohol–water layer; not more than 0.4 ml of *0.1 M sodium hydroxide* is required.

Colour

Test solution. Melt 10 g on a steam-bath, and pour 5 ml of the liquid into a clear-glass 15-mm x 150-mm test tube, keeping the petrolatum melted.

Reference solution. A mixture of 3.2 volumes of *ferric chloride CS* and 1.2 volumes of *cobaltous chloride CS*.

The warm, melted liquid is not darker than 5 ml of the reference solution in a similar tube; the comparison of the two being

https://nhathuocngocanh.com/

made in reflected light against a white background and the petrolatum tube being held directly against the background at such an angle that there is no fluorescence.

Relative density (2.4.29). 0.815 to 0.880 at 60°.

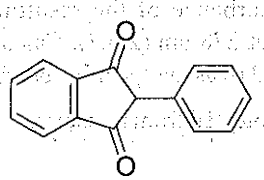
Fixed oils, fats and resin. Digest 10 g with 50 ml of *5 M sodium hydroxide* at 100° for 30 minutes. Separate the water layer, and acidify it with *2.5 M sulphuric acid*; no oily or solid matter separates.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Labelling. Label it to indicate the name and proportion of any added stabilizer.

Phenindione



$C_{15}H_{10}O_2$ Mol. Wt. 222.2

Phenindione is 2-phenylindane-1,3-dione.

Phenindione contains not less than 98.0 per cent and not more than 100.5 per cent of $C_{15}H_{10}O_2$, calculated on the dried basis.

Category. Anticoagulant.

Description. Soft, white or creamy-white crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenindione IPRS* or with the reference spectrum of phenindione.

B. Dissolve 0.1 g in 30 ml of *ethanol (95 per cent)* with the aid of heat, cool and add sufficient *ethanol (95 per cent)* to produce 50 ml. Dilute 10 ml of the solution to 250 ml with *0.1 M sodium hydroxide* and further dilute 5 ml to 100 ml with *0.1 M sodium hydroxide*. When examined in the range 230 nm and 360 nm (2.4.7), the solution shows absorption maxima at about 278 nm and at about 330 nm; absorbance at about 278 nm, about 0.55 and at about 330 nm, about 0.16.

C. To 1 g add 50 ml of *ethanol (95 per cent)* and 0.5 ml of *aniline*, heat gently under a reflux condenser for 3 hours, cool in ice and filter. The residue, after washing with 2 ml of *ethanol (95 per cent)* and recrystallisation from *chloroform*, melts at about 225° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A 0.02 per cent w/v solution of *butylated hydroxytoluene* in a mixture of 80 volumes of *toluene*, 20 volumes of *ethyl acetate* and 4 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *dichloromethane*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination in *dichloromethane*.

Allow the mobile phase to ascend 4 cm, remove the plate and dry it in a current of cold air for 1 minute. Immediately apply 10 µl of each solution. Dry the plate in warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 105° for 2 hours.

Assay. Weigh 0.3 g, add 50 ml of *ethanol (95 per cent)* and warm until solution is effected. Cool to room temperature, add 10 ml of a 10 per cent v/v solution of *bromine* in *ethanol (95 per cent)* and allow to stand for 10 minutes, shaking occasionally. Add 1 g of *2-naphthol* and shake until the colour of the bromine is discharged. Remove any vapour of bromine in the flask with a current of air, add 50 ml of *water* and 10 ml of *dilute potassium iodide solution* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using *starch solution* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01111 g of $C_{15}H_{10}O_2$.

Storage. Store protected from moisture.

Phenindione Tablets

Phenindione Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenindione, $C_{15}H_{10}O_2$.

Usual strength. 50 mg.

https://nhathuocngocanh.com/

Identification

Shake a quantity of the powdered tablets containing 0.2 g of Phenindione with 50 ml of *chloroform*, filter and evaporate the filtrate to dryness. Recrystallise the residue from *ethanol (95 per cent)*. The crystals complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenindione IPRS* or with the reference spectrum of phenindione..

B. Dissolve 0.1 g in 30 ml of *ethanol (95 per cent)* with the aid of heat, cool and add sufficient *ethanol (95 per cent)* to produce 50 ml. Dilute 10 ml of the solution to 250 ml with *0.1 M sodium hydroxide* and dilute 5 ml of the solution to 100 ml with *0.1 M sodium hydroxide*. When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima at about 278 nm and 330 nm; absorbance at about 278. about 0.55 and at about 330 nm, about 0.16.

C. To 50 mg add 1 ml of *sulphuric acid*; a deep blue to violet solution is produced. On dilution with *water* the solution becomes colourless and a white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 1.8 g of *sodium hydroxide* in 900 ml of *water,* adjusted to pH 8.0 and dilute to 1000 ml with *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium, filter. Measure the absorbance of the filtrate suitably diluted with the medium, if necessary at the maximum at about 328 nm (2.4.7). Calculate the content of $C_{15}H_{10}O_2$ in the medium from the absorbance obtained from a solution of known concentration of *phenindione IPRS* in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{10}O_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A 0.02 per cent w/v solution of *butylated hydroxytoluene* in a mixture of 80 volumes of *toluene*, 20 volumes of *ethyl acetate* and 4 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Phenindione with 15 ml of *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of *dichloromethane*.

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *dichloromethane*.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with *dichloromethane*.

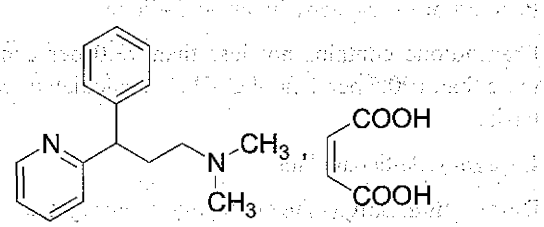
Allow the mobile phase to ascend 4 cm, remove the plate and dry it in a current of cold air for 1 minute. Immediately apply 10 µl of each solution. Dry the plate in warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b)..

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 Tablets. Weigh a quantity of the powder containing about 50 mg of Phenindione and shake with 150 ml of *0.1 M sodium hydroxide* for 1 hour, add sufficient *0.1 M sodium hydroxide* to produce 250.0 ml, filter and dilute 5.0 ml of the filtrate to 250.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{15}H_{10}O_2$ taking 1310 as the specific absorbance at 278 nm.

Storage. Store protected from moisture.

Pheniramine Maleate



$C_{16}H_{20}N_2,C_4H_4O_4$ Mol. Wt. 356.4

Pheniramine Maleate is (3*RS*)-*N*,*N*-dimethyl-3-phenyl-3-(pyridin-2-yl)propan-1-amine hydrogen maleate..

Pheniramine Maleate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{20}N_2,C_4H_4O_4$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pheniramine maleate IPRS* or with the reference spectrum of pheniramine maleate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows

https://nhathuocngocanh.com/

an inflection at about 262 nm; absorbance at about 265 nm, about 0.42.

Tests

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 10 volumes of *acetonitrile* and 90 volumes of mobile phase A.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *2-benzylpyridine (pheniramine impurity A)* in 10.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with dimethyloctadecylsilane bonded to porous silica (10 µm),
- mobile phase: A. a 0.51 per cent w/v solution of *sodium heptanesulphonate*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1ml per minute,
- spectrophotometer set at 264 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
35	62	38
37	90	10

The order of elution of three principal peaks is maleic acid, pheniramine impurity A and pheniramine.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to pheniramine impurity A and pheniramine is not less than 8.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore the peak due to maleic acid and peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water* and add 2 ml of *acetic acid* and sufficient *water* to produce 25.0 ml. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.4 g in 20 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1- naphthol-benzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01782 g of $C_{16}H_{20}N_2,C_4H_4O_4$.

Storage. Store protected from light and moisture.

Pheniramine Injection

Pheniramine Maleate Injection

Pheniramine Injection is a sterile solution of Pheniramine Maleate in Water for Injections.

Pheniramine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pheniramine maleate, $C_{16}H_{20}N_2$, $C_4H_4O_4$.

Usual strength. 22.75 mg per ml.

Identification

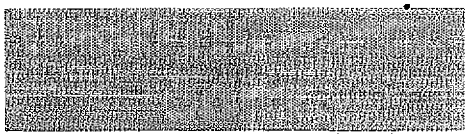
Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Evaporate an appropriate volume of the injection to dryness in a current of nitrogen using the minimum amount of heat, dissolve the residue in sufficient *chloroform* to produce a solution containing 2.0 per cent w/v solution of Pheniramine Maleate and centrifuge.

Reference solution. A 2.0 per cent w/v solution of *pheniramine maleate IPRS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution. Spray the plate with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.



https://nhathuocngocanh.com/

Tests

pH (2.4.24). 4.5 to 5.5.

Related substances. Determine by the method described under the Identification test using as the reference solution a solution prepared by diluting 1 volume of the test solution to 500 volumes with *chloroform*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 0.11 g of Pheniramine Maleate add sufficient *water* to produce 50.0 ml and mix well. To 20.0 ml add sufficient *1 M sodium hydroxide* to make the solution just alkaline to *litmus paper*, add 2 ml in excess and extract with two quantities, each of 50 ml, of *ether*. Wash each ether extract in succession with 20, 20 and 5 ml of *0.1 M hydrochloric acid*, dilute the combined extracts to 100.0 ml with *0.1 M hydrochloric acid* and mix. Dilute 5.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_{16}H_{20}N_2$, $C_4H_4O_4$ taking 210 as the specific absorbance at 265 nm.

Storage. Store protected from light.

Pheniramine Tablets

Pheniramine Maleate Tablets

Pheniramine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pheniramine maleate, $C_{16}H_{20}N_2$, $C_4H_4O_4$.

Usual strengths. 12.5 mg; 25 mg; 50 mg.

Identification

Boil a quantity of the powdered tablets containing about 0.5 g of Pheniramine Maleate with 150 ml of *acetone* under a reflux condenser for about 45 minutes. Filter and evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pheniramine maleate IPRS* or with the reference spectrum of pheniramine maleate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows an inflection at about 262 nm; absorbance at about 265 nm, about 0.42.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Pheniramine Maleate with 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). Dilute 1 volume of reference solution (a) to 20 volumes with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

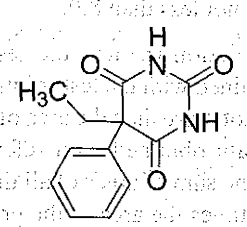
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 45 mg of Pheniramine Maleate, shake with 20 ml of *0.1 M hydrochloric acid*, centrifuge and transfer the supernatant liquid to a 100-ml volumetric flask. Repeat the extraction with three further quantities, each of 20 ml, of *0.1 M hydrochloric acid*. Combine the extracts and add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Mix and dilute 5.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*; measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_{16}H_{20}N_2$,$C_4H_4O_4$ taking 210 as the specific absorbance at 265 nm.

Storage. Store protected from light and moisture.

Phenobarbitone

Phenobarbital



$C_{12}H_{12}N_2O_3$ Mol. Wt. 232.2

Phenobarbitone is 5-ethyl-5-phenylbarbituric acid.

https://nhathuocngocanh.com/

Phenobarbitone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Category. Sedative; anticonvulsant.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests C, D and E may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone IPRS* or with the reference spectrum of phenobarbitone.

B. Determine the melting point (2.4.21) of the substance under examination and of a mixture of equal quantities of the substance under examination and *phenobarbitone IPRS*. The difference between the melting points, which are about 175°, is not greater than 2°.

C. Complies with the test for identification of barbiturates (2.3.2).

D. Dissolve about 20 mg in 5 ml of *ethanol*, add a drop of *cobalt chloride solution* and a drop of *dilute ammonia solution*; a violet colour is produced.

E. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in a mixture of 20 volumes of *2 M sodium hydroxide* and 30 volumes of *water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity. Mix 1.0 g with 50 ml of *water*, boil for 2 minutes, allow to cool, filter and adjust the volume to 50 ml. To 10 ml of the filtrate add 0.15 ml of *methyl red solution*; not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution from orange-yellow to pure yellow.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.125 g of the substance under examination in 5 ml of *methanol* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Mix 1.0 ml of the test solution and 20.0 ml of *methanol*, dilute to 100.0 ml with the mobile phase. Mix 1.0 ml of the solution with 2.0 ml of *methanol* and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg each of *phenobarbitone impurity A IPRS* and *phenobarbitone impurity B IPRS* in 2.0 ml of *methanol* and dilute to 10.0 ml with the mobile phase. Mix 1.0 ml of the solution with 20.0 ml of *methanol* and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a solution prepared by dissolving 6.6 g of *sodium acetate* in 1000 ml of *water*, add 3 ml of *glacial acetic acid*, adjusted to pH 4.5 with *glacial acetic acid* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
Phenobarbitone impurity A[1]	0.2
Phenobarbitone impurity B[2]	0.3
Phenobarbitone (Retention time: about 14 minutes)	1.0

[1](5*RS*)-5-ethyl-2,6-diimino-5-phenyltetrahydropyrimidin-4(1*H*)-one,

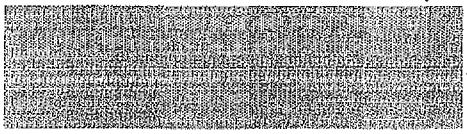
[2](5*RS*)-5-ethyl-6-imino-5-phenyldihydropyrimidine-2,4(1*H*,3*H*)-dione.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to phenobarbitone impurities A and B is not less than 1.5.

For identification of impurities, use the chromatogram obtained with reference solution (b) to identify the peaks due to phenobarbitone impurities A and B.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to phenobarbitone impurity A is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak corresponding to phenobarbitone impurity B is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.15 per cent). The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.



https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.1 g in 5 ml of *pyridine*, add 0.25 ml of *thymolphthalein solution* and 10 ml of *silver nitrate-pyridine reagent* and titrate with *0.1 M ethanolic sodium hydroxide* until a pure blue colour is obtained. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.01161 g of $C_{12}H_{12}N_2O_3$.

Storage. Store protected from moisture.

Phenobarbitone Tablets

Phenobarbital Tablets

Phenobarbitone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phenobarbitone, $C_{12}H_{12}N_2O_3$.

Usual strengths. 15 mg; 30 mg; 60 mg; 100 mg.

Identification

Extract a quantity of the powdered tablets containing about 0.5 g of Phenobarbitone with 50 ml of *ether*, filter through *anhydrous sodium sulphate* and evaporate the ether to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone IPRS* or with the reference spectrum of phenobarbitone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate with *alkaline borate buffer pH 9.6* and measure the absorbance at the maximum at about 240 nm(2.4.7). Calculate the content of phenobarbitone, $C_{12}H_{12}N_2O_3$ from the absorbance obtained from a solution of known concentration of *phenobarbitone IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{12}N_2O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Phenobarbitone in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v solution of *phenobarbitone impurity A IPRS* and 0.0005 per cent w/v solution of *phenobarbitone impurity B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 2),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a solution of 0.66 per cent w/v of *sodium acetate* in *water*, adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
Phenobarbitone impurity A[1]	0.4
Phenobarbitone impurity B[2]	0.5
Phenobarbitone (Retention time; about 9 minutes)	1.0

1(5*RS*)-5-ethyl-2, 6-diimino-5-phenyltetrahydropyrimidin-4(1*H*)-one, 2(5*RS*)-5-ethyl-6-imino-5-phenyldihydropyrimidine-2, 4 (1*H*, 3*H*)-dione.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to phenobarbitone impurity A and impurity B is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of phenobarbitone peak for the test solution. The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of phenobarbitone in 80 ml of

https://nhathuocngocanh.com/

the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *phenobarbitone IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

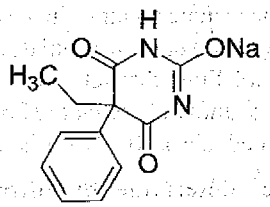
Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{12}N_2O_3$ in the tablets.

Storage. Store protected from moisture.

Phenobarbitone Sodium

Phenobarbital Sodium; Soluble Phenobarbitone; Soluble Phenobarbital



$C_{12}H_{11}N_2NaO_3$ Mol. Wt. 254.2

Phenobarbitone Sodium is sodium 5-ethyl-5-phenylbarbiturate.

Phenobarbitone Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{11}N_2NaO_3$, calculated on the dried basis.

Category. Sedative; anticonvulsant.

Description. A white powder or crystalline granules or flaky crystals; hygroscopic.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests C, D and E may be omitted if tests A, B and F are carried out.

A. Dissolve 0.2 g in 20 ml of *ethanol (50 per cent)*, acidify with *dilute hydrochloric acid* and extract with 50 ml of *ether*. Wash the ether layer with 10 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the filtrate to dryness and dry the residue at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone IPRS* or with the reference spectrum of phenobarbitone.

B. Determine the melting point (2.4.21), of the residue obtained in test A and of a mixture of equal quantities of the residue and *phenobarbitone IPRS*. The difference between the melting points, which are about 175°, is not greater than 2°.

C. Complies with the test for identification of barbiturates (2.3.2), but using the following solutions.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *ethanol (50 per cent)*.

Reference solution. A 0.09 per cent w/v solution of *phenobarbitone IPRS* in *ethanol (50 per cent)*.

D. 1 g dissolves completely in 20 ml of *ethanol (90 per cent)* (distinction from barbitone sodium).

E. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

F. Ignite about 0.1 g; the residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (50 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). Not more than 10.2, determined in a 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *concentrated ammonia*, 15 volumes of *ethanol (95 per cent)* and 80 volumes of *chloroform*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution. Dilute 0.5 ml of the test solution to 100.0 ml with *ethanol (95 per cent)*.

Apply 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution* (20 per cent w/v). Heat at 105° for 5 minutes. Any secondary spot in the chromatogram obtained with the test solution, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.5 g by drying in an oven at 150° for 4 hours.

Assay. Dissolve 0.15 g in 2 ml of *water* and add 8 ml of *0.05 M sulphuric acid*. Heat to boiling and cool. Add 30 ml of

https://nhathuocngocanh.com/

methanol and shake until dissolution is complete. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). After the first inflection, stop the addition of the *sodium hydroxide*, add 10 ml of *pyridine*, mix and continue the titration until the second inflection is reached. The difference between the volumes represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02542 g of $C_{12}H_{11}N_2NaO_3$.

Storage. Store protected from moisture.

Phenobarbitone Injection

Phenobarbital Sodium Injection; Phenobarbitone Sodium Injection; Soluble Phenobarbitone Injection

Phenobarbitone Injection is a sterile solution of Phenobarbitone Sodium in a mixture of nine volumes of Propylene Glycol and one volume of Water for Injections.

Phenobarbitone Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phenobarbitone sodium, $C_{12}H_{11}N_2NaO_3$.

Usual strengths. 30 mg, 60 mg, 65 mg and 130 mg per ml.

Identification

To a volume containing 1 g of Phenobarbitone Sodium add 15 ml of *water* if necessary, make slightly acidic with *1 M sulphuric acid* and filter. The residue, after washing with *water* and drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone IPRS* or with the reference spectrum of phenobarbitone.

B. Dissolve 50 mg in 2 ml of a 0.2 per cent w/v solution of *cobalt acetate* in *methanol*, warm, add 50 mg of powdered *borax* and heat to boiling; a bluish violet colour is produced.

Tests

pH (2.4.24). 10.0 to 11.0.

Bacterial endotoxins (2.2.3). Not more than 0.3 Endotoxin Unit per mg of phenobarbitone sodium.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Weigh 2 g, add 30 ml of *water* and 3 g of *sodium carbonate*, stir to dissolve and titrate with *0.1 M silver nitrate* until a distinct turbidity is observed when viewed against a black background, the solution being stirred vigorously throughout the titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.02542 g of $C_{12}H_{11}N_2NaO_3$.

Determine the weight per ml of the injection (2.4.29) and calculate the weight in volume of $C_{12}H_{11}N_2NaO_3$.

Storage. Store in single dose containers.

Labelling. The label states that the injection should not be used if the solution is discoloured or if it contains a precipitate.

Phenobarbitone Sodium Tablets

Phenobarbital Sodium Tablets; Soluble Phenobarbitone Tablets; Soluble Phenobarbital Tablets

Phenobarbitone Sodium Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenobarbitone sodium, $C_{12}H_{11}N_2NaO_3$.

Usual strengths. 30 mg; 60 mg.

Identification

A. Heat 0.1 g of the residue obtained in Assay on a water-bath with 15 ml of *ethanol (25 per cent)* until dissolved, filter while hot and allow to cool. Filter through a sintered-glass crucible, wash with a small quantity of *ethanol (25 per cent)* and dry at 105°. Heat in a sealed tube at 105° for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone IPRS* or with the reference spectrum of phenobarbitone.

B. The residue obtained in test A melts at about 175° (2.4.21).

C. Dissolve 50 mg of the residue obtained in Assay in 2 ml of a 0.2 per cent w/v solution of *cobaltous acetate* in *methanol*, warm, add 50 mg of powdered *borax* and heat to boiling; a bluish violet colour is produced.

D. Triturate a quantity of the powdered tablets containing 0.2 g of Phenobarbitone Sodium with 5 ml of *water* and filter; the filtrate is alkaline to *litmus solution* and yields a white precipitate on the addition of *dilute hydrochloric acid*.

E. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.3 g of Phenobarbitone Sodium, dissolve as completely as possible in 10 ml of a 2 per cent

https://nhathuocngocanh.com/

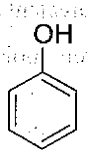
w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer and dry the residue to constant weight at 105°.

1 g of the residue is equivalent to 1.095 g of $C_{12}H_{11}N_2NaO_3$.

Storage. Store protected from moisture.

Phenol

Carbolic acid



C_6H_6O Mol. Wt. 94.1

Phenol contains not less than 99.0 per cent and not more than 100.5 per cent of C_6H_6O.

Category. Antiseptic; antipruritic; pharmaceutical aid (antimicrobial preservative).

Description. Colourless or faintly pink or faintly yellowish crystals or crystalline masses; deliquescent.

Identification

A. Dissolve 0.5 g in 2 ml of *strong ammonia solution*. Dilute the solution to about 100 ml with *water* and to 2 ml of the resulting solution, add 0.05 ml of 3 per cent w/v solution of *sodium hypochlorite*; a blue colour develops which becomes progressively more intense.

B. Dissolve 1.0 g in sufficient *water* to produce 15 ml (solution A) and to 1 ml, add 10 ml of *water* and 0.1 ml of *ferric chloride solution*; a violet colour is produced which disappears on the addition of 5 ml of *2-propanol*.

C. To 1 ml of solution A add 10 ml of *water* and 1 ml of *bromine solution*; a pale yellow precipitate is produced.

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

Acidity. To 2 ml of solution A add 0.05 ml of *methyl orange solution*; the solution is yellow.

Freezing point (2.4.11). Not less than 39.5°.

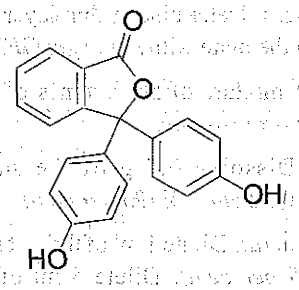
Non-volatile matter. Not more than 0.05 per cent, when 5.0 g is volatilised on a water-bath and dried to constant weight at 105°.

Assay. Weigh 0.5 g and dissolve in sufficient *water* to produce 250.0 ml. Transfer 25.0 ml to a ground-glass-stoppered flask, add 50.0 ml of *0.05 M bromine* and 5 ml of *hydrochloric acid*, stopper, allow to stand for 30 minutes, swirling occasionally, and allow to stand for a further 15 minutes. Add 5 ml of a 20 per cent w/v solution of *potassium iodide*, shake and titrate with *0.1 M sodium thiosulphate* until a faint yellow colour remains. Add 0.5 ml of *starch solution* and 10 ml of *chloroform* and continue the titration with vigorous shaking. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of bromine required.

1 ml of *0.05 M bromine* is equivalent to 0.001569 g of C_6H_6O.

Storage. Store protected from light and moisture.

Phenolphthalein



$C_{20}H_{14}O_4$ Mol. Wt. 318.3

Phenolphthalein is 3,3-bis(4-hydroxyphenyl)phthalide.

Phenolphthalein contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{14}O_4$, calculated on the dried basis.

Category. Laxative.

Description. A white or yellowish white, crystalline or amorphous powder.

Identification

A. Dissolves in dilute solutions of alkali hydroxides and in hot solutions of alkali carbonates forming a red solution which is decolorised by dilute acids.

B. Dissolve 25 mg in 100 ml of *ethanol (95 per cent)* (solution A). To 2.0 ml of solution A add 5.0 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with *ethanol (95 per cent)* (solution A_1). To 10.0 ml of solution A add 5.0 ml of *1 M hydrochloric acid*

https://nhathuocngocanh.com/

and dilute to 50.0 ml with *ethanol (95 per cent)* (solution A_2). To 2.0 ml of solution A add 5.0 ml of *1 M sodium hydroxide* and dilute to 50.0 ml with *ethanol (95 per cent)* (solution B). Examined between 220 nm and 250 nm (2.4.7), solution A_1 shows an absorption maximum at 229 nm. The specific absorbance at the maximum at 229 nm is 922 to 1018. Examined between 250 nm and 300 nm, solution A_2 shows an absorption maximum at 276 nm. The specific absorbance at the maximum at 276 nm is 142 to 158. Examined between 230 nm and 270 nm, solution B shows an absorption maximum at 249 nm. The specific absorbance at the maximum at 249 nm is 744 to 822.

Tests

Solution A. To 2.0 g add 40 ml of *distilled water*, boil, cool and filter.

Appearance of solution. A 4 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.15 ml of *bromothymol blue solution*. Add 0.05 ml of *0.01 M hydrochloric acid*, the solution is yellow. Add 0.1 ml of *0.01 M sodium hydroxide*, the solution is blue.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *acetone* and 50 volumes of *dichloromethane*.

Test solution. Dissolve 0.5 g of the substance under examination in 10 ml *ethanol (95 per cent)*.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *ethanol (95 per cent)*. Dilute 5 ml of the solution to 100 ml with *ethanol (95 per cent)*.

Reference solution (b). Dissolve 25 mg of *fluorene* in *ethanol (95 per cent)*, add 0.5 ml of the test solution and dilute to 10 ml with *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine at 254 nm and re-examine after exposure to ammonia vapour. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Chlorides (2.3.12). To 2.5 g, add 40 ml of *water* and heat to boiling. Cool and filter. This solution complies with the limit test for chlorides (100 ppm).

Heavy metals (2.3.13). Heat 5 g with 50 ml of *dilute hydrochloric acid* on a water-bath for 5 min and filter. Evaporate the filtrate almost to dryness and dissolve the residue in 50 ml of *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm). Use 10 ml of *lead standard solution (2 ppm Pb)* to prepare the standard.

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

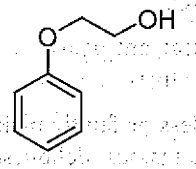
Assay. Dissolve 0.1 g in 5 ml of *dimethylformamide*. Add 5 ml of *sodium carbonate solution*, 10 ml of *sodium hydrogen carbonate solution*, 35 ml of *water* and 50.0 ml of *0.05 M iodine*. Add 10 ml of *dichloromethane* and 20 ml of *dilute sulphuric acid*. Titrate the excess of iodine with *0.1 M sodium thiosulphate*, using 0.3 ml of *starch solution* added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of *0.05 M iodine* is equivalent to 0.003979 g of $C_{20}H_{14}O_4$.

Storage. Store protected from moisture.

Phenoxyethanol

2-Phenoxyethanol



$C_8H_{10}O_2$ Mol. Wt.138.2

Phenoxyethanol is 1-hydroxy-2-phenoxyethane.

Phenoxyethanol contains not less than 99.0 per cent and not more than 100.5 per cent of $C_8H_{10}O_2$.

Category. Pharmaceutical aid.

Description. A colourless, slightly viscous liquid.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenoxyethanol IPRS* or with the reference spectrum of phenoxyethanol.

B. When examined in the range 240 nm to 350 nm (2.4.7), a 0.008 per cent w/v solution in *water*, shows two absorption maxima at 269 nm and 275 nm and specific absorbance at 269 nm is 95 to 105 and at 275 nm is 75 to 85.

C. Shake 2 ml of Phenoxyethanol with a mixture of 4.0 g of *potassium permanganate*, 5.4 g of *sodium carbonate* and

https://nhathuocngocanh.com/

75 ml of *water* for 30 minutes. Add 25 g of *sodium chloride* and stir continuously for 60 minutes, filter and adjusted to pH 1.7 with *hydrochloric acid*. The melting point of the precipitate, after recrystallisation from *water* is 96° to 99°.

Tests

Refractive index (2.4.27). 1.537 to 1.539

Relative density (2.4.29). 1.105 to 1.110

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 5 g of the substance under examination in *ethanol* and dilute to 20.0 ml with *ethanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *ethanol*.

Reference solution (b). Dissolve 25 mg of *phenol (impurity A)* in 10.0 ml of *ethanol*.

Reference solution (c). Dilute 1.0 ml, each of, reference solution (a) and reference solution (b) to 10.0 ml with *ethanol*.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *ethanol*.

Chromatographic system

- a fused-silica column 30 m x 0.25 mm, packed with macrogol 20000 (0.25 µm),
- temperature:

column	time (in min)	temperature (°)
	0-13	90 → 220
	13-23	220

- inlet port at 250° and detector at 270°,
- a flame-ionisation detector,
- flow rate: 1 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1 µl,
- split ratio: 1:100.

The retention time of phenoxyethanol is about 13 minutes.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to phenol and phenoxyethanol is not less than 15.

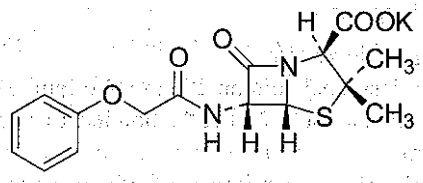
Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of peak in the chromatogram obtained with reference solution (d) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with reference solution (d) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Assay. Dissolve 2 g in 10.0 ml of freshly prepared *acetic anhydride solution*, heat in a water bath for 45 minutes. Cool, add 10.0 ml of *water*, further heat for 2 minutes, cool and add 10.0 ml of *butanol*, shake vigorously and titrate excess of *acetic acid* with *1 M sodium hydroxide* using 0.2 ml of *phenolphthalein* solution as indicator. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.1382 g of $C_8H_{10}O_2$.

Phenoxymethylpenicillin Potassium

Penicillin V Potassium



$C_{16}H_{17}KN_2O_5S$ Mol. Wt. 388.5

Phenoxymethylpenicillin Potassium is potassium (6*R*)-6-(2-phenoxyacetamido)penicillinate, produced by the growth of certain strains of *Penicillium notatum* or related organisms on a culture medium containing an appropriate precursor, or obtained by any other means.

Phenoxymethylpenicillin Potassium contains not less than 86.0 per cent of total penicillins $C_{16}H_{17}N_2O_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenoxymethylpenicillin potassium IPRS* or with the reference spectrum of phenoxymethylpenicillin potassium.

B. It gives reaction (B) of penicillins and cephalosporins (2.3.1).

C. It gives reaction (A) of potassium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 0.5 per cent w/v solution.

Specific optical rotation (2.4.22). + 215.0° to + 230.0°, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

https://nhathuocngocanh.com/

Light absorption (2.4.7). Absorbance of a 0.1 per cent w/v solution in *0.1 M sodium hydroxide* at the maximum at about 306 nm, not more than 0.33. Absorbance of a 0.02 per cent w/v solution in *0.1M sodium hydroxide* at the maximum at about 274 nm, not less than 0.50.

Phenoxyacetic acid. Not more than 0.5 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Weigh a suitable quantity of the substance under examination, dissolve in *phosphate buffer pH 6.6* and dilute to obtain a solution having a known concentration of about 20 mg per ml.

Reference solution. Weigh a suitable quantity of phenoxyacetic acid, dissolve in the *phosphate buffer pH 6.6* and dilute to obtain a solution having a known concentration of about 0.1 mg per ml.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of phenoxyacetic acid.

Limit of *p*-hydroxyphenoxymethylpenicillin. Not more than 5.0 per cent.

Using the chromatograms obtained with the test solution in the Assay, calculate the content of *p*-hydroxyphenoxymethylpenicillin from the peak response of *p*-hydroxyphenoxymethylpenicillin and the sum of the peak responses of *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 125 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve a weighed quantity of *phenoxymethylpenicillin potassium IPRS* in the mobile phase and dilute to obtain a solution having a known concentration of about 2.5 mg per ml.

Reference solution (b). A solution in the mobile phase containing 0.25 per cent w/v each of benzylpenicillin potassium and phenoxymethylpenicillin potassium.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane chemically bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 5.75 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b).The relative retention times are about 0.8 for benzylpenicillin and 1.0 for phenoxymethylpenicillin. The column efficiency determined from the phenoxymethylpenicillin peak is not less than 1800 theoretical plates and the resolution between benzylpenicillin and phenoxymethylpenicillin is not less than 3.0.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution. Record the chromatograms and measure the responses for the phenoxymethylpenicillin peak and any *p*-hydroxyphenoxymethylpenicillin peak with a retention time of about 0.4 relative to that of the main phenoxymethylpenicillin peak.

Calculate the content of $C_{16}H_{17}N_2O_5S$, from the sum of the peak responses of the *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin peaks in the chromatograms obtained with the test solution and reference solution (a).

Storage. Store protected from moisture.

Phenoxymethylpenicillin Potassium Tablets

Phenoxymethylpenicillin Tablets; Penicillin V Potassium Tablets; Penicillin V Tablets

Phenoxymethylpenicillin Potassium Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenoxymethylpenicillin, $C_{16}H_{18}N_2O_5S$.

Usual strengths. The equivalent of 62.5 mg, 125 mg, 250 mg and 500 mg of phenoxymethylpenicillin.

Identification

A. Shake a quantity of the powdered tablets containing 80 mg of phenoxymethylpenicillin with *water*, dilute to 250 ml with *water* and filter. When examined between 230 and 360 nm

https://nhathuocngocanh.com/

(2.4.7), the filtrate shows absorption maxima at about 268 nm and 274 nm and a minimum at about 272 nm.

B. Shake a quantity of the powdered tablets containing 10 mg of phenoxymethylpenicillin with 10 ml of *water*, filter and add 0.5 ml of *neutral red solution*. Add sufficient *0.01 M sodium hydroxide* to produce a permanent orange colour and then add 1.0 ml of *penicillinase solution*; the solution changes rapidly to red.

C. Ignite 0.5 g of the powdered tablets, add 5 ml of *2 M hydrochloric acid*, boil, cool and filter. The filtrate gives reaction (B) of potassium salts (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 268 nm (2.4.7). At the same time measure the absorbance of a solution of known concentration of *phenoxymethylpenicillin potassium IPRS* at the maximum at about 268 nm. Calculate the content of $C_{16}H_{18}N_2O_5S$, in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{18}N_2O_5S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and finely powder 20 tablets. Dissolve a weighed quantity of the powder containing about 0.25 g of phenoxymethylpenicillin in the mobile phase by shaking for 5 minutes and dilute to 100.0 ml with the mobile phase. Filter through a 0.5 µm or finer filter and use the filtrate.

Reference solution (a). Dissolve a weighed quantity of *phenoxymethylpenicillin potassium IPRS* in the mobile phase and dilute to obtain a solution having a known concentration of about 2.5 mg per ml.

Reference solution (b). A solution in the mobile phase containing 0.25 per cent w/v each of benzylpenicillin potassium and phenoxymethylpenicillin potassium.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane chemically bonded to porous silica,
- mobile phase: a mixture of 650 volumes of *water*, 350 volumes of *acetonitrile* and 5.75 volumes of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention times are about 0.8 for benzylpenicillin and 1.0 for phenoxymethyl-penicillin.

Inject reference solution (b). The test is not valid unless the column efficiency determined from the phenoxymethylpenicillin peak is not less than 1800 theoretical plates and the resolution between the benzylpenicillin and phenoxymethylpenicillin peaks is not less than 3.0.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 1.0 per cent.

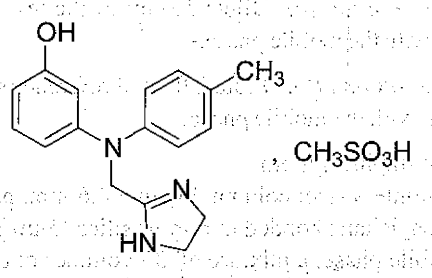
Inject reference solution (a) and the test solution. Record the chromatograms and measure the responses for the phenoxymethylpenicillin peak and any *p*-hydroxyphenoxymethylpenicillin peak with a retention time of about 0.4 relative to that of the main phenoxymethylpenicillin peak.

Calculate the content of $C_{16}H_{17}N_2O_5S$, from the sum of the peak responses of the *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin peaks in the chromatograms obtained with the test solution and reference solution (a).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of phenoxymethylpenicillin.

Phentolamine Mesylate



$C_{17}H_{19}N_3O,CH_4O_3S$ Mol. Wt. 377.5

Phentolamine Mesylate is 3-[[4,5-dihydro-1*H*-imidazol-2-yl)methyl](4-methylphenyl)aminophenol methanesulphonate.

Phentolamine Mesylate contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{17}H_{19}N_3O$, CH_4O_3S, calculated on the dried basis.

Category. Alpha-adrenoceptor antagonist.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phentolamine mesylate IPRS* or with the reference spectrum of phentolamine mesylate.

https://nhathuocngocanh.com/

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution shows an absorption maximum only at about 278 nm; absorbance at about 278 nm, about 0.5.

C. Dissolve 0.5 g in 5 ml of *ethanol (95 per cent)* and 5 ml of *0.1 M hydrochloric acid* and add 2 ml of a 0.5 per cent w/v solution of *ammonium metavanadate*; a light green precipitate is produced.

D. Mix 50 mg with 0.2 g of powdered *sodium hydroxide*, heat to fusion and continue the heating for a few seconds longer. Cool, add 0.5 ml of *water* and a slight excess of *2 M hydrochloric acid* and warm; *sulphur dioxide* is evolved, which turns moistened starch iodate paper blue.

Tests

Acidity or alkalinity. Dissolve 0.1 g in 10 ml of *carbon dioxide-free water* and add 0.1 ml of *methyl red solution*. The solution is not red and not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 33 volumes of *acetonitrile* and 67 volumes of a 0.05 per cent w/v solution of *ammonium acetate* previously adjusted to pH 5.9 with *dilute acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Phentolamine impurity A[1]	0.7	1.7
Phentolamine (Retention time: about 15 minutes)	1.0	—
Phentolamine impurity C[2]	1.2	—

[1] *N*-(2-aminoethyl)-2-[(3-hydroxyphenyl)(4-methylphenyl)amino] acetamide,

[2] 3-[(4-methylphenyl)amino]phenol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to phentolamine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 100 ml of *anhydrous 2-propanol* with the aid of ultrasound if necessary. Titrate with *0.1 M tetrabutylammonium hydroxide* in *2-propanol*. Determine the end-point potentiometrically (2.4.25), using a glass electrode and a calomel electrode containing a saturated solution of *tetramethylammonium chloride* in *2-propanol*. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03775 g of $C_{17}H_{19}N_3O, CH_4O_3S$.

Storage. Store protected from light and moisture.

Phentolamine Injection

Phentolamine Mesylate Injection; Phentolamine Mesilate Injection

Phentolamine Injection is a sterile solution of Phentolamine Mesylate in Water for Injections containing anhydrous Glucose.

Phentolamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phentolamine mesylate, $C_{17}H_{19}N_3O, CH_4O_3S$.

Usual strength. 10 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

pH (2.4.24). 3.5 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection with the mobile phase to obtain a solution containing 0.05 per cent w/v of Phentolamine Mesylate.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 33 volumes of *acetonitrile* and 67 volumes of a 0.05 per cent w/v solution of *ammonium acetate* previously adjusted to pH 5.9 with *dilute acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Phentolamine impurity A[1]	0.7	1.7
Phentolamine (Retention time: about 15 minutes)	1.0	—
Phentolamine impurity C[2]	1.2	—

[1]*N*-(2-aminoethyl)-2-[(3-hydroxyphenyl)(4-methylphenyl)amino] acetamide,

[2]3-[(4-methylphenyl)amino]phenol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to phentolamine impurity A is not more than 2.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.2 per cent), the area of any other secondary peak is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.2 per cent) and the sum of areas of all the secondary peaks is not more than 4.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.2 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 5.8 Endotoxin Units per mg of phentolamine mesylate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection with the mobile phase to obtain a solution containing 0.01 per cent w/v of Phentolamine Mesilate.

Reference solution. A 0.01 per cent w/v solution of *phentolamine mesilate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

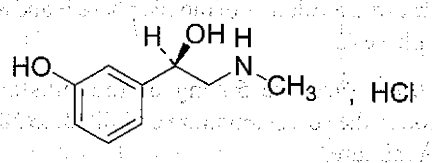
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}N_3O,CH_4SO_3$.

Storage. Store protected from light.

Phenylephrine Hydrochloride



$C_9H_{13}NO_2,HCl$ Mol. Wt. 203.7

Phenylephrine Hydrochloride is (*R*)-1-(3-hydroxyphenyl)-2-methylaminoethanol hydrochloride.

Phenylephrine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_{13}NO_2$, HCl, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenylephrine hydrochloride IPRS* or with the reference spectrum of phenylephrine hydrochloride.

https://nhathuocngocanh.com/

B. Dissolve about 10 mg in 1 ml of *water* and add 0.05 ml of *cupric sulphate solution* and 1 ml of *5 M sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

C. Dissolve 0.3 g in 3 ml of *water*, add 1 ml of *6 M ammonia* and initiate crystallisation by scratching the side of the tube with a glass rod. The melting range of the crystals, after washing with iced *water* and drying at 105° for 2 hours, is 171° to 176° (2.4.21).

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. Dissolve 2.0 g in 100 ml of *carbon dioxide-free water* prepared from *distilled water* (solution A). Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Specific optical rotation (2.4.22). −47.0° to −43.0°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of mobile phase B and 80 volumes of mobile phase A.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 2.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 5.5 cm x 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution prepared by dissolving 3.25 g of *sodium octanesulphonate monohydrate* in 1000 ml of *water* by stirring for 30 minutes, adjusted to pH 2.8 with *dilute orthophosphoric acid*,
  B. a mixture of 10 volumes of buffer solution and 90 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	93	7
3	93	7
13	70	30
14	93	7

Phenylephrine impurity C[1]	1.3	0.5
Phenylephrine impurity E[2]	3.6	0.5

[1]phenylephrone,

[2]benzylphenylephrone.

Inject the test solution. The test is not valid unless the tailing factor is not more than 1.9 for the principal peak.

Inject the reference solution and the test solution. In the chromatogram obtained the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (500 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.15 g in a mixture of 0.5 ml of *0.1 M hydrochloric acid* and 80 ml of *ethanol (95 per cent)* and titrate with *0.1 M ethanolic sodium hydroxide* determining the end-point potentiometrically (2.4.25). Record the volume added between the two inflections.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02037 g of $C_9H_{13}NO_2,HCl$.

Storage. Store protected from light and moisture.

Phenylephrine Eye Drops

Phenylephrine Hydrochloride Eye Drops

Phenylephrine Eye Drops is a sterile solution of Phenylephrine Hydrochloride in purified water.

https://nhathuocngocanh.com/

Phenylephrine Eye Drops Contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenylephrine hydrochloride, $C_9H_{13}NO_2$,HCl.

Usual strengths. 2.5 per cent w/v; 5 per cent w/v; 10 per cent w/v.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (c).

B. Dissolve about 10 mg in 1 ml of *water* and add 0.05 ml of *cupric sulphate solution* and 1 ml of *5 M sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

Tests

pH (2.4.24). 3.0 to 7.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 5 volumes of *chloroform*, 15 volumes of *10 M ammonia solution* and 80 volumes of *propan-2-ol*.

Test solution. Dilute the eye drop with *methanol* to obtained a solution containing 2.0 per cent w/v of Phenylephrine Hydrochloride.

Reference solution (a). Dilute 1 volume of the eye drops to 40 volumes with *methanol*.

Reference solution (b). Dilute 1 volume of the eye drops to 100 volumes with *methanol*.

Reference solution (c). A 0.05 per cent w/v solution of *phenylephrine hydrochloride IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate in a current of cold air and spray with *ninhydrin solution*. Heat the plate at 100° to 105° for 5 to 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute suitable volume of the eye drops with *water* to obtain a solution containing 0.1 per cent w/v of Phenylephrine Hydrochloride.

Reference solution. A 0.1 per cent w/v solution of *phenylephrine hydrochloride IPRS* in the *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- mobile phase: a solution prepared by dissolving 0.1 per cent w/v of *sodium heptanesulphonate* in a mixture of 2 volumes of *glacial acetic acid*, 400 volumes of *methanol* and 600 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{13}NO_2$,HCl in the eye drop.

Storage. Store protected from light.

Phenylephrine Injection

Phenylephrine Hydrochloride Injection

Phenylephrine Injection is a sterile solution of Phenylephrine Hydrochloride in Water for Injections.

Phenylephrine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phenylephrine hydrochloride, $C_9H_{13}NO_2$,HCl.

Usual strength. 10 mg per ml.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

B. To a volume containing 10 mg of Phenylephrine Hydrochloride add, if necessary, sufficient *water* to produce 1 ml and then add 0.05 ml of *cupric sulphate solution* and 1 ml of *5 M sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 80 volumes of *2-propanol*, 15 volumes of *10 M ammonia* and 5 volumes of *chloroform*.

Test solution (a). Evaporate a volume of the injection containing 20 mg of Phenylephrine Hydrochloride to dryness and dissolve the residue in 1 ml of *methanol*.

Test solution (b). Dilute 1 volume of test solution (a) to 200 volumes with *methanol*.

https://nhathuocngocanh.com/

Reference solution (a). Dilute 1 volume of test solution (b) to 2.5 volumes with *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *phenylephrine hydrochloride IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in cold air, spray with *ninhydrin solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with test solution (b) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (a).

Bacterial endotoxins (2.2.3). Not more than 25.0 Endotoxin Units per mg of phenylephrine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 50 mg of Phenylephrine Hydrochloride add sufficient *0.5 M sulphuric acid* to produce 100.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with *0.5 M sulphuric acid* and measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7). Calculate the content of $C_9H_{13}NO_2$,HCl taking 90 as the specific absorbance at 273 nm.

Storage. Store protected from light.

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Drops

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Oral Drops contains phenylephrine hydrochloride and chlorpheniramine maleate, in a suitable vehicle.

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Oral Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of phenylephrine hydrochloride, $C_9H_{13}NO_2$,HCl and chlorpheniramine Maleate, $C_{16}H_{19}ClN_2$,$C_4H_4O_4$.

Usual Strength. Phenylephrine Hydrochloride 5 mg and Chlorpheniramine Maleate 2 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 5.0.

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer a volume of oral drops containing 25 mg of Phenylephrine Hydrochloride to a 250-ml volumetric flask and dilute to volume with the mobile phase and filter.

Reference solution. A 0.01 per cent w/v solution of *phenylephrine hydrochloride IPRS* and 0.004 per cent w/v solution of *chlorpheniramine maleate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups bonded to porous silica (5 µm) (Such as Phenomenex CN),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 0.462 g of *diammonium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid solution* and 55 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Storage. Store protected from light.

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Syrup

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Syrup contains phenylephrine hydrochloride and chlorpheniramine maleate in a suitable flavoured vehicle.

Phenylephrine Hydrochloride and Chlorpheniramine Maleate Syrup contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of phenylephrine hydrochloride, $C_9H_{13}NO_2$,HCl and chlorpheniramine Maleate, $C_{16}H_{19}ClN_2$,$C_4H_4O_4$.

Usual Strength. Phenylephrine Hydrochloride 5 mg and Chlorpheniramine Maleate 2 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 5.0.

https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of syrup containing 5 mg of Phenylephrine Hydrochloride in 40 ml of the mobile phase with the aid of ultrasound for 15 minutes, further dilute to 50.0 ml with the mobile phase and filter.

Reference solution. A 0.01 per cent w/v solution of *phenylephrine hydrochloride IPRS* and 0.004 per cent w/v solution of *chlorpheniramine maleate IPRS* in the mobile phase.

Chromatographic system

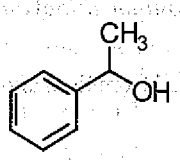
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups bonded to porous silica (5 µm) (Such as Phenomenex CN),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 0.462 g of *diammonium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid solution* and 55 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Storage. Store protected from light.

Phenylethyl Alcohol



$C_8H_{10}O$ Mol. Wt. 122.2

Phenylethyl Alcohol is 1-Phenylethanol.

Category. Pharmaceutical aid.

Description. A clear, colourless liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenylethyl alcohol IPRS* or with reference spectrum of phenylethyl alcohol.

Tests

Specific gravity (2.4.29). 1.017 to 1.02.

Refractive index (2.4.27). 1.531 to 1.534 at 20°.

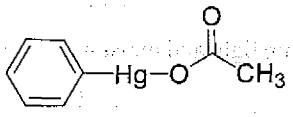
Sulphated ash (2.3.18). Not more than 0.005 per cent, by evaporating 10 ml in a suitable crucible and ignite to constant weight.

Aldehyde. Shake 5 ml with 5 ml of *1 M sodium hydroxide* and allow to stand for 1 hour; no yellow colour apprears in the organic layer.

Chlorinated compounds. Wind a 1.5 cm x 5 cm strip of 20-mesh copper gauze around the end of a copper wire. Heat the gauze in the nonluminous flame of a bunsen burner until it glows without colouring the flame green. Permit the gauze to cool, and heat several times until a good coat of oxide has formed. Apply with a medicine dropper 2 drops of *phenylethyl alcohol* to the cooled gauze, ignite, and permit it to burn freely in the air. Again cool the gauze, add 2 more drops of *phenylethyl alcohol* and burn as before. Continue this process until a total of 6 drops has been added and ignited, and then hold the gauze in the outer edge of the bunsen flame, adjusted to a height of about 4 cm; no transient green colour or other colour is imparted to the flame.

Storage. Store protected from light and moisture, at a temperature between 8° to 25°.

Phenylmercuric Acetate



$C_8H_8HgO_2$ Mol. Wt. 336.7

Phenylmercuric Acetate is (acetato)phenylmercury.

Phenylmercuric Acetate contains not less than 98.0 per cent and not more than 100.5 per cent of $C_8H_8HgO_2$.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white to creamy white, crystalline powder, or small white prisms or leaflets.

Identification

A. To 100 mg add 0.5 ml of *nitric acid*, warm gently until a dark brown colour is produced and dilute with *water* to 10 ml; the characteristic odour of *nitrobenzene* is produced.

B. To 100 mg add 0.5 ml of *sulphuric acid* and 1 ml of *ethanol (95 per cent)* and warm; the characteristic odour of *ethyl acetate* is produced.

C. To 5 ml of a saturated solution in *water*, add a few drops of a freshly prepared 10 per cent w/v solution of *sodium sulphide*;

https://nhathuocngocanh.com/

a white precipitate is formed which darkens slowly on boiling and allowing to stand.

Tests

Mercuric salts and heavy metals. Heat about 100 mg with 15 ml of *water*, cool and filter. To the filtrate add a few drops of a freshly prepared 10 per cent w/v solution of *sodium sulphide*; the precipitate formed shows no immediate colour.

Polymercurated benzene compounds. Shake 2.0 g with 100 ml of *acetone*. Filter, wash the residue with successive portions of *acetone* until a total of 50 ml is used, dry the residue at 105° for 1 hour and weigh. The weight of the residue does not exceed 30 mg (1.5 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Assay. Weigh 0.4 g, transfer to a 100-ml flask, add 15 ml of *water*, 5 ml of *formic acid* and 1 g of *zinc dust* and reflux for 30 minutes. Cool, filter and wash the filter paper and the amalgam with *water* until the washings are no longer acidic to litmus. Dissolve the amalgam in 40 ml of *8 M nitric acid*. Heat on a *water*-bath for 3 minutes and add 0.5 g *urea* and sufficient *0.02 M potassium permanganate* to produce a permanent pink colour. Cool and add *hydrogen peroxide solution* to decolorise the solution. Add 1 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate*. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of ammonium thiocyanate required.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.01684 g of $C_8H_8HgO_2$.

Storage. Store protected from light and moisture.

Phenylmercuric Nitrate

Phenylmercuric Nitrate is a mixture of phenylmercuric nitrate, $C_6H_5HgNO_3$ and phenylmercuric hydroxide, C_6H_5HgOH.

Phenylmercuric Nitrate contains not less than 62.5 per cent and not more than 63.5 per cent of mercury, Hg, calculated on the dried basis.

Category. Antiseptic; pharmaceutical aid (antimicrobial preservative).

Description. A white or pale yellow powder.

Identification

A. To 0.1 g add 3 ml of *sulphuric acid*; the mixture becomes yellow and the characteristic odour of *nitrobenzene* is produced.

B. To 0.1 g add 45 ml of *water* and heat to boiling with shaking. Cool, filter and add sufficient *water* to produce 50 ml (solution A). To 1 ml of solution A add 1 ml of *2 M hydrochloric acid*; a white, flocculent precipitate is produced.

C. To 5 ml of solution A add 8 ml of *water* and 0.1 ml of a freshly prepared 10 per cent w/v solution of *sodium sulphide*; a white precipitate is formed which darkens slowly on boiling and allowing to stand.

D. To 5 ml of solution A add 1 ml of *2 M hydrochloric acid*, 2 ml of *dichloromethane* and 0.2 ml of *dithizone solution* and shake; the lower layer is orange-yellow.

E. Solution A gives reaction of nitrates (2.3.1).

Tests

Appearance of solution. Solution A is colourless (2.4.1).

Inorganic mercuric compounds. To a 10 ml of solution A add 2 ml of *potassium iodide solution* and 3 ml of *2 M hydrochloric acid* and filter; the filtrate is colourless. Wash the precipitate with 2 ml of *water*, combine the filtrate and washings and add 2 ml of *2 M sodium hydroxide* and sufficient *water* to produce 20 ml. 12 ml of the solution complies with the limit test for heavy metals, Method D (2.3.13). Use 10 ml of *lead standard solution (1 ppm Pb)* to prepare the standard (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 24 hours.

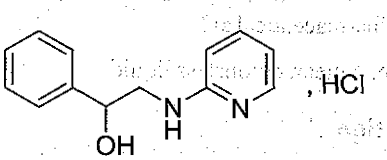
Assay. Weigh 0.2 g and dissolve in a mixture of 90 ml of *water* and 10 ml of *nitric acid*. Add 2 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate* until a persistent reddish yellow colour is obtained. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of *ammonium thiocyanate* required.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.02006 g of Hg.

Storage. Store protected from light and moisture.

Phenyramidol Hydrochloride

Fenyramidol Hydrochloride



$C_{13}H_{14}N_2O,HCl$ Mol. Wt. 250.7

Phenyramidol Hydrochloride is 1-Phenyl-2-(2-pyridylamino) ethanol hydrochloride.

https://nhathuocngocanh.com/

Phenyramidol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{14}N_2O$,HCl.

Category. Muscle Relaxant; Analgesic.

Description. A white to cream coloured crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with the reference spectrum of *phenyramidol hydrochloride IPRS* or with the reference spectrum of phenyramidol hydrochloride.

B. A 0.04 per cent w/v solution of the substance under examination in *water*. To 5 ml of the solution, add 20 ml of *1 M hydrochloric acid* and dilute to 200 ml with *water* and filter. When examined in the range 200 nm to 400 nm (2.4.7), shows two maxima at 238 nm and 310 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *phenyramidol hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Zorbax C18),
- column temperature: 35°,
- mobile phase: a mixture of 900 volumes of *water*, 1 volume of *orthophosphoric acid* and 100 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 306 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Light absorption. The absorbance of 10 per cent w/v solution at 450 nm (2.4.7) is not more than 0.02.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.4.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 2.0 g by drying in an oven for 3 hours at 105°.

Assay. Dissolve 0.24 g in 50 ml *acetic acid*, add 10 ml of *mercuric acetate* solution. Titrate with *0.1 M perchloric acid*. Determine the end point potentiometrically (2.4.25). Carry out the blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02507 g of $C_{13}H_{14}N_2O$,HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Phenyramidol Tablets

Phenyramidol Hydrochloride Tablets

Phenyramidol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenyramidol hydrochloride, $C_{13}H_{14}N_2O$,HCl.

Usual strength. 400 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Dissolve a weighed quantity of the powdered tablet containing 0.1 g of Phenyramidol Hydrochloride in *water* and dilute to 250 ml with *water*. To 5 ml of the solution, add 20 ml of *1 M hydrochloric acid* and dilute to 200 ml with *water* and filter. When examined in the range 200 nm to 400 nm (2.4.7), shows two maxima at 238 nm and 310 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A 0.04 per cent w/v solution of *phenyramidol hydrochloride IPRS* in the dissolution medium. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

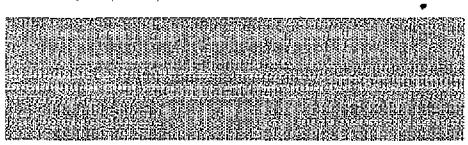
Use the chromatographic system as described under Assay.

Calculate the content of $C_{13}H_{14}N_2O$,HCl in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{14}N_2O$.HCl.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).



https://nhathuocngocanh.com/

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of powder containing 0.05 g of Phenyramidol Hydrochloride in *water* and dilute to 50.0 ml of *water*. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *phenyramidol hydrochloride IPRS* in *water*. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *triethylamine* to 600 volumes of *methanol* and 400 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 309 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

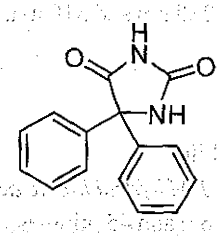
Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{14}N_2O,HCl$ in the tablets.

Storage. Store protected from light and moisture.

Phenytoin

Diphenylhydantoin



$C_{15}H_{12}N_2O_2$ Mol.Wt. 252.3

Phenytoin is 5,5-diphenylimidazolidine-2,4-dione.

Phenytoin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{12}N_2O_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin IPRS* or with the reference spectrum of phenytoin.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. To about 10 mg, add 1 ml of *water* and 0.05 ml of *ammonia*. Heat until boiling begins. Add 0.05 ml of a 5 per cent w/v solution of *copper sulphate* in *dilute ammonia* and shake; a pink crystalline precipitate is formed.

Tests

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *1 M sodium hydroxide* and 20 ml of *water*. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

Acidity or alkalinity. To 1.0 g, add 45 ml of *water* and boil for 2 minutes. Allow to cool and filter. Wash the filter with *carbon dioxide-free water* and dilute the combined filtrate and washings to 50 ml with the same solvent. To 10 ml of the solution add 0.15 ml of *methyl red solution*; not more than 0.5 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red. To 10 ml of the solution add 0.15 ml of *bromothymol blue solution*; not more than 0.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to blue.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *phenytoin IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol*, 35 volumes of *acetonitrile* and 45 volumes of a 0.58 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Phenytoin impurity C[1]	0.5	---
Phenytoin impurity D[2]	0.6	1.7
Phenytoin impurity E[3]	0.8	1.4
Phenytoin (Retention time: about 4 minutes)	1.0	—

[1]2,2-diphenylglycine,

https://nhathuocngocanh.com/

²3a,6a-diphenyltetrahydroimidazo[4,5-*d*]imidazole-2,5(1*H*,3*H*)-dione, ²(carbamoylamino)(diphenyl)acetic acid.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to phenytoin impurity E is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to phenytoin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to phenytoin impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

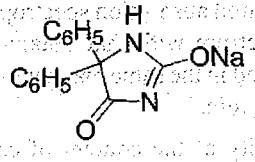
Assay. Dissolve 0.2 g in 50 ml of *dimethylformamide*. Titrate with *0.1 M sodium methoxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium methoxide* is equivalent to 0.02523 g of $C_{15}H_{12}N_2O_2$.

Storage. Store protected from light.

Phenytoin Sodium

Diphenylhydantoin Sodium



$C_{15}H_{11}N_2NaO_2$ Mol. Wt. 274.3

Phenytoin Sodium is 4-oxo-5,5-diphenyl-2-imidazolidin-2-olate.

Phenytoin Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{11}N_2NaO_2$, calculated on the anhydrous basis.

Category. Anticonvulsant; antiarrhythmic.

Description. A white powder; somewhat hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium IPRS* or with the reference spectrum of phenytoin sodium.

B. Dissolve 0.25 g in 5 ml of *water* and acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. Dissolve 0.1 g in 10 ml of a 10 per cent w/v solution of *pyridine*, add 1 ml of *cupric sulphate with pyridine solution* and allow to stand for 10 minutes; a blue precipitate is produced.

D. Incinerate 0.1 g; the residue after neutralisation with *hydrochloric acid* and addition of 2 ml of *water* gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Suspend 1.0 g in 5 ml of *water* and dilute to 20 ml with *0.1 M sodium hydroxide*; the solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Free phenytoin. Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *pyridine* and *water* and add 0.5 ml of *dilute phenolphthalein solution* and 3 ml of *silver nitrate-pyridine reagent*. Not more than 1.0 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

– a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 20 volumes of *methanol*, 35 volumes of *acetonitrile* and 45 volumes of a 0.58 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Phenytoin impurity C[1]	0.5	---
Phenytoin impurity D[2]	0.6	1.7
Phenytoin impurity E[3]	0.8	1.4
Phenytoin (Retention time: about 4 minutes)	1.0	—

[1]2,2-diphenylglycine,

[2]3a,6a-diphenyltetrahydroimidazo[4,5-*d*]imidazole-2,5(1*H*,3*H*)-dione,

[3](carbamoylamino)(diphenyl)acetic acid.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to phenytoin impurity E is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to phenytoin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to phenytoin impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. A *0.05 M monobasic ammonium phosphate*, adjusted to pH 2.5 with *orthophosphoric acid*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.01 per cent w/v of *phenytoin sodium IPRS* and 0.015 per cent w/v of *benzoin* in the mobile phase.

Reference solution (b). A 0.005 per cent w/v solution of *phenytoin sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of buffer solution, 20 volumes of *methanol* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to phenytoin and benzoin is not less than 1.5 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{15}H_{11}N_2NaO_2$

Storage. Store protected from moisture.

Phenytoin Capsules

Phenytoin Sodium Capsules; Diphenylhydantoin Sodium Capsules

Phenytoin Capsules contain not less than 92.7 per cent and not more than 107.5 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$.

Usual strengths. 25 mg, 50 mg and 100 mg.

Identification

A. Centrifuge the precipitated mixture obtained in test B, dissolve the residue in *methanol*, evaporate and dry at 105° for 30 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium IPRS* treated in the same manner or with the reference spectrum of phenytoin.

B. Shake a quantity of the content of capsules containing about 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. The filtrate yields a white precipitate on the addition of *2 M hydrochloric acid*.

https://nhathuocngocanh.com/

C. To 0.1 g of the residue obtained in test A, add 0.5 ml of *1 M sodium hydroxide*, 10 ml of a 10 per cent w/v solution of *pyridine* and 1 ml of *copper sulphate-pyridine reagent* and allow to stand for 10 minutes. A blue precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *13.5 M ammonia*, 45 volumes of *chloroform* and 45 volumes of *propan-2-ol*.

Test solution. Shake a quantity of the content of capsules containing about 0.2 g of Phenytoin Sodium with 5 ml of *methanol*, warm on a water-bath with shaking and filter.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry at 80° for 5 minutes and examine under ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Shake a quantity of the mixed contents of 20 capsules containing about 0.25 g of Phenytoin Sodium with 50 ml of *0.01 M sodium hydroxide*. Centrifuge, acidify 25 ml of the clear liquid with 10 ml of *0.1 M hydrochloric acid* and extract with successive quantities of 50, 40 and 25 ml of *ether*. Wash the combined extracts with 10 ml of *water*, evaporate to dryness and dry the residue at 105°. Dissolve in 50 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide* using 0.3 per cent w/v solution of *thymol blue* in *anhydrous pyridine* as indicator.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Phenytoin Injection

Phenytoin Sodium Injection; Diphenylhydantoin Sodium injection

Phenytoin Injection is a sterile material consisting of Phenytoin Sodium with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injection or other suitable solvent, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Phenytoin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$.

Usual strengths. 100 mg; 250 mg.

Description. A white powder; somewhat hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium IPRS* or with the reference spectrum of phenytoin sodium.

B. Dissolve 0.25 g in 5 ml of *water* and acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. Dissolve 0.1 g in 10 ml of a 10 per cent w/v solution of *pyridine*, add 1 ml of *cupric sulphate with pyridine solution* and allow to stand for 10 minutes; a blue precipitate is produced.

D. Incinerate 0.1 g; the residue after neutralisation with *hydrochloric acid* and addition of 2 ml of *water* gives the reactions of sodium salts (2.3.1).

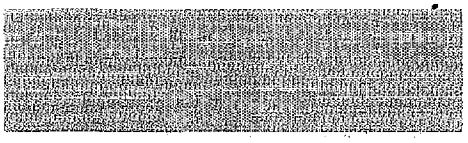
Tests

Appearance of solution. Suspend 1.0 g in 5 ml of *water* and dilute to 20 ml with *0.1 M sodium hydroxide*; the solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Completeness of solution. The contents dissolve in the quantity of the solvent recommended on the label and give a clear solution.

pH (2.4.24). 10.0 to 12.0, determined in a 5.0 per cent w/v solution in the stated solvent.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.



https://nhathuocngocanh.com/

Mobile phase. A mixture of 45 volumes of *chloroform*, 45 volumes of *2-propanol* and 10 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 80° for 5 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Bacterial endotoxins (2.2.3). Not more than 0.3 Endotoxin Unit per mg of phenytoin sodium.

Assay. Weigh 0.18 g of the mixed contents of 10 containers, suspend in 2 ml of *water*, add 8 ml of *0.05 M sulphuric acid* and heat gently for 1 minute. Add 30 ml of *methanol*, cool. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). After the first inflection, stop the addition of *sodium hydroxide*, add 5 ml of *silver nitrate solution* in *pyridine*, mix and continue the titration until a second inflection is reached. Record the volume of *0.1 M sodium hydroxide* added between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of Phenytoin Sodium contained in it; (2) the directions for preparing the Injection.

Phenytoin Oral Suspension

Diphenylhydantoin Oral Suspension

Phenytoin Oral Suspension is a suspension of phenytoin in a suitable flavoured vehicle.

Phenytoin Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin, $C_{15}H_{12}N_2O_2$.

Usual strength. 25 mg per ml.

Identification

Disperse a quantity of the suspension containing 0.1 g of Phenytoin with 20 ml of *water*, filter, acidify with *dilute hydrochloric acid* and extract with 10 ml of *chloroform*. Wash the chloroform extract with *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness and dry the residue at 105°. The residue complies with the following test. Determine by infrared absorption spectrohotometry(2.4.6). Compare the spectrum with that obtained with *phenytoin sodium IPRS* treated in the same manner or with the reference spectrum of phenytoin.

Tests

pH (2.4.24). 4.5 to 5.5.

Benzil and benzophenone. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 30 volumes of *1, 4-dioxan* and 75 volumes of *hexane*.

Test solution. Disperse a quantity of suspension containing about 30 mg of Phenytoin in 5 ml of *water* add 2 ml of *2 M hydrochloric acid*, mix well and extract with five 20 ml quantities of *ether*. Combine the ether extracts, wash with three 10 ml quantities of *water*, evaporate to dryness and dissolve the residue in 1.5 ml of a mixture of 1 volume of *glacial acetic acid* and 9 volumes of *acetone*.

Reference solution (a). A 0.004 per cent w/v solution of *benzophenone* in *ethanol (95 per cent)*.

Reference solution (b). A 0.004 per cent w/v solution of *benzil* in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution corresponding to benzophenone and benzyl respectively is not more intense than the spot in the chromatogram obtain with reference solution (a) and reference solution (b) (0.2 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Disperse a quantity of the suspension containing about 0.2 g of Phenytoin, add 10 ml of *2 M hydrochloric acid* and 15 ml of *water*, extract with three 50 ml quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol* and evaporate the combined extract to dryness. Dry the residue at 105° for 1 hour, cool and dissolve in a mixture of 3 ml of *1 M sodium hydroxide* and 50 ml of *water* with the aid of gentle heat. Cool and pass a current of *carbon dioxide* through the solution until precipitation of phenytoin is complete, filter and wash the residue with two 10 ml quantities of *water* and dry at 105° for 2 hours.

https://nhathuocngocanh.com/

Determine the weight per ml (2.4.29) of the oral suspension.

Calculate the content of $C_{15}H_{12}N_2O_2$, weight in volume.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Phenytoin Tablets

Phenytoin Sodium Tablets; Diphenylhydantoin Sodium Tablets

Phenytoin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$. The tablets are coated.

Usual strengths. 50 mg; 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Phenytoin Sodium with 20 ml of *water*, filter, acidify with *dilute hydrochloric acid* and extract with 10 ml of *chloroform*. Wash the chloroform extract with *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness and dry the residue at 105°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium IPRS* treated in the same manner or with the reference spectrum of phenytoin.

B. Triturate a quantity of the powdered tablets containing 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. Acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *hexane* and 30 volumes of *dioxan*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Phenytoin Sodium with 5 ml of *methanol*, warm on a water-bath with shaking and filter.

Reference solution. A 0.01 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with the reference solution.

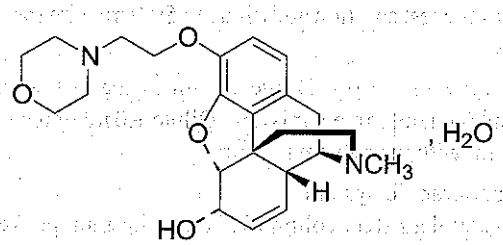
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.25 g of Phenytoin Sodium, shake with 40 ml of *0.01 M sodium hydroxide* for 5 minutes and add sufficient *0.01 M sodium hydroxide* to produce 50.0 ml. Centrifuge, acidify 25.0 ml of the clear liquid with 10 ml of *0.1 M hydrochloric acid* and extract successively with 50, 40, 25 and 25 ml of *ether*. Wash the combined extracts with 10 ml of *water*, evaporate to dryness and dry the residue at 105°. Dissolve in 50 ml of *anhydrous pyridine* and titrate with *0.1 M tetrabutylammonium hydroxide*, using 0.3 per cent w/v solution of *thymol blue* in *pyridine* as indicator and taking care to prevent absorption of carbon dioxide from the atmosphere. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Storage. Store protected from moisture.

Pholcodine



$C_{23}H_{30}N_2O_4,H_2O$ Mol. Wt. 416.5

Pholcodine is 7,8-didehydro-4,5α-epoxy-17-methyl-3-[2-(morpholin-4-yl)ethoxy]morphinan-6α-ol monohydrate.

Pholcodine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{23}H_{30}N_2O_4$, calculated on the dried basis.

Category. Opoid cough suppressant.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pholcodine IPRS* or with the reference spectrum of pholcodine.

B. To 10 ml of a 0.1 per cent w/v solution add 75 ml of *water* and 10 ml of *1 M sodium hydroxide* and dilute to 100 ml with *water*. When examined in the range 230 nm and 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 284 nm; absorbance at about 284 nm, 0.36 to 0.39.

https://nhathuocngocanh.com/

C. Dissolve 50 mg in 1 ml of *sulphuric acid* and add 0.05 ml of a 10 per cent w/v solution of *ammonium molybdate*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of *2 M nitric acid*; the colour changes to brownish red.

Tests

Specific optical rotation (2.4.22). −98.0° to −94.0°, determined at 20° in a 2.0 per cent w/v solution in *ethanol (95 per cent)*.

Morphine. Dissolve 0.1 g in sufficient of *0.1 M hydrochloric acid* to produce 5 ml, add 2 ml of a 1 per cent w/v solution of *sodium nitrite*, allow to stand for 15 minutes and add 3 ml of *6 M ammonia*. The solution is not more intensely coloured than reference solution BS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dilute 80 ml of *acetonitrile* to 1000 ml with the *0.02 M phosphate buffer solution.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *codeine* with the solvent mixture, dilute to 0.5 ml of the solution, add 0.5 ml of the test solution and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with endcapped phenylhexylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: a mixture of 50 ml of *tetrahydrofuran* and 75 ml of *acetonitrile*, diluted to 1000 ml with 0.02 M phosphate buffer solution prepared by dissolving 80.0 ml of *0.2 M sodium hydroxide* and 100.0 ml of *0.2 M potassium dihydrogen phosphate* in *water* and dilute to 1000.0 ml with *water*, adjusted to pH 7.9 with *0.2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Name	Relative retention time
Pholcodine impurity A[1]	0.4
Pholcodine impurity B[2]	0.8
Pholcodine (Retention time: about 10 minutes)	1.0
Pholcodine impurity D[3]	2.3

[1]morphine,

[2]codeine,

[3]unknown.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to pholcodine impurity B and pholcodine is not less than 3.0.

Inject reference solution (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to pholcodine impurities A, B and D, each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.9 to 4.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Dissolve 0.18 g in 50 ml of *anhydrous glacial acetic acid*, warming gently. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically at the second inflection (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01993 g of $C_{23}H_{30}N_2O_4$.

Storage. Store protected from moisture.

Pholcodine Linctus

Pholcodine Linctus is a solution containing 0.1 per cent w/v solution of Pholcodine and 1 per cent w/v solution of Citric Acid Monohydrate in a suitable flavoured vehicle.

Pholcodine Linctus contains not less than 0.090 per cent and not more than 0.110 per cent w/v of pholcodine, $C_{23}H_{30}N_2O_4H_2O$.

Category. Opioid cough suppressant.

Identification

To 20 ml add 20 ml of *water*, make alkaline to *litmus paper* with *5 M ammonia*, extract with two quantities, each of 20 ml, of *chloroform*, washing each extract with 5 ml of *water*, dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness. If necessary, add 0.1 ml of ether and scratch the sides of the vessel with a glass rod to induce

https://nhathuocngocanh.com/

crystallisation. The crystals, dried at a pressure not exceeding 2 kPa, comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pholcodine IPRS* or with the reference spectrum of pholcodine.

B. When examined in the range 230 nm and 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum only at about 284 nm.

C. To a portion of the crystals add 0.05 ml of *nitric acid* and mix; a yellow colour is produced.

D. Dissolve the remainder of the crystals in 1 ml of *sulphuric acid* and add 0.05 ml of *ammonium molybdate-sulphuric acid solution*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of *2 M nitric acid*; the colour changes to brownish red.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh 50 g and add sufficient *5 M ammonia* to make the solution alkaline to *litmus paper*, extract with four quantities, each of 25 ml, of *chloroform*, washing each extract with the same 5 ml of *water*. Combine the extracts and evaporate until the volume is reduced to 15 ml. Titrate with *0.02 M perchloric acid*, using *quinaldine red solution* as indicator. Carry out a blank titration.

1 ml of *0.02 M perchloric acid* is equivalent to 0.004165 g of $C_{23}H_{30}N_2O_4,H_2O$.

Determine the weight per ml of the linctus (2.4.29), and calculate the content of $C_{23}H_{30}N_2O_4,H_2O$, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of pholcodine.

Phosphoric Acid

Orthophosphoric Acid; Concentrated Phosphoric Acid

H_3PO_4 Mol. Wt. 98.0

Phosphoric acid contains not less than 84.0 per cent w/w and not more than 90.0 per cent w/w of H_3PO_4.

Category. Pharmaceutical aid (acidifying agent).

Description. A clear, colourless, syrupy liquid; corrosive. When kept at a low temperature it may solidify, producing a mass of colourless crystals which do not melt until the temperature reaches 28°.

Identification

A. Dilute with *water*; the solution is strongly acidic (2.4.16).

B. Dilute 10.0 g to 150 ml with *water* (solution A). Neutralise with *2 M sodium hydroxide*; the resulting solution gives the reactions of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*; the resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dilute 1.2 ml with 10 ml of *water*, neutralise with *dilute ammonia solution*, add sufficient *dilute acetic acid* to render the solution acidic and then dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 10 ml of solution A complies with the limit test for iron (60 ppm).

Chlorides (2.3.12). 5 g complies with the limit test for chlorides (50 ppm).

Sulphates (2.3.17). 20 ml of solution A complies with the limit test for sulphates (100 ppm).

Alkali phosphates. To 1.7 g in a graduated cylinder add 6 ml of *ether* and 2 ml of *ethanol (95 per cent)*; no turbidity is produced.

Aluminium and calcium. To 1.7 g add 10 ml of *water* and 8 ml of *dilute ammonia solution*; the solution remains clear.

Hypophosphorus acid and phosphorous acid. To 5 ml of solution A add 2 ml of a 1.7 per cent w/v solution of *silver nitrate* and heat on a water-bath for 5 minutes; the appearance of the solution does not change.

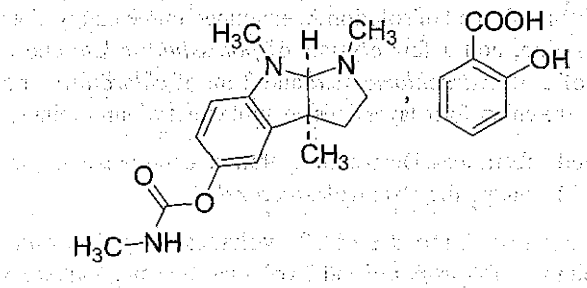
Assay. Weigh 1.0 g, add a solution of 10 g of *sodium chloride* in 30 ml of *water* and titrate with *1 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.04900 g of H_3PO_4.

Storage. Store protected from moisture, in glass containers.

Physostigmine Salicylate

Eserine Salicylate



$C_{15}H_{21}N_3O_2,C_7H_6O_3$ Mol. Wt. 413.5

https://nhathuocngocanh.com/

Physostigmine Salicylate is (3*aS*,8*aR*)-1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethylpyrrolo[2,3-*b*]indol-5-yl methylcarbamate salicylate.

Physostigmine Salicylate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{15}H_{21}N_3O_2$, $C_7H_6O_3$, calculated on the dried basis.

Category. Anticholinesterase.

Description. A colourless or faintly yellow crystals, turning red gradually under the action of air and light and rapidly in presence of moisture.

Identification

Test A may be omitted if tests B, C and D are carried out. Test C may be omitted if tests A, B and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *physostigmine salicylate IPRS* or with the reference spectrum of physostigmine salicylate.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. To a 1 per cent w/v solution add *1 M sodium hydroxide*; a white precipitate which turns pink is produced. The precipitate dissolves in an excess of the reagent, producing a red solution.

D. A 0.9 per cent w/v solution in *carbon dioxide-free water* gives reaction (A) of salicylates (2.3.1).

Tests

Appearance of solution. Dissolve 0.9 g without heating in 95 ml of *carbon dioxide-free water* prepared from *distilled water*, and dilute to 100 ml with the same solvent (solution A). The solution, examined immediately after preparation, is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.1 to 5.9, determined in solution A immediately after preparation.

Specific optical rotation (2.4.22). – 94.0° to – 90.0°, determined in solution A immediately after preparation.

Eseridine. To 5 ml of solution A, examined immediately after preparation, add a few crystals of *potassium iodate* and a drop of *2 M hydrochloric acid* and 2 ml of *chloroform* and shake; the chloroform layer does not turn violet within 1 minute.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *cyclohexane*, 23 volumes of *2-propanol* and 2 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.1 per cent w/v solution of *physostigmine salicylate IPRS* in *ethanol (95 per cent)*.

Reference solution (b). A 0.01 per cent w/v solution of *physostigmine salicylate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 20 µl of each solution. After development, dry the plate in cold air, carry out a second chromatographic development in same direction, dry the plate in air and spray with freshly prepared *acetic potassium iodobismuthate solution* and then with *hydrogen peroxide solution (10 vol)*. Examine the plate within 2 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on the residue obtained in the test for Loss on drying.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.35 g in 50 ml of a mixture of equal volumes of *chloroform* and *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04135 g of $C_{15}H_{21}N_3O_2$,$C_7H_6O_3$.

Storage. Store protected from light and moisture.

Physostigmine Injection

Physostigmine Salicylate Injection; Eserine Salicylate Injection

Physostigmine Injection is a sterile solution of Physostigmine Salicylate in Water for Injections.

Physostigmine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of physostigmine salicylate, $C_{15}H_{21}N_3O_2$, $C_7H_6O_3$.

Usual strength. 600 µg per ml.

Identification

A. Warm a volume containing 3 mg of Physostigmine Salicylate with 0.3 ml of *5 M ammonia*; a yellowish red solution is produced which on evaporation gives a bluish residue.

https://nhathuocngocanh.com/

B. The residue obtained in test A dissolves in *ethanol (95 per cent)* producing a blue solution which, on the addition of *6 M acetic acid*, appears blue by transmitted light and exhibits a red fluorescence which intensifies on dilution with *water*.

C. The residue obtained in test A dissolves in *sulphuric acid* producing a green solution which, on the gradual addition of *ethanol (95 per cent)*, changes to red but reverts to green when the ethanol is evaporated.

Tests

pH (2.4.24). 4.0 to 6.0.

Bacterial endotoxins (2.2.3). Not more than 83.4 Endotoxin Units per mg of physostigmine salicylate.

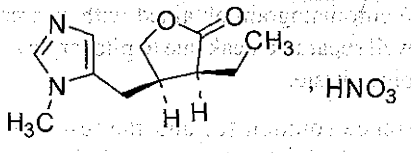
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer a measured volume containing 30 mg of Physostigmine Salicylate to a separator, add about 0.25 g of *sodium bicarbonate* and extract with six quantities, each of 15 ml, of *chloroform*. Filter the combined chloroform extracts through about 10 g of *anhydrous sodium sulphate*. Add 25 ml of *anhydrous glacial acetic acid* to the filtrate. Titrate with *0.01 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.01 M perchloric acid* is equivalent to 0.004135 g of $C_{15}H_{21}N_3O_2$, $C_7H_6O_3$.

Storage. Store protected from light, in single dose containers. The injection should not be used if it is more than slightly discoloured.

Pilocarpine Nitrate



$C_{11}H_{16}N_2O_2, HNO_3$ Mol. Wt. 271.3

Pilocarpine Nitrate is (3*S*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one nitrate.

Pilocarpine Nitrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{11}H_{16}N_2O_2, HNO_3$, calculated on the dried basis.

Category. Cholinergic.

Description. Colourless crystals or a white, crystalline powder; sensitive to light.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pilocarpine nitrate IPRS* or with the reference spectrum of pilocarpine nitrate.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 2 ml of *water*, add 2 drops of a 5 per cent w/v solution of *potassium dichromate*, 1 ml of *hydrogen peroxide solution (10 vol)* and 2 ml of *chloroform* and shake; the chloroform layer turns violet.

D. It gives reaction (A) of nitrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 3.5 to 4.5, determined in a 5.0 per cent w/v solution prepared immediately before use in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +79.5° to +83.0°, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*, prepared immediately before use.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *pilocarpine nitrate IPRS* in *water*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 200.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *methanol*, 60 volumes of *acetonitrile* and 885 volumes of a 0.068 per cent w/v solution of *tetrabutylammonium dihydrogen phosphate*, adjusted to pH 7.7 with *diluted ammonia*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The retention time of the principal peak is about 20 minutes. The elution order is pilocarpine impurity B (pilocarpic acid), pilocarpine impurity C (isopilocarpic acid), pilocarpine impurity A (isopilocarpine) and pilocarpine.

https://nhathuocngocanh.com/

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to piloarpine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the sum of areas of pilocarpine impurities A and B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks other than pilocarpine impurities A and B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and any peak due to the nitrate ion with a relative retention time with reference to pilocarpine of about 0.3.

Other alkaloids. To a 1 per cent w/v solution add *dilute ammonia solution*; no turbidity is produced. To a 1 per cent w/v solution add a few drops of *potassium dichromate solution*; no turbidity is produced.

Chlorides (2.3.12). 25 ml of a 10.0 per cent w/v solution complies with the limit test for chlorides (100 ppm).

Iron (2.3.14). 20 ml of a 10.0 per cent w/v solution complies with the limit test for iron (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02713 g of $C_{11}H_{16}N_2O_2, HNO_3$.

Storage. Store protected from light and moisture.

Pilocarpine Eye Drops

Pilocarpine Nitrate Eye Drops

Pilocarpine Eye Drops is a sterile solution of Pilocarpine Nitrate in Purified Water.

Pilocarpine Eye Drops contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pilocarpine nitrate, $C_{11}H_{16}N_2O_2, HNO_3$.

Usual strengths. 1 per cent w/v; 2 per cent w/v; 4 per cent w/v.

Identification

Evaporate to dryness a volume containing about 20 mg of Pilocarpine Nitrate on a water-bath and heat for 1 hour at 105°. On the residue determine by infrared absorption spectrophotometry (2.4.6), compare the spectrum with that obtained with *pilocarpine nitrate IPRS* or with the reference spectrum of pilocapine nitrate.

Tests

pH (2.4.24). 3.0 to 5.5.

Pilocarpic acid. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of solution containing about 80 mg of Pilocarpine Nitrate to 100.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 25.0 ml with *water*.

Reference solution (b). A 0.08 per cent w/v solution of *pilocarpine nitrate IPRS* in *0.0025 M sodium hydroxide*, heat in a boiling water-bath for 30 minutes and cool.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 5.5 volumes of *methanol*, 6.0 volumes of *acetonitrile* and 88.5 volumes of *0.002 M tetrabutylammonium dihydrogen orthophosphate*, adjusted to pH 7.75 using *6 M ammonia*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the peak in the chromatogram obtained with reference solution (b) shows well separated peak due to pilocarpic acid followed by pilocarpine nitrate.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of peak corresponding to pilocarpic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent).

Other tests. Comply with the test stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of Eye drops containing about 80 mg of Pilocarpine Nitrate to 100 ml with *water*.

Reference solution. A 0.08 per cent w/v solution of *pilocarpine nitrate IPRS* in *water*.

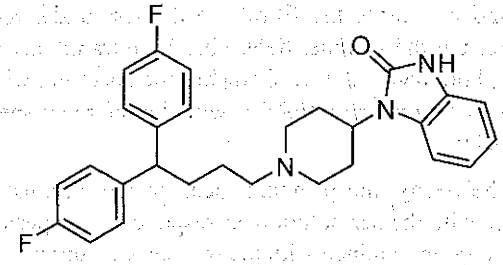
https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 5.5 volumes of *methanol*, 6.0 volumes of *acetonitrile* and 88.5 volumes of *0.002 M tetrabutylammonium dihydrogen orthophosphate*, adjusted to pH 7.75 using *6 M ammonia*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm.
- injection volume: 20 µl.

Inject the reference solution and the test solution. Two major peaks are obtained with both solutions. Run the chromatogram twice the retention time of the principal peak. Ignore the peak due to nitric acid and has the shorter retention time.

Calculate the content of $C_{11}H_{16}N_2O_2$, HNO_3 in the eye drops.

Pimozide



$C_{28}H_{29}F_2N_3O$ Mol.Wt. 461.6

Pimozide is 1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one.

Pimozide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{28}H_{29}F_2N_3O$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white to almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pimozide IPRS* or with the reference spectrum of pimozide.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. A mixture of 10 volumes of *acetone* and 90 volumes of *methanol.*

Test solution. Dissolve 30 mg of the substance under examination in 10 ml of the mobile phase.

Reference solution (a). A 0.3 per cent w/v solution of *pimozide IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.3 per cent w/v each of *pimozide IPRS* and *benperidol IPRS* in the mobile phase.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air for 15 minutes and expose it to iodine vapour until the spots appear. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Mix about 5 mg of the substance under examination with 45 mg of *heavy magnesium oxide* and ignite in a crucible until an almost white residue is obtained. Allow to cool, add 1 ml of *water*, 0.05 ml of *phenolphthalein solution* and about 1 ml of *dilute hydrochloric acid* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution* and 0.1 ml of *zirconyl nitrate solution*, add 1.0 ml of the filtrate. Mix allow to stand for 5 minutes and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

D. Melting point (2.4.21). 216° to 220°.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 10 ml of *methanol.*

Reference solution (a). Dissolve 5 mg of *pimozide IPRS* and 2 mg of *mebendazole IPRS* in 100 ml of *methanol.*

Reference solution (b). Dilute 5.0 ml of the test solution to 100 ml with *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with *methanol.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a solution containing 0.25 per cent w/v of *ammonium acetate* and 0.85 per cent w/v of *tetrabutylammonium hydrogen sulphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,

https://nhathuocngocanh.com/

– flow rate: 2 ml per minute,
– spectrophotometer set at 280 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
10	70	30
15	70	30
15.1	80	20
20	80	20

Name	Relative retention time
Pimozide impurity A[1]	0.1
Pimozide impurity B[2]	0.9
Pimozide impurity C[3]	0.95
Pimozide impurity D[4]	1.1
Pimozide impurity E[5]	1.3

[1]1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one,

[2]1-[1-[(4RS)-4-(4-fluorophenyl)-4-phenylbutyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

[3]1-[1-[(4RS)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

[4]1-[1-[4,4-bis(4-fluorophenyl)butyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

[5]1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl 1-oxide]-1,3-dihydro-2H-benzimidazol-2-one.

The relative retention time with respect to pimozide for mebendazole is about 0. 88.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to mebendazole and pimozide is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to pimozide impurity A, pimozide impurity B, pimozide impurity C, pimozide impurity D and pimozide impurity E, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of a mixture of 1 volume of *anhydrous glacial acetic acid* and 7 volumes of *methyl ethyl ketone* and titrate with *0.1 M perchloric acid*, using 0.2 ml of *naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml *0.1 M perchloric acid* is equivalent to 0.04616 g of $C_{28}H_{29}F_2N_3O$.

Storage. Store protected from light.

Pimozide Tablets

Pimozide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pimozide, $C_{28}H_{29}F_2N_3O$.

Usual strengths. 1 mg; 2 mg; 4 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 20 mg of Pimozide with 20 ml of *dichloromethane* for 5 minutes, filter and evaporate the filtrate to dryness under reduced pressure. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pimozide IPRS* or with the reference spectrum of pimozide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0002 per cent w/v solution of *pimozide IPRS* in dissolution medium.

Use chromatographic system as described under Related substances.

Calculate the content of pimozide, $C_{28}H_{29}F_2N_3O$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{28}H_{29}F_2N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Shake a quantity of powdered tablets containing about 40 mg of Pimozide with 20 ml of *methanol* for 30 minutes, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with *methanol.*

Reference solution (b). A solution containing 0.005 per cent w/v of *pimozide IPRS* and 0.002 per cent w/v of *mebendazole IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil ODS),
- mobile phase: A. a solution containing 0.25 per cent w/v of *ammonium acetate* and 0.85 per cent w/v of *tetrabutylammonium hydrogen sulphate,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
10	70	30
15	70	30
16	80	20
30	80	20

Inject reference solution (b). The test is not valid unless the resolution between the peaks obtained with mebendazole and pimozide is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Test solution. Shake one tablet with 7 ml of *methanol* for 30 minutes, dilute with *methanol* to produce a solution containing 0.01 per cent w/v of Pimozide, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). A 0.01 per cent w/v solution of *pimozide IPRS* in *methanol.*

Reference solution (b). A solution containing 0.005 per cent w/v of *pimozide IPRS* and 0.002 per cent w/v of *mebendazole IPRS* in *methanol.*

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pimozide and mebendazole is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{28}H_{29}F_2N_3O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of powdered tablets containing about 20 mg of Pimozide with 35 ml of *methanol* for 30 minutes, dilute to 50 ml with *methanol,* mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). A 0.04 per cent w/v solution of *pimozide IPRS* in *methanol.*

Reference solution (b). A solution containing 0.004 per cent w/v of *pimozide IPRS* and 0.002 per cent w/v of *mebendazole IPRS* in *methanol.*

Use chromatographic system as described under Related substances.

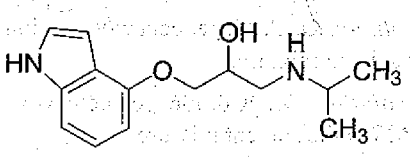
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pimozide and mebendazole is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{28}H_{29}F_2N_3O$ in the tablets.

Storage. Store protected from light.

Pindolol



$C_{14}H_{20}N_2O_2$ Mol. wt. 248.3

Pindolol is (*RS*)-1-indol-4-yloxy-3-isopropylaminopropan-2-ol.

Pindolol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{20}N_2O_2$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist.

https://nhathuocngocanh.com/

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pindolol IPRS* or with the reference spectrum of pindolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in a 0.085 per cent v/v solution of *hydrochloric acid* in *methanol* shows absorption maxima at about 264 nm and at about 287 nm, and a shoulder at about 275 nm, absorbances at about 264 nm, 0.66 to 0.70 and at about 287 nm, 0.34 to 0.38.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *dilute acetic acid* is clear (2.4.1) and not more intensely coloured than reference solution BYS4 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. 99 volumes of *methanol* and 1 volume of *anhydrous glacial acetic acid*.

Mobile phase. A freshly prepared mixture of 50 volumes of *ethyl acetate*, 50 volumes of *methanol* and 4 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 0.2 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *pindolol IPRS* in the solvent mixture.

Reference solution (b). A 0.006 per cent w/v solution of *pindolol IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate immediately in a current of cold air and examine under ultraviolet at 254 nm without delay. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 80 ml of *methanol*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.02483 g of $C_{14}H_{20}N_2O_2$.

Storage. Store protected from light and moisture.

Pindolol Tablets

Pindolol Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pindolol, $C_{14}H_{20}N_2O_2$.

Usual strengths. 5 mg; 15 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pindolol with 80 ml of *ether* for 30 minutes, filter and dry the extract with *anhydrous sodium sulphate*. Filter the extract, remove the *ether* using a rotary evaporator and dry the residue over *phosphorus pentoxide* at 110° at a pressure not exceeding 2 kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pindolol IPRS* or with the reference spectrum of pindolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 264 nm and 287 nm.

C. Shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of a mixture of 99 volumes of *methanol* and 1 volume of *glacial acetic acid* for 45 minutes. Centrifuge and dilute 1 ml of the supernatant liquid to 50 ml with the *acetic acid-methanol* mixture. To 2 ml of the solution add 1 ml of *dimethylaminobenzaldehyde solution*; a violet-blue colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 500 ml of *0.1 M hydrochloric acid*,

Speed and time: 50 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (a). A 0.002 per cent w/v solution of *pindolol IPRS* in the dissolution medium. Dilute 5.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *nortriptyline hydrochloride IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with dimethylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 19 volumes of *acetonitrile*, 19 volumes of *methanol* and 2 volumes of 0.6 per cent w/v solution of *ammonium carbonate*,
- flow rate: 3 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time for pindolol and nortriptyline is about 0.6 and 1.0, respectively.

Inject reference solution (a) and (b). The test is not valid unless the resolution between pindolol and nortriptyline hydrochloride peaks is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{20}N_2O_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{20}N_2O_2$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. 99 volumes of *methanol* and 1 volume of *anhydrous glacial acetic acid*.

Mobile phase. A freshly prepared mixture of 50 volumes of *ethyl acetate*, 50 volumes of *methanol* and 4 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of the solvent mixture for 15 minutes, centrifuge and apply the supernatant liquid to the plate as the last solution.

Reference solution (a). Dilute 1.0 ml of the test solution to 10 ml with the solvent mixture and further dilute 7 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 10 ml with the solvent mixture and further dilute 3 ml of the solution to 100.0 ml with the solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air, spray immediately with *dimethylaminobenzaldehyde solution* and warm at 50° for 20 minutes. Any spot with R_f value of about 0.1 in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.7 per cent). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any spot remaining on the line of application.

Uniformity of content. Complies with the test stated under Tablets.

Disperse one tablet in 5 ml of *water*, add 50 ml of *methanol*, shake for 10 minutes and dilute to 100.0 ml with *methanol*, mix and filter. Dilute 10.0 ml of filtrate with *methanol* to produce a solution containing 0.001 per cent w/v of pindolol and measure the absorbance of the resulting solution at the maximum at about 264 nm (2.4.7). Calculate the content of $C_{14}H_{20}N_2O_2$ taking 338 as the specific absorbance at 264 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Dissolution with the following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 20 mg of pindolol in 4 ml of *water* and add 30 ml of the mobile phase and dilute to 100.0 ml with the mobile phase, filter.

Reference solution (a). A 0.02 per cent w/v solution of *pindolol IPRS* in the mobile phase.

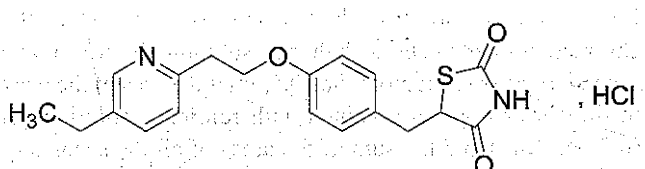
Reference solution (b). A 0.02 per cent w/v solution of *nortriptyline hydrochloride IPRS* in reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{20}N_2O_2$ in the tablets.

Storage. Store protected from light and moisture.

Pioglitazone Hydrochloride



$C_{19}H_{20}N_2O_3S,HCl$ Mol.Wt. 392.9

Pioglitazone Hydrochloride is (*RS*)-5-{4-[2-(5-ethyl-2-pyridinyl)ethoxy]benzyl}thiazolidine-2,4-dione hydrochloride.

Pioglitazone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{20}N_2O_3S,HCl$, calculated on the dried basis.

https://nhathuocngocanh.com/

Category. Antidiabetic.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pioglitazone hydrochloride IPRS* or with the reference spectrum of pioglitazone hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Related Substances. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of *methanol*.

Reference solution (a). A 0.03 per cent w/v solution of *pioglitazone hydrochloride IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 25°,
- mobile phase: a mixture of 50 volumes of *0.01 M potassium dihydrogen phosphate* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under the test for Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{20}N_2O_3S,HCl$.

Pioglitazone Tablets

Pioglitazone Hydrochloride Tablets

Pioglitazone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pioglitazone, $C_{19}H_{20}N_2O_3S$.

Usual strengths. 15 mg; 30 mg; 45 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of pioglitazone with 40 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pioglitazone hydrochloride IPRS* or with the reference spectrum of pioglitazone hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 270 nm (2.4.7). Calculate the content of $C_{19}H_{20}N_2O_3S$ in the medium from the absorbance obtained from a solution of known concentration of *pioglitazone hydrochloride IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{19}H_{20}N_2O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Transfer a quantity of the powder equivalent to 30 mg of pioglitazone and add about 150 ml of *methanol*. Mix with the aid of ultrasound at a temperature not exceeding 30° for 15 minutes and shake for

https://nhathuocngocanh.com/

20 minutes. Dilute to 250 ml with *methanol* and mix. Filter through a membrane filter and discard the first 5 ml. Use the filtrate as the test solution.

Reference solution. A solution of *pioglitazone hydrochloride IPRS* in *methanol* containing 0.00012 per cent w/v of pioglitazone.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *0.01 M potassium dihydrogen phosphate* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *water* and 65 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of pioglitazone in 20 ml of *water*, with the aid of ultrasound. Add about 150 ml of the solvent mixture and mix with the aid of ultrasound for 15 minutes, dilute to 250.0 ml with the solvent mixture and filter.

Reference solution. A 0.0136 per cent w/v solution of *pioglitazone hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* and 1.15 g of *diammonium hydrogen phosphate* in 1000 ml of *water*, adding 1.0 ml of *triethylamine* and adjusted to pH 5.0 with *orthophosphoric acid* and 65 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{20}N_2O_3S$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of pioglitazone.

Pioglitazone and Metformin Hydrochloride Tablets

Pioglitazone Hydrochloride and Metformin Hydrochloride Tablets; Metformin Hydrochloride and Pioglitazone Hydrochloride Tablets

Pioglitazone and Metformin Hydrochloride Tablets contain an amount of pioglitazone hydrochloride equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pioglitazone, $C_{19}H_{20}N_2O_3S$, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strength. Pioglitazone, 15 mg and Metformin Hydrochloride, 500 mg.

Identification

A. *For pioglitazone* — Dissolve a suitable quantity of the powdered tablets containing pioglitazone hydrochloride in *water* to obtain 0.003 per cent w/v of pioglitazone and mix with the aid of ultrasound. Pass 5 ml of this suspension through a filter having an average pore size not more than 0.45 µm, then wash the filter with 10 ml of *water* and discard the filtrate. Wash the filter with 5 ml of *0.1 M hydrochloric acid* and use the filtrate. When examined in the range 230 nm to 350 nm (2.4.7), shows a maxima between 267 nm and 271 nm.

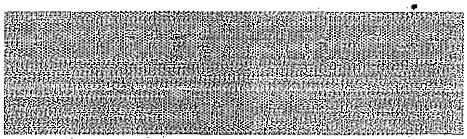
For metformin hydrochloride — Dissolve a suitable quantity of the powdered tablets containing metformin hydrochloride in *water* to obtain 0.04 per cent w/v of metformin hydrochloride and mix with the aid of ultrasound. Pass this suspension through a filter having an average pore size not greater than 0.45 µm, discard the first few ml of filtrate. Dilute the filtrate to obtain a solution of 0.0008 per cent w/v of metformin hydrochloride. When examined in the range 200 nm to 350 nm (2.4.7), shows a maxima between 230 nm and 234 nm.

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of buffer, prepared by adjusting *0.1 M citric acid* to pH 2.5 with *0.2 M dibasic sodium phosphate*,
Speed and time. 50 rpm and 30 minutes.



https://nhathuocngocanh.com/

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *0.1 M hydrochloric acid*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.037 per cent w/v solution of *pioglitazone hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.00185 per cent w/v of *pioglitazone hydrochloride IPRS* obtained by diluting reference solution (a) and 0.05555 per cent w/v of *metformin hydrochloride IPRS in* the medium (for the tablets containing 500 mg of metformin hydrochloride per tablet) or 0.0944 per cent w/v of *metformin hydrochloride IPRS*(for the tablets containing 850 mg of metformin hydrochloride per tablet) in the medium.

Chromatographic system

- a stainless steel column 15 cm x 6.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 7.2 g of *sodium dodecyl sulphate* in 1000 ml of equal volumes of *0.05 M monobasic ammonium phosphate* and *acetonitrile*,
- flow rate: 1 ml per minute,
- injection volume: 5 µl.

For detection, use 255 nm for metformin and 225 nm for pioglitazone.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 for pioglitazone and not more than 2.5 for metformin and the relative standard deviation for replicate injections for each of the peaks corresponding to pioglitazone and metformin is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{19}H_{20}N_2O_3S$ and $C_4H_{11}N_5,HCl$ in the medium.

Q. Not less than 80 per cent of the stated amounts of each of $C_{19}H_{20}N_2O_3S$ and $C_4H_{11}N_5,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — A volume of methanol not to exceed 20.0 per cent of the total volume of standard solution may be used to dissolve pioglitazone hydrochloride IPRS.

For pioglitazone —

Solvent mixture. Equal volumes of *methanol* and *0.1 M hydrochloric acid*.

Test solution. Weigh and powder 10 tablets. Weigh a quantity of the powder containing 18 mg of Pioglitazone, add 50 ml of the *solvent mixture*, shake for 30 minutes and dilute to 100.0 ml in the mobile phase. Mix, filter and discard first few ml of filtrate.

Reference solution (a). Dissolve a sufficient quantity of *pioglitazone hydrochloride IPRS* in *methanol* and dilute to volume to obtain the concentration equivalent to 0.02 per cent w/v solution of *pioglitazone hydrochloride IPRS* with the mobile phase.

Reference solution (b). A solution equivalent to 0.0001 per cent w/v of *pioglitazone hydrochloride IPRS* obtained by diluting reference solution (a) with the mobile phase.

Reference solution (c).Dissolve 30 mg of benzophenone in *methanol* and dilute to 100.0 ml with *methanol*. To 1.0 ml of the solution add 5.0 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase to obtain a solution equivalent to 0.002 per cent w/v of *pioglitazone hydrochloride IPRS* and 0.0006 per cent w/v of benzophenone.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 250 volumes of *acetonitrile*, 250 volumes of *0.1 M ammonium acetate* and 10 volumes of *glacial acetic acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 269 nm,
- injection volume: 40 µl.

NOTE — The flow rate may be adjusted to achieve the retention time of the pioglitazone peak at about 7 minutes.

The elution order is pioglitazone and benzophenone.

Inject reference solution (b) and (c). The test is not valid unless the resolution between pioglitazone and benzophenone peaks is not less than 10.0 and the tailing factor for pioglitazone is not more than 1.5 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. Run the chromatogram at least 4 times the retention time of the principal peak for the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore any peaks due to metformin and its impurities that elute before 4.5 minutes, corresponding to the relative retention time to the pioglitazone peak of about 0.64.

https://nhathuocngocanh.com/

For metformin hydrochloride —

Test solution. Weigh and powder 10 tablets. Weigh a quantity of the powder containing 100 mg of metformin hydrochloride, add 50 ml of *water*, shake for 30 minutes and dilute 100.0 ml with *water*. Mix, filter and discard first few ml of filtrate.

Reference solution (a). A 0.0005 per cent w/v solution of *metformin hydrochloride IPRS* in *water*.

Reference solution (b). A solution containing 0.0005 per cent w/v of *metformin hydrochloride IPRS*, and 0.0002 per cent w/v of melamine in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with C30 silane bonded to fully porous spherical silica (5 µm),
- mobile phase: A. dissolve 1.74 g of *sodium 1-pentanesulphonate* and 1.15 g of *monobasic ammonium phosphate* in 1000 ml of *water*,
  B. a mixture of 30 volumes of *water* and 70 volumes of *acetonitrile*.
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

NOTE — The flow rate may be adjusted to achieve the retention time of the metformin peak of about 8 minutes.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	70	30
15.1	0	100
25	0	100
25.1	100	0
35	100	0

The relative retention time of melamine with reference to metformin is about 0.9.

Inject reference solution (b).The test is not valid unless the resolution between melamine and metformin hydrochloride is not less than 4.0 and the tailing factor for metformin hydrochloride is not more than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *0.1 M hydrochloric acid.*

Test solution. Weigh and powder 10 tablets. Disperse a quantity of the powder containing 15 mg of pioglitazone in *0.1 M hydrochloric acid* to produce a solution containing 0.0075 per cent w/v of pioglitazone. Shake for 30 minutes and disperse with the aid of ultrasound for 5 minutes. Mix, filter and discard first few ml of filtrate. Dilute the filtrate with *0.1 M hydrochloric acid* to produce a solution containing 0.0015 per cent w/v of pioglitazone.

Reference solution (a). A solution containing 0.05 per cent w/v of *p-methoxyacetophenone*, and 0.04 per cent w/v of *butylparaben* in the solvent mixture.

Reference solution (b). A solution containing 0.084 per cent w/v of *pioglitazone hydrochloride IPRS* in the solvent mixture.

Reference solution (c). A solution containing 0.25 per cent w/v of *metformin hydrochloride IPRS* (for the tablets containing 500 mg of metformin hydrochloride per tablet) or 0.425 per cent w/v of *metformin hydrochloride IPRS* (for the tablets containing 850 mg of metformin hydrochloride per tablet)and 0.0084 per cent w/v of *pioglitazone hydrochloride IPRS* prepared by diluting reference solution (b) in *0.1 M hydrochloric acid.*

Reference solution (d). Transfer 10.0 ml of reference solution (c) and 5.0 ml of reference solution (a) to a 50-ml volumetric flask and dilute to the volume with *0.1 M hydrochloric acid.*

Use the chromatographic system as described under Dissolution using injection volume: 10 µl.

NOTE— The flow rate may be adjusted to achieve the retention time of the metformin peak of about 5 minutes.

Name	Relative retention time
Metformin	1.0
p-Methoxyacetophenone	1.2
Pioglitazone	1.8
Butylparaben	2.1

Inject reference solution (d). The test is not valid unless the resolution between metformin and p-methoxyacetophenone peaks and pioglitazone and butylparaben peaks is not less than 2.5 and the relative standard deviation for replicate injections for the peaks corresponding to metformin and pioglitazone is not more than 1.0 per cent.

Inject reference solution (d) and the test solution.

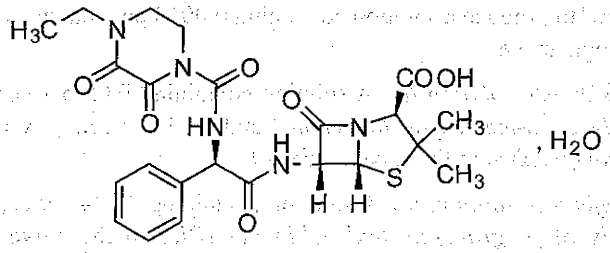
Calculate the contents of $C_{19}H_{20}N_2O_3S$ and $C_4H_{11}N_5,HCl$ in the tablets.

https://nhathuocngocanh.com/

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of pioglitazone and metformin hydrochloride.

Piperacillin



$C_{23}H_{27}N_5O_7S,H_2O$ Mol. Wt. 535.6

Piperacillin is (6*R*)-6-[*R*-2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]penicillanic acid monohydrate.

Piperacillin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{23}H_{27}N_5O_7S$, calculated on the anhydrous basis.

Category. Penicillin antibacterial.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperacillin IPRS or* with the reference spectrum of piperacillin.

Tests

Appearance of solution. A 10 per cent w/v solution in *sodium carbonate solution* is clear (2.4.1) and not more intensely coloured than the reference solution BS8 (2.4.1).

Specific optical rotation (2.4.22). + 165° to + 175°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of 3.12 per cent w/v solution of *sodium dihydrogen phosphate.*

Test solution (a). Dissolve 25 mg of the substance under examination in 50 ml of the solvent mixture.

Test solution (b). Dissolve 40 mg of the substance under examination in 20 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *piperacillin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25 ml with the solvent mixture.

Reference solution (c). Dissolve 10 mg of *piperacillin IPRS* and 10 mg of *anhydrous ampicillin IPRS* (*piperacillin impurity A IPRS*) in 50 ml solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 576 volumes of *water,* 200 volumes of 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide,* adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution,* add 200 volumes of *acetonitrile,*

  B. a mixture 126 volumes of *water,* 200 volumes of a 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide,* adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution*; add 650 volumes of *acetonitrile,*.
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	88	12
t_g	88	12
t_g +30	0	100
t_g + 45	88	12

where, t_g = retention time of piperacillin determined with reference solution (b)

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to piperacillin impurity A and piperacillin in the chromatogram obtained with reference solution (c) is not less than 10; signal-to-noise ratio is not less than 3 for the principal peak in the chromatogram obtained with reference solution (d); mass distribution ratio is (2:3) for the peak due to piperacillin in the chromatogram obtained with reference solution (c). The area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

https://nhathuocngocanh.com/

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water. (2.3.43). 2.0 per cent to 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (a).

Calculate the content of $C_{23}H_{27}N_5O_7S$.

Piperacillin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.07 Endotoxin Unit per mg of piperacillin.

Storage. Store protected from light and moisture.

Piperacillin Intravenous Infusion

Piperacillin Intravenous Infusion is a sterile solution of Piperacillin Sodium in Water for Injections. It is prepared by dissolving Piperacillin for Intravenous Infusion in the requisite amount of Water for Injections before use.

The intravenous infusion complies with the requirements stated under Parenteral Preparations (Injections).

Piperacillin for Intravenous Infusion

Piperacillin for Intravenous Infusion is a sterile material consisting of Piperacillin Sodium or Piperacillin Sodium prepared by the interaction of piperacillin with *sodium bicarbonate*, with or without excipients. It is filled in a sealed container.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parental Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Piperacillin for Intravenous Infusion contains not less than 94.0 per cent and not more than 115.0 per cent of the stated amount of piperacillin, $C_{23}H_{27}N_5O_7S$.

Usual strengths. 1 g per vial; 2 g per vial; 4 g per vial.

The contents of the sealed container comply with the requirements stated under Parental Preparations (Powder for Injections) and with the following requirements.

Identification

A. Dissolve a quantity of the powder containing about 0.25 g of anhydrous piperacillin in 20 ml of *water*, add 0.5 ml of *dilute hydrochloric acid*, mix well, allow to stand until a precipitate appears and filter. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperacillin IPRS* or with the reference spectrum of piperacillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. It gives the reaction of sodium salts (2.3.1).

Tests

pH (2.4.24). 4.8 to 6.8, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powder containing about 39 mg of anhydrous piperacillin in 100 ml of the mobile phase.

Reference solution (a). A 0.0008 per cent w/v solution of *piperacillin IPRS* in the mobile phase.

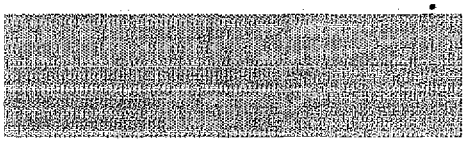
Reference solution (b). A 0.0004 per cent w/v solution of *piperacillin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 to 10 µm) (Such as Beckman Ultrasphere ODS),
- mobile phase: a mixture of 0.3 volume of *0.4 M tetrabutylammonium hydroxide*, 10 volumes of *0.2 M sodium dihydrogen orthophosphate monohydrate*, 44.7 volumes of *water* and 45 volumes of *methanol*, cool and adjusted to pH 5.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of the peak with a relative retention time of about 0.6 is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.



https://thuvienthuocngocanh.com/

Bacterial endotoxins (2.2.3). Not more than 2.5 Endotoxin Units per ml of a solution prepared in the following manner. Dissolve a quantity in *water BET* to obtain a solution containing 50 mg of piperacillin per ml. Carry out the test using Maximum Valid dilution of the solution calculated from the declared sensitivity of the lysate used in the test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powder containing about 39 mg of anhydrous piperacillin in 100 ml of the mobile phase.

Reference solution (a). Dissolve 40 mg of *piperacillin IPRS* in *methanol* and dilute to 100 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *anhydrous ampicillin IPRS* and 0.02 per cent w/v of *piperacillin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Beckman Ultrasphere ODS),
- mobile phase: a mixture of 0.3 volume of *0.4 M tetrabutylammonium hydroxide*, 10 volumes of *0.2 M sodium dihydrogen orthophosphate monohydrate*, 44.7 volumes of *water* and 45 volumes of *methanol*, cool and adjusted to pH 5.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject reference solution (b). The resolution between the peaks due to anhydrous ampicillin and piperacillin is not less than 16.

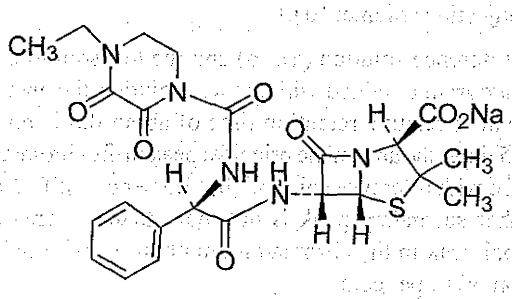
Inject the reference solution and the test solution (a).

Calculate the content of $C_{23}H_{27}N_5O_7S$ in the infusion.

Storage. Store protected from moisture.

Labelling. The label of the sealed container states the quantity of active ingredient contained in it in terms of the equivalent amount of anhydrous piperacillin.

Piperacillin Sodium



$C_{23}H_{26}N_5NaO_7S$ Mol.Wt. 539.5

Piperacillin is Sodium (*2S,5R,6R*)-6-[[(*2R*)-2-[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate.

Piperacillin Sodium contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{23}H_{26}N_5NaO_7S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder, hygroscopic.

Identification

A. Dissolve 0.25 g in *water*, add 0.5 ml of *dilute hydrochloric acid* and 5 ml of *ethyl acetate*; stir and allow to stand for 10 minutes in iced water. Filter the crystals through a small sintered-glass filter (40), applying suction. Wash with 5 ml of *water* and 5 ml of *ethyl acetate*, then dry in an oven at 60° for 60 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperacillin IPRS* or with the reference spectrum of piperacillin.

B. Gives the reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 5.0 to 7.0, determined in 10 per cent w/v solution.

Specific optical rotation (2.4.22). + 175° to + 190°, determined in a 1.0 per cent w/v solution in *water*.

Light absorption (2.4.7). Absorbance of a 10 per cent w/v solution in *water* at the maximum at about 430 nm, not more than 0.10.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of 3.12 per cent w/v solution of *sodium dihydrogen phosphate*.

Test solution (a). Dissolve 25 mg of the substance under examination in 50.0 ml of the solvent mixture.

Test solution (b). Dissolve 40 mg of the substance under examination in 20.0 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *piperacillin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (c). Dissolve 10 mg of *piperacillin IPRS* and 10 mg of *anhydrous ampicillin IPRS (piperacillin impurity A IPRS) [(2S,5R,6R)-6-[[(2R)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0] heptane-2-carboxylic acid (ampicillin) IPRS]* in 50.0 ml of the solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 576 volumes of *water*, 200 volumes of a 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide*, adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution*; add 200 volumes of *acetonitrile*,

  B. a mixture of 126 volumes of *water*, 200 volumes of a 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide*, adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution*; add 650 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	88	12
tg	88	12
tg + 30	0	100
tg + 45	88	12

where, tg = retention time of piperacillin determined with reference solution (b)

Inject reference solution (b), (c), (d) with isocratic elution at the initial mobile phase composition and test solution (b) according to the gradient programme. The test is not valid unless the resolution between the peaks due to piperacillin impurity A and piperacillin in the chromatogram obtained with reference solution (c) is not less than 10; if necessary, adjust the ratio A:B of the mobile phase; signal-to-noise ratio is not less than 3 for the principal peak in the chromatogram obtained with reference solution (d); mass distribution ratio is 2 to 3 for the peak due to piperacillin in the chromatogram obtained with reference solution (c). The area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

***N,N*-Dimethylaniline.** Not more than 20 ppm. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 50 mg of *N,N-diethylaniline* in 4 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*.

Test solution. Dissolve in a ground-glass-stoppered tube 0.5 g of the substance under examination in 30.0 ml of *water*. Add 1 ml of the internal standard solution. Adjust the solution to a temperature of 26-28°. Add 1 ml of *strong sodium hydroxide solution* and mix until completely dissolved. Add 2.0 ml of *trimethylpentane*. Shake for 2 minutes and allow the phases to separate. Use the upper layer.

Reference solution. Dissolve 50 mg of *N,N-dimethylaniline* in 4.0 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 30.0 ml with *water*. Add 1.0 ml of the internal standard solution and 1.0 ml of *strong sodium hydroxide solution*. Add 2.0 ml of *trimethylpentane*. Shake for 2 minutes and allow the phases to separate. Use the upper layer.

Chromatographic system

- a fused silica capillary column 25 m × 0.32 mm, coated with cross-linked polymethylphenylsiloxane (film thickness 0.52 µm),
- temperature: column:180°,
- temperature:

column	time (min.)	temperature (°)
	0	150
	0-5	150
	5-11.25	150→275
	11.25-14.25	275

- inlet port at 220° and detector at 300°,
- flame ionization detector,
- column head pressure of 50 kPa and a split vent of 20 ml per minutes, using helium as the carrier gas,
- split ratio: 1:20,
- a split-liner consisting of a column about 1 cm long packed with *diatomaceous earth for gas chromatography* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane*,

The retention times of *N,N*-dimethylaniline is about 3.6 minutes and *N,N*-diethylaniline is about 5.0 minutes.

https://nhathuocngocanh.com/

Inject 1 µl each of the reference solution and the test solution. Record the chromatogram and calculate the content of *N,N*-dimethylaniline.

Water. (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Piperacillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.07 Endotoxin Unit per mg of piperacillin sodium.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modifications.

- mobile phase: Initial composition of the mixture of the mobile phase A and B, adjust where applicable.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (a).

Calculate the content of $C_{23}H_{26}N_5NaO_7S$, multiplying the result by 1.042.

Storage. Store protected from moisture.

Piperacillin and Tazobactam Injection

Piperacillin and Tazobactam Injection is a sterile material consisting of Piperacillin Sodium and Tazobactam Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Piperacillin and Tazobactam Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of piperacillin, $C_{23}H_{27}N_5O_7S$ and tazobactam, $C_{10}H_{12}N_4O_5S$, the labelled amounts representing proportions of piperacillin to tazobactam of 8:1. It may contain small amounts of a suitable buffers and stabilizers.

Usual strengths. Piperacillin, 4 g and Tazobactum, 500 mg per vial; Piperacillin, 2 g and Tazobactum, 250 mg per vial.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 7.0, determined in a 4.0 per cent w/v solution of piperacillin immediately after preparation.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions, stored between 2° to 8° after preparation.

Solvent mixture A. 25 volumes of *acetonitrile* and 75 volumes of *water.*

Solvent mixture B. 4 volumes *of acetonitrile* and 96 volumes of solvent mixture A.

Test solution. Dissolve a sufficient quantity of injection in the mobile phase to obtain a solution containing 0.2 per cent w/v of Piperacillin.

Reference solution (a). A 0.05 per cent w/v solution of *tazobactam IPRS* in solvent mixture A.

Reference solution (b). A 0.1 per cent w/v solution of *piperacillin IPRS* in solvent mixture B (*NOTE-Dissolve first in acetonitrile, using about 4 per cent of the final volume, and dilute with solvent mixture B to volume).*

Reference solution (c). A solution containing 0.0006 per cent w/v of *tazobactam related compound A IPRS* and 0.0025 per cent w/v of *tazobactam IPRS* in solvent mixture A.

Reference solution (d). Dilute reference solution (a) and (b) with the mobile phase to obtain a solution containing 0.00025 per cent w/v of *tazobactam IPRS* and 0.002 per cent w/v of *piperacillin IPRS.*

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with phenyl group bonded to porous silica (3 µm),
- sample temperature: 5°,
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1 vial of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*, adjusted to pH 3.8 with 20 per cent v/v of *orthophosphoric acid*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 20 µl.

Name	Relative retention time	Correction factor
Tazobactam related compound A[1]	0.12	1.33
Tazobactam	0.25	—
Piperacillin impurity B[2]	0.31	—
Piperacillinpenilloic acid[3,4]	0.36	—
Piperacillinpenicilloic acid[3,5]	0.51	1.79
Acetylated penicilloic acid of piperacillin[6]	0.55	—
Piperacillin impurity C[2]	0.62	—
Piperacillin impurity D[2]	0.67	—
Piperacillin	1.0	—

[1](2*S*,3*S*)-2-Amino-3-methyl-3-sulfino-4-(1*H*-1,2,3-triazol-1-yl) butyric acid,

[2]Specified unknown impurities,

[3]This compound has two epimers that usually co -elute but that may be separated as a result of minor changes in the chromatographic conditions,

[4](4*S*)-2-{[2-(4-Ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenyl-acetamido]methyl}-5,5-dimethylthiazolidine-4-carboxylic acid,

[5](2*R*,4*S*)-2-{(1R)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl}-5,5-dimethylthiazolidine-4-carboxylic acid,

[6](2*R*,4*S*)-3-Acetyl-2-{(1*R*)-carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl}-5,5-dimethylthiazolidine-4-carboxylic acid.

Inject reference solution (c) and (d). The test is not valid unless the resolution between tazobactam related compound A and tazobactam peak is not less than 3.0 in the chromatogram obtained with reference solution (c), the tailing factor for tazobactam and piperacillin peak is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component in the chromatogram obtained with reference solution (d).

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to tazobactam related compound A, piperacillin penilloic acid, piperacillin impurity B, C, D and acetylated penicilloic acid of piperacillin, each of, is not more than 0.1 times the area of the piperacillin peak in the chromatogram obtained with reference solution (d) (1.0 per cent), the area of any peak corresponding to piperacillin penicilloic acid is not more than 0.5 times the area of the piperacillin peak in the chromatogram obtained with reference solution (d) (5.0 per cent), the area of any other secondary peak is not more than 0.1 times the area of the piperacillin peak in the chromatogram obtained with reference solution (d) (1.0 per cent) and the sum of the areas of all the secondary peaks other than piperacillin penicilloic acid peak is not more than 0.5 times the area of the piperacillin peak in the chromatogram obtained with reference solution (d) (5.0 per cent).

Water (2.3.43). Not more than 2.5 per cent.

Bacterial endotoxins (2.2.3). Not more than 0.08 Endotoxin Unit per mg in a portion equivalent to 1 mg of a mixture of piperacillin and tazobactam (0.89 mg and 0.11 mg).

Assay. Determine by liquid chromatography (2.4.14)

NOTE—Use freshly prepared solutions, store and inject at 2° to 8°. Analyze within 24 hours of preparation.

Test solution. Determine the weight of the content of 10 containers. Dissolve an accurately weighed quantity of the substance under examination to obtain a solution containing 0.1 per cent w/v of piperacillin and 0.0125 per cent w/v of tazobactam in the mobile phase.

Reference solution. A solution containing 0.1 per cent w/v of *piperacillin IPRS* and 0.0125 per cent w/v of *tazobactam IPRS* in the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– sample temperature: 2° to 8°,
– mobile phase: a mixture of 0.8 volumes of solution prepared by diluting 80.0 ml of 40.0 per cent w/v of *tetrabutylammonium hydroxide* in 100 ml of *water*, 5 volumes of a buffer solution prepared by dissolving 2.76 g of *monobasic sodium phosphate* in 100.0 ml of *water*, 51 volumes of *methanol*, and 43.2 volumes of *water*, adjusted to pH 5.5 with *orthophosphoric acid*.
– flow rate: 1 ml per minute,
– spectrophotometer set at 230 nm,
– injection volume: 10 µl.

The relative retention time for tazobactam with respect to piperacillin is about 0.36.

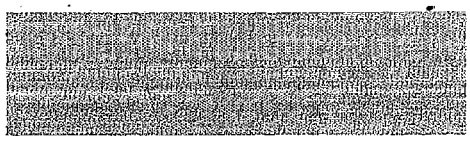
Inject the reference solution. The test is not valid unless the tailing factor for tazobactam and piperacillin peaks is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the contents of $C_{23}H_{27}N_5O_7S$ and $C_{10}H_{12}N_4O_5S$ in the injection.

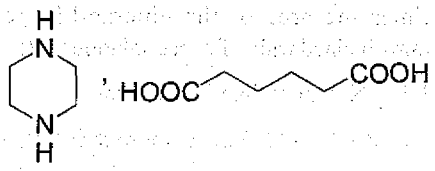
Storage. Store at controlled room temperature.

Labelling. The label states the quantity of piperacillins sodium, in terms of the equivalent amount of piperacillin, and the quantity of Tazobactam Sodium, in terms of the equivalent amount of tazobactam.



https://nhathuocngocanh.com/

Piperazine Adipate



$C_4H_{10}N_2, C_6H_{10}O_4$ Mol. Wt. 232.3

Piperazine Adipate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_{10}N_2$, $C_6H_{10}O_4$, calculated on the anhydrous basis.

Category. Anthelmintic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine adipate IPRS* or with the reference spectrum of piperazine adipate.

B. In the test for Related substances, examine the plate after spraying with both the *ninhydrin* and *iodine* solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 5 ml of *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol*.

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1.0 per cent w/v solution of *piperazine adipate IPRS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to *triethylenediamine* in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of *water*, 0.5 ml of *0.1 M hydrochloric acid* and add sufficient *water* to produce 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.2 g in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01161 g of $C_4H_{10}N_2, C_6H_{10}O_4$.

Storage. Store protected from moisture.

Piperazine Adipate Tablets

Piperazine Adipate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine hydrate, $C_4H_{10}N_2, 6H_2O$.

https://nhathuocngocanh.com/

Usual strength. The equivalent of 300 mg of piperazine hydrate. (144 mg of Piperazine Adipate is approximately equivalent to 120 mg of Piperazine Hydrate).

Identification

A. Extract a quantity of the powdered tablets containing 1 g of Piperazine Hydrate with 20 ml of *water* and filter. Dilute 1 ml of the filtrate to 5 ml with *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

B. To 10 ml of the filtrate obtained in test A add 5 ml of *hydrochloric acid* and extract with three quantities, each of 10 ml, of *ether*, evaporate the combined *ether* extracts to dryness; the residue, after washing with a small volume of *water* and drying at 105°, melts at about 152° (2.4.21).

Tests

Other tests. Comply with the tests stated under Tablets.

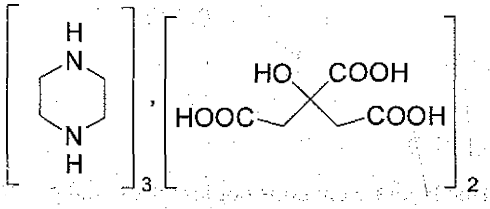
Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.2 g of Piperazine Hydrate, shake with 10 ml of *water* for 1 hour, filter and wash the residue with two quantities, each of 10 ml, of *water*. To the combined extract and washings add 5 ml of *1 M sulphuric acid* and 50 ml of *picric acid solution*, bring to boil, allow to stand for 1 hour and filter through a sintered-glass crucible (porosity No. 4) and wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3567 g of $C_4H_{10}N_2, 6H_2O$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of piperazine hydrate.

Piperazine Citrate



$(C_4H_{10}N_2)_3,2C_6H_8O_7$ Mol. Wt. 642.7 (anhydrous)

Piperazine Citrate is a salt of piperazine with citric acid containing a variable amount of water of crystallisation.

Piperazine Citrate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_4H_{10}N_2)_3, 2C_6H_8O_7$, calculated on the anhydrous basis.

Category. Anthelmintic.

Description. A white, granular powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine citrate IPRS* or with the reference spectrum of piperazine citrate.

B. In the test for Related substances, examine the plate after spraying with both the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. A 10 per cent w/v solution gives the reactions of citrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol*.

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1.0 per cent w/v solution of *piperazine citrate IPRS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

https://nhathuocngocanh.com/

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to *triethylenediamine* in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 10.0 to 14.0 per cent, determined on 0.3 g.

Assay. Dissolve 0.2 g in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01071 g of $(C_4H_{10}N_2)_3, 2C_6H_8O_7$.

Storage. Store protected from light and moisture.

Piperazine Citrate Syrup

Piperazine Citrate Oral Solution; Piperazine Citrate Elixir

Piperazine Citrate Syrup is a solution of Piperazine Citrate in a suitable flavoured Vehicle.

Piperazine Citrate Syrup contains the equivalent of not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine hydrate, $C_4H_{10}N_2, 6H_2O$.

Usual strength. The equivalent of 750 mg of piperazine hydrate in 5 ml.

(125 mg of Piperazine Citrate or 110 mg of anhydrous piperazine citrate is approximately equivalent to 100 mg of Piperazine Hydrate).

Identification

A. To 1 ml add 5 ml of *2 M hydrochloric acid* and, with stirring, 1 ml of a freshly prepared 50 per cent w/v solution of *sodium nitrite*, cool in ice for 15 minutes, induce crystallisation, wash the crystalline precipitate with *water* and dry at 105°. The crystals melt at about 159° (2.4.21).

B. Warm 10 ml with *activated charcoal* and filter. Boil a portion of the filtrate with an excess of *mercuric sulphate solution*, filter, boil the filtrate and add 0.25 ml of *dilute potassium permanganate solution*; the permanganate solution is decolorised and a white precipitate is produced.

C. Acidify a portion of the filtrate obtained in test B with *1 M sulphuric acid*, add 0.25 ml of *dilute potassium permanganate solution*, warm until the colour is discharged and add an excess of *bromine water*; a white precipitate is produced either immediately or on cooling.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh a quantity containing about 0.2 g of Piperazine Hydrate, add 3.5 ml of *0.5 M sulphuric acid* and 10 ml of *water*, add 100 ml of *picric acid solution*, heat on a water-bath for 15 minutes, allow to stand for 1 hour and filter through a sintered-glass crucible (porosity No. 4). Wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

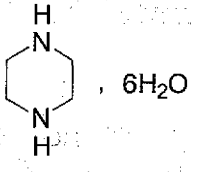
1 g of the residue is equivalent to 0.3567 g of $C_4H_{10}N_2, 6H_2O$.

Determine the weight per ml of the syrup (2.4.29), and calculate the content of $C_4H_{10}N_2, 6H_2O$, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of piperazine hydrate.

Piperazine Hydrate



$C_4H_{10}N_2, 6H_2O$ Mol. Wt. 194.2

Piperazine Hydrate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_{10}N_2, 6H_2O$.

Category. Anthelmintic.

Description. Colourless, glassy deliquescent crystals.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine hydrate IPRS* or with the reference spectrum of piperazine hydrate.

B. In the test for Related substances, examine the plate after spraying with both the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 0.2 g in 5 ml of *dilute hydrochloric acid*, add 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 10.5 to 12.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol*.

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1 per cent w/v solution of *piperazine hydrate IPRS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to triethylenediamine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

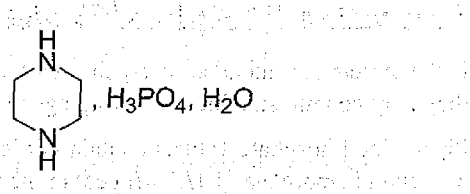
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Dissolve 0.2 g in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.009705 g of $C_4H_{10}N_2, 6H_2O$.

Storage. Store protected from light and moisture.

Piperazine Phosphate



$C_4H_{10}N_2,H_3PO_4,H_2O$ Mol. Wt. 202.2

Piperazine Phosphate contains not less than 98.5 per cent and not more than 100.5 per cent of $C_4H_{10}N_2,H_3PO_4$, calculated on the anhydrous basis.

Category. Anthelmintic.

Description. A white, crystalline powder.

Identification

A. Dissolve 0.2 g in 5 ml of *dilute hydrochloric acid*, add 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

https://nhathuocngocanh.com/

B. Dissolve 0.1 g in 5 ml of *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

C. It gives the reactions of phosphates (2.3.1).

Tests

pH (2.4.24). 6.0 to 6.5, determined in a 1.0 per cent w/v solution.

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of *2 M acetic acid* and add sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Water (2.3.43). 8.0 to 9.5 per cent, determined on 0.25 g.

Assay. Dissolve 0.2 g in a mixture of 3.5 ml of *0.5 M sulphuric acid* and 10 ml of *water*. Add 100 ml of *picric acid solution*, heat on a water-bath for 15 minutes and allow to stand for 1 hour. Filter through a sintered-glass crucible (porosity No. 4) and wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3382 g of $C_4H_{10}N_2, H_3PO_4$.

Storage. Store protected from moisture.

Piperazine Phosphate Tablets

If the tablets are intended to be chewed before swallowing they may contain suitable flavouring agents.

Piperazine Phosphate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine phosphate, $C_4H_{10}N_2, H_3PO_4, H_2O$.

Usual strengths. The equivalent of 260 mg; 520 mg Piperazine Hydrate (125 mg of piperazine phosphate is approximately equivalent to 120 mg of Piperazine Hydrate).

Identification

Extract a quantity of the powdered tablets containing 1 g of Piperazine Phosphate with 20 ml of *water* and filter. The filtrate complies with the following tests.

A. To 4 ml of the filtrate, add 1 ml of *hydrochloric acid*, 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

B. Dilute 1 ml of the filtrate to 5 ml with *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

C. It gives the reactions of phosphates (2.3.1).

Tests

Disintegration. The test does not apply to Piperazine Phosphate Tablets intended to be chewed before swallowing.

Other tests. Comply with the tests stated under Tablets.

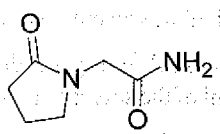
Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.15 g of Piperazine Phosphate, shake with 10 ml of *water* for 1 hour, filter and wash the residue with two quantities, each of 10 ml, of *water*. To the combined extract and washings add 5 ml of *1 M sulphuric acid* and 50 ml of *picric acid solution*, boil, allow the mixture to stand for several hours and filter through a sintered glass crucible (porosity No. 4). Wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol (95 per cent)* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3714 g of $C_4H_{10}N_2, H_3PO_4, H_2O$.

Storage. Store protected from moisture.

Labelling. The label states, where applicable, that the tablets are to be chewed before swallowing.

Piracetam



$C_6H_{10}N_2O_2$ Mol.Wt.142.2

Piracetam is 2-(2-oxopyrrolidin-1-yl)acetamide .

Piracetam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_{10}N_2O_2$, calculated on the dried basis.

Category. Nootropic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piracetam IPRS* or with the reference spectrum of piracetam.

https://nhathuocngocanh.com/

Tests

Appearance of solution. A 20.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *acetonitrile* and 90 volumes of *water*.

Test solution (a). Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of the substance under examination and 10 µl of 2-pyrrolidone in sufficient solvent mixture to produce 100.0 ml.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (c). Dissolve 50.0 mg of *piracetam IPRS* in 100.0 ml of the solvent mixture. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of 0.1 per cent w/v solution of *dipotassium hydrogen phosphate*, adjusted to pH 6.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 2-pyrrolidone and piracetam is not less than 3.0 and the symmetry factor is not more than 2.0 for the peak due to piracetam.

Inject reference solution (b) and test solution (a). Run the chromatogram 8 times the retention time of piracetam. In the chromatogram obtained with the test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy Metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances.

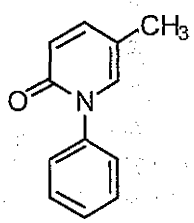
Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_6H_{10}N_2O_2$.

Storage. Store protected from light and moisture.

Pirfenidone



$C_{12}H_{11}NO$ Mol. Wt.185.2

Pirfenidone is 5-methyl-1-phenylpyridin-2-one.

Pirfenidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{11}NO$, calculated on anhydrous basis.

Category. Antifibrotic and anti-inflammatory.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pirfenidone IPRS* or with the reference spectrum of pirfenidone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution. A mixture of 0.0001 per cent w/v solution of *pirfenidone IPRS* and 0.00015 per cent w/v solution of *2-hydroxy-5-picoline IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Alltima C18),
- mobile phase: A. *0.01M sodium dihydrogen phosphate,* adjusted to pH 3.0 with *orthophosphoric acid,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
5	75	25
40	30	70
50	30	70
50.1	75	25
60	75	25

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 for pirfenidone peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-hydroxy-5-picoline is not more than the area of the principal peak of 2-hydroxy-5-picoline in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak of pirfenidone in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak of pirfenidone in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *pirfenidone IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Alltima C18),
- mobile phase: a mixture of 600 volumes of *0.01M sodium dihydrogen phosphate,* adjusted to pH 3.0 with *orthophosphoric acid* and 400 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 8000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{11}NO$.

Storage. Store protected from light and moisture.

Pirfenidone Tablets

Pirfenidone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pirfenidone, $C_{12}H_{11}NO$.

Usual strengths. 200 mg; 400 mg.

Identification

When examined in the range 230 nm to 400 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 314 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the dissolution medium. Measure the absorbance of the solution at the maximum at about 310 nm (2.4.7.) Calculate the content of $C_{12}H_{11}NO$ in the medium from the absorbance of *pirfenidone IPRS* prepared by dissolving in minimum amount of *methanol* and diluting with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{11}NO$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 200 mg of pirfenidone in 140 ml of mobile phase with the aid of ultrasound for 10 minutes and dilute to 200.0 ml with the mobile phase and filter.

Reference solution. A 0.0005 per cent w/v solution of *pirfenidone IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: a mixture of 70 volumes of buffer solution containing 0.27 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.2 with *orthophosphoric acid* and 30 volumes of *methanol*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 310 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

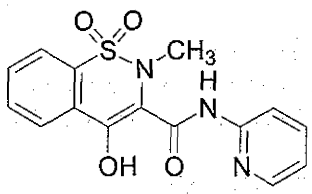
Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Transfer a quantity of the powder containing 2.0 g of Pirfenidone in 10 ml of *water* with the aid of ultrasound for 10 minutes. Add 500 ml of *methanol* and dilute to 1000.0 ml with *methanol*, mix and filter. Dilute 4.0 ml of the solution to 500.0 ml with a mixture of 600 volumes of 0.27 per cent w/v of *potassium dihydrogen orthophosphate* adjusted to pH 3.2 with *orthophosphoric acid* and 400 volumes of *methanol*. Measure the absorbance of the resulting solution at the maximum at about 314 nm (2.4.7). Calculate the content of $C_{12}H_{11}NO$ from the absorbance obtained by dissolving 64 mg of *pirfenidone IPRS* in 100 ml *methanol* and dilute 5 ml of the solution to 200 ml with the solvent mixture.

Storage. Store protected from moisture.

Piroxicam



$C_{15}H_{13}N_3O_4S$ Mol. Wt. 331.4

Piroxicam is 4-hydroxy-2-methyl-*N*-(2-pyridyl)-2*H*-1,2-benzothiazine-3-carboxamide-1,1-dioxide.

Piroxicam contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{15}H_{13}N_3O_4S$, calculated on the anhydrous basis.

Category. Analgesic; antiinflammatory; antipyretic.

Description. An off-white to light tan or light yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piroxicam IPRS* or with the reference spectrum of piroxicam.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows absorption maxima at about 242 nm and 334 nm and a minimum at about 270 nm; absorbance at about 334 nm, about 0.87.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 95 volumes of *toluene* and 5 volumes of *acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of a mixture of equal volumes of *chloroform* and *methanol*.

Reference solution. A 0.1 per cent w/v solution of *piroxicam IPRS* in a mixture of equal volumes of *chloroform* and *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 75 mg of the substance under examination in 50.0 ml of *acetonitrile*.

https://thuocngocanh.com/

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 50.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a 0.7 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The relative retention time with reference to piroxicam for piroxicam impurity B is about 0.85.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.02 per cent).

Heavy metals (2.3.13). 0.4 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 0.5 per cent , determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in *0.1 M methanolic hydrochloric acid*.

Reference solution. A 0.005 per cent w/v solution of *piroxicam IPRS* in *0.1 M methanolic hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by diluting a mixture of 7.72 g of *anhydrous citric acid* in 400 ml of *water* and 5.35 g of *sodium phosphate* in 100 ml of *water* to 1000 ml with *water* and 45 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$.

Storage. Store protected from light and moisture.

Piroxicam Capsules

Piroxicam Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piroxicam, $C_{15}H_{13}N_3O_4S$.

Usual strengths. 10 mg; 20 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 95 volumes of *toluene* and 5 volumes of *acetic acid*.

Test solution. Dissolve a portion of the contents of the capsules in sufficient of a mixture of equal volumes of *chloroform* and *methanol* to obtain a solution containing about 0.1 per cent w/v of Piroxicam. Shake for 10 minutes, filter and use the filtrate.

Reference solution. A 0.1 per cent w/v solution of *piroxicam IPRS* in a mixture of equal volumes of *chloroform* and *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw 10 ml of the medium and filter. Measure the absorbance of the filtrate (2.4.7), suitably diluted if necessary, at the maximum at about 242 nm. Calculate the content of $C_{15}H_{13}N_3O_4S$, in the medium taking 352 as the specific absorbance at 242 nm.

https://nhathuocngocanh.com/

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{13}N_3O_4S$.

Uniformity of content. Complies with the test stated under Capsules.

Test solution. Dissolve the contents of a capsule in 100.0 ml of *0.1 M methanolic hydrochloric acid* and filter. Dilute further if necessary.

Determine by liquid chromatography (2.4.14) using the chromatographic system and the reference solution described under Assay.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the capsules.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.25 g.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a weighed quantity of the mixed contents of the capsules containing about 50 mg of Piroxicam in 100.0 ml of *0.1 M methanolic hydrochloric acid*. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *piroxicam IPRS* in *0.1 M methanolic hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of a buffer solution prepared by diluting a mixture of 7.72 g of *anhydrous citric acid* in 400 ml of *water* and 5.35 g of *sodium phosphate* in 100 ml of *water* to 1000 ml with *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the capsules.

Storage. Store protected from light and moisture.

Piroxicam Gel

Piroxicam Gel contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of piroxicam, $C_{15}H_{13}N_3O_4S$.

Usual strength. 0.5 per cent w/w.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Test solution. Disperse a quantity of gel containing 10 mg of piroxicam, with 0.1 ml of a saturated solution of *sodium chloride* until the mixture becomes turbid. Dilute to 5.0 ml with *0.01 M methanolic hydrochloric acid*, shake well, centrifuge and use the clear supernatant solution.

Reference solution. A 0.2 per cent w/v solution of *piroxicam IPRS* in *0.01 M methanolic hydrochloric acid*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid* 10 volumes of *methanol* and 80 volumes of *ethyl acetate*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 7.2 to 8.2 determined in a 10 per cent w/v solution.

2-Pyridylamine. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the gel containing 5 mg of Piroxicam in 5 ml of *0.01 M methanolic hydrochloric acid* add 50 ml of the mobile phase and shake vigorously for 30 minutes, dilute to 100.0 ml with mobile phase, mix and filter through a glass fibre membrane filter (1µm).

Reference solution. Dilute 5.0 ml of a 0.0005 per cent w/v solution of 2-pyridylamine in *0.01 M methanolic hydrochloric acid* to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (such as zorbax stable bond C 8) and stainless steel guard column 12.5 mm × 4.6 mm, packed with octylsilane bonded to porous silica (5µm),
- column temperature: 40°,
- mobile phase: a mixture of 15 volumes of *methanol*, 30 volumes of *acetonitrile* 55 volumes of *0.05 M sodium dihydrogen orthoposphate*, adjusted to pH 3.5 with *5 M orthophosphoric acid*,
- flow rate: 1 ml per minute,
- fluorimetric detector set at excitation wavelength of 313 nm and an emission wavelength of 380 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution. The area of any peak corresponding to 2- pyridylamine is not more than that of the principal peak in the chromatogram obtained with reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Gel.

Assay. Determine by liquid chromatography (2.4.14).

Use chromatographic system and test solution as described as under 2-pyridylamine except detector.

Reference solution. A 0.1 per cent w/v solution of *piroxicam IPRS* in *0.01 M methanolic hydrochloric acid,* dissolve with the aid of ultrasound, if necessary. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- spectrophotometer set at 248 nm.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in gel.

Storage. Store at a temperature not exceeding 30°. Do not freeze.

Piroxicam Tablets

Piroxicam Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of piroxicam, $C_{15}H_{13}N_3O_4S$.

Usual strength. 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution correspond to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate at the maximum at about 242 nm (2.4.7). Calculate the content of $C_{15}H_{13}N_3O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *piroxicam IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{13}N_3O_4S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Dissolve a quantity of the powder containing about 50 mg of Piroxicam in 100.0 ml of *0.1 M methanolic hydrochloric acid.* Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *piroxicam IPRS* in *0.1 M methanolic hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of a buffer solution prepared by diluting a mixture of 7.72 g of *anhydrous citric acid* in 400 ml of *water* and 5.35 g of *sodium phosphate* in 100 ml of *water* to produce 1000 ml with *water;*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

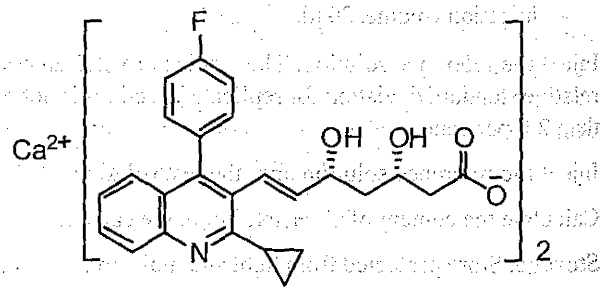
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the tablets.

Storage. Store protected from light and moisture.

Pitavastatin Calcium



$C_{50}H_{46}CaF_2N_2O_8$ Mol. Wt. 880.9

Pitavastatin Calcium is Monocalcium bis{(3*R*,5*S*,6*E*)-7-[2-cyclopropyl-4-(4-fluorophenyl)-3-quinolyl]-3,5-dihydroxy-6-heptenoate}.

Pitavastatin Calcium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{50}H_{46}CaF_2N_2O_8$, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Antihyperlipidemic.

Description. An off-white to yellowish, powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pitavastatin calcium IPRS* or with the reference spectrum of pitavastatin calcium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 9.0° to + 13.0°, determined in a 1.0 per cent w/v solution in *dimethylsulphoxide*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 365 volumes of *acetonitrile*, 50 volumes of *tetrahydrofuran* and 585 volumes of buffer solution prepared by dissolving 1.54 per cent w/v solution of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject the test solution. The area of any secondary peak is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Calcium. 4.0 to 5.0 per cent.

Weigh 0.2 g and dissolve in equal volumes of *methanol* and *ammonia-ammonium chloride buffer*. Titrate with *0.05 M ethylenediamine tetraacetate* and determine the end point using *erichrome black T* indicator.

1 ml of *0.05 M ethylenediamine tetraacetate* is equivalent to 0.002 g of *calcium*.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *pitavastatin calcium IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{50}H_{46}CaF_2N_2O_8$.

Plaster of Paris

Dried Calcium Sulphate; Exsiccated Calcium Sulphate

$CaSO_4, ½H_2O$ Mol. Wt. 145.1

Plaster of Paris is prepared by heating powdered gypsum, $CaSO_4,2H_2O$, at about 150° in a controlled manner such that it is substantially converted into the hemihydrate, $CaSO_4,½H_2O$, with minimum production of the anhydrous phases of calcium sulphate. It may contain suitable accelerators or decelerators.

Category. Surgical aid.

Description. A white or almost white powder; hygroscopic.

Identification

It gives the reactions of calcium salts and of sulphates (2.3.1).

Tests

pH (2.4.24). 6.5 to 9.0, determined in a 20.0 per cent w/v slurry in *water*.

Acid insoluble matter. Dissolve 0.5 g in 30 ml of a mixture of 1 volume of *hydrochloric acid* and 2 volumes of *water* and evaporate to dryness in a dish on a water-bath. Heat for 2 hours at 120° and again add 20 ml of the acid mixture. Warm for a few minutes and filter. Wash the residue with warm *water* until free from chlorides, dry, ignite and weigh. The residue weighs not more than 5 mg (1.0 per cent).

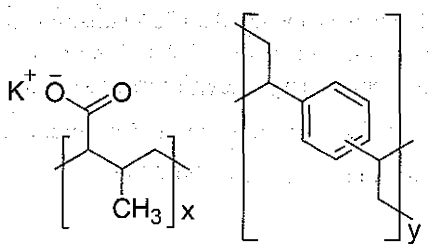
Setting properties. 20 g mixed with 10 ml of *water* at 15° to 20° in a cylindrical mould about 2.4 cm in diameter sets in not less than 4 minutes and not more than 6 minutes. The mass thus formed, after standing for 3 hours, possesses sufficient hardness to resist pressure of the fingers at the edges, which retain their sharpness of outline and do not crumble under pressure.

https://nhathuocngocanh.com/

Loss on ignition (2.4.20). 4.5 to 8.0 per cent, determined by igniting to constant weight at red heat.

Storage. Store protected from moisture.

Polacrilin Potassium



Polacrillin Potassium is 2-propenoic acid, 2-methyl-, potassium salt, polymer with diethenylbenzene.

Polacrilin Potassium is the potassium salt of a unifunctional low-cross-linked carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene.

Polacrilin Potassium contains not less than 20.6 per cent and not more than 25.1 per cent of potassium, calculated on the dried basis.

Category. Pharmaceutical aid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polacrilin potassium IPRS* or with the reference spectrum of polacrilin potassium.

B. Shake 1 g with 10 ml of *water:* the aqueous phase does not respond to the tests for potassium salts (2.3.1). Shake 1 g with 10 ml of *0.1 M hydrochloric acid*; the aqueous phase responds to the tests for potassium salts (2.3.1).

Tests

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1 g by drying at 105°, for 6 hours.

Iron (2.3.14). Not more than 0.01 per cent, using the following test solution.

Transfer 0.4 g to a suitable crucible, and ignite at a low heat until thoroughly ashed. Add to the carbonized mass 2 ml of *nitric acid* and 5 drops of *sulphuric acid*, and heat cautiously until white fumes are no longer evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 ml of *6 M hydrochloric acid*, cover, digest on a steam bath for 15 minutes, uncover, and slowly evaporate on a steam-bath to dryness. Moisten the residue with 1 drop of *hydrochloric acid*, add 10 ml of hot *water*, and digest for 2 minutes. Dilute with *water* to 25 ml. Filter, if necessary, rinse the crucible and the filter with 10 ml of *water*, combining the filtrate and rinsing in a 50-ml colour-comparison tube, add 2 ml of *hydrochloric acid*, dilute with water to 45 ml, and mix.

Sodium. Not more than 0.2 per cent.

Test solution. Transfer 2 g, weighed, to a 400-ml borosilicate beaker, add 20 ml of *sulphuric acid*, cover with a borosilicate watch glass, and heat until charring is complete. While continuing to heat the beaker, add 20 ml of *nitric acid* dropwise. Continue to heat and add *nitric acid* until all of the organic material has been destroyed as indicated by the contents of the beaker turning from brown to a very pale straw-coloured or colourless solution. Continue to evaporate the solution, and if it turns brown during the evaporation, add *nitric acid* dropwise until the brown colour disappears. Evaporate just to dryness, cool, and dissolve the residue in 40 ml of *water* and 10 ml of *6 M hydrochloric acid*. Heat to boiling, cool and dilute to 100.0 ml with *water*.

To three separate 100-ml volumetric flasks add, respectively, 1.0 ml, 2.0 ml, and 3.0 ml of a solution containing 254.2 mg of *sodium chloride* in 1000 ml of *water*. Add water to volume, and mix to obtain sodium chloride solutions having concentrations equivalent to 1 µg of Na per ml, 2 µg of Na per ml, and 3 µg of Na per ml, respectively. Adjust the settings of a suitable flame photometer so that the emission of the solution containing 3.0 ml of the sodium chloride solution reads close to 100 per cent at 589 nm. Determine the readings of the three solutions at 589 nm. Readjust the wavelength setting to 580 nm, and determine the background emission reading for one of these standards. Pipet 5 ml of the test solution and dilute to 100 ml with *water*. Observe the emission reading of the solution at 589 nm, using the same instrument settings, then readjust the wavelength setting to 580 nm, and observe the background emission reading. Subtract the corresponding background readings from the standard and test specimen readings. Prepare a standard curve by plotting the corrected standard readings versus the square root of the sodium concentration. From this standard curve, determine the sodium content of the test solultion.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Potassium

Sodium stock solution. Dissolve 7.306 g of *sodium chloride* (previously dried at 125° for 30 minutes) in *water* and dilute to 500.0 ml with *water* (5.76 g of Na per 1000 ml).

Potassium stock solution. Dissolve 745.5 mg of *potassium chloride* (previously dried at 125° for 30 minutes) and dilute to 1000 ml with *water* (391 mg of K per 1000 ml).

https://nhathuocngocanh.com/

Surfactant solution. Transfer 5.0 g of a suitable nonionic surfactant to a 250-ml beaker, add 200 ml of *water*, and stir to dissolve. Transfer this solution to a 500-ml volumetric flask and dilute with *water* to volume.

(NOTE — To prevent foaming when using this solution, gently run the solution down the sides of the vessel, and use gentle action when mixing).

Diluted sodium solution. Dilute a mixture of 50.0 ml of sodium stock solution and 10.0 ml of surfactant solution to 100.0 ml with *water*.

Reference solutions. To three separate 500-ml volumetric flasks transfer, respectively, 3.0 ml, 4.0 ml, and 5.0 ml portions of potassium stock solutions. To each flask, add 50.0 ml of sodium stock solution and 10.0 ml of surfactant solution and dilute to 500.0 ml with *water*. 1 ml of these solutions contains 2.346 µg, 3.128 µg, and 3.910 µg of K, respectively.

Test solution. Transfer 1.4 g of Polacrilin Potassium (previously dried) to a 50-ml silica crucible, moisten with 4 ml of *sulphuric acid*, heat over a small flame until the acid has fumed off, moisten the residue with a few drops of *sulphuric acid*, and ignite strongly. Allow to cool, transfer, with the aid of *water* and dilute to 1000 ml with *water*. To 1.0 ml of the solution, add 20 ml of *diluted sodium solution* and dilute to 100.0 ml with *water*, mix gently to avoid foaming.

Determine the emittances of the reference solutions and the test solution at 766 nm, with a flame photometer. Prepare a standard curve by plotting the standard readings versus the square root of the potassium concentrations. From the curve, determine the concentration, C_U, in µg per ml, of potassium in the test solution.

Calculate the content of potassium in the Polacrilin Potassium by the formula:

$$100C_U$$

Storage. Store protected from moisture.

Poloxamers

$(CH_2CH_2O)_a\,(CH(CH_3)CH_2OH)_b\,(CH_2CH_2O)_c\,H$

b is at least 15 and $(CH_2CH_2O)_{a+c}$ is varied from 20 to 90% by weight

Mol. Wt. ranges from 1000 to >16000

Poloxamers are polyethylenepropylpropyleneglycols.

Synthetic block copolymer of ethylene oxide and propylene oxide represented by the following general formula:

Poloxamer Type	Ethylene oxide units (a)	Propylene oxide units (b)	Content of oxyethylene (per cent)	Average relative molecular mass
124	10-15	18-23	44.8-48.6	2090-2360
188	75-85	25-30	79.9-83.7	7680-9510
237	60-68	35-40	70.5-74.3	6840-8830
338	137-146	42-47	81.4-84.9	12700-17400
407	95-105	54.60	71.5-74.9	9840-14600

A suitable antioxidant may be added.

Category. Pharmaceutical aid.

Description. Poloxamer 124 is a colourless or almost colourless liquid and poloxamers 188, 237, 338, 407 are a white or almost white, waxy powder, microbeads or flakes.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Compare the spectrum with that obtained with corresponding type of *poloxamer IPRS* or with the reference spectrum of corresponding type of poloxamer.

B. Average relative molecular mass.

C. Oxypropylene: oxyethylene ratio.

Tests

Melting point (2.4.21). About 50° for poloxamers 188, 237, 338 and 407.

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 5.0 to 7.5, determined in solution A.

Ethylene oxide, propylene oxide and dioxan. Determine by gas chromatography (2.4.13).

Ethylene oxide stock solution. Disperse about 0.5 g of *ethylene oxide IPRS* with 50.0 ml of *dimethyl sulphoxide*.

Ethylene oxide solution. Dilute 1.0 ml of the ethylene oxide stock solution to 250.0 ml with *dimethyl sulphoxide*.

Propylene oxide stock solution. Introduce about 7 ml of *dichloromethane* into a volumetric flask, add 0.5 g of *propylene oxide* and dilute to 10.0 ml with *dichloromethane*. Dilute 0.5 ml of the solution to 50.0 ml with *dimethyl sulphoxide*.

Propylene oxide solution. Dilute 1.0 ml of the propylene oxide stock solution to 50.0 ml with *dimethyl sulphoxide*.

https://nhathuocngocanh.com/

Dioxan solution. Introduce 0.1 g of *dioxan* into a flask and dilute to 50.0 ml with *dimethyl sulphoxide*. Dilute 2.5 ml of the solution to 100.0 ml with *dimethyl sulphoxide*.

Mixture solution. Dilute a mixture of 6.0 ml of the ethylene oxide solution, 6.0 ml of the propylene oxide solution and 2.5 ml of the dioxan solution to 25.0 ml with *dimethyl sulphoxide*.

Test solution. To 1.0 g of the substance under examination in a head-space vial, add 4.0 ml of *dimethyl sulphoxide* and close the vial immediately.

Reference solution. To 1.0 g of the substance under examination in a head-space vial, add 2.0 ml of *dimethyl sulphoxide* and 2.0 ml of the mixture solution. Close the vial immediately.

Chromatographic system
- a fused silica column 50 m x 0.32 mm, packed with poly(dimethyl)(diphenyl)siloxane (film thickness 5 µm),
- temperature :
  column 70° to 240°,
  inlet port and detector at 250°,
- a flame ionisation detector,
- flow rate: 1.4 ml per minute using nitrogen as the carrier gas,

Head-space conditions
- equilibration temperature 110°,
- equilibration time 30 minutes,
- transfer line temperature 140°,
- pressurisation time 1 minute,
- injection time 0.05 minute.

Inject 1 µl of the gaseous phase of the test solution and the reference solution. The relative retention time with reference to ethylene oxide is about 6 minutes, for propylene oxide is about 1.3, for dichloromethane is about 1.6, for dioxan is about 3.0, for dimethyl sulphoxide is about 3.7.

The ethylene oxide is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1 ppm); propylene oxide is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (5 ppm) and dioxan is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

Average relative molecular mass. Weigh 15 g of the substance under examination into a 250-ml ground glass stoppered flask, add 25.0 ml of *phthalic anhydride solution* and a few glass beads and swirl to dissolve. Boil gently under a reflux condenser for 60 minutes, cool and add 2 quantities, each of 10 ml, of *pyridine*, through the condenser. Add 10 ml of *water*, mix and allow to stand for 10 minutes. Add 40.0 ml of *0.5 M sodium hydroxide* and 0.5 ml of a 1.0 per cent w/v solution of *phenolphthalein* in *pyridine*. Titrate with *0.5 M sodium hydroxide* to a light pink endpoint that persists for 15 second and record the volume of sodium hydroxide used (S). Prepare a blank. Record the volume of sodium hydroxide used (B). Calculate the average relative molecular mass using the following expression:

$$\frac{4000m}{B-S}$$

Oxypropylene:oxyethylene ratio. Nuclear magnetic resonance spectrometry (2.4.34).

Use a 10.0 per cent w/v solution of the substance under examination in *deuterated chloroform*. Record the average area of the doublet appearing at about 1.08 ppm due to the methyl groups of the oxypropylene units (A_1) and the average area of the composite band from 3.2 ppm to 3.8 ppm due to CH_2O groups of both the oxyethylene and oxypropylene units and the CHO groups of the oxypropylene units (A_2) with reference to the internal standard. Calculate the percentage of oxyethylene, by weight, in the sample under examination using the following expression:

$$\frac{3300\alpha}{33\alpha + 58}$$

$$\text{where } \alpha = \frac{A_2}{A_1} - 1$$

Total ash (2.3.19). Not more than 0.4 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Storage. Store protected from moisture.

Labelling. The label states the type of poloxamer.

Polyethylene Glycol 1500

Macrogol 1500

Polyethylene Glycol 1500 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]_nCH_2OH$, where n is between 28 and 36.

Category. Pharmaceutical aid (ointment base).

Description. A white or creamy white, soft, wax-like solid.

Tests

Appearance of solution (2.4.1). A 25.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

https://nhathuocngocanh.com/

pH (2.4.24). 4.0 to 7.0, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 42° to 46°.

Hydroxyl value (2.3.27). 70 to 86, determined on 5.0 g.

Viscosity (2.4.28). 25 mm^2s^{-1} to 32 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size D).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polyethylene Glycol 4000

Macrogol 4000

Polyethylene Glycol 4000 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]_nCH_2OH$, where n is between 69 and 84.

Category. Pharmaceutical aid (ointment base).

Description. A creamy white, hard, wax-like solid, powder or flakes.

Tests

Appearance of solution (2.4.1). A 20.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

pH (2.4.24). 4.5 to 7.5, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 53° to 56°.

Hydroxyl value (2.3.27). 25 to 32, determined on 14.0 g.

Viscosity (2.4.28). 110 mm^2s^{-1} to 158 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size E).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polyethylene Glycol 6000

Macrogol 6000

Polyethylene Glycol 6000 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]nCH_2OH$, where n is between 112 and 158.

Category. Pharmaceutical aid (ointment base and tablet excipient).

Description. A white to creamy white, wax-like solid or flakes.

Tests

Appearance of solution (2.4.1). A 15.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

pH (2.4.24). 4.5 to 7.5, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 56° to 60°.

Viscosity (2.4.28). 250 mm^2s^{-1} to 390 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size F).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polymyxin B Sulphate is the sulphate salt of a kind of polymyxin, a substance produced by the growth of *Bacillus polymyxa* (Prazmowski) Migula (Fam. Bacillaceae), or a mixture of two or more such salts. It has a potency of not less than 6000 Polymyxin B units per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A white to buff-coloured powder.

Identification

A. In the test for Composition of Polymyxins, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. Dissolve about 2 mg in 5 ml of *water*, add 5 ml of *2.5 M sodium hydroxide* and 5 drops of 1 per cent w/v solution of *cupric sulphate*, shake after addition of each drop; a reddish-violet colour is produced.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 0.5 per cent w/v solution.

Composition of Polymyxins. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *polymyxin B sluphate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 4.5 g of *sodium sulphate anhydrous* in 1000 ml of *water*, adjusted to pH 2.3 with *dilute orthophosphoric acid* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

– spectrophotometer set at 215 nm,
– injection volume: 20 µl.

Name	Relative retention time
Polymyxin B2[1]	0.5
Polymyxin B3	0.6
Polymyxin B1-I	0.8
Polymyxin B1[1]	1.0

[1]These components are not reported individually. They are only reported in the sum of polymyxins.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to polymyxin B2 and polymyxin B3 is not less than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the polymyxin B1 peak.

Inject the reference solution and the test solution. Run the chromatogram 1.4 times the retention time of the principal peak, the area of any peak corresponding to polymyxin B3 is not more than 0.06 times the area of the corresponding peak in the chromatogram obtained with the reference solution (6.0 per cent), the area of any peak corresponding to polymyxin B1-I is not more than 0.15 times the area of the corresponding peak in the chromatogram obtained with the reference solution (15.0 per cent) and the sum of polymyxin B1, polymyxin B1-I, polymyxin B2, and polymyxin B3 is not less than 80 per cent.

Related substances. Determine by liquid chromatography (2.4.14), as described under Composition of Polymyxins.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3.0 per cent and the sum of all the secondary peaks is not more than 17.0 per cent, calculated by area normalisation. Ignore any peak with an area less than 0.007 times the area of polymyxin B1 peak in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 5.0 per cent, moistening the charred residue with 2 ml of *nitric acid* and 5 drops of *sulphuric acid*.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.1 g in a capillary-stoppered bottle by drying under vacuum at 60° for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10).

Polymyxin B sulphate intended for use in the manufacture of parenteral preparations complies with the following additional tests.

Sterility. Comply with the test for sterility (2.2.11).

Pyrogens. Complies with the test for pyrogens (2.2.8), using per kg of the rabbit's weight, 1.0 ml of a 20×10^3 polymyxin B units per ml solution of the substance under examination in pyrogen free 0.9 per cent w/v solution of *sodium chloride*.

Storage. Store protected from light and moisture.

Labelling. Where it is intended for use in preparing injectable or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

Polymyxin B for Injection

Polymyxin B for Injection is a sterile material consisting of polymyxin B sulphate. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, or 0.9 per cent w/v sodium chloride injection or 1 per cent w/v procaine hydrochloride injection, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, with in the period recommended by the manufacturer.

Polymyxin B for Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of polymyxin B.

Usual strength. 500000 units per vial.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel G.

Mobile phase. A mixture of 4 volumes of *methanol*, 2 volumes of *isopropyl alcohol*, 2 volumes of *methylene chloride*, 2 volumes of *ammonia solution* and 1.5 volumes of *water*.

Test solution. Dissolve a suitable quantity of Polymyxin B for injection with *0.1M hydrochloric acid* to obtain a solution containing about 10000 polymyxin B units per ml.

Reference solution. Dissolve a suitable quantity of *polymyxin B sulphate IPRS* in *0.1M hydrochloric acid* to obtain a solution containing about 10000 polymyxin B units per ml.

https://nhathuocngocanh.com/

Apply to the plate 10 µl of each solution. Place the plate in a presaturated chromatographic chamber and allow the mobile phase to rise about three-fourth of the length of the plate. Dry the plate at 105° for 10 minutes. Spray with 0.2 per cent w/v solution of *ninhydrin* in *butyl alcohol* and heat at 105° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to spot in the chromatogram obtained with the reference solution.

NOTE — If the chromatogram of the test solution yield excessive streaking, proceed as directed for modified procedure.

Modified procedure. Transfer the test solution to a centrifuge tube, add 10 ml of 1.2 per cent w/v solution of *picric acid*, vortex for 1 minute, centrifuge for 10 minutes, and discard the supernatant. Wash the residue with 1 ml portion of *water* until no yellow colour is observed in the washing. Discard the washings and dry the residue under a stream of nitrogen at 50°. Dissolve the residue in 1 ml of *acetone*, add 1 ml of freshly prepared 1 per cent v/v solution of *sulphuric acid* in *acetone*, shake, centrifuge for 5 minutes, and discard the supernatant. Rinse the residue with 1 ml of *acetone*, centrifuge and discard the washing. Repeat the washing until no yellow colour is observed. Dry the residue under a stream of nitrogen at 50°. Dissolve the residue in 0.5 ml of *0.1 M hydrochloric acid*. Repeat the procedure using this modified test solution instead of the test solution.

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 0.5 per cent w/v solution.

Sulphated ash (2.3.18). Not more than 5.0 per cent, charred the residue being moistened with 2 ml of *nitric acid* and 5 drops of *sulphuric acid*.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.1 g in a capillary-stoppered bottle under vaccum at 60° for 3 hours.

Sterility (2.2.11). Complies with the test for sterility.

Pyrogens. Complies with the test for pyrogens (2.2.8), using the test dose being 1.0 ml per kg of a solution in pyrogen free 0.9 per cent w/v of sodium chloride injection containing 20000 polymyxin B units per ml.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the results in Units per ml.

Storage. Store protected from light, at a temperature between 20° to 25°.

Labelling. Label it to include that where it is administered intramuscularly and /or intrathecally. it is to be given to patients hospitalized so as to provide constant supervision by a physician.

Polyoxyl 35 Castor Oil

Polyoxyl 35 Castor Oil contains mainly the tri-ricinoleate ester of ethoxylated glycerol, with smaller amounts of polyethylene glycol ricinoleate and the corresponding free glycols. It results from the reaction of glycerol ricinoleate with about 35 moles of ethylene oxide.

Category. Pharmaceutical aid.

Description. A yellow, oily liquid, having a faint.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polyoxyl 35 castor oil IPRS* or with the reference spectrum of polyoxyl 35 castor oil.

B. Dissolve about 0.1 g in 10 ml of *ethanolic potassium hydroxide solution*, boil for about 3 minutes and evaporate to dryness. The residue dissolve with 5 ml of *water*, yielding a clear solution. Add a few drops of *glacial acetic acid*; a white precipitate is formed.

C. To a 5 .0 per cent w/v solution, add *bromine solution*, dropwise, the *bromine* is decolorized.

Tests

Weight per ml (2.4.29). 1.05 to 1.06.

Viscosity (2.4.28). 600 to 850 centipoises at 25°, a capillary viscometer being used.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 65 to 80.

Saponification value (2.3.37). 60 to 75.

Iodine value (2.3.28). 25 to 35.

Heavy metals (2.3.13). Weigh about 2 g of the substance under examination in a crucible and add sufficient *sulphuric acid* to wet the substance, carefully ignite at a low temperature until thoroughly charred. Add to the carbonized mass 2 ml of *nitric acid* and 5 drops of *sulphuric acid*, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 ml of *dilute hydrochloric acid*, cover, digest on a steam-bath for 15 minutes, and slowly evaporate on a steam-bath to dryness. Moisten the residue with 1 drop of *hydrochloric acid*, add 10 ml of hot *water*, and digest for 2 minutes. Add *dilute ammonium hydroxide* dropwise until the solution is just alkaline to litmus paper, dilute with *water* to 25 ml, and adjusted to pH 3.0 with *dilute acetic acid*, filter. Rinse the crucible and the filter with 10 ml of *water*, combine the filtrate and rinsing in a 50-ml Nessler cylinder, dilute with *water* to 40 ml, and mix.

https://nhathuocngocanh.com/

To each of the cylinder containing the standard solution and the test solution, add 2 ml of *acetate buffer pH 3.5*, then add 1.2 ml of *thioacetamide- glycerine* base , dilute with *water* to 50 ml, mix, allow to stand for 2 minutes, and view downward over a white surface: the colour of the solution obtained from the test solution is not more intense than that of the solution obtained from the standard solution, produced by treating 2 ml of *lead standard solution* (10 ppm) in a similar manner.

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1 g.

Storage. Store protected from moisture.

Polyoxyl 40 Hydrogenated Castor Oil

Polyoxyl 40 Hydrogenated Castor Oil contains mainly the tri-hydroxystearate ester of ethoxylated glycerol, with smaller amounts of polyethylene glycol tri-hydroxystearate and of the corresponding free glycols. It results from the reaction of glycerol tri-hydroxystearate with about 40 to 45 moles of ethylene oxide.

Category. Pharmaceutical aid.

Identification

A. Dissolve 0.1 g in 1 ml of *water*, add 9 ml of 5.0 per cent w/v solution of *sodium chloride* and heat on a water-bath, the solution becomes turbid at a temperature between 70° and 85°.

B. Dissolve about 0.1 g in 10 ml of *ethanolic potassium hydroxide solution*, boil for about 3 minutes, and evaporate to dryness. Dissolve the residue with 5 ml of *water*, yielding a clear solution. Add a few drops of *glacial acetic acid*; a white precipitate is formed.

Tests

Congealing temperature (2.4.10). 16° to 26°.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 60 to 80.

Saponification value (2.3.37). 45 to 69.

Iodine value (2.3.28). Not more than 2.0.

Heavy metals (2.3.13). Weigh 2 g of the substance under examination in a crucible and add sufficient *sulphuric acid* to wet the substance, carefully ignite at a low temperature until thoroughly charred. Add to the carbonized mass 2 ml of *nitric acid* and 5 drops of *sulphuric acid*, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 ml of *dilute hydrochloric acid*, cover, digest on a steam bath for 15 minutes, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of *hydrochloric acid*, add 10 ml of hot *water*, and digest for 2 minutes. Add *dilute ammonium hydroxide* dropwise until the solution is just alkaline to litmus paper, dilute with *water* to 25 ml, and adjust with *dilute acetic acid* to a pH between 3.0 and 4.0, using short-range pH indicator paper as an external indicator. Filter if necessary, rinse the crucible and the filter with 10 ml of *water*, combine the filtrate and rinsing in a 50-ml Nessler cylinder, dilute with *water* to 40 ml and mix.

To each of the cylinder containing the standard solution and the test solution , add 2 ml of *acetate buffer* pH 3.5, then add 1.2 ml of *thioacetamide- glycerine* base , dilute with *water* to 50 ml, mix, allow to stand for 2 minutes, and view downward over a white surface: the colour of the solution obtained from the test solution is not more intense than that of the solution obtained from the standard solution, produced by treating 2 ml of *lead standard solution* (10 ppm) in a similar manner.

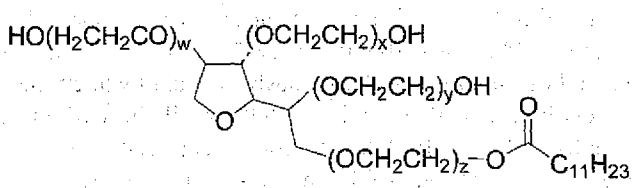
Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1 g.

Storage. Store protected from moisture.

Polysorbate 20

Polyoxyethylene 20 Sorbitan Monolaurate



w + x + y + z = 20

Polyoxyethylene 20 Sorbitan Monolaurate

Polysorbate 20 is a mixture of partial lauric esters of D-glucitol and its anhydrides copolymerised with approximately 20 moles of ethylene oxide for each mole of D-glucitol and its anhydrides. The lauric acid used for the esterification may contain other fatty acids.

Category. Pharmaceutical aid (non-ionic surfactant).

Description. A clear or slightly opalescent, oily, yellowish or brownish yellow liquid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polysorbate 20 IPRS* or with the reference spectrum of polysorbate 20.

https://nhathuocngocanh.com/

B. Dissolve 0.1 g in 5 ml of *chloroform*, add 0.1 g of *potassium thiocyanate* and 0.1 g of *cobalt nitrate* and stir with a glass rod; a blue colour is produced.

Tests

pH (2.4.24). 5.0 to 7.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Acid value (2.3.23). Not more than 2.0, determined on 5.0 g.

Hydroxyl value (2.3.27). 96 to 108, determined on 2.0 g.

Saponification value (2.3.37). 40 to 50, using 15 ml of *0.5 M ethanolic potassium hydroxide* and diluting with 50 ml of *water* before carrying out the titration.

Iodine value (2.3.28). Not more than 5.0, determined by the iodine bromide method.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Reducing impurities. Dissolve 2.0 g in 25 ml of hot *water*, add 25 ml of *1 M sulphuric acid* and 0.1 ml of *ferroin solution* and titrate with *0.01 M ceric ammonium sulphate* shaking continuously until the colour changes from red to greenish blue persists for 30 seconds. Carry out a blank titration. Not more than 2.0 ml of *0.01 M ceric ammonium sulphate* is required.

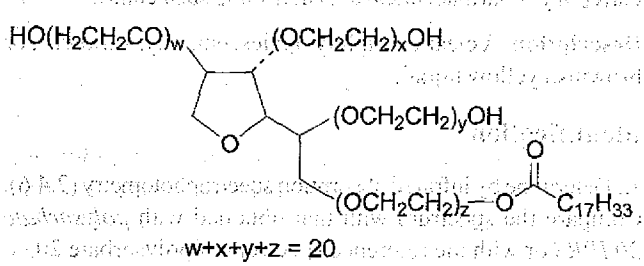
Sulphated ash. Not more than 0.2 per cent, determined by the following method. Weigh 2.0 g in a silica or platinum crucible, add 0.5 ml of *sulphuric acid* and heat on a water-bath for 2 hours. Carefully ignite at a low temperature until thoroughly charred. Add to the carbonised mass 2 ml of *nitric acid* and 0.25 ml of *sulphuric acid*, cautiously heat until white fumes are evolved and then ignite at 600° until the carbon is completely burnt off. Allow to cool, weigh and repeat the operation for periods of 15 minutes until two successive weighings do not differ by more than 0.5 mg.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Storage. Store protected from light and moisture.

Polysorbate 80

Polyoxyethylene 80 Sorbitan Monooleate



Polysorbate 80 is a mixture of partial oleic esters of D-glucitol and its anhydrides copolymerised with approximately 20 moles of ethylene oxide for each mole of D-glucitol and its anhydrides.

Category. Pharmaceutical aid (non-ionic surfactant).

Description. A clear or almost clear, oily, yellowish or brownish yellow liquid.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polysorbate 80 IPRS* or with the reference spectrum of polysorbate 80.

B. Dissolve 0.1 g in 5 ml of *chloroform*, add 0.1 g of *potassium thiocyanate* and 0.1 g of *cobalt nitrate* and stir with a glass rod; a blue colour is produced.

C. To 2 ml of a 5 per cent w/v solution add 0.5 ml of *bromine water*; the bromine is decolourised.

Tests

Acid value (2.3.23). Not more than 2.0, determined on 5 g.

Hydroxyl value (2.3.27). 65 to 80, determined on 2.0 g.

Saponification value (2.3.37). 45 to 55, using 15 ml of *0.5 M ethanolic potassium hydroxide* and diluting with 50 ml of *water* before carrying out the titration.

Iodine value (2.3.28). 18 to 24, determined by the iodine bromide method.

Reducing impurities. Dissolve 2.0 g in 25 ml of hot *water*, add 25 ml of *1 M sulphuric acid* and 0.1 ml of *ferroin solution* and titrate with *0.01 M ceric ammonium sulphate* shaking continuously until the colour changes from red to greenish blue persists for 30 seconds. Carry out a blank titration. Not more than 5.0 ml of *0.01 M ceric ammonium sulphate* is required.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

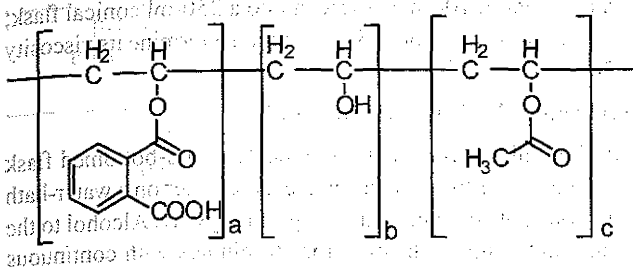
Sulphated ash. Not more than 0.2 per cent, determined by the following method. Weigh 2.0 g in a silica or platinum crucible, add 0.5 ml of *sulphuric acid* and heat on a water-bath for 2 hours. Carefully ignite at a low temperature until thoroughly charred. Add to the carbonised mass 2 ml of *nitric acid* and 0.25 ml of *sulphuric acid*, cautiously heat until white fumes are evolved and then ignite at 600° until the carbon is completely burnt off. Allow to cool, weigh and repeat the operation for periods of 15 minutes until two successive weighings do not differ by more than 0.5 mg.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Polyvinyl Acetate Phthalate



Polyvinyl Acetate Phthalate is a reaction product of phthalic anhydride and a partially hydrolyzed polyvinyl acetate.

Polyvinyl Acetate Phthalate contains not less than 55.0 per cent and not more than 62.0 per cent of phthalyl (o-carboxybenzoyl, $C_8H_5O_3$) groups, calculated on the anhydrous acid-free basis.

Category. Pharmaceutical aid.

Identification

A. The test solution obtained in the Assay shows absorption maximum at about 277 nm (2.4.7).

B. To 10 mg contained in a small test-tube add 10 mg of *resorcinol*, mix, add 0.5 ml of *sulphuric acid*, and heat in a liquid-bath at 160° for 3 minutes. Cool, and pour the solution into a mixture of 25 ml of *1 M sodium hydroxide* and 200 ml of *water*, the solution shows a vivid green fluorescence.

C. Dissolve 2 g in 20 ml of *methanol*, and pour 1 ml of the solution onto a clear glass plate; a film is deposited as the methanol evaporates.

Tests

Viscosity (2.4.28). 7 to 11 centipoises, determined by dissolving 15 g in 85 g of *methanol*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Free phthalic acid. Not more than 0.6 per cent, on the anhydrous basis.

Reference solution. Dissolve 50 mg of *phthalic anhydride* in *water* and dilute to 1000 ml with *water*.

Test solution. Dissolve 1.5 g in a mixture of 40 volumes of *dichloromethane* and 10 volumes of *methanol* and dilute to 50 ml with same solvent mixture. Transfer the solution to a separator with the aid of 75 ml of *water*, and swirl, taking care not to shake. Add 100 ml of *hexane*, shake, and allow the mixture to stand until it separates into 2 layers. Transfer the water layer to a 250-ml volumetric flask. Add 100 ml of *water* to the separator, shake, and allow to stand until the layers separate. Transfer the water layer to the same volumetric flask, dilute to 250 ml with *water*. If the solution is cloudy, centrifuge a portion until clear. Determine the absorbance at 277 nm.

Calculate the content of free phthalic acid by using the formula:

$$25 \times \frac{166.13}{148.12} \times \frac{W_S}{W_U} \times \frac{A_U}{A_S}$$

Where, 166.13 and 148.12 are the molecular weights of phthalic acid and phthalic anhydride, respectively,

W_S and W_U are the weights, in mg, of phthalic anhydride and Polyvinyl Acetate Phthalate, respectively,

A_U and A_S are the absorbances of the test solution and the reference solution, respectively.

Free acid other than phthalic. Not more than 0.6 per cent on the anhydrous basis.

Proceed as directed for test solution under Free phthalic acid, but instead of transferring the water extracts to a volumetric flask, transfer them to a 400-ml beaker, and titrate with *0.1 M sodium hydroxide*, using *phenolphthalein* as indicator.

Calculate the volume, V_p, in ml, of *0.1 M sodium hydroxide* consumed by the free phthalic acid in the sample taken by the formula:

$$V_P = \frac{1}{830.6} \times pW$$

in which p is the percentage of free phthalic acid, previously determined, and W is the weight, in mg, of the sample, on the anhydrous basis.

Calculate the percentage of free acid other than phthalic, as acetic acid, taken by the formula:

$$0.05 \times \frac{10}{W} \times (V - V_P)$$

in which V is the total volume, in ml, of *0.1 M sodium hydroxide* used.

Assay.

Test solution. Dissolve 100 mg of the substance under examination, in *ethanol (95 per cent)* and dilute to 1000.0 ml with *ethanol (95 per cent)*.

Reference solution. Dissolve 50 mg of *phthalic anhydride* with heat in 100 ml of *ethanol (95 per cent)* and dilute to 1000 ml with *ethanol (95 per cent)*.

Determine the absorbance at about 275 nm.

Calculate the content of phthalyl, on the acid-free basis, taken by the formula:

$$100 \times \frac{W_S}{W_U} \times \frac{A_U}{A_S}$$

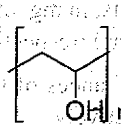
https://nhathuocngocanh.com/

Where, W_S and W_U are the weights, in mg, of phthalic anhydride and Polyvinyl Acetate Phthalate on the anhydrous basis, respectively,

A_U and A_S are the absorbances of the test solution and the reference solution, respectively.

Storage. Store protected from moisture.

Polyvinyl Alcohol



$(C_2H_4O)_n$

Polyvinyl Alcohol is a water soluble synthetic polymer represented by the formula $(C_2H_4O)_n$, in which the average value of n lies between 500 and 5000.

Polyvinyl Alcohol is prepared by 85 per cent to 89 per cent hydrolysis of polyvinyl acetate. The apparent viscosity, in mPa.s at 20° of 4 per cent w/w aqueous solution is not less than 85 per cent and not more than 115 per cent of the label claim.

Category. Pharmaceutical aid.

Description. A white to cream-coloured granular powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polyvinyl alcohol IPRS* or with reference spectrum of polyvinyl alcohol.

B. Dissolve 0.5 g of Polyvinyl Alcohol in 10 ml of *water*, with the aid of heat if necessary, and let the solution cool to room temperature. Transfer 5 ml of the solution so obtained to a test tube, add 1 drop of *iodine TS*, mix, and allow to stand; a dark red to blue colour is produced. Add 10 ml of *ethanol* to the remaining 5 ml of the polyvinyl alcohol solution, and mix; a white, turbid, or flocculent precipitate is formed.

Tests

pH (2.4.24). 5.0 to 8.0, determined in a 4.0 per cent w/v solution.

Viscosity (2.4.28). 85 per cent to 115 per cent of the label claim.

After determining the loss on drying, weigh quantity of undried Polyvinyl Alcohol, equivalent to 6.0 g on the dried basis. Over a period of seconds, transfer the test specimen with continuous slow stirring to about 140 ml of *water* contained in a suitable tared flask. When the specimen is well wetted, increase the rate of stirring, avoiding mixing in excess air. Heat the mixture to 90°, and maintain the temperature at 90° for about 5 minutes. Discontinue heating, and continue stirring for 1 hour. Add water to make the mixture weigh 150 g. Resume stirring to obtain a homogenous solution. Filter the solution through a tared 100-mesh screen into a 250-ml conical flask; cool the filtrate to about 15°, and mix. Determine its viscosity at 20°.

Acid value (2.3.23). Not more than 3.0.

Add 200 ml of *water* to a borosilicate round-bottomed flask attached to a reflux condenser. Heat the water on a water-bath with constant stirring. Add 10.0 g of Polyvinyl Alcohol to the water, and continue heating for 30 minutes with continuous stirring. Remove the flask from the water bath, and continue stirring until room temperature is reached. Transfer this solution to a 250-ml volumetric flask, dilute with *water* to volume and mix. Add 1 ml of *phenolphthalein solution* to 50 ml of the solution and titrate with *0.05 M potassium hydroxide* until the pink colour persists for 15 seconds.

Calculate the acid value from the expression:

$$2.805V/2$$

V is the number of millilitres of *0.05 M potassium hydroxide* used.

Ester value (2.3.26). 90.0 per cent to 110.0 per cent of the value stated on the label.

Saponify 1.0 g in a mixture of 25.0 ml of *0.5 M alcoholic potassium hydroxide* and 25.0 ml of *water*.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 110°.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) viscosity in terms of mPas (2) ester value.

Potassium Chloride and Dextrose Injection

Potassium Chloride in Dextrose Injection; Potassium Chloride and Dextrose Intravenous Infusion; Potassium Chloride and Glucose Intravenous Infusion

Potassium Chloride and Dextrose Injection is a sterile solution of Potassium Chloride and Dextrose in Water for Injections.

Potassium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of potassium chloride, KCl, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

https://nhathuocngocanh.com/

Usual strengths: Injections containing the following amounts of potassium chloride, KCl, and dextrose, $C_6H_{12}O_6$.

per cent w/v of Potassium Chloride (KCl)	per cent w/v of Dextrose ($C_6H_{12}O_6$)
0.075	5
0.15	5
0.225	5
0.30	5

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives reaction (B) of potassium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm, absorbance at about 284 nm (2.4.7); not more than 0.25.

Heavy metals (2.3.13). Evaporate a volume containing 4.0 g of Dextrose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For potassium chloride* — Titrate a measured volume containing 0.1 g of Potassium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.007455 g of KCl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers.

Labelling. The label states (1) the strength as the percentages w/v of Potassium Chloride and Dextrose; (2) the total osmolar concentration in mOsmol per litre; (3) where the contents are less than 100 ml, or where the label states that the Injection is not for direct use but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per ml; (4) the content of potassium in millimoles; (5) that the injection containing visible particles in the solution should not be used.

Potassium Chloride, Sodium Chloride and Dextrose Injection

Potassium Chloride in Dextrose and Sodium Chloride Injection; Potassium Chloride, Sodium Chloride and Dextrose Intravenous Infusion; Potassium Chloride, Sodium Chloride and Glucose Intravenous Infusion

Potassium Chloride, Sodium Chloride and Dextrose Injection is a sterile solution of Potassium Chloride, Sodium Chloride and Dextrose in Water for Injections.

Potassium Chloride, Sodium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, and chloride, Cl, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths: Injections containing the following amounts of potassium chloride, KCl, sodium chloride, NaCl, and dextrose, $C_6H_{12}O_6$.

per cent w/v of Potassium Chloride (KCl)	per cent w/v of Sodium Chloride (NaCl)	per cent w/v of Dextrose ($C_6H_{12}O_6$)
0.075	0.250	5

https://nhathuocngocanh.com/

Potassium Clavulanate Diluted contains not less than 91.2 per cent and not more than 107.1 per cent of the stated amount of potassium clavulanate, $C_8H_8KNO_5$.

Category. Beta-lactamase inhibitor.

Description. A white or almost white powder, hygroscopic.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. It gives reaction (A) of potassium salts (2.3.1).

C. Depending on the diluent used, carry out one of the relevant identification tests given below.

(i) On a watch-glass place a quantity of the substance under examination corresponding to 20 mg of cellulose and disperse in 4 ml of *iodinated zinc chloride solution*. The powder becomes violet-blue in colour.

(ii) It gives the reaction of silicates (2.3.1).

Tests

pH (2.4.24) 4.8 to 8.0, determined on a quantity of the substance under examination containing 0.2 g of potassium clavulanate dissolved in 20 ml of *carbon dioxide-free water*.

Polymeric impurities and other impurities absorbing at 278 nm. Disperse a quantity of the substance under examination containing 50 mg of potassium clavulanate in 10 ml of *0.1 M phosphate buffer solution pH 7.0* and dilute to 50.0 ml with the buffer solution, filter. The absorbance of the solution determined at 278 nm is not more than 0.40.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of the substance under examination containing 0.25 g of potassium clavulanate in 5 ml of mobile phase A, dilute to 25.0 ml with mobile phase A and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of *amoxycillin trihydrate IPRS* in 1 ml of the test solution and dilute to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen phosphate*, adjusted to pH 4.0 with *dilute phosphoric acid*,

B. a mixture of equal volumes of mobile phase A and *methanol*,

- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4	100	0
15	50	50
18	50	50
24	100	0

Inject reference solution (b). The resolution between the clavulanate (first peak) and amoxycillin (second peak) is not less than 13.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 2.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination containing about 50.0 mg of potassium clavulanate in a 0.4 per cent w/v solution of *sodium acetate*, the adjusted to pH 6.0 with *glacial acetic acid*, dilute to 50.0 ml with the same solution and filter.

Reference solution (a). Dissolve 50.0 mg of *lithium clavulanate IPRS* in a 0.4 per cent w/v solution of *sodium acetate* with the pH previously adjusted to 6.0 with *glacial acetic acid* and dilute to 50.0 ml with the same solution.

Reference solution (b). Dissolve 10 mg of *amoxycillin trihydrate IPRS* in 10 ml of reference solution (a).

Chromatographic system

- a stainless steel column 30 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of a 1.5 per cent w/v solution of *sodium dihydrogen phosphate*, adjusted to pH 4.0 with *dilute orthophosphoric acid*,
- flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

– spectrophotometer set at 230 nm,
– injection volume: 10 µl.

Inject reference solution (b). The resolution between the clavulanate peak and amoxycillin peak is not less than 3.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_8H_8KNO_5$.

1 mg of clavulanate ($C_8H_9NO_5$) is equivalent to 1.191 mg of $C_8H_8KNO_5$.

Storage. Store protected from moisture.

Labelling. The label states the contents of potassium clavulanate and the diluent used to prepare the mixture.

Potassium Permanganate

$KMnO_4$ Mol. Wt. 158.0

Potassium Permanganate contains not less than 99.0 per cent and not more than 100.5 per cent of $KMnO_4$.

Category. Antiseptic.

Description. A dark purple or brownish black, granular powder or dark purple or almost black slender, prismatic crystals, having a metallic lustre. It decomposes on contact with certain organic substances.

Identification

A. A solution in *water* acidified with *sulphuric acid* and heated to 70° is decolorised by *hydrogen peroxide solution (20 vol)*.

B. Heated to redness, it decrepitates, evolves oxygen and leaves a black residue which with *water* forms *potassium hydroxide solution*; the resulting solution when neutralised with *dilute hydrochloric acid* gives the reactions of potassium salts (2.3.1).

Tests

Appearance of solution. Dissolve 1.5 g in 50 ml of distilled *water*, heat on a water-bath and add gradually 6 ml of *ethanol (95 per cent)*, cool, dilute to 60 ml with distilled *water* and filter. The filtrate (solution A) is colourless (2.4.1).

Chlorides (2.3.12). 40 ml of solution A complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 10 ml of solution A complies with the limit test for sulphates (600 ppm).

Water-insoluble matter. Dissolve 0.5 g in 50 ml of *water*, heat to boiling, filter through a tared, sintered-glass filter (porosity No. 4) and wash with *water* until the filtrate is colourless. The weight of the residue, dried at 105° to constant weight, is not more than 5 mg (1.0 per cent).

Assay. Dissolve 0.3 g in sufficient *water* to produce 100.0 ml. To 20.0 ml add 20 ml of *water*, 1 g of *potassium iodide* and 10 ml of *2 M hydrochloric acid* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator.

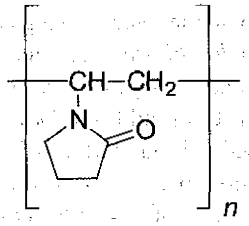
1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.003160 g of $KMnO_4$.

Storage. Store protected from moisture.

CAUTION — Great care should be taken in handling potassium permanganate as dangerous explosions are liable to occur if it is brought into contact with organic or other readily oxidisable substances, either in solution or in the dry condition.

Povidone

Polyvinylpyrrolidone; Polyvidone



$(C_6H_9NO)_n$ Mol. Wt. $(111.2)_n$

Povidone is poly(2-oxopyrrolidin-1-yl-ethylene) and consists of linear polymers of 1-vinylpyrrolidin-2-one. The different types of Povidone are characterised by their viscosity in solution, expressed as K-value, in the range 10 to 95.

Povidone with a nominal K-value of 15 or less has a K-value of not less than 85.0 per cent and not more than 115.0 per cent of the declared value. The K-value of povidone with a nominal K-value of more than 15, or a nominal K-value range with an average of more than 15, is not less than 90.0 per cent and not more than 107.0 per cent of the declared value or of the average of the declared range. It contains not less than 11.5 per cent and not more than 12.8 per cent of nitrogen, N, calculated on the anhydrous basis.

Category. Pharmaceutical aid (tablet binder, coating agent, dispersing and suspending agent).

Description. A white or yellowish white powder or flakes; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *povidone IPRS*.

https://nhathuocngocanh.com/

B. Add 2.5 g in small portions to a suitable volume of *carbon dioxide-free water*, stirring with a magnetic stirrer, and dilute to 25 ml with the same solvent (solution A). To 0.4 ml of solution A add 10 ml of *water*, 5 ml of *2 M hydrochloric acid* and 2 ml of *potassium dichromate solution*; an orange-yellow precipitate is produced.

C. To 1 ml of solution A add 0.2 ml of *dimethylaminobenzaldehyde reagent* and 0.1 ml of *sulphuric acid*; a pink colour is produced.

D. To 0.1 ml of solution A add 5 ml of *water* and 0.2 ml of *0.05 M iodine*; a red colour is produced.

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BS6 or BYS6 (2.4.1).

Heavy metals. Mix 2.0 g with 0.5 g of *magnesium oxide* in a silica crucible. Ignite to dull red heat until a homogeneous white or greyish white mass is produced. Heat at 800° for about 1 hour, dissolve the residue using two quantities, each of 5 ml, of *5 M hydrochloric acid*, add 0.1 ml of *phenolphthalein solution* and *strong ammonia solution* until a pink colour is produced. Cool, add *glacial acetic acid* until the solution is decolorised and add a further 0.5 ml. Filter if necessary and dilute the solution to 20 ml with *water*. To 12 ml of the resulting solution add 2 ml of *acetate buffer pH 3.5*, mix, add 1.2 ml of *thioacetamide reagent*, mix immediately and allow to stand for 2 minutes. Any brown colour produced is not more intense than that obtained by treating in the same manner a mixture of 2 ml of the test solution obtained above and 10 ml of the 20 ml of solution obtained by repeating the procedure using 2 ml of *lead standard solution (10 ppm Pb)* in place of the substance under examination, adding 0.5 g of *magnesium oxide* in a silica crucible and continuing as described above beginning at the words "Ignite to dull red heat...." (10 ppm).

Aldehydes. Boil 20.0 g in 180 ml of a 25 per cent v/v solution of *sulphuric acid* in a round-glass-stoppered flask under a reflux condenser for 45 minutes and allow to cool. Fit a distillation head, distil and collect 60 ml of the distillate in 20 ml of a 7.0 per cent w/v solution of *hydroxylamine hydrochloride*, previously adjusted to pH 3.1 using *1 M sodium hydroxide*, and cooled in ice. Titrate with *0.1 M sodium hydroxide* to pH 3.1. Carry out a blank titration. Not more than 9.1 ml of *0.1 M sodium hydroxide* is required (0.2 per cent, calculated as acetaldehyde, C_2H_4O).

1-vinylpyrrolidin-2-one. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 0.25 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *1-vinylpyrrolidin-2-one* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol*. Further dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *1-vinylpyrrolidin-2-one* and 0.5 g of *vinyl acetate* in 100.0 ml of *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 50 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to 1-vinylpyrrolidin-2-one and vinyl acetate is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of the peak due to 1-vinylpyrrolidin-2-one is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent determined on 0.5 g.

K-value. For Povidone with a stated K-value of 18 or less, prepare a 5.0 per cent w/v solution. For Povidone with a declared K-value of more than 18, prepare a 1.0 per cent w/v solution. Allow the solution to stand for 1 hour and carry out Method B for the determination of viscosity (2.4.28), at 25° ± 0.2° using a size no. 1 viscometer with a minimum flow time of 100 seconds. Calculate the K-value (K_o) from the expression

$$K_o = \frac{1.5 \log z - 1}{0.15 + 0.003c} + \frac{\sqrt{300c \log z + (c + 1.5c \log z)^2}}{0.15c + 0.003c^2}$$

where c is the percentage concentration w/v of the substance under examination, calculated on the anhydrous basis, and z is the viscosity of the solution relative to that of *water*.

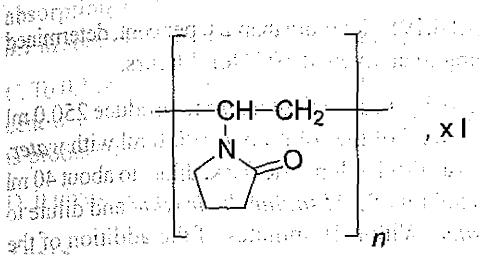
Nitrogen (2.3.30). Follow Method C, using 0.3 g, weighed and 11 ml of *nitrogen-free sulphuric acid*. For complete destruction of organic matter repeat the addition of *hydrogen peroxide (10 vol)* (usually 3 to 6 times) until a clear, light-green solution is obtained, then heat for a further 4 hours.

Storage. Store protected from moisture.

Labelling. The label states the viscosity in terms of a K-value or K-range.

https://nhathuocngocanh.com/

Povidone-Iodine



Povidone-Iodine is a complex produced by interaction between iodine and poly(2-oxopyrrolidin-1-ylethylene).

Povidone-Iodine contains not less than 9.0 per cent and not more than 12.0 per cent of available iodine, I, calculated on the dried basis.

Category. Topical anti-infective; antiseptic.

Description. A yellowish brown amorphous powder.

Identification

A. Add 0.05 ml of a 10 per cent w/v solution to a mixture of 1 ml of *starch solution* and 9 ml of *water*; a deep blue colour is produced.

B. Spread 1 ml of a 10 per cent w/v solution over an area of about 20 cm x 20 cm on a glass plate and allow it to dry in air at room temperature and in an atmosphere of low humidity overnight; a brown, dry, non-smearing film is formed which dissolves readily in *water*.

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Nitrogen (2.3.30). 9.5 to 11.5 per cent, calculated on the dried basis, determined on about 0.3 g, by Method A.

Iodide. Not more than 6.6 per cent, calculated on the dried basis, determined by the following method. Weigh 0.5 g and dissolve in 100 ml of *water*. Add sufficient *sodium bisulphite solution* until the colour of iodine is discharged. Add 25.0 ml of *0.1 M silver nitrate* and 10 ml of *nitric acid* and mix. Titrate with *0.1 M ammonium thiocyanate*, using *ferric ammonium sulphate solution* as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of silver nitrate required. 1 ml of *0.1 M silver nitrate* is equivalent to 0.01269 g of I. From the percentage of total iodine, calculated on the dried basis, subtract the percentage of available iodine determined in the Assay and obtain the percentage of iodide.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh 3 g, transfer to a beaker and add 200 ml of *water*. Cover the beaker and stir with a mechanical stirrer at room temperature for not more than 1 hour to dissolve as completely as possible. Titrate immediately thereafter with *0.1 M sodium thiosulphate* using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01269 g of I.

Storage. Store protected from light.

Povidone-Iodine Solution

Povidone-Iodine Solution is a solution of Povidone-Iodine in Purified Water. It may contain a small amount of Ethanol.

Povidone-Iodine Solution contains not less than 85.0 per cent and not more than 120.0 per cent of the stated amount of iodine, I.

Usual strengths. 5 per cent w/v; 7.5 per cent w/v; 10 per cent w/v.

Description. A deep brown liquid.

Identification

A. Dilute 1 ml to 20 ml with *water* and add 1 ml of the resulting solution to a mixture of 1 ml of *starch solution* and 9 ml of *water*; a deep blue colour is produced.

B. Transfer 10 ml to a small flask and cover the mouth of the flask with a filter paper soaked in *starch solution*; no blue colour is produced on the paper within 60 seconds.

C. Dilute 20 ml to 100 ml with *water*. To 10 ml add dropwise *0.1 M sodium thiosulphate* until the colour is just discharged. To 5 ml of the resulting solution add 5 ml of *2 M hydrochloric acid* and 2 ml of *potassium dichromate solution*; a red precipitate is produced.

Tests

pH (2.4.24). 3.0 to 6.5.

Ethanol (if present) (2.3.45). 90.0 to 110.0 per cent of the stated amount of C_2H_5OH, determined by Method A after decolorising the solution with just sufficient quantity of a 10 per cent w/v solution of *sodium thiosulphate* and treating with a few drops of *dilute sodium hydroxide solution*.

Assay. To a measured volume containing about 50 mg of iodine add sufficient *water* to produce not less than 30 ml and titrate immediately with *0.02 M sodium thiosulphate*, using 3 ml of

https://nhathuocngocanh.com/

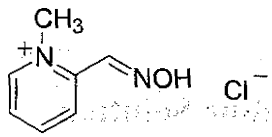
starch solution, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of *0.02 M sodium thiosulphate* is equivalent to 0.002538 g of I.

Storage. Store protected from light.

Labelling. The label states the quantities of iodine and ethanol (if present) as percentages w/v.

Pralidoxime Chloride



$C_7H_9ClN_2O$ Mol. Wt. 172.6

Pralidoxime Chloride is 2-hydroxyiminomethyl-1-methylpyridinium chloride.

Pralidoxime Chloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_7H_9ClN_2O$, calculated on the dried basis.

Category. Antidote for cholinesterase inhibitors.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pralidoxime chloride IPRS* or with the reference spectrum of pralidoxime chloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 242 nm and 292 nm and in *0.1 M sodium hydroxide*, a maximum at about 336 nm.

C. To 0.1 ml of a 20 per cent w/v solution add 1 ml of a 0.6 per cent w/v solution of *ferric chloride*; an amber-brown colour is produced.

D. It gives the reactions of chlorides (2.3.1).

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Chloride content. 20.2 to 20.8 per cent, calculated on the dried basis, determined by the following method. Dissolve 0.3 g in about 150 ml of *water*, add 20 ml of *glacial acetic acid* and 10 drops of *(4-tert-octylphenoxy) nonaethoxyethanol* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.5 g in sufficient *water* to produce 250.0 ml and mix. Dilute 5.0 ml of the solution to 100.0 ml with *water*. Transfer 5.0 ml to a 50-ml volumetric flask, dilute to about 40 ml with *water*, add 5.0 ml of *1 M sodium hydroxide* and dilute to volume with *water*. Within 10 minutes of the addition of the alkali, measure the absorbance of the solution at the maximum at about 332 nm (2.4.7), using a solution of 5.0 ml of *1 M sodium hydroxide* diluted with *water* to 50.0 ml as the blank.

Calculate the content of $C_7H_9ClN_2O$ from the absorbance obtained by carrying out the assay simultaneously using about 0.5 g, weighed, of *pralidoxime chloride IPRS*.

Storage. Store protected from moisture.

Pralidoxime Chloride Injection

Pralidoxime Chloride Injection is a sterile material consisting of Pralidoxime Chloride with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Pralidoxime Chloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pralidoxime chloride, $C_7H_9ClN_2O$.

Usual strength. 1 g.

Description. A white to pale yellow powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pralidoxime chloride IPRS* or with the reference spectrum of pralidoxime chloride.

https://nhathuocngocanh.com/

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 242 nm and 292 nm and in *0.1 M sodium hydroxide*, a maximum at about 336 nm.

C. To 0.1 ml of a 20 per cent w/v solution add 1 ml of a 0.6 per cent w/v solution of *ferric chloride*; an amber-brown colour is produced.

D. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24): 3.5 to 4.5, determined in a 5.0 per cent w/v solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

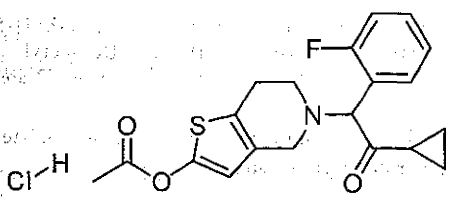
Bacterial endotoxins (2.2.3). Not more than 0.1 Endotoxin Unit per mg of pralidoxime chloride.

Assay. Dissolve 0.5 g in sufficient *water* to produce 250.0 ml and mix. Dilute 5.0 ml of the solution to 100.0 ml with *water*. Transfer 5.0 ml to a 50-ml volumetric flask, dilute to about 40 ml with *water*, add 5.0 ml of *1 M sodium hydroxide* and dilute to volume with *water*. Within 10 minutes of the addition of the alkali, measure the absorbance of the solution at the maximum at about 332 nm (2.4.7), using a solution of 5.0 ml of *1 M sodium hydroxide* diluted with *water* to 50.0 ml as the blank.

Calculate the content of $C_7H_9ClN_2O$ from the absorbance obtained by carrying out the assay simultaneously using about 0.5 g, weighed, of *pralidoxime chloride IPRS*.

Labelling. The label states the period within which the constituted injection should be used.

Prasugrel Hydrochloride



$C_{20}H_{20}FNO_3S, HCl$ Mol. Wt. 409.9

Prasugrel Hydrochloride is Ethanone, 2-[2-(acetyloxy)-6,7-dihydrothieno[3,2-c]pyridin-5(4*H*)-yl]-1-cyclopropyl-2-(2-fluorophenyl)-hydrochloride.

Prasugrel Hydrochloride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{20}H_{20}FNO_3S, HCl$, calculated on the anhydrous basis.

Category. Anti thrombotic Agent.

Description. A white to almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prasugrel hydrochloride IPRS* or with the reference spectrum of prasugrel hydrochloride .

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reactions of chlorides (2.3.1).

Tests

Related substances. A. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water.*

Test solution. Dissolve 75 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.0015 per cent w/v *prasugrel hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (c). Transfer 5 mg of *prasugrel hydrochloride IPRS* to a 50-ml volumetric flask, add 20 ml of the solvent mixture and mix to dissolve. Add 1 ml of 0.0003 per cent v/v of piperidine in *acetonitrile* and dilute to volume with the solvent mixture. Heat the solution at 50° for one hour and cool to room temperature. Dilute 2.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: a mixture of 65 volumes of 0.01M *monobasic potassium phosphate*, 25 volumes of *tetrahydrofuran* and 10 volumes of *acetonitrile*,
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time
Desacetyl prasugrel diastereomer 1[1]	0.43
Desacetyl prasugrel diastereomer 2[1]	0.45
Desfluoro prasugrel[2]	0.9
Prasugrel	1.0
4-Fluoro prasugrel[3]	1.2
3-Fluoro prasugrel[4]	1.3

https://nhathuocngocanh.com/

[1]5-[2-Cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-5,6,7,7a-tetrahydrothieno[3,2-c]pyridine-2(4H)-one. Desacetyl prasugrel diastereomer 1and desacetyl prasugrel diastereomer 2 are a pair of diastereomers. They are used for resolution measurement only,

[2]5-(2-Cyclopropyl-2-oxo-1-phenylethyl)-4,5,6,7- tetrahydrothieno [3,2-c]pyridin-2-yl acetate,

[3]5-[2-Cyclopropyl-1-(4-fluorophenyl)-2-oxoethyl] -4,5,6,7- tetra-hydrothieno[3,2-c]pyridin-2-yl acetate,

[4]5-[2-Cyclopropyl-1-(3-fluorophenyl)-2-oxoethyl] -4,5,6,7- tetra-hydrothieno[3,2-c]pyridin-2-yl acetate.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 is not less than 1.5 in the chromatogram obtained with reference solution (c). The relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a) and the signal to noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to desfluoro prasugrel is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to 4-fluoro prasugrel is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), and the area of any peak corresponding to 3-fluoro prasugrel is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

B. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water.*

Test solution. Dissolve 250 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v *prasugrel hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Transfer 5 mg of *prasugrel hydrochloride IPRS* in to a 50-ml volumetric flask, add 20 ml of the solvent mixture and mix to dissolve. Add 1 ml of 0.0003 v/v of piperidine in *acetonitrile* and dilute to volume with the solvent mixture. Heat the solution at 50° for one hour and cool to room temperature.

Prasugrel	1.0	—
Prasugrel chlorobutyryl analog[4]	1.06	1.37

[1]5-[2-Cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-7a-hydroxy5,6,7,7a-tetrahydrothieno[3,2-c]pyridine-2(4H)-one,

[2]1-Cyclopropyl-2-(2-fluorophenyl)ethane-1,2-dione,

[3]5-[2-Cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-5,6,7,7a-tetrahydrothieno[3,2-c]pyridin-2(4H)-one. Desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 are a pair of diastereomers,

[4]5-[5-Chloro-1-(2-fluorophenyl)-2-oxoethyl]-4,5,6,7-tetrahydro-thieno[3,2-c]pyridin-2-yl acetate.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 is not less than 0.9 in the chromatogram obtained with the reference solution (c), the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with the reference solution (a) and the signal to noise ratio is not less than 10 in the chromatogram obtained with the reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any

https://nhathuocngocanh.com/

peak corresponding to desacetyl hydroxyprasugrel is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any peak corresponding to prasugrel diketone is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to desacetyl prasugrel diastereomer 1 is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to desacetyl prasugrel diastereomer 2 is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to prasugrel chlorobutyryl analog is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (a) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent, using platinum crucible.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v *prasugrel hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 65 volumes of *0.01 M monobasic potassium phosphate* adjusted to pH 2.8 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent. Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak.

Calculate the content of $C_{20}H_{20}FNO_3S$, HCl,

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Prasugrel Tablets

Prasugrel Hydrochloride Tablets

Prasugrel Tablets contain prasugrel hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prasugrel, $C_{20}H_{20}FNO_3S$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01M hydrochloric acid.*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14),

Test solution. Use the filtrate, dilute if necessary, with *acetonitrile.*

Reference solution. A 0.024 per cent w/v solution of *prasugrel hydrochloride IPRS* in *acetonitrile.* Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium and further dilute 5.0 ml of the solution to 50.0 ml with the *acetonitrile.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase. a mixture of 48 volumes of a buffer solution prepared by dissolving 1.36 gm of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 2.7 with *dilute orthophosphoric acid* and 52 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the

https://nhathuocngocanh.com/

tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the medium.

Q: Not less than 75 per cent of the stated amount of $C_{20}H_{20}FNO_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Prasugrel in 10 ml of *water* with the aid of ultrasound and dilute to 100.0 ml with *acetonitrile*.

Reference solution (a). A 0.0055 per cent w/v solution of *prasugrel hydrochloride IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). To 25 mg of *prasugrel hydrochloride IPRS*, add 2 ml of *hydrogen peroxide (5 per cent)*, warm in water-bath at 80° for one minute. Cool and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase A. *0.01M potassium dihydrogen orthophosphate* adjusted to pH 3.1 with *dilute orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
40	50	50
50	25	75
60	25	75
62	70	30
70	70	30

Name	Relative retention time	Correction factor
Desacetyl hydroxyl prasugrel[1]	0.9	0.83
Prasugrel hydrochloride	1.0	—
Desacetyl prasugrel diastereomer1[2]	1.4	0.76
Desacetyl prasugrel diastereomer 2[2]	1.5	0.76

[1](5-[2-cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-7a-hydroxy-5,6,7,7a-tetrahydrothieno [3, 2-c]pyridine-2(4 H)-one),

[2](5-[2-cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-5,6,7,7a-tetra hydrothieno [3,2-c] pyridin-2(4H)-one) Desacetyl prasugrel diastereomer1 and Desacetyl prasugrel diastereomers 2 are pair of diastereomers.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) for identification of desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 peaks.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area any peak corresponding to desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 is not more than 30 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area any peak corresponding to desacetyl hydroxyl prasugrel is not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). The area of any other secondary peak is not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent) and the sum of areas of all the secondary peaks excluding desacetyl prasugrel diastereomer 1 and desacetyl prasugrel diastereomer 2 is not more than 30 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Transfer one intact tablet to a suitable volumetric flask, add 10 ml of *water* and disperse with the aid of ultrasound. Add 70 ml of *acetonitrile* and further sonicate for 30 minutes with intermittent shaking, dilute with the solvent mixture to obtain a solution containing 0.005 per cent w/v of prasugrel.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Prasugrel in 10 ml of *water* with the aid of ultrasound. Add 70 ml of *acetonitrile*

https://nhathuocngocanh.com/

and further sonicate for 30 minutes with intermittent shaking, dilute to 100.0 ml with *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.0055 per cent w/v solution of *prasugrel hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase. a mixture of 60 volumes of a buffer solution prepared by dissolving 1.36 gm of *potassium dihydrogen phosphate* in 1000 ml of *water,* adjusted to pH 2.7 with *diluted orthophosphoric acid* and 40 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of prasugrel.

Prasugrel and Aspirin Gastro-resistant Capsules

Prasugrel Hydrochloride and Aspirin Gastro-resistant Capsules

Prasugrel and Aspirin Gastro-resistant Capsules contain prasugrel hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prasugrel, $C_{20}H_{20}FNO_3S$ and aspirin, $C_9H_8O_4$.

Usual strength. Prasugrel 10 mg and Aspirin 75 mg.

Identification

In the Assay of prasugrel, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution and in the Assay of aspirin, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Prasugrel —

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate , dilute if necessary, ith *acetonitrile* to obtain a solution having a known concentration similar to the expected concentration of the reference solution.

Reference solution. A 0.024 per cent w/v solution of *prasugrel hydrochloride IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium. Further dilute 5.0 ml of the solution to 50.0 ml with *acetonitrile.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Oyster ODS 3),
- sample temperature: 15°,
- mobile phase. a mixture of 60 volumes of *0.01M potassium dihydrogen orthophosphate,* adjusted to pH 2.7 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{20}FNO_3S$.

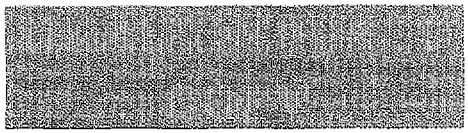
For Aspirin —

A. Apparatus No. 1 (Basket),
Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, if necessary, dilute suitably with the dissolution medium to obtain a solution with a known concentration similar to the expected concentration of the reference solution.



https://nhathuocngocanh.com/

Reference solution. Weight and transfer 30 mg of *aspirin IPRS* to 200- ml volumetric flak add 5 ml of *acetonitrile* and dissolve with the aid of ultrasound and dilute to volume with the dissolution medium. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 2),
- sample temperature: 5°,
- mobile phase: A. a buffer solution prepared by dissolving 1.78 gm of *potassium dihydrogen ortophosphate* in 1000 ml of *water,* adjusted to pH 2.3 with *dilute orthophosphoric acid,*

B. a mixture of 70 volumes *acetonitrile* and 20 volumes *methanol.*

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	55	45
10	55	45
11	20	80
15	20	80
16	55	45
20	55	45

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent. Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Complies with the acceptance criteria given under Acid stage.

B. Apparatus No. 1 (Basket),

Medium. 1000 ml of a buffer solution prepared by mixing of 75 volumes of *0.1 M hydrochloric acid* and 25 volumes of *0.2 M trisodium phosphate dodecahydrate,* adjusted to pH 6.8 with *2 M hydrochloric acid* or *2 M sodium hydroxide,*

Speed and time. 100 rpm and 90 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Dilute the filtrate, if necessary, with the dissolution medium.

Reference solution. Weight and transfer 30 mg of *aspirin IPRS* to 200-ml volumetric flak add 5 ml of *acetonitrile,* dissolve with the aid of ultrasound and dilute to volume with the dissolution medium. Dilute 5.0 ml of the solution to 10.0 ml with the dissolution medium.

Use chromatographic system as described under Acid stage.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_8O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

For Prasugrel —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water.*

Test solution. Disperse a quantity of the mixed powdered content of the capsules containing 100 mg of Prasugrel in 20 ml of *water,* with the aid of ultrasound. Add 140 ml *acetonitrile,* further sonicate for 30 minutes with intermittent shaking and dilute to 200.0 ml with *acetonitrile.*

Reference solution. A 0,0055 per cent w/v solution of *prasugrel hydrochloride IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the the solvent mixture.

NOTE — Method is sensitive for buffer pH and column temperature.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Inertsil ODS 3V),
- column temperature: 30°,
- sample temperature: 15°,
- mobile phase: A. *0.01M potassium dihydrogen orthophosphate,* adjusted to pH 3.1 with *dilute orthophosphoric acid,*

B. *acetonitrile,*

- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

50	25	75
60	25	75
62	70	30
70	70	30

https://nhathuocngocanh.com/

Name	Relative retention time	Correction factor
Prasugrel impurity HYTP [1]	0.9	0.83
Prasugrel	1.0	—
Prasugrel impurity A_1 [2]	1.4	0.76
Prasugrel impurity A_2 [2]	1.5	0.76

[1](5-[2-cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-7a-hydroxy-5,6,7,7a-tetrahydrothieno [3, 2-c]pyridine-2(4 H)-one),

[2](5-[2-cyclopropyl-1-(2-fluorophenyl)-2-oxoethyl]-4,5,6,7,tetra hydrothieno [3,2-c] pyridine-2(3H)-one).

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to prasugrel impurity A (Sum of the areas of prasugrel impurity A_1 and A_2) is not more than 30 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent) and the area any peak corresponding to prasugrel impurity HYTP is not more than 7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.7 per cent), the area of any other secondary peak is not more than 7 times the area of the principal peak in the chromatogram obtained with the reference solution (0.7 per cent) and the sum of the areas of all the secondary peaks, other than prasugrel impurity A_1 and A_2, is not more than 30 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent). Ignore the peaks due to aspirin, salicylic acid and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

For Aspirin —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water.*

Test solution. Disperse a quantity of the mixed powdered content of the capsules containing 375 mg of Aspirin in 40 ml of the solvent mixture, with the aid of ultrasound for 45 minutes with intermediate shaking and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.0075 per cent w/v solution of *aspirin IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- sample temperature: 15°,
- mobile phase: A. *0.01M potassium dihydrogen orthophosphate,* adjusted to pH 2.5 with *dilute orthophosphoric acid,*

  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
15	60	40
25	20	80
26	60	40
35	60	40

Name	Relative retention time	Correction factor
Aspirin	1.0	—
Salicylic Acid	1.48	1.16

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to salicylic acid is not more than 30 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent), the area of any other secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks, other than salicylic acid is not more than 20 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore the peak due to prasugrel.

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14), as described under Assay of prasugrel with the following modification.

Test solution. Disperse one intact capsule in 20 ml *water*, with the aid of ultrasound. Add 140 ml *acetonitrile*, sonicate for 30 minutes with intermediate shaking and dilute to 200.0 ml with *acetonitrile*, filter,

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

For Prasugrel —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse a quantity of the mixed powdered content of 20 capsules containing 100 mg of Prasugrel in 20 ml *water* and 140 ml *acetonitrile* with the aid of ultrasound for 30 minutes with intermediate shaking and dilute to 200.0 ml with the *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.0055 per cent w/v solution of *prasugrel hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- sample temperature: 15°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 2.7 with *diluted orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FNO_3S$ in the capsules.

For Aspirin —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Disperse a quantity of the mixed powdered content of 20 capsules containing 375 mg of Aspirin in the solvent mixture, with the aid of ultrasound for 45 minutes with intermittent shaking and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.075 per cent w/v solution of *aspirin IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- sample temperature: 15°,
- mobile phase: a mixture of 60 volumes *0.01M potassium dihydrogen phosphate*, adjusted to pH 2.5 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

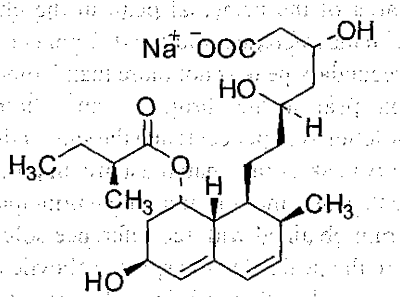
Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of the equivalent amount of prasugrel and aspirin.

Pravastatin Sodium



$C_{23}H_{35}NaO_7$ Mol. Wt. 446.5

Pravastatin Sodium is sodium (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoate

Pravastatin Sodium contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{23}H_{35}NaO_7$, calculated on the anhydrous and ethanol free basis.

Category. Antihyperlipidaemic.

Description. A white to yellowish white powder or crystalline powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pravastatin sodium IPRS* or with the reference spectrum of pravastatin sodium.

https://nhathuocngocanh.com/

B. 1 ml of a 5 per cent w/v solution in *carbon dioxide-free water* (Solution A) gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Dilute 2.0 ml of solution A to 10 ml with *water*. The solution is clear (2.4.1) and not more intensely coloured than the reference solution BYS6 (2.4.1).

pH (2.4.24): 7.2 to 9.0, determined in solution A.

Specific optical rotation (2.4.22). +153° to +159°, determined in a 0.5 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 9 volumes of *methanol* and 11 volumes of *water*.

Test solution (a). Dissolve 100 mg of the substance under examination in 100 ml of the solvent mixture.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *pravastatin impurity A IPRS* in 1 ml of test solution (b).

Reference solution (b). Dilute 2.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 12.4 mg of *pravastatin 1,1,3,3- tetramethylbutylamine IPRS* in 100.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 1 volume of *triethylamine*, 450 volumes of *methanol* and 550 volumes of *water*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

The relative retention times with reference to pravastatin for (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-8-[[(2*S*,3*R*)-3-hydroxy-2-methylbutanoyl]oxy]-2-methyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl] heptanoic acid (3″-hydroxypravastatin) (pravastatin impurity B), (3*R*,5*R*)-3,5-dihydroxy-7-[(1S,2S,6S,8S,8a*R*)-6-hydroxy-8-[[(2S,3S)-3-hydroxy-2-methylbutanoyl]oxy]-2-methyl-1,2,6,7,8,8a-hexahydronapthalen-1-yl] heptanoic acid (3″-(*S*)-hydroxypravastatin) (pravastatin impurity E), (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoic acid (6'-epipravastatin) (pravastatin impurity A), (1*S*,3*S*,7*S*,8*S*,8a*R*)-3-hydroxy-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (pravastatin lactone) (pravastatin impurity D) and (3*R*,5*R*) -3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methyl-pentanoyl]oxy]-1,2,6,7,8,8a-hexahydro-naphthalen-1-yl] heptanoic acid) (pravastatin impurity C) and (3*R*, 5*R*)-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6,8-dihydroxy-2-methyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (pravastatin impurity F) are about 0.2, 0.3, 0.6, 1.9 and 2.1 respectively.

Inject reference solution (b) and test solution (a). Run the chromatogram 2.5 times the retention time of the principal peak of pravastatin. In the chromatogram obtained with test solution (a), the area of peak due to pravastatin impurity A is not more than 1.5 times the area of the principal peak obtained with reference solution (b) (0.3 per cent), the area of peaks due to pravastatin impurities B, C, D and E is not more than the area of the principal peak obtained with reference solution (b) (0.2 per cent), the area of peak due to pravastatin impurity F is not more than 0.75 times the area of the principal peak obtained with reference solution (b) (0.15 per cent) the area of other secondary peak is not more than 0.5 times the area of the principal peak obtained with reference solution (b) (0.1 per cent) and sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *methanol* and dilute to 20 ml with the same solvent mixture and use 12 ml of the solution. The resulting solution complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (2 ppm Pb)* in the same solvent misture..

Ethanol (2.3.45). Not more than 3.0 per cent (determined by method I).

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modification.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{23}H_{35}NaO_7$ from the declared content of pravastatin in *pravastatin 1,1,3,3-tetramethylbutylamine IPRS*.

https://nhathuocngocanh.com/

1 mg of pravastatin is equivalent to 1.052 mg of pravastatin sodium.

Storage. Store protected from light and moisture.

Pravastatin Tablets

Pravastatin Sodium Tablets

Pravastatin Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pravastatin sodium, $C_{23}H_{35}NaO_7$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 10 mg of Pravastatin Sodium with 80 ml of *water* for 10 minutes, dilute to 100 ml with *water*, filter. Dilute 1 ml to 10 ml with *water*. When examined in the range 220 to 350 nm (2.4.7), exhibits a maximum only at 238 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 238 nm (2.4.7). Calculate the content of $C_{23}H_{35}NaO_7$ in the medium from the absorbance obtained from a solution of known concentration of *pravastatin 1,1,3,3-tetramethylbutylamine IPRS* in the dissolution medium.

NOTE — To Calculate the content of $C_{23}H_{35}NaO_7$, use the conversion factor of (446.51/553.78), in which 446.51 and 553.78 are the molecular weights of pravastatin sodium and pravastatin 1,1,3,3-tetramethylbutylamine respectively.

Q. Not less than 80 per cent of the stated amount of $C_{23}H_{35}NaO_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 4.1 g of *anhydrous sodium acetate* in 400 ml of *water*, adjusted to pH 5.6 with *glacial acetic acid* and add sufficient *water* to produce 500.0 ml.

Solution B. Mix 20 volumes of *methanol* with 80 volumes of solution A.

Test solution. Add 20 ml of solution A to a quantity of the powdered tablets containing about 10 mg of Pravastatin Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes, centrifuge. Dilute 1 ml of the clear supernatant liquid to 5 ml with solution B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with solution B.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with solution B.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 4.0 ml with solution B.

Reference solution (d). Dissolve 2 mg of *(3R,5R)-3,5-dihydroxy-7-[(1S,2S,6R,8S,8aR)-6-hydroxy-2-methyl-8-[[(2S)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a- hexahydronaphthalen-1-yl]heptanoic acid IPRS (pravastatin impurity A IPRS)* in the minimum volume of *methanol* and dilute to 20.0 ml with the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Ultrasphere ODS),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 1 volume of *triethylamine*, 450 volumes of *methanol* and 550 volumes of *water*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent), the area of one such peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent), not more than a further one such peak has an area more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (3 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add 20 ml of solution A to a quantity of the powdered tablets containing about 10 mg of Pravastatin

https://nhathuocngocanh.com/

Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes, centrifuge. Dilute 1.0 ml of the clear supernatant liquid to 5.0 ml with solution B.

Reference solution (a). Dissolve 12.4 mg of *pravastatin 1,1,3,3,-tetramethylbutylamine IPRS* in 20 ml of solution A. Dilute 1 ml of the solution to 5 ml with solution B.

Reference solution (b). Dissolve 2 mg of *pravastatin impurity A IPRS* in the minimum volume of *methanol* and dilute to 20.0 ml with the test solution.

Use the chromatographic system, solution A and B as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

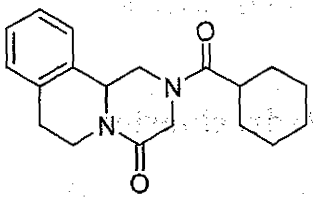
Inject reference solution (a) and the test solution.

Calculate the content of $C_{23}H_{35}NaO_7$ in the tablets using the declared content of pravastatin in *pravastatin 1,1,3,3-tetramethylbutylamine IPRS*.

1 mg of $C_{23}H_{36}O_7$ is equivalent to 1.052 mg of $C_{23}H_{35}NaO_7$.

Storage. Store protected from light and moisture.

Praziquantel



$C_{19}H_{24}N_2O_2$ Mol.Wt. 312.4

Praziquantel is (11b*RS*)-2-(cyclohexylcarbonyl)-1,2,3,6,7,11b-hexahydro-4*H*-pyrazino[2,1-*a*]isoquinolin-4-one.

Praziquantel contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{19}H_{24}N_2O_2$, calculated on the dried basis.

Category. Antihelminthic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *praziquantel IPRS* or with the reference spectrum of praziquantel.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 40 mg of the substance under examination in 10 ml of the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 40 mg of *praziquantel IPRS* in 10.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *(11bRS)-2-benzoyl-1,2,3,6,7,11b-hexahydro-4H-pyrazino[2,1-a]isoquinolin-4-one IPRS (praziquantel impurity A IPRS)* in 25 ml of reference solution (a). Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to praziquantel impurity A and praziquantel is not less than 3.0.

Inject reference solution (b), (c) and test solution (a). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of one such peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 50° over *diphosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 2 hours.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{19}H_{24}N_2O_2$.

Storage. Store protected from light.

Praziquantel Tablets

Praziquantel Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Praziquantel, $C_{19}H_{24}N_2O_2$.

Usual strength. 600 mg.

Identificaton

Extract a quantity of the powdered tablets containing 50 mg of praziquantel with 20 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *praziquantel IPRS* or with the reference spectrum of praziquantel.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Shake a quantity of the powdered tablets containing 30 mg of praziquantel in 5 ml of *methanol* for 5 minutes, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.6 per cent w/v solution of *praziquantel IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid* containing 2.0 mg per ml of *sodium lauryl sulphate*,

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *praziquantel IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{24}N_2O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 150 mg of Praziquantel, add 70 ml of mobile phase, sonicate for 5 minutes, dilute to 100.0 ml with mobile phase, mix and filter. Dilute 3.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.018 per cent w/v solution of *praziquentel IPRS* in the mobile phase.

Chromatographic System

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase : a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

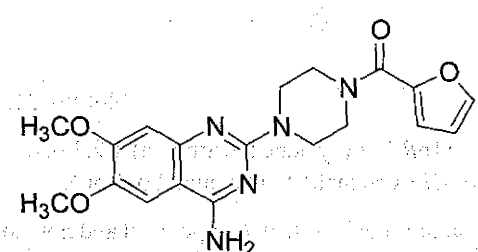
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{24}N_2O_2$ in the tablets.

Storage. Store protected from light.

Prazosin Hydrochloride



$C_{19}H_{21}N_5O_4,HCl$ Mol. Wt. 419.9

Prazosin Hydrochloride is 2-[4-(2-furoyl)piperazin-1-yl]-6,7-dimethoxyquinazolin-4-ylamine hydrochloride.

Prazosin Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{21}N_5O_4,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white or almost white powder.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prazosin hydrochloride IPRS* or with the reference spectrum of prazosin hydrochloride.

B. Prepare a 0.05 per cent w/v solution of the substance under examination in a 0.1 per cent v/v solution of *hydrochloric acid* in *methanol*. Dilute separately 1.0 ml and 5.0 ml of the solution to 100 .0ml with the same acid solution (solution A and B respectively). When examined in the range 220 nm to 280 nm (2.4.7), solution A shows an absorption maximum at about 247 nm; absorbance at the maximum, 0.66 to 0.70. When examined in the range 280 nm to 400 nm, solution B exhibits two maxima at about 330 nm and 343 nm; absorbances at the two maxima, 0.65 to 0.70 and 0.60 to 0.66 respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 1 volume of *diethylamine*, 10 volumes of *methanol* and 10 volumes of *methylene chloride*.

Mobile phase. A mixture of 5 volumes of *diethylamine* and 95 volumes of *ethyl acetate*.

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *prazosin hydrochloride IPRS* in solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in warm air and examine under ultra-violet light at 254 nm. The principal spot in the chroma togram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. A 0.1 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Iron. To 1.0 g add dropwise about 1.5 ml of *nitric acid*, heat cautiously on a water-bath until fumes are no longer evolved. Ignite by slowly raising the temperature from 150° to 1000°, maintaining the final temperature for 1 hour. Cool, dissolve the residue in 20 ml of *2 M hydrochloric acid*, evaporate to about 5 ml, dilute to 25 ml with *2 M hydrochloric acid* and examine the resulting solution by atomic absorption spectrophotometry (2.4.2), measuring at 248 nm using an iron hollow-cathode light as a source of radiation, an air-acetylene flame and *iron standard solution (8 ppm Fe)*, diluted as necessary with *water* to prepare the standard solutions (100 ppm).

Reserve about 10 ml of the solution for the Nickel test.

Nickel. Examine the final solution prepared in the test for Iron by atomic absorption spectrophotometry (2.4.2), measuring at 232 nm using a nickel hollow-cathode light as a source of radiation, an air-acetylene flame and using *nickel standard solution (10 ppm Ni)*, diluted as necessary with *water* to prepare the standard solution (50 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in the mobile phase and dilute to 50 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 8 mg of *metoclopramide hydrochloride IPRS* in 1 ml of the test solution and dilute to 25 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

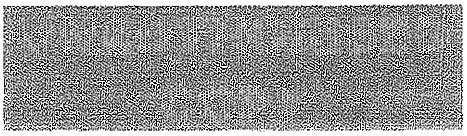
Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of a solution containing 3.484 g per litre of *sodium pentanesulphonate* and 3.64 g per litre of *tetramethylammonium hydroxide* adjusted to pH 5.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The retention times are: prazocine about 9 minutes and metoclopramide about 5 minutes.The test is not valid unless the resolution between the peaks corresponding to prazocine and metoclopramide is at least 8.

Inject reference solution (a) and the test solution. Continue the chromatography of the test solution for 6 times the retention time of the principal peak. Any secondary peak obtained with the test solution is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of all the impurities is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). Determine on the residue obtained in the test for Sulphated ash. Dissolve in sufficient *2 M nitric acid* to produce 10 ml. The resulting solution complies with the limit test for heavy metals, Method B (20 ppm).



https://nhathuocngocanh.com/

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent w/w, using 2.0 g dissolved in a mixture of equal volumes of *dichloromethane* and *methanol*.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water*

Test solution. Dissolve 20 mg of substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.002 per cent w/v solution of *prazosin hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with porous silica particles (5 µm),
- mobile phase: 0.01 per cent w/v solution of *diethylamine* in the solvent mixture,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{21}N_5O_4,HCl$.

Storage. Store protected from light.

Prazosin Tablets

Prazosin Hydrochloride Tablets

Prazosin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prazosin, $C_{19}H_{21}N_5O_4$.

Usual strengths. The equivalent of 500 µg; 1 mg; 2 mg; 5 mg of prazosin.

Identification

Shake a quantity of the powdered tablets containing about 10 mg of prazosin with a mixture of 10 ml of *dichloromethane* and 10 ml of *0.05 M potassium hydroxide*, filter the organic layer through cotton, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 2 kPa at 60° for 2 hours.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prazosin hydrochloride IPRS* treated in the same manner or with the reference spectrum of prazosin.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Solvent mixture. 10 volumes of *dichloromethane*, 10 volumes of *methanol* and 1 volume of *diethylamine*.

Mobile phase. A mixture of 95 volumes of *ethyl acetate* and 5 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets containing 5 mg of prazosin with 2 ml of the solvent mixture, centrifuge and pass the supernatant liquid through a 0.5 µm PTFE (Polytetrafluoroethylene) filter.

Reference solution (a). Dilute 1 volume of test solution to 200 volumes with the solvent mixture

Reference solution (b). Dilute 2 volumes of reference solution (a) to 5 volumes with the solvent mixture.

Apply to the plate 20 µl of each solution. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Shake one tablet for 1 hour in a suitable volume of a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water* to produce a solution containing 0.002 per cent w/v solution of prazosin, centrifuge and use the supernatant liquid.

Reference solution. A 0.0022 per cent w/v solution of *prazosin hydrochloride IPRS* in the same solvent mixture.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with porous silica particles, (5 µm),
- mobile phase: 0.01 per cent w/v solution of *diethylamine* in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Calculate the content of $C_{19}H_{21}N_5O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing about 2 mg of prazosin with 100 ml in a mixture of 96 volumes of *methanol*, 2 volumes

https://nhathuocngocanh.com/

of *glacial acetic acid* and 2 volumes of *water* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.0022 per cent w/v solution of *prazosin hydrochloride IPRS* in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water*.

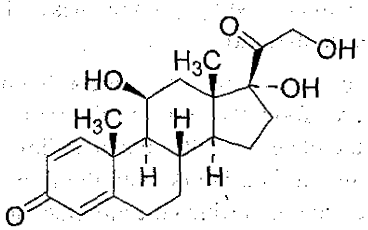
Use chromatographic conditions as described under Uniformity of content.

Calculate the content of $C_{19}H_{21}N_5O_4$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of prazosin.

Prednisolone



$C_{21}H_{28}O_5$ Mol. Wt. 360.4

Prednisolone is 11β,17α,21-trihydroxypregna-1,4-diene-3,20-dione.

Prednisolone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{21}H_{28}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone IPRS* or with the reference spectrum of prednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. *Chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisolone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Dissolve 2 mg in 2 ml of *sulphuric acid* by shaking and allow to stand for 5 minutes; an intense red colour is produced with a reddish brown fluorescence when examined under ultraviolet light at 365 nm. Pour the solution into 10 ml of *water* and mix; the colour fades and there is a yellow fluorescence under ultra-violet light (365 nm).

Tests

Specific optical rotation (2.4.22). + 96.0° to + 102°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 240 nm, 0.40 to 0.43.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 2 ml of *tetrahydrofuran* and dilute to 10ml with *water*.

Reference solution (a). Dissolve 2 mg of *prednisolone IPRS* and 2 mg of *hydrocortisone IPRS* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,

https://nhathuocngocanh.com/

– mobile phase: a mixture of 22 volumes of *tetrahydrofuran* and 78 volumes ml of *water*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

The retention times are: prednisolone, about 14 minutes and hydrocortisone about 15.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject reference solution (ab) and the test solution. Run the chromatogram 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Ignore any peak obtained with the blank run and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh 0.1 g and dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 243.5 nm. Calculate the content of $C_{21}H_{28}O_5$ taking 415 as the specific absorbance at 243.5 nm.

Storage. Store protected from light and moisture.

Prednisolone Tablets

Prednisolone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisolone, $C_{21}H_{28}O_5$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

Extract a quantity of the powdered tablets containing 30 mg of Prednisolone with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone IPRS* or with the reference spectrum of prednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Disperse a quantity of powdered tablets containing 25 mg of Prednisolone in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisolone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 900 ml of *water*,

Speed and time: 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium, filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the filtrate at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{28}O_5$ in the medium from the absorbance obtained from a solution of known concentration of *prednisolone IPRS* prepared by dissolving in *methanol* and diluting with the dissolution medium.

Q: Not less than 70 per cent of the stated amount of $C_{21}H_{28}O_5$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 10 mg of Prednisolone with 25 ml of *methanol* for 10 minutes and mix with the aid of ultrasound for 2 minutes; filter the extract (Whatman GF/F is suitable), wash the filter with two 10-ml quantities of *methanol*, combine the filtrate and washings and evaporate to dryness using a rotary evaporator and a warm water-bath, dissolve the residue in 10 ml of *tetrahydrofuran* and dilute to 20 ml with *water*.

Reference solution (a). Dissolve 2 mg of *prednisolone IPRS* and 2 mg of *hydrocortisone IPRS* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a 50 per cent v/v solution of *tetrahydrofuran*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 22 volumes of *tetrahydrofuran* and 78 volumes ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

The retention times are: prednisolone, about 14 minutes and hydrocortisone about 15.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to prednisolone and hydrocortisone is not less than 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject reference solution (ab) and the test solution. Run the chromatogram 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak obtained with the blank run and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and any peak with a retention time of 3 minutes or less.

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, add 50 ml of *ethanol (95 per cent)*, shake for 30 minutes, add sufficient *ethanol (95 per cent)* to produce 100.0 ml. Centrifuge and pipette a suitable volume of the supernatant liquid containing 0.5 mg of Prednisolone and dilute to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{28}O_5$ taking 415 specific absorbance at 240 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 5 mg of Prednisolone, add 58 ml of *methanol*, shake for 10 minutes and add sufficient *water* to produce 100.0 ml. Mix well and filter.

Reference solution (a). A solution containing 0.005 per cent w/v of *prednisolone IPRS* and 0.0075 per cent w/v of *dexamethasone* (internal standard) in a mixture of 58 volumes of *methanol* and 42 volumes of *water*.

Reference solution (b). A 0.005 per cent w/v solution of *prednisolone IPRS* in a mixture of 58 volumes of *methanol* and 42 volumes of *water*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 42 volumes of *water* and 58 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

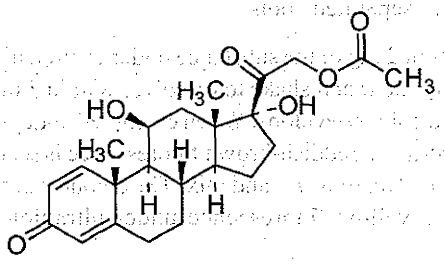
Inject reference solution (a). The test is not valid unless the resolution between the peaks due to prednisolone and dexamethasone is not less than 2.5 and the column efficiency, determined using the peak due to prednisolone in the chromatogram obtained with the test solution is not less than 15,000 theoretical plates per metre.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{21}H_{28}O_5$ in the tablets.

Storage. Store protected from light.

Prednisolone Acetate



$C_{23}H_{30}O_6$ Mol.Wt. 402.5

https://nhathuocngocanh.com/

Prednisolone Acetate is 11β,17α-dihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate.

Prednisolone Acetate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{23}H_{30}O_6$, calculated on the dried basis.

Category. Antiinflammtory; immunosuppressant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone acetate IPRS* or with the reference spectrum of prednisolone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Mobile phase. Add a mixture of 1.2 volumes of *water* and 8 volumes of *methanol* to a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *prednisolone acetate IPRS* in the solvent mixture.

Reference solution (b). Dissolve 10 mg of *prednisolone pivalate IPRS* in 10.0 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Spray with *alcoholic solution of sulphuric acid*. Heat at 105° for 10 minutes or until the spots appear. Allow to cool and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Add about 2 mg of the substance under examination in 2 ml of *sulphuric acid* and shake to dissolve. Within 5 minutes, an intense red colour develops. When examined under ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add the solution to 10 ml of *water* and mix. The colour fades and there is greenish-yellow fluorescence under ultraviolet light at 365 nm.

D. It gives the reaction of acetyl (2.3.1).

Tests

Specific optical rotation (2.4.22). +128° to +137°, determined in a 0.35 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *acetonitrile* and buffer solution pH 4 prepared by mixing 1 volume of *dilute hydrochloric acid*, 5 volumes of a 6.81 per cent w/v solution of *sodium acetate*, 15 volumes of a 3.73 per cent w/v solution of *potassium chloride* and 79 volumes of *water*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *methanol*.

Reference solution (a). Dissolve 2 mg each of *prednisolone acetate IPRS* and *hydrocortisone acetate IPRS (prednisolone impurity A IPRS)* in 100 ml of the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with the solvent mixture. Dilute 2.0 ml of the solution to 10 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to prednisolone acetate for prednisolone acetate impurity B is about 0.4, for prednisolone acetate impurity A is about 1.1, for prednisolone acetate impurity C is about 2.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to prednisolone acetate and prednisolone acetate impurity A is not less than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to prednisolone acetate impurity A and B, each of, is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of secondary peak corresponding to prednisolone acetate impurity C is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with

https://nhathuocngocanh.com/

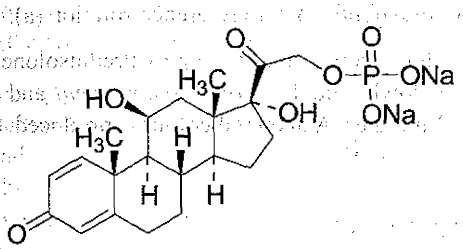
reference solution (b) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in 100.0 ml of *ethanol (95 per cent)*. Dilute 2.0 ml of the solution to 100.0 ml with the same solvent. Measure the absorbance at the maximum at about 243 nm (2.4.7). Calculate the content of $C_{23}H_{30}O_6$ taking 370 as the specific absorbance at 243 nm.

Storage. Store protected from light.

Prednisolone Sodium Phosphate



$C_{21}H_{27}Na_2O_8P$ Mol. Wt. 484.4

Predisolone Sodium Phosphate is 11β,17α, 21-trihydroxy-pregna-1,4-diene-3,20-dione-21-(dihydrogenphosphate) disodium salt.

Prednisolone Sodium Phosphate contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{21}H_{27}Na_2O_8P$, calculated on the anhydrous basis.

Category. Antiinflammtory; immunosuppressant.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone sodium phosphate IPRS* or with the reference spectrum of prednisolone sodium phosphate. (If the spectra obtained in the solid state show differences, dissolve the substance under examination and the reference substance separately in the minimum volume of *ethanol (95 per cent)* evaporate to dryness on a water-bath and record the spectra again using the residues).

B. To about 40 mg add 2 ml of *sulphuric acid* and heat gently until white fumes are evolved. Add *nitric acid* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water*, heat until white fumes are again evolved, cool, add 10 ml of *water* and neutralise to *red litmus paper* with *dilute ammonia solution*. The solution complies with reaction (A) of sodium salts and reaction (B) of phosphates (2.3.1).

Tests

pH (2.4.24). 7.5 to 10.5 determined in 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +95.0° to +102.0°, determined in a 1.0 per cent w/v solution in a mixture of 9 volumes of *phosphate buffer pH 7.0* and 1 volume of *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *prednisolone sodium phosphate IPRS* and 25 mg of *prednisolone IPRS* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: mix 1.36 g of *potassium dihydrogen phosphate* and 0.6 g of *hexylamine* and allow to stand for 10 minutes and dissolve in 185 ml of *water*, add 65 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

The retention times are: prednisolone sodium phosphate, about 6.5 minutes and prednisolone, about 8.5 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to prednisolone sodium phosphate and prednisolone is at least 4.5; if this resolution is not achieved, increase the concentration of *acetonitrile* or increase the concentration of *water* in the mobile phase.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than that from the principal peak is not

https://nhathuocngocanh.com/

greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks other than the principal peak is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Inorganic phosphate. Not more than 1.0 per cent of phosphate, PO_4.

Dissolve 50 mg in sufficient *water* to produce 100 ml. To 10 ml of the resulting solution add 5 ml of *molybdovanadic reagent*, mix and allow to stand for 5 minutes. Any yellow colour in the solution is not more intense than that produced in a standard prepared at the same time in the same manner using 10 ml of *phosphate standard solution (5 ppm PO_4)*.

Water (2.3.43). Not more than 6.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.1 g in sufficient *water* to produce 100.0 ml and mix. Dilute 5.0 ml of the resulting solution to 250.0 ml with *water*. Measure the absorbance at the maximum at about 247 nm (2.4.7). Calculate the content of $C_{21}H_{27}Na_2O_8P$ taking 312 as the specific absorbance at 247 nm.

Storage. Store protected from light.

Prednisolone Sodium Phosphate Eye Drops

Prednisolone Sodium Phosphate Eye Drops is a sterile solution of Prednisolone Sodium Phosphate in Purified Water.

Prednisolone Sodium Phosphate Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisolone sodium phosphate, $C_{21}H_{27}Na_2O_8P$.

Identification

For eye drops containing less than 0.1 per cent w/v of Prednisolone Sodium Phosphate carry out test B only.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE— Prepare the solutions immediately before use.

Mobile phase. A mixture of 33 volumes of *water*, 47 volumes of *glacial acetic acid* and 120 volumes of *butan-1-ol*.

Test solution. Dilute the eye drops to obtain a solution containing 0.1 per cent w/v solution of Prednisolone Sodium Phosphate in *water*.

Reference solution (a). A 0.1 per cent w/v solution of *prednisolone sodium phosphate IPRS* with *water*.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Reference solution (c). A mixture of equal volumes of reference solution (a) and 0.1 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 110° for 10 minutes and examine under ultraviolet light at 254 nm. The chromatogram obtained with the test solution, reference solution (a) and reference solution (b) show single principal spots with similar R_f values. The chromatogram obtained with reference solution (c) shows two principal spots with almost identical Rf values.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. To a volume containing 0.2 mg of Prednisolone Sodium Phosphate slowly add 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A deep red colour is produced.

Tests

pH (2.4.24). 7.0 to 8.5.

Free prednisolone. Determine by liquid chromatography (2.4.14).

For eye drops containing 0.01 per cent w/v or more of Prednisolone Sodium Phosphate. Use 50 µl of the following solutions —

Test solution. Dilute the volume of eye drops with the mobile phase to produce a solution containing 0.01 per cent w/v of Prednisolone Sodium Phosphate.

Reference solution. A 0.0004 per cent w/v solution of *prednisolone IPRS* in the mobile phase.

For eye drops containing less than 0.01 per cent w/v of Prednisolone Sodium Phosphate. Use 0.2 ml of the following solutions —

Test solution. Dilute the volume of eye drops with the mobile phase to produce a solution containing 0.001 per cent w/v solution of Prednisolone Sodium Phosphate.

Reference solution. A 0.00004 per cent w/v solution of *prednisolone IPRS* in the mobile phase.

Chromatographic system

— a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*;
- flow rate: 2 ml per minute,
- spectrophotometer set at 247 nm.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to prednisolone is not more than the area of the principal peak in the chromatogram obtained with the reference solution (4.0 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of the eye drops, if necessary, to obtain a solution containing 0.001 per cent w/v of Prednisolone Sodium Phosphate in *water*.

Reference solution (a). A 0.001 per w/v solution of *prednisolone sodium phosphate IPRS* in *water*.

Reference solution (b). A solution containing 0.01 per cent w/v of *betamethasone sodium phosphate IPRS* and 0.001 per cent w/v of *prednisolone sodium phosphate IPRS* in *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and prednisolone sodium phosphate is not less than 2.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{27}Na_2O_8P$ in the eye drop.

Storage. Store protected from light.

Prednisolone Sodium Phosphate Injection

Prednisolone Sodium Phosphate Injection is a sterile solution of Prednisolone Sodium Phosphate in Water for Injections.

Prednisolone Sodium Phosphate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisolone phosphate, $C_{21}H_{29}O_8P$.

Usual strength. 20 mg per ml.

Description. A clear, colourless liquid.

Identification

A. In the Assay, the chromatogram obtained with the test solution corresponds to the peak due to prednisolone sodium phosphate in the chromatogram obtained with reference solution (a).

B. To a volume containing 0.2 mg of Prednisolone Sodium Phosphate slowly add 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A deep red colour is produced.

Tests

pH (2.4.24). 7.0 to 8.0.

Bacterial endotoxins (2.2.3). Not more than 5.0 Endotoxin Units per mg of prednisolone phosphate.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the injection to obtain a solution containing 0.001 per cent w/v of prednisolone phosphate.

Reference solution (a). Weigh 10 mg of *prednisolone sodium phosphate IPRS*, dissolve in sufficient *water* to produce 100.0 ml (solution A) and dilute 10.0 ml of the solution to 100.0 ml with *water*.

Reference solution (b). Add 10 ml of a 0.01 per cent w/v solution of *betamethasone sodium phosphate IPRS* in *water* to 10 ml of solution A and dilute to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (10 µm) (such as Spherisorb ODS 1),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*,
- flow rate: 2.0 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and prednisolone sodium phosphate is at least 2.5.

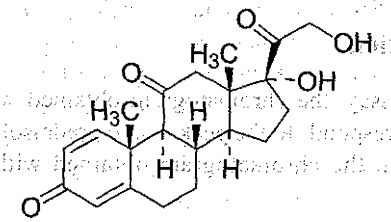
Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{29}O_8P$ in the injection.

Storage. Store protected from light, in a single-dose or in multi-dose containers.

https://nhathuocngocanh.com/

Prednisone



$C_{21}H_{26}O_5$ Mol. Wt. 358.4

Prednisone is 17α,21-dihydroxypregna-1,4-diene-3,11,20-trione.

Prednisone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{21}H_{26}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

Tests A and B may be omitted if tests C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisone IPRS* or with the reference spectrum of prednisone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. *Chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Dissolve 2 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; an orange colour is produced within 5 minutes, which exhibits a blue fluorescence under ultraviolet light at 365 nm. Pour the solution into 10 ml of *water*; the colour changes first to yellow and then fades gradually but the blue fluorescence under ultraviolet light remains.

D. Dissolve 1 mg in 1 ml of *ethanol (95 per cent)*, evaporate to dryness at a pressure not exceeding 0.7 kPa, add 5 ml of *1 M sodium hydroxide* and heat at 70° for 30 minutes; not more than a slight yellow colour is produced (distinction from cortisone acetate).

Tests

Specific optical rotation (2.4.22). + 167° to + 175°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *methanol* at the maximum at about 240 nm, 0.40 to 0.43; the ratio of the absorbance at the maximum at about 240 nm to that at about 263 nm, 1.85 to 2.05.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). Dissolve 2.0 mg of *prednisolone IPRS* and 2.0 mg of *prednisone IPRS* in methanol and dilute to 100.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilyl silica gel (5 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 100 ml of *acetonitrile*, 200 ml of *methanol* and 650 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
25	100	0
40	40	60
41	0	100
46	0	100
47	100	0
52	100	0

Equilibrate the column with the mobile phase B for at least 30 minutes and then with mobile phase A for 5 minutes. For subsequent chromatograms, use the conditions described from 40.0 to 52.0 minutes.

The retention times are: prednisone, about 19 minutes and prednisolone about 23 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to prednisone and prednisolone is at least 2.7. If necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.1 g in sufficient *ethanol* and dilute to 100.0 ml with *ethanol*. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 238 nm. Calculate the content of $C_{21}H_{26}O_5$ taking 425 as the specific absorbance at 238 nm.

Storage. Store protected from light.

Prednisone Tablets

Prednisone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisone, $C_{21}H_{26}O_5$.

Usual strengths. 5 mg; 10 mg.

Identification

Shake a quantity of the powdered tablets containing 30 mg of Prednisone with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisone IPRS* or with the reference spectrum of prednisone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{26}O_5$ in the medium from

https://nhathuocngocanh.com/

the absorbance obtained from a solution of known concentration of *prednisone IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{21}H_{26}O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of substance under examination in *methanol* and dilute to *methanol*.

Reference solution (a). A 0.002 per cent w/v, each of solution, of *prednisolone IPRS* and *prednisone IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 100 ml of *acetonitrile*, 200 ml of *methanol* and 650 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
25	100	0
40	40	60
41	0	100
46	0	100
47	100	0
52	100	0

Equilibrate the column with the mobile phase B for at least 30 minutes and then with mobile phase A for 5 minutes. For subsequent chromatograms use the conditions described from 40.0 to 52.0 minutes.

The relative retention time with reference to prednisone to prednisolone is about 1.21.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to prednisone and prednisolone is at least 2.7. If necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of the areas of all the peaks other secondary peaks is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, add 50 ml of *ethanol (95 per cent)*, shake for 30 minutes, add sufficient *ethanol (95 per cent)* to produce 100.0 ml. Centrifuge and pipette a suitable volume of the supernatant liquid equivalent to 0.5 mg of Prednisone and dilute to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{26}O_5$ taking 415 as specific absorbance at 240 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. Dissolve a weighed quantity of *acetanilide* in a 50 per cent v/v solution of *methanol* to obtain a solution having a known concentration of 0.11 mg per ml.

Test solution. Weigh and powder 20 tablets. To a weighed quantity of the powder containing about 20 mg of Prednisone, add 5 ml of *water*, mix with the aid of ultrasound for one minute, add 50 ml of *methanol* and mix with the aid of ultrasound and dilute with *water* to 100.0 ml and mix. To 5.0 ml of the solution add 5.0 ml of internal standard solution and dilute to 50.0 ml with a 50 per cent v/v solution of *methanol* and mix.

Reference solution. Weigh a suitable quantity of *prednisone IPRS* and dissolve in a 50 per cent v/v solution of *methanol* to obtain a solution having a concentration of about 0.2 mg per ml. Dilute to 5.0 ml of the solution add 5.0 ml of internal standard solution and dilute to 50.0 ml with a 50 per cent v/v solution of *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a suitable filtered mixture of 688 volumes of *water*, 250 volumes of *peroxide-free tetrahydrofuran* and 62 volumes of *methanol* ,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to prednisone for acetonitrile is about 0.75.

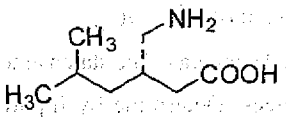
Inject the reference solution. The test is not valid unless the resolution between prednisone and the internal standard is not less than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution. Calculate the content of $C_{21}H_{26}O_5$ in the tablets.

Storage. Store protected from light.

Pregabalin



$C_8H_{17}NO_2$ Mol. Wt. 159.2

Pregabalin is (*S*)-4-amino-3-(2-methylpropyl)butyric acid.

Pregabalin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{17}NO_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pregabalin IPRS* or with the reference spectrum of pregabalin.

Tests

Specific optical rotation (2.4.22). + 10° to + 12.0°, determined on 1.0 per cent w/v solution.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Marfey's reagent (1, Fluoro-2, 4-dinitrophenyl-5-L-alaninamide). A 0.3 per cent w/v solution of *marfey 's reagent* in *acetone.*

NOTE — Store the reagent at 2° to 8°.

Test solution (a). Dissolve about 100 mg of the substance under examination in 100.0 ml of *water.*

Test solution (b). To 2.0 ml of test solution (a), add 0.5 ml of merfey's reagent and 0.5 ml of *1 M sodium bicarbonate* in the test tube. Heat at 40° for 60 minutes. Allow to equilibrate to room temperature.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- mobile phase: a mixture of 62 volumes of a buffer solution prepared by diluting about 7.18 ml of *triethylamine* to 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 38 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 340 nm,
- injection volume: 20 µl.

The retention time for S- Pregabalin is about 9 minutes and R- Pregabalin is about 12 minutes.

Inject test solution (b). The area of peak due to R-pregabalin is not more than 0.5 per cent the area of the S-pregabalin.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.2 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.9 with *5 M potassium hydroxide.*

Test solution. Dissolve 125 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Kromasil 100),
- mobile phase: A. dissolve 1.2 g of *monobasic potassium phosphate* in 940 ml of *water*, adjusted to pH 6.9 with *5 M potassium hydroxide* and 60 ml of *acetonitrile*,
  B. dissolve 1.2 g of *monobasic potassium phosphate* in 700 ml of *water*, adjusted to pH 6.7 with *5 M potassium hydroxide* and 300 ml of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 40 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4	100	0
45	0	100
46	100	0
60	100	0

The relative retention time with reference to pregabalin for lactum impurity (4-isobutylpyrrolidine-2-one) is 6.11.

Inject the test solution. The area of any peak corresponding to lactum impurity (4-isobutylpyrrolidin-2-one) is not more than 0.5 per cent. The area of any other secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy Metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent determined on 1.0 g by drying in an oven at 105° for 3 hours.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 200 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.2 per cent w/v solution of *pregabalin IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 95 volumes of *water* and 5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{17}NO_2$.

Storage. Store protected from light and moisture.

Pregabalin Capsules

Pregabalin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pregabalin, $C_8H_{17}NO_2$.

Usual strengths. 25 mg; 50 mg; 75 mg; 100 mg; 150 mg; 225 mg; 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.05 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.
Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *pregabalin IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay using injection volume 100 µl.

Inject the reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{17}NO_2$.

Q. Not less than 70 per cent of the stated amount of $C_8H_{17}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.2 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.9 with *dilute potassium hydroxide*.

Test solution. Weigh and disperse a quantity of the contents of capsules containing about 750 mg of Pregabalin, in about 25 ml of the solvent mixture, with the aid of ultrasound for 30 minutes and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.015 per cent w/v solution of *pregabalin IPRS* in the solvent mixture.

Reference solution (b). Dissolve 4.5 mg of *lactam IPRS* in 10.0 ml of the solvent mixture.

Reference solution (c). Dissolve 750 mg of *pregabalin IPRS* in 30 ml of solvent mixture. Add about 5 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- mobile phase: A. a mixture of 90 volumes of the solvent mixture and 10 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
25	35	65
30	100	0
40	100	0

The relative retention time with reference to lactam peak for lactose conjugate impurity is about 0.78.

Inject reference solution (a). The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not

https://nhathuocngocanh.com/

more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to lactam multiplied with relative response factor, 0.07 is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of lactose conjugate impurity peak multiplied with relative response factor, 0.05 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore any peak with an area is not more than 0.05 times of the area of principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Disperse a quantity of powder containing about 200 mg of Pregabalin with 35 ml of the mobile phase, sonicate for 10 minutes and dilute to 50 ml with the mobile phase.

Reference solution. A 0.4 per cent w/v solution of *pregabalin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 92 volumes of solution containing 2.72 g of *potassium dihydrogen orthophosphate* in 900 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *orthophosphoric acid*, 5 volumes of *methanol* and 3 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{17}NO_2$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Pregabalin.

Pregabalin and Methylcobalamin Capsules

Pregabalin and Methylcobalamin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pregabalin, $C_8H_{17}NO_2$ and not less than 90.0 per cent of methylcobalamin, $C_{63}H_{91}CoN_{13}O_{14}P$.

Usual strengths. Pregabalin, 75 mg and Methylcobalamin, 500 mcg; Pregabalin, 75 mg and Methylcobalamin, 750 mcg; Pregabalin, 150 mg and Methylcobalamin, 500 mcg.

Identification

A. In the Assay of pregabalin, the principal peak in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

B. In the Assay of methylcobalamin, the principal peak in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Pregabalin —

Apparatus No. 2 (Paddle),
Medium. 500 ml of *water;*
Speed and time: 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) using the chromatographic system as described under Assay of pregabalin.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Weigh accurately about 15 mg of *pregabalin IPRS* dissolve and dilute to 20.0 ml with mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with dissolution medium.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{17}NO_2$.

Q. Not less than 70 per cent of the stated amount of $C_8H_{17}NO_2$.

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14), using the chromatographic system prescribed under Assay.

Test solution. Transfer the whole contents of a capsule in 25-ml volumetric flask, add 20 ml of mobile phase and disperse with the aid of ultrasound for about 5 minutes, cool and dilute to volume with mobile phase, and filter. Dilute further with mobile phase, if necessary.

https://nhathuocngocanh.com/

Reference solution. A 0.002 per cent w/v solution of *methylcobalamin IPRS* in mobile phase. Dilute further with mobile phase, if necessary.

Inject the reference solution and test solution.

Calculate the content of $C_{63}H_{91}CON_{13}O_{14}$ in each capsule.

Other tests. Comply with the tests stated under Capsules.

Assay

For Pregabalin — Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 75 mg of Pregabalin in 100-ml volumetric flask, add 50 ml of the mobile phase and disperse with the aid of ultrasound for 10 minutes and dilute to volume with mobile phase and filter.

Reference solution. A 0.075 per cent w/v solution of *pregabalin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 900 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *orthophosphoric acid*, 6 volumes of *methanol* and 4 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{17}NO_2$ in the capsules.

For Methylcobalamin — Determine by liquid chromatography (2.4.14).

NOTE — All the test for methylcobalamin shall be carried out in dark environment.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 0.75 mg of Methylcobalamin in 25-ml volumetric flask, add 20 ml of mobile phase and disperse with the aid of ultrasound for about 5 minutes, cool and dilute to volume with mobile phase and filter.

Reference solution. 0.003 per cent w/v solution of *methylcobalamin IPRS* in mobile phase

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- sample temperature: 15°,
- mobile phase: a mixture of a solution containing 5.80 g of *disodium hydrogen phosphate* in 810 ml of *water*, adjusted to pH 3.5 with *citric acid*, and add 3.76 g of *sodium 1-hexane sulphonate sodium salt* and add 190 ml *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{63}H_{91}CON_{13}O_{14}P$ in the capsules.

Storage. Protected from light and moisture at a temperature below 30°.

Pregelatinised Starch

Pregelatinised Starch is prepared from maize starch, potato starch or rice starch by mechanical processing in the presence of *water*, with or without heat, to rupture all or part of the starch granules and subsequent drying. It contains no added substances but it may be modified to render it compressible and to improve its flow characteristics.

Description. A white or yellowish-white powder.

Identification

A. *Microscopic* — In a mixture of equal volumes of *glycerol* and *water*, it presents irregular, translucent, white or yellowish-white flakes or pieces with an uneven surface. Under polarised light (between crossed nicol prisms), starch granules with a distinct black cross intersecting at the hilum may be seen.

B. Disperse 0.5 g in 2 ml of *water* without heating, add 0.05 ml of *iodine solution*; a reddish-violet to blue colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in 3.0 per cent w/v solution in *carbon dioxide-free water*.

Oxidising substances. Transfer 4.0 g to a glass-stoppered, 125 ml conical flask and add 50.0 ml of a mixture of equal volumes of *water* and *methanol*. Insert the stopper and swirl for 5 minutes. Transfer to a glass-stoppered 50 ml centrifuge tube and centrifuge. Transfer 30.0 ml of the clear supernatant liquid to a glass-stoppered 125-ml conical flask. Add 1 ml of *glacial acetic acid* and 0.5 g to 1.0 g of *potassium iodide*

https://nhathuocngocanh.com/

Insert the stopper, swirl, and allow to stand for 30 minutes in the dark. Add 1 ml of *starch solution* and titrate with *0.002 M sodium thiosulphate* until the starch-iodine colour disappears. Carry out a blank titration. Not more than 1.4 ml of *0.002 M sodium thiosulphate* is required (0.002 per cent, calculated as H_2O_2).

1 ml of 0.002 M *sodium thiosulphate* is equivalent to 0.034 mg of oxidising substances, calculated as H_2O_2.

Sulphur dioxide (2.3.40). Not more than 50 ppm.

Iron (2.3.14). Dissolve the residue obtained in the test for Sulphated ash, in 10 ml of *dilute hydrochloric acid*, filter. This solution complies with the limit test for iron (20 ppm).

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol* and *water*, not more than traces of matter other than starch granules are present.

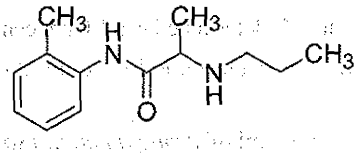
Sulphated ash (2.3.18). Not more than 0.6 per cent, determined on 2 g.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 1.0 g by drying in an oven at 130° for 90 minutes.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g and total fungal count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli*.

Labelling. The label states the type of starch used as starting material.

Prilocaine



$C_{13}H_{20}N_2O$ Mol. Wt. 220.3

Prilocaine is propanamide, *N*-(2-methylphenyl)-2-(propylamino); 2-(Propylamino)-*o*-propionotoluidide; (*RS*)-*N*-(2-methylphenyl)-2-(propylamino) propanamide.

Prilocaine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{13}H_{20}N_2O$, calculated on the anhydrous basis.

Category. Local anaesthetic

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prilocaine IPRS* or with the reference spectrum of prilocaine.

B. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. A 0.25 per cent w/v solution of the substance under examination in the mobile phase.

Use chromatographic system as described under Assay.

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of prilocaine peak. The test is not valid unless the resolution between the peaks due to prilocaine and prilocaine related compound B is not less than 3.0, the signal to noise ratio is not less than 10 for prilocaine peak, and the relative retention times of prilocaine and prilocaine related compound B are 1.0 and 1.2, respectively. The area of any individual peak is not more than 0.2 per cent and sum of the areas of all the secondary peak is not more than 0.5 per cent, calculated by area normalization.

Limit of Prilocaine related compound A. Determine by liquid chromatography (2.4.14).

Use chromatographic system as described under Assay.

Test solution. A 1.0 per cent w/v solution of the substance under examinationin the mobile phase.

Reference solution. A 0.00013 per cent w/v solution of *prilocaine related compound A IPRS* in the mobile phase.

Inject the reference solution. The test is not valid unless the signal to noise ratio is not less than 10 for prilocaine.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to prilocaine related compound A is not more the area of principal peak corresponding to chromatogram obtained with reference solution (0.01 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *prilocaine IPRS* in the mobile phase.

Reference solution(b). A 0.00025 per cent w/v solution of *prilocaine IPRS* and 0.0003 per cent w/v solution of *prilocaine related compound B IPRS* in the mobile phase.

Chromatographic system

– a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

- mobile phase: a mixture of 73 volumes of a buffer solution prepared by dissolving 0.18 g of *monobasic sodium phosphate* and 2.89 g of *dibasic sodium phosphate dihydrate* in 1000 ml of *water* and 27 volume *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

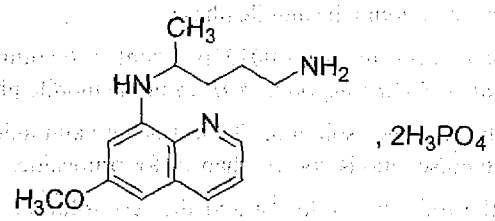
Inject reference solution (a), (b) and the test solution. Run the chromatogram 1.3 times the retention time of prilocaine peak. The test is not valid unless the resolution between the peaks due to prilocaine and prilocaine related compound B is not less than 3.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections in the chromatogram obtained with reference solution (a) is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{20}N_2O$.

Storage. Store protected from the light and moisture, at a temperature below 25°.

Primaquine Phosphate



$C_{15}H_{21}N_3O,2H_3PO_4$ Mol. Wt. 455.3

Primaquine Phosphate is (*RS*)-8-(4-amino-1-methylbutylamino)-6-methoxyquinoline diphosphate.

Primaquine Phosphate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{21}N_3O,2H_3PO_4$, calculated on the dried basis.

Category. Antimalarial.

Description. An orange, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *primaquine phosphate IPRS* or with the reference spectrum of primaquine phosphate.

B. When examined in the range 300 nm to 450 nm (2.4.7), a 0.015 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 332 nm and 415 nm; absorbance at about 332 nm, about 0.68 to 0.78 and at about 415 nm, 0.41 to 0.53. Dilute 5 ml of the solution to 50 ml with *0.01 M hydrochloric acid*. When examined in the range 215 nm to 310 nm, the resulting solution shows absorption maxima at about 225 nm, 265 nm and 282 nm; absorbances at the maxima are 0.74 to 0.77, 0.50 to 0.53 and 0.50 to 0.52, respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 60 volumes of *chloroform*, 40 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve 0.2 g in 5 ml of *water*, dilute to 10 ml with *methanol* and dilute 1 volume of the resulting solution to 10 volumes with *methanol (50 per cent)*.

Reference solution. Dissolve 20 mg of *primaquine phosphate IPRS* in 5 ml of *water*, dilute to 10 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 50 mg in 5 ml of *water*, add 2 ml of *2 M sodium hydroxide* and shake with two quantities, each of 5 ml, of *chloroform*. The aqueous layer, acidified by the addition of *nitric acid*, gives reaction (B) of phosphates (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Add 0.2 ml of *strong ammonia solution* to 1 ml of a 1.0 per cent w/v solution of the substance under examination, shake with 10 ml of the mobile phase and use the clear, lower layer.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase and dilute 1.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution (c). Add 0.2 ml of *strong ammonia solution* to 1 ml of a 1.0 per cent w/v solution of the *primaquine phosphate IPRS*, shake with 10 ml of the mobile phase and use the clear, lower layer.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (10 µm),

https://nhathuocngocanh.com/

– mobile phase: a mixture of 45 volumes of *chloroform*, 45 volumes of *hexane*, 10 volumes of *methanol* and 0.1 volume of *strong ammonia solution*,
– flow rate: 3 ml per minute,
– spectrophotometer set at 261 nm,
– injection volume: 20 µl.

The test is not valid unless in the chromatogram obtained with reference solution (c) there is a peak just before the principal peak with an area of about 6 per cent of that of the principal peak and the resolution between these peaks is not less than 2.0.

Inject each solution and record the chromatograms for at least twice the retention time of primaquine.

Inject reference solution (a) and the test solution. In the chromatogram the sum of the areas of all secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak the area of which is less than that of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 40 ml of *anhydrous glacial acetic acid* with gentle heating. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02277 g of $C_{15}H_{21}N_3O,2H_3PO_4$.

Storage. Store protected from light and moisture.

Primaquine Tablets

Primaquine Phosphate Tablets

Primaquine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of primaquine, $C_{15}H_{21}N_3O$.

Usual strengths. 7.5 mg ; 15 mg.

(13 mg of Primaquine Phosphate is approximately equivalent to 7.5 mg of primaquine).

Identification

A. Dissolve a quantity of the powdered tablets containing 60 mg of primaquine in a mixture of 10 ml of *water* and 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. On the solution, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *primaquine phosphate IPRS* treated in the same manner or with the reference spectrum of primaquine.

B. Extract a quantity of the powdered tablets containing 25 mg of primaquine with 10 ml of *water* and filter. To 2 ml of the filtrate, add 3 ml of *water* and 1 ml of a 5 per cent w/v solution of *ceric ammonium sulphate* in *2 M nitric acid*; a deep violet colour is produced immediately.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 60 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *primaquine phosphate IPRS* in the dissolution medium and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{15}H_{21}N_3O$.

Uniformity of content. Complies with the test stated under tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solutions.

Test solution. Powder one tablet, dissolve in 20 ml of the mobile phase with the aid of ultrasound for 3 minutes and dilute to 50.0 ml with the mobile phase and filter.

Reference solution. Dissolve a weighed quantity of *primaquine phosphate IPRS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{21}N_3O$ in the tablet.

https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of primaquine, dissolve in 30 ml of the mobile phase and sonicate for 20 minutes. Make up the volume to 50.0 ml with mobile phase.

Reference solution. A 0.035 per cent w/v solution of *primaquine phosphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 30°,
- mobile phase: a mixture of 40 volumes of *1- pentane sulphonate sodium* solution prepared by dissolving 960 mg of *sodium-1- pentane sulphonate* and 1 ml *glacial acetic acid* in 400 ml of *water* and 60 volumes of *methanol*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 264 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

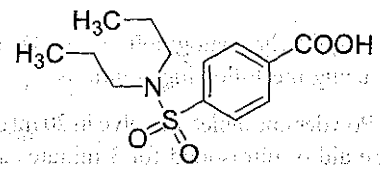
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{21}N_3O$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of primaquine.

Probenecid



$C_{13}H_{19}NO_4S$ Mol. Wt. 285.4

Probenecid is 4-(dipropylsulphamoyl)benzoic acid.

Probenecid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{19}NO_4S$, calculated on the dried basis.

Category. Uricosuric agent and for delaying renal excretion of penicillins and cephalosporins.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *probenecid IPRS* or with the reference spectrum of probenecid.

B. When examined in the range 210 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *0.1 M hydrochloric acid* shows absorption maxima at about 223 nm and 248 nm; absorbance at about 248 nm is about 0.33.

C. Dissolve 0.2 g in about 0.6 ml of *2 M ammonia* and add 3 ml of 1.7 per cent w/v solution of *silver nitrate*; a white precipitate is produced which is soluble in an excess of *dilute ammonia solution*.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *2 M sodium hydroxide* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity. Add 2.0 g to 100 ml of *water*, heat on a water-bath for 30 minutes, cool, filter and dilute with *water* to 100.0 ml. Titrate 50.0 ml of the solution with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 55 volumes of *toluene*, 20 volumes of *di-isopropyl ether*, 15 volumes of *chloroform* and 10 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.005 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

https://nhathuocngocanh.com/

Assay. Weigh 0.5 g and dissolve in 100 ml of *ethanol (95 per cent)*, shaking well and heating gently if necessary. Cool and titrate with *0.1 M sodium hydroxide*, using *bromothymol blue solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02854 g of $C_{13}H_{19}NO_4S$.

Storage. Store protected from moisture.

Probenecid Tablets

Probenecid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of probenecid, $C_{13}H_{19}NO_4S$.

Usual strength. 500 mg.

Identification

A. Triturate a quantity of the powdered tablets containing 0.5 g of Probenecid with *ethanol (95 per cent)*, filter and concentrate the filtrate by evaporation on a water-bath. Cool, filter and recrystallise the residue from *ethanol (50 per cent)*. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *probenecid IPRS* or with the reference spectrum of probenecid.

B. When examined in the range 210 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 225 nm and 248 nm.

C. The residue obtained in test A melts at about 199° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 55 volumes of *toluene*, 20 volumes of *di-isopropyl ether*, 15 volumes of *chloroform* and 10 volumes of *glacial acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 0.2 g of Probenecid with 20 ml of *acetone*, filter and use the filtrate.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus. No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.6*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Dilute 4.0 ml of the filtrate to 100.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 244 nm (2.4.7). Similarly measure the absorbance of a solution of a known concentration of *probenecid IPRS*. Calculate the content of $C_{13}H_{19}O_4S$.

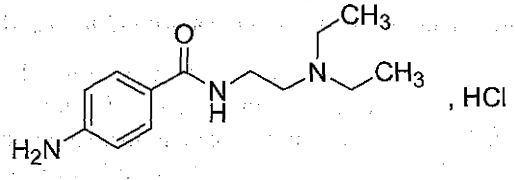
Q. Not less than 80 per cent of the stated amount of $C_{13}H_{19}NO_3S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.2 g of Probenecid in 200 ml of *ethanol (95 per cent)* and 5 ml of *1 M hydrochloric acid*, heat on a water-bath at 70° for 30 minutes, shaking occasionally. Cool, add sufficient *ethanol (95 per cent)* to produce 250.0 ml and filter. To 5.0 ml of the filtrate add 5 ml of *0.1 M hydrochloric acid*, dilute to 250.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 248 nm (2.4.7). Calculate the content of $C_{13}H_{19}NO_4S$ taking 332 as specific absorbance at 248 nm.

Storage. Store protected from moisture.

Procainamide Hydrochloride



$C_{13}H_{21}N_3O,HCl$ Mol. Wt. 271.8

Procainamide Hydrochloride is 4-amino-*N*-[2-(diethylamino) ethyl)benzamide hydrochloride.

Procainamide Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_{21}N_3O,HCl$, calculated on the dried basis.

Category. Antiarrhythmic.

Description. A white or very slightly yellow, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

https://nhathuocngocanh.com/

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride IPRS* or with the reference spectrum of procainamide hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum at about 273 nm; absorbance at about 273 nm, 0.58 to 0.61.

C. Dilute 1 ml of a solution, prepared by dissolving 2.5 g in sufficient *carbon dioxide-free water* to produce 25 ml, to 2 ml with *water*. 1 ml of the solution gives the reaction of primary aromatic amines (2.3.1).

D. A 2 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

pH (2.4.24). 5.6 to 6.3, determined in a 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Reference solution. A 0.005 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 75 ml of *water* and 10 ml of *hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02718 g of $C_{13}H_{21}N_3O$, HCl.

Storage. Store protected from light.

Procainamide Injection

Procainamide Hydrochloride Injection

Procainamide Injection is a sterile solution of Procainamide Hydrochloride in Water for Injections. It may contain Sodium Metabisulphite as a stabilising agent.

Procainamide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of procainamide hydrochloride, $C_{13}H_{21}N_3O$, HCl.

Usual strength. 100 mg per ml.

Identification

A. Dilute a volume containing 0.25 g of Procainamide Hydrochloride to 25 ml with *water*, make alkaline with *5 M sodium hydroxide* and extract with two quantities, each of 5 ml, of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate*, evaporate the filtrate to dryness using a rotatory evaporator and dissolve the residue in 5 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride IPRS* treated in the same manner or with the reference spectrum of procainamide.

B. Dilute a suitable volume of the injection with *water* to produce a solution containing 0.0005 per cent w/v of Procainamide Hydrochloride. Absorbance of the resulting solution at about 280 nm, about 0.30 (2.4.7).

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Dilute a volume of the injection containing 0.1 g of Procainamide Hydrochloride to 5 ml with *methanol*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 0.35 Endotoxin Unit per mg of procainamide hydrochloride.

https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a volume containing about 0.25 g of Procainamide Hydrochloride add 45 ml of *6 M hydrochloric acid* and boil for 1 minute, add 3 g of *potassium bromide*, cool in ice. Carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02718 g of $C_{13}H_{21}N_3O,HCl$.

Storage. Store protected from light.

Procainamide Tablets

Procainamide Hydrochloride Tablets

Procainamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of procainamide hydrochloride, $C_{13}H_{21}N_3O,HCl$.

Usual strength. 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.25 g of Procainamide Hydrochloride with 25 ml of *water*, make alkaline with *5 M sodium hydroxide* and extract with two quantities, each of 5 ml, of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate*, evaporate the filtrate to dryness using a rotatory evaporator and dissolve the residue in 5 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride IPRS* treated in the same manner or with the reference spectrum of procainamide.

B. Triturate a quantity of the powdered tablets containing 1 g of Procainamide Hydrochloride with 10 ml of *water* and filter. The filtrate gives the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted with *0.01M sodium hydroxide* (not less than twice the volume of the portion of test solution), at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{13}H_{21}N_3O.HCl$ in the medium from the absorbance obtained from a solution of known concentration of *procainamide hydrochloride IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{21}N_3O,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.4 g of Procainamide Hydrochloride with 20 ml of *methanol (90 per cent)* for 15 minutes and filter.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.5 g of procainamide in 350 ml of *methanol* and sonicate for 10 minutes at 40° in water-bath and dilute to 500.0 ml with *methanol*, cool to room temperature and centrifuge. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A 0.005 per cent w/v solution of *procainamide IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *p-amino benzoic acid* in the mobile phase. Dilute 10.0 ml of the solution and 10.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 140 volumes of *water*, 60 volumes of *methanol* and 1 volume of *triethylamine*, adjusted to pH 7.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to p-amino benzoic acid and procainamide is not less than 5.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

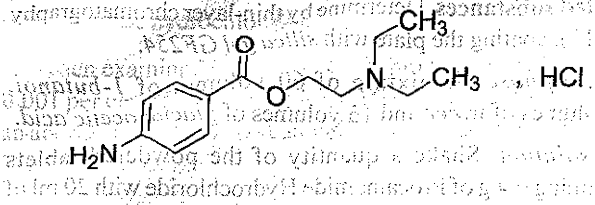
Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{21}N_3O,HCl$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Procaine Hydrochloride



$C_{13}H_{20}N_2O_2,HCl$ Mol. Wt. 272.8

Procaine Hydrochloride is 2-(diethylamino)ethyl 4-aminobenzoate hydrochloride.

Procaine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{20}N_2O_2,HCl$, calculated on the dried basis.

Category. Local anaesthetic.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procaine hydrochloride IPRS* or with the reference spectrum of procaine hydrochloride.

B. To 0.2 ml of a 5 per cent w/v solution add 2 ml of *water* and 0.5 ml of *1 M sulphuric acid*, shake and add 1 ml of a 0.1 per cent w/v solution of *potassium permanganate*; the colour is immediately discharged.

C. To about 5 mg add 0.5 ml of *fuming nitric acid*, evaporate to dryness on a water-bath, cool, dissolve the residue in 5 ml of *acetone* and add 1 ml of *0.1 M ethanolic potassium hydroxide*; only a brownish red colour develops.

D. Dilute 1 ml of a 5 per cent w/v solution to 100 ml with *water*; 2 ml of the solution gives the reaction of primary aromatic amines (2.3.1).

E. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *dibutyl ether*, 16 volumes of *n-hexane* and 4 volumes of *glacial acetic acid*.

Test solution. A 10 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.005 per cent w/v solution of *4-aminobenzoic acid* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 10 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. The principal spot remains on the line of application.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and titrate slowly with *0.1 M sodium nitrite*, stirring constantly. Determine the end point potentiometrically (2.4.25).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02728 g of $C_{13}H_{20}N_2O_2,HCl$.

Procaine Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.6 Endotoxin Unit per mg of procaine hydrochloride.

Storage. Store protected from light.

Procaine and Adrenaline Injection

Procaine Hydrochloride and Adrenaline Bitartrate Injection; Procaine Hydrochloride and Epinephrine Bitartrate Injection; Adrenaline Bitartrate and Procaine Hydrochloride Injection

Procaine and Adrenaline Injection is a sterile solution of Procaine Hydrochloride and Adrenaline Bitartrate in Water for Injections.

Procaine and Adrenaline Injection contains not less than 1.9 per cent and not more than 2.1 per cent w/v of procaine hydrochloride, $C_{13}H_{20}N_2O_2$, HCl and the equivalent of not less than 0.00175 per cent and not more than 0.00225 per cent w/v of adrenaline, $C_9H_{13}NO_3$.

Description. A clear, colourless solution.

https://nhathuocngocanh.com/

Identification

A. To 5 ml add 5 ml of *water* and 10 ml of *picric acid solution*, shake gently and set aside for 1 hour; the crystalline precipitate, after washing with *water* and drying at 100°, melts at about 134° (2.4.21).

B. To 5 ml add 1 ml of *hydrochloric acid*, cool to 0°, add 5 ml of *sodium nitrite solution* and pour the mixture into 2 ml of *2-naphthol solution* containing 1 g of *sodium acetate*; an orange-red colour is produced.

C. To 10 ml add 4 ml of *disodium hydrogen phosphate solution* and sufficient *0.1 M iodine* to produce a distinct brown colour. Add *0.1 M sodium thiosulphate* to remove the excess of iodine; a pink colour is produced.

Tests

pH (2.4.24). 3.0 to 5.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For procaine hydrochloride* — To 10.0 ml of the injection add 0.5 g of *sodium carbonate* and extract with three quantities, each of 20 ml, of a mixture of 1 volume of *2-propanol* and 3 volumes of *chloroform* until complete extraction of procaine is effected. Shake the combined extracts with 5 ml of *water*, wash the water with the solvent mixture and add the washing to the combined extracts. Shake the combined extracts and washings with 10.0 ml of *0.1 M hydrochloric acid*, separate the acid layer, wash the combined extracts and washings with 5 ml of *water*, add the aqueous extract to the separated acid layer and titrate with *0.1 M sodium hydroxide*, using *methyl red-methylene blue solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.02728 g of $C_{13}H_{20}N_2O_2,HCl$.

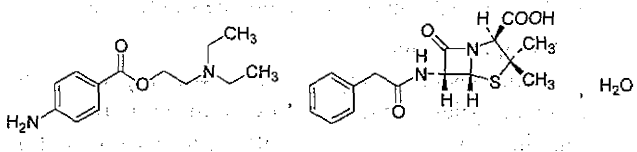
For adrenaline — To 10.0 ml of the injection add 20 mg of *sodium metabisulphite*, 0.1 ml of *ferrous sulphate-citrate solution*, 1 ml of *glycine buffer solution* and mix. Allow to stand for 10 minutes, extract with 10 ml of *ether*, allow to separate, reject the *ether* and measure the absorbance of a 4-cm layer of the solution at about 540 nm (2.4.7). Calculate the content of adrenaline, $C_9H_{13}NO_3$, from a reference curve prepared by treating suitable aliquots of a solution of *adrenaline bitartrate IPRS* in the same manner.

1 mg of adrenaline bitartrate is equivalent to 0.5497 mg of $C_9H_{13}NO_3$.

Storage. Store protected from light.

Labelling. The label states the strength as "Procaine Hydrochloride, 2 per cent w/v; Adrenaline, 0.002 per cent w/v".

Procaine Penicillin



$C_{13}H_{20}N_2O_2,C_{16}H_{18}N_2O_4S,H_2O$ Mol. Wt. 588.7

Procaine Penicillin is 2-diethylaminoethyl 4-aminobenzoate (6*R*)-6-(2-phenylacetamido)penicillanate monohydrate.

Procaine Penicillin contains not less than 51 per cent and not more than 59.6 per cent of penicillin G, calculated as $C_{16}H_{18}N_2O_4S$, and not less than 37.5 per cent and not more than 43.0 per cent of procaine, $C_{13}H_{20}N_2O_2$, both calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procaine penicillin IPRS* or with the reference spectrum of procaine penicillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

C. A turbid solution of 0.1 g in 2 ml of *2 M hydrochloric acid* gives the reaction of primary aromatic amines (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a solution prepared by shaking 50 mg in sufficient *carbon dioxide-free water* to produce 15 ml until dissolution is complete.

Specific optical rotation (2.4.22). + 165° to + 180°, determined in a solution prepared by dissolving 0.25 g in sufficient of a mixture of 3 volumes of *acetone* and 2 volumes of *water* to produce 25 ml.

Water (2.3.43). 2.8 to 4.2 per cent, determined on 0.5 g.

Assay. Determine the contents of benzyl penicillin and procaine by liquid chromatography (2.4.14).

Test solution. Weigh 70 mg of the substance under examination and dissolve in 30 ml of the mobile phase with the aid of ultrasound and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 42 mg of *benzylpenicillin potassium IPRS* and 32 mg of *procaine hydrochloride IPRS* in 25 ml of the mobile phase with the aid of ultrasound and dilute to 50.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (b). Mix 1 volume of a 0.24 per cent w/v solution of *phenoxymethylpenicillin potassium IPRS* in the mobile phase with 3 volumes of reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 50 volumes of a solution prepared by mixing 14 g of *potassium dihydrogen phosphate* in 6.5 g of *tetrabutylammonium hydroxide (40 per cent)* and adjusted to pH 7.0 with *1 M potassium hydroxide* or *dilute phosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between benzyl penicillin potassium and phenoxymethylpenicillin potassium is not less than 2. The relative retention time of procaine with reference to benzyl penicillin is about 2.2.

Inject reference solution (a) and the test solution. Record the peak responses of the main peaks of benzyl penicillin and procaine. Calculate the content of benzyl penicillin, $C_{16}H_{18}N_2O_4S$ and the content of procaine, $C_{13}H_{20}N_2O_2$ using the factor of 0.866 for converting the content of procaine hydrochloride to that of procaine.

Procaine Penicillin intended for use in the manufacture of Parenteral Preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.10 Endotoxin Unit per mg.

Procaine Penicillin intended for use in the manufacture of Parenteral Preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from moisture. If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) where applicable, that the contents are free from bacterial endotoxins; (2) where applicable, that the contents are sterile.

Fortified Procaine Penicillin Injection

Procaine Penicillin with Benzylpenicillin Injection

Fortified Procaine Penicillin Injection is a sterile mixture of five parts of Procaine Penicillin and one part of Benzylpenicillin Potassium or Benzylpenicillin Sodium, together with suitable dispersing and buffering agents. It is filled in a sealed container.

The injection is constituted by suspending the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

Storage. The constituted injection should be used within 24 hours (4 days if a buffering agent is present) of preparation when stored at a temperature not exceeding 20° or within 7 days (14 days if a buffering agent is present) when stored at a temperature between 2° and 8°.

Fortified Procaine Penicillin Injection contains a quantity of total penicillins calculated as $C_{16}H_{17}N_2NaO_4S$ and equivalent to not less than 60.0 per cent and not more than 74.0 per cent of the stated amounts of procaine penicillin and benzylpenicillin potassium or benzylpenicillin sodium and a quantity of procaine, $C_{13}H_{20}N_2O_2$, equivalent to not less than 36.0 per cent and not more than 44.0 per cent of the stated amount of procaine penicillin.

Usual strengths. Procaine Penicillin, 300 mg (300,000 Units) and Benzylpenicillin Potassium or Benzylpenicillin Sodium 60 mg (100,000 Units), Procaine Penicillin 3 g (3,000,000 Units) and Benzylpenicillin Potassium or Benzylpenicillin Sodium, 600 mg (1,000,000 Units).

Description. A white or almost white powder.

The contents of the sealed container comply with the tests stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Dissolve 10 mg in 10 ml of *water* and add 0.5 ml of *neutral red solution*. Add sufficient *0.01 M sodium hydroxide* to give a permanent orange colour and then add 1 ml of *penicillinase solution*; a red colour is produced rapidly.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It give the reaction of primary aromatic amines (2.3.1), producing a bright, orange-red precipitate.

Tests

Water (2.3.43). Not more than 3.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 10 containers equivalent to about 70 mg of procaine penicillin and dissolve in 30 ml of the mobile phase with the aid of ultrasound and dilute to 50.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (a). Weigh 56 mg of *benzylpenicillin potassium IPRS* and 32 mg of *procaine hydrochloride IPRS* and dissolve in 25 ml of the mobile phase with the aid of ultrasound and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Mix 1 volume of a 0.24 per cent w/v solution of *phenoxymethylpenicillin potassium IPRS* in the mobile phase with 3 volumes of reference solution (a).

Chromatographic system

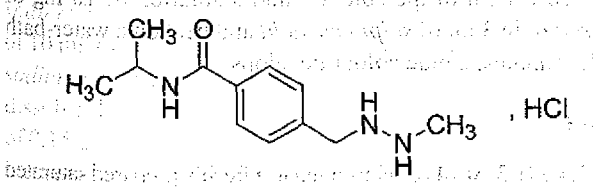
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 50 volumes of a solution containing 1.4 per cent w/v of *potassium dihydrogen orthophosphate* and 0.65 per cent w/v *tetrabutyl ammonium hydroxide* adjusted to pH 7.0 with *1 M potassium hydroxide* or *orthophosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between benzylpenicillin potassium and phenoxymethylpenicillin potassium is not less than 2. The relative retention time of procaine with reference to benzylpenicillin is about 2.2.

Inject reference solution (a) and the test solution. Record the peak responses of the main peaks of benzyl penicillin and procaine. Calculate the total penicillin content as benzylpenicillin sodium, $C_{16}H_{17}N_2NaO_4S$ and the content of procaine, $C_{13}H_{20}N_2O_2$ using the factor of 0.866 for converting the content of procaine hydrochloride to that of procaine.

Labelling. The label states (1) the quantities of Procaine Penicillin and Benzylpenicillin Potassium or Benzylpenicillin Sodium contained in it; (2) the names of any added dispersing and buffering agents; (3) "for intramuscular injection only".

Procarbazine Hydrochloride



$C_{12}H_{19}N_3O,HCl$ Mol. Wt. 257.8

Procarbazine Hydrochloride is *N-iso*.Propyl-4-[(2-methylhydrazino)methyl]benzamide hydrochloride.

Procarbazine Hydrochloride contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{12}H_{19}N_3O,HCl$.

CAUTION — Handle with exceptional care, since it is a highly potent agent.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procarbazine hydrochloride IPRS* or with the reference spectrum of procarbazine hydrochloride.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maximum at 232 nm. (*NOTE — Use low actinic glassware).*

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh 0.75 g in 100 ml of *water*. Titrate with *0.1 M sodium hydroxide*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02578 g of $C_{12}H_{19}N_3O,HCl$.

Storage. Store protected from light and moisture.

Procarbazine Hydrochloride Capsules

Procarbazine Hydrochloride Capsules contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of procarbazine $C_{12}H_{19}N_3O$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate if necessary with dissolution medium, measure the absorbance at the maximum at about 233 nm (2.4.7). Calculate the content of $C_{12}H_{19}N_3O$ in the medium from the absorbance obtained by repeating the determination using a solution of known concentration of *procarbazine hydrochloride IPRS* in *water*.

https://nhathuocngocanh.com/

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{19}N_3O$

Other tests. Comply with the test stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of mixed content of 20 capsules containing 50 mg of Procarbazine and disperse in 200.0 ml of *water* with the aid of ultrasound for 5 minutes, cool and dilute to 250.0 ml with same solvent and filter. Dilute 5.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. A solution containing 0.012 per cent w/v solution of *procarbazine hydrochloride IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *acetonitrile*, 14 volumes of *methanol* and 72 volumes of buffer solution prepared by dissolving 2.0 g of *sodium hexanesulphonate* and 4 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
- flow: 1 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

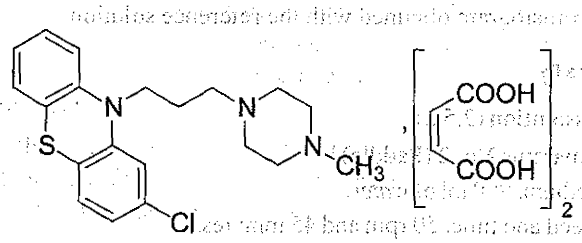
Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{19}N_3O$ in the capsules.

Storage. Store in airtight containers, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of the equivalent amount of procarbazine.

Prochlorperazine Maleate



$C_{20}H_{24}ClN_3S,2C_4H_4O_4$ Mol. Wt. 606.1

Prochlorperazine Maleate is 2-chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine di(hydrogen maleate).

Prochlorperazine Maleate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Description. A white or pale yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. To 20 mg add 5 ml of *water* and 1 ml of *1 M sodium hydroxide*, shake and extract with 10 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.2 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine maleate IPRS*, treated in the same manner or with the reference spectrum of prochlorperazine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 258 nm and a less well-defined maximum at about 313 nm; absorbance at about 258 nm, about 0.63.

C. Complies with the test for identification of phenothiazines (2.3.3).

Test solution. A solution containing 0.1 per cent w/v of the substance under examination in a mixture of equal volumes of *methanol* and *chloroform*.

Reference solution. A 0.1 per cent w/v solution of *prochlorperazine maleate IPRS* in the same solvent mixture.

Apply 4 µl of each solution.

D. Triturate 0.2 g with a mixture of 3 ml of *water* and 1 ml of *10 M sodium hydroxide* and shake with three quantities, each of 5 ml, of *ether*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; no colour develops. To the remainder of the aqueous layer add 2 ml of *bromine solution*, heat on a water-bath for 15 minutes, then heat to boiling and cool. To 0.1 ml of the solution add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; a blue colour develops.

Tests

pH (2.4.24). 3.0 to 4.0, determined in a freshly prepared saturated solution.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

NOTE— Prepare the test solution immediately before use.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g, in powder, dissolve in 50 ml of *anhydrous glacial acetic acid*, heating gently on a water-bath, allow to cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03031 g of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$.

Storage. Store protected from light and moisture.

Prochlorperazine Tablets

Prochlorperazine Maleate Tablets

Prochlorperazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of prochlorperazine maleate, $C_{20}H_{24}ClN_3S,2C_4H_4O_4$.

Usual strengths. 5 mg; 25 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Prochlorperazine Maleate add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine maleate IPRS*, treated in the same manner or with the reference spectrum of prochlorperazine.

B. To a quantity of the powdered tablets containing 5 mg of Prochlorperazine Maleate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

C. Shake a quantity of the powdered tablets containing 0.2 g of Prochlorperazine Maleate with 2 ml of *water* and 1 ml of *5 M sodium hydroxide*, mix and extract with three quantities, each of 10 ml, of *ether*. Dry the combined extracts with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of *methanol* and add a solution of 0.15 g of *picric acid* in 10 ml of *methanol*. The precipitate, after washing with a small quantity of *methanol*, melts at about 255°, with decomposition (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 500 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm for 60 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 254 nm (2.4.7).

Calculate the content of prochlorperazine maleate, $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *prochlorperazine maleate IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$.

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

NOTE— Prepare the following solutions freshly.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Prochlorperazine Maleate with 10 ml of *methanol* containing 0.5 per cent v/v of *strong ammonia solution* and filter.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the same solvent.

Apply to the plate 20 µl of each solution.

Uniformity of content. Complies with the test stated under Tablets.

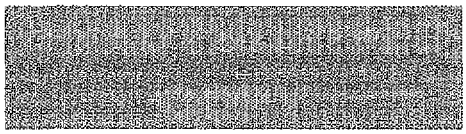
NOTE— Protect the solutions from light throughout the Assay.

Crush one tablet and extract with three quantities, each of 10 ml, of *ethanol* containing 1 per cent v/v of *strong ammonia solution*. Filter the extracts and to the combined filtrates add sufficient *ethanol* to produce 50.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol*. Dilute further with *ethanol*, if necessary, to give a final solution containing 10 µg of Prochlorperazine Maleate per ml and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ taking 620 as the specific absorbance at 258 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. *Protect the solutions from light throughout the Assay.*

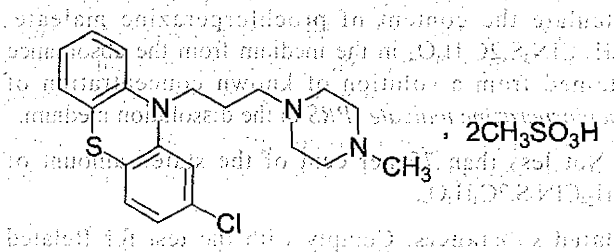
Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 25 mg of Prochlorperazine Maleate and extract with three quantities, each of 10 ml, of *ethanol* containing 1 per cent v/v of *strong ammonia solution*. Filter the extracts and to the combined filtrates add sufficient *ethanol* to produce 100.0 ml. Dilute 10.0 ml to 50.0 ml with *ethanol*, dilute 10.0 ml of the solution to 50.0 ml with *ethanol* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$ taking 620 as the specific absorbance at 258 nm.



https://nhathuocngocanh.com/

Storage. Store protected from light and moisture.

Prochlorperazine Mesylate



$C_{20}H_{24}ClN_3S,2CH_4SO_3$ Mol. Wt. 566.2

Prochlorperazine Mesylate is 2-chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine di(methanesulphonate).

Prochlorperazine Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{24}ClN_3S,2CH_4SO_3$, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine mesylate IPRS* or with the reference spectrum of prochlorperazine mesylate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 258 nm and a less well-defined maximum at about 313 nm; absorbance at about 258 nm, about 0.63.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Mix 50 mg with 0.2 g of powdered *sodium hydroxide*, heat to fusion and continue the heating for a few seconds longer. Cool, add 0.5 ml of *water* and a slight excess of *2 M hydrochloric acid* and warm; sulphur dioxide is evolved which turns moistened *starch iodate paper* blue.

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 2.0 per cent w/v solution.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

Test solution. Dissolve the substance under examination in *methanol* containing 0.5 per cent v/v of *strong ammonia solution*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.5 g in 10 ml of *water*, add 5 ml of *1 M sodium hydroxide* and extract with successive quantities of 50, 25, 25 and 25 ml of *ether*. Wash the combined *ether* extracts with 5 ml of *water*, shake the washings with 5 ml of *ether*, add the *ether* to the combined ether extracts and evaporate to dryness. Add 2 ml of *ethanol*, evaporate to dryness. Dissolve the residue in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02831 g of $C_{20}H_{24}ClN_3S,2CH_4SO_3$.

Storage. Store protected from light and moisture.

Prochlorperazine Injection

Prochlorperazine Mesylate Injection

Prochlorperazine Injection is a sterile solution of Prochlorperazine Mesylate in Water for Injections free from dissolved air.

Prochlorperazine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of prochlorperazine mesylate, $C_{20}H_{24}ClN_3S,2CH_4SO_3$.

Usual strength. 12.5 mg per ml.

Identification

A. To a volume containing 0.1 g of Prochlorperazine Mesylate add 20 ml of *water* and 2 ml of *10 M sodium hydroxide*. Shake and extract with 25 ml of *ether*. Wash the ether layer with two quantities, each of 5 ml, of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine mesylate IPRS* treated in the same manner or with the reference spectrum of prochlorperazine.

B. To a volume containing 5 mg of Prochlorperazine Mesylate add carefully 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

pH (2.4.24). 5.5 to 6.5.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

https://nhathuocngocanh.com/

Test solution. Use the injection under examination.

Reference solution (a). Dilute 1.0 ml of the test solution to 40 ml with *methanol* containing 0.5 per cent v/v of *strong ammonia solution* immediately before use.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the *methanol-ammonia mixture* immediately before use.

Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

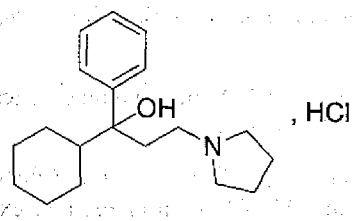
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Protect the solutions from light throughout the Assay.*

To a measured volume containing about 25 mg of Prochlorperazine Mesylate add sufficient *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* to produce 200.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with the *ammoniacal ethanol* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S, 2CH_4SO_3$ taking 635 as the specific absorbance at 258 nm.

Storage: Store protected from light.

Procyclidine Hydrochloride



$C_{19}H_{29}NO,HCl$ Mol. Wt. 323.9

Procyclidine Hydrochloride is (*RS*)-1-cyclohexyl-1-phenyl-3-pyrrolidin-1-ylpropan-1-ol hydrochloride.

Procyclidine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{29}NO,HCl$, calculated on the dried basis.

Category. Antiparkinson.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procyclidine hydrochloride IPRS* or with the reference spectrum of procyclidine hydrochloride.

B. Dissolve 0.25 g in 10 ml of *water*, make alkaline with *5 M ammonia* and extract with three quantities, each of 10 ml, of *ether*. Dry the combined ethereal extracts over *anhydrous sodium sulphate*, filter, remove the ether and scratch the residue with a glass rod to induce solidification. The residue melts at about 85° (2.4.21).

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24), 4.5 to 6.5, determined in a 1.0 per cent w/v solution.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ether* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.004 per cent w/v solution of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride IPRS* in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 15 minutes and examine under ultraviolet light at 254 nm. Any spot corresponding to 1-phenyl-3-pyrrolidinopropan-1-hydrochloride-1-one in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Spray the plate with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

B. Determine by gas chromatography (2.4.13).

Test solution. Add 5 ml of *1.25 M sodium hydroxide* to 20 ml of a 0.015 per cent w/v solution of the substance under examination and mix. Extract with two quantities, each of 20 ml, of *ether*, add to the combined extracts 5 ml of a 0.06 per cent w/v solution of *triphenylethylene* (internal standard) in *ether*, shake with *anhydrous sodium sulphate* and filter. Evaporate the filtrate and dissolve the residue in 1 ml of *ether*.

Reference solution (a). Prepare in the same manner as the test solution but using 20 ml of a 0.5 per cent w/v solution of the

https://nhathuocngocanh.com/

substance under examination and omitting the addition of the internal standard solution.

Reference solution (b). Prepare in the same manner as the test solution but using 20 ml of a 0.5 per cent w/v solution of the substance under examination.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with acid-washed, silanised diatomaceous support (Such as HP chromosorb W) coated with 10 per cent w/w of modified polyethylene glycol 20M (such as SP-1000) and 2 per cent w/w of *potassium hydroxide*,
- temperature :
  column. 240°,
  inlet port and detector at 240°,
- flow rate: 30 ml per minute of the carrier gas.

The ratio of the sum of the areas of any secondary peaks to the area of the peak due to the internal standard in the chromatogram obtained with reference solution (b) is not more than the ratio of the area of the principal peak to the area of the internal standard peak in the chromatogram obtained with the test solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.7 g in 75 ml of *anhydrous glacial acetic acid*, warm if necessary to effect solution and cool. Add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03239 g of $C_{19}H_{29}NO,HCl$.

Storage. Store protected from moisture.

Procyclidine Tablets

Procyclidine Hydrochloride Tablets

Procyclidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of procyclidine hydrochloride, $C_{19}H_{29}NO,HCl$.

Usual strengths. 2.5 mg; 5 mg.

Identification

A. Dissolve a quantity of the powdered tablets containing about 25 mg of Procyclidine Hydrochloride in 10 ml of *water*, shake with 20 ml of *ether* and discard the ether layer. Make the aqueous layer alkaline with *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *ether*. Wash the combined ether extracts with two quantities, each of 10 ml, of *water*, dry by shaking with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. If necessary, induce crystallization by scratching with a glass rod.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procyclidine hydrochloride IPRS* treated in the same manner or with the reference spectrum of procyclidine.

B. The powdered tablets give the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and pool the medium, filter. Follow the procedure described under Assay with necessary modifications and calculate the content of $C_{19}H_{29}NO,HCl$.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{29}NO,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ether* and 1 volume of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Procyclidine Hydrochloride with 5 ml of *chloroform* and filter.

Reference solution (a). A 0.001 per cent w/v solution of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride IPRS* in *chloroform*.

Reference solution (b). Dilute 1 volume of test solution to 200 volumes with *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate at 105° for 15 minutes and examine under ultraviolet light at 254 nm. Any spot corresponding to 1-phenyl-3-pyrrolidinopropan-1-one in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). Spray the plate with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any spot due to excipients on the line of application.

Other tests. Comply with the tests stated under Tablets.

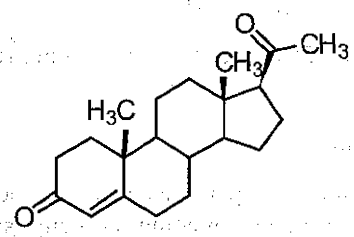
https://nhathuocngocanh.com/

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 2.5 mg of Procyclidine Hydrochloride, transfer to a 100-ml volumetric flask, add 10.0 ml of *water* and mix, and dilute to volume with a 0.025 per cent w/v solution of *bromocresol purple* in 2 per cent v/v solution of *glacial acetic acid*. Allow the undissolved particles to settle. Transfer 5.0 ml of the supernatant solution to a separating funnel, extract with 20.0 ml of *chloroform* and filter the extract, discarding the first 5 ml of the filtrate. Measure the absorbance of the filtrate at the maximum at about 405 nm (2.4.7), using as the blank a solution prepared by treating 0.5 ml of *water* and 4.5 ml of a 0.025 per cent w/v solution of *bromocresol purple* in the same manner beginning at the words "extract with 20 ml of *chloroform* ……".

Calculate the content of $C_{19}H_{29}NO,HCl$ from the absorbance obtained by repeating the operation using *procyclidine hydrochloride IPRS* in place of the powdered tablets.

Storage. Store protected from moisture.

Progesterone



$C_{21}H_{30}O_2$ Mol. Wt. 314.5

Progesterone is 4-Pregnene-3,20-dione.

Progesterone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{21}H_{30}O_2$, calculated on the dried basis.

Category. Steroidal hormone.

Description. A white or almost white crystalline powder or colourless crystals. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *progesterone IPRS* or with the reference spectrum of progesterone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 66 volumes of *dichloromethane* and 33 volumes of *ethyl acetate*.

Solvent mixture. 90 volumes of *dichloromethane* and 10 volumes of *methanol*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *progesterone IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution. Spray the plate with *ethanolic sulphuric acid (20 per cent)*, heat at 120° for 15 minutes, allow to cool and examine in day light. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 186.0° to + 194.0°, determined in a 1.0 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
20	50	50
27	20	80
45	50	50
50	50	50

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 0.8 times the area of the principal peak in the chromatogram obtained with the reference solution (0.8 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 10 mg and dissolve in 100.0 ml of *ethanol (95 per cent)*. Dilute 5.0 ml of the solution to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7). Calculate the content of $C_{21}H_{30}O_2$ taking 535 as the specific absorbance at 241 nm.

Storage. Store protected from light.

Progesterone Injection

Progesterone Injection is a sterile solution of Progesterone in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these. It may contain suitable alcohols.

Progesterone Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of progesterone, $C_{21}H_{30}O_2$.

Usual strengths. 25 mg per ml; 50 mg per ml; 100 mg per ml; 250 mg per ml.

Identification

Dissolve a volume containing 50 mg of Progesterone in 8 ml of *light petroleum (40° to 60°)* and extract with three quantities, each of 8 ml, of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*, wash the combined extract with 10 ml of *light petroleum (40° to 60°)*, dilute with *water*, until the solution becomes turbid, allow to stand in ice for 2 hours and filter. The precipitate, after washing with *water* and drying at 105°, on the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *progesterone IPRS* or with the reference spectrum of progesterone.

Tests

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 50 mg of Progesterone add sufficient *chloroform* to produce 100.0 ml. Dilute 3.0 ml of the solution to 50.0 ml with *chloroform*. To 5.0 ml of the solution, add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the resulting solution at the maximum at about 380 nm (2.4.7), using as the blank 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{21}H_{30}O_2$ from the absorbance obtained by repeating the procedure using a 0.003 per cent w/v solution of *progesterone IPRS* in *chloroform* and beginning at the words "To 5.0 ml of the solution....".

Storage. Store protected from light. If solid matter separates on standing, it should be redissolved by heating before use.

Labelling. The label states that the preparation is intended for intramuscular injection only.

Progesterone Injectable Suspension

Progesterone Injectable Suspension is a sterile suspension of Progesterone in Water for Injections.

Progesterone Injectable Suspension contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of progesterone, $C_{21}H_{30}O_2$.

Usual Strengths. 25 mg per ml; 50 mg per ml; 100 mg per ml; 200 mg per ml.

Identification

A. Filter a volume of suspension containing about 100 mg of progesterone, through a medium-porosity, sintered-glass crucible, filter again if the fluid is not clear. Wash with several 5.0 ml portions of *water*, evaporate on a steam bath, dry the residue at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *progesterone IPRS* or with the reference spectrum of progesterone.

B. Melting point (2.4.21). 126° to 131°.

Tests

pH (2.4.24). 4.0 to 7.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 85 volumes of *ethanol (95 per cent)* and 15 volumes of *water*.

Internal standard solution. A 0.66 per cent w/v solution of *methyltestosterone IPRS* in the solvent mixture.

Test solution. Shake a volume of suspension containing about 25 mg of progesterone with 16 ml of the solvent mixture into a

https://nhathuocngocanh.com/

polytef-lined, screw-capped, 25 ml test tube until the solution is clear. Add 5.0 ml of the internal standard solution and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.25 per cent w/v solution of *progesterone IPRS* in the solvent mixture. To 10.0 ml of the solution, add 5.0 ml of the internal standard solution and dilute to 25.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 100 cm x 2.1 mm, packed with octadecylsilane chemically bonded to porous silica (30-50 µm),
- mobile phase: a mixture of 72 volumes of *water* and 28 volumes of *isopropyl alcohol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to progesterone and methyltestosterone is not less than 3.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

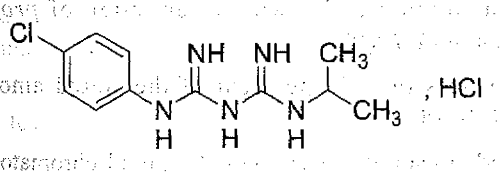
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{30}O_2$ in the suspension.

Storage. Store in single dose or multiple dose containers, preferably of Type 1 glass.

Proguanil Hydrochloride

Chloroguanide Hydrochloride



$C_{11}H_{16}ClN_5, HCl$ Mol. Wt. 290.2

Proguanil Hydrochloride is 1-(4-chlorophenyl)-5-isopropylbiguanide hydrochloride.

Proguanil Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{11}H_{16}ClN_5, HCl$, calculated on the dried basis.

Category. Antimalarial.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *proguanil hydrochloride IPRS* or with the reference spectrum of proguanil hydrochloride.

B. To 10 ml of a saturated solution add 0.25 ml of *potassium ferrocyanide solution*; a white precipitate is produced which dissolves on addition of a few drops of *dilute nitric acid*.

C. Dissolve 5 mg in 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *5 M sodium hydroxide* and 1 ml of *bromine solution*; a deep red colour is produced.

D. It gives the reactions of chlorides (2.3.1).

Tests

Acidity or alkalinity. To 35 ml of *water* maintained at 60° to 65° add 0.2 ml of *methyl red solution*, neutralise with *0.01 M sodium hydroxide* or *0.01 M hydrochloric acid*, add 0.4 g of the substance under examination and stir until dissolved. The resulting solution is not acidic and requires for neutralisation not more than 0.2 ml of *0.01 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.00005 per cent w/v solution of *proguanil impurity C IPRS (1,5-bis(4-chlorophenyl) biguanide IPRS)* in the mobile phase.

Reference solution (c). A 0.00005 per cent w/v solution of *proguanil impurity D IPRS (1,5-bis(1-methylethyl) biguanide IPRS)* in the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute to 1.0 ml of the solution, add 1.0 ml of reference solution (c) and mix.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 3.78 g of *sodium hexanesulphonate* in a mixture of 1 volume of *glacial acetic acid*, 80 volumes of *water* and 120 volumes of *methanol*,
- flow rate: 1ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to proguanil impurity D and the principal peak is not less than 5.0.

https://nhathuocngocanh.com/

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to proguanil impurity C is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent), the area of the peak due to proguanil impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with refernce solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

4-Chloroaniline. Not more than 250 ppm.

Dissolve 0.1 g in 1 ml of *2 M hydrochloric acid*, add sufficient *water* to produce 20 ml, cool to 5°, add 1 ml of *0.05 M sodium nitrite*, allow to stand at 5° for 5 minutes, add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate* and allow to stand for 10 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*, dilute to 50 ml with *water* and allow to stand for 30 minutes. Any magenta colour produced is not more intense than that obtained by treating in the same manner and at the same time 20 ml of a solution containing 1.25 µg per ml of *4-chloroaniline*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.15 g in 25 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01451 g of $C_{11}H_{16}ClN_5,HCl$.

Storage. Store protected from light and moisture.

Proguanil Tablets

Proguanil Hydrochloride Tablets; Chloroguanide Hydrochloride Tablets

Proguanil Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of proguanil hydrochloride, $C_{11}H_{16}ClN_5,HCl$.

Usual strength. 100 mg.

Identification

A. Boil a quantity of the powdered tablets containing 0.5 g of Proguanil Hydrochloride with 5 ml of *dilute hydrochloric acid*, cool and filter. To the filtrate add a slight excess of *sodium hydroxide solution*, extract with 30 ml of *ether* and evaporate the ethereal extract; the residue, after drying at 105°, melts at about 131° (2.4.21).

Dissolve the residue obtained in test A in the minimum quantity of *dilute hydrochloric acid*; the solution diluted with *water* to about 40 ml and neutralised if necessary, with cautious addition of *dilute ammonia solution*, complies with the following tests.

B. To 10 ml add 0.25 ml of *potassium ferrocyanide solution*; a white precipitate is produced which dissolves on addition of a few drops of *dilute nitric acid*.

C. To 0.5 ml add 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *5 M sodium hydroxide* and 1 ml of *bromine solution*; a deep red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.2 M hydrochloric acid* containing 0.2 per cent w/v solution of *sodium chloride*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate, if necessary with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 242 nm (2.4.7), Calculate the content of $C_{11}H_{16}ClN_5,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *proguanil hydrochloride IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{11}H_{16}ClN_5,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 100 mg of Proguanil Hydrochloride, dissolve in 50 ml of *methanol* and shake for 10 minutes, dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of test solution to 100.0 ml with the mobile phase.

Reference solution (b). Mix 1.0 ml of 0.05 per cent w/v solution of *1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride IPRS* in *methanol* and 9 ml of 0.01 per cent w/v solution of *proguanil hydrochloride IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 10 cm x 5.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- column temperature: 40°,
- mobile phase: dissolve 1.89 g of *sodium hexanesulphonate* in a mixture of 500 ml of *methanol*, 500 ml of *water* and 5 ml of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution (b). The test is not valid unless the chromatogram shows two clearly separated peaks due to proguanil hydrochloride and 1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride.

Inject reference solution (a) and the test solution. The sum of the areas of any secondary peaks in the chromatogram obtained with test solution is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

4-Chloroaniline. Not more than 250 ppm.

To a quantity of the powdered tablets containing about 0.1 g of Proguanil Hydrochloride add 5 ml of *ethanol (95 per cent)* and shake for 10 minutes. Add 2.5 ml of *2 M hydrochloric acid* and 15 ml of *water*, mix and filter through a wetted filter paper, washing the filter with 5 ml of *water*. Cool to 5°, add 1 ml of *0.05 M sodium nitrite*, allow to stand at 5° for 5 minutes, add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate* and allow to stand for 10 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)-ethylenediamine dihydrochloride*, dilute to 50 ml with *water* and allow to stand for 30 minutes. Any magenta colour produced is not more intense than that obtained by treating in the same manner and at the same time 20 ml of a solution containing 1.25 µg per ml of *4-chloroaniline*.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 100 mg of Proguanil Hydrochloride, dissolve in 50 ml of *methanol* and shake for 10 minutes, dilute to 100.0 ml with *methanol*. Dilute 5.0 ml to 50.0 ml with *methanol*. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.002 per cent w/v solution of *proguanil hydrochloride IPRS* in the mobile phase.

Reference solution (b). Mix 1.0 ml of 0.05 per cent w/v solution of *1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride IPRS* in *methanol* and 9 ml of 0.01per cent w/v solution of *proguanil hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

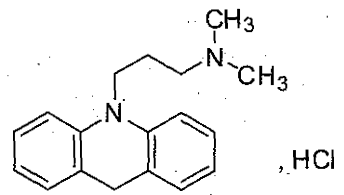
Inject reference solution (b). The test is not valid unless the chromatogram shows two clearly separated peaks due to proguanil hydrochloride and 1-(2,5-dichlorophenyl)-5-isopropylbiguanide hydrochloride.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{11}H_{16}ClN_5,HCl$.

Storage. Store protected from light and moisture.

Promazine Hydrochloride



$C_{17}H_{20}N_2S,HCl$ Mol. Wt. 320.9

Promazine Hydrochloride is 10-(3-dimethylaminopropyl) phenothiazine hydrochloride.

Promazine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2S,HCl$, calculated on the dried basis.

Category. Neuroleptic.

Description. A white or almost white, crystalline powder, slightly hygroscopic in nature.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promazine hydrochloride IPRS* or with the reference spectrum of promazine hydrochloride.

B. Complies with the test for identification of phenothiazine (2.3.3), using *promazine hydrochloride IPRS* to prepare reference solution.

C. Dissolve about 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes. An orange colour is produced.

D. It gives reaction (B) of chlorides (2.3.1).

https://nhathuocngocanh.com/

Tests

pH (2.4.24). 4.2 to 5.2, determined on 5 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE—Carry out the test protected from bright light. Prepare the solutions immediately before use.

Mobile phase. A mixture of 10 volumes of *acetone*, 10 volumes of *diethylamine* and 80 volumes of *cyclohexane*.

Solvent mixture. 5 volumes of *diethylamine* and 95 volumes of *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *chlorprothixene hydrochloride IPRS* in the solvent mixture, add 1.0 ml of the test solution and dilute to 10.0 ml with the same solvent.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03209 g of $C_{17}H_{21}ClN_2S$.

Storage. Store protected from light.

Promazine Tablets

Promazine Hydrochloride Tablets

Promazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promazine hydrochloride, $C_{17}H_{20}N_2S,HCl$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promazine Hydrochloride, add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*. On the resulting solution, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of promazine.

B. To a quantity of the powdered tablets containing 5 mg of Promazine Hydrochloride, add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. An orange colour is produced.

C. Triturate a quantity of the powdered tablets containing 0.2 g of Promazine Hydrochloride with 4 ml of *methanol*, centrifuge, filter the supernatant liquid, heat almost to boiling, immediately add 2 ml of a boiling 3.5 per cent w/v solution of *picric acid* in *methanol* and boil for 2 minutes. Cool in ice, filter, wash the crystals with three quantities of *methanol*, dissolve in 10 ml of hot *methanol* and repeat the crystallisation and washing. The rust red crystals so obtained, after drying at 105° for 1 hour, melts at about 144° (2.4.21).

Tests

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5), using mobile phase (a) and the following freshly prepared solutions.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Promazine Hydrochloride with 10 ml of *methanol* and filter.

Reference solution. Dilute 1.0 ml of test solution to 200.0 ml with *methanol*.

Other tests. Comply with the tests stated under Tablets.

Assay.

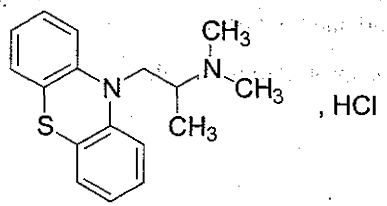
NOTE—Carry out the test protected from light.

Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Promazine Hydrochloride and triturate with 10 ml of *2 M hydrochloric acid* and add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500 ml and centrifuge about 50 ml of the mixture. To 5 ml of the clear, supernatant liquid add 10 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 100 ml. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 251 nm.

Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 935 as the specific absorbance at 251 nm.

https://nhathuocngocanh.com/

Promethazine Hydrochloride



$C_{17}H_{20}N_2S,HCl$ Mol. Wt. 320.9

Promethazine Hydrochloride is (*RS*)-dimethyl(2-phenothiazin-10-ylpropyl)amine hydrochloride.

Promethazine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2S,HCl$, calculated on the dried basis.

Category. Antiemetic.

Description. A white or faintly yellowish, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride IPRS* or with the reference spectrum of promethazine hydrochloride.

B. Complies with the test for Identification of Phenothiazines (2.3.3).

C. Dissolve 0.1 g in 3 ml of *water* and add 1 ml of *nitric acid* dropwise; a precipitate is produced which dissolves rapidly to give a red solution which becomes orange and then yellow. Heat the solution to boiling; it becomes orange and an orange-red precipitate is produced.

D. It gives reaction (B) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.0, determined in a 10.0 per cent w/v solution prepared immediately before use.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), protected from bright light using mobile phase B.

NOTE—Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.02 per cent w/v solution of *isopromethazine hydrochloride IPRS* in the same solvent mixture.

Apply to the plate 10 µl of each solution.

Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Record the volume added between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03209 g of $C_{17}H_{20}N_2S,HCl$.

Storage. Store protected from light and moisture.

Promethazine Injection

Promethazine Hydrochloride Injection

Promethazine Injection is a sterile solution of Promethazine Hydrochloride in Water for Injections free from dissolved air. It may contain suitable stabilising agents.

Promethazine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S,HCl$.

Usual strengths. 25 mg in 1 ml; 50 mg in 2 ml.

Identification

A. To a volume containing 0.1 g of Promethazine Hydrochloride add 20 ml of *water* and 2 ml of *10 M sodium hydroxide*. Shake and extract the mixture with 25 ml of *ether*. Wash the ether layer with two quantities, each of 5 ml, of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of promethazine.

https://nhathuocngocanh.com/

B. To a volume containing 0.2 g of Promethazine Hydrochloride add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a volume containing 5 mg of Promethazine Hydrochloride add carefully 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase B.

Test solution. Dilute a volume of the injection with a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to contain 1 per cent w/v of Promethazine Hydrochloride.

Reference solution (a). Dilute 1 volume of the test solution to 40 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride IPRS* in the same solvent mixture.

Apply separately to the plate 10 µl of each solution.

Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 5.0 Endotoxin Units per mg of promethazine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Carry out the following procedure protected from light.*

To a measured volume containing about 25 mg of Promethazine Hydrochloride add sufficient *0.01 M hydrochloric acid* to produce 100.0 ml. Dilute 10.0 ml to 100.0 ml with *0.01 M hydrochloric acid*, dilute 10.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 249 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S$,HCl taking 910 as the specific absorbance at 249 nm.

Storage. Store protected from light.

Promethazine Syrup

Promethazine Hydrochloride Syrup; Promethazine Hydrochloride Oral Solution; Promethazine Oral Solution

Promethazine Syrup is a solution containing Promethazine Hydrochloride in a suitable flavoured vehicle.

Promethazine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S$, HCl.

Usual strength. 5 mg per 5 ml.

Identification

Transfer an accurately measured volume of the sample containing about 25.0 mg of promethazine hydrochloride to a 250.0 ml of separator and 10.0 ml of *ammonia solution*. Extract the mixture with six quantities, each of 40.0 ml of *chloroform*, shaking vigorously. Wash the combined *chloroform* layer with 25.0 ml of 10 per cent *hydrochloric acid* and wash the acidic layer with 25.0 ml *chloroform* and add the washing to the main chloroform extract. Evaporate the combined extracts on a stream bath, with the aid of current of air, to a volume of 5.0 to 10.0ml, and finally evaporate, with the aid of current of air, to dryness and dissolve the residue in 2.5 ml of *carbon disulfide*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by treating 25.0 mg of *promethazine hydrochloride IPRS* in the same manner.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. *Carry out the following procedure protected from light.*

Transfer an accurately measured volume of the sample containing about 25 mg of Promethazine Hydrochloride to a 250.0 ml of separator and 10.0 ml of *ammonia solution*. Extract the mixture with six quantities, each of 40.0 ml of *chloroform*, shaking vigorously. Wash the combined *chloroform* layer with about 25.0 ml of 10 per cent *hydrochloric acid* and wash the acidic layer with 25.0 ml chloroform and add the washing to the main chloroform extract. Evaporate the combined extracts

https://nhathuocngocanh.com/

on a steam bath, with the aid of current of air, to a volume of 5.0 to 10.0 ml, and finally evaporate, using only a current of air, to dryness. Dissolve the residue, with slight warming in 1.0 per cent v/v *sulphuric acid*, and transfer to 500-ml volumetric flask and dilute to volume with the same medium. Mix well and filter, rejecting the first few ml of the filtrate. Measure the absorbance of the resulting solution at maximum at about 298 nm (2.4.7), using 1.0 per cent v/v *sulphuric acid* as blank. Calculate the content of $C_{17}H_{20}N_2S$,HCl in the sample from the absorbance obtained from a 0.005 per cent w/v solution of *promethazine hydrochloride IPRS* in 1.0 per cent v/v *sulphuric acid*.

Storage. Store protected from light and moisture.

Promethazine Tablets

Promethazine Hydrochloride Tablets

Promethazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S$, HCl. The tablets are coated.

Usual strengths. 10 mg; 25 mg; 50 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promethazine Hydrochloride add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of promethazine.

B. Dissolve a quantity of the powdered tablets containing 0.2 g of Promethazine Hydrochloride in 2 ml of *water*, filter, add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a quantity of the powdered tablets containing 5 mg of Promethazine Hydrochloride add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase B.

Solvent mixture. 95 volumes of *methanol* and 5 volumes of *diethylamine.*

Test solution. A solution freshly prepared by extracting a quantity of the powdered tablets containing 0.1 g of Promethazine Hydrochloride with 10 ml of the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 40 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride IPRS* in the solvent mixture.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet, add 1 ml of *dilute hydrochloric acid* and 30 ml of *water* and shake for 15 minutes. Add sufficient *water* to produce 50.0 ml and centrifuge. Complete the procedure described under Assay beginning at the words "To 5.0 ml of the clear supernatant liquid....".

Other tests. Comply with the tests stated under Tablets.

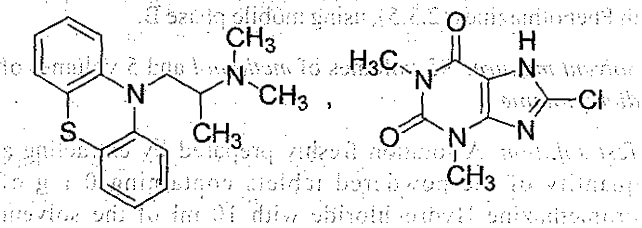
Assay. *Carry out the following procedure protected from light.*

Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Promethazine Hydrochloride with 10 ml of *2 M hydrochloric acid* and add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500.0 ml and centrifuge about 50 ml of the mixture. To 5.0 ml of the clear supernatant liquid add 10 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 249 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S$, HCl taking 910 as the specific absorbance at 249 nm.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Promethazine Theoclate



$C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$ Mol. Wt. 499.0

Promethazine Theoclate is the (*RS*)-dimethyl(2-phenothiazin-10-ylpropyl)amine salt of 8-chlorotheophylline.

Promethazine Theoclate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$, calculated on the dried basis.

Category. Antiemetic.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Shake 0.15 g with 2.5 ml of *water*, add 1 ml of *5 M ammonia* and extract with 30 ml of *ether*. Wash the ether extract with 10 ml of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine theoclate IPRS* treated in the same manner or with the reference spectrum of promethazine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0007 per cent w/v solution in *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 255 nm; absorbance is about 0.53.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Shake 0.4 g with 10 ml of *water*, add 4 ml of *5 M ammonia*, shake with two quantities, each of 30 ml, of *ether* and add 4 ml of *hydrochloric acid* to the aqueous solution; a white precipitate is produced. Filter, wash with *water* and dry at 105°. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness; a reddish residue remains which becomes purple on exposure to the vapour of ammonia.

E. Fuse 50 mg of the residue obtained in test D with 0.5 g of *anhydrous sodium carbonate*, boil the residue with 5 ml of *water*, acidify to *litmus paper* with *nitric acid* and filter. The filtrate gives reaction (A) of chlorides (2.3.1).

Tests

Chlorides (2.3.12). Shake 1.5 g with 50 ml of *water* for 2 minutes and filter. 25 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), protected from bright light, using mobile phase B.

NOTE-Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.02 per cent w/v solution of *isopromethazine hydrochloride IPRS* in the same solvent mixture.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 1.0 g in 200 ml of *acetone*. Titrate with *0.1 M perchloric acid*, using 3 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04990 g of $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$.

Storage. Store protected from light and moisture.

Promethazine Theoclate Tablets

Promethazine Theoclate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promethazine theoclate, $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$.

Usual strengths. 25 mg; 50 mg.

https://nhathuocngocanh.com/

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promethazine Theoclate add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine theoclate IPRS* treated in the same manner or with the reference spectrum of promethazine.

B. Dissolve a quantity of the powdered tablets containing 0.2 g of Promethazine Theoclate in 2 ml of *water*, filter, add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a quantity of the powdered tablets containing 5 mg of Promethazine Theoclate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Extract a quantity of the powdered tablets containing 0.2 g of Promethazine Theoclate with *chloroform*, filter and evaporate the filtrate to dryness. Shake the residue with 10 ml of *water*, add 4 ml of *5 M ammonia* and extract with two quantities, each of 30 ml, of *ether*. Wash the combined extracts with 10 ml of *water*. Combine the aqueous layer and washings, add 4 ml of *hydrochloric acid*; a white precipitate is produced. Filter, wash the residue with *water* and dry at 105°. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness; a reddish residue remains which becomes purple on exposure to the vapour of ammonia.

Tests

Related substances. Carry out the test for related substances in phenothiazines (2.3.5), using mobile phase B.

Test solution. A solution freshly prepared by extracting a quantity of the powdered tablets containing 0.1 g of Promethazine Theoclate with 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filtering.

Reference solution (a). Dilute 1 volume of the test solution to 40 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride IPRS* in the same solvent mixture.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure protected from light.*

Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Promethazine Theoclate, add 5 ml of *water* and 1 ml of *strong ammonia solution* and allow to stand for 5 minutes. Add 50 ml of *ethanol*, shake for 5 minutes and filter, washing the residue with five quantities, each of 5 ml, of *ethanol*. Add sufficient *ethanol* to the filtrate to produce 100.0 ml. Dilute 10.0 ml to 100.0 ml with *ethanol* and dilute 10.0 ml of the solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 255 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$ taking 755 as the specific absorbance at 255 nm.

Storage. Store protected from light and moisture.

Propane

C_3H_8 Mol. Wt. 44.1

Propane is dimethylmethane.

Propane contains not less than 98.0 per cent of C_3H_8.

CAUTION—Propane is highly flammable and explosive.

Identification

Determine by infrared absorption spectrophotometry (2.4.6), the solution give maxima at the wavelength of 3.4 µm, 6.8 µm and 7.2 µm.

Tests

Water (2.3.43). Not more than 0.001 per cent with the following modifications (a) provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas

https://nhathuocngocanh.com/

dispersion tube connected to a sample cylinder; (b) dilute the reagent with *anhydrous methanol* to give a water equivalence factor of between 0.2 and 1.0 mg per ml, age this diluted solution for not less than 16 hours before sanitation; (c) obtain a 100 g sample as directed under inhalation preparation, and introduce the sample into the titration vessel through the gas dispersion tube at a rate of about 100 ml of gas per minute.

High-boiling residues. Not more than 5 µg per ml, determined by the following method. Prepare a cooling coil from copper tubing (about 6 mm outside diameter × about 6.1 m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and *acetone* in a vacuum-jacketed flask, and connect one end of the tubing to the propellant sample cylinder. Carefully open the sample cylinder valve, flush the cooling coil with about 50 ml of the propellant, and discard this portion of liquefied propellant. Continue delivering liquefied propellant from the cooling coil, and collect it in a previously chilled 1000-ml sedimentation cone until the cone is filled to the 1000-ml mark. Allow the propellant to evaporate, using a warm water bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-ml portions of *pentane*, and combine the rinsings in a tared 150-ml evaporating dish. Transfer 100 ml of the *pentane* solvent to a second tared 150-ml evaporating dish, place both evaporating dishes on a water bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 minutes. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-minute periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the propellant as the difference between the weights of the residues in the two evaporating dishes.

Acidity of residue. Add 10 ml of *water* to the residue obtained in the test for High boiling residues, mix by swirling for about 30 seconds, add 2 drops of *methyl orange solution*, insert the stopper in the tube, and shake vigorously; no pink or red color appears in the aqueous layer.

Sulphur. Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose, the odour free from the characteristic odour of sulphur compounds.

Assay. Determine by Gas chromatography (2.4.13).

Test solution. Connect 1 Propane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve. Flush the liquid sample through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve.

Chromatographic system

- an aluminum column 6 m x 3 mm, packed with 10 per cent of liquid phase G30 (Tetraethylene glycol dimethyle ether) on non-acid-washed support S1C (A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized),
- a thermal-conductivity detector,
- flow rate: 50 ml per minute using nitrogen as carrier gas.

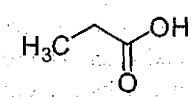
Inject the test solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0.

Inject 2 µl of test solution.

Calculate the percentage purity by dividing 100 times the propane response by the sum of all of the responses in the chromatogram.

Storage. Store protected from moisture and prevent exposure to excessive heat.

Propionic Acid



$C_3H_6O_2$ Mol. Wt. 74.1

Propionic Acid contains not less than 99.5 per cent and not more than 100.5 per cent of $C_3H_6O_2$.

Tests

Weight per ml (2.4.29). 0.988 to 0.993.

Distilling range (2.4.8). 138.5° to 142.5°.

Heavy metals (2.3.13). To the residue obtained in the test for Nonvolatile residue, add 8 ml of *0.1 M hydrochloric acid*, warm gently until solution is complete, dilute with *water* to 100 ml. 12.0 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm).

Limit of nonvolatile residue. Evaporate 20 g in a tared dish, and dry at 105° for 1 hour, the weight of the residue does not exceed 2 mg.

Readily oxidizable substances. Dissolve 15 g of *sodium hydroxide* in 50 ml of *water*, cool, add 6 ml of *bromine*, stirring to effect complete solution, and dilute with *water* to 2000 ml. Transfer 25.0 ml of the solution to a glass-stoppered, 250-ml conical flask containing 100 ml of *water*, and add 10 ml of 20.0 per cent w/v solution *sodium acetate* and 10.0 ml of *Propionic Acid*. Allow to stand for 15 minutes, add 5 ml of 25.0 per cent w/v solution of *potassium iodide* and 10 ml of *hydrochloric acid*, and titrate with *0.1 M sodium thiosulphate* just to the disappearance of the brown color. Carry out a blank titration. The difference between the volume of *0.1 M sodium thiosulphate* required for the blank and that required for the test solution is not more than 2.2 ml.

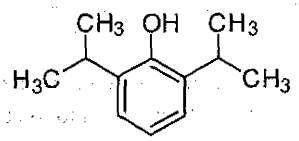
https://nhathuocngocanh.com/

Aldehydes. Transfer 10.0 ml to a glass-stoppered, 250-ml conical flask containing 50 ml of *water* and 10.0 ml of 1.25 per cent w/v solution of *sodium bisulphite*, insert the stopper, and shake vigorously. Allow the mixture to stand for 30 minutes, then titrate with *0.1 M iodine* to the same brownish yellow endpoint obtained with a blank treated with the same quantities of the same reagents. The difference between the volume of *0.1 M iodine* required for the blank and that required for the test solution is not more than 1.75 ml.

Assay. Dissolve 1.5 g in 100 ml of recently boiled and cooled *water* in a 250-ml conical flask, and titrate with *0.5 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator. 1 ml of *0.5 M sodium hydroxide* is equivalent to 0.03704 g of $C_3H_6O_2$.

Storage. Store protected from moisture.

Propofol



$C_{12}H_{18}O$ Mol. Wt. 178.3

Propofol is 2,6-diisopropylphenol.

Propofol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{18}O$.

Category. General anaesthetic.

Description. A colourless or very light yellow, clear liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propofol IPRS* or with the reference spectrum of propofol.

Tests

Refractive index (2.4.27). 1.5125 to 1.5145.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 1.0 g of the substance under examination in 10 ml of *hexane*.

Test solution (b). Dissolve 0.24 g of the substance under examination in 100 ml of *hexane*.

Reference solution (a). A solution containing 5 mg of the substance under examination and 15 µl containing 15 mg of *2,6-bis(1-methylethyl)benzene-1,4-dione IPRS (propofol impurity J IPRS)* in 50 ml of *hexane*.

Reference solution (b). Dilute 0.1 ml of *propofol for peak identification IPRS* (containing 3,3',5,5'-tetrakis(1-methylethyl)biphenyl-4,4'-diol (propofol impurities E) and 2-(1-methylethoxy)-1,3-bis(1-methylethyl)benzene (propofol impurities G) to 1.0 ml with *hexane*.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100 ml with *hexane*. Dilute 1.0 ml of the solution to 10 ml with *hexane*.

Reference solution (d). A 0.24 per cent w/v solution of *propofol IPRS* in *hexane*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: a mixture of 1 volume of *anhydrous ethanol*, 7.5 volumes of *acetonitrile* and 990 volumes of *hexane*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to propofol impurity J and propofol is not less than 4.0. The relative retention times with reference to propofol for propofol impurity G is about 0.5, for oxydibenzene (propofol impurity I) is about 0.6, for 2-(1-methylethenyl)-6-(1-methylethyl)phenol (propofol impurity B) is about 0.7, for 4-hydroxy-3,5-bis(1-methylethyl)benzoic acid (propofol impurity N) is about 2.3, for 2,5-bis(1-methylethyl) phenol (propofol impurity D) is about 2.5 , for 1-methylethyl 4-hydroxy-3,5-bis(1-methylethyl)benzoate (propofol impurity P) is about 2.9, for 2,4-bis(1-methylethyl)phenol (propofol impurity A) is about 3.0, for 2-(1-methylethyl)phenol (propofol impurity C) is about 3.4, for propofol impurity E is about 4.0, for 3-(1-methylethyl)phenol (propofol impurity F) is about 5.8 and for 4-(1-methylethyl)phenol (propofol impurity H) is about 6.4.

Inject reference solution (a), (b), (c) and test solution (a). Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of peak due to propofol impurity G, multiplied with relative response factor 5.0 is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent); the area of the peak due to propofol impurity E, multiplied with correction factor 0.25 is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.01 per cent). The area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the

https://nhathuocngocanh.com/

principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent). Ignore any peak other than propofol impurity E with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.03 per cent).

Impurities J, K, L and O. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 40 mg of the substance under examination in 10 ml of *dichloromethane*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100 ml with *dichloromethane*. Further dilute 1.0 ml of the solution to 10 ml with *dichloromethane*.

Reference solution (b). Dilute 5 µl containing 5 mg of *propofol impurity J IPRS* to 100 ml with *dichloromethane*. Dilute 1.0 ml of the solution to 25 ml with *dichloromethane*.

Reference solution (c). Dissolve 4 mg of *propofol IPRS* in 1.0 ml of reference solution (b).

Chromatographic system
- a fused-silica capillary column 30 m x 0.32 mm, coated with polymethylphenylsiloxane (0.5 µm),
- temperature:
  Column 80° from 0 - 3 minutes, 80°-210° from 3-25 minutes and 210° from 25 - 40 minutes,
  Injection port at 100° and detector at 270°,
- a flame ionisation detector,
- flow rate: 1.7 ml per minute using nitrogen as carrier gas.

Inject 1 µl of reference solution (c). The test is not valid unless the peak- to- valley ratio is not less than 3.0 where H_p is the height above the baseline of the peak due to propofol impurity J and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to propofol. The relative retention time with reference to propofol for 1-(1-methylethoxy)-2-(1-methylethyl)benzene (propofol impurity K) is about 0.76, for 2,2-dimethyl-4-(1-methylethyl)-1,3-benzodioxole (propofol impurity L) is about 0.81 , for propofol impurity J is about 1.01 and for 2-(1-methylethyl)-6-propylphenol (propofol impurity O) is about 1.03.

Inject 1 µl of the test solution, reference solution (a) and (c). In the chromatogram obtained with the test solution the area of the peak due to propofol impurities J, K, L and O, for each impurity, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (d) and test solution (b).

Calculate the content of $C_{12}H_{18}O$.

Storage. Store protected from light under an inert gas.

Propofol Injection

Propofol Injection is a sterile emulsion of Propofol in a suitable base.

Propofol Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of propofol, $C_{12}H_{18}O$.

Usual strength. 10 mg per ml.

Identification

A. Extract a volume of the injection containing 0.1 g of Propofol with three 25 ml quantities of *hexane* and filter the combined extracts using a glass fibre filter (such as Whatman GF/C). Extract the filtrate with two 20 ml quantities of *methanol* (90 per cent) and evaporate the combined extracts under reduced pressure. Dissolve the residue obtained in 2 ml of *ethanol* and evaporate to dryness under reduced pressure. Dry the residue at 50° over *phosphorus pentoxide* for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propofol IPRS* or with the reference spectrum of propofol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

pH (2.4.24). 6.0 to 8.5.

Propofol quinone and propofol dimer. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 80 mg of Propofol in 100 ml of *propan-2-ol*.

Reference solution. A solution containing 0.0008 per cent w/v of *propofol IPRS*, 0.00008 per cent w/v of *2,6-bis(1-methylethyl)-1,4-benzoquinone IPRS* (*propofol impurity J IPRS*) and 0.0002 per cent w/v of *3,3',5,5'-tetrakis (1-methylethyl)biphenyl-4,4'-diol IPRS* (*propofol dimer IPRS*) in *propan-2-ol* containing 6.8 per cent v/v of *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS),
- mobile phase: a mixture of 40 volumes of *tetrahydrofuran* and 60 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with reference to propofol for propofol impurity J is about 0.8 and for propofol dimer is about 2.5.

https://nhathuocngocanh.com/

Inject the reference solution and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to propofol quinone (propofol impurity J) is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent) and the area of the peak due to propofol dimer is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.25 per cent).

Globule size. Not more than 5000 globules more than or equal to 2 µm per ml of a 0.01 per cent v/v dilution in a filtered 0.9 per cent w/v solution of *sodium chloride*. By means of suitable equipment, pass the solution through a 50 µm aperture and count the number of globules by monitoring the change in electrical current between two electrodes immersed on either side of the aperture (such as Coulter Counter). Repeat the procedure using the 0.9 per cent w/v solution of *sodium chloride* only to determine the background count.

Free fatty acid. Not more than 7 millimoles per litre, when determined by the following method.

To 5 ml of a well shaken injection add 25 ml of a mixture of 40 volumes of *propan-2-ol*, 10 volumes of *n-heptane* and 1 volume of *0.5 sulphuric acid* and shake for 1 minute. Allow to stand for 10 minutes, add 15 ml of *n-heptane* and 15 ml of *water*. Mix by inverting the container 10 times and allow to stand for 15 minutes. To 15 ml of the upper phase add 5 ml of *nile blue A solution* and pass a stream of *nitrogen*, previously passed through *0.1 M sodium hydroxide*, through the solution. Titrate with 0.02 M sodium hydroxide, using a microburette. Calculate the content of free fatty acid from a calibration curve prepared from quantities of 1, 2, 4, 6 and 8 ml of a 1.282 per cent w/v solution of *palmitic acid* in *n-heptane*, each diluted to 50 ml with *n- heptane*. Carry out the method described above, using 5 ml of each solution and beginning at the words 'add 25 ml of a mixture'.

Lysolecithin. Not more than 0.2 per cent w/v.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 0.1 g of Propofol in 100 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *lysolecithin* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 1.4 volumes of *orthophosphoric acid*, 40 volumes of *water* and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 250 µl.

Inject the reference solution and the test solution.

Calculate the content of lysolecithin.

Bacterial endotoxins (2.2.3). Not more than 0.33 Endotoxin Unit per mg of propofol.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 80 mg of Propofol to 100.0 ml with the *propan-2-ol*.

Reference solution (a). A 0.08 per cent w/v solution of *propofol IPRS* in in *propan-2-ol* containing 6.8 per cent v/v of *water*.

Reference solution (b). A solution containing 0.0008 per cent w/v of *propofol IPRS* and 0.00008 per cent w/v of *propofol impurity J IPRS* in *propan-2-ol* containing 6.8 per cent v/v of *water*.

The chromatographic system described under Propofol quinone and propofol dimer may be used but using a detection wavelength of 275 nm and injecting 20 µl of each solution.

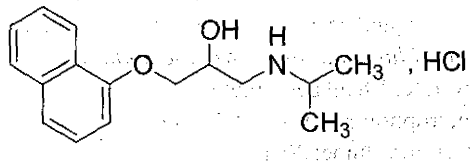
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to propofol and propofol impurity J is not less than 2.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{12}H_{18}O$ in the injection.

Storage. Store at a temperature not exceeding 30°. It should not be allowed to freeze.

Propranolol Hydrochloride



$C_{16}H_{21}NO_2,HCl$ Mol. Wt. 295.8

Propranolol Hydrochloride is (*RS*)-1-[(1-methylethyl)amino]-3-(naphthalen-1-yloxy)propan-2-ol hydrochloride.

Propranolol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{21}NO_2,HCl$, calculated on the dried basis.

Category. Antihypertensive, antianginal and antiarrhythmic agent.

https://nhathuocngocanh.com/

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride IPRS* or with the reference spectrum of propranolol hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 290 nm, 306 nm and 319 nm.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solution (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). – 1.0° to + 1.0°, determined in a 4.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution. Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.6 g of *sodium laurylsulphate* and 0.31 g of *tetrabutylammonium dihydrogen phosphate* in a mixture of 1 ml of *sulphuric acid*, 450 ml of *water* and 550 ml of *acetonitrile*, adjusted to pH 3.3 using *dilute sodium hydroxide solution*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (0.4 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 25 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02958 g of $C_{16}H_{21}NO_2,HCl$.

Storage. Store protected from moisture.

Propranolol Prolonged-release Capsules

Propranolol Hydrochloride Prolonged-release Capsules; Propranolol Hydrochloride Sustained-release Capsules; Propranolol Sustained-release Capsules; Propranolol Hydrochloride Extended-release Capsules; Propranolol Extended-release Capsules.

Propranolol Prolonged-release Capsules manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufactures may not be the same.

Propranolol Prolonged-release Capsules contain Propranolol Hydrochloride.

Propranolol Prolonged-release Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of propranolol hydrochloride, $C_{16}H_{21}NO_2,HCl$.

Usual strengths. 40 mg; 60 mg and 80 mg.

Identification

A. When examined in the range 220 nm and 380 nm (2.4.7), the solution obtained in the Assay, shows two absorption maximum at 290 nm and 319 nm and a shoulder at 306 nm.

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *18 M ammonia* and 99 volumes of *methanol*.

Test solution. Shake a quantity of the powdered capsules containing 20 mg of Propranolol Hydrochloride with 10 ml of *methanol* for 5 minutes and filter.

Reference solution. A 0.2 per cent w/v solution of *propranolol hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at

www.webofpharma.com

https://nhathuocngocanh.com/

254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Capsules.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered capsules containing 0.1 g of Propranolol Hydrochloride with 100 ml of *methanol* sonicate for 15 minutes and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with the mobile phase.

Reference solution (b). A 0.1 per cent w/v solution of *propranolol hydrochloride for performance test IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 ml of *sulphuric acid* and 9 ml of *water*, 20 ml of a 1.7 per cent w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, the mixture adjusted to pH 3.3 with *2M sodium hydroxide*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume: 10 µl.

Run the chromatogram 5 times the retention time of the principal peak.

Inject reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (b) baseline separation is achieved between the peaks due to impurity A [(2*RS*)-3-(naphthalene-1-yloxy) propane-1,2-diol] and propranolol.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 80 mg of Propranolol Hydrochloride, add 150 ml of *methanol*, heat to boiling and boil for 2 minutes, remove from the heat, shake for 20 minutes, cool to 20° and add sufficient *methanol* to produce 200.0 ml. Mix and filter, discard the first 20 ml of filtrate, and dilute 10.0 ml of the filtrate to 200.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7).

Calculate the content of $C_{16}H_{21}NO_2$,HCl taking 206 as the specific absorbance at 290 nm.

Propranolol Injection

Propranolol Hydrochloride Injection

Propranolol Injection is a sterile solution of Propranolol Hydrochloride in Water for Injections containing Citric Acid.

Propranolol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of propranolol hydrochloride, $C_{16}H_{21}NO_2$,HCl.

Usual strength. 1 mg per ml.

Identification

A. Make alkaline with *1 M sodium hydroxide* a volume containing 10 mg of Propranolol Hydrochloride and extract with three quantities, each of 5 ml, of *ether*. Wash the combined *extracts* with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride IPRS* treated in the same manner or with the reference spectrum of propranolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 290 nm, 306 nm and 319 nm.

Tests

pH (2.4.24). 3.0 to 3.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 100 mg of Propranolol Hydrochloride in 100 ml of *acetonitrile*.

Reference solution. Dilute 1.0 ml of the test solution to 500.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 5 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),

https://nhathuocngocanh.com/

– mobile phase: a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7 per cent w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, adjusted to pH 3.3 with *2 M sodium hydroxide*,
– flow rate: 1.8 ml per minute,
– spectrophotometer set at 292 nm,
– injection volume: 10 µl.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (0.8 per cent).

Bacterial endotoxins (2.2.3). Not more than 55.6 Endotoxin Units per mg of propranolol hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 2 mg of Propranolol Hydrochloride add sufficient *methanol* to produce 100.0 ml and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2$, HCl taking 206 as the specific absorbance at 290 nm.

Storage. Store protected from light, in a single dose containers.

Propranolol Tablets

Propranolol Hydrochloride Tablets

Propranolol Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of propranolol hydrochloride, $C_{16}H_{21}NO_2$,HCl.

Usual strengths. 10 mg; 40 mg.

Identification

A. Suspend a quantity of the powdered tablets containing 0.1 g of Propranolol Hydrochloride in 20 ml of *water*, filter, make the filtrate alkaline with *1 M sodium hydroxide* and extract with three quantities, each of 10 ml, of *ether*. Wash the combined extracts with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride IPRS* treated in the same manner or with the reference spectrum of propranolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 290 nm, 306 nm and 319 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2$,HCl in the medium taking 206 as the specific absorbance at 290 nm.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{21}NO_2$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 100 mg of Propranolol Hydrochloride in 100.0 ml of *methanol* and filter.

Reference solution. Dilute 1 ml of the test solution to 500 ml with the mobile phase.

Chromatographic system
– a stainless steel column 20 cm x 5 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
– mobile phase: a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7 per cent w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, adjusted to pH 3.3 with *2 M sodium hydroxide*,
– flow rate: 1.8 ml per minute,
– spectrophotometer set at 292 nm,
– injection volume: 10 µl.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak

https://nhathuocngocanh.com/

in the chromatogram obtained with the reference solution (0.8 per cent).

Uniformity of content. Complies with the test stated under Tablets.

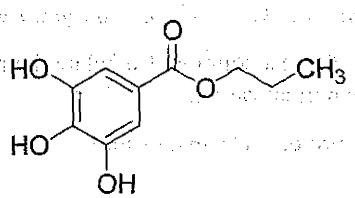
Transfer one tablet to a 100-ml volumetric flask, add 5 ml of *dilute hydrochloric acid* and allow to stand, swirling occasionally, until it is disintegrated. Add about 70 ml of *methanol* and shake well for about 1 minute. Dilute to volume with *methanol*, mix and centrifuge an aliquot of the solution. Dilute a suitable volume of the clear solution with *methanol* to produce a solution containing 20 µg of Propranolol Hydrochloride per ml. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7), using *methanol* as the blank. Calculate the content of $C_{16}H_{21}NO_2,HCl$ taking 206 as the specific absorbance at 290 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 20 mg of Propranolol Hydrochloride and shake with 20 ml of *water* for 10 minutes. Add 50 ml of *methanol*, shake for a further 10 minutes, add sufficient *methanol* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2,HCl$ taking 206 as the specific absorbance at 290 nm.

Storage. Store protected from light and moisture.

Propyl Gallate



$C_{10}H_{12}O_5$ Mol. Wt. 212.2

Propyl Gallate is propyl 3,4,5-trihydroxybenzoate.

Category. Pharmaceutical aid (antioxidant).

Description. A white or creamy white, crystalline powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 275 nm; absorbance at about 275 nm, about 0.49.

B. Dissolve 10 mg in 50 ml of *water*, cool and add 5 ml of *dilute ammonia solution*; a red colour is produced which becomes brown on standing and is restored on shaking.

C. Dissolve 5 mg in 50 ml of *water* and add 0.05 ml of *ferric chloride test solution*; a bluish black colour is produced.

Tests

Chlorides (2.3.12). Shake 1.0 g with 50 ml of *water* for 5 minutes and filter. 25 ml of the filtrate complies with the limit test for chlorides (500 ppm).

Sulphates (2.3.17). Shake 0.8 g with 100 ml of *water* for 5 minutes and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

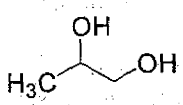
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Storage. Store protected from light and moisture, in non-metallic containers.

Propylene Glycol

1,2-Propanediol; propane-1,2-diol



$C_3H_8O_2$ Mol. Wt. 76.1

Propylene Glycol is propane-1,2-diol.

Propylene Glycol contains not less than 99.5 per cent of $C_3H_8O_2$.

Category. Pharmaceutical aid (humectant; solvent).

Description. A clear, colourless, viscous liquid; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylene glycol IPRS* or with the reference spectrum of propylene glycol.

B. Diethylene glycol and Ethylene glycol. (see Tests)

C. In the test for Diethylene glycol and Ethylene glycol, the retention time of propylene glycol peak obtained with the test solution corresponds to the propylene glycol peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Acidity. Mix 1 ml of *phenolphthalein solution* with 50 ml of *water* and add *0.1 M sodium hydroxide* until the solution is pink for 30 seconds. Add 10 ml of Propylene Glycol and titrate with *0.1M sodium hydroxide* until the original pink colour returns and remains for 30 seconds, not more than 0.2 ml of *0.1 M sodium hydroxide* consumed.

Relative density (2.4.29). 1.035 to 1.037.

Diethylene glycol and Ethylene glycol. Determine by gas chromatography (2.4.13).

Test solution. A solution containing 5.0 per cent w/v of Propylene Glycol and 0.01 per cent w/v of 2,2,2-trichloroethanol (internal standard) in *methanol.*

Reference solution. A solution containing 0.2 per cent w/v of *propylene glycol IPRS*, 0.005 per cent w/v of *ethylene glycol*, 0.005 per cent w/v of *diethylene glycol* and 0.01 per cent w/v of 2,2,2-trichloroethanol (internal standard) in *methanol.*

Chromatographic system

- a capillary column 30 m × 0.53 mm, packed with 6.0 per cent cyanopropylphenyl and 94 per cent dimethylpolysiloxane (film thickness 3.0 µm) (Such as DB-624),
- temperature:
  column. 100° hold for 4 minutes, 100° to 120° @ 50° per minute and hold for 10 minutes, 120° to 220° @ 50° per minute and hold for 6 minutes,
  inlet port at 220° and detector at 250°,
- split ratio: 10:1,
- flame ionization detector,
- flow rate: 4.5 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1µl.

Name	Relative retention time
Ethylene glycol	0.8
Propylene glycol (Retention time about 4 minutes)	1.0
2,2,2-trichloroethanol	1.7
Diethylene glycol	2.4

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ethylene glycol and propylene glycol is not less than 5.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the peak response ratio, each of, ethylene glycol and diethylene glycol relative to 2,2,2-trichloroethanol, is not more than the peak response ratio for ethylene glycol and diethylene glycol relative to 2,2,2-trichloroethanol in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). Dilute 5 ml of Propylene Glycol to 25 ml with *water.* The solution complies with the limit test for heavy metals, Method D (5 ppm), using 10 ml of *lead standard solution (1 ppm Pb).*

Chlorides (2.3.12). 15 ml of 23.8 per cent w/v solution of Propylene Glycol complies with the limit test for chlorides (70 ppm).

Sulphates (2.3.17). 10 ml of 25 per cent w/v solution of Propylene Glycol complies with the limit test for sulphates (60 ppm).

Sulphated ash (2.3.18). Not more than 0.007 per cent w/w, determined by heating 50 g of Propylene Glycol in 100 ml shallow dish until it burns, and ignite.

Water (2.3.43). Not more than 0.2 per cent, determined on 5.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Propylene Glycol.

Chromatographic system

- a glass column 1 m × 4.0 mm, packed with support (40-60 mesh) high molecular weight tetrafluorethylene polymer coated with polyethylene glycol compound (avg. mol. wt. about 15,000), a high molecular weight compound of polyethylene glycol with a diepoxide linker,
- temperature:
  column. 120° to 200° @ 5° per minute,
  inlet port 240° and detector 250°,
- a thermal-conductivity detector,
- using nitrogen as the carrier gas,

NOTE — Retention time of propylene glycol is about 5.7 minutes, and of three isomers of dipropylene glycol, when present, is about 8.2, 9.0, and 10.2 minutes, respectively.

Inject 10 µl of the test solution. Calculate the percentage of $C_3H_8O_2$ by area normalization.

Storage. Store protected from moisture.

Propylene Glycol Monocaprylate

Propylene Glycol Monooctanoate

Octanoic acid, monoester with 1,2- propane diol; Caprylic acid, monoester with propane-1,2-diol.

Propylene glycol monocaprylate is a mixture of the propylene glycol monoesters and diesters of fatty acids composed predominately of caprylic acid. The requirements for monoesters and diester content differ for the two types of propylene glycol monocaprylate.

https://nhathuocngocanh.com/

	Content of Monoesters (per cent)	Content of Diesters (per cent)
Type I	not less than 55 and not more than 80	not less than 20 and not more than 45
Type II	not less than 90	not more than 10

Category. Pharmaceutical aid (humectant; solvent).

Description. A clear, colourless, or slightly yellow, oily liquid at 20°.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylene glycol monocaprylate IPRS* or with the reference spectrum of propylene glycol *monocaprylate* .

B. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *ether*, 30 volumes of *hexane*.

Test solution. Dissolve 5 g of the substance under examination in 100.0 ml of *methylene chloride* .

Reference solution. A 5 per cent w/v solution of *propylene glycol monocaprylate type-I IPRS* or *propylene glycol monocaprylate type-II IPRS* in *methylene chloride.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm and, dry the plate in a currene of air, spray with a 0.01 per cent w/v solution of *rhodamine 6G* in *ethanol* and examine under ultraviolet light at 365 nm. The test is not valid unless the Rf value of the principal spot obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution.

C. Complies with the test of Fatty Acid Composition by Gas Chromatography (2.3.50) and exhibits the following composition profile of fatty acids.

Carbon-Chain length	No. of Double bonds	Percentage
8	0	≥ 90.0
10	0	≤ 3.0
12	0	≤ 3.0
14	0	≤ 3.0
16	0	≤ 1.0

Tests

Acid value (2.3.23). Not more than 1.5.

Saponification value (2.3.37). 285 to 315 for type-I and 270 to 295 for type-II.

Iodine value (2.3.28). Not more than 1.0.

Peroxide value (2.3.35). Not more than 6.0.

Limit of Propylene Glycol. Determine by liquid chromatography (2.4.14).

Use the chromatographic system and test solution as described under Assay.

Reference solution (a). A 0.4 per cent w/v solution of *propylene glycol IPRS* in the *tetrahydrofuran.*

Reference solution (b). Take four 5-ml of volumetric flasks , dilute respectively 0.25, 0.5, 1.0 and 2.5 ml of reference solution (a) dilute with *tetrahydrofuran*. In a fifth 5-ml volumetric flask, take 5.0 ml of reference solution (a).

Inject reference solution (b) with defferent strength and the test solution. Prepare a standard curve of peak area versus concentration, in mg per ml, of propylene glycol in reference solution (b). Obtain the concentration of propylene glycol in the test solution from the standard curve.

Calculate the percentage of free propylene glycol in the portion of propylene glycol monocaprylate using the following equation.

$$\frac{c}{c_u} \times 100$$

where, c = concentration of propylene glycol in the sample solution from the standard curve,

c_u = concentration of the sample solution (mg/ml).

Acceptance criteria. Propylene glycol monocaprylate type-I and Propylene glucol monocaprylate type-II not more than 1.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on a mixture of equal volume of *methanol* and *methylene chloride.*

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 4.0 g of the substance under examination in mobile phase and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 60 cm x 7.0 mm, packed with octadecylsilane bonded to styrene-divinylbenzene copolymer in the hydrogen form (5 µm),
- column temperature: 40°,

https://nhathuocngocanh.com/

- mobile phase: tetrahydrofuran,
- flow rate: 1 ml per minute,
- refractive index detector (Detector cell temperature: 40°)
- injection volume: 40 µl.

The relative retention time with reference to propylene glycol for diesters is about 0.85 and for monoesters is about 0.9.

Inject the test solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent for the monoester peak.

Inject the test solution. Calculate the percentage of monoesters or diesters by area nomalization procedure. In the portion of propylene glycol monocaprylate using following equation.

$$\frac{r_u}{r_t} \times (100 - D)$$

where, r_u = peak response for monoesters or diesters,
r_t = sum of the peak responses of the monoesters and diesters,
D = sum of the per centage content of propylene glycol and the per centage content of free fatty acid.

Inject the test solution. Calculate the percentage of free fatty acids using following equation.

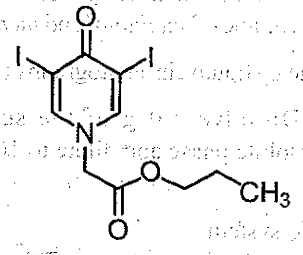
$$D = \frac{A}{561.1} \times 144$$

where, A = acid value.

Storage. Store protected from moisture and keep in well-closed container.

Labelling. The label states that the contents indicate the type (Type-I or Type-II).

Propyliodone



$C_{10}H_{11}I_2NO_3$ Mol. Wt. 447.0

Propyliodone is Propyl 3,5-diiodo-4-oxo-1(4*H*)pyridylacetate.

Propyliodone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{11}I_2NO_3$, calculated on the dried basis.

Description. A white to off-white crystalline powder.

Identification

A. Heat 100 mg with a few drops of *sulphuric acid*; a violet vapours are evolved.

B. Reflux 1 g with 10 ml of *1 M sodium hydroxide* for 30 minutes, add 10 ml of *water*, and acidify to litmus paper with *hydrochloric acid*; the precipitate of *3,5-diiodo-4-oxo-1(4H)-pyridineacetic acid*, after being washed with *water* and dried at 105°, melts at about 245°.

Tests

Melting range (2.4.21). 187° to 190°.

Acidity. Dissolve 1.0 g in 40 ml of hot *n-propyl alcohol* previously neutralised to *phenolphthalein solution*, cool, and allow to stand in an ice bath for 15 minutes with frequent shaking. Filter, wash the residue with neutralised *n-propyl alcohol*, combine the filtrate and washings, add *phenolphthalein solution*, and titrate with *0.05 M sodium hydroxide* to a pink colour that persists for 15 seconds; not more than 0.15 ml of *0.05 M sodium hydroxide* is required for neutralisation.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Iodine and iodide. Shake 2.4 g with 30 ml of *water* for 15 minutes, filter. To 10 ml of filtrate add 1 ml of *2 M nitric acid*, 1 ml of 0.2 per cent v/v solution of *sodium nitrite solution*, and 2 ml of *chloroform*, shake, and centrifuge. Any purple colour in the chloroform layer is not darker than that obtained with a mixture of 6 ml of *water* and 4 ml of 0.0026 per cent w/v solution of *potassium iodide* treated in the same manner (0.01 per cent of I).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g. by drying in an oven at 105°.

Assay. Weigh 15 mg in a mixture of 10 ml of 1 per cent w/v solution of *sodium hydroxide* and 1 ml of freshly prepared 1 per cent w/v solution of *sodium bisulphate*. Titrate with *0.02 M sodium thiosulphate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.02 M sodium thiosulphate* is equivalent to 0.000745 g of $C_{10}H_{11}I_2NO_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Propyliodone Injectable Oil Suspension

Propyliodone Injectable Oil Suspension is a sterile suspension of Propyliodone in Peanut Oil.

Propyliodone Injectable Oil Suspension contains not less than 57.0 per cent and not more than 63.0 per cent of $C_{10}H_{11}I_2NO_3$.

Identification

Mix 1 g of Injectable Oil Suspension with 20 ml of *hexane*, filter the diluted suspension through a fine-porosity, sintered-glass crucible, and wash the residue free from peanut oil with the *hexane*. The residue complies with the following tests.

A. Heat 100 mg with a few drops of *sulphuric acid*; a violet vapour appears.

B. To 1 g with 10 ml of *1 M sodium hydroxide* for 30 minutes, add 10 ml of *water*, and acidify to litmus paper with *hydrochloric acid*; the precipitate of *3,5-diiodo-4-oxo-1(4H)-pyridineacetic acid*, after being washed with *water* and dried at 105°, melts between 187° to 190°.

Tests

Weight per ml (2.4.29). 1.236 g to 1.276 g.

Iodine and iodide. Disperse 3.3 ml in 125 ml of *alcohol-free chloroform*, add 25 ml of 0.04 per cent w/v solution of *sodium hydroxide*, and shake. Separate the aqueous layer, shake it with 125 ml of *alcohol-free chloroform*, and discard the *chloroform*. To 10 ml of filtrate add 1 ml of *2 M nitric acid*, 1 ml of 0.2 per cent v/v solution of *sodium nitrite solution*, and 2 ml of *chloroform*, shake, and centrifuge. Any purple colour in the chloroform layer is not darker than that obtained with a mixture of 6 ml of *water* and 4 ml of 0.0026 per cent w/v solution of *potassium iodide solution* treated in the same manner (0.01 per cent of I).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

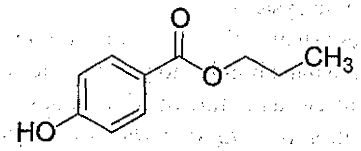
Assay. Transfer the content of 1 container containing 30 mg of Injectable Oil Suspension to a tared combustion capsule and weigh. Dissolve in a mixture of 10 ml of 1 per cent w/v solution of *sodium hydroxide* and 1 ml of freshly prepared 1 per cent w/v solution of *sodium bisulphate*. Titrate with *0.02 M sodium thiosulphate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.02 M sodium thiosulphate* is equivalent to 0.000745 g of $C_{10}H_{11}I_2NO_3$.

Storage. Store protected from light.

Propylparaben

Propyl Hydroxybenzoate



$C_{10}H_{12}O_3$ Mol. Wt. 180.2

Propylparaben is propyl 4-hydroxybenzoate.

Propylparaben contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}O_3$, calculated on the dried basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylparaben IPRS* or with the reference spectrum of propylparaben.

B. Melting point (2.4.21). 96° to 99°.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. Dissolve 1.0 g in sufficient *ethanol (95 per cent)* to produce 10 ml. To 2 ml of the solution add 3 ml of *ethanol (95 per cent)*, 5 ml of *carbon dioxide-free water* and 0.1 ml of *bromocresol green solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *4-hydroxybenzoic acid* (propylparaben impurity A), 5 mg of *ethyl parahydroxybenzoate* (propylparaben impurity C) and 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *propylparaben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, and 65 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

The relative retention time with reference to propylparaben for 4-hydroxybenzoic acid (propylparaben impurity A) is about 0.3, for ethyl parahydroxybenzoate (propylparaben impurity C) is about 0.7.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to propylparaben and propylparaben impurity C is not less than 3.0.

Inject reference solution (c) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to propylparaben impurity A multiplied by 1.4 is not more than the area the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore the peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

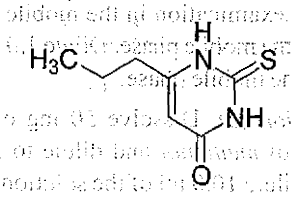
Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{10}H_{12}O_3$.

Storage. Store protected from moisture.

Propylthiouracil



$C_7H_{10}N_2OS$ Mol. Wt. 170.2

Propylthiouracil is 2,3-dihydro-6-propyl-2-thioxopyrimidin-4(1*H*)-one.

Propylthiouracil contains not less than 98.0 per cent and not more than 100.5 per cent of $C_7H_{10}N_2OS$, calculated on the dried basis.

Category. Antithyroid.

Description. A white or pale cream-coloured crystals or crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylthiouracil IPRS* or with the reference spectrum of propylthiouracil.

B. Examine the chromatograms obtained in the test for Related substances under ultraviolet light at 254 nm before exposure of the plate to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. To about 20 mg add 8 ml of *bromine water* and shake for a few minutes. Boil until the mixture is decolorised, allow to cool and filter. Add 2 ml of *barium chloride solution*; a white precipitate is produced. Add 5 ml of *2 M sodium hydroxide*; the precipitate does not become violet.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 12 volumes of *2-propanol* and 0.2 volume of *glacial acetic acid*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *propylthiouracil IPRS* in *methanol*.

Reference solution (c). A 0.0005 per cent w/v solution of *thiourea* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 minutes. By

https://nhathuocngocanh.com/

both methods of visualisation, any spot corresponding to thiourea in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Arsenic (2.3.10). Dissolve 2.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105°.

Assay. Weigh 0.3 g, add 30 ml of *water* and 30.0 ml (n_1 ml) of *0.1 M sodium hydroxide*, boil and shake until solution is complete. Add 50 ml of *0.1 M silver nitrate* with stirring, boil gently for 5 minutes, cool and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25) (n_2 ml). Record the total volume ($n_1 + n_2$ ml) of *0.1 M sodium hydroxide* added.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.008511 g of $C_7H_{10}N_2OS$.

Storage. Store protected from light and moisture.

Propylthiouracil Tablets

Propylthiouracil Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of propylthiouracil, $C_7H_{10}N_2OS$.

Usual strength. 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 20 ml of *methanol* for 10 minutes, filter and evaporate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylthiouracil IPRS* or with the reference spectrum of propylthiouracil.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *water*,

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 274 nm (2.4.7). Calculate the content of $C_7H_{10}N_2OS$ in the medium from the absorbance obtained from a solution of known concentration of *propylthiouracil IPRS*.

Q. Not less than 85 per cent of the stated amount of $C_7H_{10}N_2OS$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 12 volumes of *2-propanol* and 0.2 volume of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 5 ml of *methanol* for 15 minutes, filter and use the filtrate.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). A 0.001 per cent w/v solution of thiourea in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 minutes. By both methods of visualisation, any spot corresponding to thiourea in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Tablets

Assay. Determine by liquid chromatography (2.4.14),

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Propylthiouracil in 10 ml of *methanol*, add 50 ml of *water*, shake mechanically for about 20 minutes and dilute to 100.0 ml with *water*, filter. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Reference solution. Dissolve 25 mg of *propylthiouracil IPRS* in 5 ml of *methanol*, add 25 ml of *water*, shake mechanically for about 15 minutes and dilute to 50.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen*

https://nhathuocngocanh.com/

phosphate in 1000 ml of *water*, adjusted to pH 4.6 with *orthophosphoric acid* or *0.1 M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 20 µl.

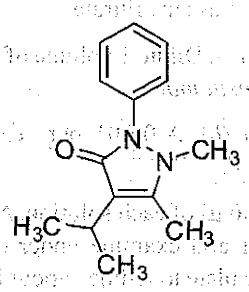
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{10}N_2OS$.

Storage. Store protected from light and moisture.

Propyphenazone



$C_{14}H_{18}N_2O$ Mol. Wt. 230.3

Propyphenazone is 4-isopropyl-2,3-dimethyl-1-phenyl-3-pyrazolin-5-one.

Propyphenazone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{18}N_2O$, calculated on the dried basis.

Category. Analgesic; antipyretic.

Description. A white or slightly yellowish, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propyphenazone IPRS* or with the reference spectrum of propyphenazone.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 2 g in sufficient of a mixture of equal volumes of *ethanol (95 per cent)* and *carbon dioxide-free water* to produce 50 ml (solution A). To 1 ml of solution A add 0.1 ml of *ferric chloride solution*; a brownish red colour is produced which becomes yellow on addition of 1 ml of *2 M hydrochloric acid*.

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *phenolphthalein solution*; the solution is colourless. Add 0.2 ml of *0.01 M sodium hydroxide*; the solution is pink. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution becomes colourless. Add 0.2 ml of *methyl red solution*; the solution is orange or red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 45 volumes of *cyclohexane*, 45 volumes of *ethyl acetate* and 10 volumes of *1-butanol*.

Test solution (a). An 8 per cent w/v solution of the substance under examination in *methanol*.

Test solution (b). A 1.6 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (a). A 0.016 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 1.6 per cent w/v solution of *propyphenazone IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of hot air for 15 minutes and examine under ultraviolet light at 254 nm. Spray the plate with a mixture of equal volumes of *potassium ferricyanide solution* and *ferric chloride solution*. By both methods of visualisation, any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Arsenic (2.3.10). Mix 1.0 g with 10 ml of a 2 per cent w/v solution of *magnesium nitrate* in *ethanol* in a silica or platinum dish, evaporate on a water-bath and heat gradually in order to incinerate. If the material remains incompletely carbonised, moisten with a small quantity of *nitric acid* and ignite again. Cool, add 3 ml of *hydrochloric acid* and heat on a water-bath to dissolve the residue. The resulting solution complies with the limit test for arsenic (10 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. Weigh 0.2 g of the dried material, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02303 g of $C_{14}H_{18}N_2O$.

Storage. Store protected from moisture.

Protamine Sulphate

Protamine Sulphate is a purified mixture of the sulphates of basic peptides prepared from the sperm or mature testes of suitable species of fish. It binds with heparin in solution, inhibiting its anticoagulant activity. It is prepared in conditions designed to minimise the degree of Microbial contamination.

Each mg of Protamine Sulphate precipitates not less than 100 Units of *heparin sodium IPRS*, calculated on the dried basis.

Category. Heparin antidote.

Description. A white or almost white powder; hygroscopic.

Identification

A. Produces a precipitate under the conditions of the Assay.

B. Dissolve 0.2 g in 5 ml of *water* and dilute to 10 ml with the same solvent (solution A). To 0.5 ml of solution A add 4.5 ml of *water*, 1 ml of a 10 per cent w/v solution of *sodium hydroxide* and 1 ml of a 0.02 per cent w/v solution of *1-naphthol* and mix. Cool to 5° and add 0.5 ml of *alkaline sodium hypobromite solution*; an intense red colour is produced.

C. Heat 2 ml of solution A on a water-bath at 60°, add 0.1 ml of *mercuric sulphate solution* and mix; no precipitate is produced. Cool the mixture in ice; a white precipitate is produced.

D. It gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. To 2.5 ml of solution A add 7.5 ml of *water*. The resulting solution is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). −85.0° to −65.0°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Light absorption (2.4.7). Dilute 2.5 ml of solution A to 5.0 ml with *water*. Absorbance of the resulting solution at 260 to 280 nm is not more than 0.1.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Iron (2.3.14). Dissolve 2.0 g in *water* with the aid of heat and dilute to 20 ml with *water*. The resulting solution complies with the limit test for iron (20 ppm).

Mercury. Add 20 ml of a mixture of equal volumes of *nitric acid* and *sulphuric acid* to 2.0 g in a 250-ml flask fitted with a ground-glass stopper, boil under a reflux condenser for 1 hour, cool and carefully dilute with *water*. Boil until nitrous fumes are no longer evolved. Cool, carefully dilute the solution to 200 ml with *water*, mix and filter. Transfer 50 ml of the filtrate to a separating funnel. Shake with successive small quantities of *chloroform* until the *chloroform* layer remains colourless. To the aqueous layer add 25 ml of *1 M sulphuric acid*, 115 ml of *water* and 10 ml of a 20 per cent w/v solution of *hydroxylamine hydrochloride*. Titrate with *dithizone solution*; after each addition, shake the mixture 20 times and towards the end-point of the titration allow to separate and discard the chloroform layer. Titrate until a greenish blue colour is produced. Calculate the content of mercury using the equivalent of mercury in µg per ml of titrant determined in the standardisation of the dithizone solution (10 ppm).

Nitrogen (2.3.30). 21.0 to 26.0 per cent, calculated on the dried basis, determined by Method C.

Sulphates. 16 to 24 per cent, determined by the following method. Dissolve 0.15 g in 15 ml of *water* in a beaker, add 5 ml of *2 M hydrochloric acid* and heat to boiling. Slowly add to the boiling solution 10 ml of *barium chloride solution*. Cover and heat on a *water*-bath for 1 hour. Filter and wash the precipitate several times with small quantities of hot *water*. Dry and ignite the residue to constant weight at 600°.

1 g of the residue is equivalent to 0.4117 g of SO_4.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Prepare solutions of the substance under examination in *water* containing (1) 0.015 per cent w/v (2) 0.01 per cent w/v and (3) 0.005 per cent w/v. Titrate each of the solutions in duplicate with a 174 IU per ml or a suitable dilution of *heparin sodium IPRS* using the following procedure. Introduce a measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable spectrophotometer, set the instrument at a suitable wavelength (none is critical) in the visible range and add the titrant in small volumes until there is a sharp increase in the absorbance. Note the volume of titrant added.

https://nhathuocngocanh.com/

Carry out three independent assays. For each individual titration, calculate the number of Units of heparin titrated per mg of the substance under examination. Calculate the result of the assay as the average of the 18 values. Test the linearity of the response by standard statistical methods. The assay is not valid unless the standard deviations calculated for the results obtained with each test solution are less than 5 per cent of the average result.

Protamine Sulphate intended for use in the manufacture of Parenteral Preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 7.0 Endotoxin Units per mg of protamine sulphate.

Protamine Sulphate intended for use in the manufacture of Parenteral Preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from moisture. If it is intended for use in the manufacture of Parenteral Preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of Parenteral Preparations.

Protamine Sulphate Injection

Protamine Sulphate Injection is a sterile solution of Protamine Sulphate in Water for Injections.

Protamine Sulphate Injection contains not less than 80.0 per cent of the stated amount of protamine sulphate.

Usual strengths. 50 mg in 5 ml; 100 mg in 10 ml.

Identification

A. Produces a precipitate under the conditions of the Assay.

B. Dilute a suitable volume with *water* to give a solution containing 0.2 per cent w/v solution of Protamine Sulphate. To 5 ml of the solution add 1 ml of a 10 per cent w/v solution of *sodium hydroxide* and 1 ml of a 0.02 per cent w/v solution of *1-naphthol* and mix. Cool to 5° and add 0.5 ml of *alkaline sodium hypobromite solution*; an intense red colour is produced.

C. Heat 2 ml on a water-bath at 60°, add 0.1 ml of *mercuric sulphate solution* and mix; no precipitate is produced. Cool the mixture in ice; a white precipitate is produced.

D. It gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5.

Optical rotation (2.4.22). – 0.68° to – 0.52°, determined in a solution prepared by diluting the injection with *0.5 M hydrochloric acid* so as to contain 0.8 per cent w/v of Protamine Sulphate.

Light absorption. Dilute the injection, if necessary, with *water* to produce a solution containing 1 per cent w/v solution of Protamine Sulphate. Absorbance of the resulting solution at 260 to 280 nm, not more than 0.1 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 7.0 Endotoxin Units per mg of protamine sulphate.

Abnormal toxicity. Complies with the test for abnormal toxicity (2.2.1), using a volume containing 0.5 mg of Protamine Sulphate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Prepare solutions of the substance under examination in *water* containing (1) 0.015 per cent w/v (2) 0.01 per cent w/v and (3) 0.005 per cent w/v. Titrate each of the solutions in duplicate with a 174 IU per ml or a suitable dilution of *heparin sodium IPRS* using the following procedure. Introduce a measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable spectrophotometer, set the instrument at a suitable wavelength (none is critical) in the visible range and add the titrant in small volumes until there is a sharp increase in the absorbance. Note the volume of titrant added.

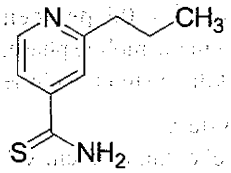
Carry out three independent assays. For each individual titration, calculate the number of Units of heparin titrated per mg of the substance under examination. Calculate the result of the assay as the average of the 18 values. Test the linearity of the response by standard statistical methods. The assay is not valid unless the standard deviations calculated for the results obtained with each test solution are less than 5 per cent of the average result.

Storage. Store protected from light, in single dose containers.

Labelling. The label states (1) that the dose is calculated from the results of determinations of the amount required to produce an acceptable blood-clotting time in the patient; (2) the approximate number of Units of heparin activity 1 ml is capable of neutralising.

https://nhathuocngocanh.com/

Prothionamide



$C_9H_{12}N_2S$ Mol. wt. 180.3

Prothionamide is 2-propyl-4-pyridinecarbothioamide.

Prothionamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_9H_{12}N_2S$, calculated on the dried basis.

Category. Antitubercular.

Description. A yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prothionamide IPRS* or with the reference spectrum of prothionamide.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 291 nm. The absorbance at 291 nm is about 0.78.

Tests

Acidity. Dissolve 2.0 g in 20 ml of *methanol*, heating to about 50°, and add 20 ml of *water*. Cool slightly, shake until crystallisation occurs, if any and allow to cool to room temperature. Add 60 ml of *water* and titrate with *0.1 M sodium hydroxide* using 0.2 ml of *cresol red solution* as indicator. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *prothionamide IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution prepared by mixing 2.0 ml of *triethylamine* with 1000 ml of *water*, adjusted to pH 6.0 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any individual impurity is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy Metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances using the following solutions.

Test solution. Dissolve 50.0 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to a 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *prothionamide IPRS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{12}N_2S$.

Storage. Store protected from light and moisture.

Prothionamide Tablets

Prothionamide Tablets contain not less than 90.0 per cent not more than 110.0 per cent of the stated amount of prothionamide, $C_9H_{12}N_2S$.

Usual strength. 250 mg.

Identification

A. Extract a quantity of the powdered tablets containing 25 mg of Prothionamide with 5 ml of *methanol*, filter and

https://nhathuocngocanh.com/

evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prothionamide IPRS* or with the reference spectrum of prothionamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium if necessary, at the maximum at about 290 nm (2.4.7). Calculate the content of $C_9H_{12}N_2S$ in the medium from the absorbance obtained from a solution of known concentration of *prothionamide IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_{12}N_2S$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Weigh a quantity of the powdered tablets containing 50 mg of Prothionamide disperse in the mobile phase, shake, dilute to 100.0 ml with the mobile phase and filter.

Reference solution. A solution containing 0.025 per cent w/v of *prothionamide IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any individual impurity peak is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all such impurities is not more than twice the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Prothionamide, disperse in the mobile phase, shake and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *prothionamide IPRS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by mixing 2.0 ml of *triethylamine* with 1000 ml of *water* and adjusted to pH 6.0 with *dilute orthophosphoric acid*, and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

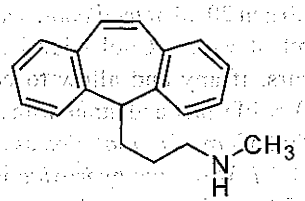
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{12}N_2S$ in the tablets.

Storage. Store protected from light and moisture.

Protriptyline Hydrochloride



$C_{19}H_{21}N,HCl$ Mol. Wt. 299.8

Protriptyline Hydrochloride is 3-(5*H*-dibenzo[*a*,*d*]cycloheptan-5-yl)propyl(methyl)amine hydrochloride.

Protriptyline Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{21}N,HCl$, calculated on the dried basis.

Category. Tricyclic antidepressant.

Description. A white to yellowish white powder.

Identification

A. Dissolve 0.1 g in 10 ml of *water*, make alkaline with *1M sodium hydroxide*, extract with 5 ml of *chloroform*, dry with *anhydrous sodium sulphate* and evaporate the solvent using a current of nitrogen. On the oily residue, determine by the

https://nhathuocngocanh.com/

infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *protriptyline hydrochloride IPRS* treated in the same manner or with the reference spectrum of protriptyline.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 6.5, determined in a 1.0 per cent w/v solution.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Dissolve 0.7 g in 0.5 ml of *acetic anhydride* and 20 ml of *anhydrous glacial acetic acid*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1M perchloric acid* is equivalent to 0.02998 g of $C_{19}H_{21}N,HCl$.

Protriptyline Tablets

Protriptyline Hydrochloride Tablets

Protriptyline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of protriptyline hydrochloride, $C_{19}H_{21}N,HCl$.

Usual strength. 5 mg.

Identification

A. When examined in the range 230 to 350 nm (2.4.7), a solution obtained in the Assay exhibits a maximum only at 292 nm.

B. Shake a quantity of the powdered tablets containing about 5 mg of Protriptyline Hydrochloride with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5 per cent w/v solution of *sodium hydrogen carbonate*, 1 ml of a 2 per cent w/v solution of *sodium periodate* and 1 ml of a 0.3 per cent w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with *1 M sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*, washing the extract with 10 ml of *0.25 M sulphuric acid*. The absorbance of trimethylpentane solution does not exhibit a maxima at 265 nm (2.4.7) (distinction from amitriptyline and nortriptyline).

C. Triturate a quantity of the powdered tablets containing about 0.1 g of Protriptyline Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve part of the residue in 3 ml of *water* and add 0.05 ml of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*. A red colour develops.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 290 nm (2.4.7). Calculate the content of $C_{19}H_{21}N,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *protriptyline hydrochloride IPRS* in dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{21}N,HCl$.

Uniformity of content. Disperse one tablet in 50 ml of a solution prepared by mixing 1 volume of *1 M hydrochloric acid* and 9 volumes of *methanol* and dilute to 100.0 ml with the same solution. Shake well and filter, discard the first few ml of filtrate and dilute a volume of the filtrate containing 1 mg of protriptyline hydrochloride to 100 ml with the same solution and measure the absorbance at the maximum at 292 nm (2.4.7). Calculate the content of $C_{19}H_{21}N,HCl$ taking 465 as the specific absorbance at 292 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14),

Buffer solution. Dissolve 11 g of *monobasic sodium phosphate* and 1.9 g of *sodium 1-hexanesulphonate*, in 1000 ml of *water*, adjusted to pH 2.9 with *orthophosphoric acid*.

Solvent mixture. Dilute 200 ml of *ethanol* and 40 ml of *2.5 M hydrochloric acid* and dilute to 1000 ml with *water*.

Test solution. Disperse 5 intact tablets in the solvent mixture and dilute to obtain a solution containing 0.02 per cent w/v protriptyline hydrochloride in the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *protriptyline hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature:30°
- mobile phase: A. a mixture of 83 volumes of the buffer solution and 17 volumes of *acetonitrile*,
  B. a mixture of 50 volumes of the buffer solution and 50 volumes of *acetonitrile* ,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

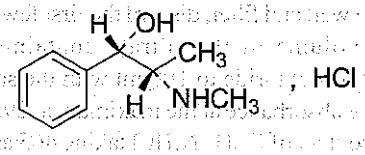
Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	0	100
20	0	00
25	100	0
30	100	0

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{21}N,HCl$ in the tablets.

Pseudoephedrine Hydrochloride



$C_{10}H_{15}NO,HCl$ Mol. Wt. 201.7

Pseudoephedrine Hydrochloride is (1*S*,2*S*)-2-methylamino-1-phenylpropan-1-ol hydrochloride.

Pseudoephedrine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{15}NO$, HCl, calculated on the dried basis.

Category. Sympathomimetic.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride IPRS* or with the reference spectrum of pseudoephedrine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.1 per cent w/v solution shows absorption maxima at about 251 nm, 257 nm and 263 nm; absorbances at the maxima, about 0.75, about 0.98 and about 0.78, respectively.

C. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is not more than very faintly opalescent and colourless (2.4.1).

pH (2.4.24). 4.6 to 6.0, determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). +61.0° to +62.5°, determined in a 5.0 per cent w/v solution using a 2-dm tube.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *ephedrine hydrochloride IPRS* (*pseudoephedrine impurity A IPRS*) in 20.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *ephedrine hydrochloride IPRS* (*pseudoephedrine impurity A IPRS*) in 5 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 6 volumes of *methanol* and 94 volumes of 1.2 per cent w/v solution of *ammonium acetate*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b), (c) and the test solution. Run the chromatogram 1.5 times the retention time of pseudoephedrine. The relative retention time with reference to pseudoephedrine for pseudoephedrine impurity A is about 0.89. The test is not valid unless the resolution between the peaks due to pseudoephedrine impurity A and pseudoephedrine is not less than 2.0. In the chromatogram obtained with the test solution the area of the peak corresponding to pseudoephedrine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of all the secondary peaks other than pseudoephedrine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

https://nhathuocngocanh.com/

Assay. Dissolve 0.5 g in a mixture of 50 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02017 g of $C_{10}H_{15}NO$, HCl.

Storage. Store protected from light and moisture.

Pseudoephedrine Syrup

Pseudoephedrine Hydrochloride Syrup

Pseudoephedrine Syrup is a solution of Pseudoephedrine Hydrochloride in a suitable flavoured vehicle.

Pseudoephedrine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pseudoephedrine hydrochloride, $C_{10}H_{15}NO$, HCl.

Usual strength. 30 mg per 5 ml.

Identification

A. Shake a quantity of the syrup containing 120 mg of Pseudoephedrine Hydrochloride with two quantities, each of 30 ml, of *ether*, and discard the ether layer. Add 4 ml of *1 M sodium hydroxide* to the aqueous layer and extract with two quantities, each of 10 ml, of *ether*. Dry the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride IPRS* treated in the same manner or with the reference spectrum of pseudoephedrine.

B. The residue obtained in test A melts at about 118° (2.4.21).

C. Dissolve 50 mg of the residue obtained in test A in 10 ml of *0.1 M hydrochloric acid*; it is dextro-rotatory.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To a measured volume of the syrup containing about 0.12 g of Pseudoephedrine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* mix, add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml, filter and use the filtrate.

Reference solution. A 0.12 per cent w/v solution of *pseudoephedrine hydrochloride IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.2 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *ethanol* and 15 volumes of a 0.4 per cent w/v solution of *ammonium acetate*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution and record the chromatogram. The test is not valid unless the relative standard deviation is not more than 2.0 per cent and the tailing factor is not more than 1.5.

Inject the reference solution and the test solution.

Storage. Store protected from light and moisture.

Pseudoephedrine Tablets

Pseudoephedrine Hydrochloride Tablets

Pseudoephedrine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pseudoephedrine hydrochloride, $C_{10}H_{15}NO$, HCl.

Usual strength. 60 mg.

Identification

A. Shake a quantity of the powdered tablets containing 60 mg of Pseudoephedrine Hydrochloride with 10 ml of *water* and filter. Shake the filtrate with 10 ml of *ether*, discard the ether layer. Add 1 ml of *1 M sodium hydroxide* to the aqueous layer and extract with two quantities, each of 10 ml, of *ether*. Dry the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride IPRS* treated in the same manner or with the reference spectrum of pseudoephedrine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

https://nhathuocngocanh.com/

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *pseudoephedrine hydrochloride IPRS* in the dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with porous silica (5 µm),
- mobile phase: a mixture of 3 volumes of 0.4 per cent w/v solution of *ammonium acetate* and 17 volumes of *ethanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{15}NO,HCl$, in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{15}NO,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 40 volumes of *butyl acetate*, 20 volumes of *acetone*, 20 volumes of *1-butanol*, 10 volumes of *5 M ammonia* and 10 volumes of *methanol.*

Test solution (a). Add 25 ml of *methanol* to a quantity of the powdered tablets containing 0.5 g of Pseudoephedrine Hydrochloride, shake for 5 minutes, filter, wash the filter with *methanol* and evaporate the combined filtrate and washings to dryness. Dissolve the residue as completely as possible in 5 ml of *methanol*, centrifuge and use the supernatant liquid.

Test solution (b). Dilute 1 volume of the test solution to 10 volumes with *methanol.*

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol.*

Reference solution (b). A 1.0 per cent w/v solution of *pseudoephedrine hydrochloride IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air, spray with a solution containing 0.3 g of *ninhydrin* in a mixture of 100 ml *1-butanol* and 3 ml of *glacial acetic acid* and heat at 120° for 20 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any yellow spot near the line of application.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. To a quantity of the powdered tablets containing about 0.12 g of Pseudoephedrine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* mix with the aid of ultrasound for 15 minutes, add sufficient *methanol* to produce 100.0 ml, filter and use the filtrate.

Reference solution. A 0.12 per cent w/v solution of *pseudoephedrine hydrochloride IPRS* in *methanol (50 per cent).*

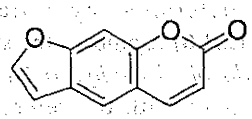
Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{15}NO,HCl$ in the tablets.

Storage. Store protected from light and moisture.

Psoralen



$C_{11}H_6O_3$ Mol. Wt. 186.2

Psoralen is 7*H*-furo[3,2-*g*][1]benzopyran-7-one, obtained from the fruits of *Psoralea carylifolia* Linn. (Fam. Legumi-nosae) and from the leaves of *Ficus carica* (Fam. Urticaceae) or prepared by synthesis.

Psoralen contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{11}H_6O_3$, calculated on the dried basis.

Category. Topical pigmenting agent.

Description. Colourless needles.

Identification

A. Dissolve 1 mg in 5 ml of *ethanol (95 per cent)* and add 15 ml of a mixture containing 43 volumes of *water*, 5 volumes of *acetic acid* and 3 volumes of *propylene glycol*; a blue fluorescence is visible under ultraviolet light at 365 nm.

https://nhathuocngocanh.com/

B. Dissolve 1 mg in 2 ml of *ethanol (95 per cent)* and add 0.1 ml of *0.1 M sodium hydroxide*; a yellow fluorescence is visible under ultraviolet light at 365 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *benzene* and 10 volumes of *ethyl acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

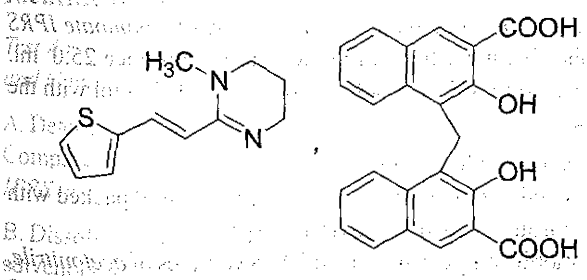
Assay. Dissolve 0.1 g in sufficient *methanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *methanol*. Further dilute 1.0 ml of the solution to 10.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 247 nm (2.4.7).

Calculate the content of $C_{11}H_6O_3$ from the absorbance obtained by repeating the operation using a final solution of 2 µg per ml of *psoralen IPRS* in *methanol* in place of the substance under examination.

Storage. Store protected from light and moisture.

Pyrantel Pamoate

Pyrantel Embonate



$C_{11}H_{14}N_2S, C_{23}H_{16}O_6$ Mol. Wt. 594.7

Pyrantel Pamoate is 1,4,5,6-tetrahydro-1-methyl-2-[(*E*)-2-(2-thienyl)vinyl]pyrimidine hydrogen; 4,4′-methylene bis(3-hydroxynaphthalene-2-carboxylate).

Pyrantel Pamoate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{34}H_{30}N_2O_6S$, calculated on the dried basis.

Category. Anthelmintic.

Description. A pale yellow or yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrantel pamoate IPRS* or with the reference spectrum of pyrantel pamoate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. Mix 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 10 volumes of *diethylamine* with cooling.

Test solution. Dissolve 80 mg of the substance under examination in 7 ml of the solvent mixture and dilute to 100.0 ml with mobile phase.

Reference solution (a). Dissolve 10.0 mg of *1-methyl-2-[(Z)-2-(thiophen-2-yl)-1,4,5,6-tetrahydropyrimidine IPRS* (*pyrantel impurity A IPRS*) in the solvent mixture, add 2.5 ml of the test solution and dilute to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: 7.2 volumes of the solvent mixture and 92.8 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume: 20 µl.

The relative retention times with reference to pyrantel pamoate are about 0.5 for pamoic acid, about 1.3 for pyrantel impurity A and about 1.8 for ((*E*)-*N*-{methylamino)propyl]-3-(thiophen-2-yl)prop-2-enamide) pyrantel impurity B.

Inject reference solution (a). Run the chromatogram for 4 times the retention time of pyrantel. The test is not valid unless the resolution between the peaks due to pyrantel and pyrantel impurity A is at least 4.0.

https://nhathuocngocanh.com/

Inject reference solution (a), (b) and the test solution. For the calculation of content, multiply the peak area of pyrantel impurity B by 0.4. In the chromatogram obtained with the test solution, the area of the peak due to pyrantel impurity A is not more than the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of the peak due to pyrantel impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the area any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks other than those of pyrantel impurities A and B is not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). To 0.7 g, add 10 ml of *dilute nitric acid* and 30 ml of *water*. Heat on water-bath for 5 minutes and cool. The resulting solution complies with the limit test for chlorides (360 ppm).

Sulphates (2.3.17). To 0.5 g, add 2.5 ml of *dilute nitric acid* and dilute to 50 ml with *water*. Heat on water bath for 5 minutes. 15 ml complies with the limit test for sulphates (0.1 per cent).

Iron (2.3.14). Ignite 0.54 g at 800° for 2 hours. Dissolve the residue in 2.5 ml of *dilute hydrochloric acid* with gentle heating for 10 minutes and cool. The resulting solution complies with the limit test for iron (75 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

Assay. Weigh 0.5 g, add 10 ml of *acetic anhydride* and 50 ml *glacial acetic acid*. Heat at 50° and stir for 10 minutes. Allow to cool (a clear solution is not obtained). Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05947 g of $C_{34}H_{30}N_2O_6S$.

Storage. Store protected from light.

Pyrantel Pamoate Oral Suspension

Pyrantel Pamoate Oral Suspension is a suspension of Pyrantel Pamoate in a suitable flavoured aqueous vehicle.

Pyrantel Pamoate Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pyrantel, $C_{11}H_{14}N_2S$.

Usual strength. 50 mg per ml

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. The upper layer of a mixture obtained by shaking 20 volumes of *methyl isobutyl ketone*, 10 volumes of *formic acid* and 10 volumes of *water*.

Test solution. Dilute a known volume of the oral suspension with sufficient *0.05 M methanolic ammonia* to produce a solution containing about 8 mg of pyrantel per ml. Shake the mixture by mechanical means and centrifuge. Use the clear supernatant liquid.

Reference solution. A solution of *pyrantel pamoate IPRS* in *0.05 M methanolic ammonia* containing 0.008 per cent w/v of *pyrantel*.

Apply to the plate 100 µl of each solution. Allow the mobile phase to rise to about 17 cm. Dry the plate in air and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the major peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.0

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Carry out the test protected from light.

Test solution. Weigh a quantity of the oral suspension containing about 60 mg of pyrantel, disperse in 60 ml of *water* and add sufficient *water* to produce 100.0 ml. Dilute 1.0 ml of the well-stirred suspension to 25.0 ml with the mobile phase to obtain a clear solution.

Reference solution. Weigh 20 mg of *pyrantel pamoate IPRS* and dissolve in sufficient mobile phase to produce 25.0 ml. Dilute 10.0 ml of the resulting solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5 to 10 µm),
- mobile phase: a mixture of 92.8 volumes of *acetonitrile*, 3 volumes of *acetic acid*, 3 volumes of *water* and 1.2 volumes of *diethylamine*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,
– spectrophotometer set at 288 nm,
– injection volume: 20 µl.

Inject the reference solution. The resolution between pyrantel and pamoic acid is not less than 10.0, the column efficiency for the pyrantel peak is not less than 8000 theoretical plates, the tailing factor for the pyrantel peak is not greater than 1.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

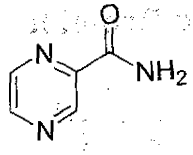
Inject the reference solution and the test solution. Continue the chromatography for a period not less than 2.5 times the retention times of pyrantel base. The relative retention times for pamoic acid and pyrantel base are about 0.6 and 1.0 respectively.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{11}H_{14}N_2S$, weight in volume.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of pyrantel.

Pyrazinamide



$C_5H_5N_3O$ Mol. Wt. 123.1

Pyrazinamide is pyrazine-2-carboxamide.

Pyrazinamide contains not less than 99.0 per cent and not more than 100.5 per cent of $C_5H_5N_3O$, calculated on the anhydrous basis.

Category. Antitubercular.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrazinamide IPRS* or with the reference spectrum of pyrazinamide.

B. Dissolve 50 mg in *water* and dilute to 100 ml with the same solvent (solution A). Dilute 1 ml of the solution A to 10 ml. When examined in the range 290 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 310 nm. Dilute 2 ml of solution A to 100 ml with *water*. When examined in the range 230 nm to 290 nm, the solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, between 0.64 and 0.68.

C. Boil 20 mg with 5 ml of *sodium hydroxide solution*; ammonia, recognisable by its odour, is evolved.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* (solution B) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 25 ml of solution B add 0.05 ml of *phenolphthalein solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is red. Add 1 ml of *0.01 M hydrochloric acid*; the solution is colourless. Add 0.15 ml of *methyl red solution*; the solution is red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 20 volumes of *glacial acetic acid* and 20 volumes of *water*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Reference solution. A 0.002 per cent w/v solution of the substance under examination in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Weigh 0.3 g and transfer to the flask of an ammonia distillation apparatus. Add 200 ml of *water* and 75 ml of *sodium hydroxide solution*. Boil gently for 20 minutes, collecting the distillate in 50.0 ml of *0.05 M sulphuric acid*. Boil vigorously to complete the distillation of the ammonia and titrate the excess of acid with *0.1 M sodium hydroxide*, using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of acid required to neutralise the ammonia formed.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.01231 g of $C_5H_5N_3O$.

Storage. Store protected from moisture.

https://nhathuocngocanh.com/

Pyrazinamide Tablets

Pyrazinamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pyrazinamide, $C_5H_5N_3O$.

Usual strengths. 250 mg; 500 mg; 750 mg; 1000 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.25 g of Pyrazinamide with 20 ml of *ethanol*, filter, evaporate the filtrate to dryness and dry the residue at 105° for 30 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrazinamide IPRS* or with the reference spectrum of pyrazinamide.

B. Shake a quantity of the powdered tablets containing 50 mg of Pyrazinamide with 50 ml of *water*, dilute to 100 ml with *water* and filter (solution A). Dilute 1 ml of solution A to 10 ml with *water*. When examined in the range 290 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 310 nm. Dilute 2 ml of solution A to 100 ml with *water*. When examined in the range 230 nm to 290 nm, the resulting solution shows an absorption maximum at about 268 nm; absorbance at 268 nm, between 0.64 and 0.68.

C. Boil a quantity of the powdered tablets containing 20 mg of Pyrazinamide with 5 ml of *sodium hydroxide solution*; ammonia, recognisable by its odour, is evolved.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium: 900 ml of *water*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 268 nm (2.4.7). Calculate the content of pyrazinamide, $C_5H_5N_3O$ in the medium from the absorbance obtained from a solution of known concentration of *pyrazinamide IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_5H_5N_3O$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 20 volumes of *glacial acetic acid* and 20 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Pyrazinamide with 50 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*, filter, evaporate to dryness and dissolve the residue in sufficient of the same solvent mixture to produce 10 ml.

Reference solution. Dilute 1 volume of the test solution to 500 volumes with a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

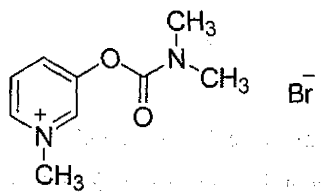
Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.1 g of Pyrazinamide, add 200 ml of *water*, allow to stand for 10 minutes, swirling occasionally, mix with the aid of ultrasound for 10 minutes and dilute to 500.0 ml with *water*. Filter and discard the first 20 ml of the filtrate. Dilute 5.0 ml of the filtrate to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 268 nm (2.4.7). Calculate the content of $C_5H_5N_3O$ taking 650 as the specific absorbance at 268 nm.

Storage. Store protected from moisture.

Pyridostigmine Bromide



$C_9H_{13}BrN_2O_2$ Mol. Wt. 261.1

Pyridostigmine Bromide is 3-(Dimethylcarbamoyl)oxy-1-methylpyridinium bromide.

Pyridostigmine Bromide contains not less than 98.5 per cent and not more than 100.5 per cent of $C_9H_{13}BrN_2O_2$, calculated on the dried basis.

Category. Anticholinesterase.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyridostigmine bromide IPRS* or with the reference spectrum of pyridostigmine bromide.

https://nhathuocngocanh.com/

B. When examine in the range 200 nm to 400 nm (2.4.7), a 0.0035 per cent w/v solution in *0.1 M hydrochloric acid* gives absorption maxima at 269 nm.

C. To 100 mg in a test-tube, add 0.6 ml of *1 M sodium hydroxide*; an orange colour develops. When the mixture is heated, the colour changes to yellow and a strip of moistened red litmus paper held over the top of the test-tube turns blue.

D. A 2.0 per cent w/v solution gives the reactions of bromide (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose with fluorescent indicator*.

Mobile phase. A mixture of equal volumes of *methanol* and *water*.

Test solution. Dissolve 100 mg of the substance under examination in 10 ml of *methanol*.

Reference solution. A 0.02 per cent w/v solution of *pyridostigmine bromide IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm and 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (2.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1 g by drying under vacuum over *phosphorus pentoxide* at 100° for 4 hours.

Assay. Dissolve 850 mg of the substance under examination in 80 ml of *glacial acetic acid*, add 25 ml of *mercuric acetate TS* and 2 drops of *quinaldine red TS*, and titrate with *0.1 M perchloric acid* in *dioxane VS* to a colourless endpoint. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02611 g of $C_9H_{13}BrN_2O_2$.

Storage. Store protected from moisture.

Pyridostigmine Injection

Pyridostigmine Bromide Injection

Pyridostigmine Injection is a sterile solution of Pyridostigmine Bromide in a suitable medium.

Pyridostigmine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pyridostigmine bromide, $C_9H_{13}BrN_2O_2$.

Usual strength. 5 mg per ml.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), the solution prepared in the Assay exhibits maxima and minima that corresponds to that of the reference solution.

B. To 2 ml of injection, add 1 ml of *2 M nitric acid*; the solution gives the reactions for bromide (2.3.1).

Tests

pH (2.4.24). 4.5 to 5.5.

Bacterial endotoxins (2.2.3). Not more than 17.0 Endotoxin Units per mg of pyridostigmine bromide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer a volume of injection containing 20 mg of Pyridostigmine Bromide to a suitable separator. Add 10 ml of *1 M hydrochloric acid* and mix. Extract with four 20-ml portions and one 15-ml portion of *ethyl ether*, and discard the extracts. Transfer the aqueous layer to a 100-ml volumetric flask, using about 25 ml of *water* to aid the transfer. Place the flask on a steam-bath and warm, with the aid of a stream of nitrogen, to evaporate any residual ether, then cool the flask to room temperature, dilute with water to volume, and mix. Dilute 20.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance at 269 nm (2.4.7). Calculate the content of $C_9H_{13}BrN_2O_2$ in the injection from the absorbance obtained from 0.004 per cent w/v solution of *pyridostigmine bromide IPRS* in *0.1 M hydrochloric acid*.

Storage. Store protected from light and in single-dose container, preferably of Type I glass.

Pyridostigmine Tablets

Pyridostigmine Bromide Tablets

Pyridostigmine Tablets contains Pyridostigmine Bromide.

Pyridostigmine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pyridostigmine bromide, $C_9H_{13}BrN_2O_2$.

Identification

Triturate a quantity of the powdered tablets containing 0.1 g of Pyridostigmine Bromide with two 5-ml quantities of *water* and filter. The filtrate complies with the following tests.

A. When examine in the range 200 nm to 400 nm (2.4.7), a 0.005 per cent w/v solution of Pyridostigmine Bromide solution in *water* gives absorption maximum at 270 nm (2.4.7).

https://nhathuocngocanh.com/

B. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *water*, 10 volumes of *formic acid*, 35 volumes of *methanol* and 50 volumes of *chloroform*.

Test solution. Dilute 1.0 ml of the filtrate to 10 ml with *methanol*.

Reference solution. A 0.1 per cent w/v solution of *pyridostigmine bromide IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 20 cm. Dry the plate in air, spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. The filtrate gives reactions of bromides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary, at the maxima at about 270 nm (2.4.7). Calculate the content of $C_9H_{13}BrN_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *pyridostigmine bromide IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_9H_{13}BrN_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of *water*.

Test solution. Disperse a quantity of powdered tablets containing 0.1 g of Pyridostigmine Bromide with 100 ml of the solvent mixture with the aid of ultrasound for 30 minutes and filter.

Reference solution (a). Dilute 6.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 250.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.0005 per cent w/v each of *pyridostigmine impurity A IPRS* and *pyridostigmine bromide IPRS* in the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a 0.43 per cent w/v solution of *sodium dodecyl sulphate*, adjusted to pH 2.0 with *orthophosphoric acid* and 30 volumes of *acetonitrile*,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time
Pyridostigmine impurity B[1]	0.75
Pyridostigmine impurity A[2]	0.92
Pyridostigmine(Retetion time: about 32 minutes)	1.0

[1]pyridin-3-yl dimethylcarbamate,

[2]3-hydroxy-1-methylpyridinium.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to pyridostigmine impurity A and pyridostigmine bromide is not less than 1.5.

Inject reference solution (a), (b), (d) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to pyridostigmine impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (6.0 per cent), the area of any peak corresponding to pyridostigmine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the sum of the areas of any other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.04 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 11.2 g of *orthophosphoric acid* in 500 ml of *water*, adjusted to pH 7.0 with 50 per cent w/v solution of *sodium hydroxide* and dilute to 1000 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Pyridostigmine Bromide in 100 ml of the solvent mixture, shake for 30 minutes and dilute to 200.0 ml with the solvent mixture, mix and centrifuge. Use the supernatant liquid.

Reference solution. A 0.25 per cent w/v solution of *pyridostigmine bromide IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.0 g of *sodium 1-heptanesulfonate* in 500 ml of *water*, add 5.0 ml of *triethylamine* and 100 ml of *acetronitrile*, dilute to 1000 ml with *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

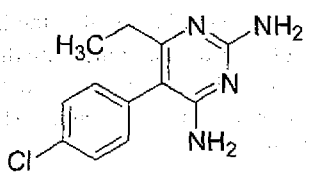
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_{13}BrN_2O_2$ in the tablets.

Storage. Store protected from light.

Pyrimethamine



$C_{12}H_{13}ClN_4$ Mol. Wt. 248.7

Pyrimethamine is 5-(4-chlorophenyl)-6-ethylpyrimidine-2,4-diamine.

Pyrimethamine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{13}ClN_4$, calculated on the dried basis.

Category. Antimalarial.

Description. Colourless crystals or an almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrimethamine IPRS* or with the reference spectrum of pyrimethamine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 0.14 g in sufficient *ethanol* to produce 100 ml, dilute 10 ml of the solution to 100 ml with *0.1 M hydrochloric acid* and dilute 10 ml of the solution to 100 ml with the same solvent. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 272 nm; absorbance at about 272 nm, 0.43 to 0.46.

Tests

Appearance of solution. Dissolve 0.25 g in sufficient of a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol* to produce 10 ml. The resulting solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or alkalinity. Shake 1.0 g with 50 ml of *water* for 2 minutes and filter (solution A). To 10 ml of solution A add 0.05 ml of *phenolphthalein solution*; the solution is colourless and not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour to pink. Add 0.4 ml of *0.01 M hydrochloric acid* and 0.05 ml of *methyl red solution*; the solution is red or orange.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 76 volumes of *toluene*, 12 volumes of *glacial acetic acid*, 8 volumes of *1-propanol* and 4 volumes of *chloroform*.

Prepare the following solutions immediately before use.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.0025 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *pyrimethamine IPRS* in the solvent mixture.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphates (2.3.17). 25 ml of Solution A complies with the limit test for sulphates. Use a mixture of 5.0 ml of *sulphate standard solution (10 ppm SO_4)* and 10 ml of *distilled water* to prepare the standard (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

https://nhathuocngocanh.com/

Assay. Dissolve 0.2 g in 25 ml of *anhydrous glacial acetic acid*, heating gently, cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02487 g of $C_{12}H_{13}ClN_4$.

Storage. Store protected from light and moisture.

Pyrimethamine Tablets

Pyrimethamine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pyrimethamine, $C_{12}H_{13}ClN_4$.

Usual strength. 25 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pyrimethamine with 50 ml of *ethanol (95 per cent)* for 20 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrimethamine IPRS* or with the reference spectrum of pyrimethamine.

B. Extract the powdered tablets with *1 M sulphuric acid*, filter and add *potassium tetraiodomercurate solution* to the filtrate. A creamy white precipitate is produced.

C. Extract a quantity of the powdered tablets containing 50 mg of Pyrimethamine with two 10 ml quantities of *chloroform* and evaporate the combined extracts to dryness. The residue melts at about 240° (2.4.21).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium, filter. Measure the absorbance of the filtrate, suitably diluted with the medium, if necessary at the maximum at about 273 nm (2.4.7). Calculate the content of $C_{12}H_{13}ClN_4$ in the medium from the absorbance obtained from a solution of known concentration of *pyrimethamine IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{13}ClN_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 4 volumes of *chloroform*, 8 volumes of *1-propanol*, 12 volumes of *glacial acetic acid* and 76 volumes of *toluene*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg Pyrimethamine with 5 ml of solvent mixture and filter.

Reference solution. Dilute 1 ml of the test solution to 400 ml with the solvent mixture.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.25 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.025g of Pyrimethamine, add 50 ml of hot *0.1 M hydrochloric acid* and heat on a water-bath for 10 minutes, swirling occasionally. Mix with the aid of ultrasound for 30 minutes, remove and cool to room temperature. Add sufficient *0.1 M hydrochloric acid* to produce 100 ml, filter and dilute 5 ml of the filtrate to 100 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 272 nm (2.4.7). Calculate the content of $C_{12}H_{13}ClN_4$ taking 316 as the specific absorbance at 272 nm.

Pyrimethamine and Sulphadoxine Tablets

Pyrimethamine and Sulphadoxine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of pyrimethamine, $C_{12}H_{13}ClN_4$, and of sulphadoxine, $C_{12}H_{14}N_4O_4S$.

Usual strength. Pyrimethamine 25 mg and sulphadoxine 500 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 4 volumes of *chloroform*, 4 volumes of *n-heptane*, 1 volume of *glacial acetic acid* and 4 volumes of a mixture of 1 volume of *methanol* and 19 volumes of *ethanol*.

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Pyrimethamine with 50 ml of a 2 per cent w/v solution of *strong ammonia solution* in *methanol*.

https://nhathuocngocanh.com/

Reference solution (a). A 0.05 per cent w/v solution of *pyrimethamine IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of *sulphadoxine IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. One of the principal spots in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a) and the other corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 25 mg of Pyrimethamine and 500 mg of Sulphadoxine and shake with 35 ml of *acetonitrile* for 30 minutes in a 100-ml volumetric flask. Dilute to volume with the mobile phase, mix and filter. To 25.0 ml of the filtrate add 2.0 ml of solution A prepared by dissolving 0.1 g of *phenacetin* (internal standard) in 100 ml of *acetonitrile* and sufficient of the mobile phase to produce 50.0 ml.

Reference solution. Weigh 25 mg of *pyrimethamine IPRS* and 500 mg of *sulphadoxine IPRS*, add 35 ml of *acetonitrile* and sufficient of the mobile phase to produce 100.0 ml and mix. To 25.0 ml add 2.0 ml of solution A and add sufficient of the mobile phase to produce 50.0 ml and mix well.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 4 volumes of a 1 per cent v/v solution of *glacial acetic acid* and 1 volume of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times with reference to phenacetin for sulphadoxine is about 0.7 and for pyrimethamine is about 1.3.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{13}ClN_4$ and the content of $C_{12}H_{14}N_4O_4S$ in the tablets.

Storage. Store protected from light and moisture.

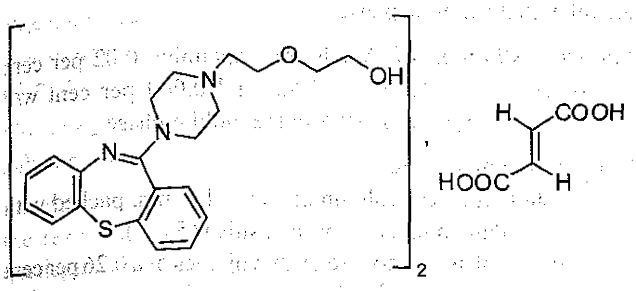
Quetiapine Fumarate



$C_{46}H_{54}N_6O_8S_2$ Mol. Wt. 883.1

Quetiapine Fumarate is Bis[2-[2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethoxy]ethanol] (2*E*)-but-2-enedioate.

Quetiapine Fumarate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{46}H_{54}N_6O_8S_2$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white or almost white powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quetiapine fumarate IPRS* or with the reference spectrum of quetiapine fumarate.

Tests

Fumaric acid. 12.5 to 13.8 per cent.

Dissolve 0.35 g of the substance under examination in 70 ml of a mixture of equal volumes of *methanol* and *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.005804 g of $C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 2.1 mm, packed with end-capped, charged surface, ethylene-bridged phenylhexylsilyl bonded to porous silica (1.7 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 90 volumes of a buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 9.0 with *ammonia solution* and 10 volumes of *methanol*,
  B. *acetonitrile*,
- flow rate: 0.5 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 240 nm,
- injection volume: 3 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
8	80	20
14.5	60	40
22.6	50	50
26	30	70
29	10	90
30	10	90
31	80	20
35	80	20

Name	Relative retention time	Correction factor
Fumaric acid	0.05	—
Quetiapine impurity G[1]	0.5	0.5
Quetiapine (retention time: about 13 minutes)	1.0	—
Quetiapine impurity N[2]	1.04	2.0

[1]dibenzo[*b*,*f*][1,4]thiazepin-11(10*H*)-one,

[2]2-[2-[4-[2-[2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethoxy]ethyl]piperazin-1-yl]ethoxy]ethanol,

Inject the reference solution. The test is not valid unless the signal-to-noise ratio for the principal peak is not less than 40.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to quetiapine impurity G and quetiapine impurity N, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore the peak due to fumaric acid and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

https://nhathuocngocanh.com/

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105°.

Assay. Dissolve 0.17 g of the substance under examination in 40 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02208 g of $C_{46}H_{54}N_6O_8S_2$.

Storage. Store protected from light.

Quetiapine Prolonged-release Tablets

Quetiapine Fumarate Prolonged-release Tablets

Quetiapine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Quetiapine Prolonged-release Tablets contain quetiapine fumarate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quetiapine, $C_{21}H_{25}N_3O_2S$.

Usual strengths. 100 mg; 200 mg; 300 mg; 400 mg.

Identification

A. Shake a quantity of the powdered tablets containing the equivalent of 40 mg of quetiapine with 10 ml of *acetonitrile*, filter and discard the filtrate. Extract the residue with 10 ml of *methanol*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quetiapine fumarate IPRS* or with the reference spectrum of quetiapine fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and disperse a quantity of powdered tablets containing 12.5 mg of Quetiapine in 20 ml of the mobile phase, with the aid of ultrasound and dilute to 25.0 ml with the mobile phase, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v of *quetiapine fumarate IPRS* and 0.004 per cent w/v of *quetiapine impurity I IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 39 volumes of a 0.26 per cent w/v solution of *diammonium hydrogen orthophosphate* in *water*, 54 volumes of *methanol* and 7 volumes of *acetonitrile*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 30 µl.

Name	Relative retention time	Correction factor
Quetiapine impurity H[1]	0.5	—
Quetiapine impurity G[2]	0.6	0.7
Quetiapine impurity I[3]	0.9	—
Quetiapine (retention time: about 14 minutes)	1.0	—

[1]2-[2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)-1-oxidopiperazin-1-yl]ethoxy]ethanol,

[2]dibenzo[*b*,*f*][1,4]thiazepin-11(10*H*)-one,

[3]2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethanol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to quetiapine and quetiapine impurity I in the chromatogram obtained is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to fumaric acid and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Quetiapine in 200 ml of the mobile phase and dilute to 250.0 ml with the mobile phase, filter.

Reference solution (a). A 0.023 per cent w/v solution of *quetiapine fumarate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v of *quetiapine fumarate IPRS* and 0.004 per cent w/v of *quetiapine impurity I IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to quetiapine and quetiapine impurity I is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent for quetiapine in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{25}N_3O_2S$ in the tablets.

1 mg of quetiapine fumarate $C_{46}H_{54}N_6O_8S_2$ is equivalent to 0.8686 mg of quetiapine, $C_{21}H_{25}N_3O_2S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of quetiapine.

Quetiapine Tablets

Quetiapine Fumarate Tablets

Quetiapine Tablets contain quetiapine fumarate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quetiapine, $C_{21}H_{25}N_3O_2S$.

Usual strengths. 25 mg; 50 mg; 100 mg; 200 mg; 300 mg.

Identification

A. Shake a quantity of the powdered tablets containing the equivalent of 40 mg of quetiapine with 10 ml of *acetonitrile*, filter and discard the filtrate. Extract the residue with 10 ml of *methanol*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quetiapine fumarate IPRS* or with the reference spectrum of quetiapine fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{21}H_{25}N_3O_2S$ in the medium from the absorbance obtained from a solution of 0.0032 per cent w/v of *quetiapine fumarate IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{25}N_3O_2S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of quetiapine in 20 ml of the mobile phase, with the aid of ultrasound and dilute to 25.0 ml with the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.02 per cent w/v of *quetiapine fumarate IPRS* and 0.004 per cent w/v of *quetiapine impurity I IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 39 volumes of a 0.26 per cent w/v solution of *diammonium hydrogen orthophosphate* in *water*, 54 volumes of *methanol* and 7 volumes of *acetonitrile*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 30 µl.

Name	Relative retention time	Correction factor
Quetiapine impurity H[1]	0.5	—
Quetiapine impurity G[2]	0.6	0.7
Quetiapine impurity I[3]	0.9	—
Quetiapine (retention time: about 14 minutes)	1.0	—

[1]2-[2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)-1-oxidopiperazin-1-yl]ethoxy]ethanol,

[3]2-[4-(dibenzo[*b*,*f*][1,4]thiazepin-11-yl)piperazin-1-yl]ethanol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to quetiapine and quetiapine impurity I is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak

https://nhathuocngocanh.com/

for test solution. The area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to fumaric acid and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), using chromatographic system and reference solution (b) as described under Related substances.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of quetiapine in 200 ml of the mobile phase, dilute to 250.0 ml with the mobile phase and filter.

Reference solution (a). A 0.023 per cent w/v of *quetiapine fumarate IPRS* in the mobile phase.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to quetiapine and quetiapine impurity I is not less than 2.0.

Inject reference solution (a) and test solution.

Calculate the content of $C_{21}H_{25}N_3O_2S$ in the tablets.

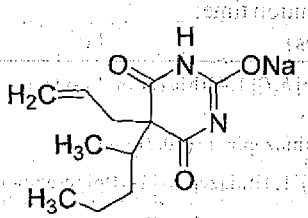
1 mg of quetiapine fumarate $C_{46}H_{54}N_6O_8S_2$ is equivalent to 0.8686 mg of quetiapine, $C_{21}H_{25}N_3O_2S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of quetiapine.

Quinalbarbitone Sodium

Quinalbarbital Sodium; Secobarbital Sodium; Secobarbitone Sodium; Soluble Quinalbarbitone



$C_{12}H_{17}N_2NaO_3$ Mol.Wt.260.3

Quinalbarbitone Sodium is sodium (*RS*)-5-allyl-5-(1-methylbutyl)barbiturate.

Quinalbarbitone Sodium contains not less than 98.5 per cent and not more than 102.0 per cent of $C_{12}H_{17}N_2NaO_3$, calculated on the dried basis.

Category. Hypnotic.

Description. A white powder; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. To 10 ml of a 10.0 per cent w/v solution in *ethanol (95 per cent)* add 120 ml of *water* and 5 ml of *2 M acetic acid*, stir vigorously, add 200 ml of *water* and boil until the precipitate dissolves and no oily particles remain on the surface of the liquid. Allow to cool until a haziness begins to appear in the solution, induce crystallisation, if necessary and allow the solution to stand for 12 hours. Wash the crystals with three quantities, each of 10 ml, of *water* and dry the residue at 80°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quinalbarbitone IPRS* treated in the same manner or with the reference spectrum of quinalbarbitone.

B. To 0.5 g, add 5 ml of *sodium carbonate solution* and 10 ml of *nitrobenzyl chloride solution*. Heat for 30 minutes on a water-bath under reflux and allow to stand for 1 hour. Filter, wash the precipitate successively with 10 ml of *dilute sodium hydroxide solution* and 50 ml of *water*; recrystallise from a mixture of equal volumes of *chloroform* and *ethanol (95 per cent)* and dry at 105°. The crystals melt at about 156° (2.4.21)

C. Complies with the test for identification of barbiturates (2.3.2).

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

E. Ignite 1 g; the residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A freshly prepared 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). Not more than 11.0, determined on a 10.0 per cent w/v solution.

Heavy metals (2.3.13). 0.67 g dissolved in a mixture of 5 ml of *1 M sodium hydroxide* and 20 ml of *water* complies with the limit test for heavy metals, Method C (30 ppm).

Related substances. Complies with the test for related substances in barbiturates (2.3.4).

https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh 0.5 g, dissolve in 10 ml of *ethanol*, add 10 ml of *silver nitrate-pyridine reagent* and titrate with *0.1 M ethanolic sodium hydroxide* using 0.5 ml of *thymolphthalein solution* as indicator, until a pure blue colour is obtained. Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02603 g of $C_{12}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Quinalbarbitone Tablets

Quinalbarbital Sodium Tablets; Quinalbarbitone Sodium Tablets; Secobarbital Sodium Tablets; Secobarbitone Sodium Tablets

Quinalbarbitone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of quinalbarbitone sodium, $C_{12}H_{17}N_2NaO_3$. The tablets are coated.

Usual strength. 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.5 g of Quinalbarbitone Sodium with 10 ml of *water* and filter. To 10 ml of the filtrate add 5 ml of *sodium carbonate solution* and 10 ml of *nitrobenzyl chloride solution*. Heat for 30 minutes on a water-bath under reflux and allow to stand for 1 hour. Filter, wash the precipitate successively with 10 ml of *dilute sodium hydroxide solution* and 50 ml of *water*; recrystallise from a mixture of equal volumes of *chloroform and ethanol (95 per cent)* and dry at 105°. The crystals melt at about 156° (2.4.21).

B. Triturate a quantity of the powdered tablets containing 0.5 g of Quinalbarbitone Sodium with 10 ml of *water*, filter, acidify the filtrate with *acetic acid*; oily drops are formed which may eventually crystallise.

C. The powdered tablets give the reactions of sodium salts (2.3.1).

Tests

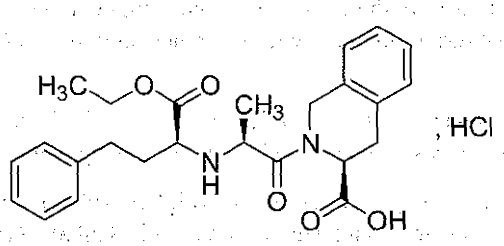
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and digest 20 tablets with 50 ml of *water* until completely disintegrated and not more than a small residue remains. Add 5 ml of *1 M sodium hydroxide*, filter and wash the residue with sufficient *water* to produce 100.0 ml. Extract a volume of the solution containing 0.5 g of Quinalbarbitone Sodium with two quantities, each of 10 ml, of *ether*, washing each ether extract with the same 3 ml of *water*. Add the water to the aqueous liquid, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue to constant weight at 50°.

1 g of residue is equivalent to 1.092 g of $C_{12}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Quinapril Hydrochloride



$C_{25}H_{30}N_2O_5,HCl$ Mol. Wt.474.9

Quinapril Hydrochloride is (*S*)-2-[(*S*)-*N*-[(*S*)-1-Carboxy-3-phenylpropyl]alanyl]-1,2,3,4-tetrahydro-3-isoquinoline-carboxylic acid, 1-ethyl ester, monohydrochloride.

Quinapril Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{25}H_{30}N_2O_5,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to off-white powder, with a pink cast at times.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quinapril hydrochloride IPRS* or with the reference spectrum of quinapril hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

Tests

Specific optical rotation (2.4.22). + 14.4° to + 15.4°, determined in a 2.0 per cent w/v solution in *methanol*.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution (c). A solution containing 0.0005 per cent w/v each of *quinapril related compound A IPRS* and *quinapril related compound B IPRS* in the solvent mixture.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to quinapril related compound A and B is not more than twice the area of the corresponding peaks in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any secondary peak other than quinapril related compound A and B is not more than 0.8 times the area of the quinapril related compound A peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all other secondary peaks is not more than 8 times the area of the quinapril related compound A peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Chloride content. 7.2 to 7.6 per cent, calculated on the anhydrous basis, determined by the following method.

Dissolve 0.1 g of accurately weighed substance under examination in about 50 ml of *water*, add 10 ml of *ethanol (95 per cent)*, acidify with *nitric acid* and titrate with *0.01 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.01 M silver nitrate* is equivalent to 0.0003545 g of chloride.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 40 volumes of *acetonitrile* and 60 volumes of *0.025 M of monobasic ammonium phosphate*, adusted to pH 6.5.

Test solution. Dissolve 100.0 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). A solution containing 0.2 per cent w/v of *quinapril hydrochloride IPRS* and 0.0005 per cent w/v each of *ethyl [3S-[(2R*), 3a, 11ab]]-1,3,4,6,11,11a-hexahydro-3-methyl-1,4-dioxo-a-(2-phenylethyl)-2H-pyrazino[1,2-b]isoquinoline-2-acetate IPRS (quinapril related compound A IPRS)* and *3-isoquinolinecarboxylic acid, 2-[2-[(1-carboxy-3-phenylpropyl)amino]-1-oxopropyl]-1,2,3,4-tetrahydro-, [3S-[2[R*(R*)],3R*]] IPRS (quinapril related compound B IPRS)* in the solvent mixture.

Reference solution (b). A 0.2 per cent w/v solution of *quinapril hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm),
- mobile phase: a mixture of 72 volumes of *water*, 28 volumes of *acetonitrile* and 0.1 volumes of *methanesulphonic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to quinapril and quinapril related compound A is not less than 1.75, the resolution between the peaks corresponding to quinapril and quinapril related compound B is not less than 3.5, the column efficiency is not less than 550 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent for reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{25}H_{30}N_2O_5,HCl$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Quinapril and Hydrochlorothiazide Tablets

Quinapril and Hydrochlorothiazide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinapril, $C_{25}H_{30}N_2O_5$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strengths. Quinapril, 10 mg and Hydrochlorothiazide, 12.5 mg; Quinapril, 20 mg and Hydrochlorothiazide, 12.5 mg and Quinapril, 20 mg and Hydrochlorothiazide, 25 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution (b) correspond to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter through a 0.45 µm nylon filter.

https://nhathuocngocanh.com/

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Use the filtrate obtained as given above.

Reference solution (a). A 0.06 per cent w/v solution of *quinapril hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 0.055 per cent w/v solution of *hydrochlorothiazide IPRS* in the solvent mixture.

Reference solution (c). Dilute reference solution (a) and reference solution (b) in the dissolution medium to obtain a solution having similar concentration to that of the test solution.

Inject reference solution (c). The test is not valid unless the column efficiency for is not less than 2500 theoretical plates for each component, the tailing factor is not more than 2.0 for each component and the relative standard deviation of replicate injections is not more than 2.0 per cent for each component.

Inject reference solution (c) and the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{25}H_{30}N_2O_5$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Disperse a quantity of the powder containing 62.5 mg of hydrochlorothiazide in 50 ml of the solvent mixture, with the aid of ultrasound for 10 minutes. Add 50 ml of *acetonitrile*, mix with the aid of ultrasound for 15 minutes with occasional shaking and dilute to 250.0 ml with the solvent mixture.

Reference solution. A solution containing 0.005 per cent w/v, each of, *quinapril hydrochloride IPRS, quinapril related compound A IPRS, quinapril related compound B IPRS, hydrochlorothiazide IPRS* and *benzothiadiazine related compound A IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- sample temperature: 5°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water*, add 2.0 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 5.0 per cent for the peaks due to quinapril and hydrochlorothiazide.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benzothiadiazine related compound A is not more than 5 times the area of the peak due to benzothiadiazine related compound A in the chromatogram obtained with the reference solution (1.0 per cent), the area of any peak corresponding to quinapril related compound A is not more than 5 times the area of the peak due to quinapril related compound A in the chromatogram obtained with the reference solution (1.0 per cent), the area of any peak corresponding to quinapril related compound B is not more than 15 times the area of the peak due to quinapril related compound B in the chromatogram obtained with the reference solution (3.0 per cent), the area of any other secondary peak is not more than the area of the peak due to quinapril in the

https://nhathuocngocanh.com/

chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks other than quinapril related compound B and benzothiadiazine related compound A is not more than 10 times the area of the peak due to quinapril in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution (a). Weigh and powder 20 tablets. Disperse an accurately of the powder equivalent to the average weight of five tablets into a 250-ml volumetric flask, add 50 ml of solvent mixture and disperse with the aid of ultrasound for 15 minutes. Add 50.0 ml of *acetonitrile* and mix with the aid of ultrasound for 15 minutes with occasional shaking. Add 50.0 ml of solvent mixture and mix with the aid of ultrasound for 15 minutes and dilute to volume with the solvent mixture.

Test solution (b). Dilute test solution (a) with the solvent mixture to obtain a solution containing 0.002 per cent w/v of quinapril.

Reference solution (a). A 0.0225 per cent w/v solution of *quinapril hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *hydrochlorothiazide IPRS* in the solvent mixture.

Reference solution (c). Dilute reference solution (a) and reference solution (b) in the solvent mixture to obtain a solution having similar concentration to that of the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water*, add 2.0 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,

0	75	25
8	40	60
12	40	60
13	75	25
18	75	25

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2500 theoretical plates for each component, the tailing factor is not more than 2.0 for each component and the relative standard deviation of replicate injections is not more than 2.0 per cent for each component.

Inject reference solution (c) and the test solution (b).

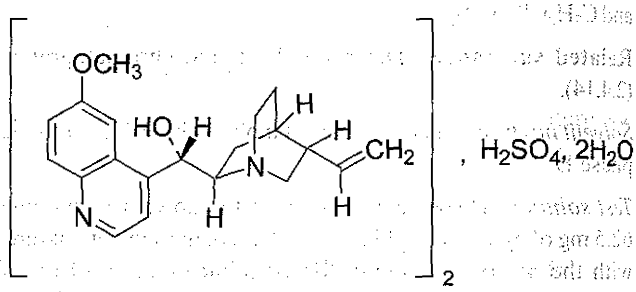
Calculate the content of $C_{25}H_{30}N_2O_5$ and $C_7H_8ClN_3O_4S_2$ in the tablet.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of equivalent amount of quinapril and hydrochlorothiazide.

Quinidine Sulphate

Quinidine Bisulphate



$(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ Mol. Wt. 783.0

Quinidine Sulphate is (8*R*,9*S*)-6′-methoxycinchonan-9-ol sulphate dihydrate. The alkaloid is obtained from the bark of various species of *Cinchona* and from *Remijia pedunculata* Fluckiger (Fam. *Rubiaceae*) or prepared from quinine.

Quinidine Sulphate contains not less than 99.0 per cent and not more than 101.5 per cent of alkaloid monosulphates, calculated as $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$ on the dried basis.

Category. Antiarrhythmic.

Description. A white or almost white, crystalline powder or needle-like crystals.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *methanol*.

https://nhathuocngocanh.com/

Reference solution (a). A 1.0 per cent w/v solution of *quinidine sulphate IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of each of *quinidine sulphate IPRS* and *quinine sulphate IPRS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. To 5 ml of a 0.1 per cent w/v solution add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

D. To 5 ml of a 1 per cent w/v solution add 1 ml of *silver nitrate solution* and stir with a glass rod; after a short interval, a white precipitate soluble in *nitric acid* is produced (distinction from many other alkaloids).

E. A 1 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.24). 6.0 to 6.8, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +275° to +290°, determined in a 2.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10.0 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by

https://nhathuocngocanh.com/

normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinidine is not greater than 15 per cent, the content of any related substance eluting before quinidine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.0 per cent to 5.0 per cent, determined on 1.0 g by drying in an oven at 130°.

Assay. Dissolve 0.2 g in a mixture of 10 ml of *chloroform* and 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02490 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$.

Storage. Store protected from light.

Quinidine Tablets

Quinidine Sulphate Tablets

Quinidine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinidine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Usual strength. 200 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. 1.0 per cent w/v solution of *quinidine sulphate IPRS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 20 ml of *water* and filter. The filtrate (solution A) is dextro-rotatory.

C. To 1 ml of solution A add 4 ml of *water*, 2 or 3 drops of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald green colour is produced.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 248 nm (2.4.7). Calculate the content of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ in the medium from the absorbance obtained from a solution of known concentration of *quinidine sulphate IPRS*.

Q. Not less than 70 per cent of the stated amount of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Mix a quantity of the powdered tablets containing 50 mg of Quinidine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25.0 ml with the mobile phase and filter, discarding the first few ml of filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,

https://nhathuocngocanh.com/

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinidine is not greater than 15 per cent, the content of any related substance eluting before quinidine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

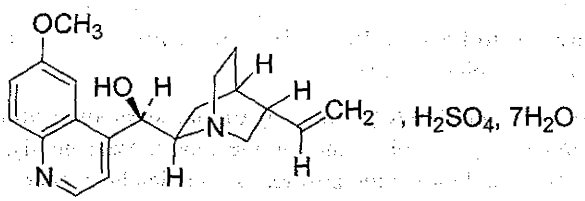
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.4 g of Quinidine Sulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02610 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Storage. Store protected from light.

Quinine Bisulphate

Quinine Acid Sulphate



$C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$ Mol. Wt. 548.6

Quinine Bisulphate is (8*S*,9*R*)-6′-methoxycinchonan-9-ol hydrogen sulphate heptahydrate. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Bisulphate contains not less than 98.5 per cent and not more than 101.5 per cent of alkaloid hydrogen sulphates, calculated as $C_{20}H_{24}N_2O_2,H_2SO_4$ on the anhydrous basis.

Category. Antimalarial.

Description. Colourless or faintly yellow crystals or a white or faintly yellow, crystalline powder; efflorescent in dry air.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100.0 ml *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *quinine sulphate IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of each of *quinidine sulphate IPRS* and *quinine sulphate IPRS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

https://nhathuocngocanh.com/

B. A 5.0 per cent w/v solution has a blue fluorescence.

C. A 5.0 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 2.8 to 3.4, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). −216° to −208°, determined at 20° in a 3.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10.0 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5; V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Titratable cation. 75.3 to 79.6 per cent, calculated on the anhydrous basis, determined by the following method. Titrate the combined aqueous solutions reserved in the Assay with *0.1 M hydrochloric acid* using 0.1 ml of *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01632 g of $[C_{20}H_{26}N_2O_2]^{2+}$.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 19.0 to 25.0 per cent, determined on 0.2 g.

Assay. Weigh 0.45 g, dissolve in 15 ml of *water*, add 25 ml of *0.1 M sodium hydroxide* and extract with three quantities, each of 25 ml, of *chloroform*. Wash each chloroform extract with the same 20 ml of *water*. Combine the aqueous solutions and reserve for the test for Titratable cation. Dry the chloroform extracts with *anhydrous sodium sulphate*, evaporate to dryness at a pressure of 2 kPa and dissolve the residue in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

https://nhathuocngocanh.com/

1 ml of *0.1 M perchloric acid* is equivalent to 0.02113 g of $C_{20}H_{24}N_2O_2,H_2SO_4$.

Storage. Store protected from light.

Quinine Bisulphate Tablets

Quinine Acid Sulphate Tablets

Quinine Bisulphate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine bisulphate, $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$. The tablets are coated.

Usual strength. 300 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Bisulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. A 1.0 per cent w/v solution of *quinine sulphate* in the same solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Bisulphate with 20 ml of *water* and filter (solution A). To 5 ml of solution A add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. Solution A is *levo-rotatory*.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 348 nm (2.4.7). Calculate the content of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$ in the medium taking 99 as the specific absorbance at 348 nm.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Bisulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25.0 ml with the mobile phase and filter, discarding the first few ml of the filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a

https://nhathuocngocanh.com/

retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

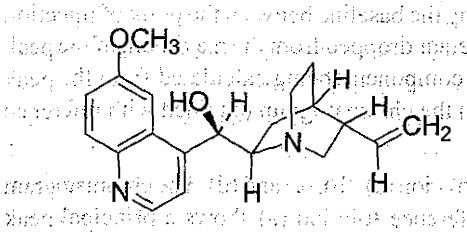
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.6 g of Quinine Bisulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05486 g of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$.

Storage. Store protected from light.

Quinine Dihydrochloride

Quinine Acid Hydrochloride



$C_{20}H_{24}N_2O_2,2HCl$ Mol. Wt. 397.3

Quinine Dihydrochloride is the (8*S*,9*R*)-6′–methoxycinchonan-9-ol dihydrochloride. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Dihydrochloride contains not less than 99.0 per cent and not more than 101.5 per cent of alkaloid dihydrochlorides, calculated as $C_{20}H_{24}N_2O_2,2HCl$ on the dried basis.

Category. Antimalarial.

Description. A white or almost white powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *quinine sulphate IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of each of *quinidine sulphate IPRS* and *quinine sulphate IPRS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

C. A 1.0 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 3.0 per cent w/v solution.

Specific optical rotation (2.4.22). −229° to −223°, determined in a 3.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Barium. To 15 ml of a 2 per cent w/v solution add 1 ml of *dilute sulphuric acid*; the solution remains clear for at least 15 minutes.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if

https://nhathuocngocanh.com/

necessary to dissolve the powder as completely as possible, cool, dilute to 10.0 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Titratable cation. 79.7 to 84.2 per cent, calculated on the dried basis, determined by the following method. Weigh 0.4 g, dissolve in 10 ml of *water*, add 40 ml of *methanol* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01632 g of $[C_{20}H_{26}N_2O_2]^{2+}$.

Sulphates (2.3.17). 0.125 g complies with the limit test for sulphates (0.12 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous glacial acetic acid* and add 20 ml of *acetic anhydride* and 10 ml of *mercuric acetate* solution. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent of 0.01987 g of $C_{20}H_{24}N_2O_2,2HCl$.

Storage. Store protected from light.

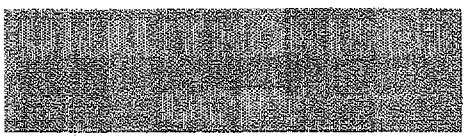
Quinine Dihydrochloride Injection

Quinine Acid Hydrochloride Injection

Quinine Dihydrochloride Injection is a sterile solution of Quinine Dihydrochloride in Water for Injections.

Quinine Dihydrochloride Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine dihydrochloride, $C_{20}H_{24}N_2O_2,2HCl$.

Usual strength. 300 mg per ml.



https://nhathuocngocanh.com/

Description. A clear, almost colourless to light yellow solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Solvent mixture. 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*.

Test solution. Extract a volume of the injection containing 0.1 g of Quinine Dihydrochloride with 10.0 ml of the solvent mixture and filter.

Reference solution (a). A 1 per cent w/v solution of *quinine sulphate IPRS* in the solvent mixture.

Reference solution (b). A solution of 1 per cent w/v of each of *quinidine sulphate IPRS* and *quinine sulphate IPRS* in the solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtain with the reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. Dilute 1 ml to 20 ml with *water*, add *0.1 M sodium hydroxide* dropwise until the solution becomed turbid. Add 1 or 2 drops of *0.05 M sulphuric acid* to obtain a clear solution. To this solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 1.5 to 3.0.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dilute, if necessary a suitable volume of the injection with the mobile phase to produce a solution containing 0.2 per cent w/v of Quinine Dihydrochloride.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution factor between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less

https://nhathuocngocanh.com/

than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

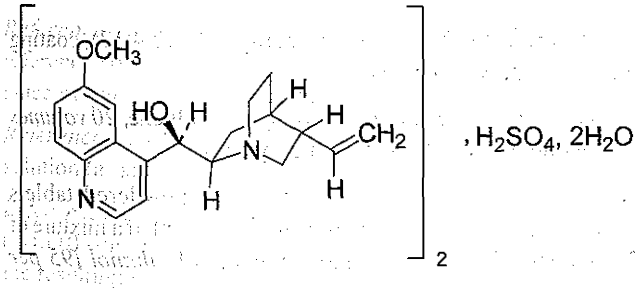
Assay. To a measured volume containing about 0.5 g of Quinine Dihydrochloride add 20 ml of *water* and 5 ml of *sodium hydroxide solution*. Extract with successive quantities, each of 10 ml, of *chloroform* until complete extraction of the alkaloid is effected, washing each extract with the same two quantities, each of 5 ml, of *water*. Remove the chloroform from the combined extracts, dissolve the residue in 50 ml of *anhydrous glacial acetic acid* and add 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01987 g of $C_{20}H_{24}N_2O_2,2HCl$.

Storage. Store protected from light.

Labelling. The label states that the solution must be diluted to a strength not exceeding 30 mg per ml before administration and that care should be taken to ensure slow intravenous injection.

Quinine Sulphate



$,H_2SO_4,2H_2O$

$(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ Mol. Wt. 783.0

Quinine Sulphate is (8*S*,9*R*)-6′-methoxycinchonan-9-ol sulphate dihydrate. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Sulphate contains not less than 99.0 per cent and not more than 101.0 per cent of alkaloid monosulphates, calculated as $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$ on the dried basis.

Category. Antimalarial.

Description. White or almost white, needle-like crystals or a crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *toluene*, 24 volumes of *ether* and 10 volumes of *diethylamine*.

Test solution. Dissolve 1.0 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 1.0 per cent w/v solution of *quinine sulphate IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. To 5 ml of a 0.1 per cent w/v solution add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

D. A 1 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.24). 5.7 to 6.6, determined in a 1.0 per cent w/v suspension in *water*.

Specific optical rotation (2.4.22). −245° to −237°, determined in a 2.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10.0 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

https://nhathuocngocanh.com/

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.0 to 5.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g, dissolve in a mixture of 10 ml of *chloroform* and add 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02490 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$.

Storage. Store protected from light.

Quinine Tablets

Quinine Sulphate Tablets

Quinine Sulphate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$. The tablets are coated.

Usual strengths. 100 mg; 300 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of toluene, *20 volumes of* acetone *and 10 volumes of* diethylamine.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. A 1 per cent w/v solution of *quinine sulphate* in the same solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Sulphate with 20 ml of *water* and filter (solution A).

https://nhathuocngocanh.com/

To 5 ml of solution A add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. Solution A is *levo-rotatory*.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 348 nm (2.4.7). Calculate the content of $C_{20}H_{24}N_2O_2, H_2SO_4, 2H_2O$ in the medium from a solution of known concentration of *quinine sulphate IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{20}H_{24}N_2O_2, H_2SO_4, 2H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25.0 ml with the mobile phase and filter, discarding the first few ml of the filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate IPRS*, with gentle heating if necessary, in 5.0 ml of the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate IPRS* in place of *quinine sulphate IPRS*.

Reference solution (c). Mix equal volumes of reference solution (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusted to pH 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume: 10 µl.

Inject reference solution (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

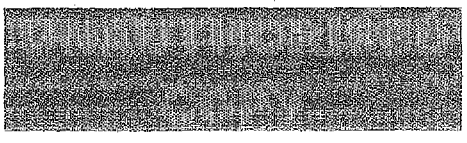
Inject reference solution (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solution (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.4 g of Quinine Sulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Filter, if necessary through Whatman No.1 filter paper and rinse with an additional 40 ml of *acetic anhydride* in small volumes. Titrate with *0.1 M perchloric*



https://hhathuocngocanh.com/

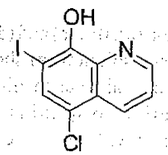
acid, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02610 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Storage. Store protected from light.

Quiniodochlor

Clioquinol; Iodochlorhydroxyquinoline; Iodochlorhydroxyquin



C_9H_5ClINO Mol. Wt. 305.5

Quiniodochlor is 5-chloro-7-iodoquinolin-8-ol.

Quiniodochlor contains not less than 97.0 per cent and not more than 103.0 per cent of C_9H_5ClINO, calculated on the dried basis.

Category. Antiamoebic; topical and intestinal antiseptic.

Description. A yellowish white to brownish yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quiniodochlor IPRS* or with the reference spectrum of quiniodochlor.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *3 M hydrochloric acid* shows an absorption maximum at about 267 nm.

C. Burn 20 mg by the oxygen-flask method (2.3.34), using 5 ml of *2 M sodium hydroxide* as the absorbing liquid and dilute to 25 ml with *water*. To 5 ml add 1 ml of *silver nitrate solution*; a yellow precipitate is produced. Add 5 ml of *5 M ammonia*, shake, filter and acidify the filtrate with *nitric acid*; a white precipitate is produced.

Tests

Acidity or alkalinity. Shake 0.5 g with 10 ml of *water* previously neutralised to *phenolphthalein solution*. The solution is colourless and not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Free iodine. Shake 1.0 g with a solution of 1 g of *potassium iodide* in 20 ml of *water* for 30 seconds, allow to stand for 5 minutes and filter. To 10 ml of the filtrate add 1 ml of *1 M sulphuric acid* and 2 ml of *chloroform* and shake. Any colour in the chloroform layer is discharged on the addition of 0.1 ml of *0.005 M sodium thiosulphate*.

Halide ions. Shake 0.5 g with 25 ml of *water* for 1 minute and filter. To the filtrate add 0.5 ml of *2 M nitric acid* and 0.5 ml of *0.1 M silver nitrate* and allow to stand for 5 minutes. Any opalescence produced is not more intense than that obtained by adding 0.5 ml of *0.1 M silver nitrate* to 25 ml of *water* containing 0.5 ml of *2 M nitric acid* and 0.2 ml of *0.01 M hydrochloric acid* and allowing to stand for 5 minutes.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Add 0.5 ml of *N,O-bis (trimethylsilyl)acetamide* to 0.5 ml of a solution in *pyridine* containing 0.4 per cent w/v of each of *5-chloro-8- hydroxyquinoline, 5,7-dichloro-8-hydroxy- quinoline* and *5-7-diiodo-8-hydroxyquinoline* and 0.04 per cent w/v of the substance under examination, mix, allow to stand for 15 minutes and add 5 ml of a 0.05 per cent w/v solution of *dibutylphthalate* (internal standard) in *hexane*.

Reference solution (a). Add 0.5 ml of *N,O-bis (trimethylsilyl) acetamide* to a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine*, mix, allow to stand for 15 minutes and add 5 ml of *hexane*.

Reference solution (b). Treat a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine* as described for the test solution.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of methyl silicone gum,
- temperature:
  column 190°,
  inlet port and detector 240°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

In the chromatogram obtained with the test solution the peaks following the solvent peak, in order of emergence, are due to (a) 5-chloro-8-hydroxyquinoline, (b) 5,7-dichloro-8-hydroxyquinoline, (c) the internal standard, (d) quiniodochlor and (e) 5,7-diiodo-8-hydroxyquinoline.

In the chromatogram obtained with reference solution (b) calculate the content of 5-chloro-8-hydroxy-quinoline, 5,7-dichloro-8-hydroxyquinoline and 5,7-diiodo-8-hydroxyquinoline by reference to the corresponding peaks in the chromatogram obtained with the test solution.

The total content of the named impurities does not exceed 3.0 per cent w/w, the content of any other impurity does not exceed 0.2 per cent w/w and the sum of the contents is not more than 4.0 per cent w/w.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 5 hours.

Assay. Dissolve 0.3 g in 25 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03055 g of C_9H_5ClINO.

Storage. Store protected from light.

Quiniodochlor Cream

Clioquinol Cream; Iodochlorhydroxyquinoline Cream; Iodochlorhydroxyquin Cream

Quiniodochlor Cream contains Quiniodochlor in a suitable cream base.

Quiniodochlor Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 4 per cent w/w.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution. The test solution and the reference solution prepared by using 1.0 ml of pyridine instead of the internal standard solution.

B. Weigh a quantity containing about 25 mg of quiniodochlor, in a 100-ml volumetric flask, add 75 ml of 25 per cent v/v solution of *hydrochloric acid*, heat on a steam bath to melt the cream, shake vigorously to extract the quiniodochlor. Cool under running water, and dilute to the volume with the same solvent. Dilute 3.0 ml of the filtrate to 100.0 ml with the same solvent.

When examined in the range 200 nm to 400 nm (2.4.7), the solution shows an absorption maximum at about 267 nm.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.2 per cent w/v solution of *pyrene* in *pyridine*.

Solvent mixture. 80 volumes of *pyridine* and 20 volumes of *n-hexane*.

Test solution. Weigh a quantity containing about 150 mg of quiniodochlor, in a 60-ml separator. Place the separator on its side in a vacuum oven at a pressure of about 10 mm of mercury at 45° for 4 hours. Remove the separator from the oven, allow to cool, add 15 ml of the solvent mixture, insert a polytef stopper, and mix. Transfer the mixture to a 50-ml volumetric flask, and rinse the separator with two 15 ml portions of the solvent mixture, shaking each time for 30 seconds. Transfer both rinsings to the volumetric flask, dilute with the solvent mixture to volume, and mix. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Reference solution. A 0.3 per cent w/v solution of *quiniodochlor IPRS* in the solvent mixture. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Chromatographic system
- a glass column 1.83 m x 2 mm, packed with 3 per cent liquid phase G3 on 80 to 100-mesh support S1AB,
- temperature:
  column. 165°,
  inlet port 170° and detector 250°,
- flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject the reference solution. The test is not valid unless the resolution between the quiniodochlor and the internal standard peaks is not less than 3.0. The relative retention time with reference to pyrene for quiniodochlor is about 0.6.

Inject the reference solution and the test solution.

Calculate the content of C_9H_5ClINO in the Cream.

Storage. Store protected from light and moisture.

Quiniodochlor Ointment

Clioquinol Ointment; Iodochlorhydroxyquinoline Ointment; Iodochlorhydroxyquin Ointment

Quiniodochlor Ointment contains Quiniodochlor in a suitable base.

Quiniodochlor Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 4 per cent w/w.

https://nhathuocngocanh.com/

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution. The test solution and the reference solution prepared by using 1.0 ml of pyridine instead of the internal standard solution.

B. Weigh a quantity containing about 25 mg of quiniodochlor in a 100-ml volumetric flask, add 75 ml of 25 per cent v/v solution of *hydrochloric acid*, heat on steam bath to melt the ointment, shake vigorously to extract the quiniodochlor. Cool under running water, dilute to volume with the same solvent. Filter and dilute 3.0 ml of this solution to 100.0 ml with the same solvent.

When examined in the range 200 nm to 400 nm (2.4.7), the solution shows an absorption maximum at about 267 nm.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.2 per cent w/v solution of *pyrene* in *pyridine*.

Solvent mixture. 80 volumes of *pyridine* and 20 volumes of *n-hexane* .

Test solution. Transfer an weighed quantity of the ointment, containing about 150 mg of Quiniodochlor, to a suitable conical flask, add 75 ml of *n-hexane*, and mix. Add 15 ml of *dimethylformamide*, and mix for 1 minute. Allow the layers to separate, and transfer the lower layer to a 50-ml volumetric flask, repeat the extraction with separate 15 ml and 10 ml portions of *dimethylformamide*, and transfer the lower layers to the 50-ml volumetric flask. Dilute with *dimethylformamide* to volume, and mix. Transfer 1.0 ml of this solution to a screw-capped glass vial fitted with a septum, and evaporate at about 60° under a stream of nitrogen to dryness. Add 1.0 ml of a mixture of internal standard solution to the residue, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes and cool.

Reference solution. A 0.3 per cent w/v solution of *quiniodochlor IPRS* in the solvent mixture. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Chromatographic system
- a glass column 1.83 m x 2 mm, packed with 3 per cent liquid phase G3 on 80 to 100-mesh support S1AB,
- temperature:
  column. 165°,
  inlet port 170° and detector 250°,
- flame ionization detector,
- flow rate: 30 ml per minute using nitrogen as the carrier gas.

Inject the reference solution. The test is not valid unless the resolution between the quiniodochlor and the internal standard peaks is not less than 3. The relative retention time with reference to pyrene for quiniodochlor is about 0.6.

Inject the reference solution and the test solution.

Calculate the content of C_9H_5ClINO in the Ointment.

Storage. Store protected from light and moisture.

Quiniodochlor Tablets

Clioquinol Tablets; Iodochlorhydroxyquinoline Tablets; Iodochlorhydroxyquin Tablets

Quiniodochlor Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 250 mg.

Identification

Triturate a quantity of the powdered tablets containing about 250 mg of Quiniodochlor with 20 ml of *acetone*, filter and add 20 ml of *water* to the filtrate. Collect the precipitate formed on a filter and dry at 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quiniodochlor IPRS* or with the reference spectrum of quiniodochlor.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *3 M hydrochloric acid* shows an absorption maximum at about 267 nm.

Tests

Disintegration (2.5.1). Maximum time, 30 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and finely powder 20 tablets. Weigh a quantity of the powder containing 0.125 g of Quiniodochlor, shake with 20 ml of hot *2-methoxyethanol*, decant the hot supernatant liquid through a fine filter. Repeat the extraction with two further quantities, of 20 ml and 10 ml, of *2-methoxyethanol*, combine the filtered extracts and dilute to 50.0 ml with *2-methoxyethanol*. To 5.0 ml of this solution add 1 ml of *water* and sufficient of a mixture of 24 volumes of *2-methoxyethanol* and 6 volumes of *water* to produce 50.0 ml. To 10.0 ml of the

solution add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *ferric chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25.0 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at about 650 nm (2.4.7), using as blank a solution prepared by treating 10 ml of the aqueous *2-methoxyethanol* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol*.....".

Calculate the content of C_9H_5ClINO from the absorbance obtained using 10.0 ml of a solution prepared in the following manner. Dissolve 0.125 g of *quiniodochlor IPRS* in sufficient *2-methoxyethanol* to produce 50.0 ml, warming to effect solution; add 1 ml of *water* to 5.0 ml of the solution and add sufficient of the mixture of 24 volumes of *2-methoxyethanol* and 6 volumes of *water* to produce 50.0 ml. Using 10.0 ml of this solution repeat the operation beginning at the words "add 10 ml of *2-methoxyethanol*...."

Storage. Store protected from light.

Quiniodochlor and Hydrocortisone Cream

Clioquinol and Hydrocortisone Cream; Iodochlorhydroxyquinoline and Hydrocortisone Cream; Iodochlorhydroxyquin and Hydrocortisone Cream

Quiniodochlor and Hydrocortisone Cream contains Hydrocortisone and Quiniodochlor in a suitable cream base.

Quiniodochlor and Hydrocortisone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO and not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

Usual Strength. Quiniodochlor 4 per cent w/w and Hydrocortisone 1 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel G*.

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Test solution. Disperse by warming and shaking, a quantity of the cream containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (95 per cent)*, cool, allow to stand at 0° for 30 minutes, filter and use the filtrate.

Reference solution (a). A 0.25 per cent w/v solution of *hydrocortisone IPRS* in *ethanol (95 per cent)*.

Reference solution (b). Dissolve 12.5 mg of *hydrocortisone IPRS* in 5 ml of test solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram due to hydrocortisone obtained with test solution (b) corresponds to the peak due to hydrocortisone in the chromatogram obtained with reference solution.

C. Fuse a quantity of the cream containing 0.1 g of quiniodochlor with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with *2 M nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in *5 M ammonia*. Add *5 M ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with *2 M nitric acid* ; a white precipitate is produced which darkens on exposure to light.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. *For hydrocortisone* — Determine by liquid chromatography (2.4.14).

Test solution (a). Add 30 ml of *2,2,4-trimethylpentane* to a quantity of the cream containing 10 mg of Hydrocortisone and warm on a water-bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80 per cent)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent.

Test solution (b). Prepare in the same manner as test solution (a) but adding 10 ml of a 4 per cent v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract and dilute to 100.0 ml with methanol (80 per cent).

Reference solution. Dissolve 5 mg of *hydrocortisone IPRS* in 5 ml of a 4 per cent v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50.0 ml with *methanol (80 per cent)*.

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: *methanol (65 per cent)*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute;
– spectrophotometer set at 242 nm,
– injection volume: 10 µl.

Calculate the content of $C_{21}H_{30}O_5$ in the cream.

For quiniodochlor — Weigh a quantity of the cream containing about 25 mg of quiniodochlor, add 80 ml of a hot mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* and heat on a water-bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol*, mix and filter. To 10 ml of the filtrate, add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at about 650 nm (2.4.7), using in the reference cell a solution prepared by treating 10 ml of the mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol*.....".

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol IPRS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml.

Calculate the content of C_9H_5ClINO in the cream.

Storage. Store protected from light.

Quiniodochlor and Hydrocortisone Ointment

Clioquinol and Hydrocortisone Ointment; Iodochlorhydroxyquinoline and Hydrocortisone Ointment; Iodochlorhydroxyquin and Hydrocortisone Ointment

Quiniodochlor and Hydrocortisone Ointment contains Quiniodochlor and Hydrocortisone in a suitable base.

Quiniodochlor and Hydrocortisone Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO and not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel G*.

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Test solution. Disperse by warming and shaking, a quantity of the ointment containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (95 per cent)*, cool, and allow to stand at 0° for 30 minutes, filter and use the filtrate.

Reference solution (a). A 0.25 per cent w/v solution of *hydrocortisone IPRS* in *ethanol (95 per cent)*.

Reference solution (b). Dissolve 12.5 mg of *hydrocortisone IPRS* in 5 ml of test solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram due to hydrocortisone obtained with test solution (b) corresponds to the peak due to hydrocortisone in the chromatogram obtained with reference solution.

C. Fuse a quantity of the ointment containing 0.1 g of Quiniodochlor with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with *2 M nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in *5 M ammonia*. Add *5 M ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with *2 M nitric acid*; a white precipitate is produced which darkens on exposure to light.

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. *For hydrocortisone* — Determine by liquid chromatography (2.4.14).

Test solution (a). Add 30 ml of *2,2,4-trimethylpentane* to a quantity of the ointment containing 10 mg of Hydrocortisone and warm on a water-bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80 per cent)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent.

Test solution (b). Prepare at the same manner as test solution (a) but adding 10 ml of a 4 per cent v/v solution of

https://nhathuocngocanh.com/

bromobenzene in *methanol* to the cooled methanolic extract and dilute to 100.0 ml with *methanol (80 per cent)*.

Reference solution. Dissolve 5 mg of *hydrocortisone IPRS* in 5 ml of a 4 per cent v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80 per cent)*.

Chromatographic system

- a stainless steel column 25 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: *methanol (65 per cent)*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 10 µl.

Calculate the content of $C_{21}H_{30}O_5$ in the ointment.

For quiniodochlor — Weigh a quantity of the ointment containing 25 mg of Clioquinol, add 80 ml of a hot mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* and heat on a water-bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with a mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water*, mix and filter. To 10 ml of the filtrate, add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at 650 nm (2.4.7), using in the reference cell a solution prepared by treating 10 ml of a mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol*.....".

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol IPRS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml.

Calculate the content of C_9H_5ClINO in the ointment.

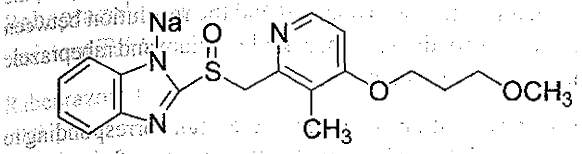
Rabeprazole Sodium



$C_{18}H_{20}N_3O_3S,Na$ Mol. Wt. 381.4

Rabeprazole sodium is 2-({[4-(3-methoxypropoxy)-3-methyl-2-pyridinyl]methyl}sulphinyl)-1*H*-benzimidazole sodium.

Rabeprazole sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{20}N_3O_3S,Na$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to light yellow, crystalline powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rabeprazole sodium IPRS* or with the reference spectrum of rabeprazole sodium.

B. A 10 per cent w/v solution in *carbon dioxide-free water* gives reaction of sodium (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *rabeprazole sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Use chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 7.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine*.

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *rabeprazole sodium IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil keystone betabasic C8),
- column temperature 40°,
- mobile phase: a mixture of 72 volumes of *0.1 M phosphate buffer pH 7.0* and 28 volumes of *acetonitrile*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the percentage content of $C_{18}H_{20}N_3O_3S,Na$.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Rabeprazole Injection

Rabeprazole Sodium Injection

Rabeprazole Injection is a sterile material consisting of Rabeprazole Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for the Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Rabeprazole Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rabeprazole sodium, $C_{18}H_{21}N_3O_3SNa$.

https://nhathuocngocanh.com/

Usual strength. 20 mg.

Description. A white or off white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 10.8 to 12.5, determine in a 0.8 per cent w/v of Rabeprazole Sodium solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use, protect from light.

Solvent mixture. Dissolve 2.725 g of *potassium dihydrogen orthophosphate* and 0.525 g of *dipotassium hydrogen orthophosphate* into 1000 ml of *water*, mix and adjusted to pH 10.0 with *1M potassium hydroxide.*

Test solution. Reconstitute 1 vial with 5.0 ml of *water*, shake. Reconstitute 4 more vials. Pool the contents of 5 vials to prepare a composite sample. Dilute a suitable volume of pooled sample with solvent mixture to obtain a solution containing 0.1 per cent w/v of rabeprazole sodium.

Reference solution (a). Weigh about 2.5 mg each of *rabeprazole sulphide IPRS* and *rabeprazole sulphone IPRS* dissolve in 2.5 ml of *methanol* and dilute to 25.0 ml with the solvent mixture.

Reference solution (b). Dissolve 50 mg of *rabeprazole sodium IPRS* in 30 ml of *water*, add 5.0 ml of reference solution (a) and dilute to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- sample temperature: 5°,
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of buffer solution prepared by dissolving 2.725 g of *potassium dihydrogen orthophosphate* and 0.525 g of *dipotassium hydrogen orthophosphate* into 1000 ml of *water*, mix and adjusted to pH 7.0 with *1 M potassium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the resolution between the peak corresponding to rabeprazole sodium and rabeprazole sulphone is not less than 1.5.

Inject the test solution. The area of the peak corresponding to rabeprazole sulphide multiplied with correction factor 0.96 is not more than 1.0 per cent and the area of the peak corresponding to rabeprazole sulphone multiplied with correction factor 1.19 is not more than 1.0. per cent. The area of any secondary peak is not more than 0.5 per cent and the sum of areas of all secondary peaks is not more than 2.5 per cent, calculated by area normalization.

Water (2.3.43). Not more than 7.0 per cent, determined on 0.1 g.

Bacterial endotoxins (2.2.3). Not more than 5 Endotoxin Units per mg of rabeprazole sodium.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protect from light and air.

Test solution. Reconstitute 1 vial with 5.0 ml of *water*, shake. Reconstitute 4 more vials. Pool the contents of 5 vials and prepare a composite sample. Transfer an amount, equivalent to 20 mg of Rabeprazole Sodium, to a 100-ml volumetric flask, and dilute with *water* to volume.

Reference solution. A 0.02 per cent w/v solution of *rabeprazole sodium IPRS* in *water.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- sample temperature: 5°,
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of buffer solution prepared by dissolving 2.725 g of *potassium dihydrogen orthophosphate* and 0.525 g of *dipotassium hydrogen orthophosphate* into 1000 ml of *water*, mix and adjusted to pH 7.0 with *1 M potassium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{21}N_3O_3SNa$ in the injection.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Rabeprazole Gastro-resistant Tablets

Rabeprazole Tablets; Rabeprazole Sodium Gastro-resistant Tablets; Rabeprazole Sodium Tablets

Rabeprazole Gastro-resistant Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rabeprazole sodium, $C_{18}H_{20}N_3O_3SNa$. They are made gastro-resistant by enteric-coating or by other means.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes *of methanol,* 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Withdraw the medium completely and disperse the intact tablet in *0.1M sodium hydroxide* (20 volume of the total volume), with the aid of ultrasound and dilute to volume with the solvent mixture to obtain a solution containing 0.02 per cent w/v of Rabeprazole Sodium and filter.

Reference solution. Dissolve 20 mg of *rabeprazole sodium IPRS* in 20 ml of *0.1M sodium hydroxide* and dilute to 100.0 ml with the solvent mixture.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3S,Na$ released in the acid medium by subtracting the content of $C_{18}H_{20}N_3O_3S,Na$ in the test solution from the total content of Rabeprazole Sodium $C_{18}H_{20}N_3O_3S,Na$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.4,*
Speed and time. 75 rpm and 45 minutes.

Transfer another 6 tablets and run the apparatus for 2 hours in *0.1 M hydrochloric acid.* Decant the medium without losing the tablets, add phosphate buffer pH 7.4 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium, dilute if necessary, with the dissolution medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. To 5.0 ml of the filtrate, add immediately 1.0 ml of *0.1M sodium hydroxide.*

Reference solution. A 0.055 per cent w/v solution of *rabeprazole sodium IPRS* in *0.1M sodium hydroxide.* Dilute 2.0 ml of the solution to 100.0 ml with the dissolution medium. To 5.0 ml of the solution, add immediately 1.0 ml of *0.1M sodium hydroxide.*

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3S,Na$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{20}N_3O_3S,Na$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol,* 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Weigh a quantity of the powdered tablets containing 50 mg of Rabeprazole Sodium, disperse in 100 ml of solvent mixture and filter.

Reference solution (a). A 0.05 per cent w/v solution of *rabeprazole sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Use chromatographic system as described under Assay.

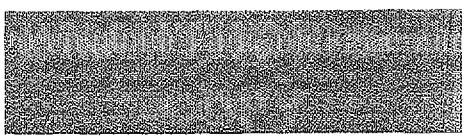
Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with the reference solution (b) (6.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Test solution. Disperse one tablet in *0.1M sodium hydroxide* (20 volume of the total volume), with the aid of ultrasound and dilute to volume with the solvent mixture to obtain a solution containing 0.02 per cent w/v of Rabeprazole Sodium and filter.



https://nhathuocngocanh.com/

Reference solution. Dissolve 20 mg of *rabeprazole sodium IPRS* in 20 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3S$,Na in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Rabeprazole Sodium in 20 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with solvent mixture, filter.

Reference solution. Dissolve 25 mg of *rabeprazole sodium IPRS* in 10 ml of *0.1 M sodium hydroxide* and dilute to 50.0 ml with solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of 0.15 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 6.0 with *orthophosphoric acid* or *sodium hydroxide solution* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3SNa$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Rabeprazole Gastro-resistant and Itopride Prolonged-release Capsules

Rabeprazole Sodium Gastro-resistant and Itopride Hydrochloride Prolonged-release Capsules

Rabeprazole Sodium Gastro-resistant and Itopride Hydrochloride Prolonged release Capsules manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the itopride hydrochloride of different manufacturers may not be the same.

Rabeprazole Gastro-resistant and Itopride Prolonged release Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rabeprazole sodium, $C_{18}H_{20}N_3O_3SNa$ and itopride hydrochloride, $C_{20}H_{26}N_2O_4HCl$.

Usual strength. Rabeprazole Sodium 20 mg and Itopride Hydrochloride 150 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Rabeprazole Sodium —

NOTE — Prepare the solutions immediately before use, protect the solutions from light.

A. Apparatus No. 2 (Paddle),
Medium. 750 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 2 hours.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and B.

Test solution. Withdraw the medium completely without any loss of residue. Transfer the residue into 50-ml volumetric flask, disperse in 25 ml of mobile phase B, with the aid of ultrasound with intermittent shaking for 10 minutes, at a temperature not exceeding 20°. Add 15 ml of mobile phase A, further ultrasound for 25 minutes with intermittent shaking, at a temperature not exceeding 20°, allow to be at room temperature and dilute to volume with mobile phase A, filter. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.002 per cent w/v solution of *rabeprazole sodium IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C8),
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 3.4 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.3 with *triethylamine*,
  B. equal volumes of *acetonitrile* and *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 284 nm,
- injection volume: 20 µl.

www.wehofpharma.com

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	62	38
11	62	38
12	40	60
15	40	60
16	62	38
20	62	38

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3SNa$ released in the acid medium by subtracting the content of $C_{18}H_{20}N_3O_3SNa$ in the test solution from the total content of rabeprazole sodium $C_{18}H_{20}N_3O_3SNa$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 2 (Paddle),

Medium: 1000 ml of a buffer solution pH 8.0 prepared by dissolving 1.56 g of *anhydrous disodium hydrogen phosphate* in 900 ml of *water*, adjusted to pH 8.0 with *dilute orthophosphoric acid* and dilute to 1000 ml with *water*. Add 5 g of *sodium lauryl sulphate* and mix,

Speed and time: 100 rpm and 30 minutes.

Determine by liquid chromatography (2.4.14).

Transfer another 6 capsules and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the residue, add the buffer solution pH 8.0 and run the apparatus for 30 minutes. Withdraw a suitable volume of the medium and filter.

Test solution. To 5.0 ml of the filtrate, add immediately 2.0 ml of *0.2M sodium hydroxide* and dilute to 10.0 ml with the dissolution media.

Reference solution. Dissolve 50 mg of *rabeprazole sodium IPRS* in 10 ml of *0.2 M sodium hydroxide*, with the aid of ultrasound, and dilute to 100.0 ml with the dissolution medium. To 1.0 ml of the solution, add 10 ml of *0.2 M sodium hydroxide* and diluteto 50.0 ml with the dissolution medium.

Use chromatographic system as described under test A, using following modification.

– sample temperature: 20°,

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3S,Na$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{20}N_3O_3S,Na$.

For Itopride Hydrochloride — Complies with the test stated under capsules.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use, protect the solutions from light.

Solvent mixture. Equal volumes of mobile phase A and B.

Test solution. Disperse a quantity of the mixed powered content of the capsules containing 100 mg of Rabeprazole Sodium in 250 ml of mobile phase B, with the aid of ultrasound for 10 minutes with intermittent shaking, at a temperature not exceeding 20°. Add 100 ml of mobile phase A, further ultrasound for 20 minutes with intermittent shaking, at a temperature not exceeding 20°, allow to be at room temperature and dilute to 500.0 ml with mobile phase A, filter.

Reference solution. A solution containing 0.02 per cent w/v of *rabeprazole sodium IPRS* and 0.15 per cent w/v of *itopride hydrochloride IPRS* in the solvent mixture. Dilute 2.0 ml of the solution to 200.0 ml with the solvent mixture.

Use chromatographic system as described under Dissolution with the following modification.

– a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
60	50	50
70	50	50
72	75	25
80	75	25

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak at a relative retention time of about 0.21, 0.52 and 1.83 with respect to itopride peak, each of, is not more than 0.75 times the area of the itopride peak in the chromatogram obtained with the reference solution (0.75 per cent), the sum of the areas of all the secondary peaks related to itopride is not more than the area of the itopride peak in the chromatogram obtained with the reference solution (1.0 per cent). The area of any other secondary peak is not more than the area of the rabeprazole peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks, excluding itopride impurities is not more

https://nhathuocngocanh.com/

than twice the area of the rabeprazole peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14), as described under Dissolution with the following modifications.

Test solution. Mix the contents of 20 capsules. Disperse a quantity of the mixed powdered contents equivalent to 100 mg of Rabeprazole Sodium in 125 ml of mobile phase B, with the aid of ultrasound with intermittent shaking for 10 minutes, at a temperature not exceeding 20°. Add 100 ml of mobile phase A, further ultrasound with intermittent shaking for 25 minutes,at a temperature not exceeding 20°. Allow to be at room temperature and dilute to 250.0 ml with mobile phase A, filter. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

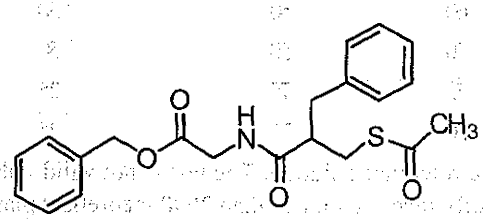
Reference solution. A solution containing 0.04 per cent w/v of *rabeprazole sodium IPRS* and 0.3 per cent w/v of *itopride hydrochloride IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{20}N_3O_3SNa$ and $C_{20}H_{26}N_2O_4HCl$ in the capsules.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Racecadotril



$C_{21}H_{23}NO_4S$ Mol. Wt. 385.5

Racecadotril is (*RS*)-Benzyl-*N*-[3-(acetylthio)-2-benzylpropanoyl]glycinate.

Racecadotril contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{23}NO_4S$, calculated on the dried basis.

Category. Antidiarrhoea.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *racecadotril IPRS* or with the reference spectrum of racecadotril.

Tests

Appearance of solution. A 50 per cent w/v solution in *acetone* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution (a). Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Test solution (b). Dilute 5.0 ml of test solution (a) to 25.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 500 µl of *racecadotril impurity A IPRS* in *acetonitrile* and dilute to 250.0 ml with *acetonitrile*. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *racecadotril impurity G IPRS (benzyl [[(2RS)-2-benzyl-3-sulfanylpropanoyl]amino]acetate IPRS)* in the solvent mixture. To 5 ml of the solution add 1.0 ml of test solution (b) and dilute to 100.0 ml with the solvent mixture.

Reference solution (d). A 0.04 per cent w/v solution of *racecadotril IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.0 g of *potassium dihydrogen phosphate* in *water*, adjust the pH to 2.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)

https://nhathuocngocanh.com/

Name	Relative retention time	Correction factor
Racecadotril impurity A[1]	0.2	—
Racecadotril impurity C[2]	0.3	1.4
Racecadotril impurity E[3]	0.5	0.6
Racecadotril impurity F[4]	0.9	0.7
Racecadotril (Retention time: about 16 minutes)	1.0	—

[1]thioacetic acid,

[2][[(2*RS*)-2-[(acetylsulfanyl)methyl]-3-phenylpropanoyl] amino]acetic acid,

[3]2-benzylacrylic acid,

[4]benzyl [(2-benzylprop-2-enoyl)amino]acetate.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to racecadotril impurity G and racecadotril is not less than 1.5.

Inject reference solution (a), (b) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak due to racecadotril impurities C, E and F is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of the peak corresponding to racecadotril impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modification.

Inject reference solution (d) and test solution (b).

Calculate the content of $C_{21}H_{23}NO_4S$.

Racecadotril Capsules

Racecadotril Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of racecadotril, $C_{21}H_{23}NO_4S$.

Usual strength. 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle) with sinkers,

Medium. 900 ml of *0.05 M acetate buffer* in 1.0 per cent w/v solution of *sodium lauryl sulphate*, prepared by dissolving 6.804 g of *sodium acetate trihydrate* in sufficient *water* to produce 800 ml. Add 10 g of *sodium lauryl sulphate* and dissolve, adjusted to pH 4.5 with *glacial acetic* acid and dilute to 1000 ml with *water*,

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14),

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Use the filtrate and, if necessary, dilute with the dissolution medium.

Reference solution. A 0.11 per cent w/v solution of *racecadotril IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with dissolution medium.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000ml *water*, adjust to pH 3.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_4S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{21}H_{23}NO_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 200 mg of Racecadotril in 50.0 ml of the

https://nhathuocngocanh.com/

solvent mixture with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution. A 0.05 per cent w/v solution of *racecadotril IPRS* in the solvent mixture. Dilute 10.0 ml of the solution to 25.0 ml with the solvent mixture. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjust to pH 3.0 with *orthophosphoric acid*, 40 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatograms 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak up to retention time 2.5 minutes.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Disperse a quantity of the mixed content of 20 capsules containing 400 mg of Racecadotril in 150 ml of the solvent mixture with the aid of ultrasound for 30 minutes and dilute to 200 ml with the solvent mixture, filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *racecadotril IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjust to pH 3.0 with *orthophosphoric acid* and 60 volumes of a mixture of equal volumes of *acetonitrile* and *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_4S$ in the capsules.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Racecadotril Sachet

Racecadotril Sachet contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of racecadotril, $C_{21}H_{23}NO_4S$.

Usual strengths. 10 mg; 30 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.05 M acetate buffer* in 1.0 per cent w/v solution of *sodium lauryl sulphate*, prepared by dissolving 6.804 g of *sodium acetate trihydrate* in sufficient *water* to produce 800 ml. Add 10 g of *sodium lauryl sulphate* and dissolve, adjust the pH to 4.5 with *glacial acetic acid* and dilute to 1000 ml with *water*,

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter,

Determine by liquid chromatography (2.4.14),

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Use the filtrate and if necessary, dilute with the dissolution medium.

Reference solution. Dissolve a quantity of *racecadotril IPRS* in the solvent mixture and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_4S$ in the sachet.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{23}NO_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powder containing 80 mg of Racecadotril in 70 ml *acetonitrile* with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with *acetonitrile*, filter.

Reference solution. A 0.02 per cent w/v solution of *racecadotril IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 25.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 60 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
15	85	15
20	60	40
50	60	40
55	85	15
60	85	15

Inject the reference solution. The test is not valid unless the column efficiency in not less than 3000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Oral Powders.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Disperse a quantity of powder containing 150 mg of Racecadotril in 150 ml of the solvent mixture with the aid of ultrasound for 30 minutes and dilute to 500.0 ml with the solvent mixture, filter.

Reference solution. A 0.03 per cent w/v solution of *racecadotril IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 60 volumes of a mixture of equal volumes of *acetonitrile* and *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 231nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

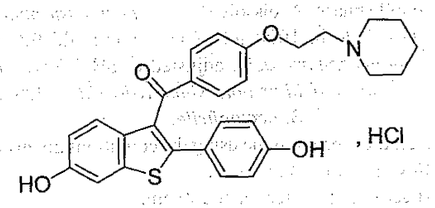
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO_4S$ in the sachet.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states, 'Should be administered orally, directly or mixed with water or beverage. While mixing with water stir well and swallow the total mixture immediately.'

Raloxifene Hydrochloride



$C_{28}H_{27}NO_4S,HCl$ Mol. Wt. 510.0

https://nhathuocngocanh.com/

Raloxifene Hydrochloride is [6-Hydroxy-2-(4-hydroxyphenyl) benzo[b]thien-3-yl][4-(2-piperidinoethoxy)phenyl]methanone hydrochloride.

Raloxifene Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{28}H_{27}NO_4S,HCl$, calculated on the dried basis.

Description. A white to pale yellow, powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *raloxifene hydrochloride IPRS* or with the reference spectrum of raloxifene hydrochloride.

B. A solution in *methanol* gives reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of mobile phase A and 30 volumes of *acetonitrile*.

Test solution. Dissolve 30 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.0003 per cent w/v solution of *raloxifene hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dissolve 6 mg of *raloxifene hydrochloride IPRS* in the mixture of 15.0 ml of *acetonitrile*, 3.0 ml of *water* and 5.0 ml of 30 per cent *hydrogen peroxide* (unstabilized). Shake for 30 minutes and keep at 30° for minimum 6 hours and dilute to 50.0 ml with mobile phase A (Raloxifene hydrochloride is partly converted to raloxifene-*N*-oxide under these conditions).

Reference solution (c). Dissolve 15 mg of *raloxifene hydrochloride IPRS* in the solvent mixture and add 5.0 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. dissolve 9.0 g of *monobasic potassium phosphate* in 1000 ml of *water* and add 0.6 ml of *orthophosphoric acid*, adjusted to pH 3.0 with *ortho phosphoric acid* or *potassium hydroxide* solution,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
9	75	25
40	50	50
42	75	25
49	75	25

The relative retention time with reference to raloxifene for raloxifene impurity I is about 0.74.

Inject reference solution (c). The test is not valid unless the resolution between the raloxifene-*N*-oxide and principal peak is not less than 3.0 and the tailing factor is not more than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of raloxifene impurity I ([6-hydroxy-2-(4-hydroxyphenyl) benzo[b]thien-3,7-diyl]bis[4-[2-(1-piperidinyl)ethoxy] phenyl] methanone) is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with area less than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.005 per cent w/v solution of *raloxifene hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dissolve 6 mg of *raloxifene hydrochloride IPRS* in the mixture of 15 ml of *acetonitrile*, 3 ml of *water* and 5 ml of 30 per cent *hydrogen peroxide* (unstabilized). Shake for 30 minutes and keep at 30° for minimum 6 hours and dilute to 50.0 ml with mobile phase A (Raloxifene hydrochloride is partly converted to raloxifene-*N*-oxide under these conditions).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),

https://nhathuocngocanh.com/

– column temperature: 35°,
– mobile phase: a mixture of 33 volumes of *acetonitrile* and 67 volumes of buffer solution prepared by dissolving 7.2 g of *monobasic potassium phosphate* in 1000 ml of *water* and add 1.5 ml of *orthophosphoric acid*, adjusted to pH 2.5 with *orthophosphoric acid* or *potassium hydroxide* solution,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 280 nm,
– injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the raloxifene-N-oxide and principal peak is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 0.7 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{28}H_{27}NO_4S,HCl$.

Storage. Store protected from moisture.

Raloxifene Hydrochloride Tablets

Raloxifene Hydrochloride Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of raloxifene hydrochloride, $C_{28}H_{27}NO_4S,HCl$.

Usual strength. 60 mg.

Identification

A. Disperse a quantity of powdered tablets containing 120 mg of Raloxifene Hydrochloride with 20 ml of *water*. Centrifuge, and discard the supernatant. Add 5 ml of *isopropyl alcohol*, shake to form a slurry, filter, and rinse the residue with *isopropyl alcohol*. Dry the residue at 105° for 30 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *raloxifene hydrochloride IPRS* or with the reference spectrum of raloxifene hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of 0.1 per cent w/v of polysorbate 80,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Triethylamine phosphate suspension. Add 2.0 ml of *triethylamine* to 500 ml of *acetonitrile*, adjusted to pH 4.0 with *orthophosphoric acid. (NOTE — Trimethylamine phosphate will precipitate, keep the suspension well mixed).*

Test solution. Dilute the filtrate, if necessary with the dissolution medium. Mix 1 volume of the solution with 1 volume of *triethylamine phosphate suspension.*

Reference solution. Dissolve a quantity of *raloxifene hydrochloride IPRS* in *methanol* and dilute with the dissolution medium to obtain a solution having known concentration similar to that of the test solution. Mix 1 volume of the solution with 1 volume of *triethylamine phosphate suspension.*

Chromatographic system
– a stainless column 15 cm x 4.6 mm, packed with nitrile group chemically bonded to porous silica (3.5µm),
– mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.2 volume of *triethylamine*, adjusted to pH 4.0 with *orthophosphoric acid*,
– flow rate: 2 ml per minute,
– spectrophotometer set at 290 nm,
– injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{27}NO_4S,HCl$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{28}H_{27}NO_4S,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 9.0 g of *monobasic potassium phosphate* in *water* and dilute to 1000 ml with *water*. Add 0.5 ml of *orthophosphoric acid*, adjusted to pH 3.0 with *orthophosphoric acid* or *potassium hydroxide solution.*

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of buffer solution.

Test solution. Disperse a quantity of powdered tablets with the solvent mixture to obtain a solution containing 0.6 per cent w/v of Raloxifene Hydrochloride. Dilute 5.0 ml of the solution to 10.0 ml with mobile phase A to obtain a solution containing 0.3 per cent w/v of Raloxifene Hydrochloride and filter.

Reference solution (a). To 6 mg of *raloxifene hydrochloride IPRS*, add 15.0 ml of *acetonitrile*, 3.0 ml of *water* and 5.0 ml of

https://nhathuocngocanh.com/

30 per cent *hydrogen peroxide* (unstabilized). Mix and dissolve. Shake the solution for 30 minutes, followed by 30 minutes of ultrasound. Allow it to stand at 30° for 6 hours and then dilute to 50.0 ml with the solvent mixture. (*NOTE — Raloxifene hydrochloride is partly converted to raloxifene N-oxide under these conditions. The reaction time can be varied as necessary to achieve an appropriate level of raloxifene N-oxide*).

Reference solution (b). To 15 mg of *raloxifene hydrochloride IPRS*, add 5.0 ml of reference solution (a) and 20 ml of the solvent mixture and then dilute to 50.0 ml with mobile phase A.

Reference solution (c). A 0.006 per cent w/v solution of *raloxifene hydrochloride IPRS* in the solvent mixture.

Reference solution (d). Mix 5 ml of reference solution (c) and 45 ml of the solvent mixture and dilute to 100.0 ml with mobile phase A to obtain a solution containing 0.0003 per cent w/v of Raloxifene Hydrochloride.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 75 volumes of buffer solution and 25 volumes of *acetonitrile*,
  B. a mixture of 50 volumes of buffer solution and 50 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
36	0	100
38	100	0
48	100	0

Name	Relative retention time
Raloxifene	1.0
Raloxifene *N*-oxide[1]	1.17

[1]Methanone, [6-hydroxy-2-(4-hydroxyphenyl) benzo[*b*]thien-3-yl][4-[2-(1-oxido-1-piperidinyl)ethoxy]phenyl].

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to raloxifene and raloxifene *N*-oxide is not less than 3.0 and the tailing factor is not more than 2.0.

Inject reference solution (d) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to raloxifene N-oxide is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.3 per cent). The area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 7.2 g of *monobasic potassium phosphate* in 1000 ml of *water*. Add 1.3 ml of *orthophosphoric acid*, adjusted to pH 2.5 with *orthophosphoric acid* or *potassium hydroxide solution*.

Solvent mixture. 60 volumes of *acetonitrile* and 40 volumes of buffer solution.

Test solution. Disperse a quantity of powdered tablets with the solvent mixture to obtain a solution having a concentration of 0.006 per cent w/v of Raloxifene Hydrochloride, filter.

Reference solution (a). Prepare as given in the related substances.

Reference solution (b). A 0.006 per cent w/v solution of *raloxifene hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 33 volumes of *acetonitrile* and 67 volumes of buffer solution,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the raloxifene-N-oxide and principal peak is not less than 2.0 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{28}H_{27}NO_4S.HCl$ in the tablets.

Storage. Store protected from light and moisture.

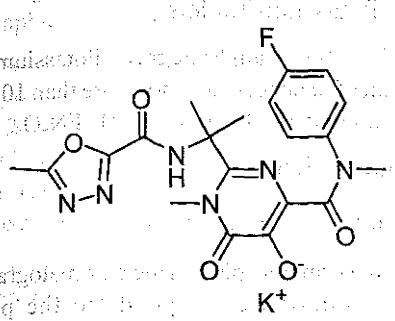
Raltegravir Potassium



$C_{20}H_{20}FKN_6O_5$ Mol. Wt. 482.5

Raltegravir Potassium is 4- pyrimidinecarboxamide,N-[(4-fluorophenyl) methyl]-1,6-dihydro-5-hydroxy-1-methyl-2-[1-methyl-1-[[(5-methyl-1,3,4-oxadiazol-2-yl) carbonyl] amino]ethyl]-6-oxo-monopotassium salt ; Potassium 4-[(4-fluorobenzyl) carbamoyl] -1-methyl-2-(1-methyl1-{[(5-methyl-1,3,4-oxadiazol-2-yl) carbonyl] amino} ethyl) -6-oxo-1,6-dihydropyrimidin-5-olate.

Raltegravir Potassium contains not less than 98.0 per cent and not more than 102. 0 per cent of $C_{20}H_{20}FKN_6O_5$, calculated on the anhydrous basis.

Category. Antiretroviral

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *raltegravir potassium IPRS* or with the reference spectrum of raltegravir potassium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Mix 1 ml each of 10 per cent w/v solution of *sodium cobaltinitrite*, 4 per cent w/v solution of substance under examination and *dilute acetic acid*. A yellow or orange yellow precipitate is formed immediately.

Tests

Related substances. Determine by liquid chromatography (2.4.14), using the solvent mixture, test solution and chromatographic system as described under Assay.

Reference solution (a). A solution containing 0.01 per cent w/v of *raltegravir potassium IPRS* and 0.00002 per cent w/v of *raltegravir related compound E IPRS* in the solvent mixture.

Reference solution (b). A 0.00001 per cent w/v solution of *raltegravir potassium IPRS* in the solvent mixture.

Reference solution (c). A 0.2 per cent w/v solution of *raltegravir potassium IPRS* in *1 M sodium hydroxide*. Stir the solution for 2 hours at room temperature. To 5.0 ml of the solution, add 5 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with the solvent mixture, (Degradation generates raltegravir amine and raltegravir oxalylacetohydrazide analog).

Name	Relative retention time
Raltegravir amine[1]	0.43
Raltegravir formididyl analog[2]	0.60
Raltegravir oxalylacetohydrazide analog[3]	0.72

[3]2-{2-[2-(2-Acetylhydrazinyl)-2-oxoacetamido]propan-2-yl}-N-(4-fluorobenzyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidine-4-carboxamide,

[4]N-{2-[4-(Benzylcarbamoyl)-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl]propan-2-yl}-5-methyl-1,3,4-oxadiazole-2-carboxamide,

[5]Ethyl(E)-N-{2-[(2-{4-[(4-fluorobenzyl)carbamoyl]-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl}propan-2-yl)amino]-2-oxoacetyl}acetohydrazonate,

[6]Ethyl(Z)-N-{2-[(2-{4-[(4-fluorobenzyl)carbamoyl]-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl}propan-2-yl)amino]-2-oxoacetyl}acetohydrazonate.

Inject reference solution (a). The test is not valid unless the resolution between raltegravir related compound E and raltegravir peak is not less than 1.5.

Inject reference solution (c) for peaks identification.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to raltegravir amine, raltegravir formididyl analog, raltegravir related compound E and raltegravir Z-ethoxyacethydrazone analog is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of peak due to raltegravir oxalylacetohydrazide analog and raltegravir E-ethoxyacethydrazone analog is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 7 times the area of the principal peak in the

https://nhathuocngocanh.com/

chromatogram obtained with reference solution (b) (0.7 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1 g complies with limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 0.6 per cent, using equal volumes of *methanol* and *formamide* as solvent. [*NOTE — Hydranal-Composite 2 to be used as a reagent*].

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *raltegravir potassium IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm packed with phenyl group bonded to porous silica (3.5 µm),
- column temperature: 15°,
- mobile phase: A. a 0.1 per cent v/v solution of *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
2	75	25
5	60	40
10	55	45
19	10	90
22	5	95
25	75	25

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{20}FKN_6O_5$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Raltegravir Tablets

Raltegravir Potassium Tablets

Raltegravir Tablets contain Raltegravir Potassium equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of raltegravir, $C_{20}H_{21}FN_6O_5$.

Usual strength. 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 100 rpm and 15 minutes and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *raltegravir potassium IPRS* in minimum amount of *acetonitrile* (20 per cent) and dilute with the dissolution medium to obtain a solution having a known concentration similar to the concentration of the test solution.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Onyx monolithic C18),
- column temperature: 40°,
- mobile phase: a mixture of 62 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 38 volumes of *acetonitrile*,
- flow rate: 5 ml per minute,
- spectrophotometer set at 303 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_6O_5$ in the medium.

Not less than 15 per cent and not more than 45 per cent of the stated amount of $C_{20}H_{21}FN_6O_5$ is dissolved in 15 minutes.

Q. Not less than 70 per cent at 60 minutes of the stated amount of $C_{20}H_{21}FN_6O_5$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14), using solvent mixture (a), (b), test solution and chromatographic system as described under Assay.

Reference solution (a). A 0.2 per cent w/v solution of *raltegravir potassium IPRS* in *1 M sodium hydroxide*, stir the solution for 2 hours. To 5.0 ml of the solution, add 5 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with solvent mixture (b). (Degradation generates raltegravir amine and raltegravir oxalylacetohydrazide analog)

Reference solution (b). A solution containing 0.01 per cent w/v of *raltegravir potassium IPRS* and 0.00002 per cent w/v of *raltegravir related compound E IPRS* in solvent mixture (b).

Reference solution (c). A 0.000044 per cent w/v solution of *raltegravir potassium IPRS* in solvent mixture (b).

Name	Relative retention time	Correction factor
Raltegravir amine*	0.14	—
Raltegravir formididyl analog*	0.29	—
Raltegravir oxalyl analog[1]	0.33	—
Raltegravir oxalylacetohydrazide analog	0.48	1.33

Raltegravir	1.0	—

*This is a process impurity controlled in the drug substance and not monitored in the drug product,

[1]2-{(2-{4-[(4-Fluorobenzyl)carbamoyl]-5-hydroxy-1-methyl-6-oxo-1,6-dihydropyrimidin-2-yl}propan-2-yl}amino}-2-oxoacetic acid.

Inject reference solution (b) and (c). The test is not valid unless the resolution between raltegravir related compound E and raltegravir peaks is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (c).

Inject reference solution (a) for peak identification.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to raltegravir oxalyl analog is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of peak corresponding to raltegravir oxalylacetohydrazide analog is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.8 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture (a). Equal volumes of *acetonitrile* and *water.*

Solvent mixture (b). 30 volumes of *acetonitrile* and 70 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 500 mg of Raltegravir in 30 ml of solvent mixture (a), with the aid of ultrasound with intermittent shaking and dilute to 50.0 ml with solvent mixture (a). Centrifuge and use clear supernatant solution. Dilute 2.0 ml of the solution to 100.0 ml with solvent mixture (b).

Reference solution. A 0.022 per cent w/v solution of *raltegravir potassium IPRS* in solvent mixture (b).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 71 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and 29 volumes of *acetonitrile,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 30 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

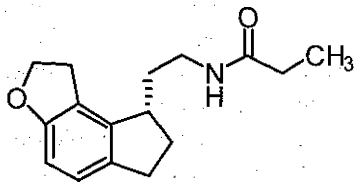
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_6O_5$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of raltegravir.

Ramelteon



$C_{16}H_{21}NO_2$ Mol Wt. 259.3

Ramelteon is (*S*)-*N*-[2-(1,6,7,8-tetrahydro-2*H*-indeno-[5,4-b]furan-8-yl)ethyl]propionamide.

https://nhathuocngocanh.com/

Ramelteon contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{21}NO_2$, calculated on the anhydrous basis.

Category. Hypnotic, Sedative.

Description. A white to cream powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramelteon IPRS* or with the reference spectrum of ramelteon.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 3.4 g of *potassium dihydrogen orthophosphate* and 4.68 g of *sodium octanesulphonate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 75 volumes of solution A and 25 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *ramelteon IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of cyano impurity and amine impurity in the solvent mixture.

Reference solution(c). Weigh 12.5 mg of *ramelteon IPRS* and add 625 µl of reference solution (b) into 25-ml of volumetric flask and dilute with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of solution A and 10 volumes of *acetonitrile*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	60	40
11	60	40
22	45	55
40	45	55
40.5	60	40
50	60	40

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to amine impurity and ramelteon is not less than 10, the column efficiency is not less than 3000 theoretical plates and tailing factor is not more than 2.0.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to cyano impurity [(E)-(1,6,7,8-tetrahydro-2H-indeno [5,4-b]furan-8 ylidene) acetonitrile] is not more than 0.5 per cent, amine impurity [(S)-2-(1,6,7,8-tetrahydro-2H-indeno [5,4-b]furan-8 yl) ethyl amine hydrochloride] is not more than 0.5 per cent and any other secondary peak is not more than 0.3 per cent. The sum of areas of all the secondary peak is not more than 1.0 per cent.

R Isomer Impurity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 12.5 mg of the substance under examination in 25 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *ramelteon IPRS* in the mobile phase.

Reference solution (b). Weigh 5 mg of *ramelton R-isomer impurity IPRS* in a 50-ml volumetric flask and dilute with the mobile phase.

Reference solution(c). Weigh 12.5 mg of *ramelteon IPRS* and add 625 µl of reference solution (b) into 25-ml of volumetric flask and dilute with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with chiralcel OD-H (5 µm),
- mobile phase: a mixture of 90 volumes of *n-hexane*, 10 volumes of *ethanol* and 0.1 volume of *trifluoroacetic acid*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject reference solution(c). The test is not valid unless the resolution between ramelton R-isomer impurity and principal peak due to ramelton is not less than 1.

https://nhathuocngocanh.com/

Inject reference solution (a), and the test solution. In the chromatogram obtained with the test solution per cent area of peak due to R-isomer is not more than 0.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 3.4 g of *potassium dihydrogen orthophosphate* and 4.68 g of *sodium octanesulphonate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 75 volumes of solution A and 25 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *ramelton IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of solution A and 10 volumes of *acetonitrile*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

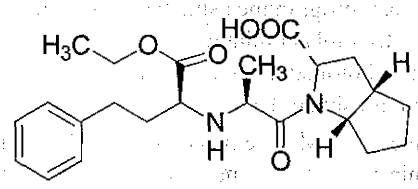
Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	60	40
11	60	40
18	40	60
26	40	60
26.5	60	40
35	60	40

Inject the reference solution. The test is not valid unless, the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution and the test solution.

Calculate the content of $C_{16}H_{21}NO_2$.

Ramipril



$C_{23}H_{32}N_2O_5$ Mol. Wt. 416.5

Ramipril is (2*S*,3a*S*,6a*S*)-1-[(*S*)-2-[[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl] octahydrocyclopenta[*b*] pyrrole-2-carboxylic acid.

Ramipril contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{23}H_{32}N_2O_5$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril IPRS* or with the reference spectrum of ramipril.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). +32.0° to +38.0°, determined in 1.0 per cent w/v solution in *0.1 M methanolic hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of mobile phase B.

Reference solution (a). A 0.1 per cent w/v solution of *ramipril IPRS* in the mobile phase B.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase B.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 65°,
- mobile phase: A. dissolve 2.0 g of *sodium perchlorate* in a mixture of 0.5 ml of *triethylamine* and 800 ml of *water;* adjusted to pH 3.6 with *orthophosphoric acid* and add 200 ml of *acetonitrile*,
  B. dissolve 2.0 g of *sodium perchlorate* in a mixture of 0.5 ml of *triethylamine* and 300 ml of

https://nhathuocngocanh.com/

water; adjusted to pH 2.6 with *orthophosphoric acid* and add 700 ml of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
6	90	10
7	75	25
20	65	35
30	25	75
40	25	75
45	90	10
55	90	10

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 60°, under vacuum, for 4 hours.

Assay. Dissolve 0.3 gm in 25 ml of *methanol* and add 25 ml of *water*. Titrate with *0.1 M sodium hydroxide*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04165 gm of $C_{23}H_{32}N_2O_5$.

Storage. Store protected from light and moisture.

Ramipril Capsules

Ramipril Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ramipril, $C_{23}H_{32}N_2O_5$.

Usual strengths. 1.25 mg; 2.5 mg; 5 mg; 10 mg.

Identification

Shake a quantity of the content of the capsules containing 25 mg of Ramipril with 50 ml of *acetone*, centrifuge for 10 minutes, filter. Evaporate the filtrate to dryness at 60° for 3 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril IPRS* or with the reference spectrum of ramipril.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate to get 0.00025 per cent w/v solution of Ramipril with *0.1 M hydrochloric acid*.

Reference solution. A 0.00025 per cent w/v solution of *ramipril IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{23}H_{32}N_2O_5$.

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one capsule in 100 ml of *0.1 M hydrochloric acid*, sonicate for 15 minutes. Dilute if necessary, to produce 0.00025 per cent w/v solution of Ramipril in *0.1 M hydrochloric acid*.

Reference solution. A 0.00025 per cent w/v solution of *ramipril IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the content of capsules containing 25 mg of Ramipril, disperse in 100.0 ml of *0.1 M hydrochloric acid*, mix and centrifuge. Dilute 1.0 ml of the resulting solution to 100.0 ml with *0.1 M hydrochloric acid*.

Reference solution. A 0.00025 per cent w/v solution of *ramipril IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 12.5 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

– mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a solution containing 1.4 per cent w/v solution of *sodium perchlorate* and 0.58 per cent w/v solution of *orthophosphoric acid* adjusted to pH 2.5 with *triethylamine*, adjust the pH of the mixture to 2.1 with *orthophosphoric acid*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Storage. Store protected from light and moisture.

Ramipril Tablets

Ramipril Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ramipril, $C_{23}H_{32}N_2O_5$.

Usual strengths. 1.25 mg; 2.5 mg; 5 mg; 10 mg.

Identification

Shake a quantity of the powdered tablets containing 25 mg of Ramipril with 50 ml of *acetone*, centrifuge for 10 minutes, filter. Evaporate the filtrate to dryness at 60° for 3 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril IPRS* or with the reference spectrum of ramipril.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 45 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate to get 0.00025 per cent w/v solution of Ramipril with *0.1 M hydrochloric acid*.

Reference solution. A 0.00025 per cent w/v solution of *ramipril IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{23}H_{32}N_2O_5$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Take one tablet, add 5 ml of *0.1 M hydrochloric acid*, sonicate for 10 minutes, dilute, if necessary, with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.00025 per cent w/v of Ramipril, centrifuge and use the supernatant liquid.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powdered tablets containing 25 mg of Ramipril, disperse in 100.0 ml of *0.1 M hydrochloric acid* and centrifuge. Dilute 1.0 ml of the resulting solution to 100.0 ml with *0.1 M hydrochloric acid*.

Reference solution. A 0.00025 per cent w/v solution of *ramipril IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system
– a stainless steel column 12.5 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a solution containing 1.4 per cent w/v solution of *sodium perchlorate* and 0.58 per cent w/v solution of *orthophosphoric acid*, adjusted to pH 2.5 with *triethylamine*, adjust the pH of the mixture to 2.1 with *orthophosphoric acid*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Storage. Store protected from light and moisture.

Ramipril and Hydrochlorothiazide Tablets

Ramipril and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of ramipril, $C_{23}H_{32}N_2O_5$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

https://nhathuocngocanh.com/

Usual strength. Ramipril 2.5 mg and Hydrochlorothiazide 12.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium 750 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary, with the dissolution medium.

Reference solution (a). Dissolve a quantity of *ramipril IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Reference solution (b). Dissolve a quantity of *hydrochlorothiazide IPRS* in mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Thermo quest Hypersil),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *acetonitrile* and 0.1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophoshoric acid,*
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The relative standard deviation for replicate injections for each peak is not more than 2.0 per cent.

Inject reference solution (a), (b) and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ and $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{32}N_2O_5$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 10 mg of Ramipril in mobile phase A, sonicate for 15 minutes and dilute to 10.0 ml with the same solvent.

Reference solution (a). A solution containing 0.2 per cent w/v of *ramipril IPRS* and 1.0 per cent w/v of *hydrochlorothiazide IPRS* in mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with mobile phase A. Dilute 5.0 ml of the solution to 100.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 60 volumes of buffer solution prepared by dissolving 4 g of *sodium perchlorate* in 600 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 2.6 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
  B. a mixture of 85 volumes of buffer solution and 15 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	0	100
13	0	100
17	50	50
20	100	0
80	100	0
82	0	100
87	0	100

The relative retention time with reference to ramipril for ramipril impurity A is about 0.9, for ramipril impurity B is about 1.2, for ramipril impurity C is about 1.5 and for ramipril impurity D is about 1.7.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections for each peak is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. The retention time of ramipril is about 30 minutes and of hydrochlorothiazide is about 10 minutes. In the chromatogram obtained with the test solution the area of each peak due to ramipril impurity A, B and C is not be more than the area of the principal peak due to ramipril in the chromatogram obtained

with reference solution (b) (1.0 per cent); the area of peak due to ramipril impurity D is not more than 7 times the area of the principal peak due to ramipril in the chromatogram obtained with reference solution (b) (7.0 per cent); the area of any other secondary peak is not more than the area of the principal peak due to ramipril in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore the peak due to hydrochlorothiazide.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Disperse 1 intact tablet in *water* and dilute to 25.0 ml with the mobile phase. Dilute 3.0 ml of the solution to 25.0 ml with the mobile phase and mix.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powder containing about 25 mg of Ramipril, disperse in *water* and dilute to 250.0 ml with the mobile phase, filter. Dilute 3.0 ml of the solution to 25.0 ml with the mobile phase and mix.

Reference solution (a). A 0.024 per cent w/v solution of *ramipril IPRS* in the mobile phase.

Reference solution (b). A 0.06 per cent w/v solution of *hydrochlorothiazide IPRS* in the mobile phase.

Reference solution (c). Dilute reference solution (a) and (b) with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Thermo quest Hypersil),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *acetonitrile* and 0.1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

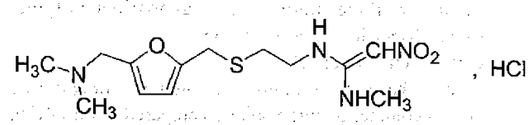
Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections for each peak is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ and $C_7H_8ClN_3O_4S_2$ in the tablet.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Ranitidine Hydrochloride



$C_{13}H_{22}N_4O_3S,HCl$ Mol. Wt. 350.9

Ranitidine Hydrochloride is *N*-[2-[[[5-[(dimethylamino) methyl]furan-2-yl]methyl]thio]ethyl]-*N*-methyl-2-nitroethene-1,1-diamine hydrochloride.

Ranitidine Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{13}H_{22}N_4O_3S,HCl$, calculated on the dried basis.

Category. Antiulcer (Histamine H_2-receptor antagonist).

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride IPRS* or with the reference spectrum of ranitidine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 13 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). A solution containing 0.013 per cent w/v solution of *ranitidine hydrochloride IPRS* and 0.00002 per cent w/v of *ranitidine impurity J IPRS (1,1'-N-[methylene bis(sulphanediyl-ethylene)] bis(N'-methyl-2-nitroethene-1,1- diamine IPRS)* in mobile phase A.

[4] 2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulfanyl] ethanamine,

[5] *N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulfinyl]ethyl]-*N'*-methyl-2-nitroethene-1,1-diamine,

[6] *N*-[2-[[[5-[(dimethyloxidoamino)methyl]furan-2-yl]methyl]sulfanyl] ethyl]-*N'*- methyl-2-nitroethene-1,1-diamine,

[7] *N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulfanyl] ethyl]-2-nitroacetamide,

[8] 1,1'-*N*-[methylenebis(sulfanediylethylene)]bis(*N'*-methyl-2-nitroethene-1,1- diamine),

[9] 2,2'-methylenebis[*N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulfanyl]ethyl]-*N'*-methyl-2-nitroethene-1,1-diamine],

[10] *N*,*N'*-bis[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulfanyl] ethyl]-2- nitroethene-1,1-diamine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ranitidine impurity J and the principal peak is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ranitidine impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any other identified peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the area of all the secondary peaks other than ranitidine impurity A is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.05 times the principal peak in the chromatogram obtained with the reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.75 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 2.75 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. A 0.0112 per cent w/v of the substance under examination in the mobile phase.

Reference solution. A 0.0112 per cent w/v of *ranitidine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{22}N_4O_3S,HCl$.

Storage. Store protected from light and moisture.

Ranitidine Injection

Ranitidine Hydrochloride Injection

Ranitidine Injection is a sterile solution of Ranitidine Hydrochloride in Water for Injections and may be suitably buffered.

Ranitidine Hydrochloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ranitidine, $C_{13}H_{22}N_4O_3S$.

Usual strength. The equivalent of 50 mg of ranitidine in 2 ml (1.12 g of ranitidine hydrochloride is approximately equivalent to 1 g of ranitidine).

Identification

A. To a volume of the injection containing 25 mg of ranitidine add 20 ml of *methanol*, mix and evaporate to dryness. Add 1 ml of *light petroleum (60° to 80°)* to the resulting residue, scratch the side of the vessel with a glass rod to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride IPRS* or with the reference spectrum of ranitidine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.7 to 7.3, if the preparation is buffered; 4.5 to 7.0, if the preparation is unbuffered.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with *water* to obtain 0.1 per cent w/v of Ranitidine.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (c). Dilute 1.0 ml of the test solution to 200.0 ml with *water*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 5.0 ml with *water*.

Reference solution (e). A solution containing 0.002 per cent w/v of *ranitidine impurity J IPRS (1,1 '-N-[methylenebis (sulphanediyl-ethylene)] bis(N'-methyl-2-nitroethene-1,1-diamine IPRS)* in mobile phase A. Transfer 1.0 ml of the solution to a 100-ml volumetric flask containing 13 mg of *ranitidine hydrochloride IPRS*, add 40 ml of *water*, shake to dissolve and dilute to volume with *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane amorphous organosilica polymer (3.5 µm) (Such as X-terra MS C18),
- column temperature: 35°,
- mobile phase: A. a mixture of 2 volumes of *acetonitrile* and 98 volumes of *0.05 M potassium dihydrogen orthophosphate*, adjusted to pH 7.1 with *sodium hydroxide solution*,
  B. a mixture of 22 volumes of *acetonitrile* and 78 volumes of *0.05 M potassium dihydrogen orthophosphate*, adjusted to pH 7.1 with *sodium hydroxide solution*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	0	100
15	0	100
16	100	0
20	100	0

Inject reference solution (e). The test is not valid unless the resolution between two principal peaks is not less than 1.5.

Inject reference solution (a), (b), (c), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). The area of not more than one secondary peak is more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of not more than two other secondary peaks is more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the area of not more than two further secondary peaks is more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent).

Bacterial endotoxins (2.2.3). Not more than 7.0 Endotoxin Units per mg of ranitidine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dilute a volume of the injection containing 10.0 mg of ranitidine to 100.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution. A 0.0112 per cent w/v solution of *ranitidine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) the strength in terms of the equivalent amount of ranitidine; (2) where appropriate, that the injection is buffered.

Ranitidine Oral Solution

Ranitidine Hydrochloride Oral Solution.

Ranitidine Oral Solution is a solution of ranitidine hydrochloride in a suitable vehicle.

Ranitidine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the ranitidine, $C_{13}H_{22}N_4O_3S$.

Usual strength. 75 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.7 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 6.804 g of *potassium dihydrogen orthophosphate* in 950 ml of *water*, adjusted to pH 7.1 with *sodium hydroxide solution* and dilute to 1000.0 ml with *water*

Test solution. Prepare a solid phase extraction cartridge containing a C18 sorbent (Such as Sep-Pak C18 cartridges) by passing 10.0 ml of *methanol* followed by 20.0 ml of *0.5 M ammonia* through the cartridge; attach the tip of a suitable syringe to the cartridge. Transfer a weighed quantity of the oral solution containing the equivalent of 15 mg of ranitidine to the barrel of the syringe, add 2.0 ml of *0.5 M ammonia* to the syringe, insert the plunger and slowly force the mixture through the cartridge, discarding the eluant; repeat with two 4.0 ml quantities of *0.5 M ammonia* discarding the eluant. Pass two 5.0 ml quantities of a mixture of 25 volumes of *0.1M hydrochloric acid* and 75 volumes of *methanol* through the cartridge and collect the eluant; add 40.0 ml of *ethanol* to the collected eluant, evaporate the resulting solution to dryness at a temperature not exceeding 30° under reduced pressure and dissolve the residue in 2.0 ml of *water*.

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *water*.

Reference solution (b). Dilute 1 volume of the test solution to 100 volumes with *water*.

Reference solution (c). Dilute 1 volume of the test solution to 200 volumes with *water*.

Reference solution (d). Dilute 1 volume of reference solution (b) to 5 volumes with *water*.

Reference solution (e). A solution containing 0.002 per cent w/v of *ranitidine impurity J IPRS (1,1'-N-[methylenebis (sulphanediyl-ethylene)] bis(N'-methyl-2-nitroethene-1,1-diamine IPRS)* in mobile phase A. Transfer 1.0 ml of the solution to a 100-ml volumetric flask containing 13 mg of *ranitidine hydrochloride IPRS*, add 40 ml of *water*, shake to dissolve and dilute to volume with *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane amorphous organosilica polymer (3.5µm) (Such as XTerra MS C_{18}),
- column temperature: 35°,
- mobile phase: A. a mixture of 2 volumes of *acetonitrile* and 98 volumes of buffer solution,
  B. a mixture of 22 volumes of *acetonitrile* and 78 volumes of buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0

20	100	0

https://nhathuocngocanh.com/

Inject reference solution (e). The test is not valid unless the resolution between two peaks corresponding to ranitidine impurity J and ranitidine hydrochloride is not less than 1.5.

Inject reference solution (a), (b), (c), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of not more than one secondary peak is more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of not more than two other secondary peaks is more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of not more than two further secondary peaks is more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the areas of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dilute a volume of oral solution with the mobile phase to obtain a solution containing 0.0025 per cent w/v of ranitidine.

Reference solution. A 0.0028 per cent w/v solution of *ranitidine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of buffer solution prepared by dissolving 7.71 gm of *ammonium acetate* in 200 ml of *water*, add 1 ml of *acetic acid* and dilute to 1000 ml with *water*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ranitidine.

Ranitidine Tablets

Ranitidine Hydrochloride Tablets

Ranitidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the ranitidine, $C_{13}H_{22}N_4O_3S$. The tablets are coated.

Usual strengths. The equivalent of 150 mg, 300 mg of ranitidine (1.12 g of ranitidine hydrochloride is approximately equivalent to 1 g of ranitidine).

Identification

A. Shake a quantity of the powdered tablets containing 25 mg of ranitidine with 5 ml of *methanol* for 5 minutes, filter and evaporate the filtrate to dryness. Add 1 ml of *light petroleum (60° to 80°)* to the resulting residue, scratch the side of the vessel with a glass rod to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride IPRS* or with the reference spectrum of ranitidine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *water*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 314 nm (2.4.7). Calculate the content of ranitidine, $C_{13}H_{22}N_4O_3S$ in the medium from the absorbance obtained from a solution of known concentration of *Ranitidine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{22}N_4O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 0.13 g of Ranitidine in 100.0 ml of *water*, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A.

https://nhathuocngocanh.com/

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with mobile phase A. Dilute 3.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (c). A solution containing 0.002 per cent w/v of *ranitidine impurity J IPRS (1,1'-N-[methylenebis (sulphanediyl-ethylene)] bis(N'-methyl-2-nitroethene-1,1-diamine IPRS)* in mobile phase A. Transfer 1.0 ml of the solution to a 100-ml volumetric flask containing 13 mg of *ranitidine hydrochloride IPRS,* add 40 ml of *water,* shake to dissolve and dilute to volume with *water.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane amorphous organosilica polymer (3.5 µm) (Such as Xterra MS C18),
- column temperature: 35°,
- mobile phase: A. a mixture of 2 volumes of *acetonitrile* and 98 volumes of *0.05 M potassium dihydrogen orthophosphate,* adjusted to pH 7.1 with *sodium hydroxide solution,*

  B. a mixture of 22 volumes of *acetonitrile* and 78 volumes of *0.05 M potassium dihydrogen orthophosphate,* adjusted to pH 7.1 with *sodium hydroxide solution,*
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	0	100
15	0	100
16	100	0
20	100	0

Inject reference solution (c). The test is not valid unless the resolution between two principal peaks is not less than 1.5.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of not more than one secondary peak is more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the area of not more than three other secondary peaks is more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution: Weigh and powder 20 tablets. Disperse a quantity of the powder containing 300 mg of Ranitidine with 80 ml of the mobile phase for 10 minutes and dilute to 100 ml with mobile phase, filter and dilute the filtrate with the mobile phase to obtain a solution containing the equivalent of 0.01 per cent w/v of ranitidine.

Reference solution. A 0.0112 per cent w/v solution of *ranitidine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of ranitidine.

Purified Rayon

Viscose Fibre; Absorbent Viscose

Category. Regenerated cellulose used in surgical dressings.

Description. White or very slightly yellow, purified rayon is a fibrous form of bleached regenerated cellulose, which can be produced with a lustrous or matt appearance, and is soft to the touch. The fibres can be produced with average staple length between 32 mm to 80 mm.

Identification

A. When examined under a microscope in the dry state, or when mounted in *ethanol (95 per cent)* and *water,* the following characteristics are observed. They are usually of more or less uniform width. Many longitudinal parallel lines are distributed unequally over the width in the case of standard viscose fibres, but such lines are absent or very few in fibres produced through the zinc-free process. The ends are cut more or less straight. Matt fibres contain numerous granular particles of approximately 1µ average diameter.

B. Treat with *iodinated zinc chloride solution;* the fibres become violet.

C. To 0.1 g add 10 ml of *zinc chloride-formic acid solution,* heat to 40° and allow to stand for 2 hours 30 minutes, shaking occasionally. The fibres dissolve completely except for the matt variety where titanium dioxide particles remain.

https://nhathuocngocanh.com/

D. Dissolve the residue obtained in the test for Sulphated ash in 5 ml of *sulphuric acid* with slight warming, allow to cool, and carefully add 0.2 ml of *hydrogen peroxide solution (10 volumes)*. The solution does not undergo colour change in case of lustrous variety of fibre, but for matt variety an orange-yellow colour is obtained, the intensity of which depends on the quantity of titanium dioxide present.

Tests

Colour of extract. Take 15 g of material under examination in a suitable vessel, add 150 ml of *water*, close the vessel and allow to macerate for 2 hours. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod, mix and filter. The filtered extract is colourless. Compare the colour of the extract with water using identical tubes of colourless, transparent, neutral glass 12 mm in diameter measuring 2 ml. Compare the colours in diffused daylight, viewing horizontally against a white background.

Acidity or alkalinity. To 25 ml of filtered extract obtained, add 0.1 ml of *dilute phenolphthalein solution*; to another 25 ml add 0.05 ml of *methyl orange solution*. Neither solution shows a pink colour.

Foreign fibres. When examined under a microscope, it is seen to consist exclusively of viscose fibres, except that occasionally a few isolated foreign fibres may be present.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight, brownish-violet fluorescence and a few yellow particles. Not more than a few isolated fibres show an intense blue fluorescence.

Absorbancy

A. Sinking time. Not more than 10 seconds, determined by the following method.

Apparatus

A dry, cylindrical copper wire basket, 80 mm high and 50 mm in diameter, fabricated from wire of diameter 0.4 mm and having a mesh aperture of 15 to 20 mm; the basket weighs 2.4 to 3.0 g.

Method

Weigh the basket to the nearest 10 mg. Take five samples, each of approximately 1 g, from different places in the material under examination, place loosely in the basket and weigh the packed basket to the nearest 10 mg. Hold the basket with its long axis in the horizontal position and drop it from a height of about 10 mm into *water* at 25° contained in a beaker at least 12 cm in diameter and filled to a depth of 10 cm. Measure with a stopwatch the time taken by the basket to sink below the surface of the water. Repeat the procedure on two further samples and calculate the average value.

B. Water-holding capacity. Not less than 18.0 g per g, determined by the following method.

After the sinking time has been recorded in test A, remove the basket from the *water*, allow it to drain for 30 seconds with its long axis in the horizontal position over the beaker, transfer it to a tared beaker and weigh to the nearest 10 mg. Calculate the weight of *water* retained by the sample. Repeat the procedure on two further samples and calculate the average value.

Colouring matter. Slowly extract 10 g in a narrow percolator with *ethanol (95 per cent)* until 50 ml of extract is obtained. The extract is not more intensely coloured than reference solution YS5 *or* GYS6, (2.4.1) or a solution prepared in the following manner. To 3.0 ml of CSS add 7.0 ml of a solution of *hydrochloric acid* containing 1 per cent w/v of *hydrochloric acid* and dilute 0.5 ml of the resulting solution to 10 ml with the same solution of *hydrochloric acid*.

Ether-soluble substances. Not more than 0.5 per cent, determined by the following method. Extract 5 g with *ether* in a continuous extraction apparatus such as a Soxhlet apparatus, for 4 hours in such a way that the rate is at least four extractions per hour. Evaporate the *ether* and dry the residue to constant weight at 105°.

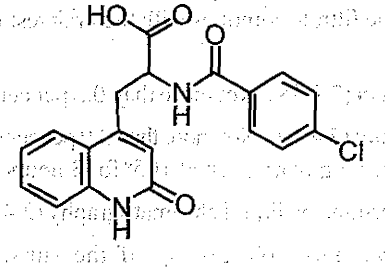
Water-soluble substances. Not more than 0.7 per cent, determined by the following method. Boil 5 g with 500 ml of *water* for 30 minutes, stirring frequently and replacing the *water* lost by evaporation. Decant the liquid into a beaker, squeeze the residual liquid from the material carefully with a glass rod, mix the liquids and filter the extract whilst hot. Evaporate 400 ml of the filtrate and dry the residue to constant weight at 105°.

Hydrogen sulphide. To 10 ml of the filtered extract obtained in the Colour of extract, add 1.9 ml of *water*, 0.15 ml of *dilute acetic acid* and 1 ml of *lead acetate solution*. After 2 minutes, the solution is not more intensely coloured than a reference solution prepared at the same time using 0.15 ml of *dilute acetic acid*, 1.2 ml of *thioacetamide reagent*, 1.7 ml of *lead standard solution (10 ppm Pb)* and 10 ml of filtered extract.

Sulphated ash (2.3.18). Not more than 1.5 per cent.

Loss on drying (2.4.19). Not more than 13.0 per cent, determined on 5 g by drying in an oven at 105°.

Rebamipide



$C_{19}H_{15}ClN_2O_4$ Mol. Wt. 370.8

https://nhathuocngocanh.com/

Rebamipide is (*RS*)-2-(4-Chlorobenzoylamino)-3-(2-oxo-1,2-dihydroquinolin-4-yl)propionic acid.

Rebamipide contains not less than 98.5 per cent and not more than 102.5 per cent of $C_{19}H_{15}ClN_2O_4$, calculated on the dried basis.

Category. Antiulcer.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rebamipide IPRS* or with the reference spectrum of rebamipide.

B. Dissolve 20 mg of the substance under examination in 5 ml of *1 M sodium hydroxide* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 25.0 ml with *water*. When examined in the range of 200 nm to 380 nm (2.4.7), the solution shows an absorption maximum at about 228 nm and 326 nm and absorption minimum at 295 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *dimethylformamide* and dilute to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 49 volumes of *methanol* and 51 volumes of a 1.0 per cent w/v solution of *sodium acetate* and 2 volumes of *glacial acetic acid*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 327 nm,
- injection volume: 20 µl.

Inject the test solution. The sum of the areas of all the secondary peaks is not more than 1.5 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chloride (2.3.12). Shake 1.0 g with 40 ml of *water* for 5 minutes and filter. The filtrate complies with the limit test for chlorides (250 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *dimethylformamide* and dilute to 100.0 ml with *methanol*. Dilute 2.0 ml of the solution to 25.0 ml of mobile phase.

Reference solution. Dissolve 50 mg of *rebapimide IPRS* in 10 ml of *dimethylformamide* and dilute to 100.0 ml with *methanol*. Dilute 2.0 ml of the solution to 25.0 ml of mobile phase.

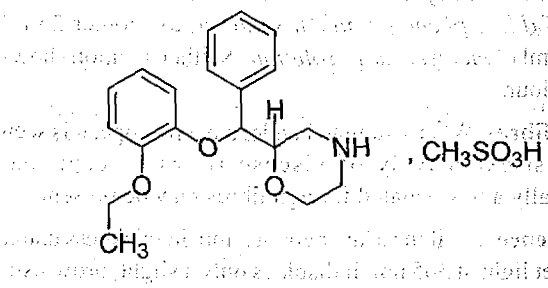
Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{15}ClN_2O_4$.

Reboxetine Methanesulphonate



$C_{20}H_{27}NO_6S$ Mol. Wt. 409.5

Reboxetine Methanesulphonate is (±)-2-[(2-Ethoxyphenoxy) benzyl]morpholine methane sulphonic acid.

Reboxetine Methanesulphonate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{27}NO_6S$, calculated on the dried basis.

Category. Antidepressant.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *reboxetine methanesulphonate IPRS* or with the reference spectrum of reboxetine methanesulphonate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 2.5 to 5.5, determined in 1 per cent w/v solution in *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

https://nhathuocngocanh.com/

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *reboxetine methanesulphonate IPRS* in the mobile phase.

Chromatographic system

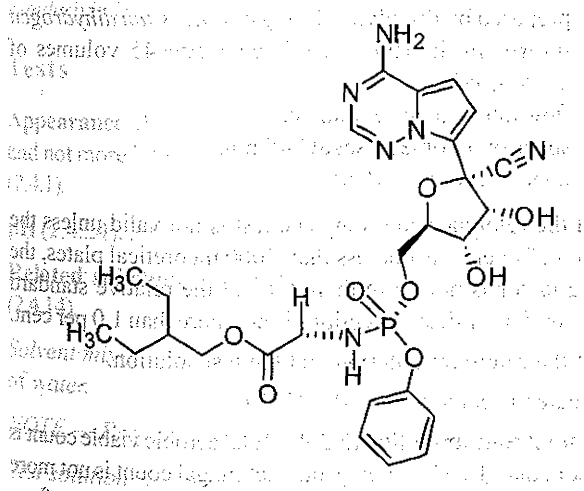
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 32 volumes of *acetonitrile* and 68 volumes of buffer solution prepared by dissolving 2.0 g of *disodium hydrogen orthophosphate* and 4.0 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.7 with *orthophosphoric acid*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{27}NO_6S$.

Remdesivir



$C_{27}H_{35}N_6O_8P$ Mol. Wt. 602.6

Remdesivir is (2*S*)-2-{(2*R*,3*S*,4*R*,5*R*)-[5-(4-Aminopyrrolo[2,1-*f*][1,2,4]triazin-7-yl)-5-cyano -3,4-dihydroxy-tetrahydro-furan-2-ylmethoxy]phenoxy-(*S*)-phosphorylamino}propionic acid 2-ethyl-butyl ester.

Remdesivir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{35}N_6O_8P$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white to off white to yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *remdesivir IPRS* or with the reference spectrum of remdesivir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). –23.0° to –17.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.005 per cent w/v solution of *remdesivir IPRS* in the solvent mixture.

Reference solution (b). Dissolve 12.5 mg of *remdesivir impurity D IPRS (fragment-B)* in 5 ml *acetonitrile* with the aid of ultrasound and dilute to 25.0 ml with the solvent mixture.

Reference solution (c). Dilute 10.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane with the extra selectivity of a penta fluoro phenyl phase bonded to porous silica (5 µm) (Such as ACE PFP C18),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*,

  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,

[3]2-ethylbutyl((*S*)-(((3aR,4R,6R,6aR)-6-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-6-cyano-2,2-dimethyltetrahydrofuro[3,4-d][1,3]dioxol-4-yl)methoxy)(phenoxy)phosphoryl)amino)-*L*-alaninate (Condensed),

[4]*N*-[(*S*)-(4-nitrophenoxy) phenoxyphosphinyl]-l-Alaine 2- ethylbutyl ester (Fragment B).

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent for remdesivir at 245 nm.

Inject reference solution (c) and the test solution at 245 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to remdesivir impurity A, B and C, each of, is not more than the area of the peak due to remdesivir in the chromatogram obtained with reference solution (c) (0.5 per cent) and the area of any other secondary peak is not more than 0.6 times the area of the peak due to remdesivir in the chromatogram obtained with reference solution (c) (0.3 per cent). Ignore any peak corresponding to remdesivir impurity D.

Inject reference solution (c) and the test solution at 275 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to remdesivir impurity D is not more than the area of the peak due to remdesivir impurity D in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore all the peaks other than remdesivir impurity D.

The sum of all secondary peaks at 245 nm and remdesivir impurity D is not more than 1.0 per cent.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg of remdesivir.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *remdesivir IPRS* in the solvent mixture.

Chromatographic system
– a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane with the extra selectivity of a penta fluoro phenyl phase bonded to porous silica (5 µm) (Such as ACE PFP C18),
– column temperature: 40°,
– sample temperature: 10°,
– mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 45 volumes of *acetonitrile*,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 245 nm,
– injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{35}N_6O_8P$.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g and total fungal count is not more than 10^2 CFU per g, determined by plate count. 1 g is free from *Escherichia coli*, *Salmonella* and *Shigella*.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Remdesivir Injection

Remdesivir for Injection

Remdesivir Injection is a sterile material consisting of Remdesivir with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Remdesivir Injection contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of remdesivir, $C_{27}H_{35}N_6O_8P$.

The contents of the sealed containers comply with the requirements stated under Parenteral Preparations (powder for Injections) and with the following requirements.

Usual strength. 100 mg per vial.

Description. A white to off white to yellow lyophilized solid or powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range from 200 nm to 400 nm (2.4.7), a 0.0012 per cent w/v solution in 50 per cent v/v solution of *methanol* shows an absorption maximum as obtained with *remdesivir IPRS* of the same concentration.

Tests

Appearance of solution. A reconstituted solution is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 3.0 to 4.0, determined on constituted solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

NOTE — Prepare the solutions immediately before use.

Test solution. Reconstitute 5 vials with 20 ml each, with the solvent mixture and pool the contents in 200-ml volumetric flask, dilute to volume with the solvent mixture. Dilute a suitable volume with the solvent mixture to obtain a solution containing 0.1 per cent w/v of Remdesivir.

Reference solution. Dissolve 10 mg of *remdesivir IPRS* in 5 ml of *acetonitrile* and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane with extra selectivity of a penta fluoro phenyl bonded to porous silica (5 µm) (Such as ACE PFP C18),
- column temperature: 40°,
- sample temperature: 5°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 5 µl.

[1](2*R*,3*R*,4*S*,5*R*)-2-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile (Fragment A),

[2](3a*R*,4*R*,6*R*,6a*R*)-4-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-6-(hydroxymethyl)-2,2-dimethyltetrahydrofuran[3,4-d][1,3]dioxole-4-carbonitrile (Acetonide),

[3]2-ethylbutyl((*S*)-(((3a*R*,4*R*,6*R*,6a*R*)-6-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-6-cyano-2,2-dimethyltetrahydrofuro[3,4-d][1,3]dioxol-4-yl)methoxy)(phenoxy)phosphoryl)amino)-*L*-alaninate (Condensed),

[4]*N*-[(S)-(4-nitrophenoxy) phenoxyphosphinyl]-l-Alaine 2- ethylbutyl ester (Fragment B).

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to remdesivir impurity A is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent), the area any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks other than remdesivir impurity A is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Water (2.3.43). Not more than 3.0 per cent, determined on 0.1 g.

Bacterial endotoxins (2.2.3).Not more than 0.6 Endotoxin Unit per mg of remdesivir.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 60 volumes of *water*.

Test solution. Reconstitute 5 vials with 20 ml each, with the solvent mixture and pool the contents in 200-ml volumetric flask, dilute to volume with the solvent mixture. Dilute 2.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *remdesivir IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane with extra selectivity of a penta fluoro phenyl bonded to porous silica (5 µm) (Such as ACE PFP C18),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

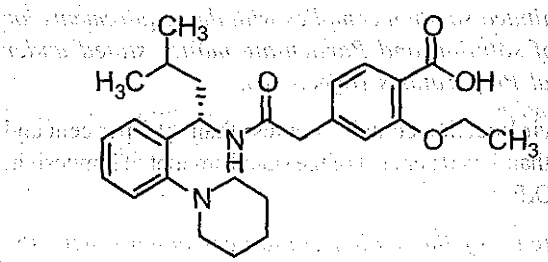
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{35}N_6O_8P$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Repaglinide



$C_{27}H_{36}N_2O_4$ Mol. Wt. 452.6

Repaglinide is (*S*)-2-Ethoxy-4-[2-[3-methyl-1-(2-(piperidin-1-yl)phenyl)butylamino]-2-oxoethyl]benzoic acid.

Repaglinide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{27}H_{36}N_2O_4$, calculated on the dried basis.

Category. Antidiabetic.

Description. A white or almost white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *repaglinide IPRS* or with the reference spectrum of repaglinide.

B. Specific optical rotation (2.4.22). +6.3° to +7.7°, determined in a 5.0 per cent w/v solution in *methanol*.

Tests

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions in amber flasks and vials.

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution (a). A 0.01 per cent w/v solution of *repaglinide impurity E IPRS (2-ethoxy-4-[2-[[(1R)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl]amino]-2-oxoethyl] benzoic acid IPRS)* in *methanol*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *methanol*.

https://nhathuocngocanh.com/

Reference solution (c). Mix 1.0 ml of the test solution and 10 ml of reference solution (a) and dilute to 50.0 ml with *methanol.*

Chromatographic system
- a stainless steel column 10 cm x 4 mm, packed with silica gel AGP for chiral chromatography (5 µm),
- mobile phase: A. a 0.1 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 4.7 with *dilute sodium hydroxide solution*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
4	60	40
6	60	40
8	80	20

The retention time of repaglinide is about 3.3 minutes and of repaglinide impurity E is about 5.0 minutes.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to repaglinide and repaglinide impurity E is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to repaglinide impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with *acetonitrile.*

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *acetonitrile.*

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *acetonitrile.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with silica alkyl-bonded for use with highly aqueous mobile phases (5 µm),
- column temperature: 45°,
- mobile phase: A. a 0.4 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.2 with *dilute orthophosphoric acid*,
  B. a mixture of 30 volumes of mobile phase A and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.
