[4]ethyl 2-ethoxy-4-[2-[[(1*S*)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl]amino]-2-oxoethyl]benzoate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.32 g in 10 ml *methanol* and add 60 ml of *anhydrous acetic acid.* Titrate with *0.1M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04526 g of $C_{27}H_{36}N_2O_4$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Repaglinide Tablets

Repaglinide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of repaglinide, $C_{27}H_{36}N_2O_4$.

Usual strengths. 0.5 mg; 1 mg; 2 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of buffer solution pH 5.0, prepared by dissolving 10.2 g of *citric acid monohydrate* and 18.2 g of *dibasic sodium phosphate dihydrate* with 1000 ml of *water*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and dilute further with dissolution medium, if necessary.

Reference solution. A 0.001 per cent w/v solution of *repaglinide IPRS* in *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 49 volumes of *acetonitrile*, 40 volumes of 0.15 per cent w/v of *monobasic potassium phosphate solution*, adjusted to pH 2.3 with *orthophosphoric acid* and 11 volumes of *methanol*,
- flow rate: 1 ml per minute,
- fluorometric detector: excitation wavelength of 244 nm and emission wavelength of 348 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{27}H_{36}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Reference solution (d). Dilute 2.5 ml of reference solution (b) to 1000 ml with the solvent mixture.

- spectrophotometer set at 210 nm,

Inject reference solution (c) and (d). The test is not valid unless the resolution between the peaks due to repaglinide and repaglinide impurity A is not less than 7.0 and the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (d).

Inject the test solution. The sum of areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *methanol* and 30 volumes of 0.2 per cent w/v of *monobasic ammonium phosphate solution*, adjusted to pH 4.0 with *orthophosphoric acid*.

Test solution. Disperse 8 intact tablets in the solvent mixture and dilute to obtain a solution containing 0.008 per cent w/v of Repaglinide in the solvent mixture, stir for 20 minutes and filter.

Reference solution (a). A 0.08 per cent w/v solution of *repaglinide IPRS* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (c). A 0.008 per cent w/v solution of *repaglinide impurity A IPRS (4-(carboxymethyl)-2-ethoxybenzoic acid IPRS)* in *methanol*. To 1.0 ml of the solution, add 5.0 ml of reference solution (a) and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 6.0 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of 0.2 per cent w/v solution of *monobasic ammonium phosphate*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to repaglinide and repaglinide impurity A is not less than 7.0, the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 2.0 in the chromatogram obtained with reference solution (b).

https://nhathuocngocanh.com/

Inject reference solution (b) and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the tablets.

Storage. Store protected from light and moisture.

Repaglinide and Metformin Tablets

Repaglinide and Metformin Hydrochloride Tablets

Repaglinide and Metformin Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of repaglinide, $C_{27}H_{36}N_2O_4$ and metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strengths. Repaglinide, 1 mg and Metformin Hydrochloride 500 mg; Repaglinide, 2 mg and Metformin Hydrochloride 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2):

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1M hydrochloric acid,*

Speed and time. 75 rpm and 30 minutes.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

- injection volume: 50 µl.

Test solution (a). Withdraw a suitable volume of the medium and filter. Dilute further, if necessary, with the dissolution medium for repaglinide.

Test solution (b). Dilute 5.0 ml of the filtrate to 100.0 ml with the dissolution medium for metformin hydrochloride.

Reference solution (a). Weigh accurately about 22 mg of *repaglinide IPRS* and transfer to a 200-ml volumetric flask. Add about 20.0 ml of *methanol* and sonicate to dissolve and make up the volume with the dissolution medium. Dilute 5.0 ml of the solution to 100.0 ml with dissolution medium.

Reference solution (b). Weigh accurately about 28 mg of *metformin hydrochloride IPRS* and transfer to a 200-ml volumetric flask. Add about 150.0 ml of dissolution medium and sonicate to dissolve and make up the volume with the dissolution medium.

Reference solution (c). Dilute reference solution (a) and (b) with dissolution medium to obtain a solution having a known concentration similar to the test solution (a) and (b).

Inject reference solution (c). The test is not valid unless the column efficiency for both repaglinide and metformin hydrochloride peaks is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c), test solution (a) and (b).

Calculate the content of repaglinide, $C_{27}H_{36}N_2O_4$ and metformin hydrochloride, $C_4H_{11}N_5,HCl$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{27}H_{36}N_2O_4$ and $C_4H_{11}N_5,HCl$.

Related substances.

For Metformin Hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powder containing 250 mg of Metformin Hydrochloride to 250-ml volumetric flask. Add about 150.0 ml of *water* and sonicate for 30 minutes. Allow the solution cool to room temperature and dilute to volume with *water* and mix.

Reference solution. 0.0005 per cent solution of *metformin hydrochloride IPRS* in *water*.

Chromatographic system

- a stainless steel column, 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (Such as Inertsil, ODS) (5µm),
- mobile phase: 90 volumes of a buffer solution prepared by dissolving 0.5 g each of *heptane sulphonic acid* and *sodium chloride* in 1000 ml of *water*, adjusted to pH 3.85 with *orthophosphoric acid* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for six replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 1.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent).

For Repaglinide — Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. A mixture of 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powder containing 10 mg of Repaglinide to a 200-ml volumetric flask and add about 10.0 ml of *water* and sonicate to disperse. Further add 150.0 ml of solvent mixture and sonicate for 30 minutes. Allow the solution cool to room temperature and make up the volume with solvent mixture and filter.

Reference solution. 0.000025 per cent solution of *repaglinide IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with base deactivated, end-capped octadecylsilyl silica gel (3µm) (Such as Hypersil BDS),
- column temperature: 40°,
- mobile phase: 50 volumes of a buffer solution prepared by dissolving 2.0 g *ammonium dihydrogen orthophosphate*, adjusted to pH 2.5 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

NOTE — Disregard the peak due to blank and placebo up to relative retention time 0.2.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Uniformity of content. Complies with the tests stated under Tablets.

For Repaglinide — Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution. Transfer one intact tablet in a 100-ml volumetric flask, add sufficent mobile phase and sonicate for 60 minutes with intermittent shaking. Allow the solution cool to room temperature and dilute to volume with mobile phase, mix and filter.

Reference solution. 0.001 per cent solution of *Repaglinide IPRS* in mobile phase.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powder containing about 1.5 mg of Repaglinide in 500-ml volumetric flask. Add 350.0 ml of mobile phase and sonicate for 60 minutes with intermittent shaking. Allow the solution cool to room temperature and make up the volume with mobile phase and mix. Filter the solution and use filtrate for repaglinide content. Further dilute the filtrate to produce a solution containing 0.003 per cent w/v of metformin for metformin content.

Reference solution (a). A 0.03 per cent w/v solution of *repaglinide IPRS* in the mobile phase.

Reference solution (b). Weigh accurately about 30 mg of *metformin hydrochloride IPRS* and transfer to a 100-ml volumetric flask. Add about 70.0 ml of mobile phase and sonicate to dissolve. Add 10.0 ml of reference solution (a), and make up the volume with mobile phase. Further dilute 5.0 ml of the solution to 50.0 ml with mobile phase and mix.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with strong cation exchange packing-aromatic sulphonic acid group bonded to porous silica (Such as Zorbax 300 SCX) (5µm),
- column temperature: 35°,
- mobile phase: a mixture of 72 volumes of buffer solution prepared by dissolving 17.0 g *ammonium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 28 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency for both repaglinide and metformin hydrochloride is not less than 2000 theoretical plates, the tailing factor is not be more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ and $C_4H_{11}N_5,HCl$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Repaglinide and Voglibose Tablets

Repaglinide and Voglibose Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of repaglinide, $C_{27}H_{36}N_2O_4$ and voglibose, $C_{10}H_{21}NO_7$.

Usual strengths. Repaglinide, 0.5 mg and Voglibose 0.2 mg; Repaglinide, 0.5 mg and Voglibose 0.3 mg; Repaglinide, 1.0 mg and Voglibose, 0.2 mg; Repaglinide, 1.0 mg and Voglibose, 0.3 mg.

Identification

In the Assay of repaglinide, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution and in the Assay of voglibose, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Repaglinide —

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 10.3 g of *citric acid monohydrate* and 18.1 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *water*, adjusted to pH 5.0,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0011 per cent w/v solution of *repaglinide IPRS* in *methanol*. To 5.0 ml of the solution, add 6 ml *methanol* and dilute to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 2 g of *ammonium dihydrogen phosphate* in 950 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{27}H_{36}N_2O_4$.

Uniformity of content. Determine by liquid chromatography (2.4.14),

For Repaglinide —

Solvent mixture. 30 volumes of a buffer solution prepared by dissolving 2 g of *ammonium dihydrogen phosphate* in 950 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 70 volumes of *methanol*.

Test solution. Disperse 1 intact tablet in the solvent mixture, with the aid of ultrasound with intermittent shaking and dilute with the solvent mixture to obtain a solution containing 0.005 per cent w/v of Repaglinide and filter.

Reference solution. A 0.05 per cent w/v solution of *repaglinide IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use the chromatographic system as described under dissolution with the following modification.

- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the tablet.

For Voglibose —

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 intact tablet in the mobile phase, with the aid of ultrasound with intermittent shaking and dilute to 25.0 ml with the mobile phase, filter.

Reference solution. Dissolve an accurately weighed quantity of *voglibose IPRS* in the mobile phase to obtain a solution of the same concentration as that of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with aminopropylsilane bonded to porous silica (5 µm) (Such as Hypersil APS-2),
- column temperature: 20°,
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 0.6 g of *potassium dihydrogen phosphate* and 0.28 g of *dipotassium hydrogen*

https://nhathuocngocanh.com/

phosphate in 1000 ml of *water* and 70 volumes of *acetonitrile*,

- flow rate: 0.8 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 100 µl.

(*NOTE — Equilibrate the column with the mobile phase for at least 4 hours.*)

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{21}NO_7$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

For Repaglinide —

Solvent mixture. 30 volumes of a buffer solution prepared by dissolving 2 g of *ammonium dihydrogen phosphate* in 950 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 70 volumes of *methanol*.

Test solution. Disperse a sufficient quantity of intact tablets containing 8 mg of Repaglinide in the solvent mixture, with the aid of ultrasound with intermittent shaking and dilute with the solvent mixture to obtain a solution containing 0.008 per cent w/v of Repaglinide.

Reference solution. A 0.08 per cent w/v solution of *repaglinide IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use the chromatographic system as described under dissolution with the following modification.

- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{36}N_2O_4$ in the tablets.

For Voglibose —

Test solution. Disperse a sufficient quantity of intact tablets containing 2.4 mg of Voglibose in the mobile phase, with the aid of ultrasound with intermittent shaking and dilute with the mobile phase to obtain a solution containing 0.0012 per cent w/v of Voglibose.

Reference solution. A 0.0012 per cent w/v solution of *voglibose IPRS* in the mobile phase.

Use the chromatographic system as described under Uniformity of content.

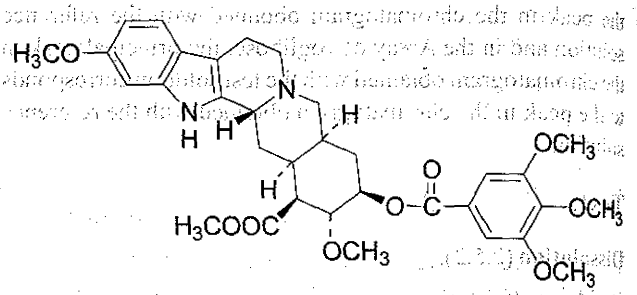
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{21}NO_7$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Reserpine



$C_{33}H_{40}N_2O_9$ Mol. Wt. 608.7

Reserpine is methyl 11,17α-dimethoxy-18β-[(3,4,5-trimethoxybenzoyl)oxy]-3β,20α-yohimbane-16β-carboxylate.

Reserpine contains not less than 99.0 per cent and not more than 101.0 per cent of total alkaloids and not less than 98.0 per cent and not more than 102.0 per cent of reserpine, $C_{33}H_{40}N_2O_9$, both calculated on the dried basis.

Category. Antihypertensive.

Description. White to slightly yellow small crystals or a crystalline powder which darkens slowly on exposure to light.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *reserpine IPRS* or with the reference spectrum of reserpine.

B. Dilute 1 ml of a 0.2 per cent w/v solution in *chloroform* to 100.0 ml with *ethanol (95 per cent)*. When examined immediately after preparation, in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, about 0.55. Over the range 288 nm to 295 nm, the spectrum exhibits a slight minimum and then a shoulder or a slight maximum; absorbance over this range, about 0.34.

https://nhathuocngocanh.com/

C. To about 1 mg add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

D. To 1 mg add 0.2 ml of a freshly prepared 1 per cent w/v solution of *vanillin* in *hydrochloric acid*; a pink colour develops within 2 minutes.

E. Mix about 0.5 mg with 5 mg of *4-dimethylaminobenzaldehyde* and 0.2 ml of *glacial acetic acid* and add 0.2 ml of *sulphuric acid*; a green colour is produced. Add 1 ml of *glacial acetic acid*; the colour changes to red.

Tests

Specific optical rotation (2.4.22). −128° to −116°, determined in a solution prepared immediately before use by dissolving 0.25 g in sufficient *chloroform* to produce 25 ml.

Oxidation products. Absorbance of a 0.02 per cent w/v solution in *glacial acetic acid* at about 388 nm, measured immediately after preparation, not more than 0.10 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *For total alkaloids* — Weigh 0.5 g and dissolve in a mixture of 40 ml of *anhydrous glacial acetic acid* and 6 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06087 g of total alkaloids.

For reserpine, $C_{33}H_{40}N_2O_9$ — Carry out the following procedure protected from light. Weigh 25.0 mg, moisten with 2 ml of *ethanol (95 per cent)*, add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine IPRS* in place of the substance under examination.

Storage. Store protected from light.

Reserpine Injection

Reserpine Injection is a sterile solution of Reserpine in Water for Injections prepared with the aid of a suitable acid. It may contain suitable antioxidants.

Reserpine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of reserpine, $C_{33}H_{40}N_2O_9$.

Usual strengths. 1 mg per ml; 2.5 mg per ml.

Identification

Extract a suitable volume of the injection containing 10 mg of Reserpine with 10 ml of *chloroform* and evaporate the chloroform layer to dryness. The residue complies with the following tests.

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *reserpine IPRS* or with the reference spectrum of reserpine.

B. Dilute 1 ml of a 0.2 per cent w/v solution in *chloroform* to 100 ml with *ethanol (95 per cent)*. When examined immediately after preparation, in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, about 0.55. Over the range 288 nm to 295 nm, the spectrum exhibits a slight minimum and then a shoulder or a slight maximum; absorbance over this range, about 0.34.

C. To about 1 mg add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

D. To 1 mg add 0.2 ml of a freshly prepared 1 per cent w/v solution of *vanillin* in *hydrochloric acid*; a pink colour develops within 2 minutes.

E. Mix about 0.5 mg with 5 mg of *4-dimethylaminobenzaldehyde* and 0.2 ml of *glacial acetic acid* and add 0.2 ml of *sulphuric acid*; a green colour is produced. Add 1 ml of *glacial acetic acid*; the colour changes to red.

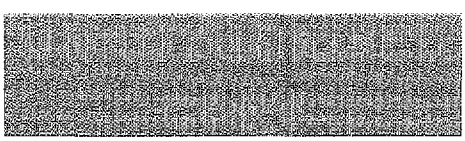
Tests

pH (2.4.24). 3.0 to 4.0.

Bacterial endotoxins (2.2.3). Not more than 71.5 Endotoxin Units per mg of reserpine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Protect the solutions from light throughout the assay.*



https://nhathuocngocanh.com/

Measure a volume of the injection containing about 10 mg of Reserpine and dilute with a 2 per cent w/v solution of *citric acid* to 100.0 ml. Extract 10.0 ml of the solution for 2 minutes with three quantities, each of 15 ml, of *chloroform*. Wash the combined extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate*, add sufficient *chloroform* to produce 50.0 ml, mix and evaporate 10.0 ml to dryness on a water-bath. Dissolve the residue in 10 ml of *ethanol (95 per cent)*, add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine IPRS* in place of the substance under examination.

Storage. Store protected from light in single dose (or if stabilising agents are present, in multiple dose) containers.

Reserpine Tablets

Reserpine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of reserpine, $C_{33}H_{40}N_2O_9$.

Usual strengths. 100 µg; 250 µg; 500 µg; 1 mg.

Identification

A. Powder a few tablets and extract with *chloroform*. Evaporate the extract to dryness, add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

B. Powder a few tablets and extract with *chloroform*. Evaporate the extract to dryness, add 0.2 ml of a freshly prepared 1 per cent w/v solution of vanillin in *hydrochloric acid*; a pink colour develops within 2 minutes.

Tests

Uniformity of content. *Protect the solutions from light throughout the test.*

Powder one tablet, disperse in 10 ml of a 2 per cent w/v solution of *citric acid* and extract for 2 minutes with three quantities, each of 5 ml, of *chloroform*; filter the extracts through a plug of cotton moistened with *chloroform*. Wash the chloroform extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate* and evaporate the chloroform extracts to dryness on a water-bath. For tablets containing upto 250 µg of Reserpine per tablet, dissolve the residue in 10.0 ml of *ethanol (95 per cent)*. For tablets containing more than 250 µg of Reserpine per tablet, dissolve the residue in a suitable volume of *ethanol (95 per cent)* to give a concentration of 250 µg of Reserpine per 10.0 ml; add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ in the tablet from the absorbance obtained by repeating the operation using *reserpine IPRS* in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

Assay. *Protect the solutions from light throughout the assay.*

Weigh a quantity of the powdered tablets containing about 1 mg of Reserpine, add 10 ml of a 2 per cent w/v solution of *citric acid* and extract for 2 minutes with three quantities, each of 15 ml, of *chloroform*. Wash the combined extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate*, add sufficient *chloroform* to produce 50.0 ml and evaporate 10.0 ml to dryness on a water-bath. Dissolve the residue in 10 ml of *ethanol (95 per cent)* and add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine IPRS* in place of the substance under examination.

Storage. Store protected from light.

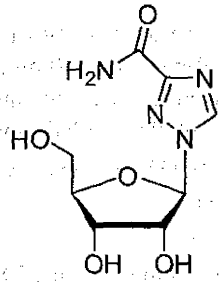
Ribavirin



$C_8H_{12}N_4O_5$ Mol.Wt. 244.2

Ribavirin is 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide.

Ribavirin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{12}N_4O_5$, calculated on the dried basis.

Category. Antiviral.

Description. A white or almost white crystalline powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ribavirin IPRS* or with the reference spectrum of ribavirin.

Tests

pH (2.4.24): 4.0 to 6.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −37° to −33°, determined in a 1.0 per cent w/v solution, use freshly prepared solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in 70 ml of *water* and dilute to 100.0 ml with *water*.

Reference solution (a). In order to produce 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxylic acid (ribavirin impurity A) in situ, mix 5.0 ml of the test solution and 5.0 ml of a 4.2 per cent w/v solution of *sodium hydroxide* and allow to stand for 90 minutes. Neutralise with 5.0 ml of a 10.3 per cent w/v solution of *hydrochloric acid* and mix well.

Reference solution (b) Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (c) A 0.05 per cent w/v solution of *ribavirin IPRS* in *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. dissolve 1.0 g of *anhydrous sodium sulphate* in 950 ml of *water*, add 2.0 ml of a 5 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 2.8 with a 5 per cent v/v solution of *orthophosphoric acid* and dilute to 1000 ml with *water*,

  B. 5 volumes of *acetonitrile* and 95 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
25	0	100
35	0	100
38	100	0

The relative retention time with reference to ribavirin (retention time is about 6 minutes) for ribavirin impurity A is about 0.8. The correction factor for ribavirin impurity A is 2.3.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to ribavirin and ribavirin impurity A is not less than 4.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak due to ribavirin impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 4.0 g in 20 ml of *water* with heating if necessary and use 10 ml of the solution. The resulting solution complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hour.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14) same as described under Related substances with the following modification.

Inject reference solution (c) and the test solution.

Calculate the content of $C_8H_{12}N_4O_5$.

Storage. Store protected from light.

Ribavirin Capsules

Ribavirin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ribavirin, $C_8H_{12}N_4O_5$.

Usual strengths. 100 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket).

Medium. 900 ml of *water*.

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.00225 per cent w/v solution of *ribavirin IPRS* in the dissolution medium.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (9 µm),
- column temperature: 65°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_4O_5$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_8H_{12}N_4O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the mixed content containing 50 mg of Ribavirin in 50 ml of the mobile phase, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.0025 per cent w/v solution of *ribavirin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm),
- column temperature: 65°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Ribose triazolole carboxylic acid[1]	0.7	1.43
Ribavirin	1.0	—

[1] 1-β-*D*-Ribofuranosyl-1*H*-1,2,4-triazole-3-carboxylic acid.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ribavirin impurity A is not more than 0.05 times the area of principal peak in the chromatogram obtained with the reference solution (0.25 per cent), the area of any other secondary peak is not more than 0.02 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and mix the content of 20 capsules. Disperse a quantity of the mixed content containing 50 mg of Ribavirin in 50 ml of the mobile phase, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.0025 per cent w/v solution of *ribavirin IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_4O_5$ in the capsules.

Storage. Store protected from moisture, at a temperature between 15° to 30°.

Ribavirin Inhalation Solution

Ribavirin Solution for Inhalation

Catogery. Antiviral.

Ribavirin Inhalation Solution is a sterile solution of Ribavirin in Water for Injections. It is prepared by dissolving Ribavirin for Inhalation in the requisite amount of Water for Injections.

Ribavirin for Inhalation

Ribavirin for Inhalation is a sterile ribavirin consisting of Ribavirin with or without excipients. It is filled in a sealed container.

The inhalation solution is constituted by dissolving the contents of the sealed container in the requisite amount of sterile water for injection, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and particulate matter stated under Inhalation Preparations.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ribavirin Inhalation Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of $C_8H_{12}N_4O_5$.

The content of the sealed container complies with the requirements stated under Inhalation Preparations and with the following requirements.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *0.1 M ammonium chloride* and 90 volumes of *acetonitrile*.

Test solution. Dissolve ribavirin inhalation solution containing about 0.1 g of Ribavirin in 10 ml of *water*.

Reference solution. A 1.0 per cent w/v solution of *ribavirin IPRS* in *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air for 15 minutes, and spray the plate with the mixture of 0.5 ml of *anisaldehyde*, 0.5 ml of *sulphuric acid*, 0.1 ml of *glacial acetic acid* and 9 ml of *ethanol (95 per cent)* and heat at 105° for 40 minutes and allow to cool. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. A 0.05 per cent w/v solution of ribavirin in the mobile phase.

Reference solution (a). A 0.000125 per cent w/v solution of ribavirin in the mobile phase.

Reference solution (b). A 0.05 per cent w/v solution of *ribavirin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 7.8 mm, packed with strong cation-exchange resin of sulphonated, cross-linked *styrene-divinylbenzene co-polymer* in the hydrogen form (7 to 11 µm) (Such as Aminex HPAH),
- column temperature: 40°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the tailing factor for the principal peak is not less than 0.7 and not more than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Reconstitute the contents of one container as instructed on the label using a measured volume of diluent,

https://nhathuocngocanh.com/

dilute a suitable volume of the solution to 200 volumes with the mobile phase to produce a solution containing 0.1 per cent w/v of Ribavirin, mix and dilute 5 volumes of the resulting solution to 20 volumes with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *ribavirin IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 7.8 mm, packed with strong cation-exchange resin of sulphonated, cross-linked *styrene-divinylbenzene co-polymer* in the hydrogen form (7 to 11 µm) (Such as Aminex HPAH),
- column temperature: 40°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not less than 0.7 and not more than 1.5.

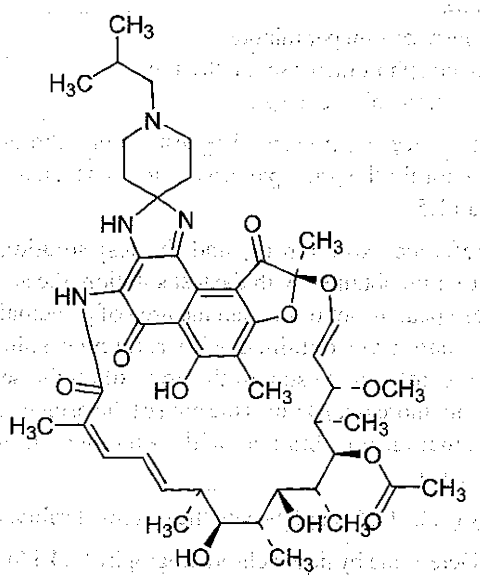
Inject the reference solution and the test solution.

Calculate the content of $C_8H_{12}N_4O_5$ in inhalation solution.

Labelling. The label of the sealed container states (1) the procedure for preparing the solution, (2) the delivery system to be used for the constituted solution (3) the conditions under which the constituted solution should be stored.

Storage. Store procted from light and moisture.

Rifabutin



$C_{46}H_{62}N_4O_{11}$ Mol. Wt. 847.0

Rifabutin is (9*S*,12*E*,14*S*,15*R*,16*S*,17*R*,18*R*,19*R*,20*S*,21*S*,22*E*,24*Z*)-6,16,18,20-Tetrahydroxy-1'isobutyl-14-methoxy-7,9,15,17,19,21,25-heptamethylspirol[9,4-(epoxypentadeca[1,11,13]trienimino)-2*H*-furo[22,32:7,8]naphth[1,2-*d*]imidazole-2,42-piperidine]-5,10,26-(3*H*,9*H*)-trione-16-yl- acetate.

Rifabutin contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{46}H_{62}N_4O_{11}$ calculated on the anhydrous basis.

Category. Antituberculosis.

Description. An amorphous red-violet powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifabutin IPRS* or with the reference spectrum of rifabutin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

N-isobutylpiperidone. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. Equal volumes of *chloroform* and *methanol*.

Mobile phase. A mixture of 100 volumes of *hexane* and 30 volumes of *acetone*.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution. Prepare 0.0005, 0.001, 0.002, 0.005 and 0.01 per cent w/v solutions of *N-isobutylpiperidone IPRS* in the solvent mixture.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose the plate to iodine vapour for about 5 minutes, then spray with *starch solution* and allow to stand for 5 minutes. No spot in the chromatogram of the test solution at R_f value corresponding to *N*-isobutylpiperidone is more intense than that of the principal spot observed in the chromatogram obtained with the reference solution containing 0.005 per cent solution (0.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the following modifications.

Inject the test solution. The area of any impurity detected at a relative retention time of about 0.5, 0.6, 0.8 or 1.4 with respect to rifabutin peak is not more than 1.0 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 3.0 per cent, calculated by area normalisation.

https://nhathuocngocanh.com/

Water (2.3.43). Not more than 2.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *rifabutin IPRS* in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *rifabutin IPRS* and 2 ml of *methanol*, add 1 ml of *2 M sodium hydroxide* and allow to stand for about 4 minutes. Add 1 ml of *2 M hydrochloric acid*, and dilute to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column12.5 cm × 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and *0.1 M monobasic potassium phosphate*, adjusted pH 6.5 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to rifabutin for a major peak for a degradant, two minor peaks for degradants are about 0.5, 0.6 and 0.8 respectively.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the rifabutin peak and the degradant peak eluting at a relative retention time of about 0.8 is not less than 1.3 in the chromatogram obtained with reference solution (b) and the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{46}H_{62}N_4O_{11}$.

Storage. Store protected from light and moisture.

Rifabutin Capsules

Rifabutin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rifabutin, $C_{46}H_{62}N_4O_{11}$.

Usual strength. 150 mg.

Identification

A. Disperse a quantity of capsule content in *methanol* to obtain a solution containing 0.002 per cent w/v, filter and examine in the range 200 to 400 nm (2.4.7). The spectra obtained with the test solution exhibits the maxima at the same wavelength with that of the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{46}H_{62}N_4O_{11}$ in the medium from the absorbance obtained by using a solution of known concentration of *rifabutin IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{46}H_{62}N_4O_{11}$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the following modifications.

Inject the test solution. The area of any secondary peak with a relative retention time of about 0.5, 0.6, 0.8 or 1.4 with respect to rifabutin peak is not more than 1.0 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 4.5 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Disperse a quantity of powder containing 25 mg of Rifabutin in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *rifabutin IPRS* in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve about 10.0 mg of *rifabutin IPRS* and 2 ml of *methanol*, add 1 ml of *2 M sodium hydroxide* and allow to stand for about 4 minutes. Add 1 ml of *2 M hydrochloric acid*, and dilute to 50.0 ml with mobile phase.

Chromatographic system
- a stainless steel column12.5 cm × 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and *0.1 M monobasic potassium phosphate*, adjusted to pH 6.5 with *2 M sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

https://nhathuocngocanh.com/

The relative retention time with reference to rifabutin for a major peak for a degradant, two minor peaks for degradants are about 0.5, 0.6 and 0.8 respectively.

Inject reference solution (a) and reference solution (b).

The test is not valid unless the resolution between the rifabutin peak and the degradant peak eluting at a relative retention time of about 0.8 is not less than 1.3 obtained with reference solution (b) and the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent obtained with reference solution (a).

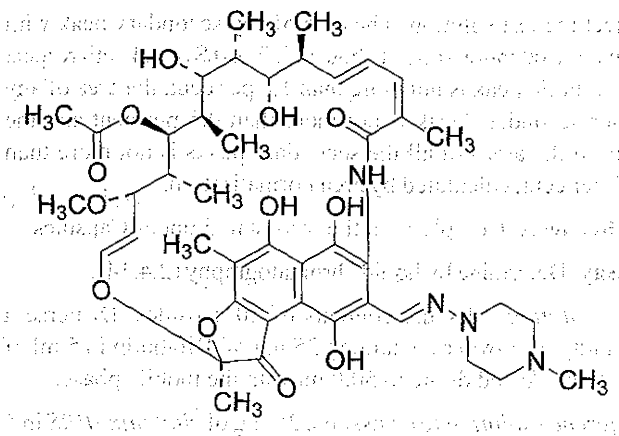
Inject reference solution (a) and the test solution.

Calculate the content of $C_{46}H_{62}N_4O_{11}$.

Storage. Store protected from light and moisture.

Rifampicin

Rifampin



$C_{43}H_{58}N_4O_{12}$ Mol. Wt. 823.0

Rifampicin is (12*Z*,14*E*,24*E*)-(2*S*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*)-1,2-dihydro-5,6,9,17,19-pentahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-(4-methylpiperazin-1-yliminomethyl)-1,11-dioxo-2,7-(epoxypentadeca-1,11,13-trienimino)naphtho[2,1-*b*]furan-21-yl acetate.

Rifampicin contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{43}H_{58}N_4O_{12}$, calculated on the dried basis.

Category. Antitubercular.

Description. A brick-red to reddish brown, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin IPRS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 1.0 per cent w/v suspension.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of powder containing 20 mg of Rifampicin, add 10 ml of *acetonitrile*, shake and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution. A solution containing 0.02 per cent w/v of *rifampicin quinone IPRS* in *acetonitrile*. To 1 ml of the solution, add 1 ml of the test solution and dilute to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone is not more than 1.5 times the area of the peak due to rifampicin quinone in the chromatogram obtained with the reference solution (1.5 per cent); the area of any peak, other than the peak due to rifampicin and rifampicin quinone, is not more than the area of the peak due to rifampicin in the chromatogram obtained with the

https://nhathuocngocanh.com/

reference solution (1.0 per cent) and the sum of the areas of any such peaks is not more than 3.5 times the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (3.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 80° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Dissolve 20.0 mg of the substance under examination in 10.0 ml of *acetonitrile* and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.2 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Use the chromatographic system and the system suitability parameters described under the test for Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{43}H_{58}N_4O_{12}$.

Storage. Store protected from light, in an atmosphere of nitrogen.

Rifampicin Capsules

Rifampin Capsules

Rifampicin Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strengths. 150 mg; 300 mg; 450 mg; 600 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 0.15 g of Rifampicin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin IPRS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium: 900 ml of *0.1 M hydrochloric acid*,
Speed and time: 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from a solution of known concentration of *rifampicin IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{43}H_{58}N_4O_{12}$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Shake a quantity of the contents of the capsules containing 200 mg of Rifampicin, with 100 ml of *acetonitrile* and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,

https://nhathuocngocanh.com/

- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times are 1.0, 0.55, 1.25 and 3.56 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively. The response factors are 1.00, 1.19, 1.03 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to rifampicin quinone is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent), the area of any peak due to rifampicin N-oxide is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the area of any peak due to 3-formylrifamycin SV is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). In the chromatogram obtained with the test solution the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Shake a quantity of the contents of the capsules containing about 300.0 mg of Rifampicin, with 200.0 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *acetonitrile*. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin IPRS* in *acetonitrile*. Dilute 10.0 ml of the solution to 50.0 ml with *acetonitrile*. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use the chromatographic system and system suitability parameters, as described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the capsules.

Storage. Store protected from light and moisture.

Rifampicin Oral Suspension

Rifampicin oral suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strengths. 10 mg per ml; 20 mg per ml.

Identification

A. To a quantity containing 0.1 g of Rifampicin add 30 ml of *water* and shake with two quantities, each of 50 ml, of *chloroform*. Dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness at a temperature not exceeding 70°. Wash the residue with 1 ml of *ether* and dry at 70°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin IPRS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

pH (2.4.24). 4.2 to 4.8.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Add 5 ml of *water* to a quantity of the oral suspension containing 20 mg of Rifampicin and extract with

https://nhathuocngocanh.com/

four quantities, each of 10 ml, of *dichloromethane*, filter the combined extracts and evaporate to dryness at a temperature not exceeding 40°. Dissolve the residue in 10 ml of *acetonitrile*. Dilute 5.0 ml of the resulting solution to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to a 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times are 1.0, 0.55, 1.25 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively. Multiply the areas of each known impurity by their response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4; the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any peak due to rifampicin N-oxide is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the area of any peak due to 3-formylrifamycin SV is not more than 5.0 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Oral Suspensions.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the oral suspension containing 150 mg of rifampicin and dilute to 100.0 ml with *acetonitrile*. Dilute 10.0 ml of the solution to 50.0 ml with *acetonitrile*. Dilute 10.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin IPRS* in *acetonitrile*. Dilute 10.0 ml of the solution to 50.0 ml with *acetonitrile*. Dilute 10.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use the chromatographic system and the system suitability parameters as described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_{43}H_{58}N_4O_{12}$ weight in volume.

Storage. Store protected from light and moisture.

Rifampicin Tablets

Rifampin Tablets

Rifampicin Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strength. 150 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.15 g of Rifampicin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin IPRS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

https://nhathuocngocanh.com/

Medium. 900 ml of *0.1 M hydrochloric acid*.

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the dissolution medium. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from a solution of known concentration of *rifampicin IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{43}H_{58}N_4O_{12}$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent solution w/v of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of the powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile*, filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 1 ml of the solution to a 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column. temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times are 1.0, 0.55, 1.25 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, and 3-formylrifamycin SV respectively. The response factors are 1.00, 1.19, 1.03 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent), the area of any peak due to rifampicin N-oxide is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the area of any peak due to 3-formyl rifamycin SV is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 300.0 mg of Rifampicin, dissolve in 200.0 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *acetonitrile*. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin IPRS* in *acetonitrile*. Dilute 10.0 ml of the solution to 50.0 ml with *acetonitrile*. Further dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use the chromatographic system and system suitability parameters described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the tablets.

Storage. Store protected from light and moisture.

Rifampicin and Isoniazid Tablets

Rifampin and Isonicotinylhydrazid Tablets

Rifampicin and Isoniazid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$ and isoniazid, $C_6H_7N_3O$.

https://nhathuocngocanh.com/

Usual strength. Rifampicin 50 mg and Isoniazid 150 mg.

Identification

A. In the Assay, the chromatogram obtained with the test solution shows peaks that correspond to the peaks due to *rifampicin IPRS* and *isoniazid IPRS* in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the medium.

Reference stock solution. A solution containing 0.0165 per cent of *rifampicin IPRS* and 0.00825 per cent of *isoniazid IPRS* in the dissolution medium.

For Rifampicin — Measure the absorbance of the sample solution and the reference stock solution suitably diluted with the dissolution medium at 475 nm (2.4.7). Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from the reference stock solution.

For Isoniazid — Determine by liquid chromatography (2.4.14).

Use the reference stock solution and sample solution suitably diluted with a solution of *0.05 M potassium dihydrogen orthophosphate*, adjust the pH to 6.2 with *0.1 M sodium hydroxide* to obtain the reference solution and the test solution, respectively.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 99 volumes of *0.05 M potassium dihydrogen phosphate* and 1 volume of *acetonitrile* with the pH adjusted to 4.0 ± 0.05 with 2 per cent w/v solution of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 1500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_7N_3O$ in the dissolution medium.

Q. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of the powdered tablets containing 200 mg of Rifampicin in 100 ml of *acetonitrile* and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution (a). Dissolve *rifampicin IPRS* in *acetonitrile* to obtain a solution containing 0.2 mg per ml. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone is not more than 4 times the area of the principal peak in the chromatogram obtained with

https://nhathuocngocanh.com/

reference solution (a) (4.0 per cent), the area of any peak due to rifampicin N-oxide is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any peaks due to 3-formylrifamycin SV and isonicotinyl hydrazone is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent) and the area of any peak due to 3-formylrifamycin SV is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any other secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjust the pH to 6.8 with *dilute phosphoric acid*.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 40 mg of Isoniazid, dissolve in 100.0 ml of *methanol* and dilute to 500.0 ml with the solvent mixture.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin IPRS* and 0.04 per cent w/v of *isoniazid IPRS* in *methanol*. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjusting the pH to 6.8 ± 0.05 with *dilute orthophosphoric acid*, and 4 volumes of *acetronitrile*.
  B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
20	100	0

NOTE — Saturate the column with mobile phase B for about 1 hour before injection.

The retention times are about 1.0 for rifampicin and about 0.3 for isoniazid.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for rifampicin and isoniazid; the column efficiency for the isoniazid peak is not less than 3000 and for rifampicin not less than 25000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid and Ethambutol Tablets

Rifampin, Isonicotinylhydrazid and Ethambutol Hydrochloride Tablets

Rifampicin, Isoniazid and Ethambutol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$ and ethambutol hydrochloride $C_{10}H_{24}N_2O_2.2HCl$.

Usual strength. Rifampicin 300 mg, Isoniazid 200 mg and Ethambutol 200 mg.

Identification

A. In the Assay for rifampicin and isoniazid, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. In the Assay for ethambutol hydrochloride the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate.

https://nhathuocngocanh.com/

Reference stock solution. A solution containing 0.0165 per cent w/v of *rifampicin IPRS*, 0.00825 per cent w/v of *isoniazid IPRS* and 0.031 per cent w/v of *ethambutol hydrochloride IPRS* in the dissolution medium. Keep this reference stock solution in the dissolution bath during the test run.

For Rifampicin — Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from suitably diluted reference stock solution.

For Isoniazid — Determine by liquid chromatography (2.4.14).

Test solution. Suitably dilute the filtered medium with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide*.

Reference solution. Suitably dilute the reference stock solution with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide*.

Chromatographic system
- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 99 volumes of *0.05 M potassium dihydrogen phosphate* and 1 volume of *acetonitrile* previously adjusted to pH 4.0 with a 2 per cent w/v solution of *phosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 1500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_7N_3O$ in the dissolution medium.

For Ethambutol Hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Suitably dilute the filtered medium with *0.05 M potassium dihydrogen orthophosphate* adjusted to pH 6.2 with *0.1 M sodium hydroxide*.

Reference solution. Suitably dilute the reference stock solution with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide*.

Use the chromatographic system described under the Assay of ethambutol hydrochloride.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_{10}H_{24}N_2O_2.2HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of the powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the areas of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than

https://nhathuocngocanh.com/

1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. *For Rifampicin and Isoniazid* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powdered tablets containing about 40 mg of Isoniazid dissolve in 100.0 ml of *methanol*, dilute to 500.0 ml with the diluent and mix.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin IPRS* and *0.04* per cent w/v of *isoniazid IPRS* in *methanol*. Dilute 10.0 ml of the solution to 50.0 ml with the diluent.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 (diluent) prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, and adjusting the pH to 6.8 ± 0.05 with *dilute phosphoroic acid*, and 4 volumes of *acetonitrile*,
  B: a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

NOTE — Saturate the column with mobile phase B for about 1 hour.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for rifampicin and isoniazid, the column efficiency determined from isoniazid peak is not less than 3000 and that from rifampicin is not less than 25000 theoretical plates respectively, and the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention times are about 1.0 for rifampicin and about 0.3 for isoniazid.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ in the tablets.

For Ethambutol Hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 60 mg of Ethambutol Hydrochloride and dissolve in 100.0 ml of the diluent.

Reference solution. A 0.06 per cent w/v solution of *ethambutol hydrochloride IPRS* in the diluent.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles 5 (µm) (Such as Zorbax SB CN),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, and 50 volumes of a buffer solution pH 7.0 prepared by dissolving 1 ml of *triethylamine* in 1000 ml of *water* and adjusting the pH to 7.0 with *dilute phosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 3.0 and the column efficiency determined from Ethambutol hydrochloride peak is not less than 1500 theoretical plates.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid and Pyrazinamide Tablets

Rifampin, Isonicotinylhydrazid and Pyrazinamide Tablets

Rifampicin, Isoniazid and Pyrazinamide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$ and pyrazinamide $C_5H_5N_3O$.

https://nhathuocngocanh.com/

Identification

In the Assay of rifampicin, isoniazid and pyrazinamide, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium: 900 ml of a solution containing 2 g of *sodium chloride* and 7.0 ml of *hydrochloric acid* in 1000 ml of *water*, with a pH of about 1.2,

Speed and time: 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate.

Reference stock solution. A solution containing 0.0165 per cent w/v of *rifampicin IPRS*, 0.00825 per cent w/v of *isoniazid IPRS* and 0.04375 per cent w/v of *pyrazinamide IPRS* in the dissolution medium and filtered. Keep this reference stock solution in the dissolution bath during the test run.

For Rifampicin — Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from suitably diluted reference stock solution.

For Isoniazid and Pyrazinamide — Determine by liquid chromatography (2.4.14).

NOTE — Use this solution within one hour from preparation.

Test solution. To 15.0 ml of the filtered medium, add 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Reference solution (a). To 15.0 ml of the reference stock solution, add 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Reference solution (b). To 10.0 ml of a 0.0125 per cent w/v solution of *isonicotinic acid* in the dissolution medium, add 4.0 ml of the reference stock solution and 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Chromatographic system

- a stainless steel column 30 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 860 volumes of *water*, 100 volumes of *1 M monobasic potassium phosphate* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject reference solution (a), (b) and the test solution. The relative retention times are about 0.7 for isonicotinic acid, 1.0 for pyrazinamide and 1.8 for isoniazid.

The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between isonicotinic acid and pyrazinamide is not less than 2.5 and between pyrazinamide and isoniazid is not less than 4.0.

Calculate the contents of $C_6H_7N_3O$ and $C_5H_5N_3O$ in the medium.

Q: Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of the powdered tablets containing about 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to a 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate*, 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

https://nhathuocngocanh.com/

Inject reference solution (a) and the test solution. The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. *For Rifampicin, Isoniazid and Pyrazinamide* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powdered tablets containing about 40 mg of Isoniazid, dissolve in 100.0 ml of *methanol*, dilute to 500 ml with the buffer solution pH 6.8 and mix.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin IPRS*, 0.04 per cent w/v of *isoniazid IPRS* and 0.2 per cent w/v of *pyrazinamide IPRS* in *methanol*. Dilute 10.0 ml of the solution to 50.0 ml with the buffer solution pH 6.8.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 (diluent) prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, adjusted to pH 6.8 ± 0.05 with *dilute orthophosphoroic acid* and 4 volumes of *acetonitrile*,
  B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

NOTE — Saturate the column with mobile phase (B) for about 1 hour.

Inject the reference solution and the test solution. The test is not valid unless the tailing factor is not less than 2.0 for rifampicin, isoniazid and pyrazinamide, the column efficiencies determined from Isoniazid, pyrazinamide and that from rifampicin are not less than 3000, 5000 and 25000 theoretical plates respectively, and the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention times are about 1.8 for rifampicin, about 0.7 for isoniazid and about 1.0 for pyrazinamide.

Inject the reference solution and the test solution.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid, Pyrazinamide and Ethambutol Tablets

Rifampin, Isonicotinylhydrazid, Pyrazinamide and Ethambutol Hydrochloride Tablets

Rifampicin, Isoniazid, Pyrazinamide and Ethambutol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$, pyrazinamide, $C_5H_5N_3O$ and ethambutol hydrochloride, $C_{10}H_{24}N_2O_2.2HCl$.

Usual strength. Rifampicin 150 mg, Isoniazid 75 mg, Pyrazinamide 400 mg and Ethambutol 275 mg.

Identification

A. In the Assay for rifampicin, isoniazid and pyrazinamide, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. In the Assay for ethambutol hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *sodium phosphate buffer pH 6.8* prepared by dissolving 7 g of *dibasic sodium phosphate anhydrous* in 5000 ml of *water* and adjusting to pH 6.8 with *orthophosphoric acid*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate. Determine the amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$, pyrazinamide, $C_5H_5N_3O$ and ethambutol hydrochloride, $C_{10}H_{24}N_2O_2.2HCl$ by using the methods described under Assay for rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride.

Q. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$, $C_5H_5N_3O$ and $C_{10}H_{24}N_2O_2$,2HCl.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh a quantity of powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5 ml of the solution to 50 ml with the solvent mixture.

Reference solution (a). Dissolve 20 mg of *rifampicin IPRS* in 100 ml of *acetonitrile*. Dilute 1.0 ml of the solution to a 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin IPRS* and *rifampicin quinone IPRS* in *acetonitrile*. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate*, 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject reference solution (a) and the test solution. The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. *For Rifampicin, Isoniazid and Pyrazinamide* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powdered tablets containing about 40 mg of Isoniazid, dissolve in 100 ml of *methanol*, dilute to 500 ml with the buffer solution pH 6.8, mix and filter.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin IPRS*, 0.04 per cent w/v of *isoniazid IPRS* and 0.2 per cent w/v of pyrazinamide *IPRS* in *methanol*. Dilute 10.0 ml of the solution to 50.0 ml with the buffer solution pH 6.8.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of

https://nhathuocngocanh.com/

water, adjusting to pH 6.8 ± 0.05 with *dilute phosphoric acid* and 4 volumes of *acetonitrile*,

B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,

– a gradient programme using the conditions given below,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 238 nm,
– injection volume: 20 µl.

Time (in min.)	Solution A (per cent v/v)	Solution B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 2.0 for rifampicin, isoniazid and pyrazinamide and the column efficiencies for isoniazid, pyrazinamide and rifampicin are not less than 3000, 5000 and 25000 theoretical plates respectively.

Inject the reference solution and the test solution. The relative retention time for rifampicin is 1.8, for isoniazid, 0.7 and for pyrazinamide, 1.0.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ in the tablets.

For Ethambutol Hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 60 mg of Ethambutol Hydrochloride and dissolve in 100 ml of the solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *ethambutol hydrochloride IPRS* in the solvent mixture.

Chromatographic system

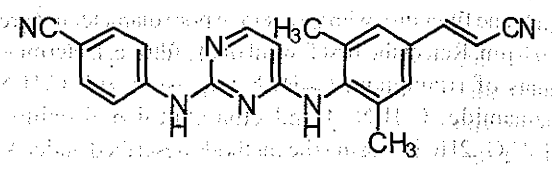
– a stainless steel column 15 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm),
– mobile phase: a mixture of 50 volumes of *acetonitrile*, and 50 volumes of buffer solution pH 7.0 (diluent) prepared by dissolving 1 ml of *triethylamine* in 1000 ml of *water* and adjusting the pH to 7.0 with *dilute phosphoric acid*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 200 nm,
– injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 3.0 and the column efficiency determined from ethambutol hydrochloride peak is not less than 1500 theoretical plates.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the tablets.

Storage. Store protected from moisture.

Rilpivirine



$C_{22}H_{18}N_6.HCl$ Mol Wt. 402.9

Rilpivirine is 4-{[4-({4-[(*E*)-2-Cyanovinyl]-2,6-dimethylphenyl}amino)pyrimidin-2-yl]amino}benzonitrile.

Rilpivirine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{18}N_6.HCl$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white to pale brown colour powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rilpivirine IPRS* or with the reference spectrum of rilpivirine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution. A 0.003 per cent w/v solution of *rilpivirine IPRS*, *impurity A IPRS* and *impurity B IPRS* in *methanol*. Dilute 0.5 ml of the solution to 20.0 ml with *methanol*.

Chromatographic system

– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– column temperature: 45°,
– mobile phase: A. dissolve 3.08 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 6.0 with *acetic acid*,

B. *methanol*,

https://nhathuocngocanh.com/

– a gradient programme using the conditions given below,
– flow rate: 0.6 ml per minute,
– spectrophotometer set at 295nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
12	20	80
15	20	80
18	40	60
20	40	60

Inject reference solution. The test is not valid unless the the resolution between rilpivirine impurity A (2E)-3-(4-amino-3,5dimethyl phenyl) acrylonitrile hydrochlorid and rilpivirine impurity B (4-(4-chloropyrimidin -2 yl-amino)- benzonitrile) is not less than 5.0.

Inject reference solution and the test solution. In the chromatogram obtained with the test solution, the area of peak due to rilpivirine impurity A is not more than area of reference solution (0.3 per cent), the area of peak due to rilpivirine mpurity B is not more than area of reference solution (0.3 per cent) , area of any other secondary peak is not more than area of rilpivirine peak in the chromatograpm obtained with the reference solution (0.3 per cent) and the sum of area of all the secondary peaks is not more than 3.3 times the area of rilpivirine peak in the chromatograpm obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.0025 per cent w/v solution of *rilpivirine IPRS* in *methanol*.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– column temperature: 45°,
– mobile phase: A. dissolve 3.08 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 6.0 with *acetic acid*,
B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of *methanol*,
– a gradient programme using the conditions given below,
– flow rate: 0.6 ml per minute,
– spectrophotometer set at 295nm,
– injection volume: 10 µl.

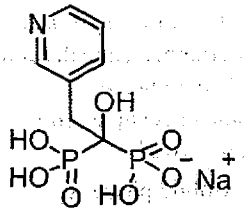
Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
12	20	80
15	20	80
18	40	60
20	40	60

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution and the test solution.

Calculate the content of $C_{22}H_{18}N_6.HCl$.

Risedronate Sodium



$C_7H_{10}NNaO_7P_2$ Mol. Wt. 305.1

$C_7H_{10}NNaO_7P_2,H_2O$(Monohydrate) Mol. Wt. 323.1

$C_7H_{10}NNaO_7P_2,2.5H_2O$ (Hemi-pentahydrate) Mol. Wt. 350.1

Risedronate Sodium is 1-Hydroxy-2-(3-pyridyl)ethane-1,1-diylbis(phosphonic acid) monosodium salt.

Risedronate Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_{10}NNaO_7P_2$, calculated on the anhydrous basis.

Category. Calcium regulator.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), compare the spectrum with that obtained with *risedronate sodium IPRS* or with the reference spectrum of risedronate sodium.

B. A 1.0 per cent w/v solution gives the reactions of sodium salt (2.3.1).

https://nhathuocngocanh.com/

Tests

Related substances. A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). A 0.0001 per cent w/v solution of *risedronate sodium IPRS* in mobile phase A.

Reference solution (b). A solution containing 0.1 per cent w/v of *risedronate sodium IPRS* and 0.0001 per cent w/v of risedronate impurity A in mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a mixture of 900 volumes of buffer solution prepared by dissolving 1.42 g of *disodium hydrogen orthophosphate*, 1.7 g of *tetrabutyl ammonium phosphate* and 0.38 g of *ethylenediamine tetraacetate* in 950 ml of *water*, adjusting to pH 7.5 with *ammonium hydroxide solution* and 100 volumes of *acetonitrile*,

  B. a mixture of 800 volumes of buffer solution and 200 volumes of *acetonitrile*,
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	100	0
40	0	100
55	0	100
67	100	0
75	100	0

Name	Relative retention time	Relative response factor
3-Pyridyl acetic acid	0.3	1.32
Risedronate impurity A[1]	0.51	1.76
Risedronate sodium	1.0	—

[1] [1-hydroxy-2-(2-pyridinyl)ethylidene] bisphosphonic acid.

Equilibrate the column with the mobile phase for at least 2 hours.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to risedronate and risedronate impurity A is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

B. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 0.46 g of *disodium edetate* in 500 ml of *water*, adjusted to pH 7.5 with *1 M sodium hydroxide*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.0005 per cent w/v solution of *risedronate sodium impurity B IPRS (3,6-bis[(3-pyridinyl)-methyl]-2,5-dihydroxy-2,5-dioxido-1,4,2,5 dioxadiphosphorinane-3,6-diyl]bis[phosphonic acid] disodium tetrahydrate IPRS*) in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 16.15 g of *dibasic potassium phosphate* and 0.46 g of *disodium edetate* in 400 ml of *water*, add 5 ml of *tetrabutylammonium dihydrogen phosphate* and 1 ml of *hydrochloric acid*, adjusted to pH 7.5 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 480 ml with *water*, add 20 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5.

Inject the test solution. The area of any peak corresponding to risedronate impurity B is not more than 0.1 per cent and the area of any other secondary peak is not more than 0.1 per cent. The sum of areas of all the secondary peaks of tests A and B is not more than 0.5 per cent, calculated by area normalization. Ignore any peak eluting before risedronate impurity B.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). 5.5 to 7.5 per cent for monohydrate; 11.9 to 13.9 per cent for hemi-pentahydrate, determined on about 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution. A 0.1 per cent w/v solution of *risedronate sodium IPRS* in mobile phase A.

https://nhathuocngocanh.com/

Use chromatographic system as described under Related substances, test A.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{10}NNaO_7P_2$.

Storage. Store protected from moisture.

Labelling. Label to indicate whether it is monohydrate or hemipentahydrate.

Risedronate Sodium Tablets

Risedronate Sodium Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of risedronate sodium, $C_7H_{10}NNaO_7P_2$.

Usual strengths. 35 mg; 75 mg; 150 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 50 mg of risedronate sodium in 10 ml of *water,* shake and filter. Add 10 ml of *0.2M cupric chloride solution*, mix well and allow the solution to stand for about 10 minutes. Add 2 ml of *dehydrated alcohol*, mix well and allow the solution to stand for a minimum of 1 hour, to form a blue precipitate of the copper complex. Collect the precipitate using a nylon filter of 0.45-µm pore size, wash it with 10 ml of *dehydrated alcohol*, and allow it to dry on the filter paper, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *risedronate sodium IPRS,* treated in the same manner or with the reference spectrum of risedronate sodium.

NOTE — Dry the precipitate under ambient conditions, do not heat the precipitate. A modest change of colour (from blue to green) may be observed upon drying.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution .

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *risedronate sodium IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 5 cm x 4.0 mm, packed with a strong anion-exchange microbeads consisting of sulphonated cross-linked polystyrene (10 µm),
- mobile phase: a buffer solution prepared by dissolving 1.8 g of *disodium edetate* in 1000 ml of *water,* adjusted to pH 9.5 with dilute *sodium hydroxide*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_7H_{10}NNaO_7P_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of Risedronate Sodium in 50 ml of mobile phase, shake for 10 minutes and sonicate for 5 minutes, dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.025 per cent w/v solution of *risedronate sodium IPRS* and 0.0004 per cent w/v solution of *risedronate related compound A IPRS [(2- pyridinil isomer [1- hydroxyl-2-(2- pyridinyl) ethyl- idene] bis (phosphonic acid) monohydrate IPRS]* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with a strong anion-exchange microbeads consisting of sulphonated cross-linked polystyrene (10 µm),
- mobile phase: a buffer solution prepared by dissolving 1.8 g of *disodium edetate* in 1000 ml of *water,* adjusted to pH 9.5 with dilute *sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 50 µl.

Inject the reference solution . The test is not valid unless the resolution between risedronate related compound A peak and risedronate peak is not less than 2.0, the tailing factor for risedronate peak is not more than 1.5 and the relative standard deviation of risedronate peaks for replicate injections is not more than 1.5 per cent.

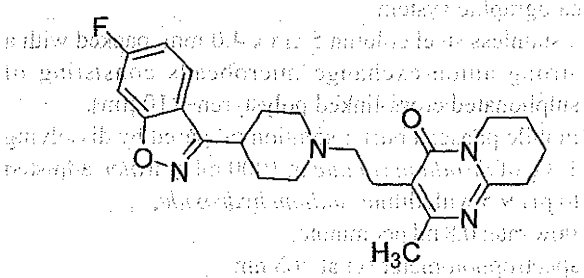
Inject the reference solution and the test solution.

Calculate the content of $C_7H_{10}NNaO_7P_2$ in the tablets.

https://nhathuocngocanh.com/

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Risperidone



$C_{23}H_{27}FN_4O_2$ Mol. Wt. 410.5

Risperidone is 3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidino]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Risperidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{27}FN_4O_2$, calculated on dried basis.

Category. Antipsychotic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *risperidone IPRS* or with the reference spectrum of risperidone.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *methanol* and dilute to 10.0 ml with the same solvent.

Reference solution (a). A solution containing 0.002 per cent w/v of *risperidone related compound G IPRS [3-[2-[4-(4-Fluoro-2-hydroxybenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4H-pyrido[1,2-a]pyrimidin-4-one hydrochloride IPRS]* and 1.0 per cent w/v of *risperidone IPRS* in *methanol*.

Reference solution (b). A 0.002 per cent w/v solution of *risperidone IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. a 0.5 per cent w/v solution of *ammonium acetate*, adjusted to pH 6.0 with *glacial acetic acid* and filter;

  B. a mixture of 40 volumes of *acetonitrile* and 60 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

[5]This impurity may not be relevant to all manufacturing processes.

https://nhathuocngocanh.com/

[a]3-[2-[4-(2,4-Difluorobenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

[b]3-[2-[4-(5-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one (also known as 5-fluororisperidone),

[c](6*RS*)-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2,6-dimethyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to risperidone and risperidone related compound G is not less than 1.5 in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to E-oxime, Z-oxime, 9-hydroxy-risperidone, 5-fluororisperidone and 6-methylrisperidone is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak due to desfluoro risperidone, risperidone difluoroketone and risperidone related compound G is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g, dry under vacuum at 80° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. A 0.5 per cent w/v solution of *ammonium acetate*, adjusted to pH 6.0 with *glacial acetic acid* and filter.

Solution B. A mixture of 80 volumes of *acetonitrile* and 20 volumes of *tetrahydrofuran*.

Test solution (a). Dissolve a suitable quantity of the substance under examination in *methanol* containing 20 per cent of the final volume and dilute with the mobile phase to obtain a 0.1 per cent w/v solution.

Test solution (b). Dilute test solution (a) with the mobile phase to obtain a 0.02 per cent w/v solution of risperidone.

Reference solution (a). Dissolve a suitable quantity of *risperidone IPRS* in *methanol* containing 20 per cent of the final volume and dilute with the mobile phase to obtain a 0.1 per cent w/v solution of risperidone.

Reference solution (b). Dilute reference solution (a) with the mobile phase to obtain a 0.02 per cent w/v solution of risperidone.

Reference solution (c). A 0.002 per cent w/v solution of *risperidone related compound G IPRS* in reference solution (b).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 80 volumes of solution A and 20 volumes of solution B,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

Run the chromatogram twice the retention time of the principal peak.

The relative retention time with reference to risperidone for risperidone related compound G is about 1.1.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to risperidone and risperidone related compound G is not less than 1.5 in the chromatogram obtained with reference solution (c), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (b) for risperidone peak.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{23}H_{27}FN_4O_2$.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Risperidone Syrup

Risperidone Oral Solution

Risperidone Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of risperidone, $C_{23}H_{27}FN_4O_2$. It may contain suitable preservative.

Usual strength. 1 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

https://nhathuocngocanh.com/

Tests

pH (2.4.24). 2.0 to 4.0.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.5 per cent w/v solution of *ammonium acetate* in *water*.

Test solution. Transfer a suitable quantity of the syrup containing 10 mg of Risperidone to a 50-ml volumetric flask, add 25 ml of the buffer solution, fill with *methanol* almost to volume and mix. Allow to cool to room temperature and dilute with *methanol* to volume.

Reference solution (a). Dissolve 2.5 mg of *risperidone related compounds mixture IPRS* in 2 ml of *methanol*. Add 2 ml of *water* and 5 ml of the buffer solution and allow to cool to room temperature, dilute to 10.0 ml with *methanol*.

Reference solution (b). A 0.0005 per cent w/v solution of *risperidone IPRS* in *methanol*.

Reference solution (c). Transfer 10.0 ml of reference solution (b) to a 50-ml volumetric flask. Add 10 ml of *water* and 25 ml of the buffer solution and allow to cool to room temperature, dilute with *methanol* to volume.

Reference solution (d). Transfer 2.0 ml of reference solution (b) to a 50-ml volumetric flask. Add 10 ml of *water* and 25 ml of the buffer solution and allow to cool to room temperature, dilute with *methanol* to volume.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 78 volumes of the buffer solution and 22 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Risperidone *cis-N*-oxide[1]	0.33	1.03
Bicyclorisperidone[2]	0.43	1.49
Risperidone *Z*-oxime[3]*	0.53	—
Risperidone	1.0	—

*Process impurity included for identification only. Process impurities are controlled in the drug substance, and are not to be reported or included in the total impurities for the drug product.

[1]*cis*-3-{2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl}-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one *N*-oxide,

[2]3-(4-Fluoro-2-hydroxyphenyl)-1-{2-(6,7,8,9-tetrahydro-2-methyl-4-oxo-4*H*-pyrido-[1,2-*a*]pyrimidin-3-yl)ethyl}-2-aza-1-azonia-bicyclo[2.2.2]oct-2-ene iodide,

[3]3-(2-{4-[(*Z*)-(2,4-Difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl}ethyl)-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Inject reference solution (a), (c) and (d). The test is not valid unless the resolution between the peaks due to bicyclorisperidone and risperidone *Z*-oxime is not less than 1.5 in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (c) and the signal-to-noise ratio for the principal peak is not less than 10.0 in the chromatogram obtained with reference solution (d).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to risperidone *cis-N*-oxide and bicyclorisperidone, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Microbial contamination (2.2.9). Total microbial count not more than 100 CFU per ml, total yeast and mould count not more than 10 CFU per ml. 1 ml is free from *Escherichia coli*.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Reference solution (a). Dissolve 2.5 mg *risperidone related compounds mixture IPRS* in 2 ml of *methanol*. Add 2 ml of *water* and 5 ml of the buffer solution and allow to cool to room temperature, dilute to 10.0 ml with *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *risperidone IPRS* in *methanol*. Transfer 10.0 ml of the solution to a 50-ml volumetric flask. Add 10 ml of *water* and 25 ml of the buffer solution and allow to cool to room temperature, dilute to volume with *methanol*.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to bicyclorisperidone and risperidone 2-oxime is not less than 1.5 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_{23}H_{27}FN_4O_2$.

Storage. Store protected from light, at a temperature not exceeding 30°. Do not freeze.

Risperidone Tablets

Risperidone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of risperidone, $C_{23}H_{27}FN_4O_2$.

Usual strengths. 1 mg; 2 mg; 3 mg; 4 mg.

Identification

A. Powder an appropriate number of tablets to prepare about 0.055 per cent w/v solution of risperidone in *ethyl acetate*, shake for 30 minutes and centrifuge for 20 minutes. Evaporate 5 ml of the supernatant liquid with the aid of a stream of nitrogen to dryness; the residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *risperidone IPRS* or with the reference spectrum of risperidone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium, 500 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *risperidone IPRS* in the dissolution medium and dilute with the same solvent to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 0.1 volume of *trifluoroacetic acid*, adjust the pH to 3.0 with *ammonia solution*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}FN_4O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{27}FN_4O_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Dilute sodium hydroxide solution. To 1000 ml of *water* in a beaker, add *0.1 M sodium hydroxide* dropwise to obtain a pH of about 8.5.

Dilute hydrogen peroxide solution. Dilute 1 ml of *hydrogen peroxide* solution (10 volume) with *water* to 500 ml.

Reference solution. Dissolve 10 mg of *risperidone IPRS* in 10 ml of *dilute sodium hydroxide solution* in a 100-ml volumetric flask. Store the flask at 90° for 24 hours. Cool the solution to room temperature. Add 10 ml of dilute hydrogen peroxide solution to the flask, and store at 90° for an additional two hours. Cool the mixture to room temperature, and dilute with *methanol* to volume.

Name	Relative retention time	Correction factor
Bicyclorisperidone[1]	0.68	1.23
Risperidone	1.0	—
Risperidone *trans-N*-oxide[2]	1.65	—
Risperidone *cis-N*-oxide[3]	1.81	1.05
Individual unidentified impurities	—	—
Total impurities	—	—

[1]3-(4-fluoro-2-hydroxyphenyl)-1-[2-(6,7,8,9-tetrahydro-2-methyl-4-oxo-4*H*-pyrido-[1,2-a]pyrimidin-3-yl)ethyl]-2-aza-1-azoniabicyclo [2.2.2]oct-2-ene iodide,

[2]*trans*-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-a]pyrimidin-4-one, *N*-oxide monohydrate,

3*cis*-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-2-methyl-4*H*-pyrido[1,2-a]pyrimidin-4-one, *N*-oxide monohydrate.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to risperidone *trans-N*-oxide and risperidone *cis-N*-oxide is not less than 1.2.

Inject the test solution. The area of any peak corresponding to bicyclorisperidone, and risperidone *cis-N*-oxide is not more than 0.5 per cent, the area of any other secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Tablets.

https://nhathuocngocanh.com/

Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Dissolution, except using

– injection volume: 20 µl.

Test solution. Transfer 1 tablet to a 100-ml volumetric flask. Add 50 ml of *0.1 M hydrochloric acid* and shake mechanically for 30 minutes, dilute to the volume with *0.1 M hydrochloric acid*, filter.

Reference solution. Weigh accurately and dissolve the *risperidone IPRS* in *0.1 M hydrochloric acid* to obtain a solution having a known concentration similar to the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}FN_4O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol* and 20 volumes of *water.*

Test solution. Transfer not less than 10 tablets to a suitable volumetric flask to obtain a 0.01 per cent w/v solution of risperidone. Add an appropriate amount of *water* equivalent to 20 per cent of the total volume of the volumetric flask, and shake mechanically for about 30 minutes. Add a volume of *methanol* equivalent to 60 per cent of the total volume of the volumetric flask, and shake mechanically for about 30 minutes, dilute with *methanol* to volume and filter.

Reference solution. A 0.01 per cent w/v solution of *risperidone IPRS* in the solvent mixture.

Chromatographic system

– a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: A. a mixture of 80 volumes of *water,* 19.5 volumes of *acetonitrile* and 0.1 volume of *trifluoroacetic acid*, adjust the pH to 3.0 with *ammonium hydroxide*,
B. a mixture of 61 volumes of *water,* 39 volumes of *methanol* and 0.1 volume of *trifluoroacetic acid*, adjust the pH to 3.0 with *ammonium hydroxide*,
– a gradient programme using the conditions given below,
– flow rate: 2.5 ml per minute,
– spectrophotometer set at 275 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	100	0
16	0	100
20	0	100
21	100	0
25	100	0

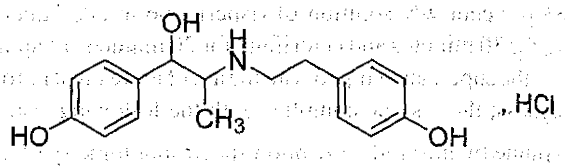
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{27}FN_4O_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Ritodrine Hydrochloride



$C_{17}H_{21}NO_3,HCl$ Mol. Wt. 323.8

Ritodrine Hydrochloride is (*RS*)-*erythro*-1-(4-hydroxyphenyl)-2-(4-hydroxyphenethylamino)-1-propanol.

Ritodrine Hydrochloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{17}H_{21}NO_3,HCl$, calculated on the dried basis.

Category. Tocolytic

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ritodrine hydrochloride IPRS* or with the reference spectrum of ritodrine hydrochloride.

B. A 1.0 per cent w/v solution gives the reactions of chloride (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.0, determined on a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of the substance under examination in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and dilute to 100.0 ml with the mobile phase,

https://nhathuocngocanh.com/

heat at a temperature of 85° for 2 hours. Cool to room temperature, mix 10 ml of the cooled solution with 8 ml of a 10 per cent w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*- diastereoisomer).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a solution containing 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water* and 300 ml of *methanol*, adjusting the pH to 3.0 with 85 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Name	Relative retention time
Ritodrine impurity A[1]	0.3
Ritodrine impurity C[3]	0.7
Ritodrine impurity B[2]	0.9
Ritodrine hydrochloride	1.0
Ritodrine impurity D[4]	1.2
Ritodrine impurity E[5]	2.3

[1]Tyramine,

[2]rac-4-[(1R,2R)-2-{[1-hydroxy-1-(4-hydroxyphenyl)propan-2-yl]amino}ethyl]cyclohexan-1-one (hexehydroxketonel),

[3]rac-4-[(1R,2R)-1-hydroxy-2-{[2-(4-hydroxyphenyl)ethyl]amino}propyl]cyclohexan-1-one (hexehydroketone II),

[4]rac-4-[(1R,2R)-1-hydroxy-2-{[2-(4-hydroxyphenyl)ethyl]amino}propyl]phenol(threo-diastereoisomer),

[5]rac-1-(4-hydroxy)-3-{[2-(4-hydroxyphenyl)ethyl]amino}peopan-1-one (aminoketone).

Inject reference solution (b). The test is not valid unless the resolution between the principal peak and *threo*-diastereoisomer peak is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to impurity C, multiplied by correction factor 2.9, is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak due to impurity A and impurity E, each of, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak due to impurity B, multiplied by correction factor 2.0 and impurity D, each of, is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). The area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.02 per cent w/v solution of *ritodrine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dissolve 20 mg of the substance under examination in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and dilute to 100.0 ml with the mobile phase, heat at a temperature of 85° for 2 hours. Cool to room temperature, mix 10 ml of the cooled solution with 8 ml of a 10 per cent w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*- diastereoisomer).

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the principal peak and *threo*- diastereoisomer peak is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$,HCl.

Storage. Store protected from moisture.

Ritodrine Injection

Ritodrine Hydrochloride Injection

Ritodrine Injection is a sterile solution of Ritodrine Hydrochloride in Water for Injections.

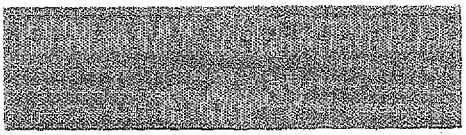
Ritodrine Injection contains not less than 93.0 per cent and not more than 105.0 per cent of the stated amount of ritodrine hydrochloride, $C_{17}H_{21}NO_3$,HCl.

Usual strength. 10 mg per ml.

Identification

A. Dilute a suitable volume of the injection with *methanol (30 per cent)* to obtain a solution containing 0.01 per cent w/v of Ritodrine Hydrochloride. When examined in the range 230 nm to 350 nm (2.4.7) exhibits a maximum at 275 nm and a shoulder at about 280 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal



https://nhathuocngocanh.com/

peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection, if necessary with the mobile phase to obtain a solution containing 0.1 per cent w/v of Ritodrine Hydrochloride.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). Heat a solution containing 0.1 per cent w/v of *ritodrine hydrochloride IPRS* in the mobile phase containing 5.6 per cent v/v of *sulphuric acid* for 2 hours at 85°. Cool and mix 10 volumes of the solution with 8 volumes of a 10 per cent w/v solution of *sodium hydroxide* (generation of *threo*-diastereoisomer).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (7 µm),
- mobile phase: a mixture of a solution containing 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water* and 300 ml of *methanol*, adjusting to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the principal peak and the peak correponding to *threo*- diastereoisomer is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent) and not more than one such peak has an area more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such peak has an area greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The sum of areas of all the secondary peaks is not more than 2.5 times the area of the peak in the chromatogram obtained with reference solution (a) (5.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg of ritodrine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with mobile phase to obtain a solution containing 0.02 per cent w/v of Ritodrine Hydrochloride.

Reference solution (a). A 0.02 per cent w/v solution of *ritodrine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Heat a solution containing 0.1 per cent w/v of *ritodrine hydrochloride IPRS* in the mobile phase containing 5.6 per cent v/v of *sulphuric acid* for 2 hours at 85°. Cool and mix 10 volumes with 8 volumes of a 10 per cent w/v solution of *sodium hydroxide* (generation of *threo*-diastereoisomer).

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the principal peak and the peak due to *threo*- diastereoisomer is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$,HCl in the injection.

Storage. Store protected from light.

Ritodrine Tablets

Ritodrine Hydrochloride Tablets

Ritodrine Tablets contain not less than 93.0 per cent and not more than 105.0 per cent of ritodrine hydrochloride, $C_{17}H_{21}NO_3$,HCl.

Usual strength. 10 mg.

Identification

A. Shake a quantity of the powdered tablets containing 10 mg of Ritodrine Hydrochloride with 30 ml of *methanol* for 20 minutes, filter. Dilute 15 ml of the filtrate to 50 ml with *water*. The resulting solution, when examined in the range 230 nm to 350 nm (2.4.7) exhibits a maximum at 275 nm and a shoulder at about 280 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Ritodrine Hydrochloride in 50 ml of the mobile phase for 5 minutes and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *ritodrine hydrochloride IPRS* in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and dilute to 100.0 ml with the mobile phase, heat at a temperature of 85° for 2 hours. Cool to room temperature, mix 10 ml of the cooled solution with 8 ml of a 10 per cent w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*-diastereoisomer).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 300 ml of *methanol* and 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water*, adjusted to pH 3.0 with an 85 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

Name	Relative retention time
Tyramine	0.3
Ritodrine Hydrochloride	1.0
threo-diastereoisomer	1.15
Aminoketone	2.3

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ritodrine hydrochloride and *threo*-diastereoisomer is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to tyramine and the *threo*-diastereoisomer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any peak due to aminoketone, multiplied with 0.2 is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Ritodrine Hydrochloride in 50 ml of the mobile phase and dilute to 100.0 ml with the mobile phase and filter.

Reference solution (a). A 0.02 per cent w/v solution of *ritodrine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dissolve 20 mg of *ritodrine hydrochloride IPRS* in 50 ml of the mobile phase, add 5.6 ml of *sulphuric acid* and dilute to 100 ml with the mobile phase, mix and heat at a temperature of 85° for 2 hours. Cool to room temperature, mix 10 ml of the cooled solution with 8 ml of a 10 per cent w/v solution of *sodium hydroxide* and allow to cool (generation of *threo*-diastereoisomer).

Use chromatographic system as described under Related substances.

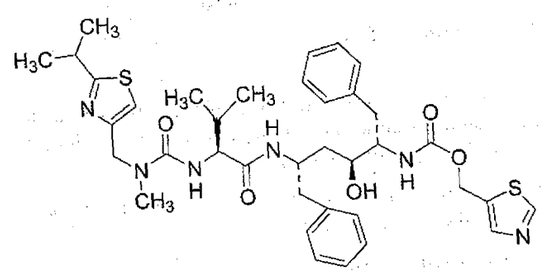
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ritodrine hydrochloride and the peak due to *threo*-diastereoisomer is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{21}NO_3$,HCl in the tablets.

Storage. Store protected from light.

Ritonavir



$C_{37}H_{48}N_6O_5S_2$ Mol. Wt. 721.0

Ritonavir is (5*S*,8*S*,10*S*,11*S*)-10-hydroxy-2-methyl-5-(1-methylethyl)-1-[2-(1-methylethyl)-4-thiazolyl]-3,6-dioxo-8,11-bis(phenylmethyl)-2,4,7,12-tetraazatridecan-13-oic acid 5-thiazolylmethyl ester.

Ritonavir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{37}H_{48}N_6O_5S_2$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white to off-white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ritonavir IPRS* or with the reference spectrum of ritonavir.

https://nhathuocngocanh.com/

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +7.0° to +10.5°, determined in a 0.2 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay and calculate the percentage of each impurity peak in the chromatogram obtained with the test solution. Not more than 0.5 per cent of any individual impurity and not more than 1.0 per cent of total impurities is found.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 45 volumes of *acetonitrile* and 55 volumes of *water*.

Test solution. Dissolve 25.0 mg of the substance under examination in sufficient in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.025 per cent w/v solution of *ritonavir IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate* and 0.94 g of *sodium hexanesulphonate* in 1000 ml of *water*, adjusted to pH 4.0 with *hydrochloric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the ritonavir peak is not less than 1000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$.

Storage. Store protected from light.

Ritonavir Capsules

Ritonavir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. 100 mg.

Identification

A. In the test for Assay, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at the same wavelengths as the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid* with 25 mM polyoxyethylene 10 lauryl ether prepared by dissolving 15.65 g of *polyoxyethylene 10 lauryl ether* in 950 ml of *water*. Add 8.5 ml of *hydrochloric acid* and dilute to 1000 ml with *water*,
Speed and time. 50 rpm and 90 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and if necessary, dilute with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *ritonavir IPRS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *0.03M monobasic potassium phosphate buffer* and 60 volumes of *acetonitrile*.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 25 mg of Ritonavir, dissolve in 50 ml of the solvent mixture and filter.

Reference solution (a). A 0.05 per cent w/v solution of *ritonavir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with butyl silane chemically bonded to porous silica (3 µm) (Such as ACE C4),
- mobile phase: A. a mixture of 69 volumes of *0.03 M mono-basic potassium phosphate buffer* prepared by dissolving 4.1 g of *monobasic potassium phosphate* in 1000 ml of *water*, 18 volumes of acetonitrile, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
  B. a mixture of 40 volumes of *0.03 M mono-basic potassium phosphate buffer*, 47 volumes of acetonitrile, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
155	100	0

Inject the reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 5000 theoretical plates.
Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 25 mg of Ritonavir, disperse in 100.0 ml of *methanol* and filter.

Reference solution. A 0.025 per cent w/v solution of *ritonavir IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature 45°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate trihydrate* and 0.94 g of *sodium 1-hexanesulphonate* in 1000 ml of *water*, adjusted to pH 4.0 with *hydrochloric acid* and 45 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject the reference solution. Run the chromatogram 1.5 times the retention time (about 3 minutes) of the principal peak The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$ in the capsules.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ritonavir Tablets

Ritonavir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strengths. 25 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),
Medium. 900 ml of a solution prepared by dissolving 15.7 g of *polyoxyethylene 10-lauryl ether* in 1000 ml of a 0.85 per cent v/v solution of *hydrochloric acid*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. The filtrate obtained as given above. Dilute the filtrate if necessary, with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *ritonavir IPRS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_{37}H_{48}N_6O_5S_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture: 40 volumes of *0.03 M monobasic potassium phosphate* and 60 volumes of *acetonitrile*.

Test solution: Shake a quantity of the powdered tablets containing 25 mg of Ritonavir with 50 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *ritonavir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with butyl silane chemically bonded to porous silica (3 µm) (Such as ACE C4),
- mobile phase: A. a mixture of 69 volumes of *0.03 M mono-basic potassium phosphate solution*, 18 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n- butanol*,

  B. a mixture of 40 volumes of *0.03 M mono-basic potassium phosphate solution*, 47 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
121	100	0
155	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh a quantity of the powdered tablets containing 25 mg of Ritonavir and disperse in 100.0 ml of *methanol*.

Reference solution. A 0.025 per cent w/v solution of *ritonavir IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with phenyl stationary phase bonded to porous silica (3µm),
- column temperature 45°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate trihydrate* and 0.94 g of *sodium 1-hexanesulphonate* to 1000 ml with *water*, adjusted to pH 4.0 with *dilute hydrochloric acid*, and 45 volumes of *acetonitrile*.
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 10 µl.

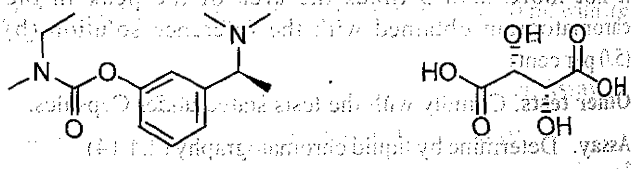
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Rivastigmine Tartrate



$C_{14}H_{22}N_2O_2,C_4H_6O_6$ Mol. Wt. 400.4

Rivastigmine Tartrate is ethylmethylcarbamic acid,3-[(S)-1-(dimethylamino)ethyl]phenyl ester, (2R,3R)-2,3-dihydroxybutanedioate.

Rivastigmine Tartrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{22}N_2O_2,C_4H_6O_6$, calculated on the anhydrous basis.

Category. Anti-Dementia Drug.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rivastigmine*

https://nhathuocngocanh.com/

tartrate IPRS or with the reference spectrum of rivastigmine tartrate.

B. In the test for Enantiomeric purity, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (c).

Tests

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.00001 per cent w/v solution of *rivastigmine tartrate R-Isomer IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *rivastigmine tartrate IPRS* and 0.00001 per cent w/v of *rivastigmine tartrate R-Isomer IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm × 4.0 mm, packed with immobilized α1-acid glycoprotein on spherical silica particles (5 µm) (Such as Chiralpak AGP),
- mobile phase. a mixture of 98 volumes of a buffer solution prepared by dissolving 1.78 g of *dibasic sodium phosphate dihydrate* and 1.38 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute orthophosphoric acid*, 2 volumes of *acetonitrile* and 0.02 volume of *N,N-dimethyloctylamine*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to R-enantiomer and S-enantiomer (rivastigmine) is not less than 0.8 in the chromatogram obtained with reference solution (c), the signal-to-noise ratio is not less 10 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (a).

NOTE —The elution order is the R-enantiomer, followed by S-enantiomer (rivastigmine).

Inject reference solution (a) and the test solution. The area of the peak corresponding to R-enantiomer is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.0001 per cent w/v solution of *rivastigmine tartrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v each of *rivastigmine related compound A IPRS* and *rivastigmine related compound B IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase. a mixture of 70 volumes of a buffer solution prepared by dissolving 8.6 g of *monobasic ammonium phosphate* in 900 ml of *water*, adjusted to pH 7.0 with *ammonia solution* and dilute to 1000 ml with *water*, 15 volumes of *methanol* and 15 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Tartaric acid	0.18	—
Phenol impurity[1]	0.28	0.63
DPTTA[2]	0.46	1.20
Nor impurity[3]	0.57	0.83
Rivastigmine	1.0	—
Carbamate impurity[4]	4.1	0.77
Ether impurity[5]	6.5	0.71

[1](S)-3-[1-(Dimethylamino)ethyl]phenol,

[2](+)-Di-(*P*-toluoyl)-D- tartric acid (rivastigmine related compound A),

[3](S)-3-[1-(Dimethylamino)ethyl]phenyldimethylcarbamate (racemic mixture is rivastigmine related compound B),

[4]3-Nitrophenyl ethyl(methyl)carbamate,

[5](*S*)-*N*,*N*-Dimethyl-1-[3-(4-nitrophenoxy)phenyl]ethanamine.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to rivastigmine related compound A and rivastigmine related compound B is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram 8 times the retention time of the principal peak. The area of any peak corresponding to phenol impurity is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to DPTTA, nor impurity, carbamate impurity and ether impurity, each of , is

https://nhathuocngocanh.com/

not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak due to tartaric acid.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Test solution. Dissolve 20 mg of the substance under examination in 70 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.02 per cent w/v solution of *rivastigmine tartrate IPRS* in the mobile phase.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to rivastigmine related compound A and rivastigmine related compound B is not less than 1.5 in the chromatogram obtained with reference solution (b), the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_2$, $C_4H_6O_6$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Rivastigmine Capsules

Rivastigmine Tartrate Capsules

Rivastigmine Capsules contain Rivastigmine Tartrate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of rivastigmine, $C_{14}H_{22}N_2O_2$.

Usual strengths. 1.5 mg; 3 mg; 4.5 mg; 6 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. A 0.0192 per cent w/v solution of *rivastigmine tartrate IPRS* in the mobile phase and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

– injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{14}H_{22}N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse a quantity of the mixed content containing 25 mg of Rivastigmine in 10 ml of the mobile phase, with the aid of ultrasound and dilute to 25.0 ml with the mobile phase, centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.00016 per cent w/v solution of *rivastigmine tartrate IPRS* in the mobile phase.

Name	Relative retention time	Correction factor
Phenol impurity[1]	0.28	0.63
Rivastigmine	1.0	—

[1](S)-3-[1-(Dimethylamino)ethyl]phenol.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to rivastigmine related compound A and rivastigmine related compound B is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area any peak corresponding to phenol impurity is not more than

https://nhathuocngocanh.com/

6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to tartaric acid.

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse the content of one capsule in 2.5 ml of *methanol* and 5 ml of the mobile phase, with the aid of ultrasound for 15 minutes with intermittent shaking and dilute to 25.0 ml with the mobile phase, centrifuge and use the clear supernatant liquid. Dilute the supernatant, if necessary, with the mobile phase to obtain a solution having the similar concentration to the reference solution.

Reference solution. Dissolve 34 mg of *rivastigmine tartrate IPRS* in 2 ml of *methanol* and 25 ml of the mobile phase, with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_2$ in the capsules.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and mix the content of 20 capsules or more. Disperse a quantity of the mixed content containing 20 mg of rivastigmine in 10 ml of *methanol* and 25 ml of the mobile phase with the aid of ultrasound for 15 minutes with intermittent shaking and dilute to 100.0 ml with the mobile phase, centrifuge. Dilute 5.0 ml of supernatant liquid to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 64 mg of *rivastigmine tartrate IPRS* in 10 ml of *methanol* and 25 ml of the mobile phase with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of *rivastigmine related compound A IPRS* and *rivastigmine related compound B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 8.6 g of *monobasic ammonium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *ammonia solution*, 15 volumes of *methanol* and 15 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The relative retention time with reference to rivastigmine for rivastigmine related compound A is about 0.46 and rivastigmine related compound B is about 0.57.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to rivastigmine related compound A and rivastigmine related compound B is not less than 1.5 in the chromatogram obtained with reference solution (b), the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

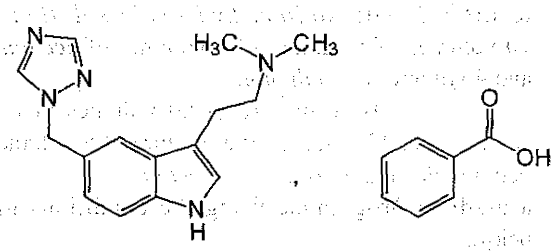
Calculate the content of $C_{14}H_{22}N_2O_2$ in the capsules.

1 mg of $C_{14}H_{22}N_2O_2.C_4H_6O_6$ is equivalent to 0.6252 mg of $C_{14}H_{22}N_2O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of rivastigmine.

Rizatriptan Benzoate



$C_{15}H_{19}N_5,C_7H_6O_2$ Mol. Wt. 391.5

Rizatriptan Benzoate is *N,N*-Dimethyl-2-[5-(1,2,4-triazol-1-ylmethyl)-1*H*-indol-3-yl] ethyl amine benzoate.

Rizatriptan Benzoate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{19}N_5,C_7H_6O_2$, calculated on the dried basis.

Category. Antimigraine.

Description. A white to off white crystalline powder.

https://nhathuocngocanh.com/

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rizatriptan benzoate IPRS* or with the reference spectrum of rizatriptan benzoate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.0001 per cent w/v solution of *rizatriptan benzoate IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *dimethyl-[2-(5-[1,2,4]-triazol-1-ylmethyl-1H-indol-3-yl)-ethyl]-amine-N-oxide IPRS (rizatriptan impurity C IPRS)* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 90 volumes of buffer solution prepared by dissolving 2.6 g of *sodium dihydrogen phosphate*, 1.0 g of *dibutyl amine* and 0.8 g of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 6.5 with *sodium hydroxide solution* and 10 volumes of a mixture of 6 volumes of *acetonitrile* and 4 volumes of *methanol*,

  B. a mixture of 60 volumes of buffer solution and 40 volumes of a mixture of 6 volumes of *acetonitrile* and 4 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
35	45	55
40	100	0
45	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to rizatriptan impurity C and rizatriptan benzoate is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak due to benzoic acid.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *rizatriptan benzoate IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{19}N_5.C_7H_6O_2$.

Storage. Store protected from light.

Rizatriptan Tablets

Rizatriptan Benzoate Tablets

Rizatriptan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rizatriptan, $C_{15}H_{19}N_5$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7).Calculate the content of $C_{15}H_{19}N_5$ in the medium from the absorbance obtained from a solution of known concentration of *rizatriptan benzoate IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_{15}H_{19}N_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture: Equal volumes of mobile phase A and mobile phase B.

Test solution. Weigh a quantity of the powdered tablets containing about 50 mg of rizatriptan, dissolve in 30 ml of the solvent mixture and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution (a). A solution of *rizatriptan benzoate IPRS* equivalent to 0.0001 per cent w/v of rizatriptan in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *dimethyl-[2-(5-[1,2,4]-triazol-1-ylmethyl-1H-indol-3-yl)-ethyl]-amine-N-oxide IPRS (rizatriptan impurity C IPRS)* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- column temperature: 40°,
- mobile phase: A. a mixture of 90 volumes of buffer solution prepared by dissolving 2.6 g of *sodium dihydrogen phosphate*, 1.3 ml of *dibutylamine* and 0.5 ml of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 6.5 with *sodium hydroxide solution* and 10 volumes of a mixture of 6 volumes of *acetonitrile* and 4 volumes of *methanol*,

  B. a mixture of 60 volumes of buffer solution and 40 volumes of a mixture of 6 volumes of *acetonitrile* and 4 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
35	45	55
40	100	0
55	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to rizatriptan impurity C and rizatriptan is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one tablet in the mobile phase and dilute suitably to obtain a concentration of 0.005 per cent w/v of Rizatriptan Benzoate equivalent to Rizatriptan.

Reference solution. A solution of *rizatriptan benzoate IPRS* equivalent to 0.005 per cent w/v of rizatriptan in the mobile phase.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and transfer a quantity of powdered tablets containing about 20 mg of rizatriptan, dissolve in 50 ml of mobile phase and dilute to 100 ml with the mobile phase, filter. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution. A solution of *rizatriptan benzoate IPRS* equivalent to 0.005 per cent w/v of rizatriptan in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 87 volumes of buffer solution prepared by dissolving 2.6 g of *sodium dihydrogen phosphate*, 1.3 ml of *dibutylamine* and 0.5 ml of *orthophosphoric acid* in 1000 ml *water*, adjusted to pH 6.5 with *sodium hydroxide solution*, 7.8 volumes of *acetonitrile* and 5.2 volumes of *methanol*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,
– spectrophotometer set at 225 nm,
– injection volume: 20 µl.

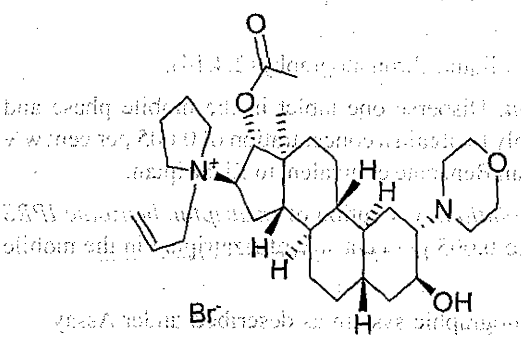
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent. Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{19}N_5$ in the tablet.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of Rizatriptan.

Rocuronium Bromide



$C_{32}H_{53}BrN_2O_4$ Mol. Wt. 609.7

Rocuronium Bromide is 1-[17β-Acetoxy-3α-hydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium bromide.

Rocuronium Bromide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{32}H_{53}BrN_2O_4$, calculated on the anhydrous basis.

Category. Non-depolarizing neuromuscular blocker.

Description. Almost white or pale yellow, slightly hygroscopic powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rocuronium bromide IPRS* or with the reference spectrum of rocuronium bromide.

B. A 1 per cent w/v solution in *carbon dioxide-free water* (solution A) gives reaction (a) of bromides (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 8.9 to 9.5, determined in solution A.

Specific optical rotation (2.4.22). +28.5° to +32.0°, determined in a 1 per cent w/v solution in *0.05 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *water* and 90 volumes of *acetonitrile*.

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.001 per cent w/v solution of *rocuronium bromide IPRS* in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *rocuronium for peak identification IPRS (containing impurities A, B, C, F, G and H)* in the solvent mixture.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm),
– mobile phase: a mixture of 10 volumes of a buffer solution prepared by dissolving 4.53 g of *tetramethylammonium hydroxide* in 1000 ml of *water*, adjusted to pH 7.4 with *orthophosphoric acid* and 90 volumes of *acetonitrile*,
– flow rate: 2 ml per minute,
– spectrophotometer set at 210 nm,
– injection volume: 5 µl.

Name	Relative retention time	Correction factor
Rocuronium impurity A[1]	0.2	0.5
Rocuronium impurity G[2]	0.4	0.4
Rocuronium impurity F[3]	0.75	1.3
Rocuronium impurity B[4]	0.8	–
Rocuronium impurity H[5]	0.95	0.4
Rocuronium (retention time is about 9 minutes)	1.0	–
Rocuronium impurity C[6]	1.2	–

[1]3α-hydroxy-2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstan-17β-yl acetate,

[2]2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstane-3α,17β-diol,

[3]1-[3α,17β-acetoxy-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

[4]1-[3α,17β-diacetoxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

[5]1-[17β-acetoxy-2-(morpholin-4-yl)-3-oxo-5α-androst-1-en-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

https://nhathuocngocanh.com/

1-[3α,17β-dihydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.

NOTE — Equilibrate the column at least for 4 hours.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where Hp is the height above the baseline of the peak due to impurity H and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to rocuronium.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to rocuronium impurity A, B, C, each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to rocuronium impurity F, G, H, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak eluting before impurity A and with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *water* and dilute to 20.0 ml with *water*.

Reference solution (a). A solution containing 0.0644 per cent w/v of *sodium bromide* and 0.0824 per cent w/v of *sodium chloride* in *water*. Dilute 1.0 ml of the solution to 50.0 ml with *water*.

Reference solution (b). A 0.00824 per cent w/v solution of *sodium chloride* in *water*. Dilute 1.0 ml of the solution to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with strong anion exchange resin (13 µm),
- mobile phase: a solution containing 0.0063 per cent w/v of *sodium hydrogen carbonate* and 0.0212 per cent w/v of *anhydrous sodium carbonate* in *water*,
- flow rate: 2 ml per minute,
- conductivity detector set at 100 µs/v and maintained at 30°, use a self-regenerating anion suppressor at 100 mA,
- injection volume: 25 µl.

The retention time of chloride and bromide are about 1.7 minutes and about 2.8 minutes, respectively.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to chloride and bromide is not less than 2.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to chloride is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

2-Propanol. Not more than 1.0 per cent, determined by method described under Residual solvents (5.4).

Heavy metals (2.3.13). 1 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 4.5 per cent, determined on 0.4 g.

Assay. Dissolve 0.4 g in 40 ml of *glacial acetic acid*. Titrate with *0.1M perchloric acid*, determining the end- point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06097 g of $C_{32}H_{53}BrN_2O_4$.

Storage. Store protected from light and moisture, and a temperature below - 15°.

Rocuronium Injection

Rocuronium Bromide Injection

Rocuronium Injection is a sterile solution of Rocuronium Bromide in Water for Injections.

Rocuronium Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rocuronium bromide, $C_{32}H_{53}BrN_2O_4$.

Usual strength. 10 mg per ml.

Description. A clear colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.5.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

https://nhathuocngocanh.com/

Test solution. Dilute a suitable volume of the injection with the solvent mixture to obtain a solution containing 0.1 per cent w/v of Rocuronium Bromide.

Reference solution (a). A 0.001 per cent w/v solution of *rocuronium bromide IPRS* in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *rocuronium for peak identification IPRS* (containing impurities A, B, C, F, G and H) in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of a buffer solution prepared by dissolving 4.53 g of *tetramethyl ammonium hydroxide* in 1000 ml of *water*, adjusted to pH 7.4 with *orthophosphoric acid* and 90 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Rocuronium impurity A[1]	0.2	0.5
Rocuronium impurity G[2]	0.4	0.4
Rocuronium impurity F[3]	0.75	1.3
Rocuronium impurity B[4]	0.8	—
Rocuronium impurity H[5]	0.95	0.4
Rocuronium (retention time is about 9 minutes)	1.0	—
Rocuronium impurity C[6]	1.2	—

[1]3α-hydroxy-2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstan-17β-yl acetate,

[2]2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstane-3α,17β-diol,

[3]1-[3α,17β-acetoxy-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

[4]1-[3α,17β-diacetoxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

[5]1-[17β-acetoxy-2-(morpholin-4-yl)-3-oxo-5α-androst-1-en-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

[6]1-[3α,17β-dihydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium.

NOTE — Equilibrate the column at least for 4 hours.

Inject reference solution (a) and (b). The test is not valid unless the peak-to-valley ratio is not less than 3.0, where Hp is the height above the baseline of the peak due to impurity H and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to rocuroniumin the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to rocuronium impurity A, B, C, F, G, H, each of, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak eluting before impurity A and with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Reference solution. A 0.1 per cent w/v solution of *rocuronium bromide IPRS* in the solvent mixture.

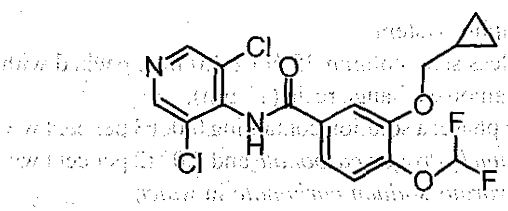
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solutionand the test solution.

Calculate the content of $C_{32}H_{53}BrN_2O_4$ in the injection.

Storage. Store at a temperature between 2° to 8°.

Roflumilast



$C_{17}H_{14}Cl_2F_2N_2O_3$ Mol Wt. 403.2

Roflumilast is *N*-(3,5-Dichloropyridin-4-yl)-3-(cyclopropylmethoxy)-4-(difluoromethoxy)benzamide.

Roflumilast contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{14}Cl_2F_2N_2O_3$, calculated on the dried basis.

https://nhathuocngocanh.com/

Category. Anti-asthmatic.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *roflumilast IPRS* or with the reference spectrum of roflumilast.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 25.0 ml with *methanol.*

Reference solution. Dissolve 1 mg of *4-amino-3,5 dichloropyridine IPRS* and 25 mg of *roflumilast IPRS* in *methanol* and dilute to 25.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.07 per cent w/v solution of *ammonium acetate* in *water*,
  B. a mixture of 80 volumes of *acetonitrile and* 20 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
30	25	75
32	60	40
40	60	40

The relative retention time with respect to roflumilast for *4-amino-3,5dichloropyridine* is about 0. 2.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any peak due to 4-amino-3,5dichloropyridine is not more than 0.5 per cent, the area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 25.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol.*

Reference solution. A 0.01 per cent w/v solution of *roflumilast IPRS* in *methanol.*

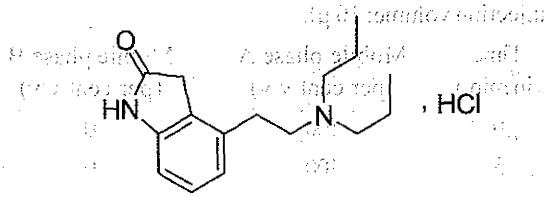
Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of 0.07 per cent w/v solution of *ammonium acetate* in *water*, 60 volumes of a mixture of 80 volumes of *acetonitrile and* 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent. Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{14}Cl_2F_2N_2O_3$.

Ropinirole Hydrochloride



$C_{16}H_{24}N_2O,HCl$ Mol. Wt. 296.8

Ropinirole Hydrochloride is 2*H*-Indol-2-one, 4-[2-(dipropylamino)ethyl]-1,3-dihydro-, monohydrochloride; 4-[2-(Dipropylamino)ethyl]-2-indolinone monohydrochloride.

Ropinirole Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{24}N_2O,HCl$, calculated on the anhydrous basis.

Category. Anti-Parkinsonian.

Description. A pale cream to yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ropinirole*

https://nhathuocngocanh.com/

hydrochloride IPRS or with the reference spectrum of ropinirole hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. If methylene ropinirole and propylidene ropinirole are known process impurities, Method B is applicable. If ropinirole indole derivative and ropinirole oxime are known process impurities, Method C is applicable.

A. Determine by liquid chromatography (2.4.14), use buffer solution and solvent mixture as described under Assay.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution. A solution containing 0.1 per cent w/v of *ropinirole hydrochloride IPRS*, and 0.00015 per cent w/v of *ropinirole impurity B IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 15 volumes of *acetonitrile* and 85 volumes of buffer solution,

  B. a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Name	Relative retention time	Correction factor
Open ring nitro derivative[1]	0.39	1.39
Monopropyl ropinirole[2]	0.58	0.91
N-hydroxyropinirole[3]	0.84	1.53
Ropinirole impurity B[4]	0.97	1.52
Ropinirole	1.00	—

[1]2-{2-[2-(Dipropylamino)ethyl]-6-nitrophenyl}acetic acid,

[2]4-[2-(Propylamino)ethyl]indolin-2-one,

[3]4-[2-(Dipropylamino)ethyl]-1-hydroxyindolin-2-one,

[4]4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 1.5, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent using ropinirole peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to impurities open ring nitro derivative, monopropyl ropinirole, N-hydroxyropinirole and impurity B is not more than 0.15 per cent, the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all secondary peaks is not more than 1.0 per cent. Ignore any peak with an area less than 0.05 per cent, calculated by area normalisation.

B. Determine by liquid chromatography (2.4.14).

Solvent mixture. 84 volumes of mobile phase A and 16 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A solution containing 0.005 per cent w/v of each *ropinirole hydrochloride IPRS*, *ropinirole impurity A IPRS* and *ropinirole impurity B IPRS* in the solvent mixture.

Reference solution (b). A 0.0003 per cent w/v solution of *ropinirole impurity B IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. dissolve 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 2.5 with *ortho phosphoric acid*,

  B. a mixture of 70 volumes of *acetonitrile* and 30 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[1] 4-[2-(Propylamino)ethyl]indolin-2-one,

[2] 4-(2-Hydroxyethyl)indolin-2-one,

[3] 4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride,

[4] 4-[2-(Dipropylamino)ethyl]-3-methyleneindolin-2-one,

[5] 4-[2-(2-Methylpentylamino)ethyl]indolin-2-one,

[6] (Z)-4-[2-(Dipropylamino)ethyl]-3-propylideneindolin-2-one.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ropinirole impurity A and ropinirole impurity B is not less than 2.0, the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 3.0, the tailing factor is not more than 1.5 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject the test solution. The area of each peak due to monopropyl ropinirole, methylene ropinirole and propylidene ropinirole is not more than 0.2 per cent, the area of each peak due to ropinirole impurity B and ropinirole isohexyl analog is not more than 0.3 per cent, the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

C. Determine by liquid chromatography (2.4.14).

Solvent mixture. 32 volumes of *acetonitrile* and 68 volumes of *water*.

Test solution. Dissolve 30 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.00012 per cent w/v solution of *ropinirole hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.1 per cent w/v of *ropinirole hydrochloride IPRS* and 0.001 per cent w/v of *ropinirole impurity B IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 3.95 g of *ammonium bicarbonate* in 1000 ml of *water*, adjusted to pH 9.2 to 9.3 with 25 per cent *ammonia solution*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	68	32
12	68	32
28	20	80
34	20	80
34.1	68	32
40	68	32

Name	Relative retention time	Correction factor
Ropinirole oxime[1]	0.69	1.0
Ropinirole	1.0	—
Ropinirole impurity B	1.2	1.0
Ropinirole indole derivative[2]	2.0	0.25

[1] 4-[2-(Dipropylamino)ethyl]-3-(hydroxyimino)indolin-2-one,

[2] *N,N*-Dipropyl-*N*-(2-indol-4-ylethyl)amine.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 1.5 in the chromatogram obtained with reference solution (b), the tailing factor is between 0.8 to 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent for ropinirole in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to ropinirole oxime and ropinirole impurity B is not more than 0.15 per cent, the area of each peak due to ropinirole indole derivative and any other secondary peaks is not more than 0.1 per cent, and the sum of areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalisation.

Palladium. Not more than 10 ppm.

NOTE —Perform this test if Pd is a known inorganic impurity.

Solution A. Dissolve 2.4 g of *sodium hydroxide* in 20 ml of *water*, and dilute with *glycerol* to 100 ml.

Solution B. A 4.0 per cent w/v solution of *thioacetamide* in *water*.

NOTE —The solution may be filtered if necessary.

Solvent mixture. Carefully add 27 ml of *hydrochloric acid* to 25 g of *ammonium acetate*, and dilute with *water* to 100.0 ml.

https://nhathuocngocanh.com/

Test solution. Transfer 1 g of the substance under examination to a platinum crucible, and heat until the material is completely carbonized. Moisten the contents with 0.5 ml of *sulphuric acid*, and heat until fumes are no longer emitted. Place the crucible in a muffle furnace at 700° and heat. Cool, add 5 ml of *hydrochloric acid* to the residue, and evaporate to dryness. Add 1 ml of *2 M hydrochloric acid* and, if necessary, dissolve the residue with gentle heating. Cool and transfer the contents to a 50-ml beaker. Wash the crucible twice with 1-ml aliquots of *water*, and add the washings to the beaker. Pass the solution through a membrane filter of 2-µm pore size into a centrifuge tube.

Reference solution. Pipet 1.0 ml of 10 ppm Pd solution into a platinum crucible, and gently evaporate to dryness. Moisten the residue with 0.5 ml of *sulphuric acid*, and heat until fumes are no longer emitted. Place the crucible in a muffle furnace at 700°, and heat for additional 5 minutes, Cool, add 5 ml of *hydrochloric acid* to the residue, and evaporate to dryness. Add 1 ml of *2 M hydrochloric acid* and, if necessary, dissolve the residue with gentle heating. When cool, transfer the contents to a 50-ml beaker. Wash the crucible twice with 1-ml aliquots of *water*, and add the washings to the beaker. Pass the solution through a membrane filter of 2-µm pore size into a centrifuge tube.

To the filtered reference solution and the test solution, add 1 ml of Solution A, 0.2 ml of Solution B, and 2 ml of solvent mixture. Cap the centrifuge tubes and incubate at 37° for 2 hours. Pass the test solution and reference solution through a membrane filter of 2-µm pore size, wash the membrane with 2-ml aliquots of *water*, and allow the membrane to dry.

The intensity of the spot due to the test is not more intense than the spot due to the reference.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *ropinirole hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.88 g of *sodium hexanesulphonate*, 1 g of *orthophosphoric acid* in 1000 ml of *water* and adjusting the pH to 6.5 with dilute triethylamine (1:10) and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.6 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{24}N_2O$, HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Ropinirole Prolonged-release Tablets

Ropinirole Hydrochloride Prolonged-release Tablets; Ropinirole Hydrochloride Sustained-release Tablets; Ropinirole Hydrochloride Extended-release Tablets; Ropinirole Sustained-release Tablets; Ropinirole Extended-release Tablets

Ropinirole Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Ropinirole Prolonged-release Tablets contain Ropinirole Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ropinirole, $C_{16}H_{24}N_2O$.

Usual strengths. 2 mg; 4 mg; 8 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

1 mg of $C_{16}H_{24}N_2O$,HCl is equivalent to 0.8771 mg of $C_{16}H_{24}N_2O$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. 80 volumes of *acetonitrile* and 20 volumes of mobile phase A.

Solvent mixture B. 20 volumes of solvent mixture A and 80 volumes of mobile phase A.

https://nhathuocngocanh.com/

Test solution. Weigh a quantity of the powdered tablets containing about 27 mg of ropinirole to a 200-ml volumetric flask, add about 100 ml of solvent mixture A, shake for 30 minutes and mix with the aid of ultrasound and dilute to volume with the same solvent and filter. Dilute 2.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (a). A 0.000015 per cent w/v solution of *ropinirole hydrochloride IPRS* in solvent mixture B.

Reference solution (b). A solution containing 0.003 per cent w/v of *ropinirole hydrochloride IPRS* and 0.0001 per cent w/v of *ropinirole impurity B IPRS* in solvent mixture B.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 10.0 ml with solvent mixture B.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A, a 0.05 per cent v/v solution of *trifluoroacetic acid* in *water*;
  B, a mixture of 80 volumes of *acetonitrile* and 20 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	84	16
23	84	16
36	40	60

Propylidene ropinirole[6]	1.96	0.5

[1]4-[2-(Propylamino)ethyl]indolin-2-one,

[2]4-[2-(Dipropylamino)ethyl]indoline-2,3-dione hydrochloride,

[3]4-[2-(Dipropylamino)ethyl]-1-hydroxymethyl)indolin-2-one,

[4]N-[2-(2-Oxoindolin-4-yl)ethyl]-N-propylpropan-1-amine oxide,

[5]4-[2-(Dipropylamino)ethyl]-3-({4-[2-(dipropylamino)ethyl]-2-oxo-2,3-dihydro-1H-indol-3-yl}methyl)-2,3-dihydro-1H-indol-2-one,

[6](Z)-4-[2-(Dipropylamino)ethyl]-3-propylideneindolin-2-one; process impurity included for identification only.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to ropinirole and ropinirole impurity B is not less than 2.0 in the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a) and the signal to noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of each peak corresponding to monopropyl ropinirole, ropinirole impurity B, ropinirole N-hydroxymethyl, ropinirole N-oxide and ropinirole methylene dimer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The sum of areas of all secondary peaks is not more than 2.9 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse 1 tablet in the solvent mixture with the aid of ultrasound, and dilute if necessary to obtain a solution having 0.01 per cent w/v solution of ropinirole.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{24}N_2O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of a solution prepared by diluting 0.7 ml of *orthophosphoric acid* in 1000 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of Ropinirole Hydrochloride in 25 ml of the solvent mixture, with the aid of ultrasound for 30 minutes and dilute to 50.0 ml with the same solvent and filter.

Reference solution (a). A 0.011 per cent w/v solution of *ropinirole hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *ropinirole hydrochloride IPRS* and 0.0003 per cent w/v of *ropinirole impurity B IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 12.5 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 75 volumes of *methanol* and 25 volumes of a buffer solution prepared by dissolving 4.5 g of *dibasic sodium phosphate dihydrate* in 900 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{24}N_2O$ in the tablets.

1 mg of $C_{16}H_{24}N_2O$,HCl is equivalent to 0.8771 mg of $C_{16}H_{24}N_2O$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ropinirole.

Ropinirole Tablets

Ropinirole Hydrochloride Tablets

Ropinirole Tablets contain Ropinirole Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ropinirole, $C_{16}H_{24}N_2O$.

Usual strengths. 0.25 mg; 0.5 mg; 1 mg; 2 mg; 5 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium: 500 ml of a buffer solution pH 4.0, prepared by dissolving 2.9 g of *sodium citrate dihydrate* and 3.3 g of *anhydrous citric acid* in 1000 ml of *water*,

Speed and time: 50 rpm and 15 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve a quantity of *ropinirole hydrochloride IPRS* in dissolution medium and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 7.5 cm × 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *acetonitrile* and 4 volumes of medium,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

1 mg of $C_{16}H_{24}N_2O$,HCl is equivalent to 0.8771 mg of $C_{16}H_{24}N_2O$.

Q: Not less than 85 per cent of the stated amount of $C_{16}H_{24}N_2O$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of a buffer solution prepared by dissolving 5 g of *sodium lauryl sulphate* in 800 ml of *water*, adjusted to pH 6.8 with *orthophosphoric acid* or *sodium hydroxide* and 20 volumes of *methanol*.

Test solution. Weigh a quantity of the powdered tablets containing about 5 mg of ropinirole hydrochloride to a 50-ml volumetric flask, add about 35 ml of the solvent mixture, shake for 30 minutes and mix with the aid of ultrasound and dilute to volume with the solvent mixture and filter.

Reference solution (a). A 0.002 per cent w/v solution of *ropinirole hydrochloride IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution (b). A 0.003 per cent w/v solution of *ropinirole hydrochloride IPRS* and 0.005 per cent w/v of *ropinirole impurity B IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 20 volumes of *methanol* and 80 volumes of a buffer solution prepared by dissolving 1.8 g of *dibasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.4 with *orthophosphoric acid*,

  B. a mixture of 80 volumes of *methanol* and 20 volumes of a buffer solution prepared by dissolving 1.8 g of *dibasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.4 with *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,

[7](Z)-4-[2-(Dipropylamino)ethyl]-3-propylideneindolin-2-one.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject the test solution. The area of each peak due to monopropyl ropinirole and ropinirole impurity B is not more than 0.6 per cent, the area of each peak due to ropinirole N-oxide, cyclopentanylindolinone and hydroxy ropinirole is not more than 0.5 per cent, the area of peak due to propylidene ropinirole is not more than 0.4 per cent, the area of any secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent calculated by area normalisation.

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse 1 tablet in the solvent mixture with the aid of ultrasound, and dilute if necessary to obtain a solution containing 0.01 per cent w/v solution of ropinirole.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{24}N_2O$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2. 4.14).

Solvent mixture. Dissolve 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid*.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 5 mg of Ropinirole to a 50-ml volumetric flask, add about 25 ml of the solvent mixture, shake for 30 minutes and mix with the aid of ultrasound and dilute to volume with the solvent mixture and filter.

Reference solution (a). A 0.011 per cent w/v solution of *ropinirole hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *ropinirole hydrochloride IPRS* and 0.00005 per cent w/v of *ropinirole impurity B IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *acetonitrile*, 6 volumes of *methanol* and 80 volumes of a solution prepared by dissolving 3.85 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ropinirole hydrochloride and ropinirole impurity B is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{24}N_2O$ in the tablets.

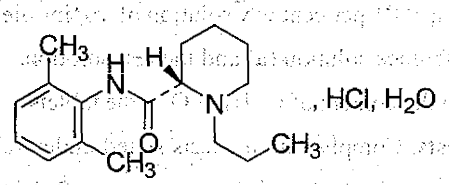
1 mg of $C_{16}H_{24}N_2O$,HCl is equivalent to 0.8771 mg of $C_{16}H_{24}N_2O$.

https://nhathuocngocanh.com/

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ropinirole.

Ropivacaine Hydrochloride



$C_{17}H_{26}N_2O,HCl,H_2O$ Mol. Wt. 328.9

Ropivacaine Hydrochloride is (*S*)-(–)-1-Propylpiperidine-2-carboxylic acid (2,6-dimethylphenyl)amide hydrochloride monohydrate; (*S*)-(–)-1-Propyl-2',6'-pipecoloxylidine hydrochloride monohydrate.

Ropivacaine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{17}H_{26}N_2O,HCl$, calculated on the anhydrous basis.

Category. Local anaesthetic.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ropivacaine hydrochloride IPRS* or with the reference spectrum of ropivacaine hydrochloride.

B. A 1.0 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution (2.4.1). A 2.0 per cent w/v solution in *carbon dioxide free water* is not more intensely coloured than reference solution YS7 (2.4.1) and is not more opalescent than standard OS1 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 30 mg of the substance under examination in 10.0 ml of mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. A solution containing 0.001 per cent w/v each of *ropivacaine hydrochloride IPRS* and *bupivacaine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of a buffer solution prepared by dissolving 0.18 g of *monobasic sodium hydrogen phosphate* and 2.9 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *water*, adjusted to pH 8.0,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

The relative retention times are about 1.0 for ropivacaine and 1.6 for bupivacaine respectively.

Inject the reference solution and test solution (b). The test is not valid unless the resolution between the peaks due to ropivacaine and bupivacaine obtained with reference solution is not less than 6.0 and the signal to noise ratio for the principal peak obtained with test solution (b) is not less than 10.0.

Inject the reference solution and the test solution (a). The area of any peak due to bupivacaine is not more than 0.2 per cent. The area of any other secondary peak is not more than 0.1 per cent and the sum of the areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalisation.

Limit of Ropivacaine related compound A (2,6-Dimethylaniline hydrochloride). Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 10.0 ml of mobile phase.

Reference solution. A solution containing 0.00001 per cent w/v of *ropivacaine hydrochloride impurity A IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. In the chromatogram obtained with the reference solution signal- to- noise ratio for the principal peak is not less than 10.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to ropivacaine impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.001 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*. Dilute 10.0 ml of this resulting solution to 100.0 ml with mobile phase.

Reference solution. A solution containing 0.0075 per cent w/v of *ropivacaine hydrochloride IPRS and* 0.000075 per cent w/v of *ropivacaine impurity B IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with chiralpak AGP (5 µm),
- mobile phase: dilute 35.0 ml of *isopropyl alcohol* into a 500-ml volumetric flask with buffer solution prepared by diluting 7.5 ml of *1 M monobasic sodium phosphate* solution and 28.5 ml of *0.5 M dibasic sodium phosphate dihydrate* solution to a 1000 ml with *water* and mix. Adjusted to pH 7.2, if necessary,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention times are about 0.75 for ropivacaine impurity B and 1.0 for ropivacaine.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ropivacaine impurity B (R enantiomer) and ropivacaine (S enantiomer) is not less than 1.5.

Inject the test solution. The area of any peak corresponding to ropivacaine hydrochloride impurity B is not more than 0.5 per cent, calculated by area normalisation.

pH (2.3.24). 4.5 to 6.0, determined on 1.0 per cent w/v solution.

Water (2.3.43). 5.0 to 6.0 per cent, determined on 0.1 g.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, method B (10 ppm).

Assay. Dissolve 1.0 g of the substance in 10 ml of *water* and 40 ml of *ethanol*. Add 1 ml of *1 M hydrochloric acid*. Titrate with 1M sodium hydroxide, determining the end point potentiometrically (2.4.25). Read the volumes added between the two points of inflection.

1 ml of *1M sodium hydroxide* is equivalent to 0.3109 g of $C_{17}H_{26}N_2O,HCl$.

Ropivacaine hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 60 Endotoxin Unit per g of ropivacaine hydrochloride.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in well-closed containers and at a temperature not exceed 30°.

Ropivacaine Injection

Ropivacaine Hydrochloride Injection

Ropivacaine Hydrochloride Injection is a sterile solution of Ropivacaine Hydrochloride in Water for Injections.

Ropivacaine Hydrochloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_{17}H_{26}N_2O,HCl$.

Usual strengths. 2.0 mg per ml; 5.0 mg per ml; 7.5 mg per ml; 10 mg per ml.

Description. A clear, colourless solution.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

B. In the Enantiomeric purity, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.0.

Limit of Ropivacaine related compound A (2,6-Dimethylaniline hydrochloride). Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Test solution. Dilute a volume of injection to obtain a solution containing 0.2 per cent w/v of ropivacaine hydrochloride in the mobile phase.

Use chromatographic system and reference solution as described under assay.

- flow rate: 1.5 ml per minute,

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ropivacaine hydrochloride and ropivacaine hydrochloride impurity A is not less than 5.0 and signal- to- noise ratio for the ropivacaine hydrochloride impurity A is not less than 10.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of the peak due to ropivacaine impurity A is not more than 0.1 times of the area of the principal peak in the chromatogram obtained with the reference solution (0.01 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection with mobile phase to obtain a solution containing 0.0075 per cent w/v of Ropivacaine Hydrochloride.

Reference solution. A solution containing 0.0075 per cent w/v of *ropivacaine hydrochloride IPRS* and 0.000075 per cent of *ropivacaine hydrochloride impurity B IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm packed with immobilised α-1 acid glycoprotein on spherical silica particles (5 µm),
- mobile phase: take 35.0 ml of *isopropyl alcohol* into a 500-ml volumetric flask and make up the volume with buffer solution prepared by diluting 7.5 ml of *1 M monobasic sodium phosphate* solution and 28.5 ml of *0.5 M dibasic sodium phosphate dihydrate* solution to a 1000 ml with *water* and mix. Adjusted to pH 7.2, if necessary,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention times are about 0.75 for ropivacaine impurity B and 1.0 for ropivacaine.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to ropivacaine hydrochloride and ropivacaine hydrochloride impurity B is not less than 1.5.

Inject the test solution. The area of any secondary peak corresponding to ropivacaine hydrochloride impurity B is not more than 2.0 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 60 Endotoxin Unit per g of Ropivacaine Hydrochloride.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection with mobile phase to obtain a solution containing 0.025 per cent w/v of Ropivacaine Hydrochloride.

Reference solution. A solution containing 0.025 per cent w/v of *ropivacaine hydrochloride IPRS* and 0.000025 per cent w/v of *ropivacaine hydrochloride impurity A IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm).
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 1.8 g of *monobasic sodium hydrogen phosphate* and 2.9 g of *disodium hydrogen phosphate dihydrate* in 1000 ml of *water* adjusted to pH 8.0, if necessary and 60 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the principal peak and the peak due to ropivacaine hydrochloride impurity A RS is not less than 5 and the relative standard deviation for replicate injection is not more than 1.0 per cent obtained with the reference solution.

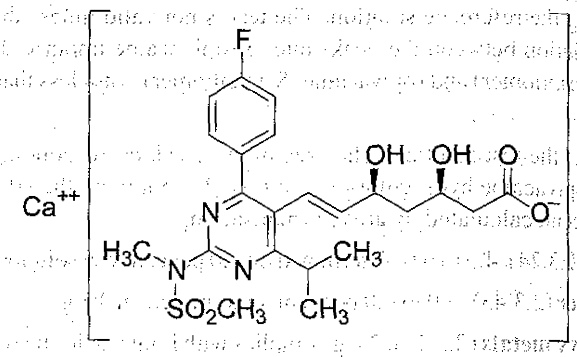
Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{26}N_2O,HCl$ in the Injection.

Storage. Store in single dose or multiple dose containers, preferably of Type I glass or of suitable plastic.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of ropivacaine hydrochloride.

Rosuvastatin Calcium



$(C_{22}H_{27}FN_3O_6S)_2.Ca$ Mol. Wt. 1001.1

Rosuvastatin Calcium is (*E*)-(3*R*,5*S*)-7-{4-(4-fluorophenyl)-6-isopropyl-2-{methyl(methylsulphonylamino)}pyrimidin-5-yl}-3,5-dihydroxyhepten-6-oic acid calcium.

Rosuvastatin Calcium contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{22}H_{27}FN_3O_6S)_2.Ca$, calculated on the anhydrous basis.

Category. Antihyperlipidaemic.

Description. An off- white to creamish white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rosuvastatin calcium IPRS* or with the reference spectrum of rosuvastatin calcium.

B. Dissolve 20 mg in 25 ml of *methanol*, add 2 drops of *methyl red indicator* neutralise with *6 M ammonium hydroxide*. Add *3 M hydrochloric acid* until the solution is acidic to the indicator. Add *ammonium oxalate solution*, a white precipitate is obtained.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *rosuvastatin calcium IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.2 per cent w/v *acetic acid* in *water*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase, mix and filter.

Reference solution. A 0.05 per cent w/v solution of *rosuvastatin calcium IPRS* in mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.2 per cent *acetic acid* in *water*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*, filter and degas.
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $(C_{22}H_{27}FN_3O_6S)_2Ca$.

Storage. Store protected from light and moisture.

Rosuvastatin Tablets

Rosuvastatin Calcium Tablets

Rosuvastatin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rosuvastatin, $C_{22}H_{28}FN_3O_6S$.

Usual strengths. 5 mg; 10 mg; 20 mg.

(1 mg of Rosuvastatin Calcium $(C_{22}H_{27}FN_3O_6S)_2Ca$ is equivalent to 961.9 µg of Rosuvastatin $(C_{22}H_{28}FN_3O_6S)_2$).

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of phosphate buffer pH 6.8,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. Dissolve a quantity of *rosuvastatin calcium IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ in the medium.

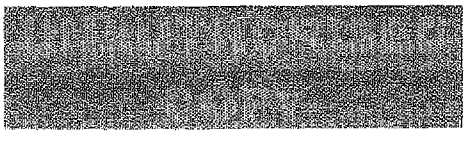
Q. Not less than 70 per cent of the stated amount of $C_{22}H_{28}FN_3O_6S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of powdered tablet containing 25 mg of rosuvastatin, disperse in 50.0 ml of the mobile phase and filter.

Reference solution (a). Dissolve a suitable quantity of *rosuvastatin calcium IPRS* in the mobile phase to obtain a solution containing 0.05 per cent w/v rosuvastatin.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase.



https://nhathuocngocanh.com/

Chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3.0 times the area of the peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modication.

Test solution. Disperse one tablet in 50.0 ml of mobile phase, mix with the aid of ultrasound and dilute to 100.0 ml with the mobile phase, filter. Dilute further, if necessary, with the mobile phase to produce a solution containing 0.005 per cent w/v solution of rosuvastatin.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powder containing 25 mg of Rosu-vastatin, disperse in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase and filter.

Reference solution. Dissolve a quantity of *rosuvastatin calcium IPRS* in mobile phase to obtain a solution containing 0.025 per cent w/v of rosuvastatin. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 585 volumes of a buffer solution prepared by dissolving 1.54 g of *ammonium acetate* in 900 ml *water*, adjust pH to 4.0 with *glacial acetic acid* and dilute to 1000 ml with *water*, 360 volumes of *acetonitrile* and 50 volumes of *tetrahydrofurane*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of Rosuvastatin.

Rosuvastatin and Ezetimibe Tablets

Rosuvastatin Calcium and Ezetimibe Tablets

Rosuvastatin and Ezetimibe Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rosuvastatin, $C_{22}H_{28}FN_3O_6S$ and ezetimibe, $C_{24}H_{21}F_2NO_3$.

Usual strengths. Rosuvastatin 5 mg, Ezetimibe 10 mg; Rosuvastatin 20 mg, Ezetimibe 10 mg; Rosuvastatin 40 mg, Ezetimibe 10 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium, 900 ml of a buffer solution prepared by dissolving 10 g of *sodium lauryl sulphate* in 1000 ml of *water*,
Speed and time. 50 rpm for 45 minutes.
Withdraw a suitable volume of the medium and filter, rejecting the first few ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above, diluted suitably if necessary, with the dissolution medium.

Reference solution. Dissolve an accurately weighed quantity of *rosuvastatin calcium IPRS* and *ezetimibe IPRS* in the solvent mixture and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use chromatographic system (except the requirement of sample temperature 5°) and solvent mixture as described under Assay.

Inject the reference solution and the test solution.

Calculate the contents of $C_{22}H_{28}FN_3O_6S$ and $C_{24}H_{21}F_2NO_3$, in the tablets.

Q. Not less than 70 per cent of the stated amounts of $C_{22}H_{28}FN_3O_6S$ and $C_{24}H_{21}F_2NO_3$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14).

Use chromatographic system, solvent mixture and test solution as described under Assay.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one tablet with 70 ml of solvent mixture ultrasound for 10 minutes, add sufficient solvent mixture to produce 100.0 ml, mix, centrifuge at 2500 rpm for about 20 minutes and filter. Dilute the filtrate, if necessary.

Use chromatographic system, solvent mixture and reference solution described under Assay.

Inject the reference solution and the test solution.

Calculate the contents of $C_{22}H_{28}FN_3O_6S$ and $C_{24}H_{21}F_2NO_3$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *dimethyl formamide* and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of Rosuvastatin with 70 ml of solvent mixture, ultrasound for 10 minutes, add sufficient solvent mixture to produce 100.0 ml, mix and filter.

Reference solution. A solution containing 0.053 per cent w/v of *rosuvastatin calcium IPRS* and 0.1 per cent w/v solution of *ezetimibe IPRS* in solvent mixture. Dilute to 1.0 ml to 10.0 ml with solvent mixture to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm ´ 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5µm) (Such as Hypersil BDS),
- sample temperature: 5°,
- mobile phase: a mixture of 600 volumes of a buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water*, 400 volumes of *acetonitrile* and 5 volumes of *triethylamine* mix and adjusted to pH 4.0 with dilute *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution.The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, and tailing factor is not more than 2.0, the column efficiency is not less than 6000 theoretical plates.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ and $C_{24}H_{21}F_2NO_3$, in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the quantity of rosuvastatin calcium in terms of the equivalent amount of rosuvastatin, and the quantity of ezetimibe.

Rosuvastatin and Fenofibrate Tablets

Rosuvastatin Calcium and Fenofibrate Tablets

Rosuvastatin and Fenofibrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rosuvastatin, $C_{22}H_{28}FN_3O_6S$ and fenofibrate, $C_{20}H_{21}ClO_4$.

Usual strengths. Rosuvastatin, 5 mg and Fenofibrate, 160 mg; Rosuvastatin, 10 mg and Fenofibrate, 80 mg; Rosuvastatin, 10 mg and Fenofibrate, 160 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium, 900 ml of a solution, prepared by dissolving 10 g of *sodium lauryl sulphate* in 1000 ml of *water*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system, solvent mixture and system suitability criteria as described under Assay.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.052 per cent w/v solution of *rosuvastatin calcium IPRS* in solvent mixture.

Reference solution (b). A 0.18 per cent w/v solution of *fenofibrate IPRS* in solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a) and (b) with dissolution medium, to obtain a solution having concentration similar to the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_{22}H_{28}FN_3O_6S$ and $C_{20}H_{21}ClO_4$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{28}FN_3O_6S$ and $C_{20}H_{21}ClO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Use chromatographic system and test solution as described under Assay.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet in 10 ml of *water* with the aid of ultrasound. Add about 30 ml of solvent mixture and disperse with aid of ultrasound for 15 minutes. Further add 30 ml of mobile phase and disperse with aid of ultrasound for 25 minutes, cool and dilute to 100.0 ml with mobile phase, mix and centrifuge at 2500 rpm for 10 minutes. Rejecting the first few ml of filtrate, dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.012 per cent w/v solution of *rosuvastatin calcium IPRS* in the solvent mixture and dilute to volume with mobile phase to obtain a solution having similar concentration to the test solution.

Use the solvent mixture and chromatographic system as described under Assay.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *N,N-diamethylformamide.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 800 mg of Fenofibrate in 125 ml of the solvent mixture, with the aid of ultrasound for 25 minutes with intermittent shaking and dilute to 250 ml with the mobile phase, mix and centrifuge. Dilute 5.0 ml of clear supernatant to 50.0 ml with the mobile phase.

Reference solution(a). A 0.052 per cent w/v solution of *rosuvastatin calcium IPRS* in the solvent mixture.

Reference solution(b). A 0.064 per cent w/v solution of *fenofibrate IPRS* in the solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a) and (b) with mobile phase, to obtain a solution having concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 0.77 g of *ammonium acetate*, add 5 ml of *triethylamine* and pH adjusted to 4.0 with *orthophosphoric acid* in 1000 ml of *water*, 60 volumes of *acetonitrile*,
- flow rate: a gradient programme using the conditions given below,

Time (in min.)	Flow (ml)
0.0	0.7
7.0	0.7
8.0	2.0
35.0	2.0
36.0	0.7
40.0	0.7

- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the relative standard deviation of replicate injections for each peaks is not more than 2.0 per cent.

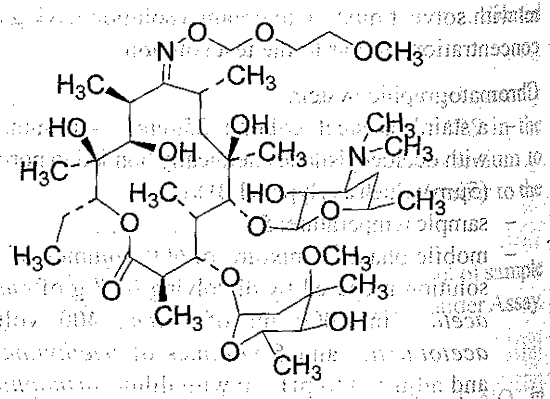
Inject reference solution (c) and the test solution.

Calculate the content of $C_{22}H_{28}FN_3O_6S$ and $C_{20}H_{21}ClO_4$ in the tablets.

Storage. Store protected from moisture at a temperature below 30°.

Labelling. The label states the strength in terms of the equivalent amount of rosuvastatin, and fenofibrate.

Roxithromycin



$C_{41}H_{76}N_2O_{15}$ Mol. Wt. 837.0

Roxithromycin is (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*S*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexo-

https://nhathuocngocanh.com/

pyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-10-[(*E*)-[(2-methoxyethoxy)methoxy]imino]-3,5,7,9,11; 13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl] oxy]oxacyclotetradecan-2-one; erythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime].

Roxithromycin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{41}H_{76}N_2O_{15}$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *roxithromycin IPRS* or with the reference spectrum of roxithromycin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). −96.0° to −93.0°, determined in a 1.0 per cent w/v solution in *acetone*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity I)* in 10 ml of reference solution (a). Further dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

Reference solution (d). Dilute 1.0 ml of *toluene* to 100.0 ml with *acetonitrile*. Dilute 0.2 ml of the solution to 200.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature: 15°,
- mobile phase: A. a mixture of 26 volumes of *acetonitrile* and 74 volumes of a 5.97 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 4.3 with *dilute sodium hydroxide solution*,
  B. a mixture of 30 volumes of *water* and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
50	100	0
80	90	10
100	100	0

The relative retention time between roxithromycin and erythromycin 9-(E)-[O-[[(2-methoxyethoxy) methoxy]methyl] oxime] (roxithromycin impurity I) is about 1.15.

Inject reference solution (c). The test is not valid unless the peak-to-valley ratio H_p / H_v is not less than 2.0, where H_p = height above the baseline of the peak due to impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Inject reference solution (b), (d) and the test solution. In the chromatogram obtained with the test solution the area of the impurity I peak obtained immediately after the peak obtained with roxithromycin is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The area of any other individual impurity peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Ignore any peak due to toluene identified using reference solution (d).

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *acetone* and dilute to 20 ml with the same solvent mixture. This solution complies with the limit test for heavy metals, Method A (10 ppm), prepring the lead standard solution in the mixture of 15 volumes of *water* and 85 volumes of *acetone*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

https://nhathuocngocanh.com/

Water (2.3.43). Not more than 3.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution.*

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin IPRS* in the solvent mixture.

Reference solution (b). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (roxithromycin impurity I)* in 10.0 ml of reference solution (a). Further dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature 15°,
- mobile phase: mix 307 volumes of *acetonitrile* and 693 volumes of a 4.91 per cent w/v solution of *ammonium dihydrogen phosphate* adjusted to pH 5.3 with *dilute sodium hydroxide solution*,
- flow rate:1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio H_p / H_v is not less than 1.5.

Inject reference solution (a) and the test solution

Calculate the content of $C_{14}H_{26}N_2O_{15}$.

Storage. Store protected from light and moisture.

Roxithromycin Tablets

Roxithromycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of roxithromycin, $C_{41}H_{76}N_2O_{15}$.

Usual strengths. 150 mg; 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.0*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. A 0.0166 per cent w/v solution of *roxithromycin IPRS* in the dissolution medium.

Chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{41}H_{76}N_2O_{15}$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{41}H_{76}N_2O_{15}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution.*

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.2 g of Roxithromycin, add 80 ml of the solvent mixture and mix. Dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin IPRS* in the solvent mixture.

Reference solution (b). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (roxithromycin impurity I)* in 10 ml of reference solution (a). Further dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with spherical end capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature: 15°,
- mobile phase: mix 307 volumes of *acetonitrile* and 693 volumes of a 4.91 per cent w/v solution of *ammonium dihydrogen phosphate* adjusted to pH 5.3 with *dilute sodium hydroxide solution*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject reference solution (b). The relative retention time between roxithromycin and erythromycin-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity I) is about 1.15. The test is not valid unless the peak-to-valley ratio H_p / H_v is not less than 1.5, where H_p = height above the baseline of the peak due to impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

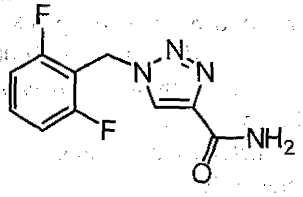
Inject reference solution (a) and the test solution.

Calculate the content of $C_{41}H_{76}N_2O_{15}$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. If the tablets are dispersible, the label states that the tablets should be dispersed in water immediately before use.

Rufinamide



$C_{10}H_8F_2N_4O$ Mol Wt. 238.2

Rufinamide is 1-(2,6-Difluorobenzyl)-1*H*-[1,2,3]triazole-4-carboxamide.

Rufinamide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_8F_2N_4O$, calculated on dried basis.

Category. Anticonvulsant.

Description. A white or off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rufinamide IPRS* or with the reference spectrum of rufinamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0ml with solvent mixture.

Reference solution. A 0.00025 per cent w/v solution of *rufinamide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. a mixture of 90 volumes of buffer solution prepared to dissolve 6.9 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water* adjusted to pH 3.5 with ortho*phosphoric acid* and 10 volumes of *methanol,*

  B. a mixture of 10 volumes of buffer solution and 90 volumes of *methanol,*
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	05
10	90	10
20	90	10
35	65	35
45	55	45
60	55	45
65	95	05
75	95	05

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. 30 volumes of buffer solution and 70 volumes of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.0025 per cent w/v solution of *rufinamide IPRS* in the solvent mixture.

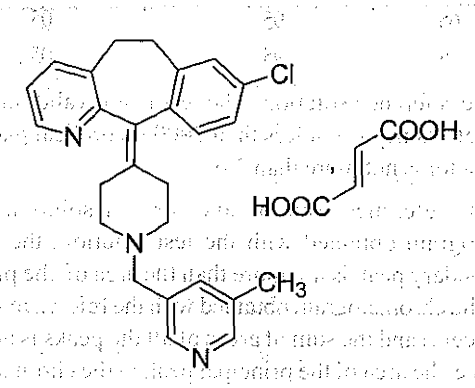
Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of buffer solution prepared to dissolving 3.48 g of *dipotassium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 with *orthophosphoric acid* , 10 volumes of *acetonitrile* and 15 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_8F_2N_4O$.

Rupatadine Fumarate



$C_{30}H_{30}ClN_3O_4$ Mol. Wt. 532.0

Rupatadine Fumarate is 8-Chloro-6,11-dihydro-11-[1-[(5-methyl-3-pyridinyl)methyl]-4-piperidinylidene]-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine fumarate.

Rupatadine Fumarate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{30}ClN_3O_4$, calculated on the dried basis.

Category. Antiallergic.

Description. An off-white to pale yellow, powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rupatadine fumarate IPRS* or with the reference spectrum of rupatadine fumarate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile*, 30 volumes of *methanol* and 40 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore the peak due to fumaric acid.

Fumaric acid. 20.0 to 25.0 per cent.

Weigh 0.3 g and dissolve in 60 ml of equal volumes of *methanol* and *water*. Titrate with *0.1 M sodium hydroxide* and determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.005803 of *fumaric acid.*

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *rupatadine fumarate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{30}H_{30}ClN_3O_4$.

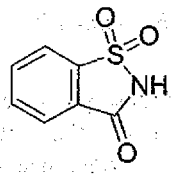
Saccharin



$C_7H_5NO_3S$ Mol. Wt. 183.2

Saccharin is 1,2-benzisothiazol-3(2*H*)-one 1,1-dioxide.

Saccharin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_5NO_3S$, calculated on the dried basis.

Category. Pharmaceutical aid (sweetening agent).

Description. White crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *saccharin IPRS* or with the reference spectrum of saccharin.

B. Mix 20 mg with 20 mg of *resorcinol*, add 0.5 ml of *sulphuric acid* and heat over a small flame until a dark green colour is produced; allow to cool and add 10 ml of *water* and an excess of *2 M sodium hydroxide*; a fluorescent green liquid is produced.

C. Dissolve 0.1 g in 5 ml of a 10 per cent w/v solution of *sodium hydroxide*, evaporate to dryness and gently fuse the residue over a small flame until ammonia is no longer evolved. Allow to cool, dissolve in 20 ml of *water*, make the solution just acidic to litmus paper, filter and add 0.05 ml of *ferric chloride solution*; a violet colour is produced.

D. A saturated solution is acidic to *litmus paper*.

Tests

Appearance of solution. Dissolve 5.0 g in 20 ml of a 20 per cent w/v solution of *sodium acetate* and dilute to 25 ml with the same solution; the solution is clear (2.4.1), and colourless (2.4.1).

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 25 mg of *caffeine* in *dichloromethane* and dilute to 100 ml with the same solvent.

Test solution. Suspend 10.0 g of the substance under examination in 20 ml of *water* and dissolve using about 5 ml of *strong sodium hydroxide solution*. If necessary, adjust the pH of the solution to 7.8 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 50 ml with *water*. Shake the solution with 4 quantities, each of 50 ml, of *dichloromethane*. Combine the lower layers, dry over *anhydrous sodium sulphate* and filter. Wash the filter and the sodium sulphate with 10 ml of *dichloromethane*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40°. With a small quantity of *dichloromethane* transfer quantitatively the residue into a suitable 10-ml tube, evaporate to dryness in a current of *nitrogen* and dissolve the residue in 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *dichloromethane* to dryness in a water-bath at a temperature not exceeding 40°. Dissolve the residue in 1 ml of *dichloromethane*.

Reference solution. Dissolve 20 mg of *o-toluenesulphonamide* and 20 mg of *p-toluene sulphonamide* in *dichloromethane* and dilute to 100 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with *dichloromethane*. Evaporate 5 ml of the final solution to dryness in a current of *nitrogen*. Dissolve the residue in 1 ml of the internal standard solution.

Chromatographic system
- a fused silica column 10 m × 0.53 mm packed with polymethylphenylsiloxane (film thickness 2 µm),
- temperature:
  column: 180°,
  inlet port and detector: 250°,
- flame ionization detector,
- flow rate: 10 ml per minute, using nitrogen as the carrier gas,
- split ratio: 1:2.

Inject 1 µl of each solution. The order of elution is *o*-toluenesulphonamide, *p*-toluenesulphonamide, caffeine.

The test is not valid unless the resolution between the peaks due to *o*-toluenesulphonamide and *p*-toluenesulphonamide in the chromatogram obtained with the reference solution is not less than 1.5 and the chromatogram obtained with the blank solution does not show any peak with the same retention times as the internal standard, *o*-toluenesulphonamide and *p*-toluenesulphonamide.

In the chromatogram obtained with the test solution the ratio of the area of the peak due to *o*-toluenesulphonamide to that of the internal standard is not more than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

In the chromatogram obtained with the test solution the ratio of the area of the peak due to *p*-toluenesulphonamide to that of the internal standard is not more than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

https://nhathuocngocanh.com/

Arsenic (2.3.10). Mix 5.0 g with 3.0 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and add to the cooled residue a mixture of 16 ml of *brominated hydrochloric acid AsT* and 5 ml of *bromine solution*. Add 40 ml of *water* and boil gently, adding sufficient bromine solution from time to time to maintain a slight excess. Filter and remove the excess of bromine with a sufficient quantity of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Readily carbonisable substances. Dissolve 0.2 g in 5 ml of *sulphuric acid (96 per cent w/w)* and maintain at about 50° for 10 minutes. The solution is not more intensely coloured than reference solution BYS6 (2.4.1).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

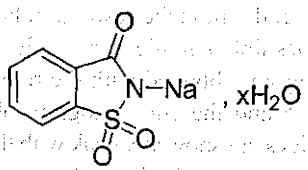
Assay. Weigh 0.5 g, dissolve in 40 ml of *ethanol (95 per cent)*, add about 40 ml of *water*. Titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01832 g of $C_7H_5NO_3S$.

Storage. Store protected from moisture.

Saccharin Sodium

Soluble Saccharin



$C_7H_4NNaO_3S,xH_2O$ Mol. Wt. 205.2

Saccharin Sodium is the sodium salt of 1,2-benzisothiazol-3(2*H*)-3-one 1,1-dioxide.

Saccharin Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_4NNaO_3S$, calculated on the anhydrous basis.

It may be anhydrous or contain a variable quantity of *water*.

Category. Pharmaceutical aid (sweetening agent).

Description. A white, crystalline powder or colourless crystals; efflorescent in dry air.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *saccharin sodium IPRS* or with the reference spectrum of saccharin sodium.

B. Dissolve 0.1 g in 5 ml of a 10 per cent w/v solution of *sodium hydroxide*, evaporate to dryness and gently fuse the residue over a small flame until ammonia is no longer evolved. Allow to cool, dissolve in 20 ml of *water*, make the solution just acidic to *litmus paper*, filter and add 0.05 ml of *ferric chloride solution*; a violet colour is produced.

C. Mix 20 mg with 20 mg of *resorcinol*, add 0.5 ml of *sulphuric acid* and heat over a small flame until a dark green colour is produced; allow to cool and add 10 ml of *water* and an excess of *2 M sodium hydroxide*; a fluorescent green liquid is produced.

D. To 5 ml of a 10 per cent w/v solution add 3 ml of *2 M hydrochloric acid*; a white precipitate is produced. The precipitate, after washing with *water* and drying at 105° melts at 226° to 230° (2.4.21).

E. 0.5 ml of a 10 per cent w/v solution gives reaction (B) of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 5.0 g in sufficient *carbon dioxide-free water* to produce 50 ml (solution A). To 10 ml of solution A add 0.1 ml of *phenolphthalein solution*. The solution is neither pink nor red. Add 0.05 ml of *0.1 M sodium hydroxide*. The solution becomes pink or red.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 25 mg of *caffeine IPRS* in *dichloromethane* and dilute to 100 ml with the same solvent.

Test solution. Suspend 10.0 g of the substance under examination in 50 ml of *water*. If necessary, adjust the pH of the solution to 7.8 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 50 ml with *water*. Shake the solution with 4 quantities, each of 50 ml, of *dichloromethane*. Combine the lower layers, dry over *anhydrous sodium sulphate* and filter. Wash the filter and the sodium sulphate with 10 ml of *dichloromethane*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40°. With a small quantity of

https://nhathuocngocanh.com/

dichloromethane transfer quantitatively the residue into a suitable 10-ml tube, evaporate to dryness in a current of *nitrogen* and dissolve the residue in 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *dichloromethane* to dryness in a water-bath at a temperature not exceeding 40°. Dissolve the residue in 1 ml of *dichloromethane*.

Reference solution. Dissolve 20 mg of *o-toluenesulphonamide* and 20 mg of *p-toluene sulphonamide* in *dichloromethane* and dilute to 100 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with *dichloromethane*. Evaporate 5 ml of the final solution to dryness in a current of *nitrogen*. Dissolve the residue in 1 ml of the internal standard solution.

Readily carbonisable substances. Dissolve 0.2 g in 5 ml of *sulphuric acid* and maintain at about 50° for 10 minutes. The solution is not more intensely coloured than reference solution BS6 (2.4.1).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

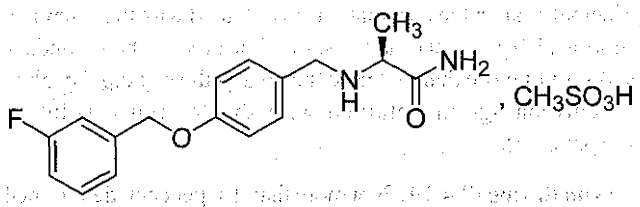
Water (2.3.43). Not more than 15.0 per cent, determined on 0.2 g.

Assay. Weigh 0.15 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, with slight heating if necessary. Titrate with *0.1M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02052 g of $C_7H_4NNaO_3S$.

Storage. Store protected from moisture.

Safinamide Methane Sulphonate



$C_{17}H_{19}FN_2O_2CH_4SO_3$ Mol Wt. 398.5

Safinamide Methane Sulphonate is (*S*)-2-(4-(3-Fluorobenzyloxy)benzylamino)propanamide methane sulphonate.

Safinamide Methane Sulphonate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{19}FN_2O_2CH_4SO_3$, calculated on dried basis.

Category. Antiparkinsonian.

Description. A white to off-white powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in mobile phase and diluted to 50.0 ml with mobile phase.

Reference solution. A 0.01 per cent w/v solution of *safinamide methane sulphonate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 45 volumes of buffer solution prepared to dissolve 6.8 g of *potassium dihydrogen orthophosphate* and 2.22 g of *sodium octanesulfonate* in 1000 ml of *water*, 10 volumes of *acetonitrile* and 45 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than 0.1 time the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the area all the secondary peaks is not more than 0.2 time the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in mobile phase and dilute to 50.0 ml with mobile phase.

Reference solution. A 0.1 per cent w/v solution of *safinamide methane sulphonate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,

- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

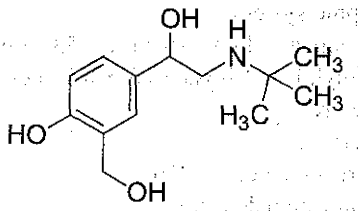
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0. and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{19}FN_2O_2CH_4SO_3$.

Salbutamol

Albuterol



$C_{13}H_{21}NO_3$ Mol. Wt: 239.3

Salbutamol is (*RS*)-1-(4-hydroxy-3-hydroxymethylphenyl)-2-(*tert*-butylamino)ethanol.

Salbutamol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_{21}NO_3$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salbutamol IPRS* or with the reference spectrum of salbutamol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.008 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 276 nm; absorbance at about 276 nm, about 0.53 to 0.60.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to salbutamol that in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg in 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*, shake and allow to separate; an orange-red colour is produced in the chloroform layer.

https://nhathuocngocanh.com/

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A solution containing 0.03 per cent w/v each of *salbutamol IPRS* and *(1RS)-2-[(1,1-dimethylethyl) amino]-1-(4- hydroxyphenyl)ethanol IPRS (salbutamol impurity A IPRS)* in the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate,* adjusted to pH 3.7 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention time with reference to salbutamol for salbutamol impurity A is about 1.3.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to salbutamol and salbutamol impurity A is not less than 3.0.

Inject the reference solution and the test solution. Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Boron. To 50 mg add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate,* evaporate to dryness on a water-bath and dry at 120°. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool, add 0.5 ml of *water* and 3.0 ml of a freshly prepared 0.125 per cent w/v solution of *curcumin* in *glacial acetic acid.* Evaporate to dryness and allow to cool. Add 3 ml of a mixture prepared by adding 5 ml of *sulphuric acid,* slowly and with stirring, to 5 ml of *glacial acetic acid.* Mix and allow to stand for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 100.0 ml, filter and measure the absorbance of the filtrate at 555 nm (2.4.7). Prepare a reference solution in the following manner. Dissolve 0.572 g of *boric acid* in 1000.0 ml of *water.* Dilute 1.0 ml to 100.0 ml with water. To 2.5 ml of the solution add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate* and treat this mixture in the same manner as described above beginning at the words "Evaporate to dryness...". The absorbance of the solution prepared from the substance under examination is not more than that of the reference solution (50 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g, dissolve in 30 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02393 g of $C_{13}H_{21}NO_3$.

Storage. Store protected from light.

Salbutamol Inhalation

Salbutamol Inhalation Aerosol; Albuterol Inhalation Aerosol

Salbutamol Inhalation is a suspension of microfine Salbutamol or Salbutamol Sulphate in a suitable liquid in a suitable pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilising agents etc.

Salbutamol Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$, per inhalation, by actuation of the valve.

Usual strength. 100 µg in each metered-dose.

Identification

A. Discharge the container a sufficient number of times into a mortar to obtain about 2 mg of salbutamol, grind the residue thoroughly with 0.1 g of potassium bromide, add a further 0.2 g of potassium bromide and mix thoroughly.

On the resultant dispersion determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salbutamol IPRS* or *salbutamol sulphate IPRS* or with the reference spectrum of salbutamol or salbutamol sulphate.

https://nhathuocngocanh.com/

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Discharge the inhaler a sufficient number of times into a small, dry beaker to obtain 10 mg of Salbutamol and dissolve the residue in 0.5 ml of *methanol*.

Reference solution (a). Dilute 1.0 volume of test solution (a) to 200 volumes with *methanol*.

Reference solution (b). A 0.010 per cent w/v solution of *salbutamol IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, place it for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised sulphanilic acid solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot with an R_f value higher than 0.85.

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Follow the procedure described under Assay wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Use 30 ml of *ethanol* for preparations containing salbutamol and 30 ml of a mixture of equal volumes of *ethanol* and *water* for preparations containing salbutamol sulphate and dilute with *ethanol* to produce a solution containing 10 µg of salbutamol per ml. To 20 ml of the solution in a separating funnel add 180 ml of *water* and in the following order, 4 ml of a 5 per cent w/v solution of *sodium bicarbonate*, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes in subdued light and extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of *cotton wool*, dilute to 25 ml with *chloroform* and measure the absorbance of the resulting solution at 605 nm (2.4.7). Calculate the content of $C_{13}H_{21}NO_3$ in the solution from the absorbance obtained by repeating the operation using a suitable quantity of a 0.001 per cent w/v solution of *salbutamol IPRS* in *ethanol*.

Calculate the amount of $C_{13}H_{21}NO_3$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{13}H_{21}NO_3$ delivered per actuation of the valve meets the requirements.

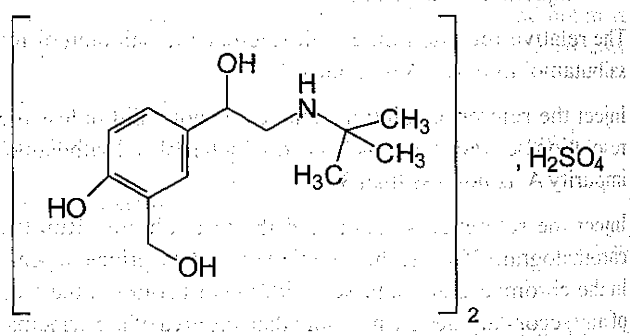
Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states whether the preparation contains Salbutamol or Salbutamol Sulphate.

When the active ingredient is Salbutamol Sulphate, the quantity is stated in terms of the equivalent amount of salbutamol.

Salbutamol Sulphate

Albuterol Sulphate



$(C_{13}H_{21}NO_3)_2,H_2SO_4$ Mol. Wt. 576.7

Salbutamol Sulphate is (*RS*)-1-(4-hydroxy-3-hydroxymethylphenyl)-2-(*tert*-butylamino)ethanol sulphate.

Salbutamol Sulphate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{13}H_{21}NO_3)_2,H_2SO_4$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B and C may be omitted if tests A, D and E are carried out.

https://nhathuocngocanh.com/

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salbutamol sulphate IPRS* or with the reference spectrum of salbutamol sulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.008 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 276 nm is 0.44 to 0.51.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to salbutamol that in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg in 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*, shake and allow to separate; an orange-red colour is produced in the chloroform layer.

E. It gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or alkalinity. To 10 ml of a 1.0 per cent w/v solution in *carbon dioxide-free water* add 0.15 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A solution containing 0.03 per cent w/v each of *salbutamol IPRS* and *(1RS)-2-[(1,1-dimethylethyl) amino]-1-(4- hydroxyphenyl)ethanol IPRS (salbutamol impurity A IPRS)* in the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate*, adjusted to pH 3.7 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention time with reference to salbutamol for salbutamol impurity A is about 1.3, for 5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-2-hydroxybenzaldehyde (salbutamol impurity D) is about 2.7 and for (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[4-(benzyloxy)-3- (hydroxymethyl) phenyl]ethanol (salbutamol impurity I) is about 23.2. The relative response factors to that of salbutamol impurity D is 2.63 and salbutamol impurity I is 1.47.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to salbutamol and salbutamol impurity A is not less than 3.0.

Inject the reference solution and the test solution. Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.17 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Boron. To 50 mg add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate*, evaporate to dryness on a water-bath and dry at 120°. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool, add 0.5 ml of *water* and 3.0 ml of a freshly prepared 0.125 per cent w/v solution of *curcumin* in *glacial acetic acid*. Evaporate to dryness and allow to cool. Add 3 ml of a mixture prepared by adding 5 ml of *sulphuric acid*, slowly and with stirring, to 5 ml of *glacial acetic acid*. Mix and allow to stand for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 100.0 ml, filter and measure the absorbance of the filtrate at 555 nm (2.4.7). Prepare a reference solution in the following manner. Dissolve 0.572 g of *boric acid* in 1000.0 ml of *water*. Dilute 1.0 ml to 100.0 ml with *water*. To 2.5 ml of the solution add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate* and treat this mixture in the same manner as described above beginning at the words " Evaporate to dryness.....". The absorbance of the solution prepared from the substance under examination is not more than that of the reference solution (50 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.4 g, dissolve in 5 ml of *anhydrous formic acid*, add 35 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

https://nhathuocngocanh.com/

1 ml of *0.1 M perchloric acid* is equivalent to 0.05767 g of $(C_{13}H_{21}NO_3)_2, H_2SO_4$.

Storage. Store protected from light.

Salbutamol Injection

Albuterol Sulphate Injection; Salbutamol Sulphate Injection

Salbutamol Injection is a sterile solution of Salbutamol Sulphate in Water for Injections containing suitable stabilising agents.

Salbutamol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strengths. The equivalent of 250 µg of salbutamol per ml; the equivalent of 500 µg of salbutamol per ml; the equivalent of 5 mg of salbutamol in 5 ml (for intravenous infusion). (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. Dilute a volume with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.008 per cent w/v of salbutamol. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 276 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Evaporate a suitable volume of the injection to dryness using a rotary evaporator, wash the residue with four quantities, each of 5 ml, of *ethanol*, filter, evaporate the filtrate to dryness and dissolve the residue in sufficient *water* to produce a solution containing the equivalent of 0.1 per cent w/v of salbutamol.

Reference solution. A 0.12 per cent w/v solution of *salbutamol sulphate IPRS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable, place for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised nitroaniline solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dilute a volume containing 0.5 mg of salbutamol to 50 ml with water, add 1 ml of *dilute ammonia solution*, 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

D. A volume containing 1 mg of salbutamol gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 3.4 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 5 mg of Salbutamol in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0004 per cent w/v of *(1RS)-2-[(1,1-dimethylethyl)amino]-1-(4- hydroxyphenyl)ethanol IPRS (salbutamol impurity A IPRS)* and 0.0005 per cent w/v of *salbutamol sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm) (Such as Waters Symmetry C8),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate*, adjusted to pH 3.7 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

https://nhathuocngocanh.com/

Assay. Dilute a volume, measured, containing about 0.15 mg of salbutamol with sufficient *water* to produce 80 ml, add 4 ml of a 5 per cent w/v solution of *sodium bicarbonate*, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes, protected from light. Extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of cotton wool and dilute to 25.0 ml with *chloroform*. Measure the absorbance of the resulting solution at 605 nm (2.4.7).

Calculate the content of $C_{13}H_{21}NO_3$ from the absorbance obtained by repeating the operation using 10.0 ml of a 0.0018 per cent w/v solution of *salbutamol sulphate*.

Storage. Store protected from light, in single dose containers in which the air has been displaced by nitrogen or other suitable inert gas.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol in a suitable dose-volume.

Salbutamol Syrup

Albuterol Sulphate Syrup; Salbutamol Sulphate Syrup

Salbutamol Syrup contains Salbutamol Sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strength. The equivalent of 2 mg of salbutamol in 5 ml. (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. To 5 ml add 50 ml of a 2 per cent w/v solution of *borax*, 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

B. To 5 ml add sufficient *1 M sodium hydroxide* to make the solution alkaline, add 1 ml of *alkaline borate buffer pH 9.2* and 1 ml of a 0.04 per cent w/v solution of *2,6-dichloroquinone chlorimide* in *ethanol (95 per cent)*; a blue colour develops.

Tests

pH (2.4.24): 3.4 to 4.5.

2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the oral solution containing 5 mg of salbutamol in the mobile phase and dilute to 50 ml with the mobile phase, filter.

Reference solution. A 0.00005 per cent w/v solution of *2-tert-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol sulphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C8),
- mobile phase: A. 1.5 volumes of *propan-2-ol* and 98.5 volumes of *0.1 M ammonium acetate*, adjusted to pH 4.5 with *glacial acetic acid*,
  B. *propan-2-ol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
20	86	14
30	86	14
35	100	0
40	100	0

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-*tert*-butylamino-1-(4-hydroxy-3-methylphenyl)ethanol is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To a measured volume containing 4 mg of salbutamol add 25 ml of *0.05 M sulphuric acid* and extract with two quantities, each of 50 ml, of *ether*. Collect the aqueous layers into a 250-ml volumetric flask and combine the ether extracts. Wash the combined ether extracts with 50 ml of *water* and add the aqueous layer to the solution in the 250 ml volumetric flask. Discard the ether extracts and dilute the aqueous solution with sufficient *water* to produce 250.0 ml. To 10.0 ml of the solution add sufficient *water* to produce 80 ml and add 4 ml of a 5 per cent w/v solution of *sodium bicarbonate*, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes, protected from light. Extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of cotton wool and dilute to 25.0 ml with *chloroform*. Measure the absorbance of the resulting solution at 605 nm (2.4.7).

Calculate the content of $C_{13}H_{21}NO_3$ from the absorbance obtained by repeating the operation using 10.0 ml of a 0.0018 per cent w/v solution of *salbutamol sulphate*.

https://nhathuocngocanh.com/

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol in a suitable dose-volume.

Salbutamol Tablets

Albuterol Sulphate Tablets; Salbutamol Sulphate Tablets

Salbutamol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strengths. The equivalent of 2 mg; 4 mg of salbutamol. (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. Carry out the method described under Related substances applying separately to the plate 2 µl of each of the following solutions. For the test solution shake a quantity of the powdered tablets containing 10 mg of salbutamol with 10 ml of *methanol (80 per cent)* and filter. The reference solution contains 0.12 per cent w/v of *salbutamol sulphate IPRS*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Shake a quantity of the powdered tablets containing 8 mg of salbutamol with 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

C. Shake a quantity of the powdered tablets containing 4 mg of salbutamol with 10 ml of *water* and filter; the filtrate gives the reactions of sulphates (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 10 mg of salbutamol with 1 ml of *water* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.006 per cent w/v solution of *salbutamol sulphate IPRS* in *water*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, place it for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised sulphanilic acid solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any pink spot near the line of application.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Add 50 ml of *water* to one tablet, shake for 1 hour, add sufficient *water* to produce 100.0 ml, mix and centrifuge. Dilute further with *water*, if necessary, to produce a solution containing 0.002 per cent w/v of salbutamol.

Reference solution (a). A 0.0024 per cent w/v of *salbutamol sulphate IPRS* in *water*.

Reference solution (b). A 0.048 per cent w/v of *2-tert-butylamino-1-(4-hydroxy-3-methylphenyl) ethanol sulphate IPRS* and 0.048 per cent w/v of *salbutamol sulphate IPRS* in *methanol (10 per cent)*.

Chromatographic system

- a stainless steel column 20 cm x 5 mm, packed with spherical particles of silica, 5 µm in diameter, the surface of which has been modified with chemically-bonded nitrile groups (Such as Spherisorb CN),
- mobile phase: a mixture of 65 volumes of *water*, 30 volumes of *0.05 M ammonium acetate* and 5 volumes of *2-propanol*, adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless resolution between two principal peaks in the chromatogram obtained with reference solution (b) is at least 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{21}NO_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of salbutamol, transfer to a 250-ml volumetric flask, add 60 ml of *water* and shake for 60 minutes, dilute to volume with *water*. Mix and centrifuge 10 ml of the solution and use the supernatant liquid.

Reference solution (a). A 0.0024 per cent w/v of *salbutamol sulphate IPRS* in *water*.

Reference solution (b). A solution containing 0.0024 per cent w/v of *2-tert-butylamino-1-(4-hydroxy-3-methylphenyl)*

https://nhathuocngocanh.com/

ethanol sulphate IPRS and 0.0024 per cent w/v of *salbutamol sulphate IPRS in methanol (10 per cent)*.

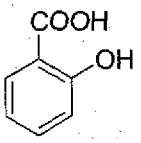
Use chromatographic procedure described under Uniformity of content. The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5.

Calculate the content of $C_{13}H_{21}NO_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol.

Salicylic Acid



$C_7H_6O_3$ Mol. Wt. 138.1

Salicylic Acid is 2-hydroxybenzoic acid.

Salicylic Acid contains not less than 99.0 per cent and not more than 100.5 per cent of $C_7H_6O_3$, calculated on the dried basis.

Category. Keratolytic.

Description. White or colourless, acicular crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salicylic acid IPRS* or with the reference spectrum of salicylic acid.

B. Dissolve about 30 mg in 5 ml of *0.05 M sodium hydroxide*, neutralise if necessary and dilute to 20 ml with *water*. 1 ml of the solution gives reaction (A) of salicylates (2.3.1).

C. Melting range. 158° to 161° (2.4.21).

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *ethanol (95 per cent)*. The resulting solution is clear, and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.5 g of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *salicylic acid impurity C* in the mobile phase.

Reference solution (b). A 0.025 per cent w/v solution of *salicylic acid impurity B IPRS* in the mobile phase.

Reference solution (c). A 0.05 per cent w/v solution of *salicylic acid impurity A* in the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (e). Dilute a mixture of 1.0 ml of each of reference solution (a), (b) and (c) to 10.0 ml with the mobile phase.

Reference solution (f). Dilute a mixture of 0.1 ml of each of reference solution (a), (b) and (c) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 40 volumes of *methanol* and 60 volumes of *water*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Name	Relative retention time
Salicylic acid impurity A[1]	0.7
Salicylic acid impurity B[2]	0.9
Salicylic acid impurity C[3]	1.0

[1]4-hydroxybenzoic acid,

[2]4-hydroxyisophthalic acid,

[3]Phenol.

Inject reference solutions (d) and (e). The test is not valid unless the 3rd peak in the chromatogram corresponds to the peak due to phenol in the chromatogram obtained with reference solution (d) and the resolution between the peaks due to impurities B and C is not less than 1.0 in the chromatogram obtained with reference solution (e).

Inject reference solution (f) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to salicylic acid impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.1 per cent). The area of any peak corresponding to salicylic acid impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.05 per cent). The area of any peak corresponding to salicylic acid

https://nhathuocngocanh.com/

impurity C is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.02 per cent), the area of any other secondary peak is not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (f) (0.05 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.2 per cent). Ignore any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (f).

Heavy metals (2.3.13). Dissolve 2.0 g in 15 ml of *ethanol (95 per cent)* and add 5 ml of *water*. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (100 ppm Pb)* diluted with a mixture of 3 volumes of *ethanol (95 per cent)* and 1 volume of *water* to contain 2 µg of Pb per ml to prepare the standard.

Iron (2.3.14). Boil 12.0 g with 14 ml of *dilute ammonia solution* and 35 ml of *water*. Cool and adjust the pH 5.0 to 6.0 by the dropwise addition of *dilute ammonia solution* or *dilute sulphuric acid* and dilute to 50 ml with *water*, if necessary. Any pink colour produced is not more intense than that obtained by boiling 2.0 g with 1 ml of *iron standard solution (20 ppm Fe)*, 2 ml of *dilute ammonia solution* and 45 ml of *water*, adjusting the pH 5.0 to 6.0 and diluting to 50 ml with *water* (2 ppm).

Chlorides (2.3.12). Dissolve 5.0 g in 50 ml of boiling *distilled water*, cool and filter (solution A). 20 ml of solution A complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 7.5 ml of solution A complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* in a desiccator.

Assay. Weigh 0.3 g, dissolve in 50 ml of *ethanol (95 per cent)*, add 20 ml of *water* and titrate with *0.1 M sodium hydroxide*, using *phenol red solution* as indicator, until a reddish violet colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01381 g of $C_7H_6O_3$.

Storage. Store protected from light.

Salicylic Acid Ointment

Salicylic Acid Ointment contains Salicylic Acid in a suitable water-emulsifying basis.

Salicylic Acid Ointment contains not less than 95.0 per cent and not more than 105.0 per cent w/w of the stated amount of salicylic acid, $C_7H_6O_3$.

Usual strengths. 2.0 per cent w/w; 6 per cent w/w; 12 per cent w/w.

Identification

Shake 1 g of ointment with 10 ml of *water*. Filter and add to the filtrate *ferric chloride solution*. An intense reddish violet colour is produced which persists on addition of *6 M acetic acid*. Further, addition of *2 M hydrochloric acid*, the colour disappears and a white, crystalline precipitate is produced.

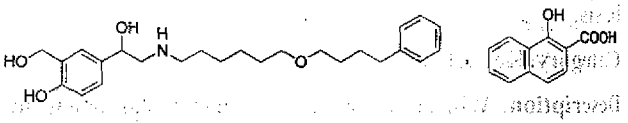
Tests

Other tests. Comply with the test stated under Ointments.

Assay. Weigh 10 g and dissolve in a mixture of 20 ml of *ethanol (95 per cent)* and 20 ml *ether* and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01381 g of $C_7H_6O_3$.

Salmeterol Xinafoate



$C_{25}H_{37}NO_4, C_{11}H_8O_3$ Mol. Wt. 603.7

Salmeterol Xinafoate is (*RS*)-4-hydroxy-α^1-[[[6-(4-phenylbutoxy)hexyl]amino]methyl]-1,3-benzenedimethanol 1-hydroxy-2-naphthoate.

Salmeterol Xinafoate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{36}H_{45}NO_7$, calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salmeterol xinafoate IPRS* or with the reference spectrum of salmeterol xinafoate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

NOTE—Protect the solutions from light.

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 24 volumes of a 0.77 per cent w/v solution of *ammonium acetate* and 24 volumes of a 2.88 per cent w/v solution of *sodium dodecyl sulphate*, adjusted to pH 2.7 with *glacial acetic acid* and 52 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
16	100	0
36	30	70
45	30	70
50	100	0
60	100	0

Name	Relative retention time
Xinafoic Acid	0.2
Salmeterol impurity A[1]	0.3
Salmeterol impurity B[2]	0.5
Salmeterol impurity C[3]	0.7
Salmeterol impurity D[4]	0.8

Salmeterol (Retention time: about 13 minutes)	1.0
Salmeterol impurity F[6]	1.6
Salmeterol impurity G[7]	2.7

[1](1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[(4-phenylbutyl)amino] ethanol,

[2](1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(2-phenylethoxy)hexyl]amino]ethanol,

[3](1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(3-phenylpropoxy)hexyl] amino]ethanol,

[4]1-[4-[2-hydroxy-2-[4-hydroxy-3-(hydroxymethyl)phenyl]ethoxy]-3-(hydroxymethyl)phenyl]-2-[[6-(3-phenylbutoxy)hexyl]amino] ethanol,

[5]1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(1-methyl-3-phenylpropoxy) hexyl]amino]ethanol,

[6](1*RS*)-1-(4-hydroxy-3-methylphenyl)-2-[[6-(4-phenylbutoxy)hexyl] amino]ethanol,

[7]1-[4-hydroxy-3-[[[2-hydroxy-2-[4-hydroxy-3-(hydroxymethyl) phenyl]ethyl][6-(4-phenylbutoxy)hexyl]amino]methyl]phenyl]-2-[[6-(4-phenylbutoxy)hexyl]amino]ethanol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to salmeterol impurity D is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any peak corresponding to salmeterol impurities A, F, G each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 9 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.9 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak due to xinafoic acid.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 12.5 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *salmeterol xinafoate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 24 volumes of a 0.77 per cent w/v solution of *ammonium acetate* with 24 volumes of a 2.89 per cent w/v solution of *sodium dodecyl sulphate*, adjusted to pH 2.7 with *glacial acetic acid* and 52 volumes of *acetonitrile*,

https://nhathuocngocanh.com/

- flow rate: 2 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{36}H_{45}NO_7$.

Storage. Store protected from light.

Salmeterol and Fluticasone Propionate Inhalation

Salmeterol and Fluticasone Propionate Inhalation is a suspension of microfine Salmeterol Xinafoate and Fluticasone Propionate in a suitable liquid filled in a suitable pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilizing agents.

Salmeterol and Fluticasone Propionate Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amounts of salmeterol, $C_{25}H_{37}NO_4$ and fluticasone propionate, $C_{25}H_{31}F_3O_5S$, per inhalation by actuation of the valve.

Usual strengths. Salmeterol, 25 µg and Fluticasone Propionate, 50 µg; Salmeterol, 25 µg and Fluticasone Propionate, 125 µg; Salmeterol, 25 µg and Fluticasone Propionate, 250 µg; Salmeterol, 50 µg and Fluticasone Propionate, 100 µg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

Test solution. Prepare using the mobile phase as described under the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Reference solution (a). A solution containing 0.5 mg of salmeterol per ml prepared by dissolving 15 mg of *salmeterol xinafoate IPRS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (b). A solution containing 0.5 mg of fluticasone propionate per ml prepared by dissolving 10 mg of *fluticasone propionate IPRS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (c). Dilute suitable volumes of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution containing 5 µg Salmeterol and 50 µg Fluticasone propionate per ml or quantities as per the label claim.

Chromatographic system
- a stainless steel column 15 cm × 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 1.15 g *ammonium dihydrogen orthophosphate* to 1000 ml of *water* and adjusted to pH 3.5 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 30 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl or 200 µl.

Inject reference solution (c). The test is not valid unless the column efficiency for salmeterol and fluticasone propionate peak is not less than 1000 and 2500 theoretical plates respectively and the tailing factor is not more than 2.0 for each peak and the relative standard deviation for replicate injections for each component is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ in the solution and the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve.

Determine the contents of the active ingredients a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve meet the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amounts of active ingredients delivered per inhalation.

Salmeterol and Fluticasone Propionate Powder for Inhalation

Salmeterol and Fluticasone Propionate Powder for Inhalation consists of Fluticasone Propionate and Salmeterol Xinafoate in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Salmeterol and Fluticasone Propionate Powder for Inhalation contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amounts of salmeterol $C_{25}H_{37}NO_4$ and fluticasone propionate, $C_{25}H_{31}F_3O_5S$ per unit dose.

Usual strengths. Salmeterol, 200 µg and Fluticasone Propionate, 125 µg; Salmeterol, 200 µg and Fluticasone Propionate, 250 µg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Other tests. Comply with the tests stated under the Inhalation Preparations (Powders for Inhalation).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules in sufficient of the mobile phase to get a solution containing 5 µg per ml of Salmeterol.

Reference solution (a). A solution containing 0.5 mg of salmeterol per ml prepared by dissolving 15 mg of *salmeterol xinafoate IPRS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (b). A solution containing 0.5 mg of fluticasone propionate per ml prepared by dissolving 10 mg of *fluticasone propionate IPRS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (c). Dilute suitable volumes of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution containing 5 µg Salmeterol and 50 µg Fluticasone propionate per ml or quantities as per the label claim.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 1.15 g *ammonium dihydrogen orthophosphate* to 1000 ml of *water* and adjusted to pH 3.5 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 30 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl or 200 µl.

Inject reference solution(c). The test is not valid unless the column efficiency determined from the salmeterol and fluticasone propionate peak is not less than 1000 and 2500 theoretical plates respectively, the tailing factor for each of salmeterol and fluticasone propionate peaks is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

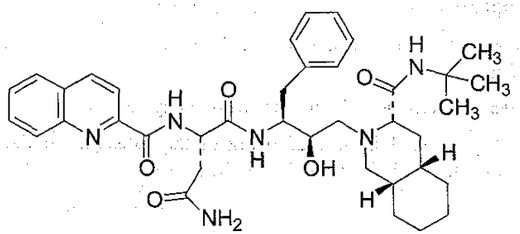
Inject reference solution (c) and the test solution.

Calculate the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ per unit.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labelling. The label states the quantities of active ingredients per pre-metered unit.

Saquinavir



$C_{38}H_{50}N_6O_5$ Mol. Wt. 670.8

Saquinavir is (*S*)-*N*-[(α*S*)-α-{(1*R*)-2-[(3*S*,4a*S*,8a*S*)-3-(*tert*-butylcarbamoyl)octahydro-2(1*H*)-isoquinolyl]-1-hydroxyethyl}phenethyl]-2-quinaldamidosuccinamide.

Saquinavir contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{38}H_{50}N_6O_5$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *saquinavir IPRS* or with the reference spectrum of saquinavir.

https://nhathuocngocanh.com/

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. When examined in the range 220 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 239 nm and 290 nm.

Tests

Specific optical rotation (2.4.22). −55.0° to −50.0°, determined in a 0.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the test solution and reference solution (c).

Inject reference solution (c). Calculate the amount of related substance by area normalisation method. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit tests for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *saquinavir IPRS* in the mobile phase.

Reference solution (b). Dissolve suitable quantities of *saquinavir-related compound A IPRS* and *saquinavir IPRS* in the mobile phase to obtain a solution containing 2 µg per ml of saquinavir-related compound A and 0.25 mg per ml of saquinavir.

Reference solution (c). A 0.000025 per cent w/v solution of *saquinavir IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol*, 50 volumes of *acetonitrile* and 30 volumes of a buffer prepared by dissolving 4 g of *sodium dihydrogen phosphate* in 1000.0 ml of *water* to which 1 ml of *diethylamine* and 1 g of *sodium octane sulphonate* has been added,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention times are about 0.89 for saquinavir-related compound A and about 1.0 for saquinavir.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to saquinavir-related compound A and saquinavir is not less than 1.5, the column efficiency determined from the saquinavir peak is not less than 500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak.

Calculate the content of $C_{38}H_{50}N_6O_5$.

Storage. Store protected from light.

Saquinavir Capsules

Saquinavir Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of saquinavir, $C_{38}H_{50}N_6O_5$.

Usual strength. 200 mg.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *saquinavir mesylate IPRS* or with the reference spectrum of saquinavir mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of citrate buffer prepared by dissolving 5.82 g of *anhydrous dibasic sodium phosphate* and 16.7 g of *citric acid monohydrate* in *water* and dilute to 1000 ml with *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{38}H_{50}N_6O_5$ in the medium from the absorbance obtained from a solution of known concentration of *saquinavir mesylate IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{38}H_{50}N_6O_5$.

https://nhathuocngocanh.com/

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Inject the test solution. The area of any secondary peak is not more than 0.2 per cent and sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Water (2.3.43). Not more than 3.0 per cent, determined on 1 g.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of mixed contents of Capsules containing 22 mg of Saquinavir in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *saquinavir mesylate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 20°,
- mobile phase: a mixture of 140 volumes of 1.0 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 2.5 with *orthophosphoric acid*, 50 volumes of *tetrahydrofuran* and 10 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

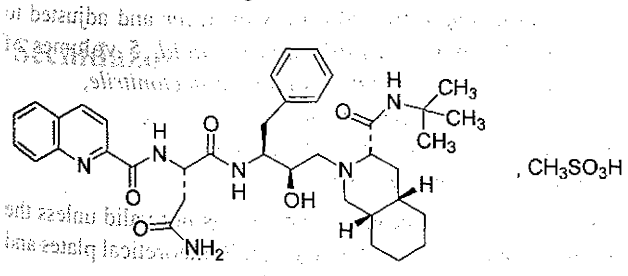
Inject the reference solution. The test is not valid unless the column efficiency is not less than 500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{50}N_6O_5$ in the capsules.

Storage. Store protected from moisture.

Saquinavir Mesylate



, CH_3SO_3H

$C_{38}H_{50}N_6O_5,CH_4O_3S$ Mol. Wt. 767.0

Saquinavir mesylate is (*S*)-*N*-[(a*S*)-a-{(1*R*)-2-[(3*S*,4a*S*,8a*S*)-3-(*tert*-butylcarbamoyl)octahydro-2(1*H*)-isoquinolyl]-1-hydroxyethyl}phenethyl]-2-quinaldamidosuccinamide methanesulphonate.

Saquinavir Mesylate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{38}H_{50}N_6O_5$, CH_4O_3S, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *saquinavir mesylate IPRS* or with the reference spectrum of saquinavir mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Specific optical rotation (2.4.22). –69.6° to –66.8°, determined in a 0.5 per cent w/v solution in *methanol* at 436 nm.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the test solution and reference solution (c).

Inject reference solution (c). Calculate the amount of related substances by area normalisation method. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Methanesulphonic acid. 11.9 to 13.1 per cent w/w, calculated on the anhydrous basis, determined by the following method. Weigh 0.1 g of the substance under examination, dissolve in 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentio-metrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00961 g of CH_3SO_3H.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in 100.0 ml of the mobile phase.

https://nhathuocngocanh.com/

Reference solution (a). A 0.025 per cent w/v solution of *saquinavir mesylate IPRS* in the mobile phase.

Reference solution (b). Dissolve suitable quantities of *saquinavir impurity A IPRS* and *saquinavir mesylate IPRS* in the mobile phase to obtain a solution containing 2 µg per ml of saquinavir impurity A and 0.25 mg per ml of saquinavir mesylate.

Reference solution (c). A 0.000025 per cent w/v solution of *saquinavir mesylate IPRS* in the mobile phase.

NOTE — Store the buffer solution protected from light. Make adjustments if necessary for system suitability.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 140 volumes of 1.0 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 2.5 with *orthophosphoric acid*, 50 volumes of *tetrahydrofuran* and 10 volumes of *acetoritrile*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention times are about 0.89 for saquinavir impurity A and about 1.0 for saquinavir mesylate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to saquinavir impurity A and saquinavir mesylate is not less than 1.5, the column efficiency determined from the saquinavir mesylate peak is not less than 500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution. Run the chromatograms 3 times the retention time of the principal peak.

Calculate the content of $C_{38}H_{50}N_6O_5$, CH_4O_3S.

Storage. Store protected from light.

Saquinavir Mesylate Tablets

Saquinavir Mesylate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of saquinavir $C_{38}H_{50}N_6O_5$.

NOTE —Perform the tests and assay using low-actinic glassware.

Usual strength. 200 mg.

Identification

A. In the Assay, the principal spot in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 400 nm (2.4.7), 1 ml of a 0.1 per cent w/v solution in *methanol* diluted to 100 ml with *citrate buffer pH 3.0* (see under Dissolution), shows absorption maxima at the same wavelengths as shown by the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *citrate buffer pH 3.0* prepared by dissolving 5.82 g of *anhydrous dibasic sodium phosphate* and 16.7 g of *citiric acid monohydrate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid*.

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly. Use the filtrate, dilute if necessary, with the dissolution medium. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 240 nm. Calculate the content of $C_{38}H_{50}N_6O_5$ in the medium from the absorbance obtained from a solution of known concentration of *saquinavir mesylate IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{50}N_6O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets Disperse a quantity of the powder containing 100 mg of saquinavir in 100 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *saquinavir mesylate IPRS* equivalent to *saquinavir* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *triethylamine phosphate solution* prepared by diluting 10 ml of *triethylamine* to 1000 ml with *water* and adjusted to pH 2.5 with *orthophosphoric acid*, 5 volumes of tetrahydrofuran and 1 volume of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram for 5 times the retention time (about 12 minutes) of the principal peak. In the chromatogram obtained with the

https://nhathuocngocanh.com/

test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with the reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of saquinavir, dissolve in 100.0 ml of mobile phase and filter. Dilute 5.0 ml of the filtrate to 20.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *saquinavir mesylate IPRS* equivalent to *saquinavir* in the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of a solution prepared by diluting 10.0 ml of *triethylamine* to 1000 ml with *water*, adjusted to pH 2.5 with *orthophosphoric acid* and filtering, 5 volumes of *tetrahydrofuran* and 1 volume of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

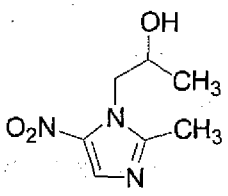
Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{50}N_6O_5$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of saquinavir.

Secnidazole



$C_7H_{11}N_3O_3$ Mol. Wt. 185.2

Secnidazole is (*RS*)-1-(2-methyl-5-nitroimidazol-1-yl) propan-2-ol.

Secnidazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_{11}N_3O_3$, calculated on the anhydrous basis.

Category. Antiamoebic.

Description. A white to yellowish white, crystalline powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 277 nm, 0.325 to 0.355.

B. Heat about 10 mg in a water-bath with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml of *2 M hydrochloric acid* for 5 minutes and cool. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *1 M hydrochloric acid* is not more opalescent than opalescence standard OS2 (2.4.1) and not more intensely coloured than reference solution GYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution (b). A solution containing 0.005 per cent w/v each of *2-methyl-5-nitroimidazole IPRS* and *secnidazole IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of 0.14 per cent w/v solution of *potassium dihydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between 2-methyl-5-nitroimidazole and secnidazole is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2 times the area of the peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks

https://nhathuocngocanh.com/

is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.5 per cent). Disregard any peak which is 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.0 to 6.0 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *secnidazole IPRS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of 0.14 per cent w/v solution of *potassium dihydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Secnidazole Tablets

Secnidazole Tablets contain not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of secnidazole, $C_7H_{11}N_3O_3$.

Usual strengths. 1 g; 2 g.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*.

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of $C_7H_{11}N_3O_3$ in the medium from the absorbance obtained from a solution of known concentration of *secnidazole IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_7H_{11}N_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of powdered tablets containing 50 mg of Secnidazole, disperse in 100 ml of mobile phase and filter.

Reference solution (a). A 0.05 per cent w/v solution of *secnidazole IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase.

Chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.0 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 6.5 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablet containing 50 mg of Secnidazole, disperse in 100.0 ml of mobile phase and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with mobile phase.

Reference solution. A 0.005 per cent w/v solution of *secnidazole IPRS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *0.01 M potassium dihydrogen orthophosphate* and 15 volumes of *acetonitrile*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,
– spectrophotometer set at 228 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

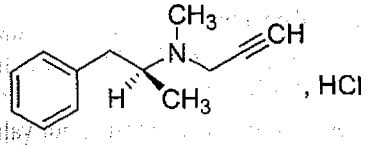
Inject the reference solution and the test solution.

Calculate the content of $C_7H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength of secnidazole.

Selegiline Hydrochloride



$C_{13}H_{17}N,HCl$ Mol. Wt. 223.7

Selegiline Hydrochloride is(*R*)-Methyl(α-methylphenethyl) prop-2-ynylamine hydrochloride.

Selegiline Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{17}N,HCl$, calculated on the dried basis.

Category. Antiparkinsonian.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *selegiline hydrochloride IPRS* or with the reference spectrum of selegiline hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 4.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water.*

Specific optical rotation (2.3.22). –12.0° to –10.0°, determined on a 10.0 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.1 per cent w/v of *selegiline hydrochloride IPRS* and 0.02 per cent w/v of *butyl parahydroxybenzoate* in the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 500 volumes of *acetonitrile* and 500 volumes of butylammonium acetate buffer solution pH 6.5 prepared by dissolving 4 ml of *butylamine* in 900 ml of *water*, adjusted to pH 6.5 with *acetic acid* and dilute to 1000 ml with *water*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 215 nm,
– injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to selegiline and butyl parahydroxybenzoate is not less than 3.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.7 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

***(S)*- Selegiline.** Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 µl of *butylamine* and 1 ml of *2-propanol.*

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 8 mg of *(RS)-selegiline hydrochloride IPRS* in the solvent mixture and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 20.0 ml with the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with silica gel OD for chiral separations (5 µm),
– mobile phase: a mixture of 0.2 volume of *2-propanol* and 99.8 volumes of *cyclohexane*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 20 µl.

https://nhathuocngocanh.com/

The retention time of *(S)*-selegiline is about 10 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponidng to *(S)*-selegiline and *(R)*-selegiline is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to *(S)*-selegiline is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 60° at a pressure not exceeding 0.5 kPa.

Assay. Dissolve 0.18 g in 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02237 g of $C_{13}H_{18}ClN$.

Storage. Store protected from light.

Selegiline Tablets

Selegiline Hydrochloride Tablets

Selegiline Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of selegiline hydrochloride, $C_{13}H_{18}ClN$.

Usual strengths. 5 mg; 10 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Selegiline Hydrochloride with 2 ml of *water* and 1 ml of *1M sodium hydroxide*. Extract with 10 ml of *dichloromethane*, filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *selegiline hydrochloride IPRS*, treated in the same manner or with the reference spectrum of selegiline.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and time. 50 rpm and 20 minutes.

Withdraw a suitable volume of the medium and centrifuge at 3500 rpm for 10 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Use the clear supernatant, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *selegiline hydrochloride IPRS* in the dissolution medium to obtain a solution having the same concentration as that to the test solution.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 80 volumes of *0.1 M monobasic ammonium phosphate*, adjusted to pH 3.1 with *orthophosphoric acid* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 15 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{17}N,HCl$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{17}N,HCl$.

(*S*)-Selegiline. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 ml of *propan-2-ol* and 10 µl of *butylamine*.

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Selegiline Hydrochloride with the solvent mixture and dilute to 10.0 ml with the mobile phase, shake thoroughly, filter.

Reference solution (a). Dissolve 8 mg of (RS)-*selegiline hydrochloride IPRS* in the solvent mixture and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel OD for chiral separation (5 µm) (Such as Chiralcel OD),
- mobile phase: a mixture of 0.2 volume of *propan-2-ol* and 99.8 volumes of *cyclohexane*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

The retention time of (*S*)-selegiline is about 10 minutes.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks corresponding to (*S*)-selegiline and (*R*)-selegiline in the chromatogram obtained with reference solution (a) is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to (*S*)-selegiline is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Selegiline Hydrochloride with 10.0 ml of a mixture of equal volumes of *methanol* and *acetonitrile*, filter. Dilute 5.0 ml of the filtrate to 10.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *methylamphetamine hydrochloride* in the mobile phase.

Reference solution (c). A solution containing 0.005 per cent w/v of *selegiline hydrochloride IPRS* and 0.001 per cent w/v of *nortriptyline hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: dilute a mixture of 250 ml of *methanol* and 250 ml of *acetonitrile* to 1000 ml with a solution prepared by dissolving 4 ml of *butylamine* in 900 ml of *water*, adjusted to pH 6.5 with *acetic acid* and diluted to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of not more than two such peaks is more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of any such peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.2 per cent).

If, in the chromatogram obtained with the test solution, the area of any peak corresponding to methylamphetamine is more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b), the following limits apply. The area of any peak corresponding to methylamphetamine is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of any such peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times that of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using following test solution.

Test solution. Disperse 1 tablet in 50 ml of equal volumes of *methanol* and *acetonitrile* and dilute with water to obtain a solution containing 0.005 per cent w/v solution of Selegiline Hydrochloride.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Selegiline Hydrochloride with 100.0 ml of a mixture of equal volumes of *methanol* and *acetonitrile*, filter. Dilute 50.0 ml of the solution to 100.0 ml with *water*.

Reference solution (a). A 0.005 per cent w/v solution of *selegiline hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v of *selegiline hydrochloride IPRS* and 0.001 per cent w/v of *nortriptyline hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The assay is not valid unless the resolution between the two principal peaks is not less than 3.0.

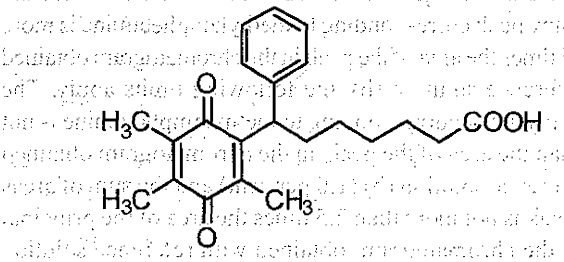
Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{18}ClN$ in the tablets.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Seratrodast



$C_{22}H_{26}O_4$ Mol Wt. 354.4

Seratrodast is 7-Phenyl-7-(2,4,5-trimethyl-3,6-dioxocyclohexa-1,4-dien-1-yl)heptanoic acid.

Seratrodast contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{26}O_4$, calculated on the dried basis.

Description. A pale yellow to orange powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *seratrodast IPRS* or with the reference spectrum of seratrodast.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with solvent mixture.

Reference solution. A 0.0003 per cent w/v solution of *seratrodast IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.1 per centv/v solution of *orthophosphoric acid* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
20	40	60
30	25	75
40	25	75
50	40	60
65	40	60

Inject reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105°, for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile*.

Test solution. Dissolve 0.1g of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *seratrodast IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.1 per cent v/v solution of *orthophosphoric acid* in *water* and 65 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215nm,
- injection volume: 20 µl.

Inject reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution and the test solution.

Calculate the content of $C_{22}H_{26}O_4$.

https://nhathuocngocanh.com/

Serratiopeptidase

Serratiopeptidase is a proteolytic enzyme for oral use which is produced by bacteria of genus Serratia.

Serratiopeptidase contains not less than 2000 units and not more than 2600 units of serratiopeptidase activity per mg.

Category. Proteolytic enzyme.

Description. A grayish white to pale brown powder.

Identification

Dissolve 0.4 g of serratiopeptidase in 100 ml of *acetic acid sodium acetate buffer solution pH 5.0*, transfer exactly 1 ml of the solution into 3 test tubes, refer them as A, B and C. Add 1 ml of *water* in tube A. In tube B and C add 1 ml of *0.04 M disodium edetate solution*. Mix gently and allow them to stand at 4±1°, for 1 hour. Add 2 ml of *water* in tube A and C. Add 2 ml of *0.04 M zinc chloride* solution in tube B. Mix gently and allow them to stand at 4±1°, for 1 hour. Pipette 1 ml of A and B and make up the volume to 200 ml with *borate buffer pH 9.0*. Pipette 1 ml of C and make up the volume to 50 ml with *borate buffer pH 9.0*. Proceed with these solutions as sample solutions as directed in the assay. The activities of solution A and B are almost same and the activity of C is not more than 5 per cent of that of activity of A.

Tests

Arsenic (2.3.10). Dissolve 2.0 g in 50 ml of *water*, and add 10 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated Ash (2.3.18). Not more than 7.0 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1 g by drying in an oven at 105° for 4 hours.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g and total fungal count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Assay. Unit definition: one serratiopeptidase unit is defined as the amount of enzyme required to liberate 1 µg of free tyrosine per minute under the specified assay conditions.

sodium borate hydrochloric acid buffer pH 9.0. Dissolve 19 g *sodium borate* in 900 ml of *water*. Adjust the pH 9.0 with *1 M hydrochloric acid* and dilute with *water* to 1000 ml.

Substrate solution. Dissolve 1.2 g dried casein in 100 ml of *sodium borate hydrochloric acid buffer pH 9.0*. Keep it on boiling water-bath for 1-2 minutes to get clear solution. Cool and filter through cotton and dilute with *sodium borate hydrochloric acid buffer pH 9.0* to 200 ml.

Protein precipitating solution. To 18 g of *trichloroacetic acid*, add 30 g of *sodium acetate* and 20 ml of *glacial acetic acid*, and dilute with *water* to 1000 ml.

Dilute folin's reagent. 1 ml of *folin's reagent*, add 2 ml of *water*.

Reference tyrosine solution. Dissolve 10 mg of *tyrosine* in 1 ml of *1 M hydrochloric acid* and dilute to 100 ml with *sodium borate hydrochloric acid buffer pH 9.0*.

Reference tyrosine curve. To 1, 2, 3, 4 and 5 ml of *reference tyrosine solution*, add 5, 4, 3, 2 and 1 ml of *sodium borate hydrochloric acid buffer pH 9.0* respectively. Add 5 ml of *protein precipitating reagent* in each tube. To 2 ml of these solutions, add 5 ml of 6.0 per cent w/v *sodium carbonate solution*. Add 1 ml of diluted *folin's reagent* mix and allow to stand at 37° for 30 minutes, measure the absorbance at 660 nm (2.4.7). Plot a graph of µmol of tyrosine per system against the absorbance.

Stock test solution. Weigh about 0.1 g of the substance under examination, dissolve in 100 ml of *sodium borate hydrochloric acid buffer pH 9.0* (solution A). Mix and keep it for 5 minutes. Take 1 ml of solution A and dilute to 200 ml with *sodium borate hydrochloric acid buffer pH 9.0* (solution B).

Test solution. Pipet 1.0 ml of *stock test solution*, allow to stand in a water-bath at 37° for 5 minutes. Add 5 ml of substrate solution shake immediately and allow to stand in water-bath at 37° for 20 minutes. Add 5 ml of *protein precipitating solution*. Mix and allow to stand in water-bath at 37° for 30 minutes and filter. Take 2 ml of the filtrate, add 5 ml of 6.0 per cent w/v *sodium carbonate solution*. Add 1 ml of *diluted folin's reagent* mix and allow to stand at 37° for 30 minutes. Measure the absorbance at 660 nm (2.4.7).

Blank solution. Pipet 1.0 ml of *stock test solution*, allow to stand in a water-bath at 37° for 5 minutes, add 5 ml of *protein precipitating solution*, shake immediately and allow to stand in water-bath at 37° for 20 minutes. Add 5 ml of substrate solution. Mix and allow to stand in water-bath at 37° for 30 minutes and filter. Take 2 ml of the filtrate, add 5 ml of 6.0 per cent w/v *sodium carbonate solution*. Add 1 ml of *diluted folin's reagent* mix and allow stand at 37° for 30 minutes. Measure the absorbance at 660 nm (2.4.7).

Calculate the serratiopeptidase IU/mg by using concentration of tyrosine from graph considering the reaction time and dilution.

Storage. Store protected from light and moisture, at temperature not exceeding 30°.

https://nhathuocngocanh.com/

Serratiopeptidase Tablets

Serratiopeptidase Tablets contain not less than 90.0 per cent of the stated amount of Serratiopeptidase.

Usual strengths. 5 mg; 10 mg.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. The tyrosine units are dissolved in *sodium carbonate solution*, which is alkaline in nature. The *Folin's ciocalteau reagent* helps in colour development where the tyrosine units bind to the copper molecule in the reagent and causes the reduction of phosphomolybdate which is present in the reagent. There is formation of tyrosine-copper molybdate coloured complex. The intensity of colour depends upon the tyrosine units present which is read at 660 nm.

Disodium tetraborate buffer. Dissolve 19.0 gm of *disodium tetraborate* in 900 ml of *water*, adjusted to pH 9.0 with *1 M hydrochloric acid* and dilute to 1000 ml with *water*.

Casein hammerstein substrate. Dissolve 1.2 gm of *Casein Hammerstein* to 100 ml of the sodium tetraborate buffer. Allow the casein to dissolve and form homogeneous solution. Boil the solution in boiling water-bath for 2 minutes. After removing from boiling water-bath, cool the casein substrate immediately in ice cold water. Filter the solution through cotton plug to get clear solution and dilute to 200 ml with *water*.

NOTE—Always add casein to the buffer while stirring. Do not add buffer to casein as this will cause lumps and not go into solution completely and giving incorrect values.

Trichloroacetic acid reagent. Dissolve 18 gm of *trichloroacetic Acid*, 30 gm of *anhydrous sodium acetate* and 20 ml of *glacial acetic acid* in 1000 ml of *water*.

NOTE—TCA should be in the crystal form and not in liquid form as this will effect the quantity weighed and thereby interfere with the complete precipitation of casein. Use Sodium acetate anhydrous because if, sodium acetate trihydrate should be used, the trihydrate forms gives lower results.

Diluted Folin's Ciocalteau Reagent. Dilute 1 ml of Folin's Ciocalteau reagent with 2 ml of *water* to get 3 ml of the reagent.

NOTE—Folin's Ciocalteau reagent should be of the protein estimation grade and not the indicator grade. Folin's reagent should be diluted to just before addition to the tubes since it is sensitive to light. Do not prepare this solution at the beginning of the assay.

Tyrosine reference solution. Dissolve 160 mg of *tyrosine* in 100 ml of *0.2 M hydrochloric acid.*

Dilute 1 ml of the solution to 100 ml with *0.2 M hydrochloric acid.* Use 2 ml of the solution for colour development.

Trisodium phosphate buffer pH 6.8. Weigh 19 g of *trisodium phosphate* and 6.4 ml of *hydrochloric acid* in 1000 ml of *water*, adjusted to pH 6.8.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 120 mg of Serratiopeptidase with 100 ml of *trisodium phosphate buffer pH 6.8.* Stir on magnetic stirrer for 1 hour. Further dilute 5.0 ml to 25 ml with *5.0 per cent ammonium sulphate solution,* stir for 5 minutes and filter. Dilute 2 ml of the filtrate to 100 ml with *sodium tetraborate buffer*. 1 ml of resulting solution is used for analysis. Set the water bath to 37°.

For each sample, keep four test tubes. Mark two test tubes as test and two as blank. Add 5 ml of Casein Substrate to the tubes marked as test and 5 ml. of TCA to the test tube marked as blank. Prewarm these tubes for five minutes along with the tubes containing the sample dilutions. Add 1 ml of enzyme solution to all these tubes and vertex the tubes for exactly 10 seconds. Keep the test tubes in the water-bath at 37° for 20 minutes for the reaction. After exactly 20 minutes, add 5 ml of TCA to tubes marked as test and 5 ml of Casein substrate to the tube marked as blank Vortex all the tubes exactly for 30 seconds. Keep the tubes in the water-bath at 37° for 30 minutes for precipitation, filter.

NOTE— For tablets, the settlement may take a longer time than 30 minutes. So filter the solution after the settlement is clearly seen (Vortex in between for better precipitation).

Mark tubes as test, blank, tyrosine and tyrosine blank.

Add the following respectively;

Test – 2 ml of the test filtrate.

Blank – 2 ml of blank filtrate.

Tyrosine – 2 ml of tyrosine standard solution.

Tyrosine blank – 0.2 M hydrochloric acid.

Add 5 ml of 6 per cent sodium carbonate solution to all tubes.

Add 1 ml of diluted Folin's reagent to all the tubes. Keep the tubes at 37° for 30 minutes for colour development. Measure the absorbance at about 660 nm (2.4.7).

$$\text{Serratiopeptidase Units/Tablet} = \frac{A_1 - A_2}{A_3 - A_4} \times 176 \times \frac{T}{0.160} \times \frac{1}{20} \times \frac{100}{\text{Spl. wt. (g)}} \times \frac{25}{5} \times \frac{100}{2} \times \text{Avg. wt. in g}$$

$$\text{Percentage of L.A.} = \frac{\text{Serratiopeptidase Units/Tablet}}{\text{L.A.}} \times 100$$

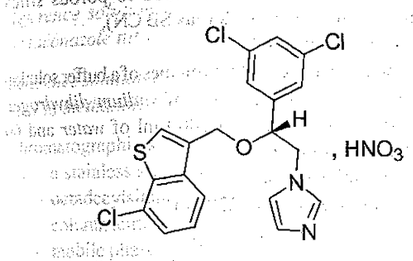
where, 176 = Conversion Co-efficient of Tyrosine to Serratiopeptidase,

T = Actual weight of Tyrosine taken (g),
0.160 = Theoretical weight of Tyrosine to be taken
20 = Reaction time (minutes),
A_1 = Absorbance of test solution,
A_2 = Absorbance of blank solution,
A_3 = Absorbance of tyrosine reference solution,
A_4 = Absorbance of 0.2M hydrochloric acid,
L.A. = Labelled amount/tablet.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of the equivalent to Enzyme activity units of Serratiopeptidase.

Sertaconazole Nitrate



$C_{20}H_{16}Cl_3N_3O_4S$ Mol. Wt. 500.8

Sertaconazole Nitrate is (*RS*)-1-[2-[(7-Chloro-1-benzothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole nitrate.

Sertaconazole Nitrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{20}H_{16}Cl_3N_3O_4S$ calculated on the anhydrous basis.

Category. Antifungal.

Description. A white or almost white powder.

Identification

Test A and C may be omitted if tests B, D and E are carried out. Tests B, D and E may be omitted if test A and C are carried out.

A. Melting point (2.4.21). 156° to 161°.

B. When examined in the range 240 nm to 320 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* gives absorption maxima at 260 nm, 293 nm and 302 nm and the absorbance ratio (A_{302}/A_{293}) is 1.16 to 1.28.

C. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sertaconazole nitrate IPRS* or with the reference spectrum of sertaconazole nitrate.

D. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 1 volume of *concentrated ammonia,* 40 volumes of *toluene* and 60 volumes of *dioxane.*

Solvent mixture. 10 volumes of *concentrated ammonia* and 90 volumes of *methanol.*

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). A 0.4 per cent w/v solution of *sertaconazole nitrate IPRS* in the solvent mixture.

Reference solution (b). A 0.4 per cent w/v solution of *miconazole nitrate IPRS* in reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate in air for 15 minutes and expose to iodine vapour for 30 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The spot in the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

E. It gives the reactions of nitrates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *sertaconazole nitrate IPRS* and *miconazole nitrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with nitrile silica (10 µm),
- mobile phase: a mixture of 37 volumes of *acetonitrile* and 63 volumes a buffer solution prepared by dissolving 1.5 g of *sodium dihydrogen phosphate* in 1000 ml of *water*.

https://nhathuocngocanh.com/

- flow rate: 1.6 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The retention time of peaks due to nitrate ion is about 1 minute, miconazole about 17 minutes and sertaconazole about 19 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to miconazole and sertaconazole is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 1.3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding sertaconazole impurity A, B and C are not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent), the relative retention time of impurity C, impurity B and impurity A are about 0.12, 0.18 and 0.3 respectively, the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak which is 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and due to nitrate ion.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.4 g in 50 ml mixture of equal volumes of *anhydrous acetic acid* and *methyl ethyl ketone*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05008 g of $C_{20}H_{16}Cl_3N_3O_4S$.

Storage. Store protected from light.

Sertaconazole Nitrate Cream

Sertaconazole Nitrate Cream contains Sertaconazole Nitrate in a suitable cream base.

Sertaconazole Nitrate Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sertaconazole nitrate, $C_{20}H_{15}Cl_3N_2OS$ in a suitable cream base.

Usual strength. 2 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.5

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 20 mg of Sertaconazole Nitrate in 70 ml of the *methanol* and sonicate for 15 minutes with intermittent shaking. Cool to room temperature and dilute to 100.0 ml with *methanol* and filter. Further dilute 5.0 ml of the solution to 25.0 ml with *methanol*.

Reference solution. A 0.004 per cent w/v solution of *sertaconazole nitrate IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with nitrile groups chemically-bonded to porous silica particles (5 µm), (Such as Zorbax SB CN),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 1.5 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water* and 60 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{15}Cl_3N_2O_5$ in the cream.

Storage. Store at a temperature not exceeding 25°. Do not freeze.

Sertaconazole Nitrate and Beclomethasone Dipropionate Cream

Sertaconazole Nitrate and Beclomethasone Dipropionate Cream in a suitable bases.

Sertaconazole Nitrate and Beclomethasone Dipropionate Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Sertaconazole Nitrate, $C_{20}H_{15}Cl_3N_2OS$ and Beclomethasone Dipropionate, $C_{28}H_{37}ClO_7$.

Usual strength. 2.0 per cent w/w. Sertaconazole Nitrate and 0.025 per cent w/w Beclomethasone Dipropionate.

https://nhathuocngocanh.com/

Identification

In the Assay, the retention time of the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24).3.0 to 4.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 50 mg of Sertaconazole Nitrate in 30.0 ml of *methanol*, vortex to disperse the cream completely, ultrasound for 15 minutes with intermittent swirling. Cool to room temperature and dilute to 50.0 ml with *methanol* and filter.

Reference solution (a). A 0.0005 per cent w/v solution of *sertaconazole nitrate IPRS* in *methanol*.

Reference solution (b). A 0.0125 per cent w/v solution of *nitric acid* in *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. dissolve 1.5 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water* and filter, B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile Phase B (per cent v/v)
0	60	40
10	60	40
20	40	60
35	40	60
42	10	90
55	10	90
60	60	40
65	60	40

The relative retention time of Beclomethasone Dipropionate is about 0.9 with respect to Sertaconazole.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 5.0 per cent.

Inject reference solution (a) and (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) Ignore the peak corresponding to the peak in the chromatogram obtained with reference solution (b) and any peak with an area less than 0. 1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Creams

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the cream containing about 50.0 mg of sertaconazole nitrate and 0.625 mg of beclomethasone dipropionate in 30 ml of the *methanol*, vortex to disperse the cream completely, ultrasound for 15 minutes with intermittent shaking. Cool to room temperature and dilute to 50.0 ml with *methanol* and filter. (use it for the analysis of beclomethasone dipropionate). Futher dilute 5.0 ml to 50.0 ml with *methanol*, (sertaconazole).

Reference solution. A solution containing 0.01 per cent w/v of *sertaconazole nitrate IPRS* and 0.00125 per cent w/v of *beclomethasone dipropionate IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 1.5 g of *sodium dihydrogen phosphate dihydrate* in 1000 ml of *water*, and 60 volumes of *acetonitrile*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

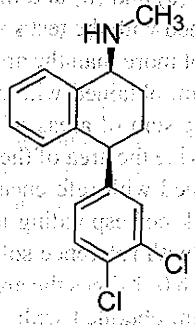
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{15}Cl_3N_2OS$ and $C_{28}H_{37}ClO_7$ in the cream.

Storage. Store below 25°. Do not refrigerate.

https://nhathuocngocanh.com/

Sertraline Hydrochloride



$C_{17}H_{17}Cl_2N,HCl$ Mol. Wt. 342.7

Sertraline Hydrochloride is (1S,4S)-4-(3,4-dichlorophenyl)-*N*-methyl-1,2,3,4-tetrahydronaphthalen-1-amine hydrochloride.

Sertraline Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{17}H_{17}Cl_2N,HCl$, calculated on the anhydrous basis.

Category. Antidepressant.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sertraline hydrochloride IPRS* or with the reference spectrum of sertraline hydrochloride.

B. Dissolve 10 mg in 5 ml of *ethanol* and add 5 ml of *water*. The solution gives reaction (A) of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). +38.8° to +43.0°, determined in a 1.0 per cent w/v solution in a mixture of 1 volume of 10.3 per cent w/v solution of *hydrochloric acid* and 19 volumes of *methanol*.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *diethylamine*, 40 volumes of *hexane* and 60 volumes of *2-propanol*.

Test solution. Dissolve 60 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *sertraline for system suitability IPRS* (containing sertraline impurity G) in 1.0 ml of the solvent mixture.

Reference solution (b). Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system.

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel AD for chiral separation (5 µm),
- mobile phase: a mixture of 30 volumes of *hexane* and 70 volumes of a mixture of 1 volume of *diethylamine*, 25 volumes of *2-propanol* and 975 volumes of *hexane*,
- flow rate: 0.4 ml per minute.
- spectrophotometer set at 275 nm,
- injection volume: 20 µl.

The elution order of the peaks is sertraline and then sertraline impurity G ((1R,4R)-4-(3,4-dichlorophenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine).

Inject reference solution (a) and (b). The test is not valid unless the signal-to-noise ratio for the peak corresponding to sertraline is not less than 10 in the chromatogram obtained with reference solution (b) and the resolution between the peaks corresponding to sertraline impurity G and sertraline is not less than 1.5 in the chromtaogram obtained with reference solution (a).

Inject reference solution (b) and the test solution. Run the chromatogram for about 30 minutes. In the chromatogram obtained with the test solution, the area of the peak corresponding to sertraline impurity G is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Impurity E. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase A and 50 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.0002 per cent w/v solution of *sertraline impurity E (mandelic acid)* in the solvent mixture.

Reference solution (b). A solution containing 0.0004 per cent w/v of *benzoic acid* and 0.0008 per cent w/v of *mandelic acid* (sertraline impurity E) in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. dissolve 1.0 g of *sodium lauryl sulphate* in 800 ml of *water* and add 200 ml of *acetonitrile*, add 1.0 ml of *orthophosphoric acid*,

  B. dissolve 1.0 g of *sodium lauryl sulphate* in 100 ml of *water* and add 900 ml of *acetonitrile*, add 1.0 ml of *orthophosphoric acid*,

https://nhathuocngocanh.com/

– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
8	60	40
9	10	90
16	10	90
24	10	90
27	60	40
35	60	40

The relative retention time with reference to sertraline (retention time: about 18 minutes) for sertraline impurity E is about 0.2 and for benzoic acid is about 0.3.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sertraline impurity E and benzoic acid is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to sertraline impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Introduce 0.25 g of the substance under examination into a 15 ml stoppered centrifuge tube, add 2.0 ml of *methanol* and 0.2 ml of a 25 per cent w/v solution of *potassium carbonate* and mix in a vortex mixer for 30 seconds. Add 8.0 ml of *dichloromethane*, stopper the tube and mix in a vortex mixer for 60 seconds. Add 1 g of *anhydrous sodium sulphate*, mix well and then centrifuge for about 5 minutes.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *dichloromethane*. Dilute 1.0 ml of the solution to 20.0 ml with *dichloromethane*.

Chromatographic system
– a fused silica column 30 m x 0.53 mm, coated with polymethylphenylsiloxane (film thickness 1.0 µm),
– temperature:

column	time (in min)	temperature (°)
	0-1	200
	1-31	200 → 260
	31-39	260

– inlet port: 250° and detector at 280°,
– flame ionization detector,
– flow rate: 9 ml per minute, using nitrogen as the carrier gas,
– split ratio: 1:10

Name	Relative retention time
Sertraline impurity B[1]	0.5
Sertraline impurity C[2]	0.7
Sertraline impurity D[3]	0.7
Sertraline (Retention time: about 24 minutes)	1.0
Sertraline impurity A[4]	1.05
Sertraline impurity F[5]	1.1

[1](1RS,4RS)-N-methyl-4-phenyl-1,2,3,4-tetrahydronaphthalen-1-amine,

[2](1RS,4RS)-4-(4-chlorophenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine,

[3](1RS,4RS)-4-(3-chlorophenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine,

[4](1RS,4SR)-4-(3,4-dichlorophenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine,

[5](4R)-4-(3,4-dichlorophenyl)-3,4-dihydronaphthalen-1(2H)-one.

Inject 1 µl of the reference solution and the test solution. In the chromatogram obtained with the test solution, the sum of areas of any peaks corresponding to sertraline impurities C and D is not more than 0.8 per cent. The area of the peak corresponding to sertraline impurities A, B and F is not more than 0.2 per cent. The area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 1.5 per cent. Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). A 5.0 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm) using 10 ml of *lead standard solution (1 ppm Pb)*.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 55 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.0055 per cent w/v solution of *sertraline hydrochloride IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 15 volumes of *methanol*, 40 volumes of buffer solution prepared by dissolving 28.6 ml of *glacial acetic acid*, 34.8 ml of *triethylamine*, and dilute to 100 ml with *water*. Dilute 10 ml of the solution to 1000 ml with *water* and 45 volumes of *acetonitrile*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{17}Cl_2N$,HCl.

Storage. Store protected from light.

Sertraline Tablets

Sertraline Hydrochloride Tablets

Sertraline Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sertraline, $C_{17}H_{17}Cl_2N$.

Usual strength. 25 mg; 50 mg; 100 mg.

Identification

Shake a quantity of the powdered tablets containing 0.25 g of Sertraline Hydrochloride with 10 ml of *ethanol* for 10 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sertraline hydrochloride IPRS* or with the reference spectrum of sertraline hydrochloride.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *sodium acetate buffer solution pH 4.5*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate as given above.

Reference solution. A solution of *sertraline hydrochloride IPRS* of the concentration similar to the test solution in the dissolution medium.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 15 volumes of *methanol*, 40 volumes of a solution containing 0.286 per cent v/v *glacial acetic acid* and 0.348 per cent v/v *triethylamine* and 45 volumes of *acetonitrile*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Calculate the content of $C_{17}H_{17}Cl_2N$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{17}H_{17}Cl_2N$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of *water*.

Test solution. Disperse a quantity of whole tablets containing 500 mg of Sertraline Hydrochloride with 150 ml of the solvent mixture with the aid of ultrasound and dilute to 200 ml with the solvent mixture and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with the solvent mixture.

Reference solution (b). A 0.001 per cent w/v solution of (R)-*mandelic acid (sertraline impurity E)* in the solvent mixture.

Reference solution (c). A 0.25 per cent w/v solution of *sertraline hydrochloride impurity IPRS* in solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 2.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.272 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute.
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (c). For peak identification of sertraline hydrochloride impurity.

Inject reference solution (a), (b), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to sertraline impurity C (1RS,4RS)-4-(4-chlorophenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine) is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent). The area of any peak corresponding to (*R*)-mandelic acid is not more than the area of any corresponding peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks other than sertraline impurity C is not more than 7.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Enatiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of whole tablets containing 400 mg of Sertraline Hydrochloride with 140 ml of a mixture of 1 volume of *acetonitrile* and 2 volumes of *water* with the aid of ultrasound and dilute to 200.0 ml with a mixture of 1 volume of *acetonitrile* and 2 volumes of *water*, filter.

Reference solution (a). A 0.003 per cent w/v solution of *sertraline hydrochloride cis-isomer IPRS* in *methanol (10.0 per cent).*

Reference solution (b). A solution containing 0.0002 per cent w/v each of *sertraline hydrochloride IPRS* and *sertraline hydrochloride cis-isomer ((1R,4R)-4-(3,4-dichloro-phenyl)-N-methyl-1,2,3,4-tetrahydronaphthalen-1-amine) IPRS* in *methanol (10.0 per cent).*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with silica gel OD for chiral sepearation (Such as ChromTech Chiral-AGP),
- mobile phase: a mixture of 10 volumes of *propan-2-ol* and 90 volumes of a 0.23 per cent w/v solution of *ammonium dihydrogen orthophosphate*,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 40 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to sertraline cis-isomer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.2 g of Sertraline Hydrochloride with 150 ml of the mobile phase with the aid of ultrasound for 45 minutes, cool and dilute to 200 ml with *water*, filter. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

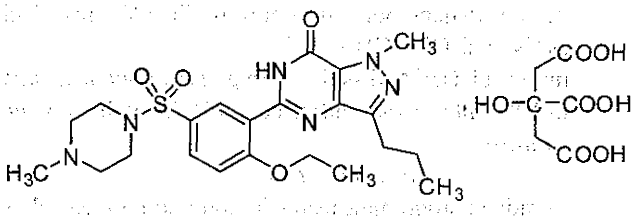
Reference solution. A 0.005 per cent w/v solution of *sertraline hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Dissolution.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{17}Cl_2N$ in the tablets.

Sildenafil Citrate



$C_{28}H_{38}N_6O_{11}S$ Mol. Wt. 666.7

Sildenafil Citrate is 5-[2-ethoxy-5-(4-methylpiperazinylsulphonyl)phenyl]-1-methyl-3-*n*-propyl-1,6-dihydro-7*H*-pyrazolo[4,3-*d*]pyrimidin-7-one citrate.

Sildenafil Citrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{28}H_{38}N_6O_{11}S$, calculated on the anhydrous basis.

Category. Used in erectile dysfunction.

Description. A white to off white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum that obtained with *sildenafil citrate IPRS* or with the reference spectrum of sildenafil citrate.

Tests

Citric acid. 28.0 per cent to 34.0 per cent.

Weigh 0.2 g of the substance under examination and transfer into a 250-ml conical flask, add 50 ml of *methanol* and sonicate

https://nhathuocngocanh.com/

to dissolve, then add 50 ml of *water*. Titrate with *0.1 M sodium hydroxide solution* using *phenolphthalein* indicator until the colour changes from colourless to pink.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.006403 g of $C_6H_8O_7$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 30 volumes of *water* and 70 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *sildenafil citrate IPRS* in the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Further dilute 3.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS C18),
- mobile phase: A, dissolve 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.5 with *ammonia solution*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cen v/v)	Mobile phase B (per cent v/v)
0	65	35
15	65	35
30	20	80
40	20	80
45	65	35
50	65	35

The relative retention time with reference to sildenafil for citric acid is about 0.11, for N-oxide is about 0.29 and for chlorosulphonyl is about 1.6.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution the area of the peak due to N-oxide impurity is not more than 1.67 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of peak due to chlorosulphonyl is not more than 0.67 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak corresponding to citric acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 30 volumes of *water* and 70 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *sildenafil citrate IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS C18),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.5 with *ammonia solution* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{38}N_6O_{11}S$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Sildenafil Tablets

Sildenafil Citrate Tablets

Sildenafil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sildenafil, $C_{22}H_{30}N_6O_4S$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M Hydrochloric acid*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 294 nm (2.4.7). Calculate the content of $C_{22}H_{30}N_6O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *sildenafil citrate IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{30}N_6O_4S$.

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. 50 volumes of mobile phase A and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of sildenafil with 35 ml of the solvent mixture, sonicate for 20 minutes and dilute to 50 ml with the solvent mixture, filter.

Reference solution (a). A 0.028 per cent w/v solution of *sildenafil citrate IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm) (Such as Zorbax Eclipse XDB C18),
- column temperature: 40°,
- mobile phase: A. a solution containing 3.85 g of *ammonium acetate* and 1.0 ml of *triethylamine* in 1000 of *water*, adjusted to pH 5.5 with *acetic acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile Phase A (per cent /v/v)	Mobile Phase B (per cent /v/v)
0	47	53
20	47	53
35	10	90
45	10	90
50	47	53
60	47	53

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent), the area of peak corresponding to N-oxide impurity at relative retention time 0.54 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.0 times the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore the peak due to citric acid at retention time about 2.4 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of sildenafil with 35 ml of the solvent mixture, sonicate for 20 minutes and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution. A 0.14 per cent w/v solution of *sildenafil citrate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica (5 µm) (Such as Zorbax Eclipse XDB C18),
- mobile phase: a mixture of 30 volumes of solution containing 3.85 g of *ammonium acetate* and 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 5.5 with *acetic acid* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{22}H_{30}N_6O_4S$ in the tablet.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of sildenafil.

Colloidal Silicon Dioxide

Colloidal Anhydrous Silica

SiO_2 Mol. Wt. 60.1

Colloidal Silicon Dioxide is a submicroscopic fumed silica prepared by the vapour-phase hydrolysis of a silicon compound.

Colloidal Silicon Dioxide contains not less than 99.0 per cent and not more than 100.5 per cent of SiO_2, calculated on the ignite basis.

Category. Pharmaceutical aid (tablet excipient).

Description. A light, fine, white, amorphous powder. It has a particle size of about 15 nm.

Identification

About 20 mg gives the reaction of silicates (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5, determined in a suspension of 1.0 g in 30 ml of *carbon dioxide-free water*.

Arsenic (2.3.10). To 2.5 g contained in a round-bottomed flask add 50 ml of *3 M hydrochloric acid* and heat under a reflux condenser for 30 minutes. Cool, filter with the aid of suction and transfer the filtrate to a 100-ml volumetric flask. Wash the filter with several portions of hot water and add the washings to the volumetric flask. Cool, dilute to volume with *water* and mix. To 50.0 ml of the solution add 3 ml of *hydrochloric acid*; the resulting solution complies with the limit test for arsenic (8 ppm).

Heavy metals (2.3.13). Suspend 2.5 g in sufficient *water* to produce a semi-fluid slurry and dry at 140°. When the dried substance is white, break up the mass using a glass rod, add 25 ml of *1 M hydrochloric acid*, boil gently for 5 minutes, stirring frequently with the glass rod, centrifuge for 20 minutes and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *2 M hydrochloric acid* and 9 ml of *water*, boil, centrifuge for 20 minutes and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water*, combine the filtrates and washings and dilute to 50.0 ml with *water*. To 20.0 ml of the solution add 50 mg of *L-ascorbic acid* and 1 ml of *strong ammonia solution*, neutralise with *2 M ammonia* and dilute to 25 ml with *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (25 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Chlorides (2.3.12). To 1.0 g add a mixture of 20 ml of *2 M nitric acid* and 30 ml of *water*, heat on a water-bath for 15 minutes, shaking frequently, dilute to 50 ml with *water* if necessary, filter and cool. The filtrate complies with the limit test for chlorides (250 ppm).

Loss on ignition (2.4.20). Not more than 5.0 per cent, determined on 0.2 g by igniting at 900° in a platinum crucible for 2 hours.

Assay. To the residue obtained in the test for Loss on ignition add 0.2 ml of *sulphuric acid* and sufficient *ethanol (95 per cent)* to moisten the residue completely, add 6 ml of *hydrofluoric acid* and evaporate to dryness on a hot plate at 95° to 105°, avoiding loss from sputtering. Wash the sides of the dish with 6 ml of *hydrofluoric acid*, evaporate to dryness in a well-ventilated hood, ignite at 1000°, allow to cool in a desiccator and weigh. The difference between the weight of the final residue and that of the residue obtained in the test for Loss on ignition represents the amount of SiO_2 in the amount of the substance taken for the test for Loss on ignition.

Storage. Store protected from light.

Silver Nitrate

$AgNO_3$ Mol. Wt. 169.9

Silver Nitrate contains not less than 99.0 per cent and not more than 100.5 per cent of $AgNO_3$.

Category. Local anti-infective.

Description. Colourless crystals or a white, crystalline powder.

Identification

A. It gives the reactions of silver salts (2.3.1).

B. 10 mg gives reaction (A) of nitrates (2.3.1).

Tests

Appearance of solution. A 4.0 per cent w/v solution (solution A) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 2 ml of solution A add 0.1 ml of *bromocresol green solution*; the solution is blue. To 2 ml of the solution add 0.1 ml of *phenol red solution*; the solution is yellow.

https://nhathuocngocanh.com/

Aluminium, bismuth, copper and lead. Dissolve 1.0 g in a mixture of 4 ml of *strong ammonia solution* and 6 ml of *water*; the resulting solution is clear (2.4.1), and colourless (2.4.1).

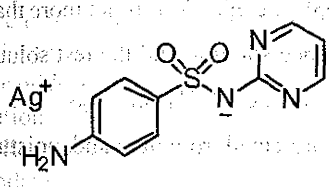
Foreign salts. Not more than 0.3 per cent, determined by the following method. To 30 ml of solution A add 7.5 ml of *2 M hydrochloric acid*, shake vigorously, heat for 5 minutes on a water-bath, filter and evaporate 20 ml of the filtrate to dryness on a water-bath. Dry the residue at 105° and weigh.

Assay. Weigh 0.3 g, dissolve in 50 ml of *water*, add 2 ml of *2 M nitric acid* and 2 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate* until a reddish yellow colour is produced.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.01699 g of $AgNO_3$.

Storage. Store protected from light and moisture, in non-metallic containers.

Silver Sulphadiazine



$C_{10}H_9AgN_4O_2S$ Mol. Wt. 357.1

Silver Sulphadiazine is benzenesulphonamide, 4-amino-*N*-2-pyrimidinyl, monosilver(1+) salt.

Silver Sulphadiazine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_9AgN_4O_2S$, calculated onthe dried basis.

Category. Antiinfective.

Description. A white to creamy-white crystalline powder. Stable in air, but turns yellow on exposure to light.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *silver sulphadiazene IPRS* or with the reference spectrum of silver sulphadiazene.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Dissolve 1 g in 15 ml of *ammonium hydroxide* and 15 ml of *water*, dilute to 50 ml with *water* the solution complies with the tests for silver (2.3.1).

Tests

Nitrate. Not more than 0.1 per cent.

Test solution. Transfer 2.0 g of the substance under examination to a beaker, add 30.0 ml of *water* stir for 20 minutes, and filter through a suitable, nitrate-free filter.

Reference solution. A 0.033 per cent w/v solution of *potassium nitrate* in *water*.

Pipet 3.0 ml of the test solution and of deionized *water* to provide the blank into separate test tubes. Pipet 1.0 ml of the reference solution and 2.0 ml of *water* into a third test tube. Cool the three test tubes in an ice-bath. Slowly add 7.0 ml of cold chromotropic acid solution prepared by dissolving 50 mg of *chromotropic acid* in 100 ml of cold *sulphuric acid*, to each test tube, while swirling, and allow the test tubes to remain in the ice-bath for 3 minutes after the addition of the chromotropic acid solution. Remove the test tubes from the ice-bath and allow to stand for 30 minutes. Determine the absorbances of the reference solution and the test solution at the maximum at about 408 nm (2.4.7) against the blank solution. Calculate the nitrate content.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile*, 6 volumes of *ammonium hydroxide* and 90 volumes of *water*.

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.0001 per cent w/v solution of *silver sulphadiazine IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.1 per cent w/v of *silver sulphadiazine IPRS* and 0.0001 per cent w/v, each of, *sulphanilic acid IPRS, sulphanilamide IPRS* and *sulphaguanidine* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as YMC-Pack Pro C18),
- mobile phase: A. a buffer solution prepared by dissolving 0.77 g of *ammonium acetate* in 900 ml of *water*, adjusted to pH 5.2 with *glacial acetic acid* and dilute to 1000 ml with *water*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: 10 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
4	98	2
16	40	60
20	40	60
22	20	80
32	20	80
34	98	2
40	98	2

Name	Relative retention time	Correction factor
Sulphanilic acid	0.27	3.7
Sulphaguanidine[1,2]	0.65	1.18
Sulphanilamide[2]	0.71	—
2-Aminopyrimidine[3]	0.82	2.08
Sulphadiazine	1.0	—
Acetylsulphadiazine[4]	1.14	—

[1]4-Amino-*N*-carbamimidoylbenzenesulphonamide,

[2]These impurities are controlled using the limit for any other secondary peak,

[3]Pyrimidin-2-amine,

[4]*N*-{4-[*N*-(Pyrimidin-2-yl) sulphamoyl]phenyl}acetamide.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to sulphaguanidine and sulphanilamide is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to sulphanilic acid and 2-aminopyrimidine, each of, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to acetylsuphadiazine is not more than twice the area of principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Silver content. 29.3 per cent to 30.5 per cent.

Transfer 500 mg to a beaker, add 150 ml of *water* and 50 ml of *nitric acid* and stir for 15 minutes. Titrate with *0.1M ammonium thiocyanate*, determining the end-point potentiometrically (2.4.25) using a silver-based indicator electrode and a double-junction reference electrode.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.01079 g of silver.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Determine by liquid chromatography (2.4.14), using the chromatographic system and solvent mixture as described under Related substances.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *silver sulphadiazine IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_9AgN_4O_2S$.

Storage. Store protected from light and moisture.

Silver Sulphadiazine Cream

Silver Sulphadiazine Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_{10}H_9AgN_4O_2S$.

Usual strength. 1 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *chloroform*, 40 volumes of *methanol* and 10 volumes of *ammonium hydroxide*.

Test solution. Transfer a quantity of cream containing 50 mg of Silver Sulphadiazine to a 50-ml conical flask, add 4 ml of *ammonium hydroxide* and mix until a smooth paste has been obtained. Add 16 ml of *methanol*, shake for 5 minutes, and filter.

Reference solution. Dissolve 35 mg of *silver sulphadiazine IPRS* in 4 ml of *ammonium hydroxide* and add 16 ml of *methanol*.

https://nhathuocngocanh.com/

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 7.0, determined in the supernatant obtained from 5 per cent w/v of cream in *water*.

Microbial contamination (2.2.9). 1.0 g is free from *E. coli*, *Staphylococcus species*, *Pseudomonas aeruginosa* and 10 g is free from *Salmonella species* and *Shigella*.

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 100 ml of *ammonium hydroxide* in *water* and dilute to 1000 ml with *water*.

Test solution. Transfer a portion of cream containing 10 mg of Silver Sulphadiazine to a 50-ml round-bottom centrifuge tube. Add about 30 ml of *methanol*, tightly seal the tube with a cap containing an inert line and mix using a vortex mixer for about 15 seconds. Centrifuge for 15 minutes. Aspirate, and discard the methanol *(Note — Care should be taken to avoid aspirating any of the residue)*. Transfer 5.0 ml of the internal standard solution into the tube and add 20 ml of *ethanol (95 per cent)*. Replace the cap and mix. Heat in a water-bath at 60° with periodic mixing for 15 minutes to melt and disperse the cream. While the mixture is still hot, transfer 10.0 ml of the solvent mixture to the tube, mix and cool to room temperature. Transfer 2.0 ml of the solution to another tube, add 40 ml of mobile phase, mix and filter.

Internal standard solution. A 0.2 per cent w/v solution of sulphamerazine in the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *silver sulphadiazine IPRS* in the solvent mixture.

Reference solution (b). Pipet 10.0 ml of reference solution (a) into a 50-ml test tube. Add 20 ml of *ethanol (95 per cent)* and 5.0 ml of the internal standard solution. Pipet 2.0 ml of the solution into a 50-ml test tube, add 40 ml of mobile phase and mix.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 900 volumes of *water*, 99 volumes of *acetonitrile* and 1 volume of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

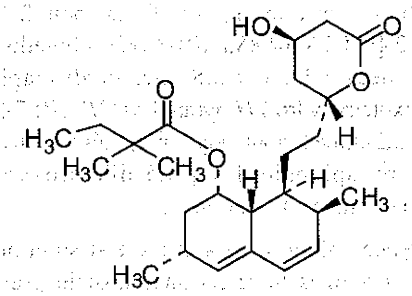
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to silver sulphadiazine and sulphamerazine is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of silver sulphadiazine in the cream.

Storage. Store protected from light and moisture.

Simvastatin



$C_{25}H_{38}O_5$ Mol.Wt. 418.6

Simvastatin is (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronapthalen-1-yl 2,2-dimethylbutyrate.

Simvastatin contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{25}H_{38}O_5$, calculated on the dried basis. A suitable antioxidant may be added.

Category. Antihyperlipidaemic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *simvastatin IPRS* or with the reference spectrum of simvastatin.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). +285° to +300°, determined in a 0.5 per cent w/v solution in *acetonitrile*.

Related substances. Determine by liquid chromatography (2.4.14), as described under the Assay.

The relative retention time with reference to simvastatin for (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-

https://nhathuocngocanh.com/

dihydroxyheptanoic acid (hydroxy acid) (simvastatin impurity A) is about 0.45, for lovastatin (simvastatin impurity E) and epilovastatin (simvastatin impurity F) is about 0.6, for (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbut-3-enoate (simvastatin impurity G) is about 0.8, for (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-(acetyloxy)-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (acetate ester) (simvastatin impurity B) is about 2.38, for (1*S*,3*R*,7*S*,8*S*,8a*R*)-3,7-dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (anhydro-simvastatin) (simvastatin impurity C) is about 2.42 and for (2*R*,4*R*)-2-[2-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl) oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl (3*R*, 5*R*)-7-[(1*S*,2*S*,6*R*, 8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl) oxy]-2,6-dimethyl-1,2,6,7,8, 8a-hexahydronaphthalen1-yl]-3,5-dihydroxyheptanoate (simvastatin impurity D) is about 3.8.

Inject reference solution (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the secondary peaks corresponding to lovastatin and epilovastatin is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any secondary peak other than lovastatin and epilovastatin is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent) and the sum of the areas of all the secondary peaks other than lovastatin and epilovastatin is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13).). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours under high vacuum.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 40 volumes of a 0.14 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 4.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*.

Test solution. Dissolve 75 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). Dissolve 1 mg each of *simvastatin IPRS* and *lovastatin IPRS* in 50.0 ml of the solvent mixture.

Reference solution (b). Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 75 mg of *simvastatin IPRS* in 50.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 3.3 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture 50 volumes of *acetonitrile* and 50 volumes of a 0.1 per cent v/v solution of *orthophosphoric acid*,

  B. 0.1 per cent v/v solution of *orthophosphoric acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 3.0 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 5 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4.5	100	0
4.6	95	5
8.0	25	75
11.5	25	75
11.6	100	0
13	100	0

Inject reference solution (a). The test is not valid unless resolution between the peaks due to lovastatin and epilovastatin and simvastatin is not less than 4.0.

Inject reference solution (c) and the test solution.

Calculate the content of simvastatin.

Storage. Store protected from light and moisture, under nitrogen.

Simvastatin Tablets

Simvastatin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of simvastatin, $C_{25}H_{38}O_5$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

Shake a quantity of the powdered tablets containing about 50 mg of Simvastatin with 20 ml of *dichloromethane*, filter and

https://nhathuocngocanh.com/

evaporate the filtrate to dryness using a rotary evaporator and a water-bath at 40°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *simvastatin IPRS* or with the reference spectrum of simvastatin.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M sodium dihydrogen orthophosphate* containing 0.5 per cent w/v of *sodium dodecyl sulphate*, adjusted to pH 7.0 with *1 M sodium hydroxide*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary in the dissolution medium.

Reference solution. Dissolve a quantity of *simvastatin IPRS* in *methanol* and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Use the chromatographic system as described under Assay.

Q. Not less than 70 per cent of the stated amount of $C_{25}H_{38}O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Buffer solution. A 0.51 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 4.5 with 25 per cent v/v solution of *orthophosphoric acid*.

Solution A. A mixture of 1 volume of 0.3 per cent v/v solution of *glacial acetic acid*, adjusted to pH 4.0 with *1 M sodium hydroxide* and 4 volumes of *acetonitrile*.

Test solution. Shake a quantity of the powdered tablets containing about 25 mg of Simvastatin with 20 ml of solution A for 15 minutes, dilute to 100 ml and filter.

Reference solution (a). Dilute 1 ml of the test solution to 500 ml with solution A.

Reference solution (b). A solution of 0.002 per cent w/v each of *simvastatin IPRS* and *lovastatin IPRS* in solution A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil ODS),
- mobile phase: A. a mixture of 40 volumes of *acetonitrile* and 60 volumes of buffer solution,

  B. a mixture of 20 volumes of buffer solution and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
5	85	15
30	0	100
45	0	100
46	85	15
50	85	15

The relative retention time with reference to simvastatin for simvastatin hydroxy acid (simvastatin impurity A) is about 0.52, for lovastatin (simvastatin impurity E) is about 0.71, for epilovastatin (simvastatin impurity F) is about 0.74, for anhydrosimvastatin (simvastatin impurity C) is about 1.74 and for simvastatin dimer (simvastatin impurity D) is about 2.42.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to simvastatin and lovastatin is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peaks corresponding to lovastatin, epilovastatin and anhydrosimvastatin is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to simvastatin impurity A is not more than 7.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent) and the sum of the areas of all the secondary peaks other than any peaks corresponding to lovastatin, epilovastatin, anhydrosimvastatin and simvastatin impurity A, is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Add 3 ml of *glacial acetic acid* to 900 ml of *water*, adjusted to pH 4.0 with *1 M sodium hydroxide* and add sufficient *water* to produce 1000 ml. Mix 1 volume of this solution with 4 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 100 mg of

https://nhathuocngocanh.com/

Simvastatin, disperse in 100 ml of solution A and filter. Dilute 5.0 ml isf the solution to 50.0 ml with solution A.

Reference solution. A 0.01 per cent w/v solution of *simvastatin IPRS* in solution A.

Chromatographic system

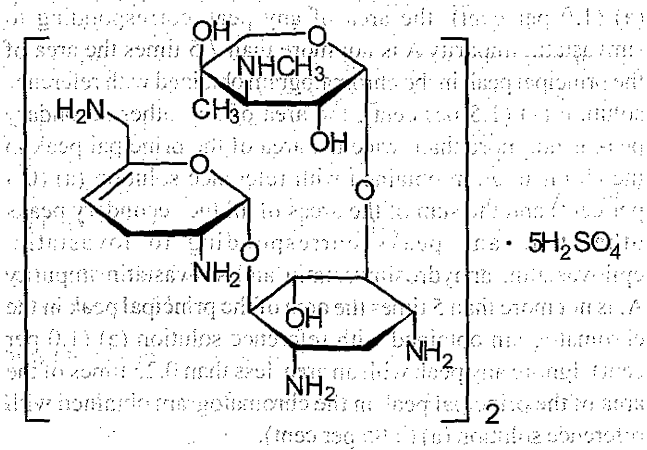
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 45°,
- mobile phase: a mixture of 7 volumes of a buffer solution prepared by dissolving 5.1 g of *sodium dihydrogen orthophosphate* in 900 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* or *1 M sodium hydroxide* and add sufficient *water* to produce 1000 ml and 13 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{38}O_5$ in the tablets.

Sisomicin Sulphate



$(C_{19}H_{37}N_5O_7)_2,5H_2SO_4$ Mol. Wt. 1385.5

Sisomicin Sulphate is 4-*O*-[(2*R*,3*R*)-*cis*-3-Amino-6-aminomethyl-3,4-dihydro-2*H*-pyran-2-yl]-2-deoxy-6-*O*-(3-deoxy-4-*C*-methyl-3-methylamino-β-*L*-arabinopyranosyl) streptamine sulphate.

Sisomicin Sulphate has a potency not less than 580 µg of sisomicin per mg, calculated on the dried basis.

Category. Antibacterial.

Description. A off-white powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *methanol*, 30 volumes of *ammonium hydroxide* and 25 volumes of *chloroform*.

Test solution. A 1.0 per cent w/v solution of the substances under examination.

Reference solution (a). A 1.0 per cent w/v solution of *sisomicin IPRS*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 5 µl of each solution. After development, allow the plate to dry in air, heat it at 110° for 15 minutes and immediately spray it with a 1.0 per cent solution of *ninhydrin* in *butanol* containing 1.0 per cent of *pyridine*. The principal brown spot in the chromatogram obtained with the test solution corresponds to those in the chromatograms obtained with reference solution (a) and (b).

B. It gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5 determined in a 4.0 per cent w/v solution.

Specific optical rotation (2.4.22). +100° to +110°, determined in a 1.0 per cent w/v solution in *water*.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.1 g by drying in an oven at 110° at a pressure of 5 mm of mercury for 3 hours.

Residue on ignition. Not more than 1.0 per cent, the charred residue being moistened with 2 ml of *nitric acid* and 5 drops of *sulphuric acid*.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the result in µg of sisomicin per mg.

Storage. Store protected from moisture.

Sisomicin Sulphate Injection

Sisomicin Sulphate Injection is a sterile solution of Sisomicin Sulphate in Water for Injection. It may contain one or more suitable buffers, chelating agents and preservatives.

Sisomicin injection contains not less than 90.0 per cent and not more than 120.0 per cent of stated amount of sisomicin, $C_{19}H_{37}N_5O_7$.

https://nhathuocngocanh.com/

Usual strengths. 10 mg per ml; 50 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *methanol*, 30 volumes of *ammonium hydroxide* and 25 volumes of *chloroform*.

Test solution. Dilute a suitable volume of injection (if required) to contain 1.0 per cent w/v solution of sisomicin sulphate.

Reference solution (a). A 1.0 per cent w/v solution of *sisomicin IPRS*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 5 µl of each solution. After development, allow the plate to dry in air, heat it at 110° for 15 minutes and immediately spray it with a 1.0 per cent solution of *ninhydrin* in *butanol* containing 1.0 per cent of *pyridine*. The principal brown spot in the chromatogram obtained with the test solution corresponds to those in the chromatograms obtained with reference solution (a) and (b).

Tests

pH (2.4.24). 2.5 to 5.5.

Bacterial endotoxins (2.2.3). Not more than 0.50 Endotoxin Unit per mg of sisomicin.

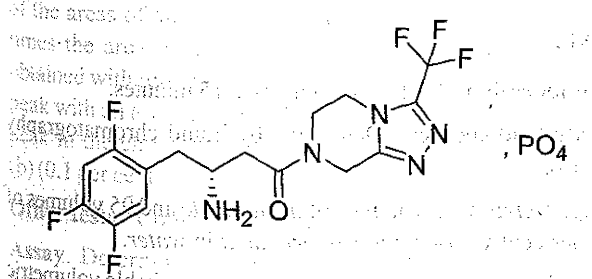
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine the microbiological assay of antibiotics, Method A (2.2.10) and express the result in mg of sisomicin, $C_{19}H_{37}N_5O_7$ per ml.

Storage. Store in single dose or in multiple dose container. Preferable of type 1 glass.

Sitagliptin Phosphate

Sitagliptin Phosphate Monohydrate



$C_{16}H_{18}F_6N_5O_5P, H_2O$ Mol. Wt 523.3

Sitagliptin Phosphateis is (3R)-3-amino-1-[3-(trifluoromethyl)-5,6-dihydro[1,2,4]triazolo[4,3-*a*]pyrazin-7(8H)-yl]-4-(2,4,5-trifluorophenyl)butan-1-one phosphate monohydrate.

Sitagliptin Phosphate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{18}F_6N_5O_5P$, calculated on the anhydrous basis.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sitagliptin phosphate IPRS* or with the reference spectrum of sitagliptin phosphate.

B. In the Enantiomeric purity test, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (b).

C. It gives reaction (A) of phosphates (2.3.1).

Tests

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *water* and 90 volumes of *methanol*.

Test solution. Dissolve 80 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). A 0.8 per cent w/v solution of *sitagliptin containing impurity A {(3S)-3-amino-1-[3-(trifluoromethyl)-5,6-dihydro[1,2,4]triazolo[4,3-a]pyrazin-7(8H)-yl]-4-(2,4,5-trifluorophenyl)butan-1-one(S-enantiomer)} IPRS* in the solvent mixture.

Chromatographic system
- a column 25 cm x 4.6 mm packed with amylose derivative of silica gel for chiral separation (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 1 volume of *water*, 1 volume of *diethylamine*, 400 volumes of *heptane*, and 600 volumes of *ethanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 10 µl.

The relative retention time with reference to sitagliptin for sitagliptin impurity A is about 0.9.

https://nhathuocngocanh.com/

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sitagliptin and sitagliptin impurity A is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram 1.6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to sitagliptin impurity A is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile* and 95 volumes of a 0.1 per cent v/v solution of *orthophosphoric acid*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 250.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *sitagliptin phosphate IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). In order to prepare sitagliptin fumarate adduct in-situ, place 10 mg of *sitagliptin phosphate IPRS* and 1 mg of *sodium stearyl fumarate* in a vial, add 1 ml of *water* and tightly seal the vial. Heat at 80° for 48 hours. Transfer the contents of the vial into a 100-ml volumetric flask using a small amount of the solvent mixture. Rinse the vial three times with the solvent mixture. Transfer the rinsates into the flask and dilute to 100.0 ml with the solvent mixture and centrifuge. Use the supernatant liquid.

Chromatographic system

- a column 15 cm x 4.6 mm packed with endcapped cyanopropylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 15 volumes of *acetonitrile* and 85 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in about 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

The relative retention time with reference to the sitagliptin peak for the fumarate adduct is about 1.2.

Inject reference solution (c). The test is not valid unless the resolution between sitagliptin and the fumarate adduct is not less than 1.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined in platinum crucible.

Water (2.3.43). 3.3 per cent to 3.7 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{18}F_6N_5O_5P$.

Storage. Store at a temperature not exceeding 30°.

Sitagliptin Tablets

Sitagliptin Phosphate Tablets

Sitagliptin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sitagliptin, $C_{16}H_{15}F_6N_5O$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Disintegration (2.5.1). Not more than 15 minutes.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile* and 95 volumes of 0.1 per cent v/v *orthophosphoric acid* in *water*.

Test solution. Transfer 10 intact tablets to a suitable volumetric flask and dilute to volume with the solvent mixture to obtain a

https://nhathuocngocanh.com/

concentration of 0.1 per cent w/v of sitagliptin. Stir vigorously for 1 hour. Transfer 8.0 ml of the solution to a 100-ml volumetric flask and dilute with the solvent mixture to volume and mix. Centrifuge a portion of the solution until clear and use the supernatant.

Reference solution (a). A 0.01 per cent w/v solution of *sitagliptin phosphate IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). In order to prepare sitagliptin fumarate adduct in-situ, place 10 mg of *sitagliptin phosphate IPRS* and 1 mg of *sodium stearyl fumarate* in a vial, add 1 ml of *water* and tightly seal the vial. Heat at 80° for 48 hours. Transfer the contents of the vial into a 100-ml volumetric flask using a small amount of the solvent mixture. Rinse the vial three times with the solvent mixture. Transfer the rinsates into the flask and dilute to 100.0 ml with the solvent mixture and centrifuge. Use the supernatant liquid.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with cyanopropylsilane bonded to porous silica (5 µm) (Such as Supelco Discovery Cyano),
- mobile phase: a mixture of 15 volumes of *acetonitrile* and 85 volumes of buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in about 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 20 µl.

The relative retention time with reference to the sitagliptin peak for the fumarate adduct is about 1.2.

Inject reference solution (c). The test is not valid unless the resolution between sitagliptin and the fumarate adduct is not less than 1.0.

Inject reference solution (b) and the test solution. Run the chromatogram about 6 times the retention time of the principal peak. The area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14.) as described under test for Related substances with the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{15}F_6N_5O$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the quantity of active ingredients in terms of the equivalent amount of sitagliptin.

Sodium Acetate

$CH_3COONa,3H_2O$

$C_2H_3NaO_2, 3H_2O$ Mol. Wt. 136.1

Sodium Acetate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_2H_3NaO_2$, calculated on the dried basis.

Category. Pharmaceutical aid (for peritoneal dialysis fluids).

Description. Colourless crystals or a white, crystalline powder.

Identification

Dissolve 10.0 g in sufficient *carbon dioxide-free water* to produce 100.0 ml (solution A). 1 ml of solution A gives reaction (B) of acetates and reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 7.5 to 9.0, determined in a 5.0 per cent w/v solution.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 15 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Calcium and magnesium. Not more than 50 ppm, calculated as Ca, determined by the following method. Mix 200 ml of *water* with 10 ml of *ammonia buffer pH 10.0*, 0.1 g of *mordant black 11 mixture* and 2 ml of *0.05 M zinc chloride*. Add dropwise *0.02 M disodium edetate* until the colour changes from violet to blue. To this solution add 10 g of the substance under examination, shake to dissolve and titrate with *0.02 M disodium edetate* until the blue colour is restored. Not more than 0.65 ml of *0.02 M disodium edetate* is required.

Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (10 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Chlorides (2.3.12). 10 ml of solution A complies with the limit test for chlorides (250 ppm).

https://nhathuocngocanh.com/

Sulphates (2.3.17). 7.5 ml of solution A complies with the limit test for sulphates (200 ppm).

Reducing substances. Dissolve 1.0 g in 100 ml of boiling *water*, add 5 ml of *1 M sulphuric acid* and 0.5 ml of *0.002 M potassium permanganate*, mix and boil gently for 5 minutes; the pink colour is not completely discharged.

Loss on drying (2.4.19). 39.0 to 40.5 per cent, determined on 0.2 g by drying in an oven at 130°. Place the substance under examination in the oven while the oven is still cold.

Assay. Dissolve 0.25 g in 50 ml of *anhydrous glacial acetic acid*, add 5 ml of *acetic anhydride*, mix and allow to stand for 30 minutes. Titrate with *0.1 M perchloric acid*, using 0.3 ml of *1-naphtholbenzein solution* as indicator, until a green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.00820 g of $C_2H_3NaO_2$.

Sodium Acetate intended for use in the preparation of dialysis solutions complies with the following additional requirement.

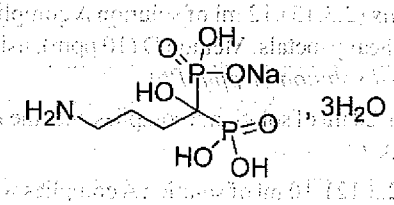
Aluminium. Dissolve 20 g in 100 ml of *water* and adjust to pH 6.0 by the addition of about 10 ml of *1 M hydrochloric acid*. Extract with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50 ml with *chloroform*. Use as the standard solution a mixture of 2.0 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 98 ml of *water* treated in the same manner and as the blank solution a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner. Measure the fluorescence (2.4.5) of the test solution and the standard solution, using an excitation wavelength of about 392 nm and emission wavelength of about 518 nm, and setting the instrument to zero with the blank solution in each case. The fluorescence of the test solution is not more than that of the standard solution (0.2 ppm).

Storage. Store protected from light.

Labelling. The label states whether or not the material is intended for use in the manufacture of dialysis solutions.

Sodium Alendronate Trihydrate

Sodium Alendronate



$C_4H_{12}NNaO_7P_2, 3H_2O$ Mol. Wt. 325.1

Sodium Alendronate Trihydrate is monosodium trihydrogen (4-amino-1-hydroxybutylidene)bisphosphonate trihydrate.

Sodium Alendronate Trihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_4H_{12}NNaO_7P_2$, calculated on the dried basis.

Category. Bisphosphonate; treatment of osteoporosis.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium alendronate IPRS* or with the reference spectrum of sodium alendronate.

B. It gives reaction (a) of sodium salt (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 4.0 to 5.0 determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 29.4 g of *sodium citrate* in *water* and dilute to 1000 ml with the same solvent.

Solution B. Dissolve 19.1 g of *disodium tetraborate* in *water* and dilute to 1000 ml with the same solvent.

Solution C. Dissolve 0.200 g of *(9-fluorenyl) methyl chloroformate* in *acetonitrile* and dilute to 50.0 ml with the same solvent.

NOTE — Prepare solutions immediately before use.

Test solution. Dissolve 30 mg of the substance under examination in 50 ml of solution A. Transfer 5.0 ml of the solution to a 50 ml polypropylene screw cap centrifuge tube containing 5.0 ml of solution B. Add 5.0 ml of *acetonitrile* and 5.0 ml of solution C. Shake and allow to stand at room temperature for 30 minutes. Add 20 ml of *methylene chloride* and shake vigorously for one minute. Centrifuge for 5-10 minutes and use the clear upper layer.

Reference solution (a). Dissolve 15 mg of *4-aminobutanoic acid* (impurity A) in 100.0 ml of solution A. Dilute 10.0 ml of the solution to 50.0 ml with solution A. Transfer 5.0 ml of the solution to a 50 ml polypropylene screw cap centrifuge tube containing 5.0 ml of solution B. Add 5.0 ml of *acetonitrile* and 5.0 ml of solution C. Shake and allow to stand at room temperature for 30 minutes. Add 20 ml of *methylene chloride* and shake vigorously for one minute. Centrifuge for 5-10 minutes and use the clear upper layer.

https://nhathuocngocanh.com/

Reference solution (b). Dissolve 3 mg of *sodium alendronate IPRS* (containing impurity D) and dilute to 5.0 ml with solution A. Transfer this solution to a 50 ml polypropylene screw cap centrifuge tube containing 5.0 ml of solution B. Add 5.0 ml of *acetonitrile* and 5.0 ml of solution C. Shake and allow to stand at room temperature for 30 minutes. Add 20 ml of *methylene chloride* and shake vigorously for one minute. Centrifuge for 5 to 10 minutes and use the clear upper layer.

Blank solution. Transfer 5 ml of solution A to a 50 ml polypropylene screw cap centrifuge tube containing 5.0 ml of solution B. Add 5.0 ml of *acetonitrile* and 5.0 ml of solution C. Shake and allow to stand at room temperature for 30 minutes. Add 20 ml of *methylene chloride* and shake vigorously for a minute. Centrifuge for 5 to 10 minutes and use the clear upper layer.

Chromatographic system

- a stainless steel column 25 cm x 4.1 mm, packed with styrene-divinylbenzene copolymer (10 µm)
- column temperature: 45°,
- mobile phase: A. 15 volumes of *acetonitrile* and 85 volumes of a buffer solution prepared by dissolving 2.84 g of *anhydrous disodium hydrogen phosphate* and 5.88 g of *sodium citrate* in 2000 ml *water*, adjusted to pH 8.0 with *orthophosphoric acid* or *sodium hydroxide*,
  B. 70 volumes of *acetonitrile* and 30 volumes of a buffer solution prepared by dissolving 2.84 g of *anhydrous disodium hydrogen phosphate* and 5.88 g of *sodium citrate* in 2000 ml *water*, adjusted to pH 8.0 with *orthophosphoric acid* or *sodium hydroxide*,
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
18	50	50
28	0	100
35	100	0

The retention time of alendronate is about 7 minutes.

The relative retention time with reference to alendronate for impurity D and impurity A is about 1.4 and 1.9 respectively.

Inject reference solution (a) and reference solution (b) to identify the peak due to impurity A and impurity D.

Inject the reference solution (b). The test is not valid unless the resolution between the peak due to alendronate and impurity D is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity A multiply by correction factor 0.4 is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), calculated by area normalization.

Impurities B and C. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in *water* and dilute to 25.0 ml with *water*.

Reference solution (a). Dissolve 50.0 mg of *sodium alendronate trihydrate IPRS* in *water* and dilute to 25.0 ml with the *water*.

Reference solution (b). Dissolve 3.0 g of *phosphoric acid* in *water* and dilute to 100.0 ml with the *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*.

Reference solution (c). Dissolve 2.5 g of *phosphorous acid* in *water* and dilute to 100.0 ml with the *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*.

Reference solution (d). Mix 2.0 ml of reference solution (b) and 2.0 ml of reference solution (c) and dilute to 50.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with anion-exchange resin containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$] attached to a lattice consisting of methacrylate (7 µm),
- column temperature: 35°,
- mobile phase: a solution of 0.2 ml of *anhydrous formic acid* in 1000 ml of *water*, adjusted the pH to 3.5 with *2 M sodium hydroxide*,
- flow rate: 1.2 ml per minute,
- refractometer,
- injection volume: 100 µl.

The retention time of alendronate is about 16 minutes.

The relative retention time with reference to alendronate for impurity B and impurity C is about 1.3 and 1.6 respectively.

Inject reference solution (b), (c). Run the chromatogram twice the retention time of the principal peak. Identify the peak due to impurity B and impurity C.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity B is not more than 0.83 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent) and impurity C is not

https://nhathuocngocanh.com/

more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Between 16.1 per cent to 17.1 per cent, determined on 1.0 g by drying in an oven at 140° to 145°.

Assay. Determine by liquid chromatography (2.4.14), as described under Impurities B and C with the following modifications.

Inject the reference solution (a) and the test solution.

Calculate the content of $C_4H_{12}NNaO_7P_2$.

Sodium Alendronate Tablets

Alendronic Acid Tablets; Alendronate Sodium Tablets

Sodium Alendronate Tablets contains Sodium Alendronate Trihydrate.

Sodium Alendronate Tablets contain sodium alendronate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of alendronic acid , $C_4H_{13}NO_7P_2$.

Usual strength. 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with *water*, to produce a solution containing 0.00084 per cent w/v of alendronic acid.

Reference solution. A 0.0011 per cent w/v solution of *sodium alendronate IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with anion exchange resin (7 µm) (Such as Allsep Anion),
- column temperature: 35°,
- mobile phase: a 0.02 per cent v/v solution of *formic acid*, pH adjusted to 3.5 with *2 M sodium hydroxide*,
- flow rate: 1.2 ml per minute,
- refractive index detector, maintained at 40°,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_{13}NO_7P_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_4H_{13}NO_7P_2$.

Phosphate and phosphite. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of alendronic acid with 20 ml of *water* and mix with the aid of ultrasound for 30 minutes. Add sufficient *water* to produce 25.0 ml and filter.

Reference solution. A solution containing 0.0024 per cent w/v of *orthophosphoric acid* and 0.002 per cent w/v of *phosphorous acid* in *water*.

Use the chromatographic system as described under Dissolution.

Run the chromatogram twice the retention time of the principal peak.

Inject the reference solution. The relative retention time with reference to alendronic acid (retention time, about 17 minutes) are: phosphate, about 1.3; phosphite, about 1.6.

Inject the reference solution. The test is not valid unless the signal to noise ratios of the peaks due to phosphate and phosphite are not less than 10.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to phosphate and phosphite is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.5 per cent).

4-Aminobutanoic acid. Determine by liquid chromatography (2.4.14).

Buffer solution. A solution containing 0.294 per cent w/v of *sodium citrate* and 0.142 per cent w/v of *anhydrous disodium hydrogen orthophosphate*, adjusted to pH 8.0 using *orthophosphoric acid* and filter.

Test solution. Shake a quantity of the powdered tablets containing 23 mg of alendronic acid with a 2.94 per cent w/v solution of *sodium citrate* and dilute to 50.0 ml with the same solvent, mix and filter; discard the first 5 ml of filtrate. To 5 ml of the filtrate in a screw cap centrifuge tube, add 5 ml of a 1.91 per cent w/v solution of *sodium borate*, 10 ml of a 0.2 per cent w/v solution of (9-fluorenyl)methyl chloroformate in *acetonitrile*, shake for 1 minute and allow to stand at room

https://nhathuocngocanh.com/

temperature for 30 minutes, add 20 ml of *dichloromethane* and shake vigorously for 1 minute; centrifuge and use the aqueous layer.

Reference solution (a). Dilute 5.0 ml solution containing 0.0003 per cent w/v of *4-aminobutanoic acid* in a 2.94 per cent w/v solution of *sodium citrate* in a screw cap centrifuge tube add 5 ml of a 1.91 per cent w/v solution of *sodium borate*, 10 ml of a 0.2 per cent w/v solution of (9-fluorenyl)methyl chloroformate in *acetonitrile*, shake for 45 seconds and allow to stand at room temperature for 30 minutes, add 20 ml of *dichloromethane* and shake vigorously for 1 minute, centrifuge and use the aqueous layer.

Reference solution (b). Dilute 5.0 ml solution containing 0.06 per cent w/v of *sodium alendronate IPRS* and 0.01 per cent w/v of *4-aminobutanoic acid* in a 2.94 per cent w/v solution of *sodium citrate* in a screw cap centrifuge tube add 5 ml of a 1.91 per cent w/v solution of *sodium borate*, 10 ml of a 0.2 per cent w/v solution of (9-fluorenyl)methyl chloroformate in *acetonitrile*, shake for 45 seconds and allow to stand at room temperature for 30 minutes, add 20 ml of *dichloromethane* and shake vigorously for 1 minute; centrifuge and use the aqueous layer.

Chromatographic system

- a stainless steel column 25 cm × 4.1 mm, packed with styrene-divinylbenzene co-polymer (10 µm) (Such as Hamilton PRP-1),
- column temperature: 45°,
- mobile phase: A. a mixture of 15 volumes of *acetonitrile* and 85 volumes of buffer solution;
  B. a mixture of 70 volumes of *acetonitrile* and 30 volumes of buffer solution,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
25	50	50
27	0	100
32	100	0
40	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sodium alendronate and aminobutanoic acid, is not less than 10.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to 4-aminobutanoic acid is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Uniformity of content. Complies with tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse 1 tablet in 10 ml of *water*, with the aid of ultrasound for 20 minutes and dilute to 25.0 ml with *water* and filter.

Calculate the content of $C_4H_{13}NO_7P_2$ in the tablet.

Other tests. Comply with the tests stated under Tablet.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of alendronic acid with 20 ml of *water* for 30 minutes with the aid of ultrasound and occasional shaking and agitate until cool, add sufficient *water* to produce 25.0 ml, mix and filter

Reference solution. A 0.25 per cent w/v solution of *sodium alendronate IPRS* in *water*.

Use chromatographic system as described under Dissolution.

Inject the reference solution and the test solution.

Calculate the content of $C_4H_{13}NO_7P_2$ in the tablets.

1 mg of $C_4H_{12}NNaO_7P_2,3H_2O$ is equivalent to 0.7662 mg of alendronic acid, $C_4H_{13}NO_7P_2$.

Labelling. The label states the strength in terms of the equivalent amount of alendronic acid.

Sodium Alginate

Sodium Polymannuronate

Sodium Alginate consists mainly of the sodium salt of alginic acid which is a mixture of polyuronic acids $[(C_6H_8O_6)_n]$ composed of residues of D-mannuronic acid and L-guluronic acids and is obtained mainly from algae belonging to the order Phaeophyceae.

Category. Pharmaceutical aid (viscosity-increasing agent).

Description. A cream-coloured to pale yellowish brown powder.

Identification

A. Dissolve 0.2 g with shaking in 20 ml of *water* and to 5 ml of the resulting solution add 1 ml of *calcium chloride solution*; a voluminous gelatinous precipitate is produced.

B. To 10 ml of the solution obtained in test A add 1 ml of *1 M sulphuric acid*; a gelatinous mass is produced.

C. To 5 mg add 5 ml of *water*, 1 ml of a freshly prepared 1 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per*

https://nhathuocngocanh.com/

cent) and 5 ml of *hydrochloric acid*. Boil for 3 minutes, cool, add 5 ml of *water* and shake with 15 ml of *di-isopropyl ether*. The upper layer exhibits a deeper bluish red colour than the upper layer obtained by repeating the procedure without the substance under examination.

D. The residue obtained in the test for Sulphated ash gives reaction (A) of sodium salts (2.3.1).

Tests

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm), using *nitric acid* instead of *sulphuric acid* for wetting the sample.

Chloride. Not more than 1.0 per cent, determined by the following method. Shake 2.5 g with 50 ml of *2 M nitric acid* for 1 hour, dilute to 100 ml with *2 M nitric acid* and filter. To 50 ml of the filtrate add 10.0 ml of *0.1 M silver nitrate* and 5 ml of *toluene*. Titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator and shaking vigorously towards the end-point. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

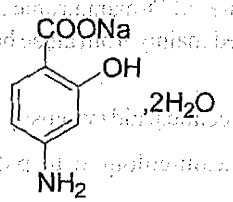
Sulphated ash (2.3.18). 30.0 to 36.0 per cent, determined on 0.1 g and calculated on the dried basis.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.2 g by drying in an oven at 105° for 4 hours.

Storage. Store protected from light.

Sodium Aminosalicylate

Sodium PAS



$C_7H_6NNaO_3,2H_2O$. Mol. Wt. 211.2

Sodium Aminosalicylate is sodium 4-amino-2-hydroxybenzoate dihydrate.

Sodium Aminosalicylate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_6NNaO_3$, calculated on the anhydrous basis.

Category. Antitubercular.

Description. A white to cream coloured crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium aminosalicylate IPRS* or with the reference spectrum of sodium aminosalicylate.

B. A 5 per cent w/v solution complies with the tests for sodium salts (2.3.1).

Tests

pH (2.4.24). 6.5 to 8.5, determined in a 2.0 per cent w/v solution.

3-aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *3-aminophenol IPRS* in 100.0 ml of the mobile phase (solution A). Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *sodium aminosalicylate IPRS* in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution and 5 ml of solution A to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous base deactivated silica (5 µm) (Such as Hypersil BDS),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent solution)* and make the volume to 1700 ml with *water* and add 300 ml of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 5.0 per cent

Inject reference solution (b). The test is not valid unless the resolution between *m*-aminophenol and sodium aminosalicylate is at least 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to 3-aminophenol is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.25 per cent).

Hydrogen Sulphide and Sulphur dioxide. Dissolve 0.5 g in 5 ml of *1 M sodium hydroxide*, add 6 ml of *3 M hydrochloric acid* and stir vigorously. No odour of hydrogen sulphide or sulphur dioxide is perceptible, and not more than a faint odour of Amyl Alcohol is perceptible. A piece of moistened *lead*

https://nhathuocngocanh.com/

acetate paper held over the mixture does not become discoloured.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath, ignite gently, dissolve the cooled residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT* and remove the excess bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 0.66 g complies with the limit test for heavy metals, Method B (30 ppm).

Chlorides (2.3.12). Dissolve 1.0 g in 10 ml of *water*, add 3 ml of *acetic acid* and filter, dilute the filtrate to 50 ml with *water*. 5.0 ml of the solution complies with the limit test for chlorides (0.25 per cent).

Sulphates (2.3.17). 0.1 g complies with the limit test for sulphates (0.15 per cent).

Loss on drying (2.4.19). 16.0 to 17.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *sodium aminosalicylate IPRS* in 100.0 ml of the mobile phase (solution A). Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *3-aminophenol IPRS* in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution and 5 ml of solution A to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent solution)* and make the volume to 1700 ml with *water* and add 300 ml of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 3000 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The test is not valid unless the resolution between 3-aminophenol and sodium aminosalicylate is not less than 5.0.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_6NNaO_3$.

Storage. Store protected from light and moisture.

Sodium Aminosalicylate Tablets

Sodium PAS Tablets

Sodium aminosalicylate tablet contains not less than 95.0 per cent not more than 105.0 per cent of $C_7H_6NNaO_3,2H_2O$.

Usual strengths. 500 mg; 1 g.

Identification

Digest a quantity of powdered tablets containing about 3.0 g of sodium aminosalicylate, with 40 ml of *water*, and filter. Add to the filtrate 15 ml of *1M acetic acid*, and allow it to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with *water* and dry at 105°C for 30 min. The residue complies with the following tests.

A. Place about 1 g of the residue in a small, round-bottom flask, and add 10 ml of *acetic anhydride*. Heat the flask on a steam bath for 30 minutes, and add 40 ml of *water*, mix, filter, cool, and allow to stand until diacetyl derivative crystallizes, wash well with *water*, and dry at 105° for 1 hour. The diacetyl derivative so obtained melts at 191° to 197°.

B. Shake 0.1 g of the residue with 10 ml of *water*, and filter. To 5 ml of the filtrate add 1 drop of *ferric chloride solution*. A violet colour is produced.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml *water*,
Speed and time. 100 rpm for 45 minutes.

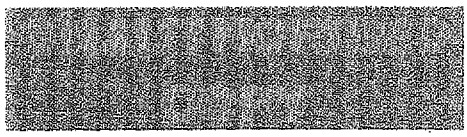
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate diluted with the mobile phase to produce a 0.055 per cent w/v solution.

Reference solution. A 0.055 per cent w/v solution of *sodium aminosalicylate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),



https://nhathuocngocanh.com/

- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Calculate the content of $C_7H_6NNaO_3.2H_2O$ in the medium

Q. Not less than 75 per cent of the stated amount of $C_7H_6NNaO_3.2H_2O$.

3-aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Sodium Aminosalicylate and dissolve in 100 ml of the mobile phase.

Reference solution (a). A 0.024 per cent w/v solution of *m-aminophenol IPRS* in the mobile phase. Dilute 5 ml to 100 ml with the mobile phase. Dilute 5 ml of the resulting solution to 50 ml with the mobile phase.

Reference solution (b). A 0.024 per cent w/v solution of *sodium aminosalicylate IPRS* in the mobile phase.

Reference solution (c). Mix 5 ml each of reference solution (a) and reference solution (b) and dilute to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous base deactivated silica (5 µm) (Such as Hypersil BDS),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (c). The resolution between 3-aminophenol and sodium aminosalicylate is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to 3-aminophenol is not more than the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.5 g of sodium aminosalicylate, add sufficient mobile phase to produce 100.0 ml and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *sodium aminosalicylate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

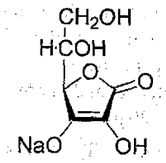
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject the reference solution and the test solution.

Calculate the content of $C_7H_6NNaO_3.2H_2O$ in the tablets.

Storage. Store protected from moisture.

Sodium Ascorbate



$C_6H_7NaO_6$ Mol. Wt. 198.1

Sodium Ascorbate is L-ascorbic acid monosodium salt.

Sodium Ascorbate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_7NaO_6$, calculated on the dried basis.

Category. Vitamin C.

Description. White or faintly yellow crystals or a crystalline powder. It darkens gradually on exposure to light.

Identification

Test A may be omitted if tests B, C and D are carried out. Test B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium ascorbate IPRS.*

B. To 4 ml of a 2 per cent w/v solution add 1 ml of *0.1 M hydrochloric acid*, add a few ml of *2,6-dichlorophenol-indophenol solution*; the solution is decolorised.

C. To 4 ml of a 2 per cent w/v solution add 1 ml of *0.1 M hydrochloric acid*, add 1 drop of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside* and 2 ml of *dilute sodium hydroxide solution*. Add 0.6 ml of *hydrochloric acid* dropwise and stir; the yellow colour turns blue.

D. A 2 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 7.0 to 8.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 103° to + 108°, determined in a 10.0 per cent w/v solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

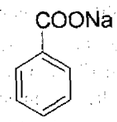
Loss on drying (2.4.19). Not more than 0.25 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in a mixture of 100 ml of *carbon dioxide-free water* and 25 ml of *1 M sulphuric acid.* Titrate immediately with *0.05 M iodine*, using 1 ml of *starch solution* as indicator, until a persistent violet-blue colour is obtained.

1 ml of *0.05 M iodine* is equivalent to 0.009905 g of $C_6H_7NaO_6$.

Storage. Store protected from light.

Sodium Benzoate



$C_7H_5NaO_2$ Mol. Wt. 144.1

Sodium Benzoate contains not less than 99.0 per cent and not more than 100.5 per cent of $C_7H_5NaO_2$, calculated on the dried basis.

Category. Pharmaceutical aid (preservative).

Description. A white, crystalline or granular powder or flakes; hygroscopic.

Identification

A. To a 10 per cent w/v solution add *ferric chloride test solution*; a buff coloured precipitate is formed. Add *dilute hydrochloric acid*; a white crystalline precipitate is produced.

B. Gives the reactions of sodium salts and reactions (B) and (C) of benzoates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity or alkalinity. To 20 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *phenolphthalein solution*. Not more than 0.2 ml of *0.1 M hydrochloric acid* or 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath. Ignite gently, dissolve the cooled residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT*, and remove the excess of *bromine* with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorinated compounds. Dissolve 0.33 g in 5 ml of *0.5 M sodium carbonate*, evaporate to dryness and heat the residue until completely charred, keeping the temperature below 400°. Extract the residue with a mixture of 10 ml of *water* and 12 ml of *dilute nitric acid* and filter; the filtrate complies with the limit test for chlorides (2.3.12).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.25 g, dissolve in 20 ml of *anhydrous glacial acetic acid*, warming to 50° if necessary, cool. Titrate with *0.1 M perchloric acid*, using 0.05 ml of *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01441 g of $C_7H_5NaO_2$.

Storage. Store protected from light.

https://nhathuocngocanh.com/

Sodium Bicarbonate

Sodium Hydrogen Carbonate

$NaHCO_3$ Mol. Wt. 84.0

Sodium Bicarbonate contains not less than 99.0 per cent and not more than 101.0 per cent of $NaHCO_3$.

Category. Electrolyte replenisher; systemic alkaliser.

Description. A white, crystalline powder or small, opaque, monoclinic crystals. It gradually forms sodium carbonate on heating in the dry state or in solution.

Identification

A. To 5 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.1 ml of *phenolphthalein solution*; a pale pink colour is produced. On heating, a gas is evolved and the solution becomes red.

B. It gives reaction (A) of bicarbonates (2.3.1).

C. Solution A gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water*, add 15 ml of *brominated hydrochloric acid AsT* and remove the excess of *bromine* with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Calcium. A 2.0 per cent w/v solution, when boiled for 5 minutes, is clear.

Heavy metals (2.3.13). Mix 4.0 g with 5 ml of *water* and 18 ml of *dilute hydrochloric acid*, heat to boiling and maintain that temperature for 1 minute. Add 0.05 ml of *phenolphthalein solution* and sufficient *5 M ammonia* dropwise to give the solution a faint pink colour, cool and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Iron (2.3.14). Dissolve 2.0 g in 20 ml of *water* and 4 ml of *hydrochloric acid* and dilute to 40 ml with *water*; the resulting solution complies with the limit test for iron (20 ppm).

Carbonate. pH of solution A, when freshly prepared, not more than 8.6.

Chlorides (2.3.12). 1.25 g dissolved in 15 ml of *water* and 2 ml of *nitric acid* complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). Suspend 1.0 g in 10 ml of *distilled water*, neutralise with *hydrochloric acid* and dilute to 15 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (150 ppm).

Assay. Weigh 1.5 g, dissolve in 50 ml of *carbon dioxide-free water* and titrate with *1 M hydrochloric acid* using 0.2 ml of *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08401 g of $NaHCO_3$.

Storage. Store protected from moisture.

Sodium Bicarbonate Injection

Sodium Bicarbonate Intravenous Infusion

Sodium Bicarbonate Injection is a sterile solution of Sodium Bicarbonate in Water for Injections.

Sodium Bicarbonate Injection contains not less than 94.0 per cent and not more than 106.0 per cent of the stated amount of sodium bicarbonate, $NaHCO_3$.

Category. Electrolyte replenisher; systemic alkaliser.

Usual strengths. 1.4, 4.2, 5.0, 7.5 and 8.4 per cent w/v.

Description. A clear, colourless solution.

Identification

A. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a yellow colour to the flame.

B. It gives reaction (A) of sodium salts and the reactions of bicarbonates (2.3.1).

Tests

pH (2.4.24). 7.0 to 8.5.

Bacterial endotoxins (2.2.3). Not more than 1.7 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Titrate a volume containing 1.5 g of Sodium Bicarbonate with *1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08401 g of $NaHCO_3$.

Storage. Store in single dose containers.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Bicarbonate; (2) the approximate concentrations, in millimoles per litre, of the sodium ions and the bicarbonate ions; (3) that an injection containing visible particles in the solution should not be used.

https://nhathuocngocanh.com/

Sodium Carbonate

Na_2CO_3 Mol. Wt. 106.0 (anhydrous)

Na_2CO_3,H_2O Mol. Wt. 124.0 (monohydrate)

Sodium Carbonate is anhydrous or contains one molecule of water of hydration.

Sodium Carbonate contains not less than 99.5 per cent and not more than 100.5 per cent of Na_2CO_3, calculated on the dried basis.

Category. Pharmaceutical aid (alkalising agent)

Description. *Anhydrous* — A white or almost white, slightly granular powder, hygroscopic.

Monohydrate — A white, crystalline powder or colourless crystals.

Identification

A. Dissolve 1 g in *water* and dilute to 10 ml with *water*; the solution is strongly alkaline.

B. The solution prepared for test A gives reaction (A) of carbonates and reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Dissolve 2.0 g in 10 ml of *water*. The resulting solution is clear and not more intensely coloured than reference solution YS6 (2.4.1).

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water*, add 20 ml of *barium chloride solution* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 minutes. The solution remains clear.

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 5 ml of *hydrochloric acid* and 25 ml of *water*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution* until the solution is neutral. Dilute to 50 ml with *water* (solution A). 10 ml of the resulting solution complies with the limit test for heavy metals, Method A (50 ppm).

Iron (2.3.14). Dilute 20 ml of solution A to 40 ml with *water*. The solution complies with the limit test for iron (50 ppm).

Chlorides (2.3.12). Dissolve 2.0 g in *water*, add 20 ml of *dilute nitric acid* and dilute to 25 ml with *water*. The solution complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (250 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent (for anhydrous form) or between 12.0 per cent and 15.0 per cent (for monohydrate form), determined on 2.0 g by drying in an oven at 300°.

Assay. Dissolve 1.0 g in 25 ml of *water* and titrate with *1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.05299 g of Na_2CO_3.

Storage. Store in tightly-closed, non-metallic containers.

Labelling. The label states whether the material is anhydrous or monohydrate.

Sodium Chloride

NaCl Mol. Wt. 58.4

Sodium Chloride contains not less than 99.0 per cent and not more than 100.5 per cent of NaCl, calculated on the dried basis.

Category. Pharmaceutical aid (tonicity agent); fluid and electrolyte replenisher.

Description. White or colourless crystals or a white crystalline powder.

Identification

A. It gives the reactions of chlorides (2.3.1).

B. A 20 per cent w/v solution in *carbon dioxide-free water* prepared from *distilled water* (solution A) gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 20 ml of solution A add 0.1 ml of *bromothymol blue solution*; not more than 0.5 ml of *0.01 M hydrochloric acid* or of *0.01 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and 12 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (1 ppm).

Barium. Dissolve 2 g in 10 ml of *water*, and add 2 ml of *dilute sulphuric acid*; no turbidity is produced within 2 hours.

Bromide. To 0.5 ml of solution A add 4.0 ml of *water*, 2.0 ml of *phenol red reagent* and 1.0 ml of 0.01 per cent w/v solution of *chloramine T* and mix immediately. After exactly 2 minutes, add 0.15 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water*. The absorbance of the solution measured at about 590 nm (2.4.7), using *water* as the blank, is not more than that of the standard solution prepared at the same time and in the same manner, starting with the addition of " 2.0 ml

https://nhathuocngocanh.com/

of *phenol red reagent*.....", using 5.0 ml of a 0.0003 per cent w/v solution of *potassium bromide* (100 ppm).

Calcium and magnesium. Not more than 50 ppm, calculated as Ca, determined by the following method. Dissolve 20.0 g in 200 ml of *water*, and add 0.1 ml of *hydrochloric acid*, 5 ml of *strong ammonia-ammonium chloride solution*, 5 drops of *eriochrome black T solution* and titrate with *0.005 M disodium edetate* to a blue end-point.

1 ml of *0.005 M disodium edetate* is equivalent to 0.0002004 g of Ca.

Ferrocyanide. Dissolve 2.0 g in 6 ml of *water* and add 0.5 ml of a mixture of 5 ml of a 1 per cent w/v solution of *ferric ammonium sulphate* in a 0.25 per cent w/v solution of *sulphuric acid*, and 95 ml of a 1 per cent w/v solution of *ferrous sulphate*; no blue colour is produced within 10 minutes.

Heavy metals (2.3.13). 4.0 g in 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Iodide. Moisten 5 g by adding dropwise, a solution freshly prepared by mixing 25 ml of *iodide-free starch solution* 2 ml of *0.5 M sulphuric acid*, 0.15 ml of *sodium nitrite solution* and 25 ml of *water* and examine the mixture in daylight; the substance shows no blue colour after 5 minutes.

Iron (2.3.14). 2.0 g dissolved in 20 ml of *water* complies with the limit test for iron (20 ppm).

Sulphates (2.3.17). 2.5 ml of solution A diluted to 15 ml with *water* complies with the limit test for sulphates (300 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.1 g in 50 ml of *water* in a glass-stoppered flask. Add 50.0 ml of *0.1 M silver nitrate*, 5 ml of *2 M nitric acid* and 2 ml of *dibutyl phthalate*, shake well and titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator, until the colour becomes reddish yellow.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Sodium Chloride intended for use in the manufacture of parenteral preparations or in the manufacture of dialysis solutions complies with the following additional requirement.

Potassium. Not more than 0.1 per cent, determined by flame photometry (2.4.4) or by method A for atomic absorption spectrophotometry (2.4.2), using a 1.0 per cent w/v solution and measuring at 767 nm. Use suitable dilutions in water of *potassium solution FP* or *potassium solution AAS* respectively, for the standard solution.

Sodium Chloride intended for use in the preparation of dialysis solutions complies with the following additional requirement.

Aluminium. Not more than 0.2 ppm, determined by the following method. Dissolve 20 g in 100 ml of *water* and add 10 ml of *acetate buffer pH 6.0*. Extract the resulting solution with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50 ml with *chloroform*. Use as the blank solution a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner and as the standard solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 90 ml of *water* treated in the same manner. Measure the fluorescence of the test solution and of the standard solution (2.4.5), using an excitation wavelength of 392 nm and a secondary filter with a transmission band centered at 518 nm, or a monochromator set to transmit at this wavelength, and setting the instrument to zero with the blank solution in each case. The fluorescence of the test solution is not more than that of the standard solution.

Sodium Chloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 5.0 Endotoxin Unit per g of sodium chloride.

Storage. Store protected from light.

Labelling. The label states whether or not the material is suitable for use in the manufacture of parenteral preparations or for the preparation of dialysis solutions.

Sodium Chloride and Dextrose Injection

Sodium Chloride and Dextrose Intravenous Infusion; Sodium Chloride and Glucose Injection; Sodium Chloride and Glucose Intravenous Infusion

Sodium Chloride and Dextrose Injection is a sterile solution of Sodium Chloride and Dextrose in Water for Injections.

Sodium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium chloride, NaCl, and dextrose, $C_6H_{12}O_6$.

Usual strengths. Injections containing the following amounts of Sodium Chloride, NaCl and Dextrose, $C_6H_{12}O_6$.

https://nhathuocngocanh.com/

Per cent w/v of sodium chloride (NaCl)	Per cent w/v of dextrose ($C_6H_{12}O_6$)	Per cent w/v of sodium chloride (NaCl)	Per cent w/v of dextrose ($C_6H_{12}O_6$)
0.11	5		
0.18	5	0.45	5
0.2	5	0.45	10
0.225	5	0.9	2.5
0.3	5	0.9	5
0.33	5	0.9	10
0.45	2.5	0.9	25

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives reaction (B) of sodium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of dextrose, $C_6H_{12}O_6$, to 500 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7); absorbance at about 284 nm, not more than 0.25.

Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per g of dextrose.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium chloride* — Titrate a measured volume containing 0.1 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For dextrose — To a measured volume containing 2 to 5 g of anhydrous dextrose, $C_6H_{12}O_6$, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume of the injection taken for assay.

Storage. Store in single dose containers. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride and Dextrose; (2) that a solution containing visible particles must not be used.

When the preparation is intended for intravenous infusion, the label states the approximate concentrations, in millimoles per litre, of the sodium and chloride ions and the number of grams per litre of dextrose, $C_6H_{12}O_6$.

Sodium Chloride and Fructose Injection

Sodium Chloride and Fructose Intravenous Infusion; Sodium Chloride and Fructose Infusion; Fructose and Sodium Chloride Injection.

Sodium Chloride and Fructose Injection is a sterile solution of Sodium Chloride and Fructose in Water for Injections.

Sodium Chloride and Fructose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium chloride, NaCl, and fructose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths. Injections containing the following amounts of Sodium Chloride, NaCl, and Fructose, $C_6H_{12}O_6$.

Per cent w/v of Sodium Chloride (NaCl)	Per cent w/v of Fructose ($C_6H_{12}O_6$)	Per cent w/v of Sodium Chloride (NaCl)	Per cent w/v of Fructose ($C_6H_{12}O_6$)
0.11	5	0.45	2.5
0.18	5	0.45	10
0.225	5	0.9	2.5
0.33	5	0.9	5
0.45	5	0.9	10

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. The solution prepared in the Assay is laevo-rotatory.

C. It gives reaction (B) of sodium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.0 to 6.0.

https://nhathuocngocanh.com/

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of Fructose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7); absorbance at about 284 nm, not more than 0.50.

Heavy metals (2.3.13). Evaporate a volume containing 4.0 g of Fructose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium chloride* — Titrate a measured volume containing about 0.1 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For fructose — To a measured volume containing about 5.0 g of Fructose, add 0.2 ml of *6 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.5427 represents the weight, in g, of fructose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers. On keeping, small solid particles may separate from glass containers.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride and Fructose; (2) when the preparation is intended for intravenous infusion, the approximate concentrations, in millimoles per litre, of the sodium and chloride ions and the number of grams per litre of fructose; (3) that a solution containing visible particles should not be used.

Compound Sodium Chloride and Dextrose Injection

Compound Sodium Chloride and Dextrose Intravenous Infusion

Compound Sodium Chloride and Dextrose Injection is a sterile solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride, 0.033 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Compound Sodium Chloride and Dextrose Injection contains not less than 0.82 per cent and not more than 0.90 per cent w/v of sodium chloride, NaCl, not less than 0.0285 per cent and not more than 0.0315 per cent w/v of potassium chloride, KCl, not less than 0.030 per cent and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.523 per cent and not more than 0.580 per cent w/v of chloride, Cl, and not less than 4.75 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. It gives reaction (B) of sodium salts and reaction (A) of chlorides (2.3.1).

C. After evaporation to one half of its original volume, the solution gives reaction (A) of potassium salts and reaction (B) of calcium salts (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium chloride* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

1 g of Na is equivalent to 2.542 g of NaCl.

For potassium chloride — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

1 g of K is equivalent to 1.907 g of KCl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH*

https://nhathuocngocanh.com/

10.9 and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total Chloride, calculated as Cl.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride, Potassium Chloride, Calcium Chloride and Dextrose; (2) that the injection contains, in millimoles per litre, the following approximate amounts of the ions sodium, 147.5, potassium, 4, calcium, 4.5, and Chloride, 156; (3) the total osmolar concentration in mOsmol per litre; (4) that the injection should not be used if it contains visible particles.

Sodium Chloride Hypertonic Injection

Hypertonic Saline

Sodium Chloride Hypertonic Injection is a sterile 1.6 per cent w/v solution of Sodium Chloride in Water for Injections. It contains no antimicrobial agent.

Sodium Chloride Hypertonic Injection contains not less than 1.52 per cent w/v and not more than 1.68 per cent w/v of sodium chloride, NaCl.

Description. A clear, colourless solution.

Identification

It gives the reactions of sodium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 40 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. To a measured volume containing about 0.16 g of Sodium Chloride in a glass-stoppered flask add 50 ml of *water* and 50.0 ml of *0.1 M silver nitrate*, 5 ml of *2 M nitric acid* and 2 ml of *dibutyl phthalate*. Shake well and titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator, until the colour becomes reddish yellow. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the injection contains approximately 270 millimoles each of sodium and chloride ions per litre.

Sodium Chloride Injection

Sodium Chloride Intravenous Infusion

Sodium Chloride Injection is a sterile 0.9 per cent w/v solution of Sodium Chloride in Water for Injections. It contains no antimicrobial agent.

Sodium Chloride Injection contains not less than 0.85 per cent w/v and not more than 0.95 per cent w/v of sodium Chloride, NaCl.

Description. A clear, colourless solution.

Identification

It gives the reactions of sodium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.0.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

https://nhathuocngocanh.com/

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. Titrate a measured volume containing about 0.2 g of sodium chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the injection contains approximately 150 millimoles each of sodium and chloride ions per litre.

Compound Sodium Chloride Injection

Ringer's Injection

Compound Sodium Chloride Injection is a sterile solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride and 0.033 per cent w/v of Calcium Chloride in Water for Injections. It contains no antimicrobial agent.

Compound Sodium Chloride Injection contains not less than 0.82 per cent w/v and not more than 0.90 per cent w/v of sodium chloride, NaCl, not less than 0.0285 per cent w/v and not more than 0.0315 per cent w/v of potassium chloride, KCl, and not less than 0.030 per cent w/v and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2, 2H_2O$.

Description. A clear, colourless solution.

Identification

It gives reaction (B) of sodium salts and reaction (A) of chlorides (2.3.1). When concentrated to one half of its original volume, it gives reaction (A) of potassium salts and reaction (B) of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium chloride* — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using sodium solution FP, suitably diluted with water for the standard solutions.

1 g of Na is equivalent to 2.54 g of NaCl.

For potassium Chloride — Dilute appropriately with *water* and determine by Method A for flame photometry (2.4.4), measuring at 767 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *potassium solution FP*, suitably diluted with water for the standard solutions.

1 g of K is equivalent to 1.907 g of KCl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *mordant black II mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride, Potassium Chloride and Calcium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the Injection contains in millimoles per litre, the following approximate amounts of ions; sodium, 147.5; potassium, 4; calcium, 2.25 and chloride, 156.

Compound Sodium Chloride Solution

Ringer's Solution

Compound Sodium Chloride Solution is a solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride and 0.033 per cent w/v of Calcium Chloride in Purified Water. The solution may be clarified by filtration.

Compound Sodium Chloride Solution contains not less than 0.82 per cent w/v and not more than 0.90 per cent of sodium chloride, NaCl, not less than 0.025 per cent and not more than 0.035 per cent w/v of potassium chloride, KCl, and not less than 0.030 per cent and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2, 2H_2O$.

https://nhathuocngocanh.com/

Category. Irrigation solution (for external use).

Description. A clear, colourless solution.

Identification

It gives reaction (B) of sodium salts and reaction (A) of chlorides (2.3.1). When concentrated to one half of its original volume, it gives reaction (A) of potassium salts and reaction (B) of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium chloride* — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *sodium solution FP*, suitably diluted with water for the standard solutions.

1 g of Na is equivalent to 2.54 g of NaCl.

For potassium chloride — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 767 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *potassium solution FP*, suitably diluted with water for the standard solutions.

1 g of K is equivalent to 1.907 g of KCl.

For calcium Chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *mordant black II mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light.

Labelling. The label states the strength as the percentages w/v of Sodium Chloride, Potassium Chloride and Calcium Chloride. If the contents of the container are sterile, the label states (1) Sterile Compound Sodium Chloride Solution; (2) that the solution is not intended for injection.

Sodium Chloride Irrigation Solution

Sodium Chloride Irrigation Solution is a sterile solution containing 0.9 per cent w/v of Sodium Chloride in Water for Injections.

Sodium Chloride Irrigation Solution contains not less than 0.85 per cent w/v and not more than 0.95 per cent w/v of sodium Chloride, NaCl. It contains no antimicrobial agent.

Description. A clear, colourless solution.

Identification

It gives the reactions of sodium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.0.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with limit test for heavy metals, Method A (0.3 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Titrate a measured volume containing about 0.135 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers. The container may be designed to empty rapidly and may contain a volume of more than 1 litre.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that the solution should not be used if it contains visible particles; (3) 'For Irrigation only' and 'Not for Injection'; (4) that once the container is opened, the unused portion should be discarded.

Sodium Citrate Eye Drops

Sodium Citrate Eye Drops are a sterile solution of Sodium Citrate in Purified Water.

Sodium Citrate Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium citrate, $C_6H_5Na_3O_7,2H_2O$.

Usual strength. 10 per cent w/v.

Description. A colourless solution.

Identification

It gives reaction (A) of sodium salt and reactions of citrates (2.3.1).

Tests

pH (2.4.24). 7.0 to 7.5.

https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Eye Drops.

Assay. Evaporate a volume containing about 0.15 g of Sodium Citrate to dryness and dissolve the residue in *anhydrous glacial acetic acid*, warming to about 50°. Allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphthlolbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.009803 g of $C_6H_5Na_3O_7,2H_2O$.

Storage. Store protected from light.

Sodium Citrate Irrigation Solution

Sodium Citrate Irrigation Solution is a sterile solution of sodium citrate in water for injections containing anhydrous citric acid or citric acid monohydrate.

Sodium Citrate Irrigation Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium citrate, $C_6H_5Na_3O_7,2H_2O$.

Usual strength. 3 per cent w/v.

Description. A colourless solution.

Identification

It gives reactions of sodium salt and citrates (2.3.1).

Tests

pH (2.4.24). 6.0 to 7.5.

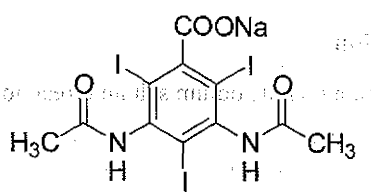
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Evaporate a volume containing 0.15 g of Sodium Citrate to dryness and dissolve the residue in *anhydrous glacial acetic acid*, warming to about 50° and allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphthlol-benzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.009803 g of $C_6H_5Na_3O_7,2H_2O$.

Sodium Diatrizoate

Diatrizoate Sodium



$C_{11}H_8I_3N_2NaO_4$ Mol. Wt. 635.9

Sodium Diatrizoate is sodium 3,5-diacetamido-2,4,6-triiodo-benzoate.

Sodium Diatrizoate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{11}H_8I_3N_2NaO_4$, calculated on the anhydrous basis.

Category. Urographic radio-opaque substance.

Description. A white powder.

Identification

Tests A and D may be omitted if tests B, C, E and F are carried out. Tests B, C and F may be omitted if tests A, D and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium diatrizoate IPRS* or with the reference spectrum of sodium diatrizoate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 20 volumes of *chloroform*, 10 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of 0.08 per cent w/v solution of *sodium hydroxide* in *methanol*.

Reference solution. A 0.1 per cent w/v of *sodium diatrizoate IPRS* in 0.08 per cent w/v solution of *sodium hydroxide* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Heat 0.5 g in a crucible; violet vapours of iodine are evolved.

D. To 20 mg add 5 ml of *1 M sodium hydroxide* and boil gently under a reflux condenser for 10 minutes. Cool, add 5 ml of *2 M hydrochloric acid* and cool in ice for 5 minutes. Add 4 ml of a 1 per cent w/v solution of *sodium nitrite*, cool in ice for 5 minutes, add 0.3 g of *sulphamic acid*, shake gently until effervescence ceases and add 2 ml of a 0.4 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; an orange-red colour is produced.

E. Heat 0.5 g with 1 ml of *sulphuric acid* on a water-bath until a pale violet solution is produced, add 2 ml of *ethanol (95 per cent)* and heat again; odour of ethyl acetate is produced.

F. It gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.5 to 9.5, determined in a 50 per cent w/v solution.

https://nhathuocngocanh.com/

Free amine. Place 1.0 g in a 50-ml glass-stoppered volumetric flask, add 5 ml of *water*, 10 ml of *0.1 M sodium hydroxide* and 25 ml of *dimethyl sulphoxide*. Stopper the flask, mix the contents gently and cool in ice, protected from light. After 5 minutes, slowly add 2 ml of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 2 per cent w/v solution of *sodium nitrite*, mix and allow to stand for 5 minutes. Add 1 ml of an 8 per cent w/v solution of *sulphamic acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in a 70 per cent w/v solution of *1,2-propanediol* and mix. Remove the flask from the ice and allow to stand in water at 25° ± 2° for 10 minutes, with occasional shaking. Add sufficient *dimethyl sulphoxide* to produce 50 ml and mix. Within 5 minutes, measure the absorbance of the resulting solution at the maximum at about 470 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* in the same manner; absorbance, not more than 0.40, calculated on the anhydrous basis.

Free iodine and iodide. Dissolve 2.0 g in 24 ml of *water* taken in a 50-ml glass-stoppered centrifuge tube. Add 5 ml of *toluene* and 5 ml of *1 M sulphuric acid*, shake well and centrifuge; no red colour appears in the toluene layer. To the mixture add 1 ml of a 2 per cent w/v solution of *sodium nitrite*, shake and centrifuge; any red colour in the toluene layer is not more intense than that produced in a solution prepared in the same manner using 2.0 ml of a 0.025 per cent w/v solution of *potassium iodide* and 22 ml of *water* (220 ppm).

Heavy metals. Dissolve 1.0 g in 20.0 ml of *water* and 5 ml of *1 M sodium hydroxide*, transfer the solution to a 50-ml Nessler cylinder, dilute with *water* to 40 ml and mix. Add 10 ml of *sodium sulphide solution*, shake and allow to stand for 5 minutes (20 ppm), the colour of the solution when viewed downward over a white surface is not more intense than that produced by treating 2.0 ml of *lead standard solution (10 ppm Pb)* in the same manner in place of the substance under examination.

Water (2.3.43). 4.0 to 7.0 per cent, determined on 0.4 g.

Assay. Weigh 0.4 g in a glass-stoppered conical flask, add 12 ml of *5 M sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through cotton and wash the flask and filter with two quantities, each of 20 ml, of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the dark brown colour becomes pale brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 0.02120 g of $C_{11}H_8I_3N_2NaO_4$.

Storage. Store protected from light.

Sodium Diatrizoate Injection

Diatrizoate Sodium Injection

Sodium Diatrizoate Injection is a sterile solution of Sodium Diatrizoate in Water for Injections. It may contain small amounts of suitable buffers, stabilisers and antimicrobial agents but the preparation intended for intravenous administration contains no antimicrobial preservative.

Sodium Diatrizoate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium diatrizoate, $C_{11}H_8I_3N_2NaO_4$.

Usual strengths. 25 per cent w/v; 40 per cent w/v.

Identification

Evaporate a volume of the injection containing 1 g of Sodium Diatrizoate to dryness. The residue complies with following tests.

A. Heat 0.5 g of residue in a crucible; violet vapours of iodine are evolved.

B. To 20 mg of the residue add 5 ml of *1 M sodium hydroxide* and boil gently under a reflux condenser for 10 minutes. Cool, add 5 ml of *2 M hydrochloric acid* and cool in ice for 5 minutes. Add 4 ml of a 1 per cent w/v solution of *sodium nitrite*, cool in ice for 5 minutes, add 0.3 g of *sulphamic acid*, shake gently until effervescence ceases and add 2 ml of a 0.4 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; an orange-red colour is produced.

C. Heat 0.5 g of residue with 1 ml of *sulphuric acid* on a water-bath until a pale violet solution is produced, add 2 ml of *ethanol (95 per cent)* and heat again; odour of ethyl acetate is produced.

Tests

pH (2.4.24). 6.6 to 7.6.

Free amine. To a volume containing 1.0 g of Sodium Diatrizoate in a 50-ml glass-stoppered volumetric flask, add 5 ml of *water*, 10 ml of *0.1 M sodium hydroxide* and 25 ml of *dimethyl sulphoxide*. Stopper the flask, mix the contents gently and cool in ice, protected from light. After 5 minutes, slowly add 2 ml of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 2 per cent w/v solution of *sodium nitrite*, mix and allow to stand for 5 minutes. Add 1 ml of a 8 per cent w/v solution of *sulphamic acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in a 70 per cent w/v solution of *1,2-propanediol* and mix. Remove the flask from the ice and allow to stand in water at 25° ± 2° for 10 minutes, with occasional shaking. Add sufficient *dimethyl sulphoxide* to produce 50 ml and mix. Within 5 minutes, measure

https://nhathuocngocanh.com/

the absorbance of the resulting solution at the maximum at about 470 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* in the same manner; absorbance, not more than 0.40, calculated on the anhydrous basis.

Free iodine and iodide. To a volume containing 2.0 g of Sodium Diatrizoate in 24 ml of *water* taken in a 50-ml glass-stoppered centrifuge tube add 5 ml of *toluene* and 5 ml of *1 M sulphuric acid*, shake well and centrifuge; no red colour appears in the toluene layer. To the mixture add 1 ml of a 2 per cent w/v solution of *sodium nitrite*, shake and centrifuge; any red colour in the toluene layer is not more intense than that produced in a solution prepared in the same manner using 2.0 ml of a 0.025 per cent w/v solution of *potassium iodide* and 22 ml of *water* (220 ppm).

Bacterial endotoxins (2.2.3). Not more than 5.6 Endotoxin Units per ml for injections containing 20.0 per cent of sodium diatrizoate; not more than 1.3 Endotoxin Units per ml for injections containing 25.0 per cent of sodium diatrizoate; and not more than 5.0 Endotoxin Units per ml for injections containing 50.0 per cent of sodium diatrizoate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Weigh 0.5 g in a glass-stoppered conical flask, add 12 ml of *5 M sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through cotton and wash the flask and filter with two quantities, each of 20 ml, of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the dark brown colour becomes pale brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 0.02120 g of $C_{11}H_8I_3N_2NaO_4$.

Storage. Store protected from light.

Labelling. The label states (1) the concentration of the active ingredient; (2) whether the contents are intended for intravenous injection and, if so, that the unused portion remaining in the container after use must be discarded.

Sodium Fluoride

NaF Mol. Wt. 42.0

Sodium Fluoride contains not less than 98.5 per cent and not more than 100.5 per cent of NaF, calculated on the dried basis.

Category. Preventive for dental caries.

Description. A white powder or colourless crystals.

Identification

A. Dissolve 2.5 g in sufficient *carbon dioxide-free water* without heating to produce 100 ml (solution A). To 2 ml of solution A add 0.5 ml of *calcium chloride solution*; a gelatinous white precipitate is produced which dissolves on adding 5 ml of *ferric chloride solution*.

B. Add about 4 mg to a mixture of 0.1 ml of *alizarin red S solution* and 0.1 ml of *zirconyl nitrate solution* and mix; the colour changes to yellow.

C. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 2.5 g of *potassium nitrate* in 40 ml of solution A, dilute to 50 ml with *carbon dioxide-free water*, cool to 0° and add 0.2 ml of *dilute phenolphthalein solution*. If the solution is colourless, not more than 1.0 ml of *0.1 M sodium hydroxide* is required to produce a red colour that persists for not less than 15 seconds. If the solution is red, not more than 0.25 ml of *0.1 M hydrochloric acid* is required to change the colour of the solution. Reserve the neutralised solution for the test for Fluorosilicate.

Chlorides (2.3.12). 40 ml of solution A complies with the limit test for chlorides (250 ppm).

Fluorosilicate. Heat to boiling the solution reserved in the test for Acidity or alkalinity and titrate while hot with *0.1 M sodium hydroxide* until a red colour is produced. Not more than 1.5 ml of *0.1 M sodium hydroxide* is required.

Sulphates (2.3.17). Dissolve 0.25 g in 10 ml of a saturated solution of *boric acid* in *distilled water* and add 5 ml of *distilled water* and 0.6 ml of *7 M hydrochloric acid*. The solution complies with the limit test for sulphates (200 ppm). Prepare the standard by mixing together 0.6 ml of *7 M hydrochloric acid*, 5 ml of *sulphate standard solution (10 ppm SO_4)* and 10 ml of a saturated solution of *boric acid* in *distilled water*.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 130° for 3 hours.

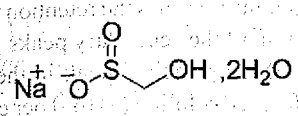
Assay. Weigh 80 mg, add a mixture of 5 ml of *acetic anhydride* and 20 ml of *anhydrous glacial acetic acid* and heat to dissolve. Cool, add 20 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.004199 g of NaF.

Storage. Store protected from moisture.

https://nhathuocngocanh.com/

Sodium Formaldehyde Sulphoxylate



$CH_3NaO_3S,2H_2O$ Mol Wt. 154.1

Sodium Formaldehyde Sulphoxylate is monosodium hydroxymethane sulphinate dihydrate. It may contain a suitable stabilising agent such as sodium carbonate.

Sodium Formaldehyde Sulphoxylate contains an amount of CH_3NaO_3S equivalent to not less than 45.0 per cent and not more than 55.0 per cent of SO_2, calculated on the dried basis.

Category. Pharmaceutical aid (antioxidant).

Description. White crystals or hard white masses.

Identification

A. Dissolve about 4 g in 10 ml of *water* in a test-tube and add 1 ml of *ammoniacal silver nitrate solution*; metallic silver is produced either as a finely divided grey precipitate or as a bright metallic mirror on the inner surface of the tube.

B. Add about 50 mg to a solution of 40 mg of *salicylic acid* in 5 ml of *sulphuric acid* and warm very gently; a permanent deep red colour develops.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Alkalinity. Dissolve 1.0 g in 50 ml of *water* and add 0.15 ml of *dilute phenolphthalein solution*; not more than 3.5 ml of *0.05 M sulphuric acid* is required to change the colour of the solution.

pH (2.4.24). 9.5 to 10.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Iron (2.3.14). Ignite 1.0 g, initially at a low temperature until thoroughly charred and finally at about 600°, preferably in a muffle furnace, until all the carbon has been burnt off. Cool, dissolve the residue in 2 ml of *hydrochloric acid* and dilute to 50 ml with *water*. Add about 50 mg of *ammonium persulphate* and 5 ml of *ammonium thiocyanate solution*, mix and transfer to a Nessler cylinder. The red colour of the solution is not more intense than that of 1.0 ml of *iron standard solution (10 ppm)* treated in the same manner.

Sulphides. Dissolve 6 g in 14 ml of *water* in a test-tube and wet a strip of *lead acetate paper* in the clear solution; no discolouration is evident within 5 minutes.

Sodium sulphite. Not more than 5.0 per cent, calculated as Na_2SO_3, determined by the following method. Transfer 4.0 ml of the solution obtained in the Assay to a flask, add 2 ml of *formaldehyde solution* and titrate with *0.05 M iodine* that is used for the Assay, adding *starch solution* towards the end of the titration as indicator.

Calculate the percentage of Na_2SO_3 from the expression $78.775(V_2-V_1)(M/W)$,

where V_1 and V_2 are the volumes, in ml, of 0.05 M iodine consumed in this test and in the Assay respectively, M is the exact molarity of 0.05 M iodine solution and W is the weight, in g, of the substance under examination taken for the Assay.

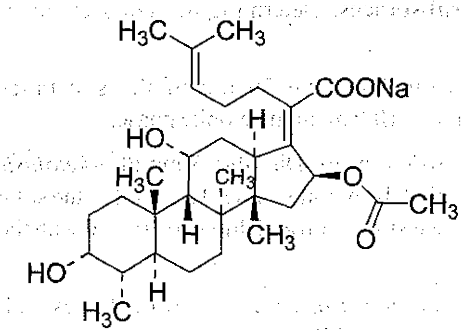
Loss on drying (2.4.19). Not more than 27.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 1.0 g in 25 ml of *water*, add sufficient *water* to produce 50.0 ml and mix. To 4.0 ml of the solution add 100 ml of *water* and titrate with *0.05 M iodine* using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.001602 g of SO_2.

Storage. Store protected from light and moisture.

Sodium Fusidate



$C_{31}H_{47}NaO_6$ Mol. Wt. 538.7

Sodium Fusidate is sodium (17*Z*)-16β-acetoxy-3α,11α-dihydroxyfusida-17(20),24-diene-21-oate, produced by the growth of certain strains of *Fusidium coccineum* or by any other means.

Sodium Fusidate contains not less than 97.5 per cent and not more than 101.0 per cent of $C_{31}H_{47}NaO_6$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder; slightly hygroscopic.

https://nhathuocngocanh.com/

Identification

A. Dissolve 0.1 g in 5 ml of *water*, add 5 ml of *chloroform* and 0.1 ml of a 10 per cent w/w solution of *phosphoric acid*, shake vigorously for 1 minute, allow to separate and filter the lower layer through absorbent cotton covered with *anhydrous sodium sulphate*. Repeat the extraction with two quantities, each of 5 ml, of *chloroform*, evaporate the combined extracts at a pressure of 2 kPa, dry the residue over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 2 hours and dissolve in 1 ml of *chloroform IR*.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *fusidic acid IPRS* or with the reference spectrum of fusidic acid.

B. Ignite 1 g. The residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 15.0 per cent w/v solution in *carbon dioxide-free water* is not more intensely coloured than reference solution BS6 (2.4.1).

pH (2.4.24). 7.5 to 9.0, determined in a 1.25 per cent w/v solution.

Specific optical rotation (2.4.22). + 5.0° to + 8.0°, determined at 20° by dissolving 1.5 g in 25 ml of *water*, adding 0.1 ml of *5 M ammonia* and diluting to 50 ml with *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid IPRS* in 5 ml of the mobile phase. To 1.0 ml of the solution add 0.2 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol*, 20 volumes of 1.0 per cent w/v solution of *orthophosphoric acid*, 20 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 3-ketofusidic acid and sodium fusidate is not less than 2.5.

Inject reference solution (a), (b) and the test solution. The signal-to-noise ratio of the principal peak is not less than 3. Run the chromatogram 3.5 times the retention time of principal peak and the sum of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.2 g in a mixture of 15 ml of *water* and 20 ml of *ethanol (95 per cent)*. Titrate with *0.1 M hydrochloric acid* to pH 4.1, stirring continuously, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.05387 g of $C_{31}H_{47}NaO_6$.

Storage. Store protected from light and moisture.

Sodium Hydroxide

Caustic Soda

NaOH Mol. Wt. 40.0

Sodium Hydroxide contains not less than 97.0 per cent and not more than 100.5 per cent of total alkali, calculated as NaOH.

Category. Pharmaceutical aid (alkalising agent).

Description. White, crystalline masses supplied as sticks, pellets or slabs; deliquescent. Readily absorbs carbon dioxide.

CAUTION — Great care should be exercised in handling Sodium Hydroxide as it rapidly destroys tissues.

Identification

A. Carefully dissolve 5.0 g in 12 ml of *distilled water*, add 17 ml of *7 M hydrochloric acid*, adjusted to pH 7.0 with *1 M hydrochloric acid* and add sufficient *distilled water* to produce 50 ml (solution A). 2 ml of solution A gives reaction (A) of sodium salts (2.3.1).

B. pH of a 0.01 per cent w/v solution, not less than 11.0 (2.4.24).

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 2.5 g in 50 ml of *water*, add 16 ml of *brominated hydrochloric acid AsT*, and remove the excess of bromine with a few drops of *stannous chloride solution AsT*.

https://nhathuocngocanh.com/

The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 5 ml of *water* and 10 ml of *3 M hydrochloric acid*; heat to boiling, cool and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Carbonates. Not more than 2.0 per cent, calculated as Na_2CO_3, determined in the Assay.

Chlorides (2.3.12). Dissolve 2.0 g in 5 ml of *water*; acidify with about 8 ml of *nitric acid* and dilute to 20 ml with *water*. The solution, without the addition of *dilute nitric acid*, complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). Dissolve 2.0 g in 6 ml of *distilled water*, adjusted to pH 7 with *hydrochloric acid* and dilute to 20 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (75 ppm).

Potassium. Acidify 2.5 ml of solution A with *acetic acid* and add 0.15 ml of *sodium cobaltinitrite solution*; no precipitate is formed.

Assay. Dissolve 2.0 g in about 80 ml of *carbon dioxide-free water*, add 0.3 ml of *phenolphthalein solution* and titrate with *1 M hydrochloric acid*. Add 0.3 ml of *methyl orange solution* and continue the titration with *1 M hydrochloric acid*.

1 ml of *1 M hydrochloric acid* used in the second part of the titration is equivalent to 0.1060 g of Na_2CO_3.

1 ml of *1 M hydrochloric acid* used in the combined titrations is equivalent to 0.0400 g of total alkali, calculated as NaOH.

Storage. Store protected from moisture, in non-metallic containers.

Sodium Lactate Injection

Sodium Lactate Intravenous Infusion

Sodium Lactate Injection is a sterile solution containing 1.85 per cent w/v of sodium lactate in Water for Injections. It is prepared from Lactic Acid with the aid of Sodium Hydroxide and sufficient Dilute Hydrochloric Acid to adjust the pH of the solution.

Sodium Lactate Injection contains not less than 1.75 per cent and not more than 1.95 per cent w/v of sodium lactate, $C_3H_5NaO_3$.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless solution.

Identification

A. When warmed with *potassium permanganate*, gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a yellow colour to the flame.

C. Carry out reaction C of calcium salts (2.3.1); no white precipitate is produced.

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per millimole.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. Measure 10 ml, evaporate to dryness in a platinum dish and ignite very gently until completely carbonised. Boil the residue with 25.0 ml of *0.05 M sulphuric acid*, filter and wash thoroughly with hot *water*. Titrate the excess of acid in the combined filtrate and washings with *0.1 M sodium hydroxide* using *methyl orange solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.01121 g of $C_3H_5NaO_3$.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) that the Injection is one-sixth molar and contains, in one litre, approximately 167 millimoles each of sodium ions and of bicarbonate ions (as lactate); (2) that the injection should not be used if the solution contains visible solid particles.

Compound Sodium Lactate and Dextrose Injection

Compound Sodium Lactate with Dextrose Intravenous Infusion; Ringer-Lactate Solution with Dextrose for Injection; Hartmann's Solution with Dextrose for Injection.

Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride, 0.027 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

https://nhathuocngocanh.com/

Compound Sodium Lactate and Dextrose Injection contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.50 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. It gives reaction (C) of calcium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Heavy metals (2.3.13). Evaporate a volume containing 4 g of dextrose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with water for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2,2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$, in the injection.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

https://nhathuocngocanh.com/

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions: sodium, 131; potassium, 5; calcium, 2; bicarbonate (as lactate), 29 and Chloride, 111; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Half Strength Compound Sodium Lactate and Dextrose Injection

Half Strength Compound Sodium Lactate with Dextrose Intravenous Infusion; Half Strength Ringer-Lactate Solution with Dextrose Injection

Half Strength Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.12 per cent v/v of Lactic Acid (equivalent to 0.16 per cent w/v of sodium lactate) with 0.3 per cent w/v of Sodium Chloride, 0.02 per cent w/v of Potassium Chloride, 0.0135 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Compound Sodium Lactate and Dextrose Injection contains not less than 0.135 per cent and not more than 0.16 per cent w/v of sodium, Na, not less than 0.0095 per cent and not more than 0.011 per cent w/v of potassium, K, not less than 0.185 per cent and not more than 0.210 per cent w/v of total chloride, Cl, not less than 0.0125 per cent and not more than 0.0145 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.115 per cent and not more than 0.140 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.5 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. It gives reaction (C) of calcium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2,2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in

https://nhathuocngocanh.com/

acetonitrile, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$ in the injection.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 65.5, potassium, 2.5, calcium, 1, bicarbonate (as lactate), 14.5, and chloride, 55.5; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Modified Compound Sodium Lactate and Dextrose Injection

Modified Compound Sodium Lactate with Dextrose Intravenous Infusion; Modified Lactated Ringer's and Dextrose Injection.

Modified Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.048 per cent v/v of Lactic Acid (equivalent to 0.064 per cent w/v of sodium lactate) with 0.12 per cent w/v of Sodium Chloride, 0.008 per cent w/v of Potassium Chloride, 0.0054 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Modified Compound Sodium Lactate and Dextrose Injection contains not less than 0.054 per cent and not more than 0.064 per cent w/v of sodium, Na, not less than 0.0038 per cent and not more than 0.0044 per cent w/v of potassium, K, not less than 0.074 per cent and not more than 0.084 per cent w/v of total chloride, Cl, not less than 0.005 per cent and not more than 0.0058 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.046 per cent and not more than 0.056 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.5 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with hydrochloric acid and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. It gives reaction (C) of calcium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm (2.4.7), not more than 0.25.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — Evaporate 100.0 ml on a water-bath to 50 ml, add to this solution 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2,2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$ in the injection.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 26.2, potassium, 1, calcium, 0.4, bicarbonate (as lactate), 5.8, and chloride, 22.2; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Compound Sodium Lactate Injection

Compound Sodium Lactate Intravenous Infusion; Ringer-Lactate Solution for Injection; Hartmann's Solution for Injection

Compound Sodium Lactate Injection is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride and 0.027 per cent w/v of Calcium Chloride in Water for Injections.

Compound Sodium Lactate Injection contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless solution.

Identification

A. When warmed with potassium permanganate gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with hydrochloric acid and introduced on a platinum wire into a flame, imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged with reddish purple.

C. It gives reaction (C) of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS*, suitably diluted for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS*, suitably diluted for the standard solutions.

For total chlorides — To 20 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of nitric acid, filter, wash the precipitate with water slightly acidified with nitric acid and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using ferric ammonium sulphate solution as indicator. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

https://nhathuocngocanh.com/

For calcium chloride — To 50 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *mordant black 11 mixture* as indicator. Carry out a blank titration.

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. Use the preparation under examination.

Reference solution (a). A 0.3 per cent w/v solution of *sodium lactate IPRS* in *water*.

Reference solution (b). A solution containing 0.3 per cent w/v, each of, *anhydrous sodium acetate* and *sodium lactate IPRS* in *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 99.8 volumes of *water*, 0.1 volume of *dicyclohexylamine* and 0.1 volume of *formic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to acetate and lactate is not less than 2 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_3H_6O_3$ in the injection.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions: sodium, 131, potassium, 5, calcium, 2, bicarbonate (as lactate), 29 and chloride, 111; (2) that the injection should not be used if the solution contains visible solid particles.

Compound Sodium Lactate Solution for Irrigation

Ringer-Lactate Solution for Irrigation; Hartmann's Solution for Irrigation

Compound Sodium Lactate Solution for Irrigation is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride and 0.027 per cent w/v of Calcium Chloride in Water for Injections.

Compound Sodium Lactate Solution for Irrigation contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2, 2H_2O$, and not less than 0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$. It contains no antimicrobial agent.

Category. Irrigation fluid.

Description. A clear, colourless solution.

Identification

A. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

C. It gives reaction (C) of calcium salts and reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. Carry out a blank titration.

https://nhathuocngocanh.com/

1 ml of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$, in the injection.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers. The container may be designed to empty rapidly and may contain a volume of more than one litre.

Labelling. The label states (1) that the irrigation solution contains, in millimoles per litre, the following approximate amounts of the ions. sodium,131, potassium, 5, calcium, 2, bicarbonate (as lactate), 29, and chloride, 111; (2) that the solution should not be used if it contains visible particles; (3) 'For irrigation only' and 'Not for injection'; (4) that once the container is opened, the unused portion should be discarded.

Sodium Lauryl Sulphate

Sodium Lauryl Sulphate is a mixture of sodium alkyl sulphates consisting mainly of sodium dodecyl sulphate, $CH_3[CH_2]_{10}CH_2OSO_3Na$.

Sodium Lauryl Sulphate contains not less than 85.0 per cent of sodium alkyl sulphates, calculated as $C_{12}H_{25}NaO_4S$.

Category. Pharmaceutical aid (anionic emulsifying agent).

Description. A white or pale yellow powder or crystals.

Identification

A. A 1 per cent w/v solution, when shaken, produces plenty of foam.

B. Mix 0.1 ml of a 1 per cent w/v solution with 0.1 ml of a 0.1 per cent w/v solution of *methylene blue* and 2 ml of *1 M sulphuric acid*, add 2 ml of *dichloromethane* and shake; the dichloromethane layer is intensely blue.

C. Mix about 10 mg with 10 ml of *ethanol* and heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate the *ethanol*. Dissolve the residue in 8 ml of *water*, add 3 ml of *2 M hydrochloric acid*, evaporate the solution to half its volume and cool. Filter and to the filtrate add 1 ml of *barium chloride solution*; a white, crystalline precipitate is produced.

D. It gives reaction (B) of sodium salts (2.3.1).

Tests

Alkalinity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water* and add 0.1 ml of *phenol red solution*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the solution.

Non-esterified alcohols. Not more than 4 per cent, determined by the following method. Dissolve 10.0 g in 100 ml of *water*, add 100 ml of *ethanol (95 per cent)* and extract the solution with three quantities, each of 50 ml, of *n-pentane*, adding *sodium chloride*, if necessary, to promote separation of the two layers. Wash the combined organic layers with three quantities, each of 50 ml, of *water*. Dry the organic solution over *anhydrous sodium sulphate*, filter and evaporate on a water-bath until the odour of pentane is no longer detectable. Heat the residue at 105° for 15 minutes, cool and weigh.

Sodium Chloride and Sodium Sulphate. Not more than a total of 8.0 per cent, determined by the following methods.

For sodium chloride — Dissolve 5.0 g in 50 ml of *water*, add *2 M nitric acid* dropwise until the solution is neutral to *litmus paper*, add 2 ml of *potassium chromate solution* and titrate with *0.1 M silver nitrate*.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For sodium sulphate — Dissolve 0.5 g in 20 ml of *water*, warming gently if necessary, and add 1 ml of a 0.05 per cent w/v solution of *dithizone* in *acetone*. If the solution is red, add *1 M nitric acid*, dropwise, until it becomes bluish green. Add 2 ml of *dichloroacetic acid solution* and 80 ml of *acetone* and titrate with *0.01 M lead nitrate* until a permanent orange-red colour is obtained.

https://nhathuocngocanh.com/

1 ml of *0.01 M lead nitrate* is equivalent to 0.001420 g of Na_2SO_4.

Assay. Weigh 1.15 g, dissolve in sufficient *water* to produce 1000.0 ml, warming if necessary. To 20.0 ml add 15 ml of *chloroform*, 10 ml of *dilute sulphuric acid* and 1 ml of *dimethyl yellow-oracet blue B solution* and titrate with *0.004 M benzethonium chloride*, shaking vigorously and allowing the layers to separate after each addition, until the chloroform layer acquires a permanent clear green colour.

1 ml of *0.004 M benzethonium chloride* is equivalent to 0.001154 g of sodium alkyl sulphates, calculated as $C_{12}H_{25}NaO_4S$.

Storage. Store protected from moisture.

Sodium Metabisulphite

Sodium Pyrosulphite; Sodium Disulphite

$Na_2S_2O_5$ Mol. Wt. 190.1

Sodium Metabisulphite may be prepared by saturating a solution of Sodium Hydroxide with sulphur dioxide and allowing crystallisation to occur.

Sodium Metabisulphite contains not less than 95.0 per cent and not more than 100.5 per cent of $Na_2S_2O_5$.

Category. Pharmaceutical aid (antioxidant).

Description. Colourless, prismatic crystals or a white or creamy white powder.

Identification

A. A 5 per cent w/v solution in *carbon dioxide free water* (solution A) gives reaction (A) of sodium salts (2.3.1).

B. To 0.4 ml of *iodinated potassium iodide solution*, add 8 ml of *water* and 1 ml of solution A, diluted 1 to 10 in *water*. The solution is colourless and gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.0, determined in solution A.

Arsenic (2.3.10). Mix 2.5 g in a porcelain dish with 10 ml of *water*, 1.25 g of *potassium chlorate* and 16 ml of *hydrochloric acid* and heat to expel chlorine, remove the last traces of chlorine with a few drops of *stannous chloride solution AsT* and add 35 ml of *water*. The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water*, add 5 ml of *hydrochloric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 25 ml of *water* containing 2 ml of *dilute acetic acid*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron. To 0.5 g add 2 ml of *hydrochloric acid* and evaporate on a water-bath to dryness. Dissolve the residue in 2 ml of *hydrochloric acid* and 20 ml of *water* and add a few drops of *bromine solution*, cool, dilute with *water* to 25 ml, then add 50 mg of *ammonium persulphate* and 5 ml of *ammonium thiocyanate solution*. Any colour produced is not more intense than that obtained by adding 5 ml of *ammonium thiocyanate solution* to a mixture of 1 ml of *iron standard solution (20 ppm Fe)*, 2 ml of *hydrochloric acid*, 50 mg of *ammonium persulphate* and sufficient *water* to produce 25 ml (40 ppm).

Thiosulphate. Dissolve 1.0 g in 10 ml of *2 M hydrochloric acid* and heat on a water-bath for 10 minutes; not more than a faint opalescence is produced.

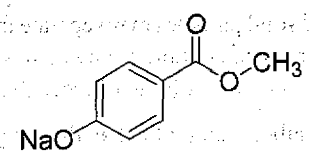
Assay. Dissolve 0.1 g in 50.0 ml *0.05 M iodine*, add 1 ml of *hydrochloric acid* and titrate the excess of iodine with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.004753 g of $Na_2S_2O_5$.

Storage. Store protected from light and moisture. On exposure to air and moisture it is slowly oxidised to sulphate with disintegration of the crystals.

Sodium Methylparaben

Sodium Methyl Hydroxybenzoate



$C_8H_7NaO_3$ Mol. Wt. 174.1

Sodium Methylparaben is the sodium salt of methyl 4-hydroxybenzoate.

Sodium Methylparaben contains not less than 95.0 per cent and not more than 102.0 per cent of $C_8H_7NaO_3$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white, crystalline powder; hygroscopic.

Identification

A. Dissolve 0.5 g in 5 ml of *water* and acidify to *litmus paper* with *hydrochloric acid*; a white precipitate is produced. Wash the precipitate with *water* and dry.

https://nhathuocngocanh.com/

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylparaben IPRS*.

B. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 9.5 to 10.5, determined in a 0.1 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *4-hydroxybenzoic acid* and 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *methylparaben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, and 65 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

The relative retention time with reference to methyparaben for 4-hydroxybenzoic acid is about 0.6.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to methylparaben and 4-hydroxybenzoic acid is not less than 2.0.

Inject reference solution (c) and the test solution. Run the chromatogram five times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-hydroxybenzoic acid multiplied by 1.4 is not more than the six times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks other than 4-hydroxybenzoic acid is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore the peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Chlorides (2.3.12). Dissolve 1.0 g in 20 ml of *water*, add 0.4 ml of *nitric acid* and filter. 15 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Sulphates (2.3.17). Dissolve 0.5 g in 40 ml of *water*, add 3.5 ml of *2 M hydrochloric acid*, dilute to 60 ml with *water* and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (b) and the test solution.

Calculate the content of $C_8H_7NaO_3$, multiplying the content of methylparaben by a correction factor of 1.145.

Storage. Store protected from moisture.

Sodium Nitrite

$NaNO_2$ Mol. Wt. 69.0

Sodium Nitrite is nitrous acid, sodium salt.

Sodium Nitrite contains not less than 97.0 per cent and not more than 101.0 per cent of $NaNO_2$, calculated on the dried basis.

Identification

A 10 per cent w/v solution complies with the tests of sodium salts (2.3.1) and nitrite (2.3.1).

Tests

Heavy metals (2.3.13). Dissolve 1 g in 6 ml of *3 M hydrochloric acid*, and evaporate on a steam-bath to dryness. Reduce the residue to a coarse powder, and continue heating on the steam-bath until the odor of hydrochloric acid no longer is perceptible. Dissolve the residue in 23 ml of *water*, and add 2 ml of *1 M acetic acid*. The solution complies with the limit test for heavy metals, method A (20 ppm).

Loss on drying (2.4.19). Not more than 0.25 per cent, drying it over silica gel for 4 hours.

https://nhathuocngocanh.com/

Assay. Dissolve 1 g in 250.0 ml of *water*. Pipette 25 ml of the solution into a mixture of 50.0 ml of *0.02 M potassium permanganate*, 50 ml of *water* and 20 ml of *dilute sulphuric acid*. When adding the sodium nitrite solution, immerse the tip of the pipette beneath the surface of the permanganate mixture. Stopper the flask, allow it to stand for 15 minutes with occasional shaking and add 3 g of *potassium iodide* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using starch solution, added towards the end of titration as an indicator. Carry out a blank titration.

1 ml of *0.02 M potassium permanganate* is equivalent to 0.00345 g of $NaNO_2$.

Storage. Store protected from moisture, at a temperature between 15° to 30°.

Sodium Nitrite Injection

Sodium Nitrite Injection is a sterile solution of Sodium Nitrite in Water for Injections.

Sodium Nitrite Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of $NaNO_2$.

Usual strength. 30 mg per ml.

Identification

The injection complies with the tests of sodium salts (2.3.1) and nitrite (2.3.1).

Tests

pH (2.4.24). 7.0 to 9.0.

Bacterial endotoxins (2.2.3). Not more than 0.33 Endotoxin Unit per mg of sodium nitrite.

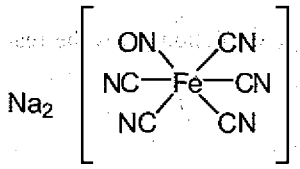
Other tests. Comply with the tests stated under Injections.

Assay. Pipette a volume of injection containing 90 mg of Sodium Nitrite into a mixture of 50.0 ml of *0.02 M potassium permanganate*, 50 ml of *water* and 20 ml of *dilute sulphuric acid*, immersing the tip of the pipette beneath the surface of the permanganate mixture during the addition. Stopper the flask, allow it to stand for 15 minutes with occasional shaking and add 3 g of *potassium iodide* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using starch solution added towards the end of titration as an indicator. Carry out a blank titration.

1 ml of *0.02 M potassium permanganate* is equivalent to 0.00345 g of $NaNO_2$.

Storage. Preserve in single-dose containers, preferably of Type I glass.

Sodium Nitroprusside



$Na_2[Fe(CN)_5NO],2H_2O$ Mol. Wt. 298.0

Sodium Nitroprusside is sodium pentacyanonitrosylferrate.

Sodium Nitroprusside contains not less than 99.0 per cent and not more than 100.5 per cent of sodium pentacyanonitrosylferrate (III)-$Na_2[Fe(CN)_5NO]$, calculated on the anhydrous basis.

Category. Vasodilator.

Description. A reddish-brown powder or crystals.

Identification

A. When examined in the range 350 nm to 600 nm (2.4.7), a 0.7 per cent w/v solution in *water* shows an absorption maximum at 395 nm, a shoulder at 510 nm and a minima at 370 nm. The specific absorbance at the maximum is 0.65 to 0.80.

B. Dissolve 20 mg in 2 ml of *water* and add 0.1 ml of *sodium sulphide solution*; a deep violet-red colour is produced.

C. Dissolve 50 mg in 1 ml of *water* and acidify the solution by the addition of *hydrochloric acid*. Place a drop of the solution in an oxidising flame; a persistent yellow colour is produced.

Tests

Insoluble matter. Dissolve 10 g without heating in 50 ml of *water*. Allow to stand for 30 minutes and filter through a sintered-glass filter. Wash the filter with cold *water* until the filtrate is colourless. Dry the residue on the filter at 105°. The residue weighs not more than 1 mg (100 ppm).

Chlorides (2.3.12). In a metallic crucible (nickel) mix 1.0 g with 8 ml of a 20 per cent w/v solution of *sodium hydroxide*. Heat slowly and evaporate carefully to dryness over a small flame, then heat to a dull red colour for 30 minutes. Allow to cool and transfer the solid residue with three successive portions, each of 8 ml of *dilute sulphuric acid*. Filter the *sulphuric acid* extracts on a filter paper and collect the filtrates. Render the filtrate acid to litmus paper by adding, if necessary, a few drops of *dilute sulphuric acid*. Wash the crucible and the filter paper with three successive portions of 10 ml of *water*, add the washings to the main sulphuric acid solution and dilute to 60 ml with *water*. 15 ml of the solution complies with the limit test for chlorides (200 ppm), using 2 ml of *chloride standard solution (25 ppm Cl)*.

https://nhathuocngocanh.com/

Ferricyanides. Dissolve 1.25 g in 50.0 ml of *acetate buffer solution pH 4.6*. Use three 50-ml volumetric flasks (A, B, C). To flask B, add 1.0 ml of *ferricyanide standard solution* (50 ppm $Fe(CN)_6$). To flasks A and B, add 1 ml of a 0.5 per cent w/v solution of *ferrous ammonium sulphate*. To the three flasks, add 10.0 ml of the solution of the substance under examination. Dilute the contents of each flask to 50.0 ml with *water*. Allow to stand for 30 minutes. The absorbance of the solution in flask A measured at 720 nm (2.4.7) using the solution in flask C as the compensation liquid is not more than the absorbance of the solution in flask B measured at 720 nm using the solution in flask A as the compensation liquid (200 ppm).

Ferrocyanides. Dissolve 4.0 g in 100.0 ml of *water*. Use three 50-ml volumetric flasks (A, B, C). To flask B, add 2.0 ml of *ferrocyanide standard solution* (100 ppm $Fe(CN)_6$). To flasks A and B, add 1 ml of *ferric chloride solution*. To the three flasks, add 25.0 ml of the solution of the substance under examination. Dilute the contents of each flask to 50.0 ml with *water*. Allow to stand for 30 minutes. The absorbance of the solution in flask A measured at 695 nm (2.4.7) using the solution in flask C as the compensation liquid is not more than the absorbance of the solution in flask B measured at 695 nm using the solution in flask A as the compensation liquid (200 ppm).

Sulphates (2.3.17). Not more than 100 ppm.

Test solution. Dissolve 3.6 g in 120 ml of *water*, add with mixing 4 ml of sulphate standard solution (10 ppm SO_4) and 20 ml of a 25 per cent w/v solution of *cupric chloride* and dilute to 150.0 ml with *water*. Allow to stand for 16 hours and filter or centrifuge until a clear light-blue solution is obtained.

Reference solution. To 40 ml of sulphate standard solution (10 ppm SO_4), add 80 ml of *water* and 12 ml to 13 ml of a 25 per cent w/v solution of *cupric chloride*, dilute to 150.0 ml with *water*. The volume of cupric chloride solution added is such that the colour of the final solution matches that of the test solution.

Allow the solutions to stand. Filter both solutions, discarding the first 25 ml of filtrate. To 100 ml of each filtrate, add 0.5 ml of *acetic acid*. Mix and add 2 ml of a 25 per cent w/v solution of *barium chloride* and mix again. The test solution is not more opalescent than the reference solution.

Water (2.3.43). 9.0 to 15.0 per cent, determined on 0.25 g.

Assay. Dissolve 0.25 g in 100 ml of *water* and add 0.1 ml of *dilute sulphuric acid*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25), using silver-mercurous sulphate electrode system.

1 ml of *0.1 M silver nitrate* is equivalent to 0.0131 g of $Na_2[Fe(CN)_5NO]$.

Storage. Store protected from light.

Sodium Nitroprusside Injection

Sodium Nitroprusside Injection is a sterile material obtained from a solution of Sodium Nitroprusside by freeze drying. It may contain excipients. It is filled in a sealed container.

The injection is constituted immediately before use by dissolving Sodium Nitroprusside Injection in the requisite amount of Glucose Intravenous Infusion (50 g per litre) and diluting the resulting solution with 250 to 500 times its volume of Glucose Intravenous Infusion (50 g per litre).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Sodium Nitroprusside Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sodium nitroprusside dihydrate, $Na_2Fe(CN)_5NO, 2H_2O$.

Usual strength. 50 mg per vial.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. When examined in the range 350 nm to 600 nm (2.4.7), a 1.6 per cent w/v solution exhibits a maximum at 395 nm and the absorbance at 395 nm is about 1.1.

B. Dissolve 20 mg in 2 ml of *water* and add 0.1 ml of *sodium sulphide solution*; a deep purple colour is produced.

C. It gives the reactions of sodium salts (2.3.1).

Tests

Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin Unit per µg of sodium nitroprusside.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Protect the solutions from light.

Test solution. Dissolve the contents of a sealed container in 5 ml of *water* and dilute the resulting solution with *water* to produce a solution containing the equivalent of 0.15 per cent w/v of Sodium nitroprusside dihydrate.

Reference solution (a). A 0.15 per cent w/v solution of *sodium nitroprusside IPRS* in *water*.

Reference solution (b). A solution containing 0.015 per cent w/v each of *sodium nitroprusside IPRS* and *potassium hexacyanoferrate (III)* in *water*.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm packed with phenyl groups chemically bonded to porous silica (10 µm) (Such as µBondapak),
- mobile phase: a mixture of 6 volumes of *methanol* and 9 volumes of a solution containing 0.34 per cent w/v of *tetrabutylammonium hydrogen sulphate* and 0.284 per cent w/v of *anhydrous disodium hydrogen orthophosphate*, adjusted to pH 6.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to ferricyanide and nitroprusside is not less than 3.0.

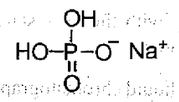
Inject reference solution (a) and the test solution.

Calculate the content of $Na_2Fe(CN)_5NO,2H_2O$ in the injection.

Labelling. The label states (1) the content of Sodium Nitroprusside in terms of the equivalent of sodium nitroprusside dihydrate contained in it; (2) that the contents of the sealed container should be dissolved in, and immediately diluted with, the stated volume of Glucose Intravenous Infusion (50 g per litre); (3) that Sodium Nitroprusside Intravenous Infusion must be used immediately after preparation; (4) that highly coloured solutions must not be used; (5) that the diluted solution must be protected from light during infusion.

Monobasic Sodium Phosphate

Sodium Dihydrogen Phosphate



NaH_2PO_4,xH_2O

Monosodium phosphate anhydrous	Mol. Wt.120.0
Monosodium phosphate monohydrate	Mol. Wt.138.0
Monosodium phosphate dihydrate	Mol. Wt.156.0

Monobasic Sodium Phosphate contains (one or two molecules of water of hydration or it is anhydrous) not less than 98.0 per cent and not more than 103.0 per cent of NaH_2PO_4, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white powder or colourless crystals.

Identification

A. A 5.0 per cent w/v solution in *carbon dioxide free water* (solution A) gives the reactions of phosphates (2.3.1).

B. Solution A gives reactions of sodium salt (2.3.1).

Tests

pH (2.4.24). 4.1 to 4.5, in a solution containing the equivalent of 1.0 g of NaH_2PO_4,H_2O in 20 ml of *water*.

Insoluble substances. Dissolve a portion equivalent to 1.0 g of NaH_2PO_4,H_2O in 100.0 ml of hot *water*, filter through a tarred crucible, wash the insoluble residue with hot *water* and dry at 105° for 2 hours. The weight of the residue is not more than 0.2 per cent.

Chlorides (2.3.12). To a portion equivalent to 1.78 g of NaH_2PO_4,H_2O, add 10 ml of *nitric acid* and 5 ml of *water*. The solution complies with the limit test for chlorides (140 ppm).

Sulphates (2.3.17). Dissolve a portion equivalent to 0.1 g of NaH_2PO_4,H_2O shows no more sulphate than corresponds to 0.3 ml of *0.01 M sulphuric acid* (0.15 per cent).

Aluminium, calcium and related elements. A portion equivalent to 1.0 g of NaH_2PO_4,H_2O in 10 ml of *water* does not become turbid when rendered slightly alkaline to litmus paper with *6 M ammonium hydroxide*.

Arsenic (2.3.10). Dissolve a portion equivalent to 1.25 g of NaH_2PO_4,H_2O in 35 ml of *water* and add 10 ml of *sannated hydrochloric acid AsT*. The resulting solution complies with limit test for arsenic (8 ppm).

Heavy metals (2.3.13). Dissolve a portion equivalent to 1.0 g of NaH_2PO_4,H_2O in 20 ml of *water*, and add 1 ml of *3 M hydrochloric acid* and dilute to 25 ml with *water*, the solution complies with the limit test for heavey metals, Method A (20 ppm).

Water (2.3.43). Not more than 2.0 per cent (anhydrous form), 10.0 to 15.0 per cent (monohydrate), 18.0 to 26.5 per cent (dihydrate), using Method 1.

Assay. Dissolve 2.5 g in 10 ml of *cold water*, add 20 ml of cold, saturated solution of *sodium chloride* then add *phenolphthalein* as indicator and titrate with *1 M sodium hydroxide* keeping the tempearture of the solution 10° to 15° during the entire titration. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.12 g of NaH_2PO_4.

Storage. Store protected from moisture.

Sodium Phosphate

Disodium Hydrogen Phosphate; Disodium Hydrogen Phosphate Dodecahydrate

$Na_2HPO_4,12H_2O$ Mol. Wt. 358.1

Sodium phosphate contains not less than 98.5 per cent and not more than 102.5 per cent of $Na_2HPO_4,12H_2O$.

Category. Cathartic; pharmaceutical aid (buffering agent).

Description. Colourless, transparent crystals; very efflorescent.

Identification

A 10.0 per cent w/v solution in *distilled water* (solution A) gives the reactions of sodium salts and of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *water*, adding 4 ml of *1 M acetic acid* and diluting to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Chlorides (2.3.12). To 10 ml of solution A add 10 ml of *2 M nitric acid* and dilute to 20 ml with *water*. The resulting solution complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). To 2.5 ml of solution A add 2 ml of *2 M hydrochloric acid* and dilute to 15 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (600 ppm).

Reducing substances. To 5 ml of solution A add 5 ml of *1 M sulphuric acid* and 0.25 ml of *0.02 M potassium permanganate* and heat on a water-bath for 5 minutes; the red colour is not completely discharged.

Sodium dihydrogen phosphate. The value of the expression $(n_2 - 25)/(25 - n_1)$,

where n_1 and n_2 are the titres of *1 M sodium hydroxide* obtained in the Assay, does not exceed 0.025.

Loss on drying (2.4.19). 57.0 to 61.0 per cent, determined on 1.0 g by drying in an oven at 130° for 4 hours.

Assay. Weigh 4.0 g (w), dissolve in 25 ml of *water*, add 25.0 ml of *1 M hydrochloric acid* and titrate potentiometrically with *1 M sodium hydroxide* to the first inflection point ($n_1$ml). Continue the titration until the second inflection of the curve is reached; the total volume of sodium hydroxide required is ($n_2$ml). Carry out a blank titration ($n_3$ml).

Calculate the content of $Na_2HPO_4,12H_2O$ from the expression

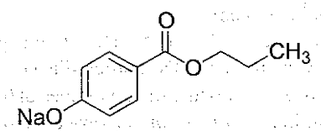
$$\frac{3581(n_3 - n_1)}{w \times 100}$$

where d is the percentage water content.

Storage. Store protected from moisture.

Sodium Propylparaben

Sodium Propyl Hydroxybenzoate



$C_{10}H_{11}NaO_3$ Mol. Wt. 202.2

Sodium Propylparaben is the sodium salt of propyl 4- hydroxybenzoate.

Sodium Propylparaben contains not less than 94.0 per cent and not more than 102.0 per cent of $C_{10}H_{11}NaO_3$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white, crystalline powder; hygroscopic.

Identification

A. Dissolve 0.5 g in 5 ml of *water* and acidify to litmus paper with *hydrochloric acid*; a white precipitate is produced. Wash the precipitate with *water* and dry.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylparaben IPRS*.

B. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 9.5 to 10.5, determined in a 0.1 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *4-hydroxybenzoic acid*, 5 mg of *ethyl parahydroxybenzoate IPRS (propylparaben impurity C IPRS)* and 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of *propylparaben IPRS* in 2.5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, and 65 volumes of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 10 µl.

The relative retention time with reference to propylparaben for 4-hydroxybenzoic acid is about 0.3, for propylparaben impurity C is about 0.7.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to propylparaben and propylparaben impurity C is not less than 3.0.

Inject reference solution (c) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-hydroxybenzoic acid multiplied by 1.4 is not more than 8 times the area the principal peak in the chromatogram obtained with reference solution (c) (4.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks other than 4-hydroxybenzoic acid is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore the peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Chlorides (2.3.12). Dissolve 1.0 g in 20 ml of *water*, add 0.4 ml of *nitric acid* and filter. 15 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Sulphates (2.3.17). Dissolve 0.5 g in 40 ml of *water*, add 3.5 ml of *2 M hydrochloric acid*, dilute to 60 ml with *water* and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 g.

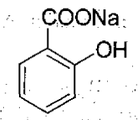
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{10}H_{11}NaO_3$, multiplying the content of propylparaben by a correction factor of 1.122.

Storage. Store protected from moisture.

Sodium Salicylate



$C_7H_5NaO_3$ Mol. Wt. 160.1

Sodium Salicylate is sodium 2-hydroxybenzoate.

Sodium Salicylate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_5NaO_3$, calculated on the dried basis.

Category. Anti-inflammatory; analgesic.

Description. Colourless, small crystals or shiny flakes or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium salicylate IPRS* or with the reference spectrum of sodium salicylate.

B. A 10.0 per cent w/v solution in *carbon dioxide-free water* prepared from *distilled water* (solution A) gives the reactions of salicylates (2.3.1).

C. It gives reaction (B) of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. To 20 ml of solution A add 0.1 ml of *phenol red solution*, the solution is yellow. Titrate with *0.01 M sodium hydroxide*

to a reddish violet colour; not more than 2.0 ml of *0.01 M sodium hydroxide* is required.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath. Ignite gently, cool, dissolve the residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT* and remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 46 ml of *water*, add with constant stirring 4 ml of *dilute hydrochloric acid*, filtering and using 25 ml of the filtrate. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). To 25 ml of solution A add 15 ml of *water* and 10 ml of *2 M nitric acid* and filter. 25 ml of the filtrate complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). 2.5 ml of solution A diluted to 15 ml with *distilled water* complies with the limit test for sulphates (600 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.15 g, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01601 g of $C_7H_5NaO_3$.

Storage. Store protected from light and moisture.

Sodium Starch Glycolate (Type A)

Sodium Starch Glycolate (Type A) is the sodium salt of a cross linked partly O- carboxymethylated starch.

Sodium Starch Glycolate (Type A) contains not less than 2.8 per cent and not more than 4.2 per cent of sodium, Na, calculated on the material washed with Ethanol (95 per cent) and dried as described under Assay.

Category. Pharmaceutical aid (tablet disintegrant).

Description. A white or almost white, fine, free-flowing powder, very hygroscopic.

Identification

A. pH (see Test).

B. Shake 4.0 g of the substance under examination with 20 ml of *carbon-dioxide-free water*, without heating. This has the appearance of a gel. Add 100 ml of *carbon-dioxide-free water* and shake. A suspension forms that settles after standing.

C. To an acidified solution, add *iodinatedpotassium iodide solution*; a blue or violet colour produced.

D. Solution A (see Test) gives reaction (a) of sodium salts (2.3.1).

Tests

Solution A. Dissolve 2.5 g of substance under examination in 2 ml of a 50 per cent w/v solution of *sulphuric acid*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, then incinerate in a muffle furnace at 600 ± 25°. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid*, heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution*, evaporate to dryness and incinerate. Allow to cool and dissolve the residue in 50 ml of *water*.

Appearance of solution. Centrifuge the suspension obtained in identification test B at 2500 rpm for 10 minutes. The supernatant liquid is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 5.5 to 7.5, determined in a 3.3 per cent w/v solution in *carbon-dioxide-free water*.

Heavy metals (2.3.13). To 4.0 g in a silica or platinum dish, add 2 ml of a 50 per cent w/v solution of *sulphuric acid;* heat in a water-bath and then cautiously over a flame at about 600°. Continue heating until all black particles have disappeared, allow to cool, add 0.1 ml of *1 M sulphuric acid*, heat to ignition once again and allow to cool. Add 0.1 ml of *2 M ammonium carbonate*, evaporate to dryness and cautiously ignite. To the residue, add 5 ml of *hydrochloric acid*, evaporate to dryness on a water-bath and dissolve the residue in 100 ml of *water*. 25 ml of a solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 10 ml of solution A complies with the limit test for iron (20 ppm).

Sodium chloride. Not more than 7.0 per cent.

Weigh 0.5 g, suspend in a mixture of 100 ml of *water* add 1 ml of *nitric acid* and mix. Titrate with *0.1 M silver nitrate*, determining the end point potentiometrically (2.4.25), using a silver indicator electrode. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Sodium glycolate.

Test solution. To 0.2 g add 5 ml of *glacial acetic acid*, mix well and add 5 ml of *water*; stir until dissolution is complete (about 10 minutes). Add 50 ml of *acetone* and 1 g of *sodium chloride*. Filter through a fast filter paper impregnated with *acetone*, and filter with *acetone*. Combine the filtrate and washing and dilute to 100.0 ml with *acetone*. Allow to stand for 24 hours without shaking. Use the clear supernatant.

https://nhathuocngocanh.com/

Reference solution. Dissolve 0.31 g of *glycolic acid* previously dried under vacuum over *phosphorus pentoxide* at room temperature overnight with *water* and dilute to 500 ml with *water*. Take 5.0 ml of the solution, add 5 ml of *acetic acid* and allow to stand for about 30 minutes. Add 50 ml of *acetic acid* and allow to stand for 30 minutes. Add 50 ml of *acetone* and 1 g of *sodium chloride*, filter through a fast filter paper impregnated with *acetone*. Combine the filtrate and washing and dilute to 100.0 ml with *acetone*. Allow to stand for 24 hours without shaking. Use the clear supernatant.

Transfer 2.0 ml of the test solution to an open flask, heat on a water-bath for 20 minutes, cool to room temperature, add 20.0 ml of *2,7-dihydroxynaphthalene solution*. Shake and heat on water-bath for 20 minutes. Cool under running water, transfer to a volumetric flask and diluted to 25.0 ml with *sulphuric acid*, maintaining the flask under running water. Within 10 minutes, measure the absorbance at 540 nm using water as blank. The absorbance of the solution prepared with the test solution is not more than the solution prepared at the same time and in the same manner using 2.0 ml of the reference solution (2.0 per cent).

Settling volume. To 70 ml of *water* in a100 ml graduated cylinder, add 1 g of the substance under examination (dried substance), stir with a glass rod to avoid lumps and dilute to 100.0 ml with *water* and stir againuntil the substance is homogeneously distributed. Allow to stand for 2 hours. The volume of the sediment is less than 45.0 ml.

Microbial contamination (2.2.9). 1.0 g is free from *Escherichia coli* and 10.0 g is free from *Salmonella*.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 130° for 1.5 hours.

Assay. Weigh 1.0 g, add 20 ml of *ethanol (80 per cent)*, shake for 10 minutes and filter. Repeat the extraction three times, or until a test for chloride ions is negative using *silver nitrate solution*. Dry the residue at 105° to constant weight. Weigh 0.7 g of the residue, add 80 ml of *anhydrous glacial acetic acid*, heat under a reflux condenser for 2 hours, cool. Titrate with *0.1 M perchloricacid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0023 g of Na.

Storage. Store protected from light and moisture.

Sodium Starch Glycolate (Type B)

Sodium Starch Glycolate (Type B) is the sodium salt of a cross linked partly O-carboxymethylated starch.

Sodium Starch Glycolate (Type B) contains not less than 2.0 per cent and not more than 3.4 per cent of sodium, Na, calculated on the material washed with *ethanol (80 per cent)* and dried as described under Assay.

Category. Pharmaceutical aid (tablet disintegrant).

Description. A white or almost white, fine, free-flowing powder, very hygroscopic.

Identification

A. pH (see Test)

B. Shake 4.0 g of the substance under examination with 20 ml of *carbon-dioxide-free water*, without heating. This has the appearance of a gel. Add 100 ml of *carbon-dioxide-free water* and shake. A suspension forms that settles after standing.

C. To an acidified solution, add *iodinated potassium iodide solution*; a blue or violet colour produced.

D. Solution A (see Test) gives reaction (a) of sodium salts (2.3.1).

Tests

Solution A. Dissolve 2.5 g of substance under examination in 2 ml of a 50 per cent w/v solution of *sulphuric acid*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, then incinerate in a muffle furnace at 600 ± 25°. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid*, heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution*, evaporate to dryness and incinerate. Allow to cool and dissolve the residue in 50 ml of *water*.

Appearance of solution. Centrifuge the suspension obtained in identification test B at 2500 rpm for 10 minutes. The supernatant liquid is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 3.0 to 5.0, determined in a 3.3 per cent w/v solution in *carbon-dioxide-free water*.

Heavy metals (2.3.13). To 4.0 g in a silica or platinum dish, add 2 ml of a 50 per cent w/v solution of *sulphuric acid*; heat in a water-bath and then cautiously over a flame at about 600°. Continue heating until all black particles have disappeared, allow to cool, add 0.1 ml of *1 M sulphuric acid*, heat to ignition once again and allow to cool. Add 0.1 ml of *2M ammonium carbonate*, evaporate to dryness and cautiously ignite. To the residue, add 5 ml of *hydrochloric acid*, evaporate to dryness on a water-bath and dissolve the residue in 100 ml of *water*. 25 ml of a solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 10 ml of solution A, complies with the limit test for iron (20 ppm).

Sodium Chloride. Not more than 7.0 per cent.

https://nhathuocngocanh.com/

Weigh 0.5 g, suspend in a mixture of 100 ml of *water* add 1 ml of *nitric acid* and mix. Titrate with *0.1 M silver nitrate*, determining the end point potentiometrically (2.4.25), using a silver indicator electrode. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Sodium glycolate.

Test solution. To 0.2 g add 5 ml of *glacial acetic acid*, mix well and add 5 ml of *water*, stirring until dissolution is complete (about 10 minutes). Add 50 ml of *acetone* and 1 g of *sodium chloride*. Filter through a fast filter paper impregnated with *acetone*, and filter with *acetone*. Combine the filtrate, washing and dilute to 100.0 ml with *acetone*. Allow to stand for 24 hours without shaking. Use the clear supernatant.

Reference solution. Dissolve 0.31 g of *glycolic acid* previously dried under vacuum over *phosphorus pentoxide* at room temperature overnight with *water* and dilute to 500 ml with *water*. Take 5.0 ml of the solution, add 5 ml of *acetic acid* and allow to stand for about 30 minutes. Add 50 ml of *acetone* and 1 g of *sodium chloride*, filter through a fast filter paper impregnated with *acetone*. Combine the filtrate and washing and dilute to 100.0 ml with *acetone*. Allow to stand for 24 hours without shaking. Use the clear supernatant.

Transfer 2.0 ml of the test solution to an open flask, heat on a water-bath for 20 minutes, cool to room temperature, add 20.0 ml of *2,7-dihydroxynaphthalene solution*. Shake and heat on water-bath for 20 minutes. Cool under running water, transfer to a volumetric flask and diluted to 25.0 ml with *sulphuric acid*, maintaining the flask under running water. Within 10 minutes, measure the absorbance at 540 nm using water as blank. The absorbance of the solution prepared with the test solution is not more than the solution prepared at the same time and in the same manner using 2.0 ml of the reference solution (2.0 per cent).

Settling volume. To 70 ml of *water* in a 100 ml graduated cylinder, add 1 g of the substance under examination (dried substance), stir with a glass rod to avoid lumps and dilute to 100.0 ml with *water* and stir again until the substance is homogeneously distributed. Allow to stand for 2 hours. The volume of the sediment is less than 45.0 ml.

Microbial contamination (2.2.9). 1.0 g is free from *Escherichia coli* and 10.0 g is free from *Salmonellae*.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 130° for 1.5 hours.

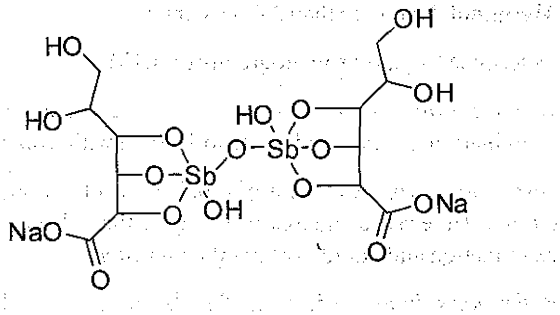
Assay. Weigh 1.0 g, add 20 ml of *ethanol (80 per cent)*, shake for 10 minutes and filter. Repeat the extraction three times, or until a test for chloride ions is negative using *silver nitrate solution*. Dry the residue at 105° to constant weight. Weigh 0.7 g of the residue, add 80 ml of *anhydrous glacial acetic acid*, heat under a reflux condenser for 2 hours, cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0023 g of sodium.

Storage. Store protected from light and moisture.

Sodium Stibogluconate

Sodium Antimony Gluconate



Sodium Stibogluconate is mainly the disodium salt of μ-oxy-bis[gluconato(3)-O^2,O^3,O^4-hydroxoantimony].

The method of manufacture is such as to ensure consistently controlled reaction stoichiometry in order to yield sodium stibogluconate that is satisfactory with regard to intrinsic toxicity.

Sodium Stibogluconate contains not less than 30.0 per cent and not more than 34.0 per cent of pentavalent antimony, calculated on the dried and methanol-free basis.

Category. Antiprotozoal.

Description. A colourless, mostly amorphous powder.

Identification

A. An aqueous solution is *dextro-rotatory*.

B. Pass *hydrogen sulphide* into a 5 per cent w/v solution for several minutes; an orange precipitate is produced.

C. When heated, it chars without melting, emitting an odour of burnt sugar and leaving a residue which gives the reactions of antimony compounds and the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 5.6, determined in the solution obtained in the test for Stability of solution.

https://nhathuocngocanh.com/

Stability of solution. Heat a solution containing 10.0 per cent w/v of pentavalent antimony in an autoclave at 115.5° and at a pressure of 70 kPa for 30 minutes. The resulting solution is colourless or almost colourless.

Trivalent antimony. Dissolve 2.0 g in 30 ml of *water*, add 15 ml of *hydrochloric acid* and titrate with *0.00833 M potassium bromate* using *methyl orange solution* as indicator. Not more than 1.3 ml of *0.00833 M potassium bromate* is required.

Chlorides. Dissolve 2.5 g in 50 ml of *water* and add 2 ml of *2 M nitric acid* and 75 ml of *acetate buffer pH 5.0*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Not more than 3.0 ml of *0.1 M silver nitrate* is required.

Methanol. Not more than 2.0 per cent w/w.

Determine by gas chromatography (2.4.13).

Test solution (a). Dissolve 0.5 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Test solution (b). Add 5 ml of a 0.2 per cent v/v solution of *ethanol* (internal standard) to 0.5 g of the substance under examination and dilute to 10.0 ml with *water*.

Reference solution. Add 1 ml of a 1.0 per cent v/v solution of *methanol* to 5 ml of a 0.2 per cent v/v solution of the internal standard and dilute to 10.0 ml with *water*.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with porous polymer beads (80 to 100 mesh) (Such as Porapak Q),
- temperature:
  column: 130°,
  inlet port 180° and detector at 180°,
- flame ionization detector,
- flow rate: 40 ml per minute using nitrogen as carrier gas,
- injection volume: 2 µl.

Inject the reference solution, test solution (a) and (b).

Calculate the content of methanol taking 0.792 g as its weight per ml (2.4.29) at 20°.

Undue toxicity. Dissolve a suitable quantity of the substance under examination in *water for injections* to give a solution containing 28 mg of pentavalent antimony per ml. Inject intravenously 0.3 ml of the solution into each of 10 mice that have been deprived of food for not less than 17 hours. After injections allow the mice access to food and water. None of the mice dies within 24 hours. If one of the mice dies within 24 hours, repeat the test. None of the second group of mice dies within 24 hours.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.25 g by drying in an oven at 130° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.16 g in 30 ml of *hydrochloric acid*, add 70 ml of *phosphoric acid* and stir carefully until completely mixed. Titrate with *0.05 M ferrous ammonium sulphate* prepared using *sulphuric acid (1 per cent)*, determining the end-point potentiometrically (2.4.25), using a platinum electrode and a silver-silver chloride reference electrode.

1 ml of *0.05 M ferrous ammonium sulphate* is equivalent to 0.003044 g of pentavalent antimony.

Storage. Store protected from moisture.

Sodium Stibogluconate Injection

Sodium Antimony Gluconate Injection

Sodium Stibogluconate Injection is a sterile solution of Sodium Stibogluconate in Water for Injections. Injection in multiple dose containers must not contain phenol as preservative.

Sodium Stibogluconate Injection contains not less than 9.5 per cent w/v and not more than 10.5 per cent w/v of pentavalent antimony, Sb.

Usual strength. The equivalent of 100 mg of pentavalent antimony per ml.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. It is *dextro*-rotatory.

B. Dilute 2 ml to 10 ml with *water* and pass hydrogen sulphide through the solution; no immediate precipitate is produced. Continue to pass hydrogen sulphide through the solution for several minutes; an orange precipitate is produced.

C. The residue obtained by evaporation to dryness, after incineration, gives the reactions of antimony compounds and the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 5.6.

Undue toxicity. Dilute a suitable volume of the injection under examination with sufficient *water for injections* to give a solution containing the equivalent of 28 mg of pentavalent antimony per ml. Inject intravenously 0.3 ml of the solution into each of 10 mice that have been deprived of food for not less than 17 hours. After injections allow the mice access to food and water. None of the mice dies within 24 hours. If one of the mice dies within 24 hours, repeat the test. None of the second group of mice dies within 24 hours.

https://nhathuocngocanh.com/

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To 1.0 ml, measured, add 30 ml of *hydrochloric acid* and 70 ml of *phosphoric acid* and mix. Titrate with *0.05 M ferrous ammonium sulphate* prepared using *sulphuric acid (1 per cent)*, determining the end-point potentiometrically (2.4.25), using a platinum electrode and a silver-silver chloride reference electrode.

1 ml of *0.05 M ferrous ammonium sulphate* is equivalent to 0.003044 g of pentavalent antimony.

Labelling. The label states the strength in terms of the equivalent amount of pentavalent antimony per ml.

Sodium Thiosulphate

Sodium Hyposulphite

$Na_2S_2O_3,5H_2O$ Mol. Wt. 248.2

Sodium Thiosulphate contains not less than 99.0 per cent and not more than 101.0 per cent of $Na_2S_2O_3,5H_2O$.

Category. Antidote to cyanide poisoning.

Description. Colourless large crystals or a coarse, crystalline powder; deliquescent in moist air and effloresces in dry air at temperature above 33°. It dissolves in its water of crystallisation at about 49°.

Identification

A. To 0.5 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.5 ml of *water* and 2 ml of *0.1 M silver nitrate*; a white precipitate is produced which quickly becomes yellowish and finally black.

B. To a portion of solution A add a few drops of *iodine solution*; the colour is discharged.

C. Dilute 2.5 ml of solution A to 5 ml with *water* and add 1 ml of *hydrochloric acid*; a gas is evolved which turns starch-iodate paper blue and a precipitate of sulphur is produced.

D. 1 ml of solution A gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 6.0 to 8.4, determined in solution A.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water*. Slowly add 5 ml of *dilute hydrochloric acid* and evaporate the mixture to dryness on a water-bath. Gently boil the residue with 15 ml of *water* for 2 minutes and filter. Heat the filtrate to boiling, add sufficient *bromine solution* to the hot filtrate to produce a clear solution and add a slight excess of *bromine solution*. Boil the solution to expel the bromine completely, cool to room temperature and add a drop of *phenolphthalein solution* and *sodium hydroxide solution* until a slight pink colour is produced. Add 2 ml of *dilute acetic acid* and dilute with *water* to 25 ml. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). To 12.5 ml of solution A add 15 ml of *2 M nitric acid*, boil gently for 3 to 4 minutes, cool and filter. The filtrate complies with the limit test for chlorides (200 ppm).

Sulphides. To 10 ml of solution A add 0.05 ml of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside*; the solution does not become violet.

Sulphates and sulphites (2.3.17). Dilute 2.5 ml of solution A to 10 ml with *distilled water*. To 3 ml of the solution add 2 ml of *iodine solution* and gradually add more *iodine solution* and dilute to 15 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (0.2 per cent).

Assay. Dissolve 0.5 g in 20 ml of *water* and titrate with *0.05 M iodine* using *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.02482 g of $Na_2S_2O_3,5H_2O$.

Storage. Store protected from moisture.

Sodium Thiosulphate Injection

Sodium Hyposulphite Injection

Sodium Thiosulphate Injection is a sterile solution of Sodium Thiosulphate in Water for Injections.

Sodium Thiosulphate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium thiosulphate, $Na_2S_2O_3,5H_2O$.

Usual strength. 100 mg per ml.

Description. A clear, colourless solution.

Identification

A. To 0.5 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.5 ml of *water* and 2 ml of *0.1 M silver nitrate*; a white precipitate is produced which quickly becomes yellowish and finally black.

https://nhathuocngocanh.com/

B. To a portion of solution A add a few drops of *iodine solution*; the colour is discharged.

C. Dilute 2.5 ml of solution A to 5 ml with *water* and add 1 ml of *hydrochloric acid*; a gas is evolved which turns starch-iodate paper blue and a precipitate of sulphur is produced.

D. 1 ml of solution A gives reaction (A) of sodium salts (2.3.1).

Tests

pH (2.4.24): 7.0 to 9.0.

Bacterial endotoxins (2.2.3). Not more than 0.03 Endotoxin Unit per mg of sodium thiosulphate.

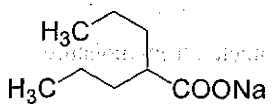
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 0.5 g of Sodium Thiosulphate add about 20 ml of *water* and titrate with *0.05 M iodine*, using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.02482 g of $Na_2S_2O_3,5H_2O$.

Storage. Store in single dose containers.

Sodium Valproate



$C_8H_{15}NaO_2$ Mol. Wt. 166.2

Sodium Valproate is sodium 2-propylpentanoate.

Sodium Valproate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{15}NaO_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium valproate IPRS* or with the reference spectrum of sodium valproate.

B. Dissolve 1.25 g in 20 ml of *distilled water* in a separating funnel, add 5 ml of *2 M nitric acid*, shake and allow the mixture to stand for 12 hours; the lower layer (solution A) gives reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 20.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1), and is not more intensely coloured than reference solution YS6 (2.4.1).

Acidity or alkalinity. To 10 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* add 0.1 ml of *dilute phenolphthalein solution*; not more than 0.75 ml of either *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid* is required to change the colour of the solution.

Related substances. Determine by gas chromatography (2.3.13).

Test solution. Dissolve 0.5 g of the substance under examination in 10 ml of *water*. Add 5 ml of *dilute sulphuric acid* and shake with 3 quantities, each of 20 ml, of *heptane*. Dilute the combined upper layers to 100.0 ml with *heptane*.

Reference solution (a). Dissolve 5 mg of *valproic acid for system suitability IPRS* (containing impurity K) in 1.0 ml of *heptane*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *heptane*.

Chromatographic system

- a capillary column 30 m x 0.53 mm, wide bore fused silica, coated with macrogol 20 000 and 2-nitroterephthalate (film thickness 0.5 µm),
- temperature:

column	time (in minutes)	temperature (°)
	0 - 5	80
	5 - 15	80 - 150
	15 – 28.3	150 – 190
	28.3 – 30	190

  inlet port and detector at 220°,
- flow rate: 8 ml per minute, using helium as the carrier gas.

The relative retention time with reference to valproic acid (retention time = about 17 min) for valproic acid impurity K is about 0.97.

Inject reference solution (a). The test is not valid unless the resolution between valproic acid and impurity K is not less than 2.0.

Inject 1 µl of reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to valproic acid impurity K is not more than 0.15 times the area of the principal peak in the

https://nhathuocngocanh.com/

chromatogram obtained with reference solution (0.15 per cent), the area of any secondary peak is not more than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent) and the sum of the areas of all the other secondary peaks is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent). Ignore any peak with an area less than 0.03 times the area of the principal peak in the chromatogram obtained with reference solution (0.03 per cent).

Chlorides (2.3.12). Dissolve 2.5 g in 40 ml of *water* in a separating funnel, add 10 ml of *dilute nitric acid* and shake. Allow the mixture to stand for 12 hours. 25 ml of lower layer complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (200 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B. Use 2 ml of *lead standard solution (10 ppm)* to prepare the standard (20 ppm).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.15 g and dissolve in 25 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01662 g of $C_8H_{15}NaO_2$.

Storage. Store protected from moisture.

Sodium Valproate Injection

Sodium Valproate Injection is a sterile aqueous solution of sodium valproate, formed from the interaction of valproic acid and sodium hydroxide, in Water for Injections, and one or more suitable buffering or sequestering agents.

Sodium Valproate Injection contains sodium valproate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valproic acid, $C_8H_{16}O_2$. It contains no antimicrobial agents.

Usual strength. 20 mg per ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Gives the reaction of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.0 to 9.0.

Bacterial endotoxins (2.2.3). Not more than 23.0 Endotoxin Units per ml.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 55 volumes of *water* and 45 volumes of *acetonitrile*.

Test solution. Dilute a volume of the injection containing 50 mg of valproic acid to 100.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *valproic acid IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v of *valproic acid IPRS* and 0.005 per cent w/v of *valproic acid related compound B* ((2*RS*)-2-(1-methylethyl) pentanoic acid) *IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 55 volumes of a buffer solution, prepared by dissolving 3.5 gm of *sodium dihydrogenphosphate* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute phosphoric acid* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Run the chromatogram at least 1.6 times the retention time of the valproic acid. The relative retention time with reference to valproic acid for valproic acid related compound B is about 0.9.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to valproic acid and valproic acid related compound B is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_8H_{16}O_2$ in the injection.

Storage. Store at a temperature not exceeding 30° and in single dose containers, preferably of Type 1 glass.

Labelling. The label states the amount of any buffering or sequestering agents used.

Sodium Valproate Oral Solution

Sodium Valproate Elixir

Sodium Valproate Oral Solution is a solution of Sodium Valproate in a suitable flavoured vehicle.

Sodium Valproate Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium valproate, $C_8H_{15}NaO_2$.

Usual strength. 200 mg in 5 ml.

Identification

A. Shake a quantity containing about 0.25 g of Sodium Valproate with two quantities, each of 25 ml, of *chloroform* and discard the chloroform extracts. Add 10 ml of a saturated solution of *sodium chloride* and 10 ml of *2 M hydrochloric acid*, mix and shake with 25 ml of *chloroform*. Wash the chloroform layer with 5 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate to dryness.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valproic acid IPRS* or with the reference spectrum of valproic acid.

B. Shake a quantity containing about 0.25 g of Sodium Valproate with a mixture of 10 ml of a saturated solution of *sodium chloride*, 10 ml of *2 M hydrochloric acid* and 25 ml of *chloroform*. Evaporate the chloroform layer to dryness, dissolve the residue in 2 ml of *water*, make just alkaline with *2 M sodium hydroxide* and add 0.5 ml of a 10 per cent w/v solution of *cobalt nitrate*; a purple precipitate is produced which is soluble in *dichloromethane*.

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution (a). Mix a quantity of the oral solution containing 0.50 g of Sodium Valproate with 10 ml of *water*, acidify with *2 M sulphuric acid* and shake with three quantities, each of 20 ml, of *dichloromethane*. Wash the combined dichloromethane extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (b). Mix a quantity of the oral solution containing 0.5 g of Sodium Valproate with 10 ml of a 0.02 per cent w/v solution of *octanoic acid* (internal standard) in *0.1 M sodium hydroxide* and continue as described for test solution (a) beginning at the words "acidify with *2 M sulphuric acid*...".

Reference solution. A 0.02 per cent w/v solution of the internal standard in *dichloromethane*.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with *acid-washed, silanised diatomaceous support* (80 to 180 mesh) coated with 15 per cent w/w of free fatty acid phase (Such as Supelco FFAP 2-1063) and *1 per cent w/w of phosphoric acid*,
- temperature: column: 170°, inlet port at 190° and detector at 250°.

Inject 1 µl of the reference solution, test solution (a) and (b). In the chromatogram obtained with test solution (b), the sum of the areas of all the secondary peaks is not more than the area of peak in the chromatogram obtained with the reference solution (0.4 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh a quantity containing about 0.15 g of Sodium Valproate, add 50 ml of *water*, mix thoroughly and add 10 ml of saturated solution of *sodium chloride*, 10 ml of *2 M hydrochloric acid* and 40 ml of a mixture of 2 volumes of *ether* and 1 volume of *light petroleum (40° to 60°)*, shake, allow to separate and reserve the ether layer. Shake the aqueous layer with a further 40 ml of the *ether-light petroleum mixture* and discard the aqueous layer. Shake each of the ether extracts with the same three quantities, each of 10 ml, of a saturated solution of *sodium chloride*, combine the extracts and evaporate to a volume of about 1 ml at a temperature not exceeding 30°. Add 50 ml of *ethanol (95 per cent)*, previously neutralised with *0.01 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator, and titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01662 g of $C_8H_{15}NaO_2$.

Determine the weight per ml of the preparation (2.4.29) and calculate the content of $C_8H_{15}NaO_2$ weight in volume.

Sodium Valproate Tablets

Sodium Valproate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium valproate, $C_8H_{15}NaO_2$.

Usual strengths. 100 mg; 200 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.5 g of Sodium Valproate with 10 ml of *water* and centrifuge. Acidify 5 ml of the supernatant liquid with *2 M sulphuric acid*, shake with 25 ml of *chloroform* and wash the chloroform layer with 5 ml of *water*. Dry by shaking with *anhydrous sodium sulphate*, filter and evaporate the chloroform.

https://nhathuocngocanh.com/

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valproic acid IPRS* or with the reference spectrum of valproic acid.

B. Shake a quantity of the powdered tablets containing about 0.25 g of Sodium Valproate with 3 ml of *water* and centrifuge. To 2 ml of the supernatant liquid add 0.5 ml of a 10 per cent w/v solution of *cobalt nitrate*; a purple precipitate is produced which is soluble in *dichloromethane*.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 900 ml of *phosphate buffer* pH 6.8,

Speed and time: 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *sodium valproate IPRS* with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 30 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as µ bondapak C18),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 0.32 g *potassium dihydrogen orthophosphate* in 100 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 55 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NaO_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_8H_{15}NaO_2$.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Sodium Valproate with 10 ml of *water*, acidify with *2M sulphuric acid* and shake with three quantities, each of 20 ml of *heptane*. Wash the combined *heptane* extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and dilute to 100.0 ml with *heptane*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *heptane*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution (b). A 0.5 per cent w/v solution of *valproic acid for system suitability IPRS* in *heptane*.

Chromatographic system

- a capillary column 30 m x 0.53 mm, bonded with a 0.5 µm layer of macrogol 20,000 2-nitroterephthalate (Such as DB-FFAP),
- temperature:

column	time (in min)	temperature (°)
	0 - 5	80
	5 - 15	80 - 150
	15-28.3	150 - 190
	28.3 - 30	190
	30 - 40	190 - 80

- inlet port at 200° and detector at 220°,
- flame ionization detector,
- flow rate: 8 ml per minute using nitrogen as carrier gas,
- injection volume: 1 µl.

Inject reference solutions (b). The test is not valid unless the resolution between the peaks due to valproic acid impurity K and valproic acid is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.5 g of Sodium Valproate with 10 ml of *water*, acidify with *2M sulphuric acid* and shake with three quantities, each of 20 ml of *heptane*. Wash the combined *heptane* extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and dilute to 100.0 ml with *heptane*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution (a). Weigh a quantity of 0.5 g of *sodium valproate IPRS*, disperse in 10 ml of *water*, acidify with *2 M sulphuric acid* and shake with three quantities, each of 20 ml of *heptane*. Wash the combined *heptane* extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and dilute to 100.0 ml with *heptane*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution (b). A 0.5 per cent w/v solution of *valproic acid for system suitability IPRS* in *heptane*.

https://nhathuocngocanh.com/

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to valproic acid impurity K and valproic acid is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_8H_{15}NaO_2$ in the tablets.

Sodium Valproate Gastro-resistant Tablets

Sodium Valproate Gastro-resistant Tablets contain Sodium Valproate. They are made gastro-resistant by enteric-coating or by other means.

Sodium Valproate Gastro-resistant Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium valproate, $C_8H_{15}NaO_2$.

Identification

Shake a quantity of the powdered tablets containing 0.5 g of Sodium Valproate with 10 ml of *water* and centrifuge. Acidify 5 ml of the supernatant liquid with *2 M sulphuric acid*, shake with 25 ml of *dichloromethane* and wash the *dichloromethane* layer with 5 ml of *water*. Dry by shaking with *anhydrous sodium sulphate*, filter and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium valporate IPRS* treated in the same manner or with the reference spectrum of valproic acid.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 120 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium to obtain a solution containing 0.001 per cent w/v of Sodium Valproate.

Reference solution. Dissolve a quantity of *sodium valproate IPRS* in the dissolution medium and dilute to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 0.32 g of *potassium dihydrogen orthophosphate* in 100 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 55 volumes of *acetronitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NaO_2$ in the medium.

Complies with the acceptance criteria given in Acid stage.

B. Apparatus No. 1 (Basket),
Medium. Replace *0.1 M hydrochloric acid* with 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic system as described in Method A.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium to obtain a solution containing 0.002 per cent w/v of Sodium Valproate.

Reference solution. Dissolve a quantity of *sodium valproate IPRS* in the dissolution medium and dilute to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NaO_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_8H_{15}NaO_2$.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Sodium Valproate with 10 ml of *water*, acidify with *2 M sulphuric acid* and shake with three quantities, each of 20 ml of *heptane*. Wash the combined *heptane* extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and dilute to 100.0 ml with *heptane*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *heptane*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution (b). A 0.5 per cent w/v solution of *valproic acid for system suitability IPRS* in *heptane*.

Chromatographic system
- a capillary column 30 m x 0.53 mm, bonded with a 0.5 µm layer of macrogol 20,000 2-nitroterephthalate (Such as DB-FFAP),

https://nhathuocngocanh.com/

Use chromatographic system as described under Related substances.

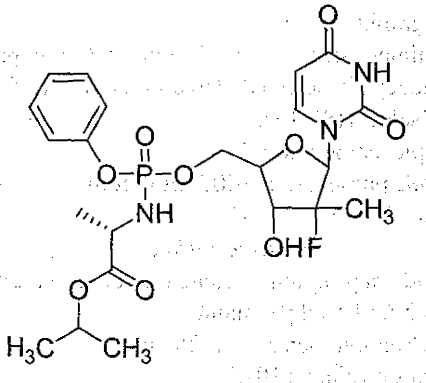
Inject reference solution (b). The test is not valid unless the resolution between the peak due to valproic acid impurity K and valproic acid is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_8H_{15}NaO_2$ in the tablets.

Labelling. The label states that the tablets should be swallowed whole and not chewed.

Sofosbuvir



$C_{22}H_{29}FN_3O_9P$ Mol. Wt. 529.5

Sofosbuvir is propan-2-yl (2S)-2-[[[(2R,3R,4R,5R)-5-(2,4-dioxopyrimidin-1-yl)-4-fluoro-3-hydroxy-4-methyloxolan-2-yl]methoxy-phenoxyphosphoryl]amino]propanoate.

Sofosbuvir contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{22}H_{29}FN_3O_9P$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sofosbuvir IPRS* or with the reference spectrum of sofosbuvir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.01M ammonium acetate buffer prepared by dissolving 0.77 g of *ammonium acetate* in 1000 ml of *water,* adjusted to pH 4.0 with *dilute acetic acid.*

https://nhathuocngocanh.com/

Solvent mixture. 60 volumes of the buffer solution and 40 volumes of *methanol.*

Test solution. Dissolve 48 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.048 per cent w/v solution of *sofosbuvir IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.048 per cent w/v of *sofosbuvir IPRS* and 0.000048 per cent w/v of *sofosbuvir Rp isomer IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Xselect HSS T3),
- sample temperature: 5°,
- mobile phase: A. a 0.05 per cent v/v solution of *orthophosphoric acid* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
27.4	21	79

Phosphoramidate intermediate[7]	1.57	—

*This impurity is to be disregarded as controlled under Content of Pentafluoro phenol and Phosphoramidate intermediate test.

[1]2'-deoxy-2'-fluoro-2'-methyluridine,

[2](S)-2[(S)-[[(2R,3R,4R,5R)-5-(2,4-dioxo-3,4-dihyd-2*H*-pyrimidin-1-yl)-4-fluoro-3-hydroxy-4-methyltetrahydro-2-furanyl]methoxy](phenoxy) phosphorylamino]propanoic acid-1-ethyl ester,

[3]propan-2-yl(2*S*)-2-{[(*R*)-{[(2*R*,3*R*,4*R*,5*R*)-5-(2,4-dioxo-3,4-dihydropyrimidin-1(2*H*)-yl)-4-fluoro-3-hydroxy-4-methyltetrahydrofuran-2-yl]methoxy}(phenoxy)phosphoryl]amino}propanoate,

[4]propan-2-yl(2*S*)-2-{[(*S*)-{[(2*R*,3*R*,4*R*,5*R*)-4-chloro-5-(2,4-dioxo-3,4-dihydropyrimidin-1(2*H*)-yl)-3-hydroxy-4-methyltetrahydrofuran-2-yl]methoxy}(phenoxy)phosphoryl]amino}propanoate,

[5]2,3,4,5,6-pentofluorophenol,

[6]propan-2-yl(2*S*)-2-{[{[(2*R*,3*R*,4*R*,5*R*)-2-[3*S*,5*S*)-5,8-dimethyl-3,6-oxido-6-oxo-3-phenoxy-2,7-dioxa-4-aza-3λ^5-phosphanon-1-yl]-5-(2,4-dioxo-3,4-dihydropyrimidin-1(2*H*)-yl)-4-fluoro-4-methyltetrahydrofuran-3-yl]oxy}(phenoxy)phosphoryl]amino}propanoate,

[7]*N*-[(*S*)-(2,3,4,5,6-pentafluorophenoxy)phenoxyphosphinyl]-*L*-Alanine-1-methylethyl ester.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to sofosbuvir Rp isomer and sofosbuvir is not less than 1.5 in the chromatogram obtained with reference solution (c), the column efficiency is not less than 100000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to fluoro uridine impurity, Rp isomer, chloro analog and phosphoramidate sofosbuvir, each of, is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak corresponding to ethyl analog is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent) and the sum of areas of all peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0 per cent). Ignore the peaks due to pentafluoro phenol and phosphoramidate intermediate and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Content of Pentafluoro phenol and Phosphoramidate intermediate. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. A solution containing 0.0003 per cent w/v, each of, *pentafluoro phenol IPRS* and *phosphoramidate intermediate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 2.1 mm, packed with octadecylsilane bonded to porous silica (1.7 µm) (Such as Acquity UPLC BEH C18),

https://nhathuocngocanh.com/

- column temperature: 45°,
- sample temperature: 5°,
- mobile phase: A. a 0.05 per cent v/v solution of *orthophosphoric acid* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 2 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
8	30	70
10	30	70
10.1	65	35
12	65	35

The relative retention time with reference to phosphoramidate intermediate for pentafluoro phenol is about 0.38.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.8 for pentafluoro phenol and the relative standard deviation for replicate injections is not more than 5.0 per cent for both the peaks.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to pentafluoro phenol and phosphoramidate intermediate, each of, is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 100000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{29}FN_3O_9P$.

Storage. Store protected from moisture, at a temperature not exceeding 30°

Sofosbuvir Tablets

Sofosbuvir Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sofosbuvir, $C_{22}H_{29}FN_3O_9P$.

Usual strength. 400 mg.

Identification

In the Assay, the principal peak in chromatogram obtained with the test solution corresponds to the peak in chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 0.9 g of *sodium hydroxide* in 950 ml of *water,* adjusted to pH 6.8 and dilute to 1000 ml with *water*,
Speed and time. 75 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted, if necessary with the dissolution medium at about 262 nm (2.4.7). Calculate the content of sofosbuvir, $C_{22}H_{29}FN_3O_9P$ in the medium from the absorbance obtained from a solution of known concentration of *sofosbuvir IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{22}H_{29}FN_3O_9P$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 0.77 g of *ammonium acetate* in 1000 ml of *water,* adjusted to pH 4.0 with *dilute acetic acid.*

Solvent mixture. 60 volumes of the buffer solution and 40 volumes of *methanol.*

Test solution. Transfer 10 intact tablets to a 1000-ml volumetric flask, add about 600 ml of the buffer solution continuously stir flask vigorously using magnetic stirrer, till tablets are completely disintegrated, add 300 ml of *methanol* and stir vigorously for 60 minutes, dilute to volume with *methanol,* mix and filter. Centrifuge at 5000 rpm for 10 minutes. Dilute 3.0 ml of the clear supernatant to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.00024 per cent w/v solution of *sofosbuvir IPRS* in the solvent mixture.

Reference solution (b). Dissolve 0.5 mg of *sofosbuvir Rp isomer IPRS* in 3.0 ml of *methanol* and dilute to 10.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (c). Dissolve 48 mg of *sofosbuvir IPRS* in 70 ml of the solvent mixture, add 1.0 ml of reference solution (b) and dilute to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as X Select HSS T3),
- sample temperature: 5°,
- mobile phase: A. a 0.05 per cent v/v solution of *orthophosphoric acid* in *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

[4]2′-deoxy-2-fluoro-5-O-[hydroxyl(phenoxy)phosphoryl]-2′-methyluridine,

[5]propan-2-yl(2*S*)-2-{[{[(2*R*,3*R*,4*R*,5*R*)-5-(2,4-dioxo-3,4-dihydropyrimidin-1(2*H*)-yl)-4-fluoro-3hydroxy-4-methyltetrahydrofuran-2-yl]methoxy}(hydroxy)phosphoryl]amino}propanoate.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to sofosbuvir Rp isomer and sofosbuvir is not less than 1.5 in the chromatogram obtained with reference solution (c), the column efficiency is not less than 100000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fluoro uridine impurity, uridine alanine phosphate impurity, phenol impurity, fluoro uridine phosphate impurity, uridine phenyl phosphate impurity and uridine isopropyl alanine phosphate impurity, each of, is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Reference solution. A 0.0048 per cent w/v solution of *sofosbuvir IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 100000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{29}FN_3O_9P$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Sofosbuvir and Daclatasvir Tablets

Sofosbuvir and Daclatasvir Dihydrochloride Tablets

Sofosbuvir and Daclatasvir Tablets contain daclatasvir dihydrochloride equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of daclatasvir, $C_{40}H_{50}N_8O_6$ and sofosbuvir, $C_{22}H_{29}FN_3O_9P$.

Usual strength. Sofosbuvir, 400 mg and Daclatasvir, 60 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution (a) and test solution (b) correspond to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *phosphate buffer pH 6.8* with 0.75 per cent w/v *polyoxyethylene glycol dodecyl ether (Brij 35)* solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* and 0.9 g *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 6.8 with *0.2 M sodium hydroxide*. Add 7.5 g of *polyoxyethylene glycol dodecyl ether* and sonicate to dissolve and mix,

Speed and time. 75 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *methanol*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). A 0.132 per cent w/v solution of *daclatasvir dihydrochloride IPRS* in *methanol*.

Reference solution (b). Dissolve 40 mg of *sofosbuvir IPRS* in 70 ml of the solvent mixture, add 5.0 ml of reference solution (a) and dilute to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Inertsil ODS 3V),
- sample temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*. Add 2.0 ml of *triethylamine* and mix, adjusted to pH 2.5 with *dilute orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 262 nm for sofosbuvir and 318 nm for daclatasvir,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	45	55
15	20	80
17	75	25
22	75	25

The elution order is the daclatasvir followed by sofosbuvir peak.

Inject reference solution (b) at 318 nm and 262 nm. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent for both the peaks.

Inject reference solution (b) and the test solution at 318 nm and at 262 nm.

Calculate content of $C_{40}H_{50}N_8O_6$ and $C_{22}H_{29}FN_3O_9P$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{40}H_{50}N_8O_6$ and $C_{22}H_{29}FN_3O_9P$.

Related substances.

For Daclatasvir —

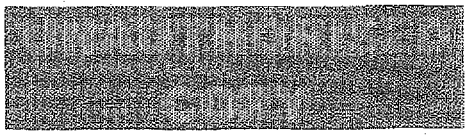
Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 60 mg of Daclatasvir in 70 ml of *methanol*, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 100.0 ml with *methanol*. Centrifuge the solution at 5000 rpm for 10 minutes. Use the clear supernatant.

Reference solution. A 0.033 per cent w/v solution of *daclatasvir dihydrochloride IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (Such as ACE 5 C18-HL),
- sample temperature: 10°,
- mobile phase: A. a 0.136 per cent w/v of *potassium dihydrogen phosphate* in *water*, add 2.0 ml of *triethylamine* and mix, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. a mixture of 10 volumes of *water* and 90 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,



https://nhathuocngocanh.com/

– spectrophotometer set at 300 nm,
– injection volume: 10 µl.

*Process impurity include for identification only and not included in the calculation of total degradation products.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore the peak due to sofosbuvir and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

For Sofosbuvir —

Determine by liquid chromatography (2.4.14), as described under Related substances of Daclatasvir with the following modifications.

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol.*

Test solution. Disperse a quantity of powdered tablets containing 0.4 g of Sofosbuvir in the 75 ml of the solvent mixture, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 100.0 ml with the solvent mixture. Centrifuge the solution at 5000 rpm for about 10 minutes. Use the clear supernatant.

Reference solution. A 0.002 per cent w/v solution of *sofosbuvir IPRS* in the solvent mixture.

– sample temperature: 25°,
– spectrophotometer set at 262 nm.

Name	Relative retention time	Correction factor
Fluoro uridine impurity	0.14	0.49
Ethyl analog impurity*	0.91	—
Sofosbuvir Rp isomer*	0.97	—
Sofosbuvir	1.00	—
Chloro analog impurity*	1.06	—
Penta fluoro phenyl impurity*	1.09	—
Disubstitued impurity*	1.53	—
Phosphoramidate intermediate impurity*	1.73	—

*Process impurity include for identification only and not included in the calculation of total degradation products.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to fluoro uridine impurity is not more than 0.4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of areas of all peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore any peak due to daclatasvir and with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

The sum of all the impurities (daclatasvir and sofosvuvir impurities) is not more than 1.0 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *water* and 30 volumes of *methanol.*

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.3 g of Daclatasvir in 20 ml *water,* with the aid of ultrasound for 10 minutes. Add 180 ml of *methanol,* sonicate for 60 minutes with intermittent shaking

https://nhathuocngocanh.com/

and dilute to 250.0 ml with *methanol*. Centrifuge at 5000 rpm for 10 minutes. Dilute 5.0 ml of clear supernatant to 100.0 ml with the solvent mixture.

Test solution (b). Dilute 10.0 ml of test solution (a) to 25.0 ml with the solvent mixture.

Reference solution. A solution containing 0.066 per cent w/v of *daclatasvir dihydrochloride IPRS* and 0.16 per cent w/v of *sofosbuvir IPRS* in *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Use chromatographic system as described under Dissolution.

Inject the reference solution at 318 nm and 262 nm. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent for both the peaks.

Inject the reference solution and test solution (a) at 318 nm (for daclatasvir).

Inject the reference solution and test solution (b) at 262 nm (for sofosbuvir).

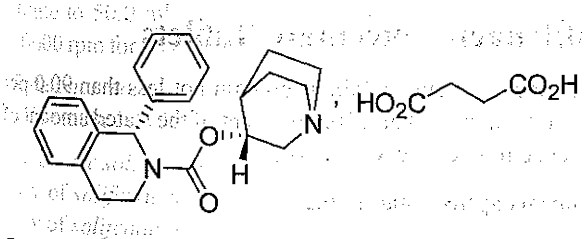
Calculate the content of $C_{40}H_{50}N_8O_6$ and $C_{22}H_{29}FN_3O_9P$ in the tablets.

1 mg of daclatasvir hydrochloride, $C_{40}H_{52}Cl_2N_8O_6$ is equivalent to 0.91 mg of daclatasvir, $C_{40}H_{50}N_8O_6$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labeling. The label states the strength in terms of the equivalent amount of daclatasvir and sofosbuvir.

Solifenacin Succinate



$C_{27}H_{32}N_2O_6$ Mol. Wt. 480.6

Solifenacin Succinate is (3R)-1-Azabicyclo[2.2.2] octan-3-yl (1S)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate hydrogen butanedioate.

Solifenacin Succinate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{27}H_{32}N_2O_6$, calculated on the dried basis.

Category. Muscarinic M_3 receptor antagonist; anticholinergic.

Description. A white or light yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *solifenacin succinate IPRS* or with the reference spectrum of solifenacin succinate.

B. Isomeric purity (see Tests).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the mobile phase A.

Reference solution (a). Dissolve 5 mg of impurity A (*1-phenyl-1;2,3,4-tetrahydroisoquinoline*) in the test solution and dilute to 25.0 ml with the test solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm × 2.1 mm, packed with end-capped polar embedded octadecylsilane bonded to amorphous organosilica (1.7 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 55 volumes of a buffer solution prepared by dissolving 0.6 g of *ammonium phosphate* in 1000 ml of *water*, add 1.0 ml of *diethylamine* adjusted to pH 11 with *concentrated ammonia* and 45 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 2.5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
0.5	90	10
10.5	68	32
12.5	68	32
13.0	90	10
15.0	90	10

Name	Relative retention time
Solifenacin Succinate	0.2
Solifenacin impurity A	0.7
Solifenacin (Retention time is about 2 minutes)	1.0

https://nhathuocngocanh.com/

Inject reference solution (a). The test is not valid unless the resolution between the peak due to impurity A and solifenacin is not less than 4.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of individual impurity is not more than the area of peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Isomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 20.0 ml of the mobile phase.

Reference solution(a). Dissolve the contents of a vial of *solifenacin for system suitability IPRS* (containing impurities F, G and H) in 1.0 ml of the mobile phase.

Reference solution(b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with amylose derivative of silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 0.1 volume of *diethylamine*, 200 volumes of *anhydrous ethanol* and 800 volumes of *heptane*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Name	Relative retention time
Solifenacin impurity F[1]	0.7
Solifenacin impurity H[2]	0.76
Solifenacin impurity G[3]	0.84
Solifenacin (Retention time is about 17 minutes)	1.0

[1](*3S*)-1-azabicyclo[2.2.2] octan-3-yl(*1R*)-1-phenyl-3,4-dihydroisoquinoline-2(*1H*)-carboxylate,

[2](*3S*)-1-azabicyclo[2.2.2]octan-3yl (*1S*)-1-phenyl-3,4-dihydroisoquinoline-2(*1H*)-carboxylate,

[3](*3R*)-1-azabicyclo[2.2.2]octan-3yl (*1R*)-1-phenyl-3,4-dihydroisoquinoline-2 (*1H*)-carboxylate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to impurity F and H is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution, the area of each peak corresponding to impurity F, G and H is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent).

Impurity E. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase: A mixture of 6 volumes of *concentrated ammonia*, 31 volumes of *anhydrous ethanol* and 63 volumes of *toluene*.

Test solution. Dissolve 0.5 g of the substance under examination in 5.0 ml of *methanol*.

Reference solution. Dissolve 5 mg of impurity E[(*3R*)-1-azabicyclo[2.2.2]octan-3-ol (3- quinuclidinol)] in 50.0 ml of *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise two third of the plate. Dry the plate at 100° to 105° for 1 hour and expose to iodine vapour for 2 hours. Relative retention time with reference to solifenacin (Rf about 0.6) and impurity E is 0.2. Any spot due to impurity E is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.4 g and dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*. Determine the end point potentiometrically (2.4.25). Carry out the blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04806 g of $C_{27}H_{32}N_2O_6$.

Solifenacin Succinate Tablets

Solifenacin Succinate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of solifenacin succinate, $C_{27}H_{32}N_2O_6$.

Usual strengths. 5 mg ;10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

https://nhathuocngocanh.com/

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *solifenacin succinate IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as inertsil),
- column temperature: 40°,
- mobile phase: a mixture of 68 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water,* add 1 ml of *triethylamine*, adjusted to pH 3.6 with *orthophosphoric acid* and 32 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{32}N_2O_6$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{27}H_{32}N_2O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Solifenacin Succinate in 30 ml of *methanol* with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with *methanol* .Centrifuge the solution at 10000 rpm for 10 minutes and filter.

Reference solution (a). A 0.001 per cent w/v solution of *solifenacin succinate IPRS* in *methanol.*

Reference solution (b). A solution containing 0.0002 per cent w/v of *solifenacin-N- oxide impurity IPRS* and 0.1 per cent w/v of *solifenacin succinate IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as inertsil),
- column temperature: 10°,
- autosampler temperature: 10°,
- mobile phase: A. a buffer solution prepared by dissolving 2 g of *1-hexane sulphonic acid sodium salt* in 1000 ml of *water* add 2 ml of *triethylamine*, mix and adjust the pH 2.6 with dilute *orthophosphoric acid,*

B. *acetonitrile,*

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	62	38
15	62	38
25	40	60
50	40	60
52	62	38
60	62	38

Name	Relative retention time	Correction factor
(1S)-1-phenyl-1,2,3,4-tetra hydro isoquinoline (SLF-4)	0.42	0.5
Solifenacin (Retention time is about 11 minutes)	1.0	—
Solifenacin-*N*-oxide	1.24	0.9

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 7500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b). The test is not valid unless, the resolution between solifenacin and solifenacin-*N*-oxide peaks is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than the 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in suitable volume of the solvent mixture, with the aid of ultrasound and dilute with the solvent mixture to obtain a solution containing 0.005 per cent w/v solution of solifenacin succinate.

Calculate the content of $C_{27}H_{32}N_2O_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. Dissolve about 2.9 g of *sodium dihydrogen orthophosphate monohydrate* in 600 ml of *water*. Adjust the pH 6.5 with *10 M sodium hydroxide*, dilute to 750 ml with *water*. To this solution, add 250 ml of *acetonitrile*, mix and filter.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Solifenacin Succinate in 150 ml of the solvent mixture, with the aid of ultrasound for 20 minutes and dilute to 200.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *solifenacin succinate IPRS* in the solvent mixture.

Use Chromatographic system as described under Dissolution.

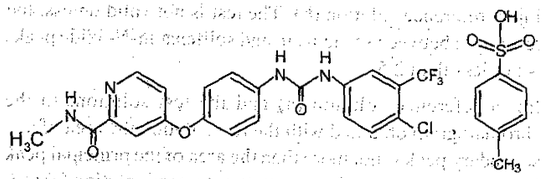
Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{32}N_2O_6$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Sorafenib Tosylate



$C_{21}H_{16}ClF_3N_4O_3.C_7H_8SO_3$ Mol. Wt. 637.0

Sorafenib Tosylate is 4-[4-({[4-chloro-3-(trifluoromethyl) phenyl] carbamoyl} amino) phenoxy] - N-methylpyridine-2-carboxamide.

Sorafenib Tosylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{16}ClF_3N_4O_3.C_7H_8SO_3$, calculated on the dried basis.

Category. Anticancer.

Description. A cream to yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sorafenib tosylate IPRS* or with the reference spectrum of sorafenib tosylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Paratoluenesulphonic acid. 25.6 per cent to 28.3 per cent.

Dissolve 0.3 g of the substance under examination in 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01722 g of paratoluenesulphonic acid.

Related substances. Determine by liquid chromatography (2.4.14).

Solvemt mixture. Equal volumes of mobile phase A and *acetonitrile*.

Test solution. Disssolve 25 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). A solution containing 0. 005 per cent of *sorafenib tosylate IPRS* and 0.0075 per cent w/v each of *sorafenib impurity A IPRS, sorafenib impurity B IPRS* and *sorafenib impurity C IPRS* in the solvent mixture. Further dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution (b). A solution containing 0.0005 per cent w/v of *sorafenib tosylate IPRS* and 0.000075 per cent each of *sorafenib impurity A IPRS, sorafenib impurity B IPRS* and *sorafenib impurity C IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm) (Such as YMC Basic),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *tetrahydrofuran*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
5	60	40
10	50	50
20	50	50
25	30	70
35	30	70
37	60	40
45	60	40

Name	Relative retention time
Sorafenib impurity A[1]	0.18
Sorafenib impurity C[2]	0.96
Sorefenib	1.0
Sorafenib impurity B[3]	1.65

[1]4-(2-*N*-methylcarbamoyl)-4-pyridyloxy)aniline,

[2]4-[4-[[2-Chloro-3-(trifluoromethyl)phenyl] carbamoylamino] phenoxy]-*N*-methyl-pyridine-2-caboxamide,4-methylbenzene sulfonic acid,

[3]1, 3-bis (4-Chloro-3-(trifluomethyl)phenyl] urea.

Inject reference solution (a). The test is not valid unless the column efficiency of the principal peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the resolution between sorafenib impurity C and sorafenib is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.15 per cent) and the sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak due to para toluene sulphonic acid (relative retention time about 0.16).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *sorafenib tosylate IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances with spectrophotometer set at 265 nm.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{16}ClF_3N_4O_3.C_7H_8SO_3$.

Storage. Store protected from light.

Sorafenib Tablets

Sorafenib Tosylate Tablets

Sorafenib Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sorafenib, $C_{21}H_{16}ClF_3N_4O_3$.

Usual strength. 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid* in 1.0 per cent w/v *sodium dodecyl sulphate*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *acetonitrile*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *sorafenib tosylate IPRS* in the solvent mixture and dilute with the dissolution medium to obtain a solution having a known concentration to the expected concentration of test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{16}ClF_3N_4O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *acetonitrile*.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of sorafenib in 200.0 ml of the solvent mixture.

Reference solution. A solution containing 0.0001 per cent w/v of *sorafenib impurity C IPRS (4-[4-[[[[2-Chloro-3-(trifluoromethyl) phenyl]amino]carbonyl]amino]-phenoxy]-N-6-methyl-2-pyridinecaboxamide tosylate IPRS*) and

https://nhathuocngocanh.com/

0.00005 per cent w/v of *sorafenib tosylate IPRS* equivalent to sorafenib in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm) (Such as YMC Basic),
- mobile phase: A. dissolve 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *tetrahydrofuran*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
5	60	40
10	50	50
20	50	50
25	30	70
35	30	70
37	60	40
45	60	40

Inject the reference solution. The test is not valid unless the resolution between the peaks due sorafenib impurity C and sorafenib is not less than 1.5, the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak due to para toluene sulphonic acid (relative retention time about 0.16).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.2 g of Sorafenib in the solvent mixture and dilute to 250.0 ml with the solvent mixture. Dilute 3.0 ml of the solution to 250.0 ml with the solvent mixture.

Reference solution. A 0.0013 per cent w/v solution of *sorafenib tosylate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm) (Such as YMC Basic),
- column temperature: 40°,
- mobile phase: a mixture of 530 volumes of buffer prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid*, 395 volumes of *acetonitrile* and 75 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{16}ClF_3N_4O_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of Sorafenib.

Sorbic Acid

$C_6H_8O_2$ Mol. Wt. 112.1

Sorbic Acid is (2*E*,4*E*)-hexa-2,4-dienoic acid.

Sorbic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_8O_2$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sorbic acid IPRS* or with the reference spectrum of sorbic acid.

B. Dissolve 50 mg in sufficient *water* to produce 250 ml and dilute 2 ml of the solution to 200 ml with *0.1 M hydrochloric acid*.

https://nhathuocngocanh.com/

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 264 nm; absorbance at about 264 nm, 0.43 to 0.51.

C. Dissolve 0.2 g in 2 ml of *ethanol (95 per cent)* and add 0.2 ml of *bromine water*; the solution is decolorised.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Heavy metals. 12 ml of 5 per cent w/v solution in *ethanol (95 per cent)* complies with the test for heavy metals, Method D (10 ppm), using 5 ml of *lead standard solution (1ppm Pb)* and 5 ml of *ethanol (95 per cent)*.

Aldehydes. Not more than 0.15 per cent, determined by the following method. Dissolve 1.0 g in a mixture of 50 ml of *2-propanol* and 30 ml of *water*, adjust the pH of the solution to 4.0 with *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* and dilute to 100 ml with *water*. To 10 ml of the resulting solution add 1 ml of *decolorised fuchsin solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that obtained in a solution prepared simultaneously by adding 1 ml of *decolorised fuchsin* solution to a mixture of 1.5 ml of *acetaldehyde standard solution (100 ppm C_2H_4O)*, 4 ml of *2-propanol* and 4.5 ml of *water*.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

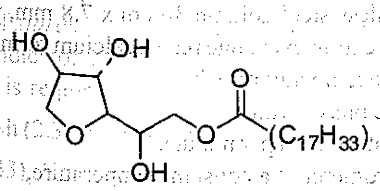
Water (2.3.43). Not more than 1.0 per cent, determined on 2.0 g.

Assay. Weigh 0.2 g, dissolve in 20 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, using 0.2 ml of *phenolphthalein solution* as indicator, until a pink colour is produced. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01121 g of $C_6H_8O_2$.

Storage. Store protected from light and moisture.

Sorbitan Oleate



$C_{24}H_{44}O_6$ Mol. Wt. 428.6

Sorbitan Oleate is mixture usually obtained by esterification of 1 mole of sorbitol and its mono-and di- anhydrides per mole of oleic (*cis*-9-octadecenoic) acid. A suitable antioxidant may be added.

NOTE—When sorbitan mono-oleate is demanded, Sorbitan Oleate shall be supplied.

Category. Pharmaceutical aid.

Description. A brownish-yellow, viscous liquid.

Identification

A. Complies with the test for hydroxyl value (2.3.27).

B. Complies with the test for iodine value (2.3.28).

C. Complies with the test for composition of fatty acids.

D. *Margaric acid.* Not more than 0.2 per cent for oleic acid of vegetable origin and not more than 4.0 per cent for oleic acid of animal origin.

Tests

Relative density (2.4.29). About 0.99.

Acid value (2.3.23). Not more than 8.0, determined on 5.0 g.

Hydroxyl value (2.3.27). 190 to 210.

Saponification value (2.3.37). 145 to 160. Carry out the saponification for 1 hour.

Iodine value (2.3.28). 62 to 76.

Peroxide value (2.3.35). Not more than 10.0.

Composition of fatty acids. Determine Fatty Acid Composition by gas chromatography (2.3.50, Method C).

Composition of the fatty acid fraction of the substance:

- *myristic acid:* Not more than 5.0 per cent;
- *palmitic acid:* Not more than 16.0 per cent;
- *palmitoleic acid:* Not more than 8.0 per cent;
- *stearic acid:* Not more than 6.0 per cent;
- *oleic acid:* 65.0 per cent to 88.0 per cent;
- *linoleic acid:* Not more than 18.0 per cent;
- *linolenic acid:* Not more than 4.0 per cent;
- *fatty acids with chain length greater than C18:* Not more than 4.0 per cent.

Heavy metals (2.3.13). In a silica crucible, mix thoroughly 2.0 g of the substance under examination with 0.5 g of *magnesium oxide*. Ignite to dull redness until a homogeneous white or greyish-white mass is obtained.

If after 30 min of ignition the mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800° for about 1 hour. Take up the residue in 2 quantities, each of 5 ml, of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 0.1 ml of

https://nhathuocngocanh.com/

phenolphthalein solution and then *concentrated ammonia* until a pink colour is obtained. Cool, add *glacial acetic acid* until the solution is decolourised and add 0.5 ml in excess. Filter if necessary and wash the filter. Dilute to 20 ml with *water*. 12 ml of resultant solution complies with the limit test for heavy metals, Method D (10 ppm). Prepare the standard using 10.0 ml of *lead standard solution (1 ppm Pb)*.

Total ash (2.3.19). Not more than 0.5 per cent, determined on 1.5 g.

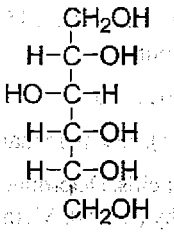
Water (2.3.43). Not more than 1.5 per cent, determined on 1.0 g.

Storage. Store protected from light.

Labelling. The label states the origin of the oleic acid used (animal or vegetable).

Sorbitol

D-Glucitol



$C_6H_{14}O_6$ Mol. Wt. 182.2

Sorbitol is D-glucitol, a hexahydric alcohol related to glucose.

Sorbitol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_6H_{14}O_6$, calculated on the anhydrous basis.

Category. Nutrient (for parenteral administration); pharmaceutical aid (sweetening agent; excipient).

Description. A white, crystalline powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Dissolve 50 mg in 3 ml of *water*, add 3 ml of *catechol solution* and pour the mixture into 6 ml of *sulphuric acid*; a pink colour is produced.

C. Dissolve 5 g in 3 ml of *water* with the aid of gentle heat, cool, add 7 ml of *methanol*, 1 ml of *benzaldehyde* and 1 ml of *hydrochloric acid*, mix and shake continuously for 2 hours. Filter, dissolve the crystals in 20 ml of boiling *sodium bicarbonate solution* and allow to crystallise. The residue, after washing rapidly with 5 ml of a mixture of equal volumes of *methanol* and *water* and drying in a current of air, melts at about 175° (2.4.21).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 5.0 g in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 50 ml (solution A). To 10 ml of solution A add 10 ml of *carbon dioxide-free water*. To 10 ml of the resulting solution add 0.05 ml of *phenolphthalein solution*; not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink. To a further 10 ml of the solution add 0.05 ml of *methyl red solution*; Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Specific optical rotation (2.4.22). +4.0° to +7.0°, determined in a solution prepared in the following manner. Dissolve a mixture of 5.0 g of the substance under examination and 6.4 g of *borax* in 40 ml of *water*, allow to stand for 1 hour, shaking occasionally, dilute to 50 ml with *water* and filter, if necessary.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5.0 g of the substance under examination in 100.0 ml of *water*.

Reference solution (a). Dissolve 0.5 g of *sorbitol IPRS* in 10.0 ml of *water*.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water*.

Reference solution (d). Dissolve 0.5 g each of *sorbitol* and *mannitol (sorbitol impurity A)* in 10.0 ml of *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature: 85°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractometer at a constant temperature,
- injection volume: 20 µl.

The relative retention time with reference to sorbitol for maltitol (sorbitol impurity C) is about 0.6, for mannitol (sorbitol impurity A) is about 0.8 and for iditol (sorbitol impurity B) is about 1.1.

https://nhathuocngocanh.com/

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to sorbitol and sorbitol impurity A is not less than 2.0.

Inject reference solutions (b), (c), (d) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 5.0 g complies with the limit test for chlorides (50 ppm).

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20 ml with *water* (1 ppm).

Sulphates (2.3.17). 12 ml of solution A complies with the limit test for sulphates (125 ppm).

Reducing sugars. Dissolve 5.0 g in 3 ml of *water* with the aid of gentle heat, cool, add 20 ml of *cupri-citric solution* and a few glass beads, heat in such a manner that the solution boils in 4 minutes and continue boiling for a further 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* followed by 20.0 ml of *0.025 M iodine*. Add, shaking continuously, 25 ml of a 6 per cent v/v solution of *hydrochloric acid* and, when any precipitate has redissolved, titrate the excess iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modification.

Inject reference solution (a) and the test solution.

Calculate the content of $C_6H_{14}O_6$.

Sorbitol intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins *complies with the following additional requirement.*

Bacterial endotoxins (2.2.3). Not more than 4.0 Endotoxin Units per g for parenteral preparations having a concentration of less than 10 per cent w/v of sorbitol and not more than 2.5 Endotoxin Units per g for parenteral preparations containing 10 per cent w/v or more of sorbitol.

Storage. Store protected from moisture.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Sorbitol Solution (70 Per cent) (Crystallising)

Sorbitol (70 per cent) (Crystallising)

Sorbitol Solution (70 per cent) (Crystallising) is an aqueous solution of hydrogenated, partly hydrolysed starch.

Sorbitol Solution (70 per cent) (Crystallising) contains not less than 68.0 per cent w/w and not more than 72.0 per cent w/w of anhydrous substances and not less than 92.0 per cent w/w and not more than 101.0 per cent w/w of D-glucitol, $C_6H_{14}O_6$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A clear, colourless , syrupy liquid, miscible with water.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g, add 40 ml of *water* and 6.4 g of *disodium tetraborate*. Allow to stand for 1 hour, shake occasionally and dilute to 50.0 ml with *water*. The angle of rotation (2.4.22) is 0° to +1.5°.

C. It is clear syrupy liquid at 25°.

Tests

Appearance of solution. A 14.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Conductivity (2.4.9). Not more than 10 μS cm^{-1}, measured on undiluted liquid sorbitol (crystallising) while gently stirring with a magnetic stirrer.

https://nhathuocngocanh.com/

Reducing sugars. Not more than 0.2 per cent, calculated as glucose equivalent.

To 5.0 g, add 6.0 ml of *water*, 20.0 ml of *cupri-citric solution* and a few glass beads. Heat so that boiling begins after 4 minutes and maintain boiling for 3 minutes. Cool rapidly and add 100.0 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25.0 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Lead. Not more than 0.5 ppm.

Determine by atomic absorption spectrometry (2.4.2), Method A.

Solvent mixture. Equal volumes of *dilute acetic acid* and *water*.

Test solution. Dissolve 100 g of the substance under examination in 500 ml of the solvent mixture. To 100 ml of the solution add 2.0 ml of 1 per cent w/v solution of *ammonium pyrrolidinedithio-carbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (a). Dissolve 0.5 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (b). Dissolve 1.0 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (c). Dissolve 1.5 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithiocarbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Set the zero of the instrument using *methyl isobutyl ketone* treated as described for the test solution without the substance under examination. Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame.

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3.0 ml of *bromine water* and 2.0 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10.0 ml of *6 M ammonia* and 1.0 ml of a 1.0 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50.0 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20.0 ml with *water* (1 ppm).

Water (2.3.43): 28.0 per cent to 32.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1.0 g of the substance under examination in 50.0 ml of *water*.

Reference solution (a). Dissolve 65 mg of *sorbitol IPRS* in 5.0 ml of *water*.

Reference solution (b). Dissolve 65 mg of *mannitol* and 65 mg of *sorbitol* in 5.0 ml of *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature: 85°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractometer set at a constant temperature,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sorbitol and mannitol is not less than 2.0. The relative retention time with reference to sorbitol (Retention time is about 27 minutes) for mannitol is about 0.8.

Inject reference solution (a) and the test solution. Run the chromatogram for three times the retention time of sorbitol.

Calculate the content of D-sorbitol (D-glucitol), $C_6H_{14}O_6$.

Storage. Store protected from moisture.

Sorbitol Solution (70 Per cent) (Non-Crystallising)

Sorbitol (70 per cent) (Non-crystallising)

Sorbitol Solution (70 per cent) (Non-crystallising) is an aqueous solution of hydrogenated, partly hydrolysed starch.

Sorbitol Solution (70 per cent) (Non-crystallising) contains not less than 68.0 per cent w/w and not more than 72.0 per cent w/w of anhydrous substances and not less than 72.0 per cent w/w and not more than 92.0 per cent w/w of D-glucitol, $C_6H_{14}O_6$, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Pharmaceutical aid (sweetening vehicle); humectant.

Description. A clear, colourless or faintly yellow, syrupy liquid.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g, add 40 ml of *water* and 6.4 g of *disodium tetraborate*. Allow to stand for 1 hour, shake occasionally and dilute to 50.0 ml with *water*. The angle of rotation (2.4.22) is +1.5° to +3.5°.

C. It is clear syrupy liquid at 25°.

Tests

Appearance of solution. A 14.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Conductivity (2.4.9). Not more than 10 μS cm^{-1}, measured on undiluted liquid sorbitol while gently stirring with a magnetic stirrer.

Reducing sugars. Not more than 0.2 per cent, calculated as glucose equivalent.

To 5.0 g, add 6.0 ml of *water*, 20.0 ml of *cupri-citric solution* and a few glass beads. Heat so that boiling begins after 4 minutes and maintain boiling for 3 minutes. Cool rapidly and add 100.0 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25.0 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Reducing sugars after hydrolysis. Not more than 9.3 per cent, calculated as glucose equivalent.

To 6.0 g, add 35 ml of *water*, 40 ml of *1 M hydrochloric acid* and a few glass beads. Reflux for 4 hours. Cool and neutralize with *dilute sodium hydroxide solution*, using 0.2 ml of *bromothymol blue solution* as indicator. Cool and dilute to 100.0 ml with *water*. To 3.0 ml of the solution, add 5.0 ml of *water*, 20 ml of *cupri-citric solution* and a few glass beads. Heat so that boiling begins after 4 minutes and maintain boiling for 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid* and 94 volumes of *water* and when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 8.0 ml of *0.05 M sodium thiosulphate* is required.

Lead. Not more than 0.5 ppm.

Determine by atomic absorption spectrometry (2.4.2).

Solvent mixture. Equal volumes of *dilute acetic acid* and *water*.

Test solution. Dissolve 100 g of the substance under examination in 500 ml of the solvent mixture. To 100 ml of the solution add 2.0 ml of 1 per cent w/v solution of *ammonium pyrrolidinedithio-carbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (a). Add 0.5 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithio-carbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (b). Add 1.0 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithio-carbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solution (c). Add 1.5 ml of *lead standard solution (10 ppm Pb)* in 100 ml of the test solution. Add 2.0 ml of a clear 1 per cent w/v solution of *ammonium pyrrolidinedithio-carbamate* and 10.0 ml of *methyl isobutyl ketone*, shake for few seconds and protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Set the zero of the instrument using *methyl isobutyl ketone* treated as described for the test solution without the substance under examination. Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame.

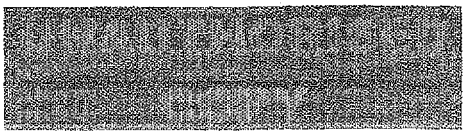
Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3.0 ml of *bromine water* and 2.0 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10.0 ml of *6 M ammonia* and 1.0 ml of a 1.0 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50.0 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20.0 ml with *water* (1 ppm).

Water (2.3.43). 28.0 per cent to 32.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1.0 g of the substance under examination in 50.0 ml of *water*.

Reference solution (a). Dissolve 55 mg of *sorbitol IPRS* in 5.0 ml of *water*.



https://nhathuocngocanh.com/

Reference solution (b). Dissolve 55 mg of *mannitol IPRS* and 55 mg of *sorbitol IPRS* in 5.0 ml of *water*.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature: 85°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractometer set at a constant temperature,
- injection volume: 20 µl.

The relative retention time with reference to sorbitol (Retention time is about 27 minutes) for mannitol is about 0.8.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sorbitol and mannitol is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram for three times the retention time of sorbitol.

Calculate the content of D-sorbitol (D-glucitol), $C_6H_{14}O_6$.

Storage. Store protected from moisture.

Soyabean Oil

Soyabean Oil is a fixed oil obtained from the seeds of Glycine soja Sieb. and Zucc. and Glycine max (L) Merr. (G. hispida (Moench) Maxim.) by extraction and subsequent refining; it may contain a suitable antioxidant.

Category. Pharmaceutical aid.

Description. A clear, pale-yellow coloured liquid, with a bland taste that solidifies at -10° to -16°.

Identification

Complies with the test of Fatty Acid Composition by Gas Chromatography (2.3.50) and exhibits the following composition profile of fatty acids.

Carbon-Chain length	No. of Double bonds	Percentage
<14	0	≤0.1
14	0	≤0.2
16	0	9.0 to 13.0
16	1	≤0.3
18	0	2.5 to 5.0
18	1	17.0 to 30.0
18	2	48.0 to 58.0
18	3	5.0 to 11.0
20	0	≤1.0
20	1	≤1.0
22	0	≤1.0
22	1	≤0.3
24	0	≤0.5

Tests

Weight per ml (2.4.29). 0.916 g to 0.922 g.

Refractive index (2.4.27). 1.471 to 1.475.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Acid value (2.3.23). Not more than 0.3.

Peroxide value (2.3.35). Not more than 10.0.

Iodine value (2.3.28). 120 to 141.

Saponification value (2.3.37). 180 to 200.

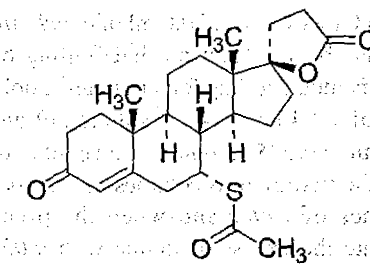
Unsaponifiable matter (2.3.39). Not more than 1.5 per cent.

Water (2.3.43). Not more than 0.1 per cent.

Storage. Store protected from light and moisture.

Labelling. The label states the name and quantity of any added antioxidant.

Spironolactone



$C_{24}H_{32}O_4S$ Mol. Wt. 416

Spironolactone is 7α-acetylthio-3-oxo-17α-pregn-4-ene-21,17β-carbolactone.

Spironolactone contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{24}H_{32}O_4S$, calculated on the dried basis.

Category. Diuretic.

Description. A yellowish white to buff coloured powder. It shows polymorphism (2.5.11).

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *spironolactone IPRS* or with the reference spectrum of spironolactone.

https://nhathuocngocanh.com/

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *spironolactone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Shake about 10 mg with 2 ml of *sulphuric acid (50 per cent)*; an orange solution with an intense yellowish fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide is evolved which turns *lead acetate paper* black. Add the solution to 10 ml of *water*; a greenish yellow solution is produced which shows opalescence or a precipitate.

Tests

Specific optical rotation (2.4.22). −37.0° to −33.0°, determined in a 1.0 per cent w/v solution in *chloroform*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in 2.5 ml of *tetrahydrofuran* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of *canrenone IPRS* in 1.0 ml of *tetrahydrofuran* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution and 1 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *acetonitrile*, 18 volumes of *tetrahydrofuran* and 74 volumes of *water*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 254 nm and 283 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to canrenone and spironolactone is not less than 1.4 and the signal-to-noise ratio of the principal peak is not less than 6.

Inject reference solution (a), (c), (d), (e) and the test solution. At 254 nm, run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks other than canrenone, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (e). At 283 nm, the area of the peak due to canrenone is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the content of canrenone at 283 nm and the content of the other impurities at 254 nm. The sum of areas of all the peaks is not more than 1.0 per cent.

Chromium. Mix 0.2 g with 1 g of *potassium carbonate* and 0.3 g of *potassium nitrate* in a platinum crucible, heat gently until fused and ignite at 600° to 650° until the carbon is removed. Cool, dissolve the residue as completely as possible in 10 ml of *water* with the aid of gentle heat, filter and dilute to 20 ml with *water*. To 10 ml of the solution add 0.5 g of *urea* and just acidify with *sulphuric acid (14 per cent)*. When effervescence ceases add a further 1 ml of *sulphuric acid (14 per cent)*, dilute to 20 ml with *water* and add 0.5 ml of *diphenylcarbazide solution*. Any colour produced is not more intense than that obtained by adding 1 ml of *sulphuric acid (14 per cent)* to 0.5 ml of a freshly prepared 0.00283 per cent w/v solution of *potassium dichromate*, diluting to 20 ml with *water* and adding 0.5 ml of *diphenylcarbazide solution* (50 ppm).

https://nhathuocngocanh.com/

Free mercapto compounds. Shake 2.0 g with 20 ml of *water* for 1 minute and filter. To 10 ml of the filtrate add 0.05 ml of *0.01 M iodine* and 0.1 ml of *starch solution* and mix; a blue colour develops.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours,

Assay. Weigh 50 mg, dissolve in sufficient *methanol* to produce 250.0 ml, dilute 5.0 ml to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{24}H_{32}O_4S$ taking 470 as the specific absorbance at 238 nm.

Storage. Store protected from light and moisture.

Spironolactone Tablets

Spironolactone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of spironolactone, $C_{24}H_{32}O_4S$. The tablets may contain added flavouring agents.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.125 g of Spironolactone with two quantities, each of 10 ml, of *chloroform*, filter, evaporate the combined filtrates to dryness and dissolve the residue in 2.5 ml of chloroform.

On the resulting solution determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *spironolactone IPRS* or with the reference spectrum of spironolactone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Extract a quantity of the powdered tablets containing 50 mg of Spironolactone with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve 25 mg the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *spironolactone IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Shake about 10 mg of the residue obtained in test B with 2 ml of *sulphuric acid (50 per cent)*; an orange solution with an intense yellowish fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide is evolved which turns *lead acetate paper* black. Add the solution to 10 ml of *water*; a greenish yellow solution is produced which shows opalescence or a precipitate.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *0.1 M hydrochloric acid* containing 0.1 per cent w/v of *sodium dodecyl sulphate*,

Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium, filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 242 nm (2.4.7). Calculate the content of $C_{24}H_{32}O_4S$ in the medium taking 445 as the specific absorbance at 242 nm.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{32}O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing about 62.5 mg of Spironolactone with 25 ml of *chloroform*, sonicate for 15 minutes, centrifuge and filter the supernatant. Repeat the procedure on the residue with a further 25 ml of *chloroform*. Combine the chloroform extracts and evaporate to dryness using a rotary evaporator. Add 2.5 ml of *tetrahydrofuran* and 22.5 ml of the mobile phase to the residue.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of *canrenone IPRS* in 1.0 ml of *tetrahydrofuran* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution and 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm) (Such as Spherisorb C8),
- mobile phase: a mixture of 8 volumes of *acetonitrile*, 18 volumes of *tetrahydrofuran* and 74 volumes of *water*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 254 nm and 283 nm,
- injection volume: 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to canrenone and spironolactone is not less than 1.4 and the signal-to-noise ratio of the principal peak is not less than 6.

Inject reference solution (a), (c), (d), (e) and the test solution. At 254 nm, run the chromatogram twice the retention time of principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks other than the canrenone, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (e). At 283 nm, the area of the peak due to canrenone is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the content of canrenone at 283 nm and the content of the other impurities at 254 nm. The sum of areas of all the peaks is not more than 1.0 per cent.

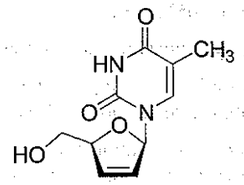
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Spironolactone, add 100 ml of *methanol* and heat just to boiling, with swirling. Cool, add sufficient *methanol* to produce 250.0 ml, dilute 10.0 ml to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{24}H_{32}O_4S$ taking 470 as the specific absorbance at 238 nm.

Storage. Store protected from light and moisture.

Stavudine



$C_{10}H_{12}N_2O_4$ Mol. Wt. 224.2

Stavudine is 2',3'-didehydro-3'-deoxythymidine.

Stavudine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}N_2O_4$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *stavudine IPRS* or with the reference spectrum of stavudine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to stavudine in the chromatogram obtained with reference solution (c).

C. Melts at about 164° (2.4.21).

Tests

Specific optical rotation (2.4.22). –46.0° to –39.0°, determined in a 0.7 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay.

Inject reference solution (a), (b) and the test solution and record the chromatograms for at least three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to thymine is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1 per cent); the area of any peak corresponding to β-thymidine is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any individual impurity peak other than thymine and β-thymidine is not more than 0.5 per cent and the sum of the areas of all the impurity peaks other than thymine and β-thymidine is not more than 1.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

https://nhathuocngocanh.com/

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.05 per cent w/v of *stavudine IPRS*, 0.01 per cent w/v of *thymine* and 0.0005 per cent w/v of *β-thymidine* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *thymine* in the mobile phase.

Reference solution (c). A 0.05 per cent w/v solution of *stavudine IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 20 volumes of *methanol* and 80 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (c). The order of elution in the chromatogram obtained with reference solution (a) is thymine, β-thymidine and stavudine with relative retention times of about 0.5, 0.7 and 1.0 respectively. The test is not valid unless the column efficiency determined from the stavudine peak in the chromatogram obtained with reference solution (a) is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections of reference solution (c) is not more than 2.0 per cent.

Inject reference solution (c) and the test solution and measure the responses of the principal peak.

Calculate the content of $C_{10}H_{12}N_2O_4$.

Storage. Store protected from light and moisture.

Stavudine Capsules

Stavudine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stavudine, $C_{10}H_{12}N_2O_4$.

Usual strengths. 30 mg; 40 mg.

Identification

A. Shake a quantity of the mixed contents of the capsules containing about 50 mg of Stavudine with 80 ml of *water* for 10 minutes. Add sufficient *water* to produce 100 ml, mix and filter. Dilute 10 ml of the filtrate to 100 ml with *water*.

When examined in the range 200 nm to 300 nm (2.4.7), the resulting solution shows an absorption maximum at about 265 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to stavudine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. In the case of capsules containing 30 mg of Stavudine, weigh 30 mg of *stavudine IPRS* and transfer to a 100-ml volumetric flask. Dissolve and dilute to volume with *0.01 M hydrochloric acid*. Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*; in the case of capsules containing 40 mg of stavudine, weigh 40 mg of *stavudine IPRS* and transfer to a 100-ml volumetric flask. Dissolve and dilute to volume with *0.01 M hydrochloric acid*. Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *water* and 15 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 20 µl.

Inject the reference solution. Run the chromatogram twice the retention time of stavudine. The test is not valid unless the column efficiency determined from the stavudine peak is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_{10}H_{12}N_2O_4$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{10}H_{12}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Mix well the contents of 20 capsules and transfer a weighed quantity containing about 50 mg of Stavudine to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound for 10 minutes, dilute to volume with *water*, mix and filter.

Reference solution. Weigh 5 mg each of *stavudine IPRS* and *thymine IPRS* and transfer to a 25-ml volumetric flask. Add 5 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to volume with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.1 M ammonium acetate*, B.*acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
35	95	5

Inject the reference solution. The test is not valid unless the column efficiency determined from the peaks of stavudine and thymine is not less than 7000 theoretical plates and the tailing factor is not more than 2.0.

Inject water and the test solution. Examine the water chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution corresponding to thymine is not more than 3.0 per cent. Any other secondary peak observed in the chromatogram obtained with the test solution is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 4.0 per cent when calculated by percentage area normalisation.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 50 mg of Stavudine and transfer to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound for 10 minutes, dilute to volume with *water*, mix and filter. Further dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Weigh 50 mg of *stavudine IPRS* and transfer to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound to dissolve and dilute to volume with *water*. Dilute 10.0 ml of the solution to 25.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *acetonitrile* and 95 volumes of *0.1 M ammonium acetate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the stavudine peak is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the reference solution and the test solution and measure the responses for the major peak.

Calculate the content of $C_{10}H_{12}N_2O_4$ in the capsules.

Storage. Store protected from moisture.

Stavudine Oral Solution

Stavudine Oral Solution is a mixture consisting of Stavudine with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The oral solution is constituted by dispersing the contents of the sealed container in the specified volume of water just before issue.

Stavudine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stavudine $C_{10}H_{12}N_2O_4$.

The constituted solution, when stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use, contains not less than 90.0 per cent of the stated amount of stavudine, $C_{10}H_{12}N_2O_4$.

Usual strength. 1 mg per ml.

The contents of the sealed container comply with the requirements stated under Oral Liquids and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

https://nhathuocngocanh.com/

Tests

pH (2.4.24). 5.0 to 7.0, determined in the reconstituted solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dilute a volume of the reconstituted solution containing 10 mg of stavudine and dissolve in 20 ml of *water*.

Reference solution (a). A 0.05 per cent w/v solution of *stavudine IPRS* in *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water*.

Reference solution (c). A solution containing 0.0125 per cent w/v each of thymine and thymidine in *water*. Dilute 2.0 ml of the solution to 100.0 ml of *water*.

Use the chromatographic system described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject reference solution (c). The test is not valid unless the resolution between thymine and thymidine peak is not less than 8.4.

Inject reference solution (b) and the test solution. Run the chromatogram for 4 times the retention time (about 9 minutes) of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh a quantity of the reconstituted solution containing 10 mg of Stavudine, disperse in sufficient *water* and diluted to 100.0 ml with *water*.

Reference solution (a). A 0.01 per cent w/v solution of *stavudine IPRS* in *water*.

Reference solution (b). A solution containing 0.0125 per cent w/v each of thymine and thymidine in *water*. Dilute 2.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 3.3 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 95 volumes of 25 mM *ammonium acetate* and 5 volumes of *methanol*,
  B. 50 volumes of 25 mM *ammonium acetate* and 50 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
155	100	0
165	100	0

Inject reference solution (b). The test is not valid unless the resolution between thymine and thymidine is not less than 8.4.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_{10}H_{12}N_2O_4$, weight in volume. Repeat the procedure using a portion of the constituted solution that has been stored at the temperature and for the period stated on the label.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Stavudine and Lamivudine Tablets

Stavudine and Lamivudine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of stavudine, $C_{10}H_{12}N_2O_4$ and lamivudine, $C_8H_{11}N_3O_3S$.

Usual strengths. Stavudine, 30 mg and Lamivudine, 150 mg; Stavudine, 40 mg and Lamivudine, 150 mg.

Identification

In the Assay, the two principal peaks in the chromatogram obtained with the test solution correspond to the peaks due to stavudine and lamivudine in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. In the case of tablets containing 30 mg of stavudine, weigh 33 mg of *stavudine IPRS* and 167 mg of *lamivudine IPRS* and transfer to a 100 ml volumetric flask. Add about 20 ml of *methanol*, sonicate to dissolve and dilute to volume with a solvent mixture of equal volumes of *methanol* and *water* (diluent). Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*; in the case of tablets containing 40 mg of stavudine, weigh 44 mg of *stavudine IPRS* and 167 mg of *lamivudine IPRS* and transfer to a 100-ml volumetric flask. Add about 20 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to volume with the diluent. Dilute 5.0 ml of the solution to 50.0 ml with *0.01 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of a buffer prepared by dissolving 0.68 g of *potassium dihydrogen phosphate* and 1.0 g of *sodium octanesulphonate* in 1000.0 ml of *water* to which 1 ml of *triethylamine* is added and the pH of which is adjusted to 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual stavudine and lamivudine peaks is not more than 1.5 and the relative standard deviation for replicate injections for each of the peaks corresponding to stavudine and lamivudine is not more than 1.0 per cent.

Inject the reference solution and the test solution and measure the responses for the major peaks due to stavudine and lamivudine.

Calculate the contents of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amounts of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 100 mg of lamivudine and transfer to a 200-ml volumetric flask. Add about 100 ml of *water*, mix with the aid of ultrasound for 10 minutes with occasional shaking to obtain a uniform dispersion, cool to room temperature, dilute to volume with *water* and mix. Filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution (a). Weigh 65 mg of *stavudine IPRS* and 6.5 mg of *thymine IPRS*, and transfer to a 25-ml volumetric flask. Add 5 ml of *methanol*, sonicate to dissolve, dilute to volume with *water* and mix.

Reference solution (b). Weigh 100 mg of *lamivudine IPRS*, transfer to a 200 ml volumetric flask, add about 100 ml of *water* and mix with the aid of ultrasound to dissolve. Add 10 ml of reference solution (a) to this solution and dilute to volume with *water* and mix.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.1 M ammonium acetate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phaseA (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
35	95	5

Inject reference solutions (b) and (c). The test is not valid unless the column efficiency determined from the thymine, stavudine and lamivudine peaks is not less than 3000 theoretical plates and the tailing factor for the same peaks is not more than 2.0.

Inject water and the test solution. Examine the chromatogram obtained with water for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution corresponding to thymine is not more than 3.0 per cent. Any other secondary peak observed in the chromatogram obtained with the test solution is not more

https://nhathuocngocanh.com/

than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 4.0 per cent when calculated by percentage area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Transfer a weighed quantity of the powder containing 150 mg of Lamivudine to a 100-ml volumetric flask, add about 20 ml of *methanol* and 50 ml of a mixture of equal volumes of *water* and *methanol*, mix with the aid of ultrasound for 5 minutes with occasional shaking to obtain a uniform dispersion. Cool to room temperature and dilute to volume with the same solvent mixture. Filter the solution through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute suitably with the same solvent mixture to obtain a solution with a concentration of 0.15 mg per ml of lamivudine.

Reference solution. A similarly prepared solution containing 0.015 per cent w/v of *lamivudine IPRS* and a concentration of *stavudine IPRS* similar to that of the concentration of stavudine in test solution.

Use the chromatographic system described under Dissolution.

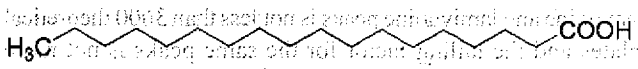
Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual peaks due to lamivudine and stavudine is not more than 1.5 and the relative standard deviation for replicate injections for each of the peaks corresponding to stavudine and lamivudine is not more than 2.0 per cent.

Inject separately the reference solution and the test solution and measure the responses for the major peaks.

Calculate the contents of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$ in the tablets.

Storage. Store protected from moisture.

Stearic Acid



Stearic Acid consists of a mixture of fatty acids, chiefly stearic acid ($C_{18}H_{36}O_2$) and palmitic acid ($C_{16}H_{32}O_2$). It may contain a suitable antioxidant.

Stearic Acid contains not less than 40.0 per cent of $C_{18}H_{36}O_2$ and the sum of the contents of $C_{18}H_{36}O_2$ and $C_{16}H_{32}O_2$ is not less than 90.0 per cent.

Category. Pharmaceutical aid (tablet lubricant; emulsion adjunct).

Description. A white powder or white, greasy, flaky crystals or hard masses showing signs of crystallisation.

Identification

In the Assay, the chromatogram obtained with the test solution shows two principal peaks which correspond to the two principal peaks in the chromatogram obtained with the reference solution.

Tests

Congealing temperature (2.4.10). Not lower than 54°.

Acid value (2.3.23). 200 to 212, determined on 1.0 g.

Iodine value (2.3.28). Not more than 4.0 *(iodine monochloride method)*.

Mineral acid. Shake 5 g of the melted substance with an equal volume of hot *water* for 2 minutes, cool and filter. To the filtrate add 0.05 ml of *methyl orange solution*; no red colour is produced.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of substance under examination in 5 ml of *boron trifluoride solution* in a conical flask fitted with a reflux condenser. Reflux for 10 minutes, add 4.0 ml of *heptane* through the condenser and boil again for 10 minutes. Allow to cool, add 20 ml of a saturated solution of *sodium chloride*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry it over 0.2 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution. Dissolve 50 mg of *palmitic acid IPRS* and 50 mg of *stearic acid IPRS* in 5 ml of *boron trifluoride solution* in a conical flask fitted with a reflux condenser. Reflux for 10 minutes, add 4.0 ml of *heptane* through the condenser and boil again for 10 minutes. Allow to cool, add 20 ml of a saturated solution of *sodium chloride*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry it over 0.2 g of *anhydrous sodium sulphate*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Chromatographic system

- a fused-silica column 30 m x 0.32 mm, packed with macrogol 20000 (0.5 µm),
- temperature:
  column 70° from 0 to 2 minutes, 70° to 240° from 2 to 36 minutes and hold at 240° from 36 to 41 minutes,
  inlet port at 220°and detector at 260°,

https://nhathuocngocanh.com/

– a flame-ionisation detector,
– flow rate: 2.4 ml per minute, using nitrogen as the carrier gas.

The relative retention time with reference to methyl stearate for methyl palmitate is about 0.9.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to methyl palmitate and methyl stearate is not less than 5.0 and the relative standard deviation of methyl stearate and methyl palmitate for replicate injections is not more than 3.0 per cent.

Inject 1 µl of the reference solution and the test solution.

Calculate the content of stearic acid and palmitic acid.

Storage. Store protected from moisture.

Stearyl Alcohol

Stearyl Alcohol is a mixture of solid alcohols consisting chiefly of 1-octadecanol, ($C_{18}H_{38}O$).

Stearyl Alcohol contains not less than 95.0 per cent of $C_{18}H_{38}O$.

Category. Pharmaceutical aid (stiffening agent).

Description. A white, unctuous mass or almost white flakes or granules.

Tests

Appearance of solution. Dissolve 0.5 g in 20 ml of *ethanol (95 per cent)* by heating to boiling and allow to cool. The solution is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

Melting range (2.4.21). 55° to 60°.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 195 to 220.

Iodine value (2.3.28). Not more than 2.0 *(iodine bromide method)*, determined on 2.0 g dissolved in 25 ml of *chloroform*, warming if necessary to effect solution.

Saponification value (2.3.37). Not more than 2.0, determined on 10.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *ethanol (95 per cent)*.

Reference solution (a). Dissolve 50 mg of *cetyl alcohol* in 10.0 ml of *ethanol (95 per cent)*.

Reference solution (b). Dissolve 50 mg of *stearyl alcohol IPRS* in 5.0 ml of *ethanol (95 per cent)*.

Reference solution (c). To 1.0 ml of reference solution (a), add 1.0 ml of reference solution (b) and dilute to 10.0 ml with *ethanol (95 per cent)*.

Chromatographic system
– a capillary column 30 m x 0.32 mm, packed with poly(dimethyl)siloxane (1 µm),
– temperature:

Column	time (min)	temperature (°)
	0 – 20	150 – 250
	20 – 40	250

– injector port and detector at 250°,
– flame ionization detector,
– flow rate: 1 ml per minute using nitrogen as the carrier gas.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to cetyl alcohol and stearyl alcohol is not less than 5.0.

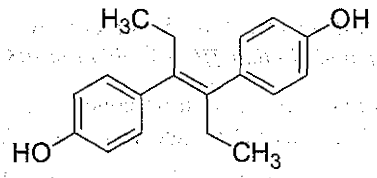
Inject 1 µl of the test solution, reference solution (b) and (c).

Calculate the content of $C_{18}H_{38}O$.

Storage. Store protected from moisture.

Stilboestrol

Diethylstilboestrol



$C_{18}H_{20}O_2$ Mol. Wt. 268.4

Stilboestrol is (*E*)-α,β-diethylstilbene-4,4'-diol.

Stilboestrol contains not less than 97.0 per cent and not more than 101.0 per cent of $C_{18}H_{20}O_2$, calculated on the dried basis.

Category. Oestrogen.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *stilboestrol IPRS* or with the reference spectrum of stilboestrol.

https://nhathuocngocanh.com/

B. When examined in the range 230 nm to 450 nm (2.4.7), the irradiated solution prepared as directed in the Assay shows absorption maxima at about 292 nm and 418 nm.

C. In the test for Mono- and di-methyl ethers, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

D. Dissolve 0.5 mg in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat in a water-bath for 3 minutes; a deep yellow colour is produced which almost disappears on dilution with 3 ml of *glacial acetic acid* (distinction from dienoestrol).

Tests

4,4'-Dihydroxystilben and related ethers. Absorbance of a 1.0 per cent w/v solution in *ethanol* at about 325 nm, not more than 0.50 (2.4.7).

Mono- and di-methyl ethers. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *diethylamine*.

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.5 per cent w/v solution of *stilboestrol IPRS in ethanol (95 per cent)*.

Reference solution (b). A 0.05 per cent w/v solution of *stilboestrol monomethyl ether IPRS* in *ethanol (95 per cent)*.

Reference solution (c). A 0.05 per cent w/v solution of *stilboestrol dimethyl ether IPRS* in *ethanol (95 per cent)*.

Reference solution (d). A solution containing 0.25 per cent w/v each of *dienoestrol IPRS* and *stilboestrol IPRS*

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent)* and heat at 120° for 10 minutes. Any secondary spots in the chromatogram obtained with the test solution corresponding to the mono-and di-methyl ethers of stilboestrol are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively. Stilboestrol sometimes produces two spots. The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots of approximately the same intensity.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 20 mg in sufficient *ethanol* to produce 100.0 ml and dilute 10.0 ml of the solution to 100.0 ml with *ethanol*. To 25.0 ml of the resulting solution add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at the maximum at about 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ from the absorbance obtained by repeating the operation using *stilboestrol IPRS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Stilboestrol Tablets

Diethylstilboestrol Tablets

Stilboestrol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stilboestrol, $C_{18}H_{20}O_2$.

Usual strengths. 500 µg; 1 mg; 5 mg; 25 mg.

Identification

A. When examined in the range 230 nm to 450 nm (2.4.7), the irradiated solution prepared as directed in the Assay shows absorption maxima at about 292 nm and 418 nm.

B. Extract a quantity of the powdered tablets containing 3 mg of Stilboestrol with *ether*, filter and evaporate the filtrate to dryness. Dissolve 0.5 mg of the residue in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat in a water-bath for 3 minutes; a deep yellow colour is produced which almost disappears on dilution with 3 ml of *glacial acetic acid* (distinction from dienoestrol).

Tests

Uniformity of content. Complies with the test stated under Tablets.

Finely crush one tablet, add 10 ml of *ethanol*, shake for 30 minutes, add sufficient *ethanol* to produce 25.0 ml and centrifuge. Pipette an aliquot of the supernatant liquid containing 0.5 mg of Stilboestrol add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at the maximum at about 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ in the tablet from the absorbance obtained by repeating the operation using *stilboestrol IPRS* in place of the substance under examination.

https://thuocngocanh.com/

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 5 mg of Stilboestrol, add 5 ml of *ethanol*, shake for 15 minutes, add sufficient *ethanol* to produce 100.0 ml and centrifuge. Dilute 20.0 ml of the clear, supernatant liquid to 50.0 ml with *ethanol* and mix. To 25.0 ml of the resulting solution, add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ in the tablet from the absorbance obtained by repeating the operation using *stilboestrol IPRS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Streptokinase

Streptokinase is a preparation of a protein obtained from culture filtrates of certain strains of *Streptococcus haemolyticus* group C. It has the property of combining with human plasminogen to form plasminogen activator and is purified to contain not less than 600 Units of Streptokinase activity per µg of nitrogen before addition of any stabiliser or carrier. It usually contains a buffer and may be stabilised by the addition of suitable substances such as Human Albumin.

Category. Fibrinolytic enzyme.

Description. A white powder or a white, friable solid; hygroscopic.

Identification

A. Place 0.5 ml of citrated human plasma in a haemolysis tube maintained in a water-bath at 37°. Add 0.1 ml of a solution of the substance under examination containing 10,000 Units per ml in *citro-phosphate buffer pH 7.2* and 0.1 ml of a solution of *thrombin* containing 20 Units per ml in *citro-phosphate buffer pH 7.2* and shake immediately; a clot forms and lyses within 30 minutes. Repeat the procedure using citrated bovine plasma; lysis does not occur within 1 hour.

B. Dissolve 0.6 g of *agar* in 50.0 ml of *mixed barbitone buffer pH 8.6*, heating until a clear solution is obtained. Place glass plates (50 mm x 50 mm) that are free from traces of grease on a level surface. Apply to each plate 4 ml of the agar solution and allow to cool until set. Bore a hole 6 mm in diameter in the centre of the agar and an appropriate number of holes (not exceeding six) at distances of 11 mm from the central hole removing the residual agar by means of a cannula connected to a vacuum pump. Place a quantity of 80 µl of goat or rabbit antistreptokinase serum containing 10,000 Units of antistreptokinase activity per ml in the central hole and 80 µl of a solution of the substance under examination containing 125,000 Units of streptokinase activity per ml of each of the surrounding holes. Place the plates in a humidified tank for 24 hours.

Only one precipitation arc is produced which is well-defined and localised between the application point of the serum and each hole containing the solution of the substance under examination.

Tests

pH (2.4.24). 6.8 to 7.5, determined on a solution prepared in carbon dioxide free water containing 5000 Units per ml.

Streptodornase. Introduce 0.5 ml of a 0.1 per cent w/v solution of *sodium deoxyribonucleate* in *imidazole buffer pH 6.5* into each of eight centrifuge tubes. To each of the first two tubes add 0.25 ml of *imidazole buffer pH 6.5* and 0.25 ml of solution of the substance under examination in *imidazole buffer pH 6.5* containing 150,000 Units per ml (solution A) followed immediately by 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge for 5 minutes at 3000 rpm and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank a mixture of 1.0 ml of *imidazole buffer pH 6.5* and 3.0 ml of *0.25 M perchloric acid*. Calculate the sum of the two absorbances (A_1). To each of the remaining six tubes add, respectively, 0.25, 0.25, 0.125, 0.125, 0 and 0 ml of *imidazole buffer pH 6.5* followed by 0.25 ml of solution A and finally 0, 0, 0.125, 0.125, 0.25 and 0.25 ml respectively of a solution of the Standard Preparation containing 20 Units of streptodornase activity per ml in *imidazole buffer pH 6.5*. [The standard preparation is the Second WHO International standard preparation for streptodornase, established in 2010, consisting of streptodornase supplied in ampoules containing 3200 IU of streptodornase reconstituted with 1 ml of *water*. *NOTE — Current international standard preparation must be used for comparison of the preparation under examination*]. Mix the contents of each tube, incubate at 37° for 15 minutes and add to each tube 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank the mixture specified above. If the sum of the absorbances of the liquids in the third and fourth tubes is A_2, that of the liquids in the fifth and six tubes is A_3, and that of the liquids in the seventh and eighth tubes is (A_4), ($A_2 - A_1$) is less than $0.5(A_3+A_4)-A_2$.

Streptolysin. Dissolve a quantity of the substance under examination containing 500,000 Units in 0.5 ml of a mixture of 90 volumes of *saline solution* and 10 volumes of *citro-*

https://nhathuocngocanh.com/

phosphate buffer pH 7.2 in a haemolysis tube. Add 0.4 ml of a 2.3 per cent w/v solution of *sodium thioglycollate* and incubate in a water-bath at 37° for 10 minutes. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 Units per ml and incubate at 37° for 5 minutes. Add 1 ml of *rabbit erythrocyte suspension,* continue the incubation for 30 minutes and centrifuge at about 1000 rpm. The absorbance of the supernatant liquid at about 550 nm (2.4.7), is not more than 1.5 times the absorbance obtained by repeating the above procedure using 0.5 ml of the mixture of saline solution and citro-phosphate buffer pH 7.2 in place of the solution containing the substance under examination.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 2.7 kPa for 24 hours.

Assay

Potency. The potency of streptokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of streptokinase calibrated in International Units; the formation of plasmin is determined using a suitable chromogenic substrate.

The International Unit is the activity of a stated amount of the International Standard for streptokinase. The equivalence in International Units of the International Standard is stated by the competent authority.

Reference and test solutions. Prepare 2 independent series of 4 dilutions of each of the substance under examination and of the reference preparation of Streptokinase in *tris (hydroxymethyl) aminomethane sodium chloride buffer pH 7.4* in the range of 0.5 to 4.0 IU per ml. Prepare and maintain all solutions at 37°.

Substrate solution. Mix 1.0 ml of *tris (hydroxymethyl) aminomethane buffer pH 7.4* with 1.0 ml of chromophore substrate. Add 5 µl of a 10 per cent w/v solution of *polysorbate 20*. Keep at 37° in a water-bath. Immediately before commencing the activation assay, add 45 µl of a 1 mg per ml solution of human plasminogen.

Analyse each streptokinase dilution, maintained at 37°, in duplicate. Initiate the activation reaction by adding 60 µl of each dilution to 40 µl of substrate solution. For blank wells, use 60 µl of *tris (hydroxymethyl) aminomethane sodium chloride buffer solution pH 7.4* instead of the reference and test solutions. Allow the reaction to proceed at 37° for 20 minutes and read the absorbance at 405 nm. If a suitable thermostated plate reader is available, this may be used to monitor the reaction. Alternatively, it may be necessary to stop the reaction after 20 minutes using 50 µl of a 50 per cent v/v solution of *glacial acetic acid*. Best results are obtained when the absorbance for the highest streptokinase concentration is between 0.1 and 0.2 (after blank subtraction). If necessary, adjust the time of incubation in order to reach this range of absorbances.

Calculate the regression of the absorbance on log concentrations of the solutions of the substance under examination and of the reference preparation of streptokinase and calculate the potency of the substance under examination using the usual statistical methods for parallel-line assays.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

Streptokinase intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Abnormal toxicity (2.2.1). Determine by Method A, using a solution containing 50,000 Units in 0.5 ml of *water for injections* administered in 15 to 20 seconds.

Bacterial endotoxins (2.2.3). Dissolve the contents of the sealed container in *water BET* to give a solution containing 10,000 Units of Streptokinase per ml. Carry out the test on the resulting solution; the maximum allowable endotoxin concentration of the solution is 23.33 Units of endotoxin per ml. Carry out the test using the maximum valid dilution of the prepared solution calculated from the declared sensitivity of the lysate used in the test.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in sealed containers, protected from light. The containers should be sterile, tamper-evident and sealed so as to exclude micro-organisms. Under these conditions the contents may be expected to retain their potency for 2 years.

Labelling. The label states (1) the number of Units of streptokinase activity in the container; (2) the number of Units of streptokinase activity per mg, calculated with reference to the dried preparation; (3) the name and quantity of any added substances; (4) the storage conditions; (5) whether or not it is intended for use in the manufacture of parenteral preparations.

Streptokinase Injection

Streptokinase Injection is a sterile material consisting of Streptokinase with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

https://nhathuocngocanh.com/

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. 50,000 Units; 100,000 Units; 750,000 Units; 1,500,000 Units.

Identification

A. Place 0.5 ml of citrated human plasma in a haemolysis tube maintained in a water-bath at 37°. Add 0.1 ml of a solution of the contents of the container containing 10,000 Units per ml in *citro-phosphate buffer pH 7.2* and 0.1 ml of a solution of *thrombin* containing 20 Units per ml in *citro-phosphate buffer pH 7.2* and shake immediately; a clot forms and lyses within 30 minutes. Repeat the procedure using citrated bovine plasma; lysis does not occur within 1 hour.

B. Dissolve 0.6 g of *agar* in 50.0 ml of *mixed barbitone buffer pH 8.6*, heating until a clear solution is obtained. Place glass plates (50 mm x 50 mm) that are free from traces of grease on a level surface. Apply to each plate 4 ml of the agar solution and allow to cool until set. Bore a hole 6 mm in diameter in the centre of the agar and an appropriate number of holes (not exceeding six) at distances of 11 mm from the central hole removing the residual agar by means of a cannula connected to a vacuum pump. Place a quantity of 80 µl of goat or rabbit antistreptokinase serum containing 10,000 Units of antistreptokinase activity per ml in the central hole and 80 µl of a solution of the contents of the container containing 125,000 Units of streptokinase activity per ml of each of the surrounding holes. Place the plates in a humidified tank for 24 hours.

Only one precipitation arc is produced which is well-defined and localised between the application point of the serum and each hole containing the solution of the substance under examination.

Tests

NOTE — Tests for Streptolysin and Streptodornase may be omitted if the Streptokinase injection is prepared from Streptokinase complied as per monograph in current edition of IP.

pH (2.4.24). 6.8 to 7.5, determined on a freshly constituted injection containing 5000 Units per ml, using carbon dioxide free water.

Streptodornase. Introduce 0.5 ml of a 0.1 per cent w/v solution of *sodium deoxyribonucleate* in *imidazole buffer pH 6.5* into each of eight centrifuge tubes. To each of the first two tubes add 0.25 ml of *imidazole buffer pH 6.5* and 0.25 ml of solution of the contents of the container with the substance under examination in *imidazole buffer pH 6.5* containing 150,000 Units per ml (solution A) followed immediately by 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge for 5 minutes at 3000 rpm and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank a mixture of 1.0 ml of *imidazole buffer pH 6.5* and 3.0 ml of *0.25 M perchloric acid*. Calculate the sum of the two absorbances (A_1). To each of the remaining six tubes add, respectively, 0.25, 0.25, 0.125, 0.125, 0 and 0 ml of *imidazole buffer pH 6.5* followed by 0.25 ml of solution A and finally 0, 0, 0.125, 0.125, 0.25 and 0.25 ml respectively of a solution of the Standard Preparation containing 20 Units of streptodornase activity per ml in *imidazole buffer pH 6.5*. [The standard preparation is the 2nd WHO International standard preparation for streptodornase, established in 2010, consisting of streptodornase supplied in ampoules containing 3200 IU of streptodornase reconstituted with 1 ml of *water*. *NOTE — Current international standard preparation must be used for comparison of the preparation under examination*]. Mix the contents of each tube, incubate at 37° for 15 minutes and add to each tube 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank the mixture specified above. If the sum of the absorbances of the liquids in the third and fourth tubes is A_2, that of the liquids in the fifth and six tubes is A_3, and that of the liquids in the seventh and eighth tubes is (A_4), ($A_2 - A_1$) is less than $0.5(A_3+A_4)-A_2$.

Streptolysin. Dissolve a quantity of the contents of the container containing 500,000 Units in 0.5 ml of a mixture of 90 volumes of *saline solution* and 10 volumes of *citro-phosphate buffer pH 7.2* in a haemolysis tube. Add 0.4 ml of a 2.3 per cent w/v solution of *sodium thioglycollate* and incubate in a water-bath at 37° for 10 minutes. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 Units per ml and incubate at 37° for 5 minutes. Add 1 ml of *rabbit erythrocyte suspension*, continue the incubation for 30 minutes and centrifuge at about 1000 rpm. The absorbance of the supernatant liquid at about 550 nm (2.4.7), is not more than 1.5 times the absorbance obtained by repeating the above procedure using 0.5 ml of the mixture of saline solution and citro-phosphate buffer pH 7.2 in place of the solution containing the substance under examination.

Bacterial endotoxins (2.2.3). Dissolve the contents of the sealed container in *water BET* to give a solution containing 10,000 Units of Streptokinase per ml. Carry out the test on the

https://nhathuocngocanh.com/

resulting solution; the maximum allowable endotoxin concentration of the solution is 23.33 Units of endotoxin per ml. Carry out the test using the maximum valid dilution of the prepared solution calculated from the declared sensitively of the lysate used in the test.

Abnormal toxicity (2.2.1). Determine by using a solution containing 50,000 Units in 0.5 ml of water for injection administered in 15 to 20 minutes.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay

Potency. The potency of streptokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of streptokinase calibrated in International Units; the formation of plasmin is determined using a suitable chromogenic substrate.

The International Unit is the activity of a stated amount of the International Standard for streptokinase. The equivalence in International Units of the International Standard is stated by the competent authority.

Reference and test solutions. Prepare 2 independent series of 4 dilutions of each of the substance under examination and of the reference preparation of Streptokinase in *tris (hydroxymethyl) aminomethane sodium chloride buffer pH 7.4* in the range of 0.5 to 4.0 IU per ml. Prepare and maintain all solutions at 37°.

Substrate solution. Mix 1.0 ml of *tris (hydroxymethyl) aminomethane buffer pH 7.4* with 1.0 ml of chromophore substrate. Add 5 µl of a 10 per cent w/v solution of *polysorbate 20*. Keep at 37° in a water-bath. Immediately before commencing the activation assay, add 45 µl of a 1 mg per ml solution of human plasminogen.

Analyse each streptokinase dilution, maintained at 37°, in duplicate. Initiate the activation reaction by adding 60 µl of each dilution to 40 µl of substrate solution. The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

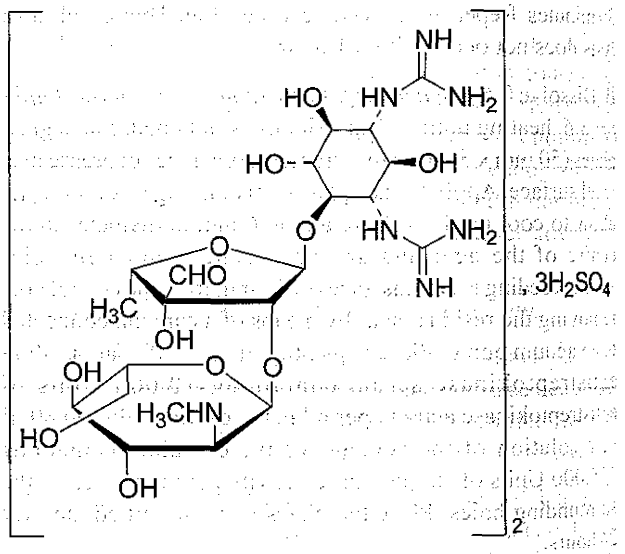
Storage. Store in sealed containers, protected from light in a refrigerator (2° to 8°). The containers should be sterile and sealed so as to exclude micro-organisms. Under these conditions the contents may be expected to retain their potency for 2 years.

Labelling. The label states the total number of Units of streptokinase activity contained in it.

Streptomycin Sulphate



$(C_{21}H_{39}N_7O_{12})_2,3H_2SO_4$ Mol. Wt. 1457.4

Streptomycin Sulphate is the sulphate of *O*-2-deoxy-2-methylamino-α-L-glucopyranosyl-(1→ 2)-*O*-5-deoxy-3-*C*-formyl-α-L-lyxofuranosyl-(1→ 4)-*N*^{1},*N*^{3}-diamidino-D-streptamine, a substance produced by the growth of certain strains of *Streptomyces griseus* or obtained by any other means.

Streptomycin Sulphate has a potency equivalent to not less than 720 µg of streptomycin per mg, calculated on the dried basis.

Category. Antitubercular.

Description. A white or almost white powder; hygroscopic.

https://nhathuocngocanh.com/

Identification

A. Determine by thin-layer chromatography (2.4.17). Prepare the plate by mixing 0.3 g of *carbomer* with 240 ml of *water*, allowing to stand with moderate stirring for 1 hour, adjusted to pH 7.0 by the gradual addition with constant shaking of *2 M sodium hydroxide* and adding 30 g of *silica gel H*. Spread a uniform layer of the resulting suspension 0.75 mm thick. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v of *streptomycin sulphate IPRS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v of *streptomycin sulphate IPRS*, 0.1 per cent w/v of *neomycin sulphate IPRS* and 0.1 per cent w/v of *kanamycin monosulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and *sulphuric acid (45 per cent)* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 5 to 10 mg in 4 ml of *water* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 minutes. Add a slight excess of *2 M hydrochloric acid* and 0.1 ml of a 10 per cent w/v solution of *ferric chloride*; a violet colour is produced.

C. Dissolve 0.1 g in 2 ml of *water* and add 1 ml of *dilute 1-naphthol solution* and 2 ml of a mixture of equal volumes of *dilute sodium hypochlorite solution* and *water*; a red colour is produced.

D. Dissolve 10 mg in 5 ml of water and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 minutes. Add 2 ml of a 0.5 per cent w/v solution of *1-naphthol* in *1 M sodium hydroxide* and heat in a water-bath for 1 minute; a faint yellow colour is produced.

E. It gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 25.0 per cent w/v solution in *carbon dioxide-free water* is not more intensely coloured than degree 3 of the appropriate range of reference solutions (2.4.1). The solution, after standing protected from light at a temperature of about 20° for 24 hours, is not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 4.5 to 7.0, determined in a 25.0 per cent w/v solution.

Sulphates. 18.0 to 21.5 per cent, calculated on the dried basis, when determined by the following method. Dissolve 0.25 g in 100 ml of *water*, adjusted to pH 11 with *strong ammonia solution* and add 10.0 ml of *0.1 M barium chloride* and 0.5 mg of *metalphthalein*. Titrate the excess of barium chloride with *0.1 M disodium edetate*, adding 50 ml of *ethanol (95 per cent)* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of sulphate, SO_4.

Colorimetric test. Dissolve 0.1 g in sufficient *water* to produce 100 ml. To 5 ml, add 5 ml of *0.2 M sodium hydroxide* and heat in a water-bath for exactly 10 minutes. Cool in ice for exactly 5 minutes, add 3 ml of a 1.5 per cent w/v solution of *ferric ammonium sulphate* in *0.25 M sulphuric acid* and sufficient *water* to produce 25 ml and mix. Exactly 20 minutes after the addition of the *ferric ammonium sulphate solution*, measure the absorbance of a 2-cm layer of the solution at the maximum at about 525 nm (2.4.7), using as the blank a solution prepared in the same manner but omitting the substance under examination. The absorbance is not less than 90.0 per cent of that obtained by carrying out the procedure at the same time and in the same manner using *streptomycin sulphate IPRS* in place of the substance under examination, each absorbance being calculated on the dried basis.

Streptomycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *toluene*, 25 volumes of *glacial acetic acid* and 25 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 5 ml of a freshly prepared mixture of 97 volumes of *methanol* and 3 volumes of *sulphuric acid*, heat under a reflux condenser for 1 hour, cool, wash down the condenser with *methanol* and add sufficient *methanol* to produce 20 ml.

Reference solution. Dissolve 36 mg of *D-mannose* in 5 ml of a freshly prepared mixture of 97 volumes of *methanol* and 3 volumes of *sulphuric acid*, heat under a reflux condenser for 1 hour, cool, wash down the condenser with *methanol* and add sufficient *methanol* to produce 50 ml. Dilute 5 ml of the resulting solution to 50 ml with *methanol*; this solution contains the equivalent of 0.03 per cent w/v of streptomycin B (1 mg of D-mannose is equivalent to 4.13 mg of streptomycin B).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 13 to 15 cm. Dry the plate in air, and spray with a

https://nhathuocngocanh.com/

freshly prepared mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and a 20 per cent v/v solution of *sulphuric acid* and heat at 110° for 5 minutes. Any spot in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram with the reference solution.

Methanol. Determine by gas chromatography (2.4.13).

Test solution. A 4 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.012 per cent w/v solution of *methanol* in *water*.

Chromatographic system

- a glass column 1.5 to 2.0 m × 2 to 4 mm, packed with ethylvinylbenzene-divinylbenzene copolymer (150 to 180 µm) porous polymer beads (Such as Porapak Q),
- temperature: column 120° to 140°,
  inlet port and detector at least 50° higher than that of the column,
- flow rate: 30 to 40 ml per minute, using nitrogen as the carrier gas.

The area of any peak corresponding to methanol in the chromatogram obtained with the test solution is not more than that of the peak in the chromatogram obtained with reference solution (0.3 per cent).

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.1 kPa for 24 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the results in µg of streptomycin per mg.

Streptomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of streptomycin.

Streptomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the equivalent weight of streptomycin contained in it; (2) whether or not the contents are intended for use in the manufacture of parenteral preparations; (3) the name and quantity of any added stabiliser.

Streptomycin Injection

Streptomycin Sulphate Injection

Streptomycin Injection is a sterile material consisting of Streptomycin Sulphate with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Streptomycin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of streptomycin, $C_{21}H_{39}N_7O_{12}$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. The equivalent of 750 mg and 1 g of streptomycin.

Description. A white or almost white powder which yields a clear, colourless or faintly yellow coloured solution when dissolved in water.

Identification

A. Determine by thin-layer chromatography (2.4.17). Prepare the plate by mixing 0.3 g of *carbomer* with 240 ml of *water*, allowing to stand with moderate stirring for 1 hour, adjusted to pH 7.0 by the gradual addition with constant shaking of 2 *M sodium hydroxide* and adding 30 g of *silica gel H*. Spread a uniform layer of the resulting suspension 0.75 mm thick. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v of *streptomycin sulphate IPRS* in *water*.

https://nhathuocngocanh.com/

Reference solution (b). A solution containing 0.1 per cent w/v of *streptomycin sulphate IPRS*, 0.1 per cent w/v of *neomycin sulphate IPRS* and 0.1 per cent w/v of *kanamycin monosulphate IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and *sulphuric acid (45 per cent)* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 5 to 10 mg in 4 ml of *water* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 minutes. Add a slight excess of *2 M hydrochloric acid* and 0.1 ml of a 10 per cent w/v solution of *ferric chloride*; a violet colour is produced.

C. Dissolve 0.1 g in 2 ml of *water* and add 1 ml of *dilute 1-naphthol solution* and 2 ml of a mixture of equal volumes of *dilute sodium hypochlorite solution* and *water*; a red colour is produced.

D. Dissolve 10 mg in 5 ml of water and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 minutes. Add 2 ml of a 0.5 per cent w/v solution of *1-naphthol* in *1 M sodium hydroxide* and heat in a water-bath for 1 minute; a faint yellow colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in a 25.0 per cent w/v solution.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.1 kPa for 24 hours.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine on the mixed contents of ten containers by the microbiological assay of antibiotics, Method A or B (2.2.10).

Bacterial endotoxins (2.2.3): Not more than 0.25 Endotoxin Unit per mg of streptomycin.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of streptomycin.

Streptomycin Tablets

Streptomycin Sulphate Tablets

Streptomycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of streptomycin, $C_{21}H_{39}N_7O_{12}$.

Usual strength. The equivalent of 500 mg of streptomycin.

Identification

A. Triturate a quantity of the powdered tablets containing 0.2 g of streptomycin in a mixture of 2 ml of *methanol* and 0.1 ml of *sulphuric acid*, filter, if necessary, and allow to stand at about 25°; crystals of streptidine sulphate separate in the course of 2 to 3 days. Dissolve the crystals in a solution of 0.1 g of *picric acid* in 10 ml of hot *water* and cool; the precipitate, after recrystallisation from hot *water*, melts at about 283° (2.4.21).

B. Boil a small quantity of the powdered tablets containing 0.1 g of streptomycin with 5 ml of *1 M sodium hydroxide* for a few minutes, add a slight excess of *2 M hydrochloric acid* and 0.15 ml of a 10 per cent w/v solution of *ferric chloride*; a brilliant violet colour is produced.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.3 g of streptomycin and, triturate with 20 ml of *buffer solution pH 8.0*. Dilute to 100.0 ml with *water*.

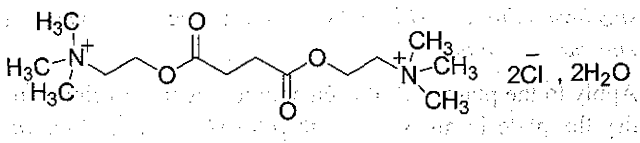
Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of streptomycin.

Succinylcholine Chloride

Suxamethonium Chloride



$C_{14}H_{30}Cl_2N_2O_4,2H_2O$ Mol. Wt. 397.3

Succinylcholine Chloride is 2,2'-succinyldioxybis(ethyltrimethylammonium) dichloride dihydrate.

Succinylcholine Chloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{14}H_{30}Cl_2N_2O_4$, calculated on the anhydrous basis.

Category. Depolarising skeletal muscle relaxant.

Description. A white or almost white, crystalline powder; hygroscopic.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *succinylcholine chloride IPRS* or with the reference spectrum of succinylcholine chloride.

B. Dissolve about 25 mg in 1 ml of *water*, add 0.1 ml of a 1 per cent w/v solution of *cobalt chloride* and 0.1 ml of *potassium ferrocyanide solution*; a green colour is produced.

C. Dissolve 1 g in sufficient *carbon dioxide-free water* to produce 20 ml. To 1 ml of the solution add 9 ml of *water*, 10 ml of *1 M sulphuric acid* and 30 ml of *ammonium reineckate solution*; a pink precipitate is produced. Allow to stand for 30 minutes, filter and wash with *water*, then with *ethanol (95 per cent)* and finally with *ether*. The residue, after drying at 80° melts at 180° to 185° (2.4.21).

D. It gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1). 4 ml of solution A diluted to 10 ml with *water* is colourless (2.4.1).

pH (2,4,24). 4.0 to 5.0, determined in a 0.5 per cent w/v solution.

Choline chloride. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose*.

Mobile phase. A mixture of 50 volumes of *1-butanol*, 40 volumes of *water* and 10 volumes of *anhydrous formic acid*, shake for 10 minutes, allow to separate. Use the upper layer as the mobile phase.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A solution containing 4 per cent w/v of *succinylcholine chloride IPRS* and 0.02 per cent w/v of *choline chloride* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot due to choline chloride in the chromatogram obtained with the reference solution. The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 8.0 to 10.0 per cent, determined on 0.3 g.

Assay. Dissolve 0.3 g in 30 ml of *anhydrous glacial acetic acid*, add 30 ml of *acetic anhydride* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a bluish green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01807 g of $C_{14}H_{30}Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Succinylcholine Injection

Suxamethonium Chloride Injection

Succinylcholine Injection is a sterile solution of Succinylcholine Chloride in Water for Injections.

Succinylcholine Injection contains not less than 90.0 per cent and not more than 107.5 per cent of the stated amount of succinylcholine chloride, $C_{14}H_{30}Cl_2N_2O_4,2H_2O$.

Usual strength. 50 mg per ml.

Identification

Dilute a volume containing 20 mg of Succinylcholine Chloride to 50 ml with *water*. To 0.5 ml add 2 ml of *chloroform*, 2 ml of a solution containing 0.16 per cent w/v of *citric acid* and 6.6 per cent w/v of *disodium hydrogen phosphate* and 0.1 ml of a solution containing 0.15 per cent w/v of each of *bromothymol blue* and *anhydrous sodium carbonate*. Shake for 2 minutes and allow to separate. The chloroform layer is yellow.

Tests

pH (2.4.28). 3.0 to 5.0.

Hydrolysis products. The volume of *0.1 M sodium hydroxide* required for the preliminary neutralisation in the Assay is not more than one tenth of the total volume of *0.1 M sodium hydroxide* required for the preliminary neutralisation and the hydrolysis.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of succinylcholine chloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing about 0.25 g of Succinylcholine Chloride add 30 ml of *carbon dioxide-free water* and shake with five quantities, each of 25 ml, of *ether*. Wash the combined ether solutions with two quantities, each of 10 ml, of *water* and discard the ether. Shake the combined washings with two quantities, each of 10 ml, of *ether*, add the washings to the original aqueous solution and neutralise with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Add 25.0 ml of *0.1 M sodium hydroxide*, heat

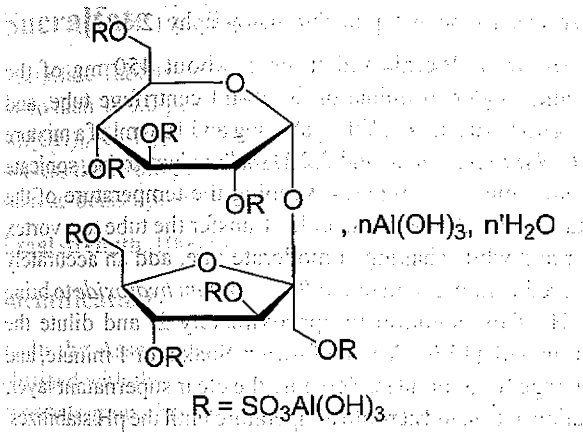
https://nhathuocngocanh.com/

under a reflux condenser for 40 minutes, allow to cool and titrate the excess of alkali with *0.1 M hydrochloric acid* using *bromothymol blue solution* as indicator. Repeat the operation using 40 ml of *carbon dioxide-free water* beginning at the words "Add 25.0 ml of *0.1 M sodium hydroxide*.....". The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01987 g of $C_{14}H_{30}Cl_2N_2O_4,2H_2O$.

Storage. Store protected from light, at a temperature between 2° to 8°. The injection should not be allowed to freeze.

Sucralfate



Sucralfate is $Al_8(OH)_{16}(C_{12}H_{14}O_{35}S_8)[Al(OH)_3]_n[H_2O]_{n'}$ in which n = 8 to 10, and n' = 22 to 31. α-D-Glucopyranoside, β-D-fructofuranosyl-, octakis (hydrogensulphate), aluminium complex.

Sucralfate is the hydrous basic aluminium salt of sucrose octasulfate. It contains the equivalent of not less than 30.0 per cent and not more than 38.0 per cent of sucrose octasulfate, $C_{12}H_{14}O_{35}S_8$.

Category. Antiulcer.

Description. A white or almost white, amorphous powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Dissolve 500 mg of the substance under examination in 100.0 ml of *0.1 M hydrochloric acid*, and boil the mixture gently, with stirring, for 20 minutes until the sample is completely dissolved. Neutralize with *0.1 M sodium hydroxide*, and allow to cool. Add 4 ml of *alkaline cupric tartrate solution*. Boil a small amount of the solution: a red copious precipitate of cuprous oxide is produced.

C. A solution in *3 M hydrochloric acid* gives the reactions of aluminium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *1 M sulphuric acid* is clear and colourless (2.4.1).

Neutralising capacity. Weigh and transfer 0.25 g of the substance under examination in 250 ml screw-capped bottle, add 100.0 ml of *0.1 M hydrochloric acid* previously heated to 37°, cap the bottle and place in water-bath, maintaining the temperature at 37° in water-bath, and stir continuously for 1 hour. Cool to room temperature and transfer 20.0 ml of this resulting solution to a 100-ml beaker add 30 ml of *water* and titrate with *0.1 M sodium hydroxide* to a pH of 3.5. Carry out a blank titration using a mixture of 30 ml of *water* and 20.0 ml of *0.1 M hydrochloric acid*.

Calculate the mEq of acid consumed per g of sucralfate taken by the formula:

$$\frac{5M(V_B - V_T)}{W}$$

Where M is the exact molarity of the *0.1 M sodium hydroxide*, V_B and V_T are the volumes, in ml of *0.1 M sodium hydroxide* consumed by the blank and the test solution, respectively; and W is the weight, in g, of sample taken.

Not less than 12.0 mEq of *acid* is consumed.

Chloride (2.3.12). Transfer 0.5 g to a 100.0 ml volumetric flask, add 30 ml of *2 M nitric acid*, dissolve and dilute to volume with *water*. 10.0 ml of the solution complies with the limit test for chlorides (0.5 per cent).

Arsenic (2.3.10). Dissolve 2.5 g in 15 ml of *brominated hydrochloric acid*, add 45 ml of *water* and remove excess of *bromine* with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit for arsenic (4 ppm).

Pyridine and 2-methylpyridine. Not more than 0.05 per cent each of pyridine and 2-methylpyridine, determine by gas chromatography (2.4.13).

Internal standard solution. Dilute 1.0 ml of *3-methylpyridine* into a 50.0 ml volumetric flask with *chloroform* and mix. Further dilute 1.0 ml of the solution to 50.0 ml with *chloroform*.

Test solution. Disperse 1.0 g of the substance under examination in 10.0 ml of *1 M sodium hydroxide* with the aid of ultrasound until a uniformly cloudy mixture is obtained, extract

https://nhathuocngocanh.com/

with three 5 ml quantities of *chloroform* and collect the chloroform layer in 20.0 ml volumetric flask, add 1.0 ml of internal standard solution , dilute to volume with *chloroform* and mix.

Reference solution (a). Weigh and dissolve 0.5 g of each of, *2-methylpyridine* and *pyridine* in sufficient *chloroform* to produce 50.0 ml. Dilute 5.0 ml of the solution to 50.0 ml with *chloroform*. Further dilute 5.0 ml of this resulting solution to 50.0 ml with *chloroform* and mix.

Reference solution (b). Dilute 5.0 ml of reference solution (a), add 1.0 ml of internal standard solution to 20.0 ml with *chloroform*.

Chromatographic system
- a capillary column 10 m x 0.53 mm, coated with 5 per cent phenyl and 95 per cent methylpolysiloxane (film thickness 2.65 µm),
- column temperature: 50°,
- injection port at 150° and detector at 200°,
- flame ionization detector,
- pressure: 0.7 psi using helium or nitrogen as carrier gas
- injection volume: 1 µl.

Inject reference solution (b). The relative retention times for pyridine, 2-methylpyridine and 3-methylpyridine are about 0.42, 0.72 and 1.0 respectively. The test is not valid unless the resolution between the peaks due to pyridine and 2-methylpyridine is not less than 3.5 and for the peaks due to 2-methylpyridine and 3-methylpyridine is not less than 2.5. The relative standard deviation for the ratio of the area of analyte peak to internal standard for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. Calculate the content of pyridine and 2-methylpyridine from the peak response ratios of pyridine to the internal standard and 2-methylpyridine to internal standard obtained with reference solution (b) and the test solution respectively.

Calculate the content of pyridine and 2-methylpyridine.

Sucrose Heptasulphate: Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Mobile phase. A buffer solution prepared by dissolving 99.1 g of *ammonium sulphate* in 900 ml of *water*, dilute to 1000 ml with *water* and adjusted to pH 3.5 with *orthophosphoric acid.*

Inject the test solution. The relative retention time for sucrose heptasulphate and sucrose octasulfate is 0.6 and 1.0 respectively. The ratio of the peak response of the sucrose heptasulphate peak to that of the sucrose octasulfate peak is not more than 0.1.

Aluminum: 15.5 to 18.5 per cent of aluminium calculated on as is basis and determined by the following method.

Dissolve about 1.0 g of the substance under examination accurately weighed in a 250.0 ml volumetric flask, add 10 ml of *6.0 M hydrochloric acid*, mix, and heat with continuous stirring in a water-bath at 70° for 5 minutes. Cool to room temperature, dilute to volume with *water* and mix. Filter the solution, discarding the first portion of the filtrate. Transfer 25.0 ml of the filtrate to a 250-ml beaker, add 25.0 ml of *0.05 M disodium edetate disodium*, add 20 ml of *acetic acid-ammonium acetate buffer* and mix. Heat in a water-bath at 70° for 5 minutes. Cool to room temperature add 50 ml of *ethanol (95 per cent)* and 2 ml of *dithizone solution* and mix. Titrate with *0.05 M zinc sulphate* to a bright rose-pink colour. Carry out a blank titration.

1 ml of 0.05 M *disodium edetate* is equivalent to 0.001349 g of aluminium.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and transfer about 450 mg of the substance under examination in 50-ml centrifuge tube, and shake on a vortex mixer. While shaking add 10.0 ml of a mixture of *2.0 M sulphuric acid* and *2.2 M sodium hydroxide*, sonicate with swirling for 5 minutes, keeping the temperature of the mixture below 30°. Without delay transfer the tube to a vortex mixer and while shaking at moderate rate, add an accurately measured volume, V, in ml, of *0.1 M sodium hydroxide* to bring the pH of the solution to approximately 2, and dilute the solution with (15.0 – V) ml of *water*. Shake for 1 minute, and centrifuge for 5 minutes. Separate the clear supernatant layer, and allow it to stand at room temperature until the pH stabilizes. If the pH is not between 2.3 and 3.5, repeat the test using a different volume of *0.1 M sodium hydroxide*.

Reference solution. A 1.0 per cent w/v solution of *anhydrous potassium sucrose octasulphate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with aminopropylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 132 g of *ammonium sulphate* in 900 ml of *water*, dilute to 1000 ml with *water* and adjusted to pH 3.5 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- refractive index detector maintained at 30°,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency due to sucrose octasulfate peak is not less than 400 theoretical plates, the tailing factor is not more than 4.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{14}O_{35}S_8$ as

$$\frac{974.75}{1287.53} \times 25C \times \frac{r_u}{r_s}$$

where 974.75 and 1287.53 are the molecular weight of sucrose octasulfate and anhydrous potassium sucrose octasulfate, respectively, C is the concentration in mg per ml of anhydrous potassium sucrose octasulfate in reference solution and r_u and r_s are the peak responses of sucrose octasulfate obtained from the test solution and the reference solution respectively.

1 mg of *anhydrous potassium sucrose octasulfate* is equivalent to 0.757 mg of sucrose octasulfate.

Storage. Store protected from moisture.

Sucralfate Tablets

Sucralfate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sucralfate, $Al_8(OH)_{16}(C_{12}H_{14}O_{35}S_8)[Al(OH)_3]_n[H_2O]_n$) corresponding to not less than 30.6 per cent and not more than 37.4 per cent of sucrose octasulphate, $C_{12}H_{14}O_{35}S_8$.

Usual strength. 1000 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Dissolve 1.0 g of sucralfate in *3 M hydrochloric acid*. The resulting solution gives the reactions of aluminium salts (2.3.1).

Tests

Neutralising Capacity. Weigh and powder 20 tablets. Transfer 0.25 g of the powder in a 250 ml screw-capped bottle, add 100.0 ml of *0.1 M hydrochloric acid* previously heated to 37°, cap the bottle, and place in water-bath, maintaining the temperature at 37°, and stir continuously for 1 hour. Cool to room temperature and transfer 20.0 ml of this resulting solution to a 100-ml beaker add 30 ml of *water* and titrate with *0.1 M sodium hydroxide* to pH 3.5. Carry out a blank titration using a mixture of 30 volumes of *water* and 20 volumes of *0.1 M hydrochloric acid*.

Calculate the mEq of acid consumed per g of Sucralfate calculated by the formula:

$$\frac{5M(V_B - V_T)}{W}$$

Where M is the exact molarity of the *sodium hydroxide* VS, V_B and V_T are the volumes, in ml of *sodium hydroxide* consumed by the blank and the test solution, respectively; and W is the weight, in g , of equivalent amount of sample taken.

Not less than 12.0 mEq of *acid* is consumed.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 450 mg of Sucralfate in 35-ml centrifuge tube, and shake on a vortex mixer. While shaking add 10.0 ml of a mixture of *2.0 M sulphuric acid* and *2.2 M sodium hydroxide* Sonicate with swirling for 5 minutes, keeping the temperature of mixture below 30°. Without delay transfer the tube to a vortex mixer and while shaking at moderate rate, add an accurately measured volume, V, in ml, of *0.1M sodium hydroxide* to bring the pH of the solution to approximately 2, and dilute the solution with (15.0 – V) ml of *water*. Shake for 1 minute, and centrifuge for 5 minutes. Separate the clear supernatant layer, and allow to stand at room temperature until the pH stabilizes. If the pH is not between 2.3 and 3.5, repeat the test using a different volume of *0.1 M sodium hydroxide.*

Reference solution. A 1.0 per cent w/v solution of *anhydrous potassium sucrose octasulfate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with aminopropylsilane bounded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 132 g of *ammonium sulphate* in 900 ml of *water*, dilute to 1000 ml with *water* and adjusted to pH 3.5 with *orthophosphoric acid.*
- flow rate: 1 ml per minute,
- refractive index detector maintained at 30°,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency due to sucrose octasulphate peak is not less than 400 theoretical plates, the tailing factor is not more than 4.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{14}O_{35}S_8$ in the of tablets as,

$$\frac{974.75}{1287.53} \times 25C \times \frac{r_u}{r_s}$$

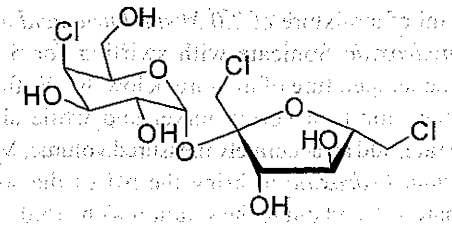
where 974.75 and 1287.53 are the molecular weight of sucrose octasulphate and anhydrous potassium sucrose octasulphate, respectively, C is the concentration in mg per ml of anhydrous potassium sucrose octasulphate in reference solution and r_u and r_s are the peak responses of sucrose octasulphate obtained from the test solution and the reference solution respectively.

https://nhathuocngocanh.com/

1 mg of *anhydrous potassium sucrose octasulfate* is equivalent to 0.757 mg of sucrose octasulfate.

Storage. Store protected from moisture.

Sucralose



$C_{12}H_{19}Cl_3O_8$ Mol. Wt. 397.6

Sucralose is 1,6-dichloro-1,6-dideoxy-β-D-fructofuranosyl-4-chloro-4-deoxy-α-D-galactopyranoside.

Sucralose contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{19}Cl_3O_8$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (sweetening vehicle).

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sucralose IPRS* or with the reference spectrum of sucralose.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +84.0° to +87.5°, determined at 20° in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with octadecylsilanized silica gel.

Mobile phase. A mixture of 70 volumes of 5 per cent w/v solution of *sodium chloride* and 30 volumes of *acetonitrile*.

Test solution. Dissolve about 1.0 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *sucralose IPRS* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray the plate with 15 per cent w/v solution of *sulphuric acid* in *methanol*. Heat the plate at 125° for 10 minutes. The R_f value of the principal spot obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Hydrolysis products. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel.

NOTE—This test does not require a developing solvent.

Test solution. Dissolve about 2.5 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 10.0 per cent w/v solution of *mannitol* in *water*.

Reference solution (b). A solution containing 0.04 per cent w/v of *fructose* and 10 per cent w/v of *mannitol* in *water*.

Apply to the plate 5 µl of each solution. Spray with a solution containing 1.23 g of *p-anisidine* and 1.66 g of *phthalic acid* in 100 ml of *methanol*, heat the plate at 105° for 15 minutes. If the spot from reference solution (a) has darkened, repeat the test, heating for a shorter period of time. Immediately after heating, view the plate against a dark background: the color of the spot obtained from the test solution is not more intense than that obtained from reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.7 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 250 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *sucralose IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *water* and 15 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- refractive index detector
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 per cent.

https://nhathuocngocanh.com/

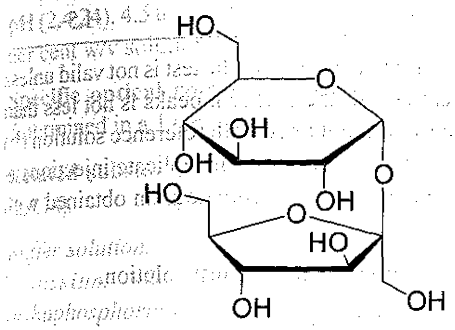
Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{19}Cl_3O_8$.

Storage. Store protected from moisture, at a temperature not exceeding 21°.

Sucrose

Refined Sugar



$C_{12}H_{22}O_{11}$ Mol. Wt. 342.3

Sucrose is β-D-fructofuranosyl α-D-glucopyranoside.

Category. Pharmaceutical aid (sweetening agent; tablet excipient).

Description. An almost white or colourless crystals, dry crystalline powder.

Identification

Dissolve 150.0 g in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 300 ml (solution A). Dilute 1 ml of solution A to 100 ml with *water*. To 5 ml of the solution add 2 ml of freshly prepared *2 M sodium hydroxide* and 0.15 ml of a freshly prepared *copper sulphate solution*; the solution is clear and blue and remains so on boiling. To the hot solution add 4 ml of *2 M hydrochloric acid*, heat to boiling and add 4 ml of *2 M sodium hydroxide*; an orange precipitate is produced immediately.

Tests

Acidity or alkalinity. To 10 ml of solution A add 0.3 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). +65.9° to +67.0°, determined in a 10 per cent w/v solution.

Barium. To 10 ml of solution A add 1 ml of *1 M sulphuric acid*. When examined immediately and after 1 hour any opalescence is not more intense than that of a mixture of 1 ml of *distilled water* and 10 ml of solution A.

Calcium. To 1 ml of solution A add 9 ml of *water* and 1 ml of *ammonium oxalate solution*; the solution remains clear for at least 1 minute.

Heavy metals (2.3.13). Add 0.1 ml of *dilute hydrochloric acid* to 4 ml of solution A and dilute with sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Sulphites. To 4 ml of solution A add sufficient *water* to produce 20 ml, add 0.05 ml of *0.1 M iodine* and 0.05 ml of *starch solution*; a blue colour develops.

Dextrins. To 2 ml of solution A add 8 ml of *water*, 0.05 ml of *2 M hydrochloric acid* and 0.05 ml of *0.05 M iodine*; the solution remains yellow or becomes faint bluish green.

Glucose and invert sugar. Dissolve 50 g in *water* and dilute to 100.0 ml with the same solvent. To 5.0 ml of the solution in a test-tube about 150 mm long and 16 mm in diameter add 5 ml of *water*, 1.0 ml of *1 M sodium hydroxide* and 1.0 ml of a 0.1 per cent solution of *methylene blue*. Mix and place in a water-bath. After exactly 2 minutes, take the tube out of the bath and examine the solution immediately. The blue colour does not disappear completely. Ignore any blue colour at the air/solution interface.

Colouring matter. A. To 100 ml of solution A in a ground-glass-stoppered tube add 1 ml of *dilute hypophosphorous acid* and allow to stand for 1 hour; no unpleasant odour is detectable.

B. Examine solution A under ultraviolet light at 365 nm. Any fluorescence is not more intense than that of a solution containing 0.4 µg per ml of *quinine sulphate* in *0.005 M sulphuric acid*.

Sulphated ash (2.3.18). Not more than 0.1 per cent determined by dissolving 5.0 g in 5 ml of *water*, adding 2 ml of *sulphuric acid*, evaporating to dryness and igniting to constant weight.

Sucrose intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin unit per mg of Sucrose.

Storage. Store protected from light and moisture.

Sugar Spheres

Sugar Spheres contain not less than 62.5 per cent and not more than 91.5 per cent of sucrose, $C_{12}H_{22}O_{11}$, calculated on the dried basis, the remainder consisting mainly of starch. They consist of approximately spherical particles of a labeled

https://nhathuocngocanh.com/

nominal size range. They may contain colour additives permitted for use in drugs.

Category. Pharmaceutical aid.

Description. Hard, brittle, free flowing, spherical masses ranging generally in size from 10 to 60 mesh. Usually white, but may be coloured.

Identification

A. A 10 per cent w/v solution produce a violet to deep blue colour on addition of *iodine*.

B. Specific optical rotation (see Test).

Tests

Particle size distribution estimation (2.5.7). Not less than 90 per cent of it passes the coarser sieve size stated in the labeling; all of it passes the next coarser sieve size listed in Table 1 of the chapter; and not more than 10 per cent passes the finer sieve size stated on the label.

Specific optical rotation (2.4.22). + 41.0° to + 61.0°, determined in a 10 per cent w/v solution prepared by dissolving 20 g in 160 ml of *water* and dilute to 200.0 ml with *water*. Pass the solubilised sucrose solution by vacuum filtration through fine filter paper.

Sulphated ash (2.3.18). Not more than 0.25 per cent, determined on 2.0 g at a temperature of about 700°.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 100 CFU per g. 1 g is free from *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa*. 10 g is free from *Salmonella*.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1.0 g of Sugar Spheres in 20 ml of *water* and dilute to 50.0 ml with *water*.

Reference solution (a). A 2.0 per cent w/v solution of *sucrose IPRS* in *water*.

Reference solution (b). A solution containing 2.0 per cent w/v of *sucrose IPRS*, 0.1 per cent w/v of *dextrose IPRS*, 0.06 per cent w/v of *fructose IPRS*, 0.06 per cent w/v of *maltose monohydrate IPRS*, and 0.08 per cent w/v of *anhydrous lactose IPRS* in *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with amino propylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 80 volumes of *acetonitrile* and 20 volumes of *water*,
- flow rate: 2 ml per minute,
- refractive index detector at 40°,
- injection volume: 15 µl.

Name	Relative retention time
Fructose	0.5
Dextrose (glucose)	0.6
Sucrose	1.0
Maltose	1.3
Lactose	1.5

Inject reference solution (a) and (b). The test is not valid unless the resolution between all the adjacent peaks is not less than 1.3 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent the chromatogram obtained with reference solution (a).

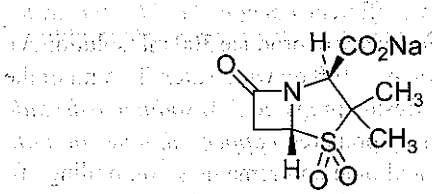
Inject reference solution (a) and the test solution.

Calculate the content of $C_{12}H_{22}O_{11}$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the nominal particle size range. Label it to indicate the name and amount of any added color additives.

Sulbactam Sodium



$C_8H_{10}NNaO_5S$ Mol. Wt. 255.2

Sulbactam Sodium is (2*S*,5*R*)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate 4,4-dioxide.

Sulbactam Sodium contains not less than 97.0 per cent and not more than 102.0 per cent of $C_8H_{10}NNaO_5S$, calculated on the anhydrous basis.

Category. β-lactamase inhibitor.

Description. A white or almost white, hygroscopic, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulbactam*

https://nhathuocngocanh.com/

sodium IPRS or with the reference spectrum of sulbactam sodium.

B. It gives reaction (A) of sodium (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution is clear (2.4.1).

Light absorption (2.4.7). Absorbance of 1.0 per cent w/v solution at 430 nm is not more than 0.1.

pH (2.4.24). 4.5 to 7.2, if the substance is sterile: 5.2 to 7.2, of 5 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). + 219.0° to + 233.0°, determined in a 1 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.27 per cent w/v solution of *monobasic potassium phosphate*, adjusted to pH 4.0 with *orthophosphoric acid*.

Solvent mixture. 98 volumes of the buffer solution and 2 volumes of *acetonitrile*.

NOTE — Protect the solution from light.

Test solution. Dissolve 77 mg of the substance under examination in 2 ml of *acetonitrile* and dilute to 100.0 ml with the buffer solution.

Reference solution (a). Dissolve 70 mg of *sulbactam IPRS* in 2 ml of *acetonitrile* and dilute to 100.0 ml with the buffer solution.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.007 per cent w/v each of *sulbactam related substance A IPRS, sulbactam related substance D IPRS, sulbactam related substance E IPRS* and *sulbactam related substance F IPRS* in *acetonitrile*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a 0.54 per cent w/v solution of *monobasic potassium phosphate*, adjusted to pH 4.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
7.5	50	50
8.5	50	50
9.0	98	2
13	98	2

Name	Relative retention time	Correction factor
Sulbactam related compound A[1]	0.4	0.59
Amoxicillin related compound A[2]	0.6	0.50
Sulbactam	1.0	—
6-Bromopenicillanic acid sulfone[3]	1.6	—

[1]3-Sulfino-D-valine; (2*S*)-2-Amino-3-methyl-3-sulfinobutanoic acid,

[2]6-Aminopenicillanic acid; (2*S*,5*R*,6*R*)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,

[3](2*S*,5*R*,6*R*)-6-Bromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid 4,4-dioxide,

[4]6-Bromopenicillanic acid; (2*S*,5*R*,6*R*)-6-Bromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,

[5]6,6-Dibromopenicillanic acid sulfone; (2*S*,5*R*)-6,6-Dibromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid 4,4-dioxide,

[6]6,6-Dibromopenicillanic acid; (2*S*,5*R*)-6,6-Dibromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

Inject reference solution (b) and (c). The test is not valid unless the resolution between sulbactam related compound D and sulbactam related compound E peaks is not less than 1.5 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to sulbactam related compound A is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to 6-bromopenicillanic acid sulfone and sulbactam related compound E, each of is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak corresponding to amoxicillin related compound A, sulbactam related compound D and sulbactam related compound F, each of is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per

https://nhathuocngocanh.com/

cent) and the sum of areas of all peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

2-Ethylhexanoic acid (2.3.51). Not more than 0.5 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a) and the test solution.

1 mg of sulbactam is equivalent to 1.094 mg of $C_8H_{10}NNaO_5S$.

Calculate the content of $C_8H_{10}NNaO_5S$.

Sulbactam Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

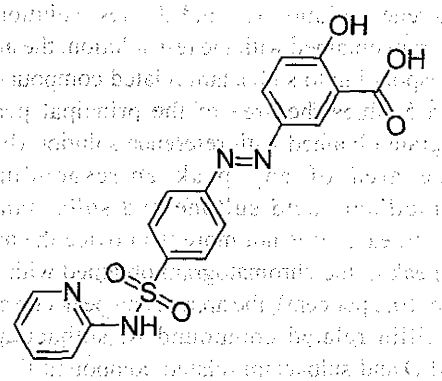
Bacterial endotoxins (2.2.3). Not more than 0.17 Endotoxin Units per mg of sulbactam sodium.

Sulbactam Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture. If the substance is sterile, store in a sterile, moisture free container.

Sulfasalazine



$C_{18}H_{14}N_4O_5S$ Mol. Wt. 398.4

Sulfasalazine is 2-hydroxy-5-[2-[4-(pyridin-2-ylsulfamoyl) phenyl]diazenyl]benzoic acid.

Sulfasalazine contains not less than 97.0 per cent and not more than 101.5 per cent of $C_{18}H_{14}N_4O_5S$, calculated on the dried basis.

Category. Disease-modifying antirheumatic drug (DMARD)

Description. A bright yellow or brownish-yellow, fine powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulfasalazine IPRS* or with the reference spectrum of sulfasalazine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *dilute ammonia* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *dilute ammonia*.

Reference solution (b). Dissolve 1 mg of *sulfasalazine derivative for resolution IPRS* in 10.0 ml of reference solution (a). Dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.13 g of *sodium dihydrogen phosphate* and 2.5 g of *sodium acetate* in 900 ml of *water* ; adjusted to pH 4.8 with *glacial acetic acid* and dilute to 1000 ml with *water*,
  B. a mixture of 80 volumes of *methanol* and 20 volumes of mobile phase A,
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 20 µl.

[1]4,4'-[(4-hydroxy-1,3-phenylene)bis(diazenediyl)]bis[*N*-(pyridin-2-yl)benzenesulfonamide],

[2]2-hydroxy-3,5-bis[2-[4-(pyridin-2-ylsulfamoyl)phenyl]diazenyl]benzoic acid,

[3]2-hydroxy-5-[2-[4-(2-iminopyridin-1(2*H*)-yl)phenyl]diazenyl]benzoic acid,

[4]4-[2-(2-hydroxyphenyl)diazenyl]-*N*-(pyridin-2-yl) benzenesulfonamide,

[5]2-hydroxy-4'-(pyridin-2-ylsulfamoyl)-5-[2-[4-(pyridin-2-ylsulfamoyl)phenyl]diazenyl]biphenyl-3-carboxylic acid,

[6]2-hydroxy-3-[2-[4-(pyridin-2-ylsulfamoyl)phenyl]diazenyl]benzoic acid,

[7]5-[2-[4',5-bis(pyridin-2-ylsulfamoyl)biphenyl-2-yl]diazenyl]-2-hydroxybenzoic acid,

[8]2-hydroxybenzenecarboxylic acid (salicylic acid),

[9]2-hydroxy-5-[2-(4-sulfophenyl)diazenyl]benzoic acid.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sulfasalazine and its derivatives is not less than 3.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to impurities A, B, C, D, E, F, G and I is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent), and also ignore any peak with a retention time less than 6 minutes (due to impurities H and J).

Impurities H and J. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *dilute ammonia* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *salicylic acid* (impurity H) and 5 mg of *sulfapyridine IPRS* (H_2N-R: 4-amino-*N*-(pyridin-2-yl)benzenesulfonamide: impurity J) in *dilute ammonia* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *dilute ammonia*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of mobile phase B and 70 volumes of mobile phase A (as described under Related substances),
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sulfasalazine impurity H and sulfasalazine impurity J is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to impurities H and J is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). Shake 1.8 g with 30 ml of *water*, heat at about 70° for 5 minutes, cool and filter, add 1 ml of *nitric acid*, allow to stand for 5 minutes and filter, if necessary. The solution complies with the limit test for chlorides (140 ppm).

Sulphates (2.3.17). Shake 0.375 g with 30 ml of *water*, heat at about 70° for 5 minutes, cool and filter, add 1 ml of *dilute hydrochloric acid* and allow to stand for 5 minutes and filter, if necessary. The solution complies with the limit test for sulphates (400 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 150 mg in sufficient quantity of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *0.1 M sodium hydroxide*. Dilute 5.0 ml of the solution with 750 ml of *water* add 20 ml of *0.1 M acetic acid* and dilute to 1000.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 359 nm (2.4.7).

Calculate the content of $C_{18}H_{14}N_4O_5S$ from the absorbance obtained by repeating the operation using *sulfasalazine IPRS* in the place of the substance under examination.

https://nhathuocngocanh.com/

Sulfasalazine Gastro-resistant Tablets

Sulfasalazine Gastro-resistant Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulfasalazine, $C_{18}H_{14}N_4O_5S$. They are made gastro-resistant by enteric-coating or by any other means.

Usual strength. 500 mg.

Identification

A. To a quantity of the powdered tablets containing 0.2 g of Sulfasalazine, add 100 ml of *methanol*, shake thoroughly and filter. Evaporate the filtrate to dryness and dry at about 35° the resulting precipitate at a pressure of 2kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulfasalazine IPRS* or with the reference spectrum of sulfasalazine.

B. In the test of Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

A. Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0056 per cent w/v solution of *sulfasalazine IPRS* in *0.1M sodium hydroxide.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porus silica (5 µm),
- mobile phase: a mixture of 11 volumes of *isopropanol*, 7 volumes of *acetronitrile*, 22 volumes of *water* and 0.4 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{14}N_4O_5S$:

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 1 (Basket),
Medium. 900 ml of *phosphate buffer pH 7.5,*
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0056 per cent w/v solution of *sulfasalazine IPRS* in *0.1M sodium hydroxide.*

Use chromatographic system as described under test A.

Inject the reference solution. The test is not valid unless the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 85 per cent of the stated amount of $C_{18}H_{14}N_4O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of sulfasalazine with 100.0 ml of *0.1 M ammonia* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *0.1M ammonia.*

Reference solution (b). A solution containing 0.001per cent w/v of *sulfasalazine derivative for resolution IPRS* in reference solution (a).

Reference solution (c). A solution containing 0.001per cent w/v of *sulfasalazine IPRS* in *0.1M ammonia.*

Reference solution (d). Dilute 1 ml of reference solution (a) to 20 ml with *0.1M ammonia.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: A. a solution containing 0.013per cent w/v of *sodium dihydrogen orthophosphate* and 0.25per cent w/v of *sodium acetate* adjusted to pH 4.8 with *glacial acetic acid*,
  B. a mixture of 80 volumes of *methanol* and 20 volumes of mobile phase A,
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 20 µl.

[1]4,4'-[(4-hydroxy-1,3-phenylene)bis(diazenediyl)]bis[*N*-(pyridin-2-yl) benzenesulfonamide],

[2]2-hydroxy-3,5-bis[2-[4-(pyridin-2-ylsulfamoyl)phenyl]diazenyl] benzoic acid,

[3]2-hydroxy-5-[2-[4-(2-iminopyridin-1(2*H*)-yl)phenyl]diazenyl]benzoic acid,

[4]4-[2-(2-hydroxyphenyl)diazenyl]-*N*-(pyridin-2-yl) benzenesulfonamide,

[5]2-hydroxy-4,2'-(pyridin-2-ylsulfamoyl)-5'-[2-[4-(pyridin-2-yl sulfamoyl)phenyl]diazenyl]biphenyl-3-carboxylic acid,

[6]2-hydroxy-3-[2-[4-(pyridin-2-ylsulfamoyl)phenyl]diazenyl]benzoic acid,

[7]5-[2-[4,2'-bis(pyridin-2-ylsulfamoyl)biphenyl-2-yl]diazenyl]-2-hydroxybenzoic acid,

[8]2-hydroxybenzenecarboxylic acid (salicylic acid),

[9]2-hydroxy-5-[2-(4-sulfophenyl)diazenyl]benzoic acid.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sulfasalazine and its derivatives is not less than 3.0.

Inject reference solution (a), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent), and also ignore any peak with a retention time less than 6 minutes (due to impurities H and J).

Salicylic acid and Sulfapyridine. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of sulfasalazine with 100.0 ml of *0.1 M ammonia* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution. A solution containing 0.05 per cent w/v of *salicylic acid* and 0.05 per cent w/v of *sulfapyridine IPRS* (H_2N-R: 4-amino-*N*-(pyridin-2-yl)benzenesulfonamide) in *0.1 M ammonia*. Dilute 1.0 ml of the solution to 50.0 ml with *0.1M ammonia*.

Use chromatographic system as described under Related substances with the following modifications

– spectrophotometer set at 300 nm,

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
12	70	30
15	30	70
25	30	70
27	70	30
35	70	30

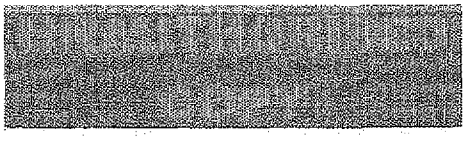
Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to salicylic acid and sulfapyridine is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to impurities salicylic acid and sulfapyridine is not more than 0.5 times the areas of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent of each).

Other tests. Comply with the tests stated under Tablets.

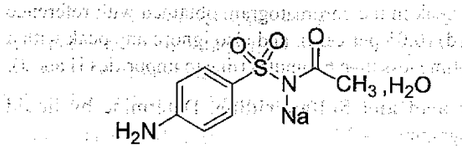
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 150 mg in 100.0 ml of *0.1 M sodium hydroxide*. Dilute 5.0 ml of the solution with 750 ml of *water* add 20 ml of *0.1 M acetic acid* and dilute to 1000.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 359 nm (2.4.7).

Calculate the content of $C_{18}H_{14}N_4O_5S$ from the absorbance obtained by repeating the operation using *sulfasalazine IPRS* in the place of the substance under examination.



https://nhathuocngocanh.com/

Sulphacetamide Sodium



$C_8H_9N_2NaO_3S,H_2O$ Mol. Wt. 254.2

Sulphacetamide Sodium is the monohydrate of the sodium salt of *N'*-acetylsulphanilamide.

Sulphacetamide Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_9N_2NaO_3S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or yellowish white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests B, C, D and E may be omitted if tests A and F are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphacetamide sodium IPRS* or with the reference spectrum of sulphacetamide sodium.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. Dissolve 1 g in 10 ml of *water*, add 6 ml of *2 M acetic acid* and filter. Wash the precipitate with a small volume of *water* and dry at 105° for 4 hours. The melting range of the precipitate is 181° to 185° (2.4.21).

D. Dissolve 0.1 g of the precipitate obtained in test C in 5 ml of *ethanol (95 per cent)*, add 0.2 ml of *sulphuric acid* and heat; ethyl acetate, recognizable by its odour, is produced.

E. Dissolve 1 mg of the precipitate obtained in test C in 5 ml of *water* with the aid of heat. The solution gives the reaction of primary aromatic amines (2.3.1), producing an orange-red precipitate.

F. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.28). 8.0 to 9.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 0.2 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg each of *sulphacetamide sodium IPRS* and *sulphanilamide* (sulphacetamide sodium impurity A) in 1.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm)
- mobile phase: a mixture of 1 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 89 volumes of *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to sulphacetamide for sulphacetamide impurity A is about 0.5.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to sulphacetamide impurity A and sulphacetamide is not less than 5.0.

Inject reference solution (b) and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to sulphacetamide impurity A, multiplied by correction factor of 0.5 is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphates (2.3.17). Dissolve 1.5 g in sufficient *distilled water* to produce 25 ml, add 25 ml of *2 M acetic acid*, shake for 30 minutes and filter. 25 ml of the filtrate complies with the limit test for sulphates (200 ppm).

Water (2.3.43). 6.0 to 8.0 per cent, determined on 0.2 g.

Assay. Dissolve 0.25 g in a mixture of 50 ml of *water* and 20 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02362 g of $C_8H_9N_2NaO_3S$.

Storage. Store protected from light and moisture.

Sulphacetamide Eye Drops

Sulphacetamide Sodium Eye Drops

Sulphacetamide Eye Drops are a sterile solution of Sulphacetamide Sodium in Purified Water. It may contain a suitable antimicrobial agent.

Sulphacetamide Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulphacetamide sodium, $C_8H_9N_2NaO_3S,H_2O$.

Usual strengths. 10 per cent w/v; 20 per cent w/v; 30 per cent w/v.

Identification

To a volume containing 0.5 g of Sulphacetamide Sodium add 6 ml of *5 M acetic acid*, stirring constantly. Filter the precipitate, wash with *water* and dry at 105° for 4 hours. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphacetamide sodium IPRS* treated in the same manner or with the reference spectrum of sulphacetamide.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. Dissolve 10 mg in 2 ml of *2 M hydrochloric acid*. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dilute the eye drops, if necessary, to contain 10.0 per cent w/v of Sulphacetamide Sodium. The solution is not more intensely coloured than reference solution BYS4 (2.4.1).

pH (2.4.24). 6.6 to 8.6.

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve a volume of solution containing about 0.2 g of Sulphacetamide Sodium in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg each of *sulphacetamide sodium IPRS* and *sulphanilamide* (sulphacetamide sodium impurity A) in 1.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm)
- mobile phase: a mixture of 1 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 89 volumes of *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to sulphacetamide impurity A and sulphacetamide is not less than 5.0. The relative retention time with reference to sulphacetamide for sulphacetamide impurity A is about 0.5.

Inject reference solution (b) and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to sulphacetamide impurity A, multiplied by correction factor of 0.5 is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. To a measured volume containing about 0.5 g of Sulphacetamide Sodium add 75 ml of *water* and 10 ml of *hydrochloric acid*. Add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

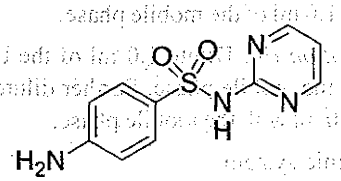
1 ml of *0.1 M sodium nitrite* is equivalent to 0.02542 g of $C_8H_9N_2NaO_3S,H_2O$.

Storage. Store protected from light and moisture. The Eye Drops should not be allowed to freeze.

Labelling. The label states (1) the name and concentration of any antimicrobial agent used; (2) that it is not meant for injection; (3) that the solution should be used within one month of opening the container; (4) that the solution should not be used if it is dark brown in colour; (5) that it should not be allowed to freeze.

https://nhathuocngocanh.com/

Sulphadiazine



$C_{10}H_{10}N_4O_2S$ Mol. Wt. 250.3

Sulphadiazine is *N*¹-(pyrimidin-2-yl)sulphanilamide.

Sulphadiazine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{10}N_4O_2S$, calculated on the dried basis.

Category. Antibacterial.

Description. White, yellowish white or pinkish white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadiazine IPRS* or with the reference spectrum of sulphadiazine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with the reference solution (c).

C. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml of the solution to 10 ml with *water*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

D. Heat 3 g in a test-tube inclined at an angle of 45° with the lower part immersed in a silicone oil-bath at about 270°. It decomposes and a white or yellowish white sublimate is produced. The sublimate, after recrystallisation from *toluene* and drying at 100° melts at 123° to 127° (2.4.21).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances (2.3.7). Complies with test C for Related substances in Sulphonamides (2.3.7), Method C.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.2 g, dissolve in a mixture of 20 ml of *2 M hydrochloric acid* and 50 ml of *water*. Add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.3).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02503 g of $C_{10}H_{10}N_4O_2S$.

Storage. Store protected from light and moisture.

Sulphadiazine Tablets

Sulphadiazine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulphadiazine, $C_{10}H_{10}N_4O_2S$.

Usual strength. 500 mg.

Identification

A. Triturate a quantity of the powdered tablets containing 0.5 g Sulphadiazine with two successive quantities, each of 5 ml, of *chloroform* and reject the chloroform. Triturate the residue with 10 ml of *dilute ammonia solution* for 5 minutes, add 10 ml of *water* and filter. Warm the filtrate until most of the ammonia has been expelled, cool and acidify with *acetic acid*. Collect the precipitate, wash with *water* and dry at about 100°; the residue melts at about 256°, with decomposition (2.4.21).

B. On the residue obtained in test A determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadiazine IPRS* or with the reference spectrum of sulphadiazine.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the sample and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 mm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same

https://nhathuocngocanh.com/

solvent. Dilute suitably with *0.01 M sodium hydroxide*. Measure the absorbances of the resulting solution and of a standard solution of *sulphadiazine IPRS* of similar concentration in the same medium at the maximum at about 254 nm (2.4.7).

Calculate the content of $C_{10}H_{10}N_4O_2S$ in the medium.

Q. Not less than 70.0 per cent of the stated amount of $C_{10}H_{10}N_4O_2S$.

Related substances (2.3.7). Complies with test C for Related substances in Sulphonamides (2.3.7), Method C, but using the following solutions.

Test solution (a). Extract a quantity of the powdered tablets containing 0.5 g of Sulphadiazine with 25 ml of a mixture of 90 volumes of *methanol* and 10 volumes of *strong ammonia solution* by shaking for 10 minutes, filter and use the filtrate.

Test solution (b). Dilute 1 volume of test solution (a) to 5 volumes with a mixture of 24 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (c). Dilute 1 volume of test solution (a) to 200 volumes with the same solvent mixture.

Reference solution. A 0.4 per cent w/v solution of *sulphadiazine IPRS* in the same solvent mixture.

Any secondary spot in the chromatogram obtained with the test solution (a) is not more intense that the spot obtained with test solution (c).

Other tests. Comply with the tests stated under Tablets.

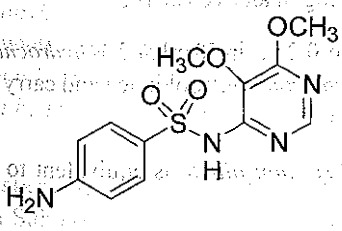
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.5 g of Sulphadiazine and dissolve as completely as possible in a mixture of 50 ml of *water* and 10 ml of *hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice. Carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02503 g of $C_{10}H_{10}N_4O_2S$.

Storage. Store protected from light and moisture.

Sulphadoxine

Sulphormethoxine; Sulphoethomidine



$C_{12}H_{14}N_4O_4S$ Mol. Wt. 310.3

Sulphadoxine is N^1-(5,6-dimethoxypyrimidin-4-yl) sulphanilamide.

Sulphadoxine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{14}N_4O_4S$, calculated on the dried basis.

Category. Antibacterial; antimalarial in combination with pyrimethamine.

Description. A white or yellowish white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadoxine IPRS* or with the reference spectrum of sulphadoxine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with the reference solution (c).

C. Dissolve 0.5 g in 1 ml of *sulphuric acid (40 per cent)*, heating gently to effect solution, and continue heating until a crystalline precipitate is produced. Allow to cool, add 10 ml of *2 M sodium hydroxide*, cool again, add 25 ml of *ether* and shake for 5 minutes. Dry the upper layer over *anhydrous sodium sulphate*, filter and evaporate the solvent by heating on a water-bath. The residue melts either at 80° to 82° or at 90° to 92° (2.4.21).

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml to 10 ml with *water*. The resulting solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Complies with the test for Related substances in Sulphonamides (2.3.7), Method C, but using the following solution.

Test solution. A 2 per cent w/v solution of the substance under examination in a mixture of 24 volumes of *methanol* and 1 volume of *strong ammonia solution*.

https://nhathuocngocanh.com/

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

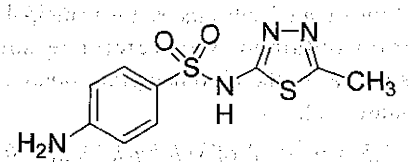
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.03103 g of $C_{12}H_{14}N_4O_4S$.

Storage. Store protected from light and moisture.

Sulphamethizole



$C_9H_{10}N_4O_2S_2$ Mol. Wt. 270.3

Sulphamethizole is *N*^{1}-(5-methyl-1,3,4-thiadiazol-2-yl) sulphanilamide.

Sulphamethizole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_9H_{10}N_4O_2S_2$, calculated on the dried basis.

Category. Antibacterial.

Description. White or yellowish white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphamethizole IPRS* or with the reference spectrum of sulphamethizole.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 50 mg in 4 ml of *methanol* and add 0.2 ml of a 4.0 per cent w/v solution of *cupric acetate*; a flocculent, yellowish green precipitate is produced which becomes dark green.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml of the solution to 10 ml with *water*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *chloroform* and 15 volumes of *methanol*.

Test solution (a). Dissolve 0.3 g of the substance under examination in 10 ml of *acetone*.

Test solution (b). Dissolve 0.3 g of the substance under examination in 100 ml of *acetone*.

Reference solution (a). Dissolve 15 mg of the substance under examination in 100 ml of *acetone*.

Reference solution (b). A 0.3 per cent w/v solution of *sulphamethizole IPRS* in *acetone*.

Apply to the plate 2 µl of each solution. After development, dry the plate at 105° and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

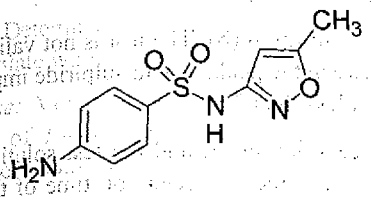
Assay. Dissolve 0.25 g in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02703 g of $C_9H_{10}N_4O_2S_2$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Sulphamethoxazole



$C_{10}H_{11}N_3O_3S$ Mol. Wt. 253.3

Sulphamethoxazole is *N'*-(5-methylisoxazol-3-yl) sulphanilamide.

Sulphamethoxazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{11}N_3O_3S$, calculated on the dried basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphamethoxazole IPRS* or with the reference spectrum of sulphamethoxazole.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with the reference solution (c).

C. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml to 10 ml with *water*. The resulting solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

D. Melting range (2.4.21). 169° to 172°.

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance with 25 ml of *carbon dioxide-free water* at 70° for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Complies with the test for Related substances in Sulphonamides (2.3.7), Method C, but using the following solution.

Test solution. Dissolve 0.1 g of the substance under examination in sufficient of a mixture of 1 volume of *strong ammonia solution* and 24 volumes of *methanol* to produce 5 ml.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

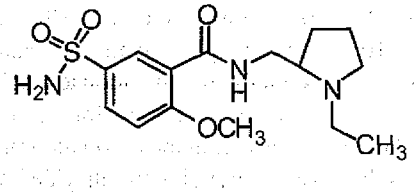
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02533 g of $C_{10}H_{11}N_3O_3S$.

Storage. Store protected from light and moisture.

Sulpiride



$C_{15}H_{23}N_3O_4S$ Mol. Wt. 341.4

Sulpiride is (*RS*)-5-(Aminosulfonyl)-*N*-[(1-ethyl-2-pyrrolidinyl) methyl]-2-methoxybenzamide.

Sulpiride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{15}H_{23}N_3O_4S$, calculated on the dried basis.

Category. Neuroleptic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulpiride IPRS* or with the reference spectrum of sulpiride.

B. In the test for impurity A, the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a).

C. To 1 mg in a porcelain dish, add 0.5 ml of *sulphuric acid* and 0.05 ml of *formaldehyde solution*. When examined under

https://nhathuocngocanh.com/

ultraviolet light at 365 nm (2.4.7); the solution shows blue fluorescence.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *dilute acetic acid* is clear (2.4.1) and not more intensely coloured than YS6 (2.4.1).

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *concentrated ammonia*, 10 volumes of *dioxan*, 14 volumes of *methanol* and 90 volumes of *dichloromethane*.

Test solution. Dissolve 0.2 g of the substance under examination in *methanol* and dilute to 10 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *sulpiride IPRS* in *methanol*.

Reference solution (b). A 0.0002 per cent w/v solution of *sulpiride impurity A IPRS ([(2RS)-1-ethylpyrrolidin-2-yl]methanamine IPRS)* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm for identification test B. Then spray with *ninhydrin solution*, heat at 105° for 15 minutes and examine in daylight. Any spot in the chromatogram obtained with the test solution corresponding to sulpiride impurity A is not more intense than the correponding spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *sulpiride IPRS* and *sulpiride impurity B IPRS (methyl 2-methoxy-5-sulfamoylbenzoate IPRS)* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 10 volumes of *methanol* and 80 volumes of a solution containing 0.68 per cent w/v of *potassium dihydrogen phosphate* and 0.1 per cent w/v of *sodium octanesulphonate*, adjusted to pH 3.3 using *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sulpiride impurity B and sulpiride is not less than 2.5.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Chlorides (2.3.12). Shake 1.0 g with 20 ml of *water*, filter. To 10 ml of the filtrate, add 5 ml of *water*. The solution complies with the limit test for chlorides (100 ppm), using 2 ml of *chloride standard solution (25 ppm Cl)*.

Iron (2.3.14). Ignite 1.0 g in a silica crucible. To the residue add 1 ml of *1 M hydrochloric acid*, 3 ml of *water* and 0.1 ml of *nitric acid*. Heat on a water-bath for a few minutes. Place the solution in a test-tube. Rinse the crucible with 4 ml of *water*. Collect the rinsings in the test-tube and dilute to 10 ml with *water*. The solution complies with the limit test for iron (10 ppm) using 0.5 ml of *iron standard solution (20 ppm Fe)*.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 80 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the endpoint potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03414 g of $C_{15}H_{23}N_3O_4S$.

Sulpiride Tablets

Sulpiride Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulpiride, $C_{15}H_{23}N_3O_4S$.

Usual strengths. 100 mg; 200 mg; 400 mg.

Identification

To a quantity of the powdered tablets containing 0.2 g of Sulpiride add 20 ml of *methanol*, shake for 5 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the

spectrum with that obtained with *sulpiride IPRS* or with the reference spectrum of sulpiride.

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *13.5 M ammonia*, 10 volumes of *1,4-dioxan*, 14 volumes of *methanol* and 90 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Sulpiride with 20 ml of *methanol*, shake for 5 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of *methanol*.

Reference solution (a). A 0.02 per cent w/v solution of *sulpiride impurity A IPRS ([(2RS)-1-ethylpyrrolidin-2-yl]methanamine IPRS)* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air, spray with *ninhydrin solution*, heat at 105° for 15 minutes. Any spot in the chromatogram obtained with the test solution corresponding to the principal spot in the chromatogram obtained with reference solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Sulpiride with 20 ml of *methanol*, shake for 5 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in the mobile phase and dilute to 200.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *sulpiride IPRS* and *sulpiride impurity B IPRS (methyl 2-methoxy-5-sulphamoylbenzoate IPRS)* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 10 volumes of *methanol* and 80 volumes of a solution containing 6.8 per cent w/v of *potassium dihydrogen orthophosphate* and 0.1 per cent w/v of *sodium octanesulphonate*, adjusted to pH 3.3 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

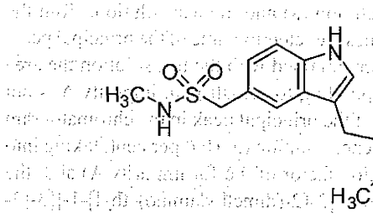
Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to sulpiride impurity B and sulpiride is not less than 2.5.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Sulpiride with 50 ml of *0.1 M sodium hydroxide* with the aid of ultrasound for 5 minutes, and dilute to 100.0 ml with *0.1 M sodium hydroxide*, filter, discarding the first 10 ml of filtrate. Dilute 5.0 ml of the filtrate to 100.0 ml with *0.1 M sodium hydroxide* and measure the absorbance of the solution at the maximum at 291 nm (2.4.7). Calculate the content of $C_{15}H_{23}N_3O_4S$ in the tablets from the absorbance of a 0.005 per cent w/v solution of *sulpiride IPRS* in *0.1 M sodium hydroxide*.

Sumatriptan



$C_{14}H_{21}N_3O_2S$ Mol. Wt. 295.4

Sumatriptan is 3-(2-dimethylaminoethyl)indol-5-yl-*N*-methylmethanesulphonamide.

Sumatriptan contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{14}H_{21}N_3O_2S$, calculated on the anhydrous basis.

Category. Antimigraine.

Description. A white to pale yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sumatriptan IPRS* or with the reference spectrum of sumatriptan.

Tests

Impurities A and H. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. 1 volume of *acetonitrile* and 3 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5.

Test solution. A 0.2 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with the solvent mixture.

Reference solution (b). Dissolve the contents of a vial of *sumatriptan for system suitability IPRS* to 1 ml with *1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm) (Such as Spherisorb silica S5W),
- mobile phase: a mixture of 10 volumes of *10 M ammonium acetate* and 90 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between [3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*- methylmethanesulphonamide (sumatriptan impurity A) and sumatriptan is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to sumatriptan impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent, taking into account the correction factor of 0.6 for impurity A) and the area of any peak due to [3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*- methylmethanesulphona-mide (sumatriptan impurity H) is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5.

Test solution. A 0.2 per cent w/v solution of the substance under examination in the solvent mixture.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with the solvent mixture and further dilute 1 ml of the resulting solution to 10 ml with the solvent mixture.

Reference solution (b). Dilute the contents of a vial of *sumatriptan impurity mixture IPRS* to 1 ml with *0.1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of buffer solution prepared by dissolving 0.97 g of *dibutylamine*, 0.735 g of *orthophosphoric acid* and 2.93 g of *sodium dihydrogen phosphate* in 750 ml of *water*, adjusted to pH 6.5 with *sodium hydroxide solution* and diluted to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to [3-[2-(dimethylamino) ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*- methylmethane-sulphonamide (sumatriptan impurity C) and sumatriptan is not less than 1.5.

Inject the reference solution (a) and the test solution. In the chromatogram obtained with the test solution the areas of any peaks corresponding to *N*-methyl[3-[2-(methylamino) ethyl]-1*H*-indol-5-yl]methanesulphonamide (sumatriptan impurity B), [3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*- methylmethanesulphonamide (sumatriptan impurity C) and *N*,*N*-dimethyl-2-[5-[(methylsulphamoyl) methyl]-1*H*-indol-3-yl]ethanamine *N*-oxide (sumatriptan impurity D) is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of any peak corresponding to [3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide (sumatriptan impurity E) is not more than the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the area of any other secondary peak is not more than the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The total impurity content in the test for Impurities A and H and in the test for Related substances is not more than 1.5 per cent. Ignore any peak with an area less than 0.5 times the area of the peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances, using the following solutions.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.014 per cent w/v solution of *sumatriptan succinate IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (b). Dilute the contents of a vial of *sumatriptan impurity mixture IPRS* to 1 ml with *0.1 M hydrochloric acid.*

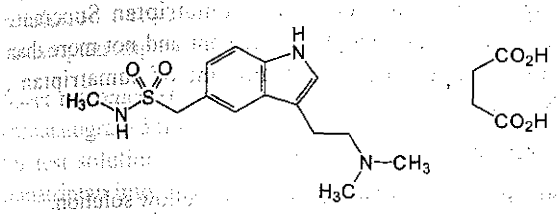
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sumatriptan and sumatriptan impurity C is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{21}N_3O_2S$.

Storage. Store protected from light.

Sumatriptan Succinate



$C_{14}H_{21}N_3O_2S,C_4H_6O_4$ Mol. Wt. 413.5

Sumatriptan Succinate is [3-[2-(Dimethylamino)ethyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide hydrogen butanedioate.

Sumatriptan Succinate contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{18}H_{27}N_3O_6S$, calculated on the anhydrous basis.

Category. Antimigraine.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sumatriptan succinate IPRS* or with the reference spectrum of sumatriptan succinate.

Tests

Solution A. Dissolve 1.0 g in *carbon dioxide-free water* and dilute to 25.0 ml with the same solvent.

pH (2.4.24). 4.5 to 5.3, Dilute 2.5 ml of solution A to 10 ml with *carbon dioxide-free water.*

Light absorption (2.4.7). Not more than 0.1, measured at 440 nm on solution A.

Impurities A and H. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: a mixture of 10 volumes of 77.1 per cent w/v solution of *ammonium acetate* and 90 volumes of *methanol,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

The relative retention time with reference to sumatriptan for sumatriptan impurity A ([3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]- 1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) is about 2.2 and for sumatriptan impurity H ([3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]- 1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) is about 3.0.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to sumatriptan impurity A is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent) and the area of the peak due to sumatriptan impurity H is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 2.925 g of *sodium dihydrogen phosphate* in 600 ml of *water*, adjusted to pH 6.5 with *sodium hydroxide solution*, dilute to 750 ml with *water*, add 250 ml of *acetonitrile.*

Test solution (a). Dissolve 30 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dissolve 15 mg of the substance under examination in solution A and dilute to 100.0 ml with solution A.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (b). Dissolve 15 mg of *sumatriptan succinate IPRS* in solution A and dilute to 100.0 ml with solution A.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of buffer solution prepared by dissolving 0.97 g of *dibutylamine*, 0.735 g of *phosphoric acid* and 2.93 g of *sodium dihydrogen phosphate* in 750 ml of *water*, adjusted to pH 6.5 with *sodium hydroxide solution* and dilute to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 10 µl.

The relative retention time with reference to sumatriptan for sumatriptan impurity E ([3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) is about 0.5, for sumatriptan impurity B (*N*-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5- yl]methanesulphonamide) is about 0.6, for sumatriptan impurity D (*N,N*-dimethyl-2-[5-[(methylsulphamoyl)methyl]-1*H*-indol-3-yl]ethanamine *N*- oxide) is about 0.7 and for sumatriptan impurity C ([3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) is about 0.8.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a) and test solution (a). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any peak due to sumatriptan impurity B, C and D is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any peak due to sumatriptan impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modification.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{18}H_{27}N_3O_6S$.

Storage. Store protected from light.

Sumatriptan Injection

Sumatriptan Succinate Injection

Sumatriptan Injection is a sterile isotonic solution of Sumatriptan Succinate in Water for Injections.

Sumatriptan Injection contains Sumatriptan Succinate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sumatriptan, $C_{14}H_{21}N_3O_2S$.

Usual strength. 6 mg per 0.5 ml.

Description. A clear, colourless to pale yellow solution.

Identification

To a volume of the injection containing equivalent to 30 mg of sumatriptan, add 1 ml of *saturated sodium chloride solution* and 1ml of *saturated sodium carbonate solution*. Shake vigorously for 30 seconds, add two quantities of 2 ml of *propan-2-ol*, shake, allow to separate (this may take up to 24 hours) and discard the aqueous layer. Evaporate under a stream of nitrogen and dry at 100°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *sumatriptan succinate IPRS* treated in the same manner or with the reference spectrum of sumatriptan.

Tests

pH (2.4.24). 4.2 to 5.3.

Impurities A and H. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5 and 25 volumes of *acetonitrile*.

Test solution. Dilute a volume of injection in the solvent mixture to obtain a solution containing 0.214 per cent w/v of sumatriptan.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute the contents of a vial of *sumatriptan for system suitability IPRS* (containing

https://nhathuocngocanh.com/

sumatriptan impurity A ([3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethyl-amino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethane sulphonamide) and sumatriptan impurity H ([3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethane-sulphonamide) to 1.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with silica (5 µm) (Such as Spherisorb silica S5W),
- mobile phase: a mixture of 10 volumes of *10 M ammonium acetate* and 90 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sumatriptan and sumatriptan impurity A is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak for test solution. The area of any peak corresponding to sumatriptan impurity A, multiplied with correction factor of 0.6, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the area of any peak corresponding to sumatriptan impurity H is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5 and 25 volumes of *acetonitrile*.

Test solution. Dilute a volume of injection in the solvent mixture to obtain a solution containing 0.21 per cent w/v of sumatriptan.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 75 volumes of a solution containing 0.97 g of *dibutylamine*, 0.735 g of *orthophosphoric acid* and 2.93 g of *sodium dihydrogen orthophosphate* in 750 ml of *water*, adjusted to pH 7.5 with *10 M sodium hydroxide*, diluted to 1000 ml with *water* and 25 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Sumatriptan impurity D[1]	0.2	—
Sumatriptan impurity 2[2]	0.3	0.3
Sumatriptan impurity 1[3]	0.4	0.2
Sumatriptan impurity E[4]	0.5	—
Sumatriptan impurity B[5]	0.6	—
Sumatriptan impurity F[6]	0.7	—
Sumatriptan impurity C[7]	0.8	—
Sumatriptan (Retention time is about 17 minutes)	1.0	—

[1] *N,N*-dimethyl-2-[5-[(methylsulfamoyl)methyl]-1*H*-indol-3-yl]ethanamine N-oxide,

[2] 1-{3-[2-(dimethylamino)ethyl]-3-hydroxy-2-oxo-2,3-dihydro-1*H*-indol-5-yl}-*N*-methylmethanesulfonamide,

[3] 3a-hydroxy-1,1-dimethyl-5-{[(methylamino)sulfonyl]methyl}-1,2,3,3a,8,8a-hexahydropyrrolo[2,3-b]indol-1-ium trifluoroacetate,

[4] [3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulfonamide,

[5] R1 = R2 = H: N-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5-yl] methanesulfonamide,

[6] R = H: N-methyl(2,3,4,9-tetrahydro-1*H*-pyrido[3,4-b]indol-6-yl) methanesulfonamide,

[7] R1=CH2-OH, R2 = CH3: [3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulfonamide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak for test solution. The area of any peak corresponding to sumatriptan impurity 1, multiplied with correction factor 0.2, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak corresponding to sumatriptan impurity 2, multiplied with correction factor 0.3, is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). The total impurity content in test for impurities A and H and the test for Related substances is not more than 4.0 per cent.

Bacterial endotoxins (2.2.3). Not more than 29.2 Endotoxin Units per mg of sumatriptan.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5 and 25 volumes of *acetonitrile*.

Test solution. Dilute a volume of injection in the solvent mixture to obtain a solution containing 0.021 per cent w/v of sumatriptan.

Reference solution. A 0.03 per cent w/v solution of *sumatriptan succinate IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{21}N_3O_2S$ in the injection.

1 mg of $C_{14}H_{21}N_3O_2S$ is equivalent to 1.4 mg of $C_{14}H_{21}N_3O_2S$, $C_4H_6O_4$.

Storage. Store protected from light.

Surgical Spirit

Surgical Spirit contains 0.45 per cent to 0.55 per cent v/v of methyl salicylate, $C_8H_8O_3$ and 1.8 cent to 2.2 per cent v/v of diethyl phthalate, $C_{12}H_{14}O_4$.

Surgical Spirit contains	
Methyl Salicylate	5 ml
Diethyl Phthalate	20 ml
Castor Oil	25 ml
Industrial Methylated Spirit	Sufficient to produce 1000 ml.

Category. Skin disinfectant.

Identification

A. To 1 ml, add 0.5 ml of 0.4 M *iron (III) chloride hexahydrate*, a violet colour is produced.

B. To 1 ml, add 50 mg of *resorcinol* and 1 ml of *sulphuric acid*, heat for 1 minute, cool, pour into *water* and make alkaline with *5 M sodium hydroxide*; a distinct green fluorescence is produced which disappears when the solution is made acidic and reappears when it is made alkaline.

Tests

Weight per ml (2.4.29). 0.817 to 0.827 g.

Assay. *For methyl salicylate* —

Dilute 5 ml to 100 ml with *ethanol*, further dilute 10 ml of the solution to 100 ml with *ethanol* and measure the absorbance at the maximum at 306 nm (2.4.7). Calculate the content of $C_8H_8O_3$ taking 335 as the specific absorbance at 306 nm.

For diethyl phthalate—

Further dilute 10 ml of the solution prepared in the Assay for methyl salicylate to 50 ml with *ethanol* and measure the absorbance of the resulting solution at 227 nm (2.4.7). Subtract from the observed absorbance the absorbance due to the methyl salicylate present, as determined above, taking 432 as the specific absorbance of methyl salicylate. For calculation, take 419 as the specific absorbance of diethyl phthalate at 227 nm.

Storage. Store protected from moisture.

Labelling. The label states that the preparation is flammable and should be kept away from a naked flame.

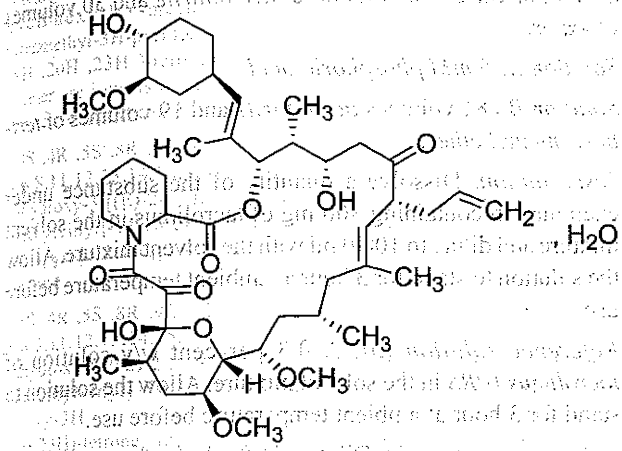
Tacrolimus



$C_{44}H_{69}NO_{12},H_2O$ Mol. Wt. 822.03

Tacrolimus is *E*-(7*R*,8*R*,10*S*,11*R*,12*S*,14*S*,18*R*,21*S*,22*R*,23*S*)-18-Allyl-1,2,3,4,6,7,8,9,10,11,12,13,14,15,18,19,20,21,22,23,25,25a-docosahydro-7,21-dihydroxy-23-{(*E*)-2-[(1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-10,12-dimethoxy-8,14,16,22-tetramethyl-7,11-epoxy-5*H*-24-oxa-4a-azabenzocyclotricosene-5,6,19,25-tetrone.

Tacrolimus contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{44}H_{69}NO_{12}$, calculated on the anhydrous and solvent-free basis.

Category. Immunosuppressive; immunomodulator.

Description. White Crystals or white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tacrolimus IPRS* or with the reference spectrum of tacrolimus.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Specific optical rotation (2.4.22). – 115.0° to – 110.0°, calculated on as is basis and determined in a 1.0 per cent w/v solution in *dimethylformamide*.

Related substances. Determine by liquid chromatography (2.4.14).

A. Determine by liquid chromatography (2.4.14).

NOTE — Used when the impurity profile includes tacrolimus methylacrylaldehyde and tacrolimus diene. Condition the new column with 500 ml of ethanol before use.

Test solution. Dissolve 50 mg of substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution each of *tacrolimus IPRS* and *tacrolimus impurity A IPRS* in the mobile phase.

Chromatographic system

- two stainless steel columns 25 cm x 4.6 mm, packed with dihydroxy propane chemically bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 70 volumes of *hexane*, 20 volumes of *n-butyl chloride* and 10 volumes of *acetonitrile* (*NOTE — Add n-butyl chloride to hexane, mix well before adding acetonitrile. After adding acetonitrile, mix the mobile phase for 2 hours to get a clear solution*),
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor

For informational purposes only; not to be reported.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the resolution between tacrolimus and tacrolimus impurity A is not less than 1.1 and the tailing factor is not more than 1.5.

Inject the test solution. The area of any peak due to tacrolimus methylacryl aldehyde, tacrolimus diene and tacrolimus impurity A is not more than 0.2 per cent, the area of any other secondary peak is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 0.3 per cent, calculated by area normalization method.

NOTE — If the related substance test other than A is used the label states the article complies with related substance test B.

B. Determine by liquid chromatography (2.4.14). Use solvent mixture, solution A, solution B, reference solution (a), reference solution (b), test solution and Chromatographic system as described under Assay with the following modifications.

NOTE — Used when the impurity profile includes ascomycin, desmethyl tacrolimus, tacrolimus 8-epimer, and tacrolimus 8-propyl analog.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections for sum of the responses of tacrolimus and tacrolimus 19-epimer is not more than 10.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution the area of any peak due to ascomycin 19-epimer and desmethyl tacrolimus is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak due to ascomycin is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to tacrolimus 8-epimer is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak due to tacrolimus 8-propyl analog is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks excluding tacromilus open ring and tacrolinus epimer is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light by using low-actinic glassware.

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Solution A. 6 mM phosphoric acid.

Solution B. 81 volumes *acetonitrile* and 19 volumes of *tert-butyl methyl ether*.

Test solution. Dissolve a quantity of the substance under examination containing 300 mg of tacrolimus in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Allow the solution to stand for 3 hour at ambient temperature before use.

Reference solution (a). A 0.3 per cent w/v solution of *tacrolimus IPRS* in the solvent mixture. Allow the solution to stand for 3 hour at ambient temperature before use.

Reference solution (b). Dilute of 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 60°,
- sample temperature: 4°,
- mobile phase: A. 80 volumes of solution A and 20 volumes of solution B,
  B. 80 volumes of solution B and 20 volumes of solution A,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

(3S,4R,5S,8S,9E,12S,14S,15R,16S,18R,19R,26aS)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-{(E)-2-[(1R,3R,4R)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3H-pyrido[2,1-c][1,4]oxaazacyclotricosine 1,7,20,21(4H,23H)-tetrone.

Inject reference solution (a). The test is not valid unless the relative standard deviation of replicate injections is not more than 2.0 per cent for the sum of responses of tacrolimus, tacrolimus open ring, and tacrolimus 19-epimer.

Inject reference solution (a) and the test solution.

Calculate the content of tacrolimus $C_{44}H_{69}NO_{12}$ in the portion of tacrolimus taken by the formula

$$\frac{rU}{rS} \times \frac{CS}{CU} \times 100$$

in which *rU* is the sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the test solution, *rS* is the sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the reference solution and *CS* and *CU* are the concentration of reference solution and test solution respectively.

Storage. Store protected from moisture and at a controlled temperature.

Tacrolimus Capsules

Tacrolimus Capsules contain not less than 93.0 per cent and not more than 105.0 per cent of the stated amount of tacrolimus, $C_{44}H_{69}NO_{12}$.

Usual strengths. 0.5 mg; 1 mg; 2 mg; 5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

NOTE — Allow reference solution (b) to stand for 3 hour at ambient temperature before use. Protect the solution from light by using low-actinic glassware.

Apparatus No. 2 (Paddle) (Use sinkers, if required);

Medium. 900 ml of buffer solution prepared by dissolving 6 g of *sodium dodecylsulphate* and 8.28 g *monobasic sodium phosphate* in 6000 ml of *water,* adjusted to pH 7.0 with *2 M sodium hydroxide,*

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate as given above, suitably diluted if necessary

Reference solution (a). Dissolve 20 mg of *tacrolimus IPRS* in 30 ml of *ethanol (95 per cent)* and dilute to 100.0 ml with the dissolution medium.

Reference solution (b). Dilute reference solution (a) to obtain a 0.0005 per cent w/v solution of *tacrolimus IPRS* in the dissolution medium. Dilute further with dissolution medium, if necessary.

Chromatographic system

- a stainless steel column 5.5 cm x 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 60°,
- mobile phase: a mixture of 600 volumes of *6mM orthophosphoric acid,* 50 volumes of *tert-butyl ether* and 335 volumes of *acetonitrile,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 100 µl.

The relative retention time for tacrolimus 19 epimer and tacrolimus are about 0.67 and 1.0 respectively.

https://nhathuocngocanh.com/

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2 and the relative standard deviation for replicate injections is not more than 5.0 per cent for the sum of the areas of tacrolimus and tacrolimus 19-epimer.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{44}H_{69}NO_{12}$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{44}H_{69}NO_{12}$.

Related substances. A. Determine by liquid chromatography (2.4.14).

NOTE — Used when the impurity profile includes tacrolimus diene and tacrolimus regioisomer. Conditioned the new column with 500 ml of ethanol before use to meet the resolution criteria. Prepare the solution immediately before use.

Test solution. Transfer the mixed contents of the capsules containing about 10 mg of Tacrolimus (5 mg, in case of capsules having label claim of 0.5 mg) to a centrifuge tube. Add 1.5 ml of a mixture of 2 volumes of *n-butyl chloride* and 1 volume of *acetonitrile*, mix with the aid of ultrasound add 3.5 ml of *n-hexane*, mix. Centrifuge the solution, and collect the supernatant or pass the solution through a 0.45-µm membrane filter.

Reference solution. A 0.01 per cent w/v solution each of *tacrolimus IPRS* and *tacrolimus impurity A* in mobile phase.

Chromatographic system

- two stainless steel column 25 cm x 4.6 mm, packed with dihydoxypropane groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *hexane*, 20 volumes of *n-butyl chloride* and 10 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

[1](14E,18E)-17-Allyl-1-hydroxy-12-[(E)-2-(4-hydroxy-3-methoxycyclohexyl)-1-methylvinyl]23,25-dimethoxy-13,19,21,27-tetramethyl-11,28-dioxa-4-azatricyclo[22.3.1.04,9]octacosa-14,18-diene-2,3,10,16-tetrone.

[2](4E,11E)-10-Allyl-7,8,10,13,14,15,16,17,18,19,20,21,26,22,28,28a-hexadecahydro-7,21-dihydroxy-3-(4-hydroxy-3-methoxycyclohexyl)-16,18-dimethoxy-4,6,12,14,20-pentamethyl-17,21-epoxy-3H-pyrido[2,1-c][1,4]oxaazacyclopentacosine-1,9,22,23(6H,25H)-tetrone.

[3]Tacrolimus impurity A is a specified, unidentified impurity.

[4]For information only, not to be reported.

[5](3S,4R,5S,8R,9E,12S,14S,15R,16S,18R,19S,26aS)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-{(E)-2-[(1R,3R,4R)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3H-pyrido[2,1c][1,4]oxaazacyclotricosine-1,7,20,21(4H,23H)-tetrone. For information only, not to be reported.

[6](3S,4R,5S,8R,12S,14S,15R,16S,18R,26aS,E)-8-Allyl5,6,11,12,13,14,15,16,17,18,24,25,26,26a-tetradecahydro-5,15,20,20-tetrahydroxy-3-{(E)-2-[(1R,3R,4R)-4-hydroxy-3methoxycyclohexyl]-1-methylvinyl}-14,16-dimethoxy-4,10,12,18-tetramethyl-3H pyrido[2,1c][1,4]oxaazacyclotricosine-1,7,19,21(4H,8H,20H,23H)-tetrone. For information only, not to be reported.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to tacrolimus and tacrolimus impurity A is not less than 1.1 and the tailing factor is not more than 2.0.

Inject the test solution. Run the chromatogram 3 times the retention time of tacrolimus. The area of the peak corresponding to tacrolimus diene is not more than 0.3 per cent, the area of any peak due to tacrolimus regioisomer is not more than 0.5 per cent, the area of any peak due to tacrolimus impurity A is not more than 0.3 per cent. The area of any secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks excluding tacrolimus open ring and tacrolimus 19 epimer is not more than 1.0 per cent, calculated by area normalization.

NOTE — If the related substance test other than A is used the label states the article complies with related substance test B.

B. Determine by liquid chromatography (2.4.14).

NOTE — Used when the impurity profile includes tacrolimus 21-carboxylic acid and tacrolimus 8-epimer. It is suggested to equilibrate the column overnight with a mixture of 85 volumes of mobile phase A and 15 volumes of mobile phase B before performing this method. Allow reference solution (a), reference solution (b) and test solution to stand for 3 hour at ambient temperature before use. Protect the solution from light using low-actinic glassware.

Solution A. 81 volumes of *acetonitrile* and 19 volumes of *tert-butyl methyl ether.*

Solution B. Prepared by dissolving 50 g of *polyoxyethylene (23) lauryl ether* in 1000 ml *6 mM orthophosphoric acid.*

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of solution B.

Test solution. Disperse a quantity of the mixed content of capsules containing 15 mg of Tacrolimus in the solvent mixture

https://nhathuocngocanh.com/

with the aid of ultrasound, and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.00075 per cent w/v solution of *tacrolimus IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecysilane bonded to porous silica (3 µm),
- column temperature: 60°,
- mobile phase: A. 80 volumes of *6 mM orthophosphoric acid* and 20 volumes of solution A,
  B. 20 volumes of *6 mM orthophosphoric acid* and 80 volumes of solution A,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 40 µl.

These are process impurities that are controlled in the drug substance. They are not to be reported in the drug product.

Inject reference solution (b). The test is not valid unless, the signal to noise ratio not less than 10.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to tacrolimus hydroxyl acid multiplied by correction factor 0.67 and tacrolimus 8-epimer is not more than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the

https://nhathuocngocanh.com/

chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with area less than the area of the principal peak in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Allow the solution to stand for 3 hour at ambient temperature before use. Protect the solution from light by using low-actinic glassware.

Solution A. Prepared by dissolving 50 g of *polyoxyethylene (23) lauryl ether* in 1000 ml of *water.*

Solution B. A mixture of 30 volumes of solution A and 70 volumes of *acetonitrile.*

Test solution. Weigh and mix content of 20 capsules. Disperse a quantity of the mixed content containing 5 mg of tacrolimus in solution B and dilute it to 100.0 ml with the solution B.

Reference solution. A 0.005 per cent w/v solution of tacrolimus in solution B.

Chromatographic system

- a stainless steel column 5.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 60°,
- mobile phase: a mixture of 600 volumes of *6 mM orthophosphoric acid*, 55 volumes of *tertbutylmethyl-ether* and 335 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 5 µl.

The relative retention time for tacrolimus 19-epimer and tacrolimus are 0.67 and 1.0 respectively.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections for the sum of the tacrolimus and tacrolimus 19-epimer peaks is not more than 3.0 per cent.

Inject the reference solution and the test solution.

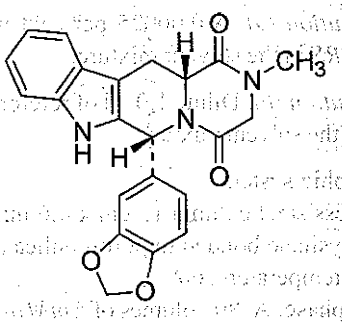
Calculate the content of tacrolimus $C_{44}H_{69}NO_{12}$ in the portion of capsules taken by the formula

$$\frac{rU}{rS} \times \frac{CS}{CU} \times 100$$

in which *rU* is the sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the test solution, *rS* is the sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the reference solution and *CS* and *CU* are the concentration of reference solution and test solution respectively.

Storage. Store protected from moisture.

Tadalafil



$C_{22}H_{19}N_3O_4$ Mol. Wt. 389.4

Tadalafil is (6*R*,12a*R*)-6-(1,3-benzodioxol-5-yl)-2-methyl-2,3,6,7,12,12a-hexahydropyrazino[1',2':1,6]-pyrido[3,4-*b*]indole-1,4-dione.

Tadalafil contains not less than 97.5 per cent and not more than 102.5 per cent of $C_{22}H_{19}N_3O_4$, calculated on the dried basis.

Category. Erectile disfunction.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tadalafil IPRS* or with the reference spectrum of tadalafil.

B. In the test for Enantiomeric and Diastereomeric purity, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the identification solution.

Identification solution. A 0.05 per cent w/v solution of *tadalafil IPRS* in the solvent mixture.

Tests

Enantiomeric and Diastereomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *hexane*, 40 volumes of *isopropyl alcohol* and 20 volumes of *acetonitrile.*

Test solution. Dissolve a quantity of the substance under examination in the solvent mixture to obtain a solution containing 0.05 per cent w/v of Tadalafil.

Reference solution (a). A 0.005 per cent w/v solution of *tadalafil IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 25 mg of the substance under examination in 40 ml of the solvent mixture. Add 1.0 ml of *1.0*

https://nhathuocngocanh.com/

M tetrabutylammonium hydroxide in *methanol* and allow to stand at room temperature for 20 minutes. Add 1.0 ml of *trifluoroacetic acid* and dilute to 50.0 ml with the solvent mixture to generate 6R,12aS diastereomer of tadalafil.

Reference solution (d). Transfer 1.0 ml of reference solution (c) and 10 ml of reference solution (a) to a 50-ml volumetric flask and dilute to volume with the solvent mixture.

Reference solution (e). Dilute 5 ml of reference solution (b) to 10 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel AD for chiral separation (10 µm),
- mobile phase: equal volumes of *hexane* and *isopropyl alcohol*,
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 10 µl.

Name	Relative retention time
6R,12aS diastereomer [1]	0.79
Tadalafil	1.0
6S,12aS enantiomer[2]	1.4
6S,12aR diastereomer[3]	1.7

[1](6*R* ,12a*S*)-6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methyl-pyrazino[1',2':1,6]pyrido[3,4-*b*]indole-1,4-dione,

[2](6*S* ,12a*S*)-6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methyl-pyrazino[1',2':1,6]pyrido[3,4-*b*]indole-1,4-dione,

[3](6*S* ,12a*R*)-6-(1,3-benzodioxol-5-yl)-2,3,6,7,12,12a-hexahydro-2-methyl-pyrazino[1',2':1,6]pyrido[3,4-*b*]indole-1,4-dione.

Inject reference solution (b), (d) and (e). The test is not valid unless the resolution between the peaks due to 6R,12aS diastereomer and tadalafil is not less than 2.0 in the chromatogram obtained with reference solution (d); the tailing factor is not less than 0.8 and not more than 1.5 and the relative standard deviation for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (b). The signal-to-noise ratio is not less than 20 in the chromatogram obtained with reference solution (e).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Do not use sonication during the preparation of test solution.

Test solution. Dissolve a quantity of the substance under examination in a mixture of equal volumes of *acetonitrile* and mobile phase A, prepared by first dissolving in *acetonitrile* and then dilute to volume with mobile phase A to obtain a solution containing 0.04 per cent w/v of Tadalafil.

Reference solution (a). A 0.00004 per cent w/v solution of *tadalafil IPRS* in a mixture of equal volumes of *acetonitrile* and mobile phase A, prepared by first dissolving in *acetonitrile* and then dilute to volume with mobile phase A.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with a mixture of equal volumes of *acetonitrile* and mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. add 1.0 ml of *trifluoroacetic acid* to 1000 ml of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
3	85	15
30	5	95
33	5	95
35	85	15

The relative retention time with reference to tadalafil for 6R,12aS diastereomer is about 1.03.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor is not more than 1.5 in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). Ignore the peaks due to the 6R ,12aS and 6S ,12aR diastereomers of tadalafil, which co-elute at a retention time of about 1.03 relative to tadalafil.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying under vacuum at 105° for 3 hours.

https://nhathuocngocanh.com/

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Add 1.0 ml of *trifluoroacetic acid* to 1000 ml of *water*.

Test solution. Dissolve a quantity of the substance under examination in a mixture of equal volumes of *acetonitrile* and solution A, prepared by first dissolving in *acetonitrile* and then dilute to volume with solution A to obtain a solution containing 0.01 per cent w/v of tadalafil.

Reference solution. A 0.01 per cent w/v solution of *tadalafil IPRS* in a mixture of equal volumes of *acetonitrile* and solution A, prepared by first dissolving in *acetonitrile* and then dilute to volume with solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of solution A,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0.

Inject the reference solution and the test solution.

Calculate the content of tadalafil, $C_{22}H_{19}N_3O_4$.

Storage. Store protected from moisture.

Tadalafil Tablets

Tadalafil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tadalafil, $C_{22}H_{19}N_3O_4$.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of 0.5 per cent w/v of *sodium dodecyl sulphate*,

Speed and time. 50 rpm ,10 minutes and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.025 per cent w/v solution of *tadalafil IPRS* in a mixture of equal volumes of *acetonitrile* and *water*. Dilute a volume of the solution with the dissolution medium to obtain 0.0075 mg per ml of *tadalafil IPRS*.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: a mixture of equal volumes of *methanol* and *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0.

Q. Not less than 40 per cent of the stated amount of $C_{22}H_{19}N_3O_4$ at 10 minutes and not less than 80 per cent of the stated amount of $C_{22}H_{19}N_3O_4$ at 30 minutes.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

The relative retention time with reference to tadalafil for 6R,12aS diastereomer of tadalafil is about1.2.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor is not more than 1.5 in the chromatogram obtained with reference solution (a) and the resolution between the peaks due to tadalafil and the 6R,12aS diastereomer peak is not less than 3.0 in the chromatogram obtained with reference solution (b).

Inject the test solution. The area of any secondary peak is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 0.3 per cent. Ignore any peak with an area less the 0.05 per cent, calculated by area normalization method.

Uniformity of content. Complies with the test stated under Tablets.

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Add 1 tablet to a suitable volumetric flask to obtain a solution containing 0.1 to 0.2 mg per ml of Tadalafil. Add a volume of solvent mixture upto 50 per cent of the volume of the flask and mechanically shake for 15 minutes, dilute with the solvent mixture to volume and filter. Dilute 5.0 ml of the filtrate to

50.0 ml using solvent mixture. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{22}H_{19}N_3O_4$ from the absorbance obtained by repeating the procedure using a solution of *tadalafil IPRS* of the same concentration as that of the test solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Place not less than 20 tablets into an appropriate size volumetric flask. Fill the flask about 50 per cent with the solvent mixture and disperse with the aid of ultrasound and dilute with the solvent mixture to volume. Allow the solution to stand for 1 hour. Dilute the solution, if necessary to obtain a solution containing 0.25 mg per ml of Tadalafil. Centrifuge or filter the solution. *(NOTE — The initial concentration before a secondary dilution step should not exceed 6 mg per ml)*.

Reference solution (a). A 0.025 per cent w/v solution of *tadalafil IPRS* in the solvent mixture.

Reference solution (b). To partially convert tadalafil to the 6R,12aS diastereomer, transfer 25 ml of the reference solution into a suitable container. Add 0.25 ml of *5 M sodium hydroxide*, mix well, and let stand for 30 minutes. Neutralize the solution to pH 7 by drop-wise addition of *trifluoroacetic acid*. *(NOTE— This solution is stable for 1 month when stored in a refrigerator)*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 35 volumes of *acetonitrile*, 65 volumes of *water* and 0.1 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

The relative retention time with reference to tadalafil for 6R,12aS diastereomer is about 1.2.

Inject reference solution (a) and (b). The test is not valid unless resolution between the peaks due to tadalafil and the 6R ,12aS diastereomer peak is not less than 3.0 in the chromatogram obtained with reference solution (b) and the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{19}N_3O_4$ in the tablets.

Storage. Store protected from moisture.

Talc

Purified Talc; Talcum

Powdered, selected, natural, hydrated magnesium silicate. Pure talc has the formula $Mg_3Si_4O_{10}(OH)_2$. It may contain variable amounts of associated minerals among which chlorites (hydrated aluminium and magnesium silicates), magnesite (magnesium carbonate), calcite (calcium carbonate) and dolomite (calcium and magnesium carbonate) are predominant.

Category. Pharmaceutical aid (dusting powder).

Description. A white or almost white powder, free from grittiness; readily adheres to the skin; unctuous to the touch.

Production

Talc derived from deposits that are known to contain associated asbestos is not suitable for pharmaceutical use. The manufacturer is responsible for demonstrating by the test for amphiboles and serpentines that the product is free from asbestos. The presence of amphiboles and of serpentines is revealed by infrared spectrophotometry. If detected, the specific morphological criteria of asbestos are investigated by a suitable method of optical microscopy to determine whether tremolite asbestos or chrysotile is present, as described below.

Determine by infrared absorption spectrophotometry (2.4.6).

In the range 740 cm^{-1} to 760 cm^{-1} using scale expansion, any absorption band at 758 cm^{-1} may indicate the presence of tremolite or of chlorite. If the absorption band remains after ignition of the substance under examination at 850 ± 50° for at least 30 minutes, it indicates the presence of the tremolite. In the range 600 cm^{-1} to 650 cm^{-1} using scale expansion, any absorption band or shoulder may indicate the presence of serpentines.

Identification

Test A may be omitted if tests B, C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), shows absorption bands at 3677 ± 2 cm^{-1}, 1018 ± 2 cm^{-1} and 669 ± 2 cm^{-1}.

B. In a platinum crucible, melt a mixture of 0.2 g of *anhydrous sodium carbonate* and 2.0 g of *potassium carbonate*. To the melted mass add 0.1 g of the substance under examination and heat until the mixture is completely melted. Allow to cool and transfer the melted mass into an evaporating dish with 50 ml of hot *water*. Add *hydrochloric acid* until effervescence

https://nhathuocngocanh.com/

ceases. Add 10 ml of *hydrochloric acid* and evaporate to dryness on a water-bath. Allow to cool. Add 20 ml of *water*, heat to boiling and filter (the residue is used for identification test C). To 5 ml of the filtrate add 1 ml of *ammonia* and 1 ml of *ammonium chloride solution* and filter. To the filtrate add 1 ml of *disodium hydrogen phosphate solution*. A white, crystalline precipitate is formed.

C. The residue obtained in identification test B gives the reaction of silicates (2.3.1).

Tests

Acidity or alkalinity. Shake 5.0 g with 25 ml of *carbon dioxide-free water* for 1 minute, filter and add to the filtrate 0.5 ml of *bromothymol blue solution*; the solution is not acidic and requires not more than 0.3 ml of *0.1 M hydrochloric acid* to make it acidic.

Iron (2.3.14). Boil 4.0 g with 25 ml of *water* for 30 minutes, replacing the water lost by evaporation, and filter. The filtrate, after the addition of 5 ml of *nitric acid*, complies with the limit test for iron (10 ppm).

Acid-soluble substances. Not more than 2.0 per cent, determined by the following method. Digest 2.0 g with 40 ml of *dilute hydrochloric acid* for 15 minutes, filter, evaporate the filtrate; to the residue add 0.1 ml of *sulphuric acid* and ignite at 800 ± 25° to constant weight.

Water-soluble substances. To 10 g add 50 ml of *carbon dioxide-free water*, heat to boiling and maintain boiling under a reflux condenser for 30 minutes. Allow to cool, filter through a medium-speed filter paper and dilute to 50.0 ml with *carbon dioxide-free water*. Take 25 ml of the filtrate, evaporate to dryness and heat at 105° for 1 hour. The residue weighs a maximum of 10 mg.

Carbonates. To 1 g add 20 ml of *dilute hydrochloric acid*; no effervescence is produced.

Chlorides (2.3.12). Suspend 2.0 g in 10 ml of *water*, add 10 ml of *2 M nitric acid*, shake for 15 minutes and filter. 10 ml of the filtrate complies with the limit test for chlorides (250 ppm).

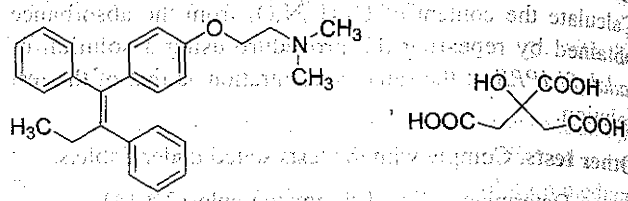
Organic compounds. The residue obtained in the test for Loss on drying is not more than slightly yellow or grey.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 180° for 1 hour.

Microbial contamination (2.2.9). If intended for topical application, the total aerobic viable count is not more than 10^2 CFU per g. If intended for oral administration, the total aerobic viable count is not more than 10^3 CFU per g and total fungal count is not more than 10^2 CFU per g.

Storage. Store protected from moisture.

Tamoxifen Citrate



$C_{26}H_{29}NO,C_6H_8O_7$ Mol. Wt. 563.6

Tamoxifen Citrate is (*Z*)-2-[4-(1,2-diphenylbut-1-enyl)-1-phenoxy]ethyldimethylamine citrate.

Tamoxifen Citrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{26}H_{29}NO, C_6H_8O_7$, calculated on the dried basis.

Category. Antioestrogen.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamoxifen citrate IPRS* or with the reference spectrum of tamoxifen citrate.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 237 nm and 275 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *triethylamine*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A 1.0 per cent w/v solution of *tamoxifen citrate IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 10 mg add 4 ml of *pyridine* and 2 ml of *acetic anhydride* and shake; a yellow colour is produced. Heat in a water-bath for 2 minutes; a pink to red colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

NOTE — Prepare the solutions immediately before use, protect from light.

Test solution. Dissolve 15 mg of the substance under examination in mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.0015 per cent w/v solution of *tamoxifen citrate IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.15 per cent w/v solution of *tamoxifen citrate for performance test IPRS* (containing impurities A and F) in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 0.9 g of *sodium dihydrogen orthophosphate* and 4.8 g of *N,N-dimethyloctylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minutes,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time
Tamoxifen impurity A[1]	0.8
Tamoxifen impurity F[2]	0.9
Tamoxifen (retention time: about 20 minute)	1.0

[1]2-[4-[(E)-1,2-diphenylbut-1-en-1-yl]phenoxy]-N,N-dimethylethan-1-amine((e)-isomer),

[2]2-[4-[(Z)-1,2-diphenylbut-1-en-1-yl]phenoxy]-N-methylethan-1-amine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tamoxifen impurity A and tamoxifen impurity F is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak for test solution. The area of any peak corresponding to tamoxifen impurity A is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to tamoxifen impurity F is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak due to citrate and the area of any peak less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 1.0 g in 150 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphthol-benzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05636 g of $C_{26}H_{29}NO, C_6H_8O_7$.

Storage: Store protected from light and moisture.

Tamoxifen Tablets

Tamoxifen Citrate Tablets

Tamoxifen Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tamoxifen, $C_{26}H_{29}NO$.

Usual strengths: The equivalent of 10 mg, 20 mg and 40 mg of tamoxifen.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. To a quantity of the powdered tablets containing 0.1 g of Tamoxifen add 20 ml of *water*, warm, add 2 ml of *5 M sodium hydroxide* and cool. Extract with two quantities, each of 10 ml, of *ether*, filtering after each extraction. Combine the ether extracts and evaporate to dryness in a stream of nitrogen at room temperature. Dry the residue at a pressure not exceeding 0.7 kPa for 30 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamoxifen citrate IPRS* treated in the same manner or with the reference spectrum of tamoxifen.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* of the residue obtained in test A shows absorption maxima at about 237 nm and 275 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ethyl acetate*, 10 volumes of *methanol* and 1 volume of *strong ammonia solution*.

https://nhathuocngocanh.com/

Test solution. Shake a quantity of the powdered tablets containing 0.1 g Tamoxifen with 10 ml of *methanol*, filter, evaporate the filtrate to dryness on a water-bath, dry the residue at 100° for 30 minutes and dissolve 10 mg of the residue in 10 ml of *methanol*.

Reference solution. A 0.1 per cent w/v solution of *tamoxifen citrate IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg of the residue obtained in the preparation of the test solution in test C in 4 ml of *pyridine*, add 2 ml of *acetic anhydride* and heat on a water-bath for 2 minutes; a pink to red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium, 1000 ml of *0.02 M hydrochloric acid*,

Speed and time. 150 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, dilute if necessary with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{26}H_{29}NO$ in the medium taking 305 as the specific absorbance at 275 nm.

Q. Not less than 75 per cent of the stated amount of $C_{26}H_{29}NO$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use, protect from light.

Test solution. Disperse a quantity of powdered tablets containing 50 mg of tamoxifen in the mobile phase, with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with the mobile phase, centrifuge and filter.

Reference solution (a). A 0.0015 per cent w/v solution of *tamoxifen citrate IPRS* in the mobile phase.

Reference solution (b). A 0.15 per cent w/v solution of *tamoxifen citrate for performance test IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 0.9 g of *sodium dihydrogen orthophosphate* and 4.8 g of *N,N-dimethyloctylamine* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Name	Relative retention time
Tamoxifen E- isomer[1]	0.8
Tamoxifen impurity F[2]	0.9
Tamoxifen (retention time: about 20 minutes)	1.0

[1]2-[4-[(E)-1,2-diphenylbut-1-en-1-yl]phenoxy]-N,N-dimethylethan-1-amine((e)-isomer),

[2]2-[4-[(Z)-1,2-diphenylbut-1-en-1-yl]phenoxy]-N-methylethan-1-amine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tamoxifen E-isomer and tamoxifen impurity F is not less than 3.0 and between the peaks due to tamoxifen impurity F and tamoxifen is not less than 1.5.

Inject reference solution (a), (c) and the test solution. Run the chromatogram twice the retention time of the principal peak for test solution. The area of any peak corresponding to tamoxifen E-isomer is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of all the secondary peaks, excluding tamoxifen E-isomer peak, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore the peak due to citrate and the area of any peak less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Assay using the following solution.

Test solution. Disperse one tablet in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.01 per cent w/v of tamoxifen.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{29}NO$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 5 mg of tamoxifen in 35 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.015 per cent w/v solution of *tamoxifen citrate IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

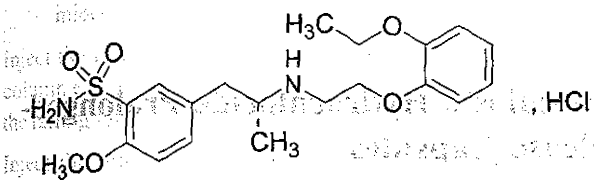
Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{29}NO$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of tamoxifen.

Tamsulosin Hydrochloride



$C_{20}H_{28}N_2O_5S,HCl$ Mol. Wt. 445.0

Tamsulosin Hydrochloride is (*R*)-5-(2{[2-(*o*-ethoxyphenoxy) ethyl]aminopropyl)-2-methoxybenzenesulfonamide hydrochloride.

Tamsulosin Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{28}N_2O_5S,HCl$, calculated on the dried basis.

Category. Uninary tract analgesic.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamsulosin hydrochloride IPRS* or with the reference spectrum of tamsulosin hydrochloride.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at about 279 and 225 nm.

C. Dissolve with heating 0.75 g in *water* and dilute to 100.0 ml with *water*. To 5 ml of the solution, cooled in an ice-bath add 3 ml of *dilute nitric acid* and shake. Allow to stand at room temperature for 30 minutes and filter. The filtrate gives reaction (A) of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). −21.0° to −17.0°, determined in a 0.75 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

A. *Test solution.* Dissolve 50 mg of the substance under examination in 10 ml of the mobile phase.

Reference solution(a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 4 mg of *2-methoxy-5-[(2R)-2-[(2-(2-methoxyphenoxy)ethyl]amino]propyl]benzenesulphonamide IPRS* (*tamsulosin impurity A IPRS*) and 4 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 4 mg of *(2R)-N- [2-(2-ethoxyphenoxy)ethyl]-1-(4-methoxyphenyl)propan-2-amine IPRS* (*tamsulosin impurity B IPRS*) and 4 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 600 ml of *acetonitrile* and 1400 ml of a solution prepared by dissolving 3.0 g of *sodium hydroxide* in a mixture of 8.7 ml of *perchloric acid* and 1900 ml of *water*, adjusted to pH 2.0 with *0.5 M sodium hydroxide* and diluting to 2000 ml with *water*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject reference solution (b). Run the chromatogram 1.5 times the retention time of tamsulosin (retention time = about 6 minutes). The test is not valid unless the resolution between the peaks due to tamsulosin impurity A and tamsulosin is not less than 6.0.

In the chromatogram obtained with the test solution, for each unspecified impurity eluting before tamsulosin, the area of the peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

B. Repeat the chromatographic procedure with the following modifications.

- mobile phase: dissolve 3.0 g of *sodium hydroxide* in a mixture of 8.7 ml of *perchloric acid* and 900 ml of *water*, adjusted to pH 2.0 with *0.5 M sodium hydroxide* and dilute to 2000 ml with *water*; add 2000 ml of *acetonitrile*,
- flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

Inject reference solution (c). Run the chromatogram 5 times the retention time of tamsulosin (retention time = 2.5 minutes). The test is not valid unless the resolution between the peaks due to tamsulosin and tamsulosin impurity B is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, for each unspecified impurity eluting after tamsulosin, the area of any peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of the impurities eluting before tamsulosin in test A and after tamsulosin in test B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

***S*-isomer**. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.05 g of the substance under examination in *methanol* and add sufficient *methanol* to produce 25.0 ml.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *methanol*.

Reference solution (b). Dissolve 5.0 mg of *tamsulosin racemate IPRS* in *methanol* and dilute to 25.0 ml with *methanol*. Dilute 2.0 ml of the solution to 10.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with silica gel OD for chiral separations (Such as Chiralpak AD-H) (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 1 volume of *diethylamine*, 150 volumes of *methanol*, 200 volumes of *anhydrous ethanol* and 650 volumes of *hexane*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

The relative retention with reference to tamsulosin (retention time is about 14 minutes) of tamsulosin impurity C is about 0.8.

Inject reference solution (b). Run the chromatogram for about 20 minutes. The test is not valid unless the resolution between tamsulosin and impurity C (5-[(2*S*)-2-[[2-(2-ethoxyphenoxy) ethyl]amino] propyl]-2-methoxybenzenesulphonamide) is not less than 2.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak obtained due to tamsulosin impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.35 g in 5.0 ml of *anhydrous formic acid*, add 75 ml of a mixture of 2 volumes of *acetic anhydride* and 3 volumes of *glacial acetic acid*. Titrate immediately with *0.1M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0445 g of $C_{20}H_{28}N_2O_5S,HCl$.

Storage. Store protected from light.

Tamsulosin Hydrochloride Prolonged-release Capsules

Tamsulosin Prolonged-release Capsules

Tamsulosin Prolonged-release Capsules manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Tamsulosin Prolonged release Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Tamsulosin hydrochloride, $C_{20}H_{28}N_2O_5S,HCl$.

Usual strengths. 0.2 mg; 0.4 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range 210 nm to 400 nm (2.4.7), the test solution obtained in the Assay exhibits absorption maximum at 225 nm.

Tests

Dissolution (2.5.2). Complies with the test stated under Capsules.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of mixed contents of the capsules containing 0.8 mg of Tamsulosin Hydrochloride in 10 ml of *1 M methanolic hydrochloric acid* with the aid of ultrasound for 15 minutes and with intermittent shaking and

https://nhathuocngocanh.com/

filter through a 0.7-µm glass fibre filter. To 1 volume of the filtrate, add 4 volumes of *1 M methanolic hydrochloric acid*.

Reference solution. Dilute 1.0 ml of the test solution to 500.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 300 volumes of *acetonitrile* and 700 volumes of *water* containing 0.44 per cent v/v *perchloric acid* and 0.15 per cent w/v *sodium hydroxide* previously adjusted to pH 2.0 with *1 M sodium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 7 times the retention time of the principal peak. The retention time of tamsulosin is about 6 minutes. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 7.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Uniformity of content. Complies with the test stated under Capsules.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse the contents of 1 capsule with 10 ml of *1 M methanolic hydrochloric acid* with the aid of ultrasound for 15 minutes and with intermittent shaking, filter through a 0.7-µm glass fibre filter. Dilute 1 volume of the filtrate to 10 volumes with *1 M methanolic hydrochloric acid* and filter through a 0.7-µm glass fibre filter.

Reference solution. A 0.04 per cent w/v solution of *tamsulosin hydrochloride IPRS* in *methanol* with the aid of ultrasound. Dilute 1 volume to 100 volumes with *1 M methanolic hydrochloric acid*.

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5S,HCl$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 1.6 mg of Tamsulosin Hydrochloride in 50 ml of *1 M methanolic hydrochloric acid* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *1 M methanolic hydrochloric acid*, filter using a 0.7-µm glass fibre filter. Dilute 1 volume of the filtrate to 4 volumes with *1 M methanolic hydrochloric acid*.

Reference solution. A 0.04 per cent w/v solution of *tamsulosin hydrochloride IPRS* in *methanol* with the aid of ultrasound. Dilute 1 volume to 100 volumes with *1 M methanolic hydrochloric acid*.

Use chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5S,HCl$ in the capsules.

Tamsulosin Hydrochloride Prolonged-release and Dutasteride Capsules

Tamsulosin Hydrochloride Prolonged-release and Dutasteride Capsules manufactured by different manufacture, whilst complying with the requirements of the monograph are not interchangeable, as the dissolution profile of the products of different manufactures may not be the same.

Tamsulosin hydrochloride Prolonged - release and Dutasteride Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of tamsulosin hydrochloride, $C_{20}H_{28}N_2O_5S,HCl$ and dutasteride, $C_{27}H_{30}F_6N_2O_2$.

Usual strength. Dutasteride, 0.5 mg and Tamsulosin Hydrochloride 0.4 mg.

Identification

A. In the Assay of dutasteride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. In the Assay of tamsulosin hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

For tamsulosin hydrochloride. Complies with the test stated under Tablets.

For Dutasteride —

Apparatus No. 2 (Paddle),

Medium: 500 ml of a buffer solution prepared by dissolving 2.0 g of *sodium chloride* and 7.0 ml *hydrochloric acid* in 800 ml of *water* and add 5.0 g of *sodium lauryl sulphate* and dilute to 1000 ml with *water*,

Speed and time: 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.025 per cent w/v solution of *dutasteride IPRS* in mobile phase. Dilute 2.0 ml of the solution to 500.0 ml with dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40.0 volumes of a buffer solution prepared by 0.05 M *sodium dihydrogen phosphate monohydrate* and adjusted to pH 5.0 with *dilute sodium hydroxide* and 60 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 200 µl.

Inject the reference solution and the test solution.

Q: Not less than 70 per cent of the stated amount of $C_{27}H_{30}F_6N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

For Dutasteride III and Isomer impurity —

Test solution. Disperse a quantity of the powder containing 2 mg of dutasteride in *acetonitrile* and dilute to 10.0 ml with *acetonitrile*.

Reference solution. A 0.0001 per cent w/v solution of *dutasteride IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: A. a buffer solution prepared by *0.02 M potassium dihydrogen phosphate*, adjusted to pH 3.0 with *dilute orthophosphoric acid*,

  B. 90 volumes of *acetonitrile* and 10 volumes of *water*,
- a gradient programme using the conditions given below;
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
20	90	10
30	30	70
40	40	60
60	40	60
61	90	10
70	90	10

Name	Relative retention time
Dutasteride III[1]	0.69
Dutasteride isomer[2]	1.05

[1]3-oxo-4-aza-5a-androst-1-ene-17β-carboxylic acid,

[2]17β-N-[2,5-bis(trifluoromethyl)phenyl]carbomoyl-4-aza-5β-androst-1-ene-3-one.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution. The area of any peak corresponding to dutasteride III and dutasteride isomer is not more than 1.0 per cent, the area of any other secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

For Dutasteride dihydro impurity —

Test solution. Disperse a quantity of the powder containing 3.5 mg of dutasteride in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. A solution containing 0.05 per cent w/v solution of *dutasteride IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) (Such as kromasil 100 silica),
- mobile phase: a mixture of 60 volumes of *n-hexane* and 40 volumes of *1,4 dioxane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with respect to dutasteride for dutasteridedihydro impurity (*17β-N-{2,5-bis(trifluoromethyl) phenyl}carbomoyl-4-aza-5a-androstane-3-one*) is about 1.98.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 3.0.

https://nhathuocngocanh.com/

Inject the test solution. The area of any peak corresponding to dutasteride dihydro impurity is not more than 1.0 per cent, the area of any other secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation.

Uniformity of content. Complies with the test stated under Capsules.

For Dutasteride — Determine by liquid chromatography (2.4.14), solvent mixture and chromatographic system as described under Assay.

Test solution. Transfer the contents of one capsule into a 10.0 ml volumetric flask, add 8 ml of solvent mixture and disperse with the aid of ultrasound for about 30 minutes, cool and dilute with solvent mixture, mix well and filter.

Reference solution. A 0.005 per cent w/v solution of *dutasteride IPRS* in solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}F_6N_2O_2$ in the capsule.

For Tamsulosin hydrochloride — Determine by liquid chromatography (2.4.14), Using reference solution, solvent mixture (a), (b) and chromatographic system as described under Assay.

Test solution. Transfer the contents of one capsule into a 10.0 ml volumetric flask, add 8 ml of solvent mixture(a), and disperse with the aid of ultrasound for about 30 minutes, cool and dilute with solvent mixture (a), mix well and filter. Dilute 5.0 ml of the solution to 10 .0 ml with solvent mixture (b).

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5S,HCl$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

For Dutasteride —

Solvent mixture. 90 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Weigh and transfer a quantity of the mixed contents of 20 capsules containing about 5.0 mg of Dutasteride to a 20.0 ml volumetric flask and dissolve in solvent mixture. Mix well and filter.

Reference solution. A solution containing 0.025 per cent w/v solution of *dutasteride IPRS* in solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 80 volumes of a buffer solution prepared by *0.02 M disodium hydrogen phosphate dihydrate*, adjusted to pH 5.0 with *dilute ortho phosphoric acid* and 20 volumes of *acetonitrile*,

B. 90 volumes of *acetonitrile* and 10 volumes of *water*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	30	70
10	30	70
12	0	100
35	0	100
38	30	70
45	30	70

Inject the reference solution. The test is not valid unless theoretical plates are not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}F_6N_2O_2$ in the Capsules.

For Tamsulosin Hydrochloride — Determine by liquid chromatography (2.4.14).

Solvent mixture (a). A buffer solution prepared by dissolving 4 g of *sodium hydroxide* into a 1000 ml volumetric flask add 100 ml of *water* and dilute to 1000 ml with *methanol*.

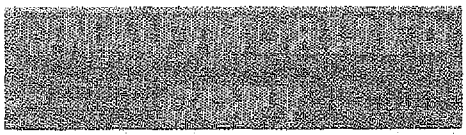
Solvent mixture (b). A solution of 80 volumes of *water* and 20 volumes of *acetonitrile*.

Test solution. Weigh and transfer a quantity of the mixed contents of 20 capsules containing about 5 mg of Tamsulosin Hydrochloride in 50.0 ml volumetric flask add 30 ml of solvent mixture (a), disperse with the aid of ultrasound for 20 minutes, cool and dilute to volume with solvent mixture (a), mix well. centrifuge at 3500 rpm for 15 minutes and use the clear, supernatant liquid. Dilute 5.0 ml of the solution to 25.0 ml with solvent mixture (b).

Reference solution. A 0.002 per cent w/v solution of *tamsulosin hydrochloride IPRS* in solvent mixture (b).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.5 ml of *orthophosphoric acid* in 1000 ml of *water* and 30 volumes of *cetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.



https://nhathuocngocanh.com/

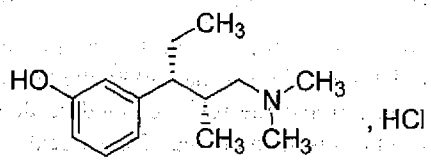
Inject the reference solution . The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5S,HCl$ in the Capsules.

Storage Store protected from light and moisture at a temperature below 30°.

Tapentadol Hydrochloride



$C_{14}H_{23}NO, HCl$ Mol Wt. 257.8

Tapentadol Hydrochloride is (2*R*,3*R*)-3-(1-Dimethylamino-2-methylpentan-3-yl)phenol hydrochloride.

Tapentadol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{23}NO, HCl$, calculated on the dried basis.

Category. Analgesic.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tapentadol hydrochloride IPRS* or with reference spectrum of tapentadol hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) for chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 1.0 per cent w/v of solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −28.5° to −24.5°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and diluted to 50.0 ml of the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *tapentadol hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase. a mixture of 80 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 2.0 ml of *triethyl amine*. Adjusted to pH 2.5 with *orthophosphoric acid* and 20 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. the area of any other secondary peak is not more than 0.5 per cent and sum of the area of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Use the chromatographic system as described under Related substances.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *tapentadol hydrochloride IPRS* in the mobile phase.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference and the test solution.

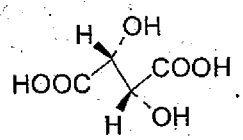
Calculate the content of $C_{14}H_{23}NO, HCl$.

Storage. Store protected from moisture , temperature between 15° to 30°.

https://nhathuocngocanh.com/

Tartaric Acid

L-Tartaric Acid



$C_4H_6O_6$ Mol. Wt. 150.1

Tartaric Acid is (2*R*,3*R*)-2,3-dihydroxybutanedioic acid.

Tartaric Acid contains not less than 99.5 per cent and not more than 101.0 per cent of $C_4H_6O_6$, calculated on the dried basis.

Category. Pharmaceutical aid (buffering agent).

Description. Colourless crystals or a white or almost white crystalline powder.

Identification

A. Ignite a few mg; it gradually decomposes giving off an odour resembling that of burnt sugar (distinction from citric acid).

B. A 10 per cent w/v solution in *distilled water* (solution A) is strongly acidic (2.4.46).

C. It gives reactions (A) and (B) of tartrates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). + 12.0° to + 12.8°, determined in a 20.0 per cent w/v solution.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorides (2.3.12). 20 ml of solution A complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 10 ml of solution A complies with the limit test for sulphates (150 ppm).

Oxalate. Neutralise 10 ml of solution A with *dilute ammonia solution*, add 0.1 ml of *dilute acetic acid* and 10 ml of *calcium sulphate solution*; no opalescence is produced within 20 minutes.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

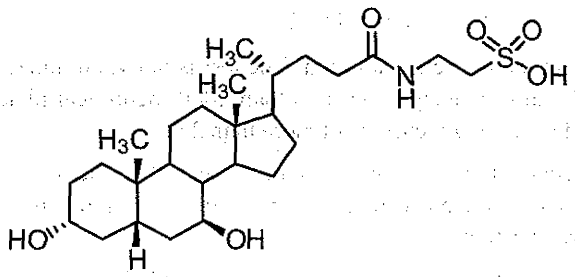
Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 1.0 g in 25 ml of *water* and titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.07505 g of $C_4H_6O_6$.

Storage. Store protected from moisture.

Tauroursodeoxycholic Acid



$C_{26}H_{45}NO_6S$ Mol Wt. 499.7

Tauroursodeoxycholic Acid is 3α, 7β-dihydroxy-5β – cholanoyltaurine.

Tauroursodeoxycholic Acid contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{26}H_{45}NO_6S$, calculated on the anhydrous basis.

Category. Use to dissolve cholesterol gallstones.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tauroursodeoxycholic acid IPRS* or with the reference spectrum of tauroursodeoxycholic acid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 42° to + 48°, determined on 1.0 per cent w/v solution in *ethanol* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *tauroursodeoxycholic acid IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of a solution prepared by dissolving 0.69 g of *sodium dihydrogen orthophosphate* into 1000 ml of *water*, 40 volumes of *methanol*, 30 volumes of *acetonitrile* and 0.1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- refrective index detector set at a constant temperature,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates n and the tailing factor is not more than 2.0.

Inject the test solution. The sum of areas of all the secondary peaks is not more than 3.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *tauroursodeoxycholic acid IPRS* in the mobile phase.

Chromatographic system

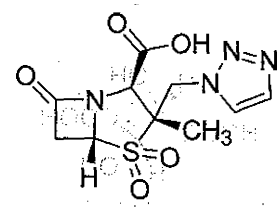
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of a solution prepared by dissolving 0.69 g of *sodium dihydrogen orthophosphate* into 1000 ml of *water*, 40 volumes of *methanol*, 30 volumes of *acetonitrile* and 0.1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- refractive index detector set at a constant temperature,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{45}NO_6S$

Tazobactam



$C_{10}H_{12}N_4O_5S$ Mol. Wt. 300.3

$C_{10}H_{12}N_4O_5S,½H_2O$ Mol. Wt. 309.3

Tazobactam is (2*S*,3*S*,5*R*)-3-methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid,4,4-dioxide hemihydrate.

Tazobactam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}N_4O_5S$, calculated on the anhydrous basis.

Category. Beta-lactamase inhibitor.

Description. A white to pale yellow, non-hygroscopic, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tazobactam IPRS* or with the reference spectrum of tazobactam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 1.8 to 2.8, determined in a 0.25 per cent w/v solution in *water*.

Specific optical rotation (2.4.22). + 160.0° to + 167°, determined at 20° in a 1.0 per cent w/v solution in *dimethylformamide*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions, store and inject at 3°.

Test solution. Use the test solution as given under Assay.

Reference solution. A solution containing 0.0016 per cent w/v of *L-phenylalanine*, 0.0050 per cent w/v of *tazobactam IPRS* and 0.0008 per cent w/v of *tazobactam- related compound A IPRS [(2S,3S)-2-amino-3-methyl-3-sulphino-4-(1H-1,2,3-triazol-1-yl)butyric acid]* in mobile phase.

Use the chromatographic conditions as described under Assay.

https://nhathuocngocanh.com/

Inject the reference solution. The relative retention time with reference to tazobactam for tazobactam- related compound A is about 0.3 and for *L*-phenylalanine is about 0.7.

The test is not valid unless the resolution between tazobactam and *L*-phenylalanine peaks is not less than 6.0.

Inject the test solution. The area of any peak corresponding to tazobactam- related compound A is not more than 1.0 per cent. The area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks other than tazobactam- related compound A is not more than 0.3 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.6 per cent for anhydrous form and between 2.2 per cent to 3.8 per cent for hemihydrate form.

Microbial contamination (2.2.9). The total viable aerobic count does not exceed 10^3 cfu per g and the total combined moulds and yeasts count does not exceed 10^2 cfu per g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions, store and inject at 3°, using a cooled autosampler.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *tazobactam IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 2° to 4°,
- mobile phase: a mixture of a buffer solution prepared by dissolving 1.32 g of *dibasic ammonium phosphate* in about 750 ml of *water*, adjusted to pH 2.5 with 5 per cent v/v solution of *orthophosphoric acid*, dilute to 1000 ml with *water* and 30 ml of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_5S$.

Tazobactam intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

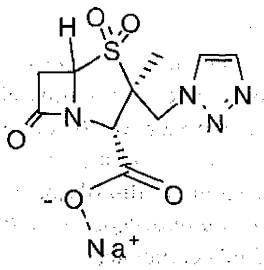
Tazobactam intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.08 Endotoxin Unit per mg of tazobactam.

Storage. Store protected from moisture, preferably at temperature below 30°.

Labelling. The label states whether the material is anhydrous or hemihydrates form.

Tazobactam Sodium



$C_{10}H_{11}N_4NaO_5S$ Mol. Wt. 322.3

Tazobactam Sodium is Sodium (2S,3S,5R)-3-methyl-7-oxo-3-(1*H*-1,2,3-triazol-1-ylmethyl)-4-thia-1-azabicyclo[3.2.0] heptane-2-carboxylic acid,4,4-dioxide.

Tazobactam Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{11}N_4NaO_5S$, calculated on the anhydrous basis.

Category. Beta-lactamase inhibitor.

Description. A white to off-white crystalline hygroscopic powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tazobactam sodium IPRS* or with the reference spectrum of tazobactam sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Gives the reactions of sodium salts (2.3.1).

https://nhathuocngocanh.com/

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). + 140.0° to + 150.0°, determined in a 1.0 per cent w/v solution.

pH (2.4.24). 5.0 to 8.0, determined in a 10.0 per cent w/v solution.

Light absorption (2.4.7). Absorbance of a 10 per cent w/v solution in *water* at about 430 nm is not more than 0.10.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *tazobactam IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *methanol*, 20 volumes of *acetonitrile* and 50 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{11}N_4NaO_5S$ by multiplying the content of $C_{10}H_{12}N_4O_5S$ with 1.073.

Tazobactam Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

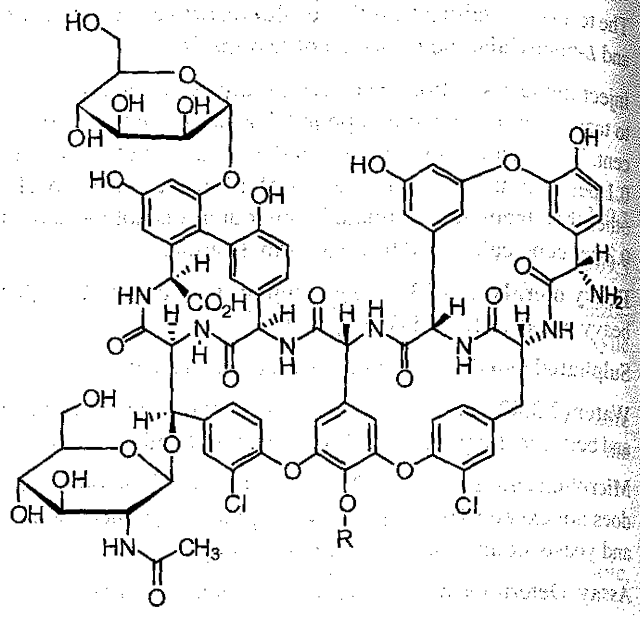
Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of tazobactam sodium.

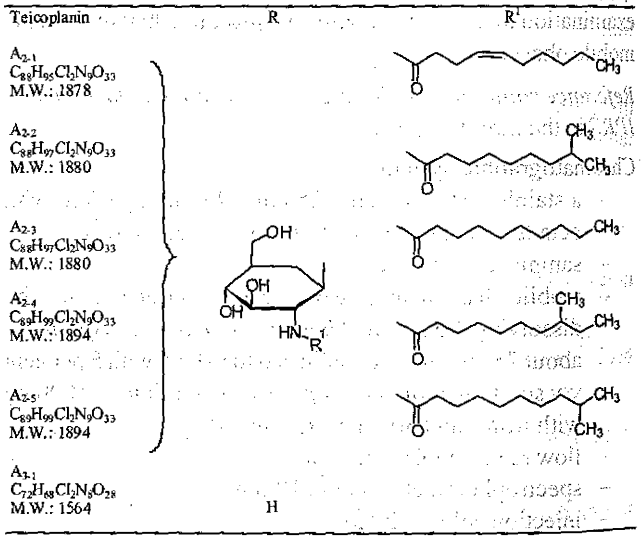
Tazobactam Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Teicoplanin





Category. Glycopeptides antibacterial.

Teicoplanin is a mixture of the glycopeptides produced by the growth of certain strains of *Actinoplanes teichomyceticus sp.* fermentation product. The 6 principle contents of the mixture are teicoplanin A_{2-1} to A_{2-5} and teicoplanin A_{3-1}.

Teicoplanin has a potency of not less than 900 Units per mg, calculated on the anhydrous basis and on sodium chloride free substances.

https://nhathuocngocanh.com/

Description. A yellowish, amorphous powder.

Identification

A. Determine by infrared absorption spectrophotometery (2.4.6). Compare the spectrum with that obtained with *teicoplanin IPRS* or with the reference spectrum of teicoplanin.

B. In the test for Composition and Related substances, the retention time and area of the principal peaks (teicoplanins A_{3-1}, A_{2-1}, A_{2-2}, A_{2-3}, A_{2-4} and A_{2-5}) in the chromatogram obtained with test solution corresponds to the principal peaks in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution (2.4.1). A 8.0 per cent w/v solution in *carbon dioxide- free water* is clear and not more intensely coloured than reference solution BYS3 or BS4.

pH (2.4.24). 6.5 to 7.5, determined in 5.0 per cent w/v solution in *carbon dioxide-free water.*

Composition and Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *water* and dilute to 50.0 ml with *water.*

Reference solution (a). Dissolve 20 mg of *teicoplanin peak identification IPRS* in *water* and dilute to 10.0 ml with *water.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *water.* Dilute 1.0 ml of the solution to 20.0 ml with *water.*

Reference solution (c). Dissolve 50 mg of *mesityl oxide IPRS* in *water* and dilute to 25.0 ml with *water.* Dilute 1.0 ml of the solution to 10.0 ml with *water.* Dilute 1.0 ml of the solution to 100.0 ml with *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with spherical end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 900 volumes of a solution prepared by dissolving 3.0 g of *anhydrous sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *1 M sodium hydroxide solution* and 100 volumes of *acetonitrile,*

  B. a mixture of 300 volumes of a solution prepared by dissolving 3.0 g of *anhydrous sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *1 M sodium hydroxide solution* and 700 volumes of *acetonitrile.*
- a gradient programme using the conditions given below,
- flow rate: 2.3 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	50	50
31	10	90
35	10	90
38	100	0

Name	Relative retention time
Teicoplanin A_{3-1}	0.43
Teicoplanin A_{2-1}	0.93
Teicoplanin A_{2-2} (retention time about 18 minutes)	1.0
Teicoplanin A_{2-3}	1.04
Teicoplanin A_{2-4}	1.12
Teicoplanin A_{2-5}	1.14
Impurities is more than 1.25	

Inject treference solution (a) The test is not valid unless the resolution between the peak due to teicoplanin A_{2-4} and teicoplanin A_{2-5} is not less than 1.0.

The relative retention time with respect to Teicoplanin A_{2-2} peak for of groups and impurities with reference to teicoplanin A_{2-2} are

- Teicoplanin A_3 group is less than 0.7,
- Teicoplanin A_2 group is more than 0.7 and less than 1.25 and within this group,
- Teicoplanin A_{2-1} group is less than 1.0,
- Teicoplanin A_{2-3} group is more than 1 and less than 1.12,
- Teicoplanin A_{2-4} is about 1.12,
- Teicoplanin A_{2-5} group is more than 1.12 and less than 1.25.

Calculate the content of the different components using the following equations.

$$\text{teicoplanin } A_2 \text{ group} = \frac{S_a}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{teicoplanin } A_{2-2} = \frac{S_2}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{teicoplanin } A_{2-1} \text{ group} = \frac{S_1}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{teicoplanin } A_{2-3} \text{ group} = \frac{S_3}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{teicoplanin } A_{2-4} = \frac{S_4}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{teicoplanin } A_{2-5} \text{ group} = \frac{S_5}{S_a + 0.83 \times S_b + S_c} \times 100$$

https://nhathuocngocanh.com/

$$\text{teicoplanin } A_3 \text{ group} = \frac{0.83 \times S_b}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{impurities} = \frac{S_C}{S_a + 0.83 \times S_b + S_c} \times 100$$

Where, S_a = sum of the areas of the peaks due to teicoplanin A_2 group in the chromatogram obtained with the test solution;

S_b = sum of the areas of the peaks due to teicoplanin A_3 group in the chromatogram obtained with the test solution; disregard any peak due to mesityl oxide;

S_c = sum of the areas of the peaks with a relative retention more than 1.25;

S_1 = sum of the areas of the peaks due to teicoplanin $A_{2\text{-}1}$ group in the chromatogram obtained with the test solution;

S_2 = area of the peak due to teicoplanin $A_{2\text{-}2}$ in the chromatogram obtained with the test solution;

S_3 = sum of the areas of the peaks due to teicoplanin $A_{2\text{-}3}$ group in the chromatogram obtained with the test solution;

S_4 = area of the peak due to teicoplanin $A_{2\text{-}4}$ in the chromatogram obtained with the test solution;

S_5 = sum of the areas of the peaks due to teicoplanin $A_{2\text{-}5}$ group in the chromatogram obtained with the test solution.

The area of any secondary peak corresponding to teicoplanin A_2 group is not less than 80.0 per cent; teicoplanin $A_{2\text{-}2}$ group is not less than 35.0 per cent and not more than 55.0 per cent. Teicoplanin $A_{2\text{-}1}$ group is not more than 20.0 per cent, teicoplanin teicoplanin $A_{2\text{-}3}$ group is not more than 20.0 per cent, teicoplanin $A_{2\text{-}4}$ group is not more than 20.0 per cent, teicoplanin teicoplanin $A_{2\text{-}5}$ group is not more than 20.0 per cent and teicoplanin A_3 group is not more than 15.0 per cent and the sum of the areas of all other secondary peak other than mesityl oxide with a relative retention time 1.25 times is not more than 5.0 per cent. Ignore the peak due to teicoplanin $A_{2\text{-}2}$ with an area less than 0.5 times of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent).

Impurity A. Determine by liquid chromatography (2.4.14).

Use the Chromatographic system as described under test for Composition and related substances.

Name	Relative retention time
Teicoplann impurity A[1]	0.6
Teicoplann $A_{2\text{-}2}$ (Retention time: about 18 minutes)	1.0

[1]4-methylpent-3-en-2-one (mesityl oxide).

Inject reference solution (c) and the test solution. The area of peak corresponding to impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent).

Chlorides (2.3.12). Not more than 5.0 per cent expressed as *sodium chloride*, calculated on anhydrous basis, determined by following method.

Dissolve 1.0 g in 300 ml of *water*, stir and acidify with 2 ml of *nitric acid*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 15.0 per cent, determined on 0.30 g

Bacterial endotoxins (2.2.3). Not more than 0.31 Endotoxin units per mg of teicoplanin.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10).

Storage. Store protected from light, at a temperature of 2° to 8°.

Teicoplanin Injection

Teicoplanin Injection is a sterile material consisting of Teicoplanin with or without auxiliary substances. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of Sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for the Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Teicoplanin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of Teicoplanin.

The contents of the sealed container comply with requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual Strengths. 200 mg; 400 mg.

Description. A white or off white to yellowish powder.

https://nhathuocngocanh.com/

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), a 0.005 per cent w/v solution in *water* shows an absorption maximum at about 278 nm.

B. In the composition and related substances, The principal peaks (teicoplanins A_{3-1}, A_{2-1}, A_{2-2}, A_{2-3}, A_{2-4} and A_{2-5}) in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 8.0, determined in 5.0 per cent w/v solution in the carbon dioxide free *water*.

Composition and Related Substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of injection powder containing 400 mg of Teicoplanin, disperse in sufficient *water* with the aid of ultrasound and dilute to 200.0 ml with *water*.

Reference solution. A 0.2 per cent w/v solution of *teicoplanin IPRS* in *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: A. a mixture of 850 volumes of a solution prepared by dissolving 3.9 g of *sodium dihydrogen orthophosphate* in 850 ml of *water* and 150 volumes of *acetonitrile*, adjusted to pH 6.0 with *sodium hydroxide* solution.

  B. a mixture of 300 volumes of a solution prepared by dissolving 3.9 g of *sodium dihydrogen orthophosphate* in 300 ml of *water* and 700 volumes of *acetonitrile*, adjusted to pH 6.0 with *sodium hydroxide* solution.
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
19	70	30
22	50	50
24	100	0
30	100	0

Relative retention of groups and impurities with reference to teicoplanin A_{2-2} is.

Name	Relative retention time
Teicoplanin A_3 group	< 0.70
Teicoplanin A_2	> 0.70 and < 1.25 and within this group
Teicoplanin A_{2-1} group	< 1.00
Teicoplanin A_{2-2}	1.00
Teicoplanin A_{2-3} group	> 1.00 and < 1.12
Teicoplanin A_{2-4}	about 1.12
Teicoplanin A_{2-5} group	> 1.12 and < 1.25
Impurities	> 1.25

Relative retention of principal peaks of the groups with reference to teicoplanin A_{2-2} is.

Name	Relative retention time
Teicoplanin A_{3-1}	about 0.43
Teicoplanin A_{2-1}	about 0.93
Teicoplanin A_{2-2}	1.00
Teicoplanin A_{2-3}	about 1.04
Teicoplanin A_{2-5}	about 1.14

Inject the reference solution. The test is not valid unless the resolution between the peak due to teicoplanin A_{2-4} and teicoplanin A_{2-5} is not less than 1.0.

Inject the test solution.

Calculate the percentage content ratio of the different components using the following equations

$$\text{Teicoplanin } A_2 \text{ group} = \frac{S_a}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{Teicoplanin } A_3 \text{ group} = \frac{0.83 \times S_b}{S_a + 0.83 \times S_b + S_c} \times 100$$

$$\text{Impurities} = \frac{S_c}{S_a + 0.83 \times S_b + S_c} \times 100$$

Where, S_a = sum of the areas of the peaks due to teicoplanin A2 group in the chromatogram obtained with the test solution;

S_b = sum of the areas of the peaks due to teicoplanin A3 group in the chromatogram obtained with the test solution;

S_c = sum of the areas of the peaks with a relative retention more than 1.25;

https://nhathuocngocanh.com/

The area of peaks corresponding to teicoplanin A_2 group is not less than 75.0 per cent, teicoplanin A_3 group is not more than 20.0 per cent and the sum of the areas of all other secondary peaks with a relative retention time more than 1.25 is not more than 5.0 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Bacterial endotoxins (2.2.3). Not more than 0.30 Endotoxin unit per mg of teicoplanin.

Sterility (2.2.11). Complies with the test for sterility.

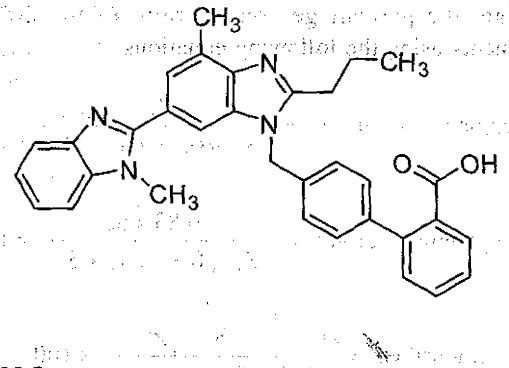
Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) on a solution prepared in the following manner.

Reconstitute teicoplanin for injection as directed in the labeling. Withdraw an accurately measured volume of a resultant solution, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with buffer.

The upper fiducial limit of error is not less than 90.0 per cent and the lower fiducial limit of errors is not more than 120 per cent of the estimated potency.

Storage. Store in a cool place.

Telmisartan



$C_{33}H_{30}N_4O_2$ Mol. Wt. 514.6

Telmisartan is 4'-{[4-methyl-6-(1-methyl-1*H*-benzimidazol-2-yl)-2-propyl-1*H*-benzimidazol-1-yl]methyl}-2-biphenylcarboxylic acid.

Telmisartan contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{33}H_{30}N_4O_2$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white to off-white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *telmisartan IPRS* or with the reference spectrum of telmisartan.

Tests

Appearance of solution. A 5 per cent w/v solution in *1 M sodium hydroxide* is not more intensely coloured than reference solution YS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 5 ml of *methanol*, add 100 µl of a 4 per cent w/v solution of *sodium hydroxide* and dilute to 50.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Thermoquest),
- column temperature: 40°,
- mobile phase: A. dissolve 2.0 g of *potassium dihydrogen phosphate* and 3.8 g of *sodium pentanesulphonate monohydrate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
  B. a mixture of 20 volumes of *methanol* and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
3	70	30
28	20	80
30	70	30

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of areas of all the secondary peaks

https://nhathuocngocanh.com/

is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol*.

Test solution. Dissolve 40 mg of substance under examination in 100.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *telmisartan IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine* and adjusted to pH 2.4 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{30}N_4O_2$.

Storage. Store protected from light and moisture.

Telmisartan Tablets

Telmisartan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of telmisartan, $C_{33}H_{30}N_4O_2$.

Usual strengths. 20 mg; 40 mg; 80 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.5*, prepared by dissolving 13.61 g of *potassium dihydrogen phosphate* in about 800 ml of *water*, adjusted to pH 7.5 with *2M sodium hydroxide*, and diluted with *water* to 1000 ml,
Speed and time. 75 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 296 nm (2.4.7). Calculate the content of $C_{33}H_{30}N_4O_2$ in the medium from the absorbance obtained from a solution prepared by dissolving 44 mg of *telmisartan IPRS* in 1 ml of *0.1M sodium hydroxide*, and dilute to 100 ml with *methanol*. Further dilute the solution with dissolution medium to obtain a solution with a final concentration of 0.0011per cent of *telmisartan*.

Q. Not less than 75 per cent of the stated amount of $C_{33}H_{30}N_4O_2$.

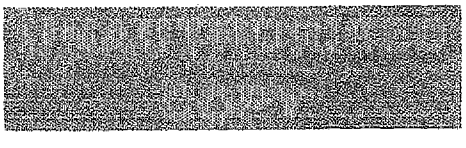
Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 100 mg of Telmisartan in 100.0 ml of solvent mixture with the aid of ultrasound for 45 minutes and filter.

Reference solution. A 0.0005 per cent w/v solution of *telmisartan IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: A. dissolve 0.5 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine*, adjusted to pH 3.2 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume: 20 µl.



https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	78	22
6	80	20
7	70	30
15	60	40
25	60	40
26	40	60
35	20	80
40	78	22

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 40 mg of Telmisartan in 100 ml of the solvent mixture and sonicate for 45 minutes. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *telmisartan IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine* and adjusted to pH 2.4 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{30}N_4O_2$ in the tablets.

Telmisartan and Amlodipine Tablets

Telmisartan and Amlodipine Besylate Tablets; Telmisartan and Amlodipine Besilate Tablets

Telmisartan and Amlodipine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of telmisartan, $C_{33}H_{30}N_4O_2$ and amlodipine, $C_{20}H_{25}ClN_2O_5$.

Usual strengths. Telmisartan, 40 mg and amlodipine, 5 mg; Telmisartan, 80 mg and amlodipine, 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

For Amlodipine —

Apparatus No. 2 (Paddle),
Medium. 500 ml *0.01 M hydrochloric acid*,
Speed and time.75 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution.A 0.001 per cent w/v solution of *amlodipine besylate IPRS* in the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- sample temperature: 10°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 3.43 g *monobasic sodium phosphate dihydrate* and 2 ml of *triethylamine* in 1000 ml of *water* and adjusted to pH 6.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

– spectrophotometer set at 257 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{25}ClN_2O_5$.

For Telmisartan —

Apparatus No. 2 (Paddle),

Medium, 900 ml of *phosphate buffer pH 7.5*, prepared by dissolving 6.8 g of *monobasic potassium phosphate* and 1.52 g *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 7.5 with *dilute sodium hydroxide*,

Speed and time. 75 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Add 5 volumes of *triethylamine* in 500 volumes of *water* and further add 500 volumes of *acetonitrile* and mix.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *telmisartan IPRS* in solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution medium.

Use chromatographic system as described under dissolution of Amlodipine.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{33}H_{30}N_4O_2$.

Q. Not less than 80 per cent of the stated amount of $C_{33}H_{30}N_4O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *0.1M hydrochloric acid* and 90 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets into fine powder. Transfer the powder containing 25 mg of Amlodipine into 100.0 ml volumetric flask and dissolve in about 70.0 ml solvent mixture and sonicate for 45 minutes. After sonication bring the solution into room temperature and dilute to volume up to the mark with solvent mixture.

Reference solution (a). A 0.004 per cent w/v solution of *telmisartan IPRS* in solvent mixture.

Reference solution (b). A solution of *amlodipine besylate IPRS* containing 0.00125 per cent w/v of amlodipine in solvent mixture.

Reference solution (c). Transfer 5ml of reference solution (a) and 2 ml of reference solution (b) in 100.0 ml volumetirc flask and dilute to volume upto the mark with solvent mixture and mix.

Chromatographic system

– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: A. a mixture of 85 volumes of a buffer solution prepared by dissolving 1.36 g *potassium dihydrogen orthophosphate* in 1000.0 ml of *water* and adjusted to pH 3.2 with *orthophosphoric acid* and 15 volumes of *acetonitrile*.

B. a mixture of 15 volumes of a buffer solution prepared by dissolving 1.36 g *potassium dihydrogen orthophosphate* in 1000.0 ml of *water* and adjusted to pH 3.2 with *orthophosphoric acid* and 85 volumes of *acetonitrile*.
– a gradient programme using the conditions given below,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 237 nm,
– injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
7	85	15
15	90	10
20	75	25
35	60	40
40	55	45
45	45	55
50	35	65
55	85	15
60	85	15

Inject reference solution (c). The test is not valid unless the column efficiency for both the peak is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

The relative retention time with reference to amlodipine for Impurity D (3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate) is 0.5. Multiply the peak area of impurity D by correction factor 2.58.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any

https://nhathuocngocanh.com/

peak due to impurity D of amlodipine is not more than the 10 times the area of the amlodipine principal peak in reference solution (c) (1.0 per cent). The area of any secondary peak due to amlodipine and telmisartan is not more than the 5 times the area of the telmisartan principal peak in reference solution (c) (0.5 per cent) and the sum of the areas of the all secondary peaks excluding Impurity D is not more than 20 times the area of the principal peak of telmisartan in the chromatogram obtained with reference solution (c) (2.0 per cent). Ignore any peaks with an area less than 0.5 times of telmisartan peak in chromatogram obtained with reference solution (c) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Use chromatographic condition, reference solution, solvent mixture and system suitability as described under Assay.

Test solution. Transfer 1 tablet into 100.0 ml volumetric flask add about 5.0 ml of mobile phase and sonicate to disperse whole tablet completely, add about 70.0 ml of solvent mixture and sonicate for 90 minutes. After sonication bring the solution into room temperature and dilute up to the mark with solvent mixture, mix and filter. Dilute 5.0 ml of the solution to 25.0 ml with solvent mixture and mix.

Inject reference solution (c) and test solution.

Calculate the content of $C_{20}H_{25}ClN_2O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *0.01 M hydrochloric acid* and 90 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 5 mg of Amlodipine in 50.0 ml volumetric flask, add about 5ml of mobile phase and sonicate add 30.0 ml of solvent mixture and sonicate. After sonication dilute up to the mark with solvent mixture and mix. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture and mix.

Reference solution (a). A 0.08 per cent w/v solution of *telmisartan IPRS* in solvent mixture.

Reference solution (b). A solution of *amlodipine besylate IPRS* containing 0.02 per cent w/v solution of *amlodipine IPRS* in solvent mixture.

Reference solution (c). Dilute reference solution (a) and (b) with the solvent mixture to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolve 2.72 g *potassium dihydrogen orthophosphate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 237 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the column efficiency for both the analyte peak is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{33}H_{30}N_4O_2$ and $C_{20}H_{25}ClN_2O_5$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of amlodipine.

Telmisartan and Hydrochlorothiazide Tablets

Telmisartan and Hydrochlorothiazide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of telmisartan $C_{33}H_{30}N_4O_2$ and not less than 90.0 per cent and not more than 107.5 per cent of the stated amount of hydrochlorothiazide $C_7H_8ClN_3O_4S_2$.

Usual strengths. Telmisartan, 40 mg and Hydrochlorothiazide, 12.5 mg; Telmisartan, 80 mg and Hydrochlorothiazide, 12.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

For Telmisartan —

Apparatus No. 2 (Paddle),
Medium. 900 ml of a *phosphate buffer pH 7.5*, prepared by dissolving 13.61 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *2 M sodium hydroxide*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

https://nhathuocngocanh.com/

For Hydrochlorothiazide —

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution (a). Dissolve a quantity of *telmisartan IPRS* in minimum quantity of *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Reference solution (b). Dissolve a quantity of *hydrochlorthiazide IPRS* in minimum quantity of *methanol* and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system

- a stainless steel column 6 cm x 3.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 5.0 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *diluted phosphoroic acid*,
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- spectrophotometer set at 270 nm for hydrochlorothiazide and 298 nm for telmisartan,
- injection volume: 4 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow rate (ml per min.)
0	85	15	0.6
1.5	85	15	0.6
1.51	60	40	0.6
5.0	60	40	0.6
5.01	20	80	1.0
6.2	20	80	1.0
6.21	85	15	0.6
9.7	85	15	0.6

The relative retention time with reference to telmisartan for hydrochlorothiazide is about 0.33.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor for each peak is not more than 2.5 and the relative standard deviation for replicate injections for each peak is not more than 2.0 per cent.

Inject reference solution (a) and (b) and the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{33}H_{30}N_4O_2$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Reference solution (d). A 0.0025 per cent w/v solution of *4-Amino-6-chloro-1,3-benzenedisulphonamide IPRS* (*benzothiadiazine impurity A IPRS*) in the solvent mixture and further dilute with a solution prepared by diluting equal volumes of mobile phase A and mobile phase B to obtain a final concentration of 0.00005 per cent w/v for telmisartan 40 mg and hydrochlorothiazide 12.5 mg and 0.000025 per cent w/v for telmisartan 80 mg and hydrochlorothiazide 12.5 mg.

Reference solution (e). A solution containing 0.016 per cent w/v of *telmisartan IPRS* and 0.005 per cent w/v *hydrochlorothiazide IPRS* in the solvent mixture. Dilute 1.0 ml of the solution and 2.0 ml of 0.0025 per cent w/v solution of *benzothiadiazine impurity A* RS in the solvent mixture to 100.0 ml with the solvent mixture and further dilute 1.0 ml of the solution to 5.0 ml with a solution prepared by diluting equal volumes of mobile phase A and mobile phase B.

Inject reference solution (c) and (e). The test is not valid unless the resolution between the peaks due to hydrochlorothiazide and benzothiadiazine impurity A in the chromatogram obtained with reference solution (c) is not less than 2.0 and the relative standard deviation for replicate injections for both peaks of telmisartan and hydrochlorothiazide in thechromatogram obtained with reference solution (c) is not more than 2.0 per cent. The signal to noise ratio for the telmisartan, hydrochlorothiazide and benzothiadiazine impurity A peaks in the chromatogram obtained with reference solution (e) is not less than 3.0.

Inject reference solution (c), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to benzothiadiazine impurity A is not more than 6.4 times the area of the benzothiadiazine impurity A peak in the chromatogram obtained with reference solution (d) (1.0 per cent),the area of any individual secondary peak due to telmisartan is not more than 0.005 times the area of the telmisartan peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any individual secondary peak due to hydrochlorothiazide is not more than 0.002 times the area of the hydrochlorothiazide peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of areas of all the secondary peaks due to telmisartan is not more than 0.005 times the area of the telmisartan peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks due to hydrochlorothiazide is not more than 0.02 times the area of the

https://nhathuocngocanh.com/

hydrochlorothiazide peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.005 M methanolic solution of sodium hydroxide.

NOTE — To prevent heat from degrading the sample, do not extend the sonication time and also maintain the bath temperature at a temperature not exceeding 22° by adding ice.

Test solution. Weigh and disperse 10 intact tablets in a suitable volumetric flask, add *0.1 M Sodium hydroxide solution,* not exceeding 5 per cent of the total volume and shake until the tablets are completely dispersed. Add *methanol,* not exceeding 80 per cent of the total volume, mix with the aid of ultrasound for 10 minutes, stir vigorously for 30 minutes, cool and dilute to volume with *methanol* to obtain a solution containing 0.16 per cent w/v of telmisartan. Centrifuge the solution at 4000 rpm and use clear supernatant liquid. Dilute 1.0 ml of the solution to 5.0 ml with a solution prepared by diluting equal volumes of mobile phase A and mobile phase B.

Reference solution (a). A 0.32 per cent w/v solution of *telmisartan IPRS* in the solvent mixture.

Reference solution (b). A 0.05 per cent w/v solution of *hydrochlorothiazide IPRS* in the solvent mixture.

Reference solution (c). Dilute a suitable volume of reference solution (a), reference solution (b) and 0.0025 per cent w/v solution of *benzothiadiazine impurity A* in solvent mixture in equal volumes of mobile phase A and mobile phase B to obtain a solution having similar concentration to the test solution and 0.00005 per cent w/v solution of *benzothiadiazine impurity A.*

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 2.0 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water,* adjusted to pH 3.0 with *diluted phosphoric acid,*
  B. a mixture of equal volumes of *methanol* and *acetonitrile,*
- flow rate: 1.2 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 270 nm for hydrochlorothiazide and 298 nm for telmisartan,
- injection volume: 10 µl.

12.0	20	80
12.1	85	15
15.5	85	15

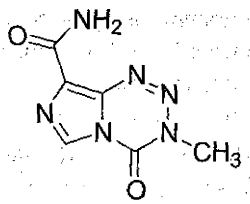
Inject reference solution (c). The test is not valid unless the resolution between the peaks due to hydrochlorothiazide and benzothiadiazine impurity A is not less than 2.0 and the relative standard deviation for replicate injections for both peaks of telmisartan and hydrochlorothiazide is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{33}H_{30}N_4O_2$ and $C_7H_8ClN_3O_4S_2$ in the tablet.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Temozolomide



$C_6H_6N_6O_2$ Mol. Wt. 194.2

Temozolomide is 3,4-dihydro-3-methyl-4-oxoimidazo[5,1-*d*]-1,2,3,5-tetrazine-8-carboxamide.

Temozolomide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_6N_6O_2$, calculated on anhydrous basis.

Category. Anticancer.

Description. A white to light pink or light tan powder.

NOTE— Temozolomide is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *temozolomide IPRS* or with the reference spectrum of temozolomide.

https://nhathuocngocanh.com/

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Shake the solutions to dissolve. Do not sonicate.

Test solution. Dissolve 100 mg of the substance under examination in *dimethylsulphoxide* and dilute to 100.0 ml with *dimethylsulphoxide. (NOTE – Use freshly opened bottle)*

Reference solution (a). A 0.0001 per cent w/v solution of *temozolomide IPRS* in *dimethylsulphoxide.*

Reference solution (b). Mix 5 ml of *0.1 M hydrochloric acid* and 5 ml of 0.1 per cent w/v solution of *temozolomide IPRS in dimethylsulphoxide.* Heat the mixture in a water-bath for 1hour. [*The preparation forms 2-azahypoxanthine, temozolomide acid and aminoimidazolecarboxamide.*]

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase : a mixture of 96 volumes of 0.5 per cent v /v solution of *glacial acetic acid* in *water* and 4 volumes of *methanol* containing 0.094 per cent w/v of *sodium 1-hexanesulphonate,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
2-Azahypoxanthine[1]	0.42	0.63
Temozolomide related compound A[2]	0.53	—
Temozolomide acid[3]	0.84	—
Temozolomide	1.0	—
Aminoimidazolecarboxamide[4]	1.37	0.4
Cyanotemozol omide[5,6]	2.3	—

[1]4a,5-dihydro-4H -imidazo[4,5-d][1,2,3]triazin-4-one,

[2]4-diazo-4H -imidazole-5-carboxamide,

[3]3-methyl-4-oxo-3,4-dihydroimidazo[5,1-d][1,2,3,5]tetrazine -8-carboxylic acid,

[4]5-aminoimidazole-4-carboxamide. Two peaks may be observed, use the sum of the peak areas for calculation,

[5]3-methyl-4-oxo-3,4-dihydroimidazo[5,1-*d*][1,2,3,5]tetrazine-8-carbonitrile,

[6]If possible from the manufacturing process.

Inject reference solution (b).The test is not valid unless the resolution between the peaks due to temozolomide acid and temozolomide is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram 3.2 times the retention time of the principal peak. The area of any peak due to 2-azahypoxanthine is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak due to temozolomide related compound A is not more than 5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any peak corresponding to temozolomide acid and aminoimidazolecarboxamide, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to cyanotemozol omide is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.4 per cent, using method 3.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances using following modifications.

Reference solution. A 0.1 per cent w/v solution of *temozolomide IPRS* in *dimethylsulphoxide.*

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.9 and the relative standard deviation of replicate injections is not more than 1.5.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_6N_6O_2$.

Storage. Store protected from light and moisture.

Temozolomide Capsules

Temozolomide Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of temozolomide, $C_6H_6N_6O_2$.

CAUTION —Temozolomide is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Usual strengths. 20 mg; 100 mg; 250 mg.

https://nhathuocngocanh.com/

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

Other tests. Comply with tests stated under capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of mixed contents of 20 capsules containing 20 mg of Temozolomide in 100.0 ml of mobile phase.

Reference solution. A 0.02 per cent w/v solution of *temozolomide IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 90 volumes of 0.5 per cent v/v *acetic acid* and 10 ml volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 329 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_6N_6O_2$ in the capsules.

Storage. Store protected from light and moisture.

Temozolomide Injection

Temozolomide Injection is a sterile, lyophilized material consisting of Temozolomide with or without excipients. It is filled in a sealed container.

Temozolomide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of temozolomide, $C_6H_6N_6O_2$.

NOTE — Temozolomide is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strength. 100 mg.

Storage. The reconstituted solution stand at room temperature, must be used within 14 hours, including infusion time.

The content of the sealed container comply with the requirements stated under Parenteral Preparation (Powder for Injection) and with the following requirement.

Identification

A. Disperse a quantity of injection containing 50 mg of temozolomide in *methylene chloride* with the aid of ultrasound for 30 minutes and filter. Evaporate the filtrate under a stream of nitrogen to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *temozolomide IPRS* treated in similar manner or with the reference spectrum of temozolomide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.28). 3.0 to 4.5, determined on a freshly constituted vial of temozolomide injection, using 40 ml *carbon- dioxide free water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Reconstitute 5 vials with each of 40 ml of *water*, with the aid of ultrasound, combine and dilute to 250.0 ml with water. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *temozolomide IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Transfer 50 ml of *0.1 M hydrochloric acid* and 50 ml of reference solution (a) to a suitable glass container. Heat the container at 80° for 4 hours. Dilute 10.0 ml of the solution to 25.0 ml with the mobile phase. *(NOTE — the preparation forms 2-azahypoxanthine, temozolomide acid and aminoimidazole carboxamide).*

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 2° to 8°,
- mobile phase: a mixture of 96 volumes of 0.5 per cent v/v solution of *glacial acetic acid* in *water* and 4 volumes of *methanol* containing 0.094 per cent w/v of *sodium 1-hexanesulphonate*,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,
– spectrophotometer set at 270 nm,
– injection volume: 75 µl.

Name	Relative retention time	Correction factor
2-Azahypoxanthine[1]	0.4	0.63
Temozolomide related compound A[2]	0.5	—
Temozolomide acid[3]	0.9	1.32
Temozolomide	1.0	—
Aminoimidazolecarboxamide[4]	1.4	0.29
Cyanotemozolomide[5]	2.3	

[1]4a,5-dihydro-4H -imidazo[4,5-d][1,2,3]triazin-4-one,

[2]4-diazo-4H -imidazole-5-carboxamide, (This is a process impurity and include for peak identification only),

[3]3-methyl-4-oxo-3,4-dihydroimidazo[5,1-d][1,2,3,5]tetrazine -8-carboxylic acid,

[4]5-aminoimidazole-4-carboxamide,

[5]3-methyl-4-oxo-3,4-dihydroimidazo[5,1-d][1,2,3,5]tetrazine-8-carbonitrile (This is a process impurity and include for peak identification only).

Inject reference solution (c) and (d). The test is not valid unless the resolution between the peaks due to temozolomide and aminoimidazole carboxamide is not less than 2.5 in the chromatogram obtained with reference solution (c) and the signal to noise ratio is not less than 10 in the chromatogram obtained with reference solution (d).

Inject reference solution (b) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak for the test solution. The area of any peak corresponding to 2-azahypoxanthine is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of any peak corresponding to temozolamide acid is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks other than peaks corresponding to temozolamide related compound A and cyanotemozolamide is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.88 Endotoxin Units per mg of temozolomide.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

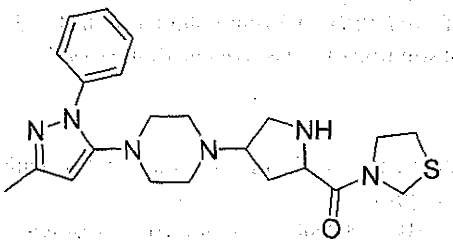
Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_6H_6N_6O_2$ in the injection.

Storage. Store protected from light and moisture, at a temperature 2° to 8°.

Teneligliptin Hydrobromide Hydrate



$C_{22}H_{30}N_6OS, 2½ HBr, xH_2O$ Mol. Wt.628.9

Teneligliptin Hydrobromide Hydrate is {(2*S*,4*S*)-4-[4-(3-methyl-1-phenyl-1*H*-pyrazol-5-yl)piperazine-1-yl]pyrrolidine-2-yl} (1,3-thiazolidine-3-yl) methanone hemipentahydrobromide hydrate.

Teneligliptin Hydrobromide Hydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{30}N_6OS$, 2½ HBr, calculated on the anhydrous basis.

Category. Antidiabetic.

Description. An off white to cream coloured powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *teneligliptin hydrobromide hydrate IPRS* or with the reference spectrum of teneligliptin hydrobromide hydrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Hydrobromic acid content. Not less than 28.0 per cent w/w and not more than 34.0 per cent w/w, calculated on the anhydrous basis, determine by liquid chromatography

https://nhathuocngocanh.com/

(2.4.14), as described under Assay with following modifications:

Reference solution. A 0.003 per cent w/v solution of *hydrobromic acid IPRS* in the solvent mixture.

Calculate the content of HBr.

Enantiomeric purity. Not more than 0.5 per cent. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in 25.0 ml of *ethanol.*

Reference solution (a). A 0.02 per cent w/v solution of *R-isomer IPRS [{(2R,4R)-4-[4-(3-Methyl-1-phenyl-1H-pyrazol-5-yl)piperazine-1-yl]pyrrolidine-2-yl}(1,3-thiazolidine-3-yl)methanone hemipentahydrobromide hydrate IPRS]* in *ethanol.*

Reference solution (b). Weigh about 100 mg of *teneligliptin hydrobromide hydrate IPRS* to a 50-ml volumetric flask, add 5.0 ml of reference solution (a), dissolve and dilute to volume with *ethanol.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with chiral Pak IC (5 µm),
- mobile phase: a 0.1 per cent w/v solution of *diethylamine* in *ethanol.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time of R- isomer peak is about 0.61 with respect to teneligliptin peak.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to R-isomer and teneligliptin is not less than 3.0.

Inject the test solution and measure the area of the *R*-isomer.

Calculate the content of the *R*-isomer by area normalization.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile.*

Test solution. Dissolve about 50 mg of substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution each of *teneligliptin impurity A IPRS, impurity B IPRS* and *impurity C IPRS* in the solvent mixture.

Reference solution (b). Weigh and transfer about 50 mg of *teneligliptin hydrobromide hydrate IPRS* to a 50-ml volumetric flask, add 5.0 ml of reference solution (a), dissolve and dilute to volume with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with phenyl group bonded to porous silica (5 µm) (Such as Inertsil Ph-3),
- mobile phase: A. a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* and 1g of *1-octane sulphonic acid sodium salt* in 1000 ml of *water*, adjusted to pH 2.7± 0.03 with *dilute orthophosphoric acid,*

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
7	75	25
35	60	40
45	50	50
50	75	25
60	75	25

Name	Relative retention time	Correction factor
Hydrobromic acid	0.09	—
Impurity A[1]	0.46	0.58
Impurity C[2]	0.58	1.70
Impurity B[3]	1.96	0.81

[1]1-3-methyl-1-phenyl-5-pyrazolyl) piperazine,

[2]tert-butyl(2*S*)-4-hydroxy-2-(thiazolidine-3-carbonyl) pyrrolidine-1-carboxylate,

[3]tert-butyl(2*S*,4*S*)-4-(4-(3-methyl-1-phenyl-1*H*-pyrazol-5-yl) piperazine-1-yl)-2-(thiazolidine-3-carbonyl) pyrrolidine-1-carboxylate.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity C and teneligliptin is not less than 4.0.

Inject the test solution. The area of the peak due to impurity A, impurity B and impurity C is not more than 0.5 per cent. The area of any other secondary peak is not more than 0.3 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation. Ignore the peak due to hydrobromic acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 2.8 per cent to 6.0 per cent, determined on 0.25 g.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile.*

Test solution. Dissolve about 50 mg of substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *teneligliptin hydrobromide hydrate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with phenyl group bonded to porous silica (5 µm) (Such as Inertsil Ph-3),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* and 1g of *1-octane sulphonic acid sodium salt* into 1000 ml of *water*; adjusted to pH 2.7± 0.03 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}N_6OS$, 2½ HBr.

Teneligliptin Tablets

Teneligliptin Hydrobromide Hydrate Tablets

Teneligliptin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of teneligliptin, $C_{22}H_{30}N_6OS$.

Usual strength. 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water,*

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.0033 per cent w/v solution of *teneligliptin hydrobromide hydrate IPRS* in the dissolution medium.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 1000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}N_6OS$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{30}N_6OS$.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 1 g of *1-octane sulphonic acid sodium salt anhydrous* in 900 ml of *water.* Adjusted to pH 3.1 with *dilute orthophosphoric acid* and dilute to 1000 ml with *water.*

Solution B. A mixture of 50 volumes of solution A, 10 volumes of *water* and 40 volumes of *acetonitrile.*

Test solution. Weigh and transfer intact tablets containing about 100 mg of teneligliptin in 250-ml volumetric flask. Add about 200 ml of solution B and sonicate for 15 minutes with intermittent swirling. Cool and dilute to volume with solution B, filter.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Peerless Basic),
- mobile phase: A. a mixture of 82 volumes of solution A and 18 volumes of *acetonitrile,*
  B: a mixture of 50 volumes of solution A and 50 volumes of *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	52	48
5	52	48
30	0	100
31	52	48
40	52	48

https://nhathuocngocanh.com/

The relative retention time with reference to teneligliptin for teneligliptin impurity A [1-(3-methyl -1-phenyl-5-pyrazolyl) piperazine] is about 0.52.

Inject the test solution. The area of peak corresponding to teneligliptin impurity A, multiplied with the correction factor 0.59 is not more than 1.0 per cent. The area of any other secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalisation. Ignore any peak due to hydrobromic acid obtained with the test solution at relative retention time about 0.09.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Weigh and transfer intact tablets containing about 100 mg of Teneligliptin in 500-ml volumetric flask. Add about 10 ml of *water* and sonicate. Add about 350 ml of the solvent mixture and sonicate for 15 minutes with intermittent swirling. Cool and dilute to volume with the solvent mixture, filter. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A 0.0059 per cent w/v solution of *teneligliptin hydrobromide hydrate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Eurosphere II 100-5),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* and 1g of *1-octane sulphonic acid sodium salt monohydrate* into 1000 ml of *water*, adjusted to pH 2.7 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 1000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}N_6OS$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of teneligliptin.

Teneligliptin and Metformin Hydrochloride Prolonged-release Tablets

Teneligliptin and Metformin Hydrochloride Sustained-release Tablets; Teneligliptin and Metformin Hydrochloride Extended-release Tablets

Teneligliptin and Metformin Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Teneligliptin and Metformin Hydrochloride Prolonged-release Tablets contain teneligliptin hydrobromide hydrate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of teneligliptin, $C_{22}H_{30}N_6OS$ and metformin hydrochloride, $C_4H_{11}N_5$ HCl.

Usual strengths. Teneligliptin, 20 mg and Metformin hydrochloride, 500 mg; Teneligliptin, 20 mg and Metformin hydrochloride, 1000 mg.

Identification

A. In the Assay for teneligliptin, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. In the Assay for metformin hydrochloride, the absorbance maxima obtained with the test solution corresponds to the absorbance maxima at same wavelength obtained with the reference solution.

Tests

Dissolution (2.5.2).

For Teneligliptin —

Apparatus No. 2 (Paddle),

Medium. 1000 ml of phosphate buffer pH 6.8 prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 6.8 with *1M sodium hydroxide*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Solvent mixture. Equal volumes of *isopropyl alcohol* and *water*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.02 per cent w/v solution of *teneligliptin hydrobromide hydrate IPRS* in the solvent

https://nhathuocngocanh.com/

mixture. Dilute a suitable volume of the solution with the dissolution medium to obtain a solution having similar concentration as that of the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 3.48 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.2 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}N_6OS$ in the medium.

Q: Not less than 70 per cent of the stated amount of $C_{22}H_{30}N_6OS$.

For Metformin Hydrochloride — Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

For Teneligliptin —

Solvent mixture. 70 volumes of *water* and 30 volumes of *acetonitrile*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Teneligliptin in 70 ml of *water*, with the aid of ultrasound for 25 minutes and dilute to 100.0 ml with *water*. Centrifuge the solution at 3000 rpm for 10 minutes. Use the supernatant liquid.

Reference solution. A solution containing 0.05 per cent w/v, each of, *teneligliptin impurity A IPRS, teneligliptin impurity B IPRS* and *teneligliptin hydrobromide hydrate IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 2.16 g of *octane sulphonic acid sodium salt* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to teneligliptin impurity A and B, each of, is not more than 0.5 times the area of the corresponding peaks in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore the peak due to metformin hydrochloride and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

For Metformin hydrochloride —

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Metformin Hydrochloride in 70 ml of *water*, with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with *water*.

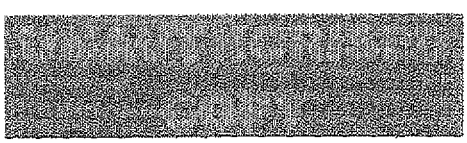
Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (b). A 0.0001 per cent w/v solution of *dicyandiamide IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 0.87 g of *sodium pentane-1 sulphonic acid* and 1.2 g of *sodium chloride* in 1000 ml of *water*, adjusted to pH 3.5 with *dilute orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak for test solution. The area of any peak corresponding to dicyandiamide is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak due to teneligliptin.



https://nhathuocngocanh.com/

Uniformity of content. Complies with the test stated under Tablets.

For Teneligliptin — Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse 1 tablet in sufficient quantity of the solvent mixture, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute with the solvent mixture to obtain a solution containing 0.02 per cent w/v of Teneligliptin. Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}N_6OS$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under dissolution for Teneligliptin with following modifications.

For Teneligliptin —

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Teneligliptin in 70 ml of the solvent mixture, with the aid of ultrasound for 25 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *teneligliptin hydrobromide hydrate IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{22}H_{30}N_6OS$ in the tablets.

For Metformin hydrochloride —

Test solution. To a quantity of the powdered tablets containing 0.5 g of Metformin Hydrochloride, add 10 g of *sodium dihydrogen orthophosphate* and 80 ml of *water*, stir the solution on magnetic stirrer for 1 hour with intermittent shaking and dilute to 1000.0 ml with *water*. Dilute 2.0 ml of the solution to 100.0 ml with *water*.

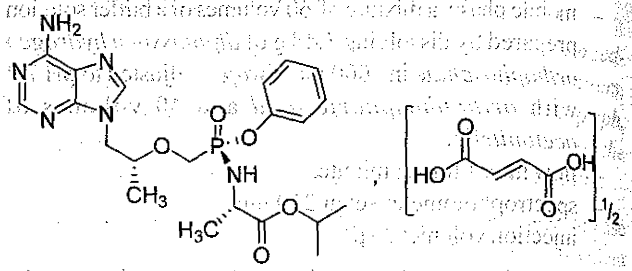
Reference solution. To 100 mg of *metformin hydrochloride IPRS*, add 1 g of *sodium dihydrogen orthophosphate* and 80 ml of *water*, sonicate for 2 minutes and dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*.

Measure the absorbance of the reference solution and the test solution at 233 nm (2.4.7). Calculate the content of $C_4H_{11}N_5$, HCl in tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of teneligliptin and metformin hydrochloride.

Tenofovir Alafenamide Fumarate



$C_{23}H_{31}N_6O_7P$ Mol. Wt. 534.5

Tenofovir Alafenamide Fumarate is propan-2-yl N-[(S)-({[(2R)-1-(6-amino-9H-purin-9-yl) propan-2-yl] oxy}methyl) (phenoxy) phosphoryl]-*L*-alaninate hemi(2E)-but-2-enedioate.

Tenofovir Alafenamide Fumarate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{31}N_6O_7P$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white to off- white powder or light tan powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tenofovir alafenamide fumarate IPRS* or with the reference spectrum of tenofovir alafenamide fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *tetrahydrofuran* and 30 volumes of *acetonitrile*.

Buffer solution. Dissolve 0.7 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 6.0 with *glacial acetic acid*.

Test solution. Dissolve 25 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution. A 0.005 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in mobile phase A. Dilute 1.0 ml of the solution to 100.0 ml with mobile phase A.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solutions and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to PMPA anhydro impurity is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any peak corresponding to monophenyl PMPA, PMPA monoamidate, methyl impurity, ethyl impurity, n-propyl impurity and PMPA bisamidate, each of, is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any peak corresponding to diastereomer-1 is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 20 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent). Ignore peak due to tenofovir impurity, fumaric acid and diastereomer-2 or 3.

Fumaric acid and tenofovir impurity. 10.3 per cent to 11.4 per cent of fumaric acid and not more than 1.0 per cent of tenofovir impurity.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of mobile phase A and 5 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (a). A 0.05 per cent w/v solution of *fumaric acid IPRS* in the solvent mixture.

Reference solution (b). A 0.005 per cent w/v solution of *tenofovir impurity IPRS* in the solvent mixture.

Reference solution (c). Dilute 5.0 ml each of reference solution (a) and (b) to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, stable bond aqueous column (5 µm) (Such as zorbax SB-aq),
- column temperature: 35°,
- sample temperature: 4°,
- mobile phase: A. a buffer solution prepared by dissolving 1.4 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
  B. a mixture of 90 volumes of *acetonitrile* and 10 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Tenofovir alafenamide (Retention time: about 17 minutes)	1.0

[1](2E)-but-2-enedioic acid,

[2]({[1-(6-amino-9*H*-purin-9-yl)propan-2-yl]oxy}methyl) phosphonic acid.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 for fumaric acid and tenofovir peak and the relative standard deviation for replicate injections is not more than 1.0 per cent for fumaric acid peak and not more than 5.0 per cent for tenofovir impurity peak.

Inject reference solution (c) and the test solution.

Calculate the content of fumaric acid and tenofovir impurity.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *ethanol* and dilute to 25.0 ml with *ethanol*.

Reference solution. A 0.001 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in *ethanol*.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with chiral Pak AD-H (5 µm),
- column temperature: 15°,
- sample temperature: 5°,
- mobile phase: a mixture of 60 volumes of *n-hexane* and 25 volumes of *isopropyl alcohol*, 15 volumes of *ethanol* and 0.1 volume of *methanesulphonic acid*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Name	Relative retention time
Diastereomer-3[1]	0.58
Diastereomer-2[2]	0.65
Enantiomer Impurity[3]	0.85
Tenofovir alafenamide	1.0

[1]Propan-2-yl N[({[1-(6-amino-9H-purin-9yl)propan-2-yl]oxy}methyl) (phenoxy) phosphoryl] alaninate (2E)-but-2-enedioate,

[2]Propan-2-yl N[({[1-(6-amino-9H-purin-9yl)propan-2-yl]oxy}methyl) (phenoxy) phosphoryl] alaninate (2E)-but-2-enedioate,

[3]Propan-2-yl N[(R)-({[(2S)-1-(6-amino-9H-purin-9-yl)propan-2-yl]oxy}methyl) (phenoxy) phosphoryl]-D-alaninate(2E)-but-2-enedioate.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to diastereomer-3, diastereomer-2 and enantiomer peak, each of, is not more than 0.15 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the same solvent.

https://nhathuocngocanh.com/

Reference solution. A 0.05 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in the solvent mixture

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as X-Bridge Phenyl),
- sample temperature: 5°,
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 3.4 g of *tetrabutyl ammonium hydrogen sulphate* in 1000 ml of *water* and add 5 ml of *triethylamine*, adjusted to pH 2.0 with *orthophosphoric acid*, 5 volumes of *acetonitrile*, 5 volumes of *methanol* and 5 volumes of *tetrahydrofuran*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{31}N_6O_7P$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Tenofovir Alafenamide Tablets

Tenofovir Alafenamide Fumarate Tablets

Tenofovir Alafenamide Tablets contain Tenofovir Alafenamide Fumarate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tenofovir alafenamide, $C_{21}H_{29}N_6O_5P$.

Usual strength. 25 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *phosphate buffer pH 6.8*,

Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, diluted if necessary, with the dissolution medium.

Reference solution. A 0.031 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in *water*. Dilute 1.0 ml of the solution to 10.0 ml with the dissolution medium.

Chromatographic system
- a stainless steel column 5 cm × 2.1 mm, packed with octadecylsilane bonded to porous silica (1.7 µm) (Such askinetex XB, 100 Å),
- column temperature: 35°,
- mobile phase: A. a 0.1 per cent v/v solution of *trifluoroacetic acid*,
  B. *acetonitrile*,
- flow rate: 0.8 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	96.5	3.5
0.1	96.5	3.5
0.8	10	90
1.2	10	90
1.3	96.5	3.5

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{29}N_6O_5P$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{29}N_6O_5P$.

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. 70 volumes of *tetrahydrofuran* and 30 volumes of *acetonitrile*.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Tenofovir Alafenamide in 5 ml of *water*, with the aid of ultrasound and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with equal volumes of *water* and *methanol*.

Reference solution. A 0.011 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with equal volumes of *water* and *methanol*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Ace 5),
- sample temperature: 5°,

https://nhathuocngocanh.com/

– mobile phase: A, a mixture of 99 volumes of solution prepared by dissolving 2.31 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute glacial acetic acid* and 1 volume of Solution A,
B, a mixture of 50 volumes of solution prepared by dissolving 2.31 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute glacial acetic acid* and 50 volumes of Solution A,

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of tenofovir impurity peak is not more than 1.25 times the area of the peak in the chromatogram obtained with the reference solution (1.25 per cent), the area of monophenyl PMPA and PMPA monoamidate impurity peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) , the area of PMPA anhydro impurity peak is not more than 0.8 times the area of the peak in the chromatogram obtained with the reference solution (0.8 per cent) and the area of any other secondary peak is not more than 0.2 times the area obtained with the reference solution (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 3.5 times the area of the peak in the chromatogram obtained with the reference solution (3.5 per cent). Ignore peak due to fumaric acid.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 70 volumes of *terhahydrofuran* and 30 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 250 mg of Tenofovir Alafenamide in 5 ml of *water*, with the aid of ultrasound and dilute to 250.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with equal volumes of *water* and *methanol*.

Reference solution. A 0.11 per cent w/v solution of *tenofovir alafenamide fumarate IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with equal volumes of *water* and *methanol*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Ace 5),
- sample temperature: 8°,
- mobile phase: A. a mixture of 99 volumes of solution prepared by dissolving 2.31 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 6.0 with *dilute glacial acetic acid* and 1 volume of the solvent mixture,

  B. a mixture of 50 volumes of solution prepared by dissolving 2.31 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute glacial acetic acid* and 50 volumes of solvent mixture,
- flow rate: 0.8 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
5	70	30
8	65	35
15	60	40
20	60	40
25	70	30
35	70	30

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

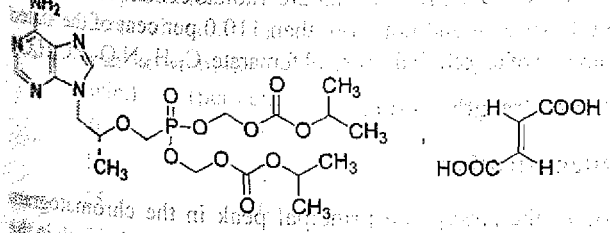
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{29}N_6O_5P$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of tenofovir alafenamide.

Tenofovir Disoproxil Fumarate



$C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ Mol. Wt. 635.5

Tenofovir Disoproxil Fumarate salt of bis(isopropyloxycarbonyloxymethyl ester of (*R*)-9-(2-phosphonomethoxypropyl)adenine with fumaric acid.

Tenofovir Disoproxil Fumarate contain not less than 97.0 per cent and not more than 102. 0 per cent of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$, calculated on the anhydrous basis.

Category. Antiviral.

Description. A white to off- white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tenofovir disoproxil fumarate IPRS* or with the reference spectrum of tenofovir disoproxil fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 3.5 g of *potassium dihydrogen phosphate* and 1.7 g of *tertabutyl ammonium hydrogen sulphate* in 800 ml of *water*, adjusted to pH 6.0 with *1M sodium hydroxide* and dilute to 1000 ml with *water*.

Test solution. Dissolve 10 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A 0.0005 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in *water*.

Reference solution (b). Dissolve 10 mg of *fumaric acid* in 50.0 ml of *water*.

Reference solution (c). Heat the test solution in a boiling water-bath for 20 minutes.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- sample temperature: 6°,
- mobile phase: A. a mixture of 2 volumes of *acetonitrile*, 20 volumes of the buffer solution and 78 volumes of *water*.

  B. a mixture of 65 volumes of *acetonitrile*, 20 volumes of the buffer solution and 15 volumes of *water*,
- flow rate: 1 ml per minutes,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	81	19
5	81	19
40	49	51
60	0	100
65	0	100
70	81	19
80	81	19

The relative retention time with reference to tenofovir disoproxil fumarate for tenofovir monoester is about 0.5.

Inject reference solution (c). The test is not valid unless the resolution between the tenofovir disoproxil fumarate peak and tenofovir monoester peak is not less than 25.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with test solution, the area of tenofovir monoester (impurity A) is not more than twice the area multiplied with correction factor of 0.62 of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore any peak corresponding to the peak in the chromatogram obtained with reference solution (b) and any peak having area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Fumaric Acid. 17.5 per cent to 19.0 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution. Dissolve 25 mg of the *fumaric acid* in 50 ml of the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a buffer solution prepared by adding 0.1 per cent v/v of *triethylamine* in *0.05M sodium dihydrogen phosphate*, adjusted to pH 2.3 with *orthophosphoric acid* and filtered,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of fumaric acid.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and carry out the test protected from light.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a buffer solution prepared by adding 1 ml *triethylamine* to *0.05M sodium dihydrogen phosphate*, adjusted to pH 2.3 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Storage. Store protected from light in a refrigerator (2° to 8°).

Tenofovir Disoproxil Fumarate Tablets

Tenofovir Disoproxil Fumarate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Usual strength. 300 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at the same wavelength as the reference solution.

Tests

Dissolution (2.5.2).
Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes

Withdraw a suitable volume of the medium and filter promptly. Use the filtrate, dilute if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 260 nm. Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *tenofovir disoproxil fumarate IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 100 mg of Tenofovir Disoproxil Fumarate and disperse in 50 ml of *methanol* and filter.

Reference solution (a). A 0.2 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in *methanol*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *methanol*.

Reference solution (c). Dissolve 10 mg of *fumaric acid* in 50 ml of *methanol*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 3.8 with *glacial acetic acid*,

  B. *methanol*,
- flow rate: 1.5 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3.5 times the area of the peak in the chromatogram obtained with reference solution (b) (3.5 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with the reference solution (b) (6.0 per cent). Ignore the peak corresponding to the peak in the chromatogram obtained in the reference solution (c).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *water* and *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 300 mg of Tenofovir Disoproxil Fumarate in 100 ml of solvent mixture and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A 0.120 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 7.8 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water*, adding 1 ml of *triethylamine* and adjusted to pH 2.3 with *orthophosphoric acid (10 per cent v/v)*, and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Tenofovir and Emtricitabine Tablets

Tenofovir Disoproxil Fumarate and Emtricitabine Tablets

Tenofovir and Emtricitabine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ and emtricitabine, $C_8H_{10}FN_3O_3S$.

Usual strength. Tenofovir disoproxil fumarate 300 mg and Emtricitabine 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle)

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.32 per cent w/v of *tenofovir disoproxil fumarate IPRS* and 0.24 per cent w/v of *emtricitabine IPRS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system given under Assay.

Inject the reference solution and the test solution.

Calculate the contents of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$ in the medium.

Q. Not less than 75 per cent of the stated amounts of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

For Emtricitabine —

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing 50 mg of Emtricitabine, disperse in 5 ml of *methanol*, dilute to 50 ml with mobile phase A and filter.

Reference solution (a). A 0.1 per cent w/v solution of *emtricitabine IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system,

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 1.9 g of ammonium *acetate* in 1000 ml of *water*, adjusted to pH 3.8 with *glacial acetic acid*, and 5 volumes of *methanol*,
  B. a filtered mixture of 30 volumes of the buffer solution and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	100	0
35	0	100
55	0	100
60	100	0
75	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 500 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

For Tenofovir Disoproxil Fumarate —

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Tenofovir Disoproxil Fumarate and disperse in 50 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Reference solution (c). Dissolve 10 mg of *fumaric acid* in 50 ml of *methanol*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 3.8 with *glacial acetic acid*,

https://nhathuocngocanh.com/

B. *methanol*,

– flow rate: 1.5 ml per minute,
– a gradient programme using the conditions given below,
– spectrophotometer set at 260 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5
75	95	5

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3.5 times the area of the peak in the chromatogram obtained with reference solution (b) (3.5 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with reference solution (b) (6.0 per cent). Ignore the peak corresponding to the peak in the chromatogram obtained in reference solution (c).

Other tests. Comply with the tests stated under the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Tenofovir Disoproxil Fumarate in 10 ml of *water* and dilute to 250.0 ml with *methanol*. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A solution containing 0.025 per cent w/v of *emtricitabine IPRS* and 0.04 per cent w/v of *tenofovir disoproxil fumarate IPRS* in *methanol*. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

– a stainless steel column 5 cm x 4.6 mm packed with octylsilane bonded to porous silica (3 µm),
– column temperature: 40°,
– mobile phase: A. a buffer solution prepared by dissolving 1.35 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid*,

B. a mixture of 20 volumes of the buffer solution and 80 volumes of *acetonitrile*,

– flow rate: 1.5 ml per minute,
– a gradient programme using the conditions given below,
– spectrophotometer set at 260 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	94	6
3	94	6
5	50	50
8	35	65
9	94	6
12	94	6

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates for the peak due to tenofovir disoproxil, 500 theoretical plates for the peak due to emtricitabine and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the contents of $C_{19}H_{30}N_5O_{10}P$, $C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Tenofovir Disoproxil Fumarate, Lamivudine and Efavirenz Tablets

Tenofovir Disoproxil Fumarate, Lamivudine and Efavirenz Tablets contain not less than 90.0 per cent and not more than 110.0 per cent each of the stated amounts of tenofovir disoproxil fumarate $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$, lamivudine $C_8H_{11}N_3O_3S$ and efavirenz $C_{14}H_9ClF_3NO_2$.

Usual strength. Tenofovir Disoproxil Fumarate 300 mg, Lamivudine 300 mg and Efavirenz 600 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For lamivudine and tenofovir disoproxil fumarate—

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

https://nhathuocngocanh.com/

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.03 per cent w/v each of *lamivudine IPRS* and *tenofovir disoproxil fumarate IPRS* prepared by dissolving in a mixture of equal volumes of *methanol* and *water* and diluted with the dissolution medium.

Use chromatographic system as described under Assay.

The retention time of tenofovir disoproxil is about 4.5 minutes and lamivudine is about 1.3 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates for tenofovir disoproxil and 800 theoretical plates for lamivudine peak. The tailing factor for both lamivudine and tenofovir disoproxil peaks is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of lamivudine, $C_8H_{11}N_3O_3S$ and tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of lamivudine, $C_8H_{11}N_3O_3S$ and tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

For efavirenz—

Apparatus No. 2 (Paddle),
Medium. 1000 ml of 2.0 per cent w/v solution of *sodium lauryl sulphate solution,*
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.
Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.06 per cent w/v solution of *efavirenz IPRS* prepared by dissolving in *methanol* and diluting with the dissolution medium.

Chromatographic system
- a stainless steel column 5.0 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 30 volumes of buffer solution prepared by dissolving 2.16 g of *sodium octanesulphonate* in 1000 ml of 0.1 per cent v/v of *triethylamine*, adjusted to pH 2.0 with *orthophosphoric acid* and 70 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency for efavirenz is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of efavirenz, $C_{14}H_9ClF_3NO_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of efavirenz $C_{14}H_9ClF_3NO_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 6 g of Efavirenz, 3 g of Lamivudine and 3 g of Tenofovir Disoproxil Fumarate and transfer into 1000-ml volumetric flask. Add about 300 ml of *water*, disperse with the aid of ultrasound and add 400 ml of *methanol* and sonicate for 30 minutes with intermittent swirling, dilute to volume with *methanol*, filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the solvent mixture.

Reference solution. A solution containing 0.03 per cent w/v each of *lamuvidine IPRS* and *tenofovir disoproxil fumarate IPRS* and 0.06 per cent w/v of *efavirenz IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 5.0 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. dissolve 2.16 g of *sodium octanesulphonate* in 1000 ml of 0.1 per cent v/v *triethylamine*, adjusted to pH 2.0 with *orthophosphoric acid*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
2.0	60	40
3.0	25	75
4.5	25	75
5.0	60	40
6.5	60	40

The retention time of tenofovir Disoproxil is about 4.5 minutes, efavirenz is about 5.0 minutes and lamivudine is about 1.3 minutes.

UNAUTHORISED COPY

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates for tenofovir disoproxil, 800 theoretical plates for lamivudine and 1000 theoretical plates for efavirenz. The tailing factor for each peak is not more than 2.0 and the relative standard deviation for replicate injections of each peak is not more than 2.0 per cent.

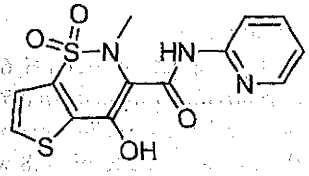
Inject the reference solution and the test solution.

Calculate the content of efavirenz $C_{14}H_9ClF_3NO_2$, lamuvidine $C_8H_{11}N_3O_3S$, and tenofovir disoproxil fumarate $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the amount of lamivudine, tenofovir disoproxil fumarate and efavirenz.

Tenoxicam



$C_{13}H_{11}N_3O_4S_2$ Mol. Wt. 337.4

Tenoxicam is 4-Hydroxy-2-methyl-N-(pyridin-2-yl)-2H-thieno[2,3-e]1,2-thiazine-3-carboxamide1,1-dioxide.

Tenoxicam contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{11}N_3O_4S_2$, calculated on the anhydrous basis.

Category. Analgesic; antiinflammatory.

Description. A yellow crystalline powder. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tenoxicam IPRS* or with the reference spectrum of tenoxicam.

If the spectra obtained in solid state show difference, dissolve the substance under examination and reference substance separately in minimum volume of *methylene chloride*. Evaporate to dryness and record new spectra using the residues.

Tests

Appearance of solution. A 0.5 per cent w/v solution in *methylene chloride* is clear (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protect from light.

Solvent mixture. Equal volumes of *acetonitrile* and *water*, adjusted to pH 3.2 with *dilute orthophosphoric acid*.

Test solution. Dissolve 35 mg of the substance under examination in the solvent mixture with the aid of ultrasound and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve the content of a vial of *tenoxicam impurity mixture IPRS* (containing impurities B, G and H) in 1.0 ml of the test solution.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with diisopropylcyanosilane bonded to porous silica (3.5 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 25 volumes of *methanol*, 75 volumes of *water*, adjusted to pH 3.2 with *dilute orthophosphoric acid*,
  B. a mixture of 25 volumes of *water* and 75 volumes of *methanol*, adjusted to pH 3.2 with *dilute orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	96	4
5	96	4
16	76	24
25	76	24
26	96	4
30	96	4

Name	Relative retention time	Correction factor
Tenoxicam impurity A[1]	0.10	0.2
Tenoxicam impurity G[2]	0.85	—
Tenoxicam impurity H[3]	0.90	—
Tenoxicam (Retention time: about 12 minutes)	1.0	—
Tenoxicam impurity B[4]	1.30	2.0

[1]Pyridin-2-amine,

[2]4-hydroxy-2-methyl-2*H*-thieno[2,3-e]1,2-thiazine-3-carboxamide1,1-dioxide,

https://nhathuocngocanh.com/

[3-[(methylamino)sulfonyl]thiophene-2-carboxylic acid, [4]methyl 4-hydroxy-2-methyl-2*H*-thieno[2,3-e]1,2-thiazine-3-carboxylate 1,1-dioxide.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tenoxicam and tenoxicam impurity H (or G if peaks are inverted) is not less than 1.3 and the resolution between the peaks due to tenoxicam impurity G and tenoxicam impurity H is not less than 1.3.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to tenoxicam impurity A multiplied with correction factor 0.2 and tenoxicam impurity B multiplied with correction factor 2.0, each of, is not more than 1.5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent) the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.25 g of the substance under examination in 5 ml of *anhydrous formic acid* and add 70 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03374 g of $C_{13}H_{11}N_3O_4S_2$.

Storage. Store protected from light.

Tenoxicam Tablets

Tenoxicam Tablets contain not less than 92.5 per cent and not more than 105.0 per cent of the stated amount of tenoxicam, $C_{13}H_{11}N_3O_4S_2$.

Usual strength. 20 mg

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 4 volumes of *anhydrous formic acid*, 30 volumes of *acetone* and 70 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the powdered tablets containing 20 mg of Tenoxicam in 20 ml of *dichloromethane*, with the aid of ultrasound for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.1 per cent w/v solution of *tenoxicam IPRS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatograms obtained with the reference solution.

Tests

Dissolution (2.5.2)

Apparatus No. 2 (Paddle),
Medium. 900 ml of phosphate buffer pH 6.8 prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 500 ml of *water*, add 2 ml of *1M sodium hydroxide* and dilute with *water* to 1000 ml. Adjusted to pH 6.8 with *1M sodium hydroxide* or 10 per cent w/v solution of *orthophosphoric acid* as required.
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of filtrate with dissolution medium if necessary. Measure the absorbance of filtered solution at maximum at about 368 nm (2.4.7). Calculate the content of tenoxicam, $C_{13}H_{11}N_3O_4S_2$ in the medium from the absorbance obtained from a solution of known concentration of *tenoxicam IPRS* in dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{13}H_{11}N_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.
Test solution. Weigh a quantity of the powdered tablets containing 100 mg of Tenoxicam, disperse in 50 ml of the solvent mixture with the aid of ultrasound for 70 minutes with intermittent shaking and dilute to 100.0 ml with the solvent mixture. Allow to stand for 10 minutes, dilute 5.0 ml of the clear supernatant liquid to 20.0 ml with the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution (b). A 0.0625 per cent w/v solution of *2-pyridylamine* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

– a stainless steel column 25 cm × 4.0 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Nucleosil C8),

– mobile phase: a mixture of 7 volumes of 0.012 per cent w/v solution of *sodium dodecyl sulphate* in *methanol* and 10 volumes of *0.05 M potassium dihydrogen orthophosphate* and adjusted to pH 2.8 with *orthophosphoric acid*,

– flow rate: 0.7 ml per minute,

– spectrophotometer set at 254 nm and 290 nm,

– injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-pyridylamine is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent) at 290 nm, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent) at 254 nm.

Other tests. Comply with tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as stated under Related substances with the following modifications.

Test solution. Disperse 10 intact tablets in 200.0 ml of the solvent mixture, with the aid of ultrasound for 70 minutes with intermittent shaking. Allow to stand for 10 minutes, dilute a volume of clear supernatant liquid with the mobile phase to obtain a solution containing 0.025 per cent w/v of Tenoxicam and filter.

Reference solution. A 0.1 per cent w/v solution of *tenoxicam IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

– spectrophotometer set at 290 nm.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

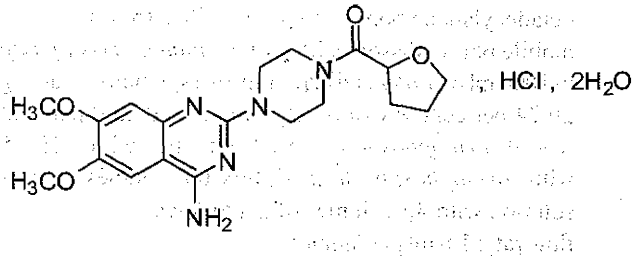
Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{11}N_3O_4S_2$ in the tablets.

Storage. Store protected from light.

Terazosin Hydrochloride

Terazosin Hydrochloride Dihydrate



$C_{19}H_{25}N_5O_4,HCl,2H_2O$ Mol. Wt. 459.9

Terazosin Hydrochloride is (*RS*)-6,7-dimethoxy-2-[4-(tetrahydrofuran-2-carbonyl)piperazin-1-yl]quinazolin-4-ylamine hydrochloride dihydrate.

Terazosin Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{25}N_5O_4,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white or slightly yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *terazosin hydrochloride IPRS* or with the reference spectrum of terazosin hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon-dioxide free water* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 3.0 to 5.0, determined in 2.0 per cent w/v solution in *carbon-dioxide free water*.

Impurities N and O. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the solvent mixture.

Reference solution (a). Dissolve 5 mg each of *2-chloro-6,7-dimethoxyquinazolin-4-amine (terazosin impurity A IPRS)* and *1-[[(2RS)-tetrahydrofuran-2-yl]carbonyl]piperazine IPRS (terazosin impurity N) IPRS* in *acetonitrile*, add 5 ml of the test solution and dilute to 50 ml with *acetonitrile*. Dilute 10.0 ml of the solution to 100.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2.8 g of *sodium laurylsulphate* in 1000 ml of *water* and add 11 ml of a solution containing 20.24 per cent w/v of *triethylamine* and 23.0 per cent w/v of *orthophosphoric acid* and adjusted to pH 2.5 with *orthophosphoric acid*; mix 60 volumes of this solution with 40 volumes of *acetonitrile,*
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The relative retention time with reference to terazosin for 1,4-bis[(tetrahydrofuran-2-yl)carbonyl]piperazine (terazosin impurity O) is about 0.2, for terazosin impurity N is about 0.3 and for terazosin impurity A is about 0.4. The test is not valid unless the resolution between the peaks due to terazosin impurity A and N is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of each peak corresponding to terazosin impurity N and terazosin impurity O is not more than the area of the peak due to terazosin in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100 ml with the mobile phase. Dilute 5.0 ml of the solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *terazosin for system suitability IPRS* (containing terazosin impurity A, terazosin impurity B (1-(4-hydroxy-6,7-dimethoxyquinazolin-2-yl)-4-[[(2*RS*)-tetrahydrofuran-2-yl] carbonyl]piperazine), terazosin impurity C (6,7-dimethoxy-2-(piperazin-1-yl)quinazolin-4-amine), terazosin impurity J (1-(4-amino-6,7-dimethoxyquinazolin-2-yl)-4-[(2*RS*)-2-hydroxy-pentanoyl]piperazine), terazosin impurity K (prazosin) and terazosin impurity M (1,4-bis(furan-2-ylcarbonyl) piperazine) in 10 ml of the mobile phase.

Reference solution (c). Dissolve 5 mg of *1-(furan-2-ylcarbonyl)piperazine IPRS (terazosin impurity L IPRS)* in 100 ml of the mobile phase. Dilute 1.0 ml of the solution to 100 ml with the mobile phase.

Reference solution (d). To 5 mg of *2,2-(piperazine-1,4-diyl)bis(6,7-dimethoxyquinazolin-4-amine) IPRS (terazosin impurity E IPRS)* add 70 ml of *methanol* and 30 ml of *water.* Allow to stand for at least 1 hour to dissolve the substance.

Chrmatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: mix 2 volumes of *triethylamine*, 350 volumes of *acetonitrile*, and 1650 volumes of a solution containing 0.6 per cent w/v of *sodium citrate* and 1.425 per cent w/v of *anhydrous citric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to terazosin impurity B and terazosin impurity J is not less than 1.5.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to terazosin impurity A, C, E and K, each of, is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of secondary peak corresponding to terazosin impurity L is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent), the area of secondary peak corresponding to terazosin impurity B, J, M, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Multiply the peak areas of the impuirites by the correction factor for calculating the contents, for impuirty C is 0.7 and for impuirty M is 1.6, the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 7.0 to 8.6 per cent, determined on 0.2 g.

Assay. Dissolve 0.3 g in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

https://nhathuocngocanh.com/

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04239 g of $C_{19}H_{26}ClN_5O_4$.

Storage. Store protected from light.

Terazosin Tablets

Terazosin Hydrochloride Tablets

Terazosin Tablets contain Terazosin Hydrochloride.

Terazosin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terazosin, $C_{19}H_{25}N_5O_4$.

Usual strengths. 1 mg; 2 mg; 4 mg; 5 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 10 mg of terazosin in 50 ml of *0.1 M hydrochloric acid* with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid*. Dilute 5.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid* and filter. The filtrate when examined in the range from 200 nm to 400 nm (2.4.7) shows an absorption maximum similar to that obtained with the same concentration of *terazosin hydrochloride IPRS* in *0.1 M hydrochloric acid*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 900 ml of *water*,

Speed and time: 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the resulting solution at the maximum at about 245 nm (2.4.7). Calculate the content of $C_{19}H_{25}N_5O_4$ in the medium from the absorbance obtained from a solution of known concentration of *terazosin hydrochloride IPRS*, prepared by dissolving in the dissolution medium to get similar concentration as that of the test solution.

Q: Not less than 75 per cent of the stated amount of $C_{19}H_{25}N_5O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 15 mg of terazosin in 25 ml of the mobile phase with the aid of ultrasound for 10 minutes and with mechanical shaking for about 20 minutes and dilute to 50.0 ml with the mobile phase, filter through 0.45 µm nylon or teflon filter.

Reference solution (a). A solution of *terazosin hydrochloride IPRS* in the mobile phase to obtain 0.0003 per cent w/v of terazosin.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 6 volumes of *acetonitrile* and 19 volumes of buffer solution prepared by dissolving 4.1 g of *monobasic potassium phosphate* and 1.1 g of *sodium 1-heptanesulphonate monohydrate* in 950 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 10 µl.

Name	Relative retention time	Relative response factor
Piperazinyl-ADMQ[1]	0.52	1.1
Terazosin Hydrochloride	1.0	—
Chloro ADMQ[2]	1.37	1.2
Bis-ADMQ-piperazine[3]	3.85	1.0

[1] *N*-(4-Amino-6,7 dimethoxy-2-quinazolinyl)piperazine,

[2] 2-Chloro-4-amino-6,7 dimethoxy-2-quinazoline,

[3] *N,N*-Bis-(4-amino-6,7 dimethoxy-2-quinazolinyl)piperazine.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor is not more than 2.0 in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. Run the test solution 4.5 times the retention time of the principal peak. The area of any peak corresponding to piperazinyl-ADMQ, chloro ADMQ and bis-ADMQ piperazine, each of, is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.2 per cent).

Uniformity of content. Determine by liquid chromatography (2.4.14), as described under Assay using following modification.

UNCONTROLLED COPY

https://nhathuocngocanh.com/

Test solution. Transfer one tablet to 20 ml of solvent mixture, disperse with the aid of ultrasound for about 20 minutes, cool and dilute, with sufficient of the solvent mixture, to produce a solution containing 0.005 percent w/v tearzosin, mix and shake well, filter.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use an all-glass syringe.

Solvent mixture. 40 volumes of *0.01 M methanolic hydrochloric acid* and 60 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of terazosin in 100 ml of the solvent mixture with the aid of ultrasound for 10 minutes and mechanical shaking for further 10 minutes and dilute to 200.0 ml with the solvent mixture and filter.

Reference solution. A 0.0055 per cent w/v solution of *terazosin hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*, add 1 volume of *glacial acetic acid*, filter and pipet 0.2 volume of *diethylamine* into the solution,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

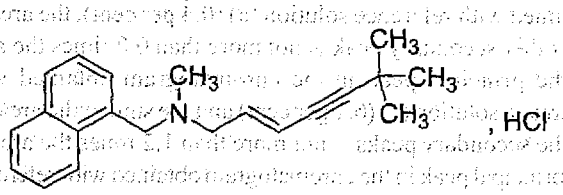
Inject the reference solution. The test is not valid unless the tailing factor is not morre than 2.0 and the relative standard deviation for replicate injections is not more than 2.0

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak.

Calculate the content of $C_{19}H_{25}N_3O_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Terbinafine Hydrochloride



$C_{21}H_{25}N,HCl$ Mol. Wt. 327.9

Terbinafine Hydrochloride is *N*-(6, 6-dimethyl-2-hepten-4-ynyl)-N-methyl-,(E)-,hydrochloride.

Terbinafine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{25}N,HCl$, calculated on the dried basis.

Category. Antifungal.

Description. A white, crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *terbinafine hydrochloride IPRS* or with the reference spectrum of terbinafine hydrochloride.

B. It gives reaction (A) of chloride (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Solution A. 300 volumes of *methanol* A and 200 volumes of *acetonitrile.*

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of *solvent mixture.*

Reference solution (a). A solution containing 0.00005 per cent w/v each of *terbinafine hydrochloride IPRS, terbinafine related compound A IPRS, terbinafine related compound B IPRS, terbinafine related compound C IPRS and terbinafine related compound D IPRS;* in the solvent mixture.

Reference solution (b). A 0.000025 per cent w/v solution of *terbinafine hydrochloride IPRS* from reference solution (a) in the solvent mixture.

Reference solution (c). A 0.1 per cent w/v solution of *terbinafine hydrochloride IPRS* and 0.0005 per cent w/v solution of *terbinafine related compound B IPRS* in the solvent mixture.

Reference solution (d). A 0.05 per cent w/v solution of *terbinafine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- buffer solution: A buffer solution prepared by dissolving 2.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 7.5 with *dilute acetic acid,*
- mobile phase: A. 70 volumes of solution A and 30 volumes of buffer solution,
  B. 95 volumes of solution A and 5 volumes of buffer solution,
- flow rate: 0.8 ml per minute,

[1]*N*-Methyl-1-(naphthalene-1-yl)methanamine also known as *N*-methyl-*C*-(naphthalene-2-yl)methanamine.

[2]trans-Isoterbinafine or (*E*)-*N*,6,6-trimethyl-*N*-(napthalen-1-ylmethyl)hept-2-en-4-yn-1-amine.

[3]cis-Terbinafine or (z)-*N*,6,6-trimethyl-*N*-(naphthalene-1-ylmethyl)hept-2-en-4-yn-1-amine.

[4]4-Methylterbinafine or (E)-N,6,6-trimethyl-*N*-((4-methylnaphthalen-1-yl)methyl)hept-2-en-4-yn-1-amine.

[5](2*E*,4*E*)-4-(4,4-Dimethylpent-2-ynylidene)-N^1, N^5-dimethyl-N^1, N^5-bis(naphthalene-1-ylmethyl)pent-2-ene-1,5-diamine.

Inject reference solution (c). The test is not valid unless the resolution between terbinafine releted compound B and terbinafine peaks is not less than 2.0.

Inject reference solution (a). The relative standard deviation of replicate injections is not more than 10.0 per cent for peak due to terbinafine hydrochloride.

Inject reference solution (b). The signal-to- noise ratio is not less than 10.0 for peak due to terbinafine hydrochloride.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of impurity due to terbinafine related compound A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of impurity due to terbinafine related compound C is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of impurity due to terbinafine related compound B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of impurity due to terbinafine related compound D is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of impurity due to terbinafine diamer is not more than the, 0.5 times the area of peak due to terbinafine in the chromatogram obtained with reference solution (a) (0.05 per cent) , the area of any other secondary peak is not more than the area of the peak due to terbinafine hydrochloride in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the peak due to terbinafine hydrochloride in the chromatogram obtained with reference solution (a) (0.3 per cent). Disregard any peak which is 0.5 times the area of the peak due to terbinafine hydrochloride in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (d). The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (d) and the test solution.

Calculate the content of $C_{21}H_{25}N,HCl$.

Storage. Store protected from light and moisture.

Terbinafine Cream

Terbinafine Hydrochloride Cream

Terbinafine Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbinafine hydrochloride, $C_{21}H_{25}N,HCl$ in a suitable cream base.

Usual strength. 1 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Shake a quantity of the cream containing about 25 mg of Terbinafine Hydrochloride with 70.0 ml of the mobile phase, warm on a water-bath at 55° for 10 minutes. Cool to room temperature. Sonicate with intermittent swirling to obtain uniform dispersion and dilute to 100.0 ml with mobile phase and filter.

Reference solution. A 0.000125 per cent w/v solution of *terbinafine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 28 volumes of *acetonitrile*, 10 volumes of *methanol*, 62 volumes of *0.05 M phosphate buffer* prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, 0.1 volume of *orthophosphoric acid* and 0.1 volume of *triethylamine*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 224 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the cream containing about 25 mg of Terbinafine Hydrochloride with 70 ml of the *methanol*, warm on a water-bath at 55° for 10 minutes with intermittent swirling. Sonicate for 15 minutes with intermittent swirling to obtain a uniform dispersion. Cool to room temperature and dilute to 100.0 ml with *methanol* and filter. Further dilute 5.0 ml to 25.0 ml with mobile phase.

Reference solution. Dissolve 25 mg of *terbinafine hydrochloride IPRS* in 30 ml of *methanol* and dilute to 50.0 ml with the *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 500 volumes of *water*, 400 volumes of *acetonitrile*, 100 volumes of *methanol*, 1 volume of *orthophosphoric acid* and 1 volume of *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume: 20 µl.

Inject the reference solution, the test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}N$,HCl in the cream.

Storage. Store at a temperature not exceeding 30°. The cream should not be allowed to freeze.

Terbinafine Tablets

Terbinafine Hydrochloride Tablets

Terbinafine Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbinafine, $C_{21}H_{25}N$.

Usual strength. 250 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a *citrate buffer pH 3.0*, prepared by dissolving 7.9 g of citric acid anhydrous and 2.3 g *sodium citrate* in *water*.

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with *citrate buffer* if necessary, at the maximum at about 283 nm (2.4.7). Calculate the content of terbinafine, $C_{21}H_{25}N$, in the medium from the absorbance obtained by repeating the determination using a solution of known concentration of *terbinafine hydrochloride IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{25}N$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 20 mg of terbinafine with 50 ml of the mobile phase

https://nhathuocngocanh.com/

and mix with the aid of ultrasound for 20 minutes, dilute to 100.0 ml with mobile phase filter and use the filtrate.

Reference solution. A solution of *terbinafine hydrochloride IPRS* in the mobile phase containing 0.00007 per cent w/v of terbinafine.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octaylsilane chemically bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution prepared by dissolving 0.85 g of *monobasic potassium phosphate* and 1.0 g of *sodium 1-decanesulfonate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
N-Methyl-1-(naphthalene-1-yl) methanamine	0.14	0.67
Terbinafine	1.0	—
Unknown	—	1.0
Total impurity	—	—

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution and the test solution. In the chromatogram with the test solution, the area of impurity due to *N*-Methyl-1-(naphthalene-1-yl) is not more than 0.57 times the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent), the area of any secondary peak is not more than 0.57 times the area of the principal peak in the chromatogram obtained with reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2 times the area of the peak in the chromatogram obtained with reference solution (0.7 per cent).

Limit of Terbinafine Dimer. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile* and 10 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing 250 mg of terbinafine with 50 ml of the solvent mixture and mix with the aid of ultrasound for 20 minutes, dilute to 100.0 ml with solvent mixture and filter.

Reference solution. A solution of *terbinafine hydrochloride IPRS* in the solvent mixture containing 0.00014 per cent w/v of terbinafine.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 52°,
- mobile phase: A. 1.0 ml of *triethylamine* in 1000.0 ml of *water*,

  B. 1.0 ml of *triethylamine* in a 1000.0 ml of a mixture of 19 volumes of *acetonitrile* and 1 volume of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 100 µl,

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
8	30	70
18	30	70
24	16	84
26	5	95
30	0	100
37	40	60
45	40	60

Name	Relative retention time	Correction factor
Terbinafine	1.0	—
Terbinafine dimer[1]	2.0	0.48

[1](2*E* ,4*E*)-4-(4,4-Dimethylpent-2-ynylidene)-N^1, N^5-dimethyl-N^1, N^5-bis(naphthalen-1-ylmethyl)pent-2-ene-1,5-diamine.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of impurity due to terbinafine diamer is not more than 0.9 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Shake a quantity of the powder containing 20 mg of Terbinafine with 50 ml of the mobile phase and mix with the aid of ultrasound for 20 minutes, dilute to 100.0 ml with the mobile phase and filter.

Reference solution. A 0.022 per cent w/v solution of *terbinafine hydrochloride IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octaylsilane bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution prepared by dissolving 0.85 g of *monobasic potassium phosphate* and 1.0 g of *sodium 1-decanesulfonate* in 1000 ml of *water* and adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

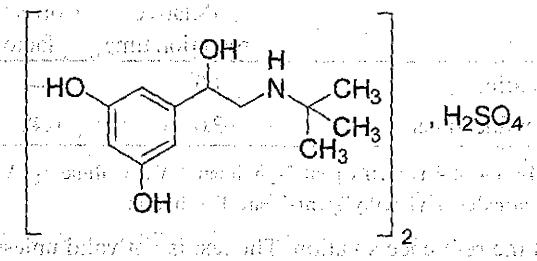
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}N$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of terbinafine.

Terbutaline Sulphate



$(C_{12}H_{19}NO_3)_2,H_2SO_4$ Mol. Wt. 548.7

Terbutaline Sulphate is (*RS*)-2-(*tert*-butylamino)-1-(3,5-dihydroxyphenyl)ethanol sulphate.

Terbutaline Sulphate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{12}H_{19}NO_3)_2,H_2SO_4$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *terbutaline sulphate IPRS* or with the reference spectrum of terbutaline sulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.007 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 276 nm and 280 nm, which may be fused; absorbance at both 276 nm and 280 nm, 0.46 to 0.49.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

D. A 2.0 per cent w/v solution in *carbon dioxide-free water* gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1); absorbance of a 2-cm layer at 400 nm, not more than 0.11 (2.4.7).

Acidity. Dissolve 0.2 g in 10 ml of *carbon dioxide-free water* and titrate with *0.01 M sodium hydroxide*, using *methyl red solution* as indicator. Not more than 1.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to yellow.

tert-Butylamino-3,5-dihydroxyacetophenone. Absorbance of a 2 per cent w/v solution in *0.01 M hydrochloric acid* at about 330 nm, not more than 0.50 (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination 50.0 ml of the mobile phase.

Reference solution (a). Dissolve 7.5 mg of *1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanone IPRS (terbutaline impurity C IPRS)* and 22.5 mg of *terbutaline sulphate IPRS* in 50.0 ml of the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 4.23 g of *sodium hexanesulphonate* in 770 ml of *0.05 M ammonium formate solution* prepared by dissolving 3.15 g of *ammonium formate* in about 980 ml of *water*, adjusted to pH 3.0 by *anhydrous formic acid* and dilute to 1000 ml with *water* and add 230 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

www.webofpharma.com

https://nhathuocngocanh.com/

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to terbutaline impurity C and terbutaline is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to terbutaline impurity C is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peaks is not more than area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks other than terbutaline impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.3.13). Mix 1.6 g with 0.6 g of *anhydrous sodium sulphate* and ignite without melting the sodium sulphate. Cool, add 3 ml of *2 M hydrochloric acid*, boil and dilute to 50 ml with *water*. Cool and filter, 25 ml of the filtrate complies with the limit test for heavy metals, Method A (25 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.5 g in 60 ml of *anhydrous glacial acetic acid* with the aid of heat. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05487 g of $(C_{12}H_{19}NO_3)_2, H_2SO_4$.

Storage. Store protected from light and moisture.

Terbutaline Inhalation

Terbutaline Sulphate Inhalation; Terbutaline Inhalation Aerosol; Terbutaline Sulphate Inhalation Aerosol

Terbutaline Inhalation is a suspension of Terbutaline Sulphate, as a superfine powder, in a suitable liquid in a suitable pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilising agents, etc.

Terbutaline Inhalation delivers not less than 75.0 per cent and not more than 125.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2,H_2SO_4$, per inhalation, by actuation of the valve.

Usual strength. 250 µg in each metered dose.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid*.

Test solution. Remove the actuator from the pressurised container, shake the container for about 30 seconds and place it in an inverted position in a small beaker containing 5 ml of *water*. Discharge a sufficient number of deliveries containing 5 mg of Terbutaline Sulphate, under the surface of the solvent.

Reference solution. A 0.1 per cent w/v solution of *terbutaline sulphate IPRS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 2 per cent w/v solution of *4-aminoantipyrine* in *methanol*. Examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to spot in the chromatogram obtained with reference solution.

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Follow the procedure described under Assay wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Use 35 ml of *water* and finally dilute to 50.0 ml with *water*. Dilute a suitable volume of the solution with *water* to produce a solution containing 50 µg of Terbutaline Sulphate per ml. To 10.0 ml of the solution in a 50-ml volumetric flask add 35 ml of *buffer solution pH 9.5* and 1.0 ml of *4-aminoantipyrine solution*. Mix, add 1.0 ml of *potassium ferricyanide solution* with vigorous swirling of the flask, dilute to volume with *water* and mix. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a solution prepared in the same manner using 10.0 ml of *water* in place of the solution of the substance under examination.

Calculate the content of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ in the solution from the absorbance obtained by repeating the operation using a solution containing 100 µg of *terbutaline sulphate IPRS* in place of the solution of the substance under examination.

Calculate the amount of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ delivered per actuation of the valve meets the requirements.

https://nhathuocngocanh.com/

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amount of active ingredient delivered per inhalation.

Terbutaline Injection

Terbutaline Sulphate Injection

Terbutaline Injection is a sterile solution of Terbutaline Sulphate in Water for Injections.

Terbutaline Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2, H_2SO_4$.

Usual strength. 500 µg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid*.

Test solution. Use the injection.

Reference solution. A 0.1 per cent w/v solution of *terbutaline sulphate IPRS* in *saline solution*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 2 per cent w/v solution of *4-aminoantipyrine* in *methanol*. Dry the plate in air and spray with a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* in a mixture of 4 volumes of *strong ammonia solution* and 1 volume of *water*. The principal spot in the chromatogram obtained with the test solution corresponds to spot in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0.

Bacterial endotoxins (2.2.3). Not more than 1250.0 Endotoxin Units per mg of terbutaline sulphate.

Other tests. Comply with the tests stated under Parenteral preparations (Injections).

Assay. Measure a volume containing about 5 mg of Terbutaline Sulphate and add sufficient *water* to produce 50.0 ml. To 5.0 ml add 35 ml of a buffer solution prepared by dissolving 36.3 g of *tris (hydroxymethyl) aminomethane* in 900 ml of *water*, adjusted to pH between 9.4 and 9.6 and adding sufficient *water* to produce 1000 ml. Add 1.0 ml of a freshly prepared 2.0 per cent w/v solution of *4-aminoantipyrine*, mix and add 1.0 ml of a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* with vigorous swirling and sufficient of the buffer solution to produce 50.0 ml. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using *water* as the blank.

Calculate the content of $(C_{12}H_{19}NO_3)_2, H_2SO_4$ from the absorbance obtained by repeating the operation using a 0.01 per cent w/v solution of *terbutaline sulphate IPRS* and beginning at the words "To 5.0 ml add 35 ml.....".

Storage. Store protected from light, in single dose containers.

Labelling. The label states that the injection should not be used if the solution is discoloured.

Terbutaline Tablets

Terbutaline Sulphate Tablets

Terbutaline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2, H_2SO_4$.

Usual strengths. 2.5 mg; 5 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Terbutaline Sulphate with 50 ml of *0.1 M sodium hydroxide* for 10 minutes, dilute to 100 ml with *0.1 M sodium hydroxide* and filter. Dilute 20 ml of the filtrate to 50 ml with *0.1 M sodium hydroxide*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 296 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid*.

Test solution. Shake a quantity of the powdered tablets containing 10 mg of Terbutaline Sulphate with 4 ml of a mixture of equal volumes of *ethanol (95 per cent)* and *water* for 10 minutes, centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.25 per cent w/v solution of *terbutaline sulphate IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 2 µl of each solution. After development, dry the plate in air, allow to stand for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised nitroaniline solution*. The principal spot in the chromatogram obtained with the test solution corresponds to

https://nhathuocngocanh.com/

that in the chromatogram obtained with reference solution (a) and the principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *water*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Carry out the method as described under Assay beginning at the words "To 5.0 ml, add 35 ml of a buffer solution....". Calculate the content of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ in the medium from the absorbance obtained from a solution of known concentration of *terbutaline sulphate IPRS* prepared in the same manner.

Q: Not less than 70 per cent of the stated amount of $(C_{12}H_{19}NO_3)_2.H_2SO_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 75 mg of Terbutaline Sulphate with 35 ml of the mobile phase for 15 minutes and dilute to 50.0 ml with the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.00045 per cent w/v of *terbutaline sulphate IPRS* and 0.00015 per cent w/v of *terbutaline impurity C IPRS (1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanone IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base-deactivated octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- mobile phase: dissolve 4.23 g of *sodium hexane sulphonate* in 770 ml of the 0.05 M ammonium formate solution prepared by dissolving 3.15 g of *ammonium formate* in 980 ml of *water*, adjusted to pH 3.0 by the adding about 8 ml of *anhydrous formic acid* and dilute to 1000 ml with *water* and 230 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 20 µl.

The retention time of terbutaline impurity C is about 9 minutes and of terbutaline sulphate is about 11 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to terbutaline sulphate and terbutaline impurity C is not less than 2.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to terbutaline impurity C is not more than twice the area of the peak due to terbutaline impurity C in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent) and any peaks with a retention time of less than 2.5 minutes.

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, transfer to a 25-ml volumetric flask, add 15 ml of *0.01 M hydrochloric acid* and shake for 10 minutes. Dilute to volume with *0.01 M hydrochloric acid* and filter, rejecting the first 5 ml of the filtrate. Dilute, if necessary, a suitable volume of the filtrate with *0.01 M hydrochloric acid* to produce a solution containing 0.01 per cent w/v solution of Terbutaline Sulphate. Carry out the method as described under Assay beginning at the words "To 5.0 ml add 35 ml of a buffer solution....". Calculate the content of $(C_{12}H_{19}NO_3)_2$, H_2SO_4 in the tablet from the absorbance obtained by carrying out the Assay simultaneously using *terbutaline sulphate IPRS*.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 5 mg of Terbutaline Sulphate, transfer to a 50-ml volumetric flask, add 30 ml of *0.01 M hydrochloric acid* and shake for 10 minutes. Dilute to volume with *0.01 M hydrochloric acid* and filter, rejecting the first 5 ml of the filtrate. To 5.0 ml add 35 ml of a buffer solution prepared by dissolving 36.3 g of *tris (hydroxymethyl) aminomethane* in 900 ml of *water*, adjusted to pH between 9.4 and 9.6 and adding sufficient *water* to produce 1000 ml. Add 1.0 ml of a freshly prepared 2.0 per cent w/v solution of *4-aminoantipyrine*, mix and add 1.0 ml of a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* with vigorous swirling and sufficient of the buffer solution to produce 50.0 ml. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using *water* as the blank.

Calculate the content of $(C_{12}H_{19}NO_3)_2$, H_2SO_4 from the absorbance obtained by carrying out the Assay simultaneously using *terbutaline sulphate IPRS*.

Storage. Store protected from light and moisture.

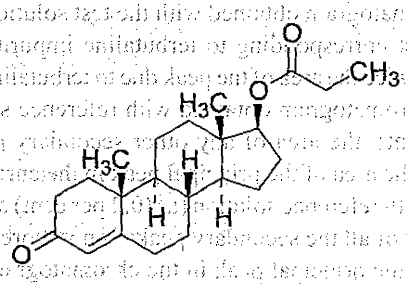
Testosterone Propionate



$C_{22}H_{32}O_3$ Mol. Wt. 344.5

Testosterone Propionate is 3-oxoandrost-4-en-17β-yl propionate.

Testosterone Propionate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{22}H_{32}O_3$, calculated on the dried basis.

Category. Androgen; anabolic steroid.

Description. A white or almost white powder or colourless crystals.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *testosterone propionate IPRS* or with the reference spectrum of testosterone propionate.

B. In the test for Related substances the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to testosterone propionate in the chromatogram obtained with reference solution (a).

C. Melting range. 119° to 123° (2.4.21).

Tests

Specific optical rotation (2.4.22). +83.0° to +90.0°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 50 ml with the *methanol*.

Reference solution (a). Dissolve 2 mg of *testosterone propionate IPRS* and 2 mg of *testosterone acetate IPRS* in *methanol* and dilute to 50 ml with the *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *water* and 80 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time of about four impurities with reference to testosterone propionate (retention time, about 9 minutes) range from 0.5 to about 1.4.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to testosterone propionate and testosterone acetate is not less than 4.0.

Inject reference solution (b) and the test solutions. Run the chromatogram twice the retention time for testo-sterone propionate. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 25 mg in sufficient *ethanol* to produce 250.0 ml and mix. Dilute 5.0 ml to 50.0 ml with the *ethanol* and measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7).

Calculate the content of $C_{22}H_{32}O_3$ taking 490 as the specific absorbance at 241 nm.

Storage. Store protected from light and moisture.

Testosterone Propionate Injection

Testosterone Propionate Injection is a sterile solution of Testosterone Propionate in Ethyl Oleate or any other suitable ester, in a suitable fixed oil or in any mixture of these.

Testosterone Propionate Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of testosterone propionate, $C_{22}H_{32}O_3$.

Usual strength. 25 mg per ml; 50 mg per ml.

www.webofpharma.com

https://nhathuocngocanh.com/

Identification

Dissolve a volume containing 50 mg of Testosterone Propionate in 8 ml of *light petroleum (40° to 60°)* and extract with three quantities, each of 8 ml, of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand for 2 hours in ice and filter. The precipitate, after washing with *water* and drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *testosterone propionate IPRS* or with the reference spectrum of testosterone propionate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *light petroleum (40° to 60°)* and 10 volumes of *liquid paraffin*.

Mobile phase. A mixture of 30 volumes of *water* and 20 volumes of *glacial acetic acid*.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *testosterone propionate IPRS* in the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot A.

Tests

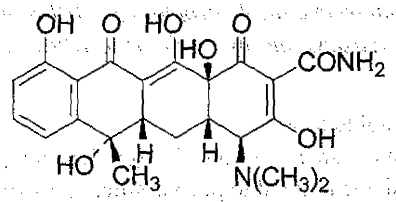
Other tests. Comply with the tests stated under Parenteral preparations (Injections).

Assay. To an measured volume containing about 0.1 g of Testosterone Propionate add sufficient *chloroform* to produce 100.0 ml and mix. Dilute 3.0 ml to 50.0 ml with *chloroform* and to 5.0 ml of the solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the resulting solution at the maximum at about 380 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *chloroform* in the same manner.

Calculate the content of $C_{22}H_{32}O_3$ from the absorbance obtained by repeating the operation using a 0.006 per cent w/v solution of *testosterone propionate IPRS* in *chloroform* and beginning at the words "to 5.0 ml of the solution.....".

Storage. Store protected from light.

Tetracycline



$C_{22}H_{24}N_2O_8$ Mol. Wt. 444.5

Tetracycline is (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide. It contains a variable quantity of water.

Tetracycline contains not less than 88.0 per cent of $C_{22}H_{24}N_2O_8$, calculated on the dried basis.

Category. Antibacterial.

Description. A yellow, crystalline powder.

Identification

A. In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. Dissolve about 10 mg in a mixture of 1 ml of *2 M nitric acid* and 5 ml of *water*, shake well and add 1 ml of *silver nitrate solution*. Any opalescence produced is not more intense than that in a solution prepared in the same manner omitting the substance under examination.

https://nhathuocngocanh.com/

Tests

pH (2.4.24). 3.5 to 6.0, determined in a 1.0 per cent w/v suspension in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −280° to −260°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 0.0025 per cent w/v solution of *4-epitetracycline hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride IPRS* and 0.01 per cent w/v of *tetracycline hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 680 volumes of *0.1 M ammonium oxalate*, 270 volumes of *dimethylformamide* and 50 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-epitetracycline is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) and the sum of areas of all the secondary peaks is not more than 5.0 per cent.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (50 ppm). Use 2.5 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 13.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *tetracycline hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride IPRS* and 0.01 per cent w/v of *tetracycline hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 680 ml of *0.1 M ammonium oxalate*, 270 ml of *dimethylformamide* and 50 ml of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

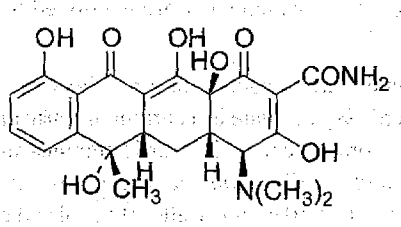
Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_8$.

1 mg of $C_{22}H_{24}N_2O_8$, HCl is equivalent to 0.92 mg of $C_{22}H_{24}N_2O_8$.

Storage. Store protected from light and moisture.

Tetracycline Hydrochloride



, HCl

$C_{22}H_{24}N_2O_8$,HCl Mol. Wt. 480.9

Tetracycline Hydrochloride is (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-naphthacene-2-carboxamide hydrochloride.

Tetracycline Hydrochloride contains not less than 95.0 per cent and not more than 100.5 per cent of $C_{22}H_{24}N_2O_8$, HCl, calculated on the dried basis.

Category. Antibacterial.

Description. A yellow, crystalline powder.

https://nhathuocngocanh.com/

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 1.8 to 3.0, determined in a 1.0 per cent w/v suspension in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −255° to −239°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of solvent mixture.

Reference solution (a). A 0.0025 per cent w/v solution of *4-epitetracycline hydrochloride IPRS* in the solvent mixture.

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl.

Tetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg.

Tetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

https://nhathuocngocanh.com/

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude microorganisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Tetracycline Capsules

Tetracycline Hydrochloride Capsules

Tetracycline Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tetracycline hydrochloride, $C_{22}H_{24}N_2O_8$, HCl.

Usual strengths. 250 mg; 500 mg.

Identification

A. In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To a quantity of the mixed contents of 20 capsules containing about 10 mg of Tetracycline Hydrochloride, add 20 ml of warm *ethanol (95 per cent)*, allow to stand for 20 minutes, filter and evaporate the filtrate to dryness on a water-bath. To 0.5 mg of the residue add *2 ml of sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. The residue obtained in test B gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water* freshly prepared by distillation,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Measure the absorbance of the resulting solution, suitably diluted if necessary, at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the medium from the absorbance obtained from a solution of known concentration of *tetracycline hydrochloride IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{24}N_2O_8$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the mixed contents of 20 capsules containing 25 mg of Tetracycline Hydrochloride with 80 ml of *0.01 M methanolic hydrochloric acid* for 10 minutes, dilute to 100 ml with the same solvent, mix and filter if necessary.

Reference solution (a). A 0.002 per cent w/v solution of *4-epitetracycline hydrochloride IPRS* in *0.01 M methanolic hydrochloric acid*.

Reference solution (b). A solution containing 0.0015 per cent w/v each of *4-epitetracycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *0.01 M methanolic hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- column. temperature 40°,
- mobile phase: a mixture of 5 volumes of *dimethylformamide* and 95 volumes of *0.1 M oxalic acid*, the pH of the mixture being adjusted to 3.9 with *triethylamine*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-epitetracycline hydrochloride is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) and the sum of areas of all the secondary peaks is not more than 10.0 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g of the contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 50 mg of Tetracycline Hydrochloride, shake with about 50 ml of *0.01 M methanolic hydrochloric acid* and dilute with the same solvent to produce 100.0 ml, mix and filter. Discard the first few ml of the filtrate.

Reference solution (a). A 0.05 per cent w/v solution of *tetracycline hydrochloride IPRS* in *0.01 M methanolic hydrochloric acid*.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride IPRS* and 0.01 per

https://nhathuocngocanh.com/

cent w/v of *tetracycline hydrochloride IPRS* in *0.01 M methanolic hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 to10 µm),
- mobile phase: a mixture of 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide* and 5 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the capsules.

Storage. Store protected from light and moisture.

Tetracycline Ointment

Tetracycline Hydrochloride Eye Ointment

Tetracycline Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of tetracycline hydrochloride, $C_{22}H_{24}N_2O_8$, HCl.

Usual strengths: 0.5 per cent w/w; 1 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g dissolved in a mixture of 2 volumes of *carbon tetrachloride*, 2 volumes of *chloroform* and 1 volume of *methanol*.

Other tests. Comply with the tests stated under Eye Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide*.

Test solution. Weigh a quantity containing about 25 mg of Tetracycline Hydrochloride and transfer to a separating funnel with the aid of 15 ml of *cyclohexane*. Add 15 ml of solvent mixture and shake well. Collect the lower layer in a 50-ml volumetric flask. Repeat the extraction with two further quantities, each of 15 ml, of the solvent mixture, combining the extracts in the same 50-ml volumetric flask. Add sufficient solvent mixture to produce 50.0 ml, mix and filter.

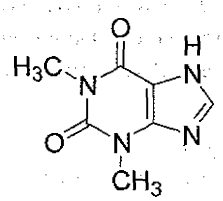
Reference solution. A 0.05 per cent w/v solution of *tetracycline hydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 to10 µm),
- mobile phase: a mixture of 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide* and 5 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the eye ointment.

Storage. Store protected from moisture.

Theophylline



$C_7H_8N_4O_2$ Mol. Wt. 180.2 (anhydrous)
$C_7H_8N_4O_2,H_2O$ Mol. Wt. 198.2 (hydrate)

Theophylline is 1,3-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione. It contains one molecule of water or is anhydrous.

Theophylline contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_8N_4O_2$, calculated on the dried basis.

Category. Xanthine bronchodilator.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline IPRS* or with the reference spectrum of theophylline.

https://nhathuocngocanh.com/

B. Dissolve about 10 mg in 10 ml of *water*, add 0.5 ml of a 5 per cent w/v solution of *mercuric acetate* and allow to stand; a white, crystalline precipitate is produced.

C. The melting range, after drying at 105°, 270° to 274° (2.4.21).

D. It gives the reaction of xanthines (2.3.1).

Tests

Appearance of solution. Dissolve 0.5 g in 75 ml of *carbon dioxide-free water* with heating; the resulting solution (solution A), is clear (2.4.1), and colourless (2.4.1).

Acidity. To 50 ml of solution A add 0.1 ml of *methyl red solution*. The solution is red and not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to yellow.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* at the maximum at about 270 nm, not less than 0.53.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in 20.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (7 µm),
- mobile phase: a mixture of 7 volumes of *acetonitrile* and 93 volumes of 0.14 per cent w/v solution of *sodium acetate* containing 0.5 per cent v/v solution of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 20 µl.

The relative retention time with reference to theophylline for theophylline impurity C is about 0.3, for theophylline impurity B is about 0.4, for theophylline impurity D is about 0.5 and for theophylline impurity A is about 2.5.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to theobromine and theophylline is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent (for the anhydrous form) and 8.0 per cent to 9.5 per cent (for the hydrated form), determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of substance under examination in 1 ml of *methanol* and 50 ml of *water*, with the aid of ultrasound and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *theophylline IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *methanol* and 75 volumes of *water*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_8N_4O_2$.

Storage. Store protected from moisture.

Theophylline Injection

Theophylline in Dextrose Injection

Theophylline Injection is a sterile solution of Theophylline and Dextrose in Water for Injections.

Theophylline Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of anhydrous theophylline, $C_7H_8N_4O_2$, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6, H_2O$.

https://nhathuocngocanh.com/

Usual strengths. Anhydrous theophylline, 0.4, 0.8, 1.6, 2, 3.2, 4 mg per ml in 5 per cent w/v Dextrose.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay for theophylline shows an absorption maximum at about 274 nm.

B. Add 0.2 ml of the injection to 5 ml of *potassium cupri-tartrate solution* and heat to boiling; a red to orange precipitate is formed.

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and Related substances. Use a glass chromatographic column (66 cm x 11 mm) with a sealed-in, coarse-porosity sintered disc or a glass wool plug and fitted with a stopcock. Mix 8 g of a 20- to 50-mesh styrenedivinylbenzene anion-exchange resin in the hydroxide form with 25 ml of *water*, allow to settle and decant the supernatant liquid until a slurry of resin remains. Pour the slurry into the column and allow to settle as a homogeneous bed having a bed volume of about 15 ml. Wash the resin bed at a flow rate of about 3 ml per minute with 100 ml of a 5.7 per cent w/v solution of *ammonium carbonate* followed by washing with *water* until the eluate has a pH of 7.

Dilute an measured volume of the injection containing 1.0 g of Dextrose, $C_6H_{12}O_6,H_2O$ to 250.0 ml with *water*. Pass this solution through the resin bed in the column at a flow rate of about 3.5 ml per minute, discarding the first 50 ml of the eluate. Measure the absorbance of the eluate at 284 nm, using *water* as the blank; the absorbance is not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg of anhydrous theophylline.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *For theophylline* — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the injection with sufficient water to produce a solution containing 0.01 per cent w/v of anhydrous theophylline.

Reference solution. A 0.01 per cent w/v solution of *theophylline IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *methanol* and 75 volumes of *water*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_8N_4O_2$, in the injection.

For dextrose — Transfer an measured volume of the injection containing about 5 g of Dextrose to a 100-ml volumetric flask, add 0.2 ml of *6 M ammonia*, dilute to volume with *water* and mix. Determine the optical rotation of the resulting solution in a suitable polarimeter tube at 25° (2.4.22). The observed rotation, in degrees multiplied by $1.0425A$, represents the weight, in g, of $C_6H_{12}O_6,H_2O$ in the volume of the injection taken for the assay, where A is the ratio of 200 divided by the length, in mm, of the polarimeter tube employed.

Storage. Store protected from light, in single dose containers.

Labelling. The label states the strength in terms of the amounts of anhydrous theophylline and Dextrose monohydrate.

Theophylline Prolonged-release Tablets

Theophylline Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Theophylline Prolonged-release Tablets contain Theophylline or Theophylline Hydrate.

Theophylline Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of theophylline, $C_7H_8N_4O_2$.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.2 g of Theophylline with 10 ml of a mixture of 60 volumes of *chloroform* and 40 volumes of *methanol*, filter and evaporate the filtrate to dryness. It gives the reaction of xanthenes (2.3.1).

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 10 volumes of *ammonia*, 30 volumes of *acetone*, 30 volumes of *chloroform* and 40 volumes of *butan-1-ol*.

https://nhathuocngocanh.com/

Solvent mixture. 60 volumes of *chloroform* and 40 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of theophylline with 10 ml of the solvent mixture with the aid of ultrasound and centrifuge.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Apply 10 µl of each solution. After removal of the plate, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of theophylline in 1 ml of *methanol* and 50 ml of *water* with the aid of ultrasound and dilute to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *theophylline IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *methanol* and 75 volumes of *water*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

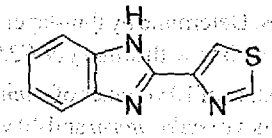
Inject the reference solution and the test solution.

Calculate the content of $C_7H_8N_4O_2$ in the tablets.

Labelling. When the active ingredient is Theophylline Hydrate the quantity is stated in terms of the equivalent amount of theophylline.

Thiabendazole

Tiabendazole



$C_{10}H_7N_3S$ Mol. Wt. 201.3

Thiabendazole is 2-(1,3-thiazol-4-yl)-1*H*-benzimidazole.

Thiabendazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{10}H_7N_3S$, calculated on the anhydrous basis.

Category. Anthelmintic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiabendazole IPRS* or with the reference spectrum of thiabendazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 243 nm and 302 nm; ratio of the absorbance at the maximum at about 302 nm to that at about 243 nm, 1.8 to 2.1.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Dissolve 5 mg in 5 ml of *0.1 M hydrochloric acid*, add 3 mg of *4-phenylenediamine dihydrochloride* and shake until dissolved. Add 0.1 g of *zinc powder*, mix, allow to stand for 2 minutes and add 10 ml of *ferric ammonium sulphate solution*; a deep blue or bluish violet colour is produced.

Tests

Appearance of solution. Add 5 ml of *methanol* to 0.5 g in a flask fitted with a ground-glass stopper, stir for 5 minutes, with a magnetic stirrer and filter through a sintered-glass filter (1.6 µm to 4 µm). The solution is not more intensely coloured than reference solution BS6 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 62.5 volumes of *toluene*, 25 volumes of *glacial acetic acid*, 10 volumes of *acetone* and 2.5 volumes of *water*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol*.

Test solution (b). Dilute 2.0 ml of test solution (a) to 20.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 10.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 25.0 ml with *methanol*.

www.nhathuocngocanh.com

https://nhathuocngocanh.com/

Reference solution (c). Dissolve 20 mg of *thiabendazole IPRS* in 20.0 ml of *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b)

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.15 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02013 g of $C_{10}H_7N_3S$.

Storage. Store protected from light and moisture.

Thiabendazole Tablets

Tiabendazole Tablets

Thiabendazole Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of thiabendazole, $C_{10}H_7N_3S$.

Usual strength. 500 mg.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum at about 302 nm.

B. Dissolve a quantity of the powdered tablets containing 30 mg of Thiabendazole in 5 ml of *0.1 M hydrochloric acid*, add 3 mg of *4-phenylenediamine dihydrochloride* and shake until dissolved. Add 0.1 g of *zinc powder*, mix, allow to stand for 2 minutes and add 10 ml of *ferric ammonium sulphate solution*; a deep bluish violet colour is produced.

Tests

Other tests. Comply with the tests stated under Tablets.

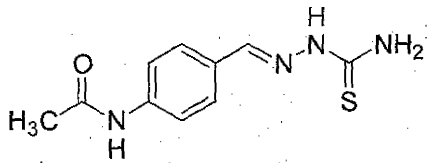
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Thiabendazole in 75 ml of *0.1 M hydrochloric acid*, warm on a water-bath for 15 minutes, shaking occasionally, cool, dilute to 100.0 ml with *0.1 M hydrochloric acid* and filter. Dilute 5.0 ml of the filtrate to 1000.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 302 nm (2.4.7).

Calculate the content of $C_{10}H_7N_3S$ in the tablets taking 1230 as the specific absorbance at 302 nm.

Storage. Store protected from light and moisture.

Labelling. The label states that the tablets should be chewed before swallowing.

Thiacetazone



$C_{10}H_{12}N_4OS$ Mol. Wt. 236.3

Thiacetazone is 4-acetamidobenzaldehyde thiosemicarbazone.

Thiacetazone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}N_4OS$, calculated on the dried basis.

Category. Antitubercular.

Description. Pale yellow crystals or a crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiacetazone IPRS* or with the reference spectrum of thiacetazone.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0003 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 328 nm absorbance at about 328 nm, about 0.55.

C. Boil 10 mg with 5 ml of *1 M hydrochloric acid* for 3 minutes, cool and add sufficient *water* to produce 200 ml. Mix 5 ml of the solution with 0.25 ml of *sodium nitrite solution* and add the mixture to 0.5 ml of *2-naphthol solution*; a red colour is produced.

Tests

Thiosemicarbazide. To 2.0 g, finely powdered, add sufficient *water* to produce 50 ml, shake, allow to stand for 1 hour with occasional shaking and filter, discarding the first few ml of the

https://nhathuocngocanh.com/

filtrate. Acidify 25 ml of the clear filtrate with *dilute sulphuric acid*, add 0.1 ml of *o-phenanthroline-ferrous complex solution* and titrate with *0.1 M ceric ammonium sulphate* to a blue end-point which persists for 1 minute; not more than 0.8 ml is required.

4-acetamidobenzalazine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Dissolve 0.4 g of the substance under examination in 100 ml of *methanol*.

Reference solution. Dissolve with the aid of heat 0.016 g of *4-acetamidobenzalazine IPRS* in 150 ml of *methanol*, cool and dilute to 200 ml with *methanol* and further dilute 5 ml of the solution to 50 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *2 M nitric acid* and within 2 minutes examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in 60 ml of *methanol* by heating at 60° in a water-bath, add slowly 20 ml of hot *methanolic silver nitrate solution*, maintain the solution at 60° until the precipitate coagulates and leaves a clear supernatant liquid. Cool, filter through a sintered-glass crucible (porosity No. 4), wash the residue with *methanol* until the washings are free from silver nitrate and dry to constant weight at 105°.

1 g of residue is equivalent to 0.4606 g of $C_{10}H_{12}N_4OS$.

Storage. Store protected from light and moisture.

Thiacetazone and Isoniazid Tablets

Thiacetazone and Isoniazid Tablets contain one part by weight of Thiacetazone and two parts by weight of Isoniazid.

Thiacetazone and Isoniazid Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amounts of thiacetazone, $C_{10}H_{12}N_4OS$, and isoniazid, $C_6H_7N_3O_2$.

Category. Antitubercular.

Usual strengths. Thiacetazone, 37.5 mg and Isoniazid, 75 mg; Thiacetazone, 75 mg and Isoniazid, 150 mg; Thiacetazone, 150 mg and Isoniazid, 300 mg.

Identification

A. Extract a quantity of the powdered tablets containing about 30 mg of Thiacetazone with 70 ml of *ethanol (95 per cent)* with the aid of heat for 15 minutes with occasional shaking. Cool, dilute to 100 ml with *ethanol (95 per cent)* and filter. Dilute 1 ml to 100 ml with *ethanol (95 per cent)*. The solution complies with the following test.

When examined in the range 230 nm to 360 nm (2.4.7), the solution shows an absorption maximum at about 328 nm, absorbance at about 328 nm is about 0.55.

B. Shake a quantity of the powdered tablets containing 0.1 g of isoniazid with 50 ml of water and filter. To 5 ml of filtrate, add 5 ml of *ethanol (95 per cent)*, 0.1 g of *borax* and 5 ml of a 5 per cent w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (95 per cent)*, evaporate to dryness on a water-bath and continue heating for a further 10 minutes. To the residue add 10 ml of *methanol* and mix; a reddish purple colour is produced.

Tests

Disintegration (2.5.1). Not more than 30 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. *For thiacetazone* — Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of Thiacetazone in 70 ml of *ethanol (95 per cent)* and heat on a water-bath for 15 minutes with intermittent shaking. Cool, add sufficient *ethanol (95 per cent)* to produce 100.0 ml and filter. To 1.0 ml of the filtrate add sufficient *ethanol (95 per cent)* to produce 100.0 ml and measure the absorbance of the resulting solution at the maximum at about 328 nm (2.4.7), using *ethanol (95 per cent)* as the blank.

Calculate the content of $C_{10}H_{12}N_4OS$ from the absorbance obtained by repeating the operation using *thiacetazone IPRS* in place of the tablets under examination.

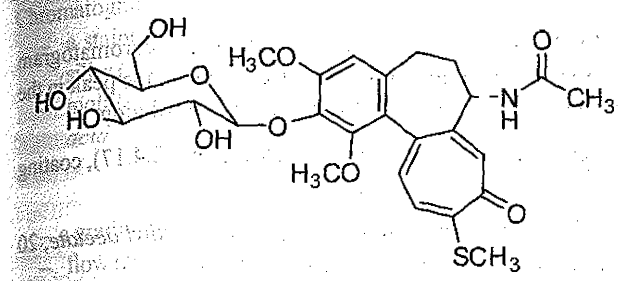
For isoniazid — Weigh a quantity of the powdered tablets containing 0.2 g of Isoniazid, dissolve as completely as possible in 100 ml of *water* and filter. Wash the residue with *water*, combine the filtrate and washings and dilute to 250.0 ml with *water*. To 50.0 ml of the resulting solution add 50 ml of water, 20 ml of *hydrochloric acid* and 0.2 g of *potassium bromide*. Titrate with *0.0167 M potassium bromate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.0167 M potassium bromate* is equivalent to 0.003429 g of $C_6H_7N_3O_2$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Thiocolchicoside



$C_{27}H_{33}NO_{10}S$ Mol. Wt. 563.5

Thiocolchicoside is 2-demethoxy-2-glucosidoxythiocolchicine.

Thiocolchicoside contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{33}NO_{10}S$, calculated on the dried basis.

Description. A yellow crystalline powder.

Category. Muscle relaxant.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiocolchicoside IPRS* or with the reference spectrum of thiocolchicoside.

B. When examined in the range of 220 nm to 440 nm (2.4.7), a 0.0015 per cent w/v solution in *water* shows absorption maxima at the same wavelength as obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.5, determined in a 0.5 per cent w/v solution in *carbon-dioxide free water*.

Specific optical rotation (2.4.22). – 580° to – 550° at 23°, determined on 0.5 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in 50.0 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *colchicoside IPRS* in *methanol*.

Reference solution (b). A 0.05 per cent w/v solution of *thiocolchicoside IPRS* in *methanol*.

Reference solution (c). Dilute 1.0 ml each of reference solution (a) and (b) to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica (5 µm),
- mobile phase: A. *n- heptane* containing *2 per cent acetic acid*,
  B. *chloroform*,
  C. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 360 nm,
- injection volume: 20 µl.

60	86	10	4

Inject reference solution (c). The test is not valid unless the theoretical plates is not less than 20000, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the peak due to thiocolchicoside.

The relative retention time with reference to thiocolchicoside for colchicine is about 0.55, for N- deacetyl N- formyl thiocolchicoside is about 1.05 and for colchicoside is about 1.10.

Inject reference solution (c) and test solution. In the chromatogram obtained with the test solution, the area of each peak corresponding to N-deacetyl N-formyl thiocolchicoside and colchicoside is not more than the area of thiocolchicoside and colchicoside peak, respectively in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of the areas of all other secondary peaks is not more than the area of peak due to thiocolchicoside in the chromatogram obtained with reference solution (c) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Microbial contamination (2.2.9). Total microbial count not more than 1000 CFU per g, total yeast and mould count not more than 100 CFU per g, 1 g is free from *Escherichia coli, Staphylococcus aureus, Pseudomonas aeruginosa, Enterobacteriaceae* and 10 g is free from *Salmonella* and *Shigella*.

Thiocolchicoside intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

https://nhathuocngocanh.com/

Bacterial endotoxins (2.2.3). Not more than 87.5 Endotoxin Unit per mg.

Thiocolchicoside intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of substance under examination in 100.0 ml of *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Reference solution. A 0.1 per cent w/v solution of *thiocolchicoside IPRS* in *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- spectrophotometer set at 370 nm,
- injection volume: 20 µl.

Time (in min.)	Flow (ml/min.)	Mobile phase A (per cent /v/v)	Mobile phase B (per cent v/v)
0	1.0	90	10
10	1.0	90	10
11	1.0	75	25
12	1.8	75	25
15	1.8	75	25
17	1.8	70	30
18	1.8	70	30
20	1.8	90	10
22	1.0	90	10

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate content of $C_{27}H_{33}NO_{10}S$.

Storage: Store protected from light and at a temperature not exceeding 30°.

Thiocolchicoside Capsules

Thiocolchicoside Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of thiocolchicoside, $C_{27}H_{33}NO_{10}S$.

Usual strengths. 4 mg; 8 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *ethyl acetate*, 20 volumes of *ethanol* and 10 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 5.0 ml of *methanol*.

Reference solution. A 1.0 per cent w/v solution of *thiocolchicoside IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 7.5*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.044 per cent w/v solution of *thiocolchicoside IPRS*. Dilute 1.0 ml of the solution to 100.0 ml with the dissolution medium.

0.001 per cent w/v solution of *thiocolchicoside IPRS* in *water*.

Use the chromatographic condition as described under Assay.

Calculate the content of $C_{27}H_{33}NO_{10}S$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{27}H_{33}NO_{10}S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse the content of the capsules containing about 50 mg of Thiocolchicoside in 50.0 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *colchicoside IPRS* in *methanol*.

Reference solution (b). A 0.05 per cent w/v solution of *thiocolchicoside IPRS* in *methanol*.

https://nhathuocngocanh.com/

Reference solution (c). Dilute 1.0 ml each of reference solution (a) and (b) to 100.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica (5 µm),
- mobile phase: A. *n- heptane* containing 2 per cent *acetic acid,*
  B. *chloroform,*
  C. *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 360 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Mobile phase C (per cent v/v)
0	86	10	4
50	0	65	35
51	86	10	4
60	86	10	4

The relative retention time with reference to thiocolchicoside for colchicine is about 0.55, for N-deacetyl N-formyl thiocolchicoside is about 1.05 and for colchicoside is 1.10.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 20000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the peak due to thiocolchicoside.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution the area of each peak corresponding to N-deacetyl N-formyl thiocolchicoside and colchicoside is not more than the area of corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of the areas of all other secondary peaks is not more than the area of peak due to thiocolchicoside in the chromatogram obtained with reference solution (c) (0.5 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the content of 20 capsules containing about 10 mg of Thocolchicoside with 100.0 ml of *water.*

Reference solution. A 0.01 per cent w/v solution of *thiocolchicoside IPRS* in *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- spectrophotometer set at 370 nm,
- injection volume: 20 µl.

Time (in min.)	Flow (ml/min.)	Mobile phase A (per cent /v/v)	Mobile phase B (per cent v/v)

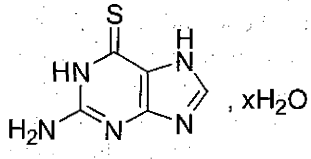
12	1.8	75	25
15	1.8	75	25
17	1.8	70	30
18	1.8	70	30
20	1.8	90	10
22	1.0	90	10

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{33}NO_{10}S$ in the capsules.

Thioguanine



$C_5H_5N_5S$ (anhydrous) Mol.Wt. 167.2

$C_5H_5N_5S.\ ½\ H_2O$ Mol.Wt. 176.2

Thioguanine is 6H -Purine-6-thione, 2-amino-1,7-dihydro; 2-Aminopurine-6(1H)-thione hemihydrate.

Thioguanine is anhydrous or contains one-half molecule of water of hydration. It contains not less than 96.0 per cent and not more than 100.5 per cent of $C_5H_5N_5S$, calculated on the dried basis.

CAUTION — Thioguanine is potentially cytotoxic; Great care should be taken in handling the powder and preparing the solutions.

Category. Cytotoxic.

Description. A pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thioguanine IPRS* or with the reference spectrum of thioguanine.

https://nhathuocngocanh.com/

B. Transfer about 100 mg of of the substance under examination, previously dried, to a 100.0 ml volumetric flask. Dissolve in a mixture of 15 ml of *water* and 1.5 ml of *1 M sodium hydroxide*, dilute with *water* to volume, and mix. Transfer 1.0 ml of the solution to a 200.0-ml volumetric flask and add 1 per cent v/v solution of *hydrochloric acid* to volume, and mix. The UV absorption spectrum (2.4.7) of the solution so obtained, exhibits maxima and minima at the same wavelengths as that obtained with *thioguanine IPRS* treated in the same manner.

Tests

Sulphur compounds. Dissolve 50 mg of thioguanine in 5.0 ml of *1 M sodium hydroxide*, the resulting solution obtained is clear.

Inorganic phosphate. Not more than 0.03 per cent as phosphate, determined by the following method.

Ammonium molybdate solution. Dissolve 8.3 g of *ammonium molybdate* in 40.0 ml of *water*, add 33.0 ml of *dilute sulphuric acid* and dilute with *water* to 100.0 ml.

NOTE— This solution is stable for about 2 weeks.

Weigh 50.0 mg of the substance under examination to a large test tube, add 1.0 ml of *dilute sulphuric acid* and heat in a water bath for 5 minutes. Cautiously add *nitric acid*, dropwise, continue heating until the mixture becomes colourless, and then heat for further one minute. Cool, dilute with *water* to 10 ml, and transfer the solution to a 25.0 ml volumetric flask with the aid of a few ml of *water*. To the flask add 0.75 ml of ammonium molybdate solution and 1.0 ml of *aminonaphthol-sulphonic acid*, dilute with *water* to volume, mix and measure the absorbance of the resulting solution at the maximum at about 620 nm (2.4.7), using a blank solution prepared in the same manner but omitting the substance under examination. The absorbance is not greater than that produced by repeating the operation using a solution prepared in the same manner using 1.5 ml of *phosphate standard solution (10 ppm PO_4)*.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution (a). *0.04* per cent solution of the substance under examination in *0.1 M sodium hydroxide*.

Test solution (b). Dilute 1.0 volume of test solution (a) to 10.0 volumes with mobile phase.

Reference solution (a). A 0.004 per cent w/v solution of *guanine IPRS* in *0.01 M sodium hydroxide*.

Reference solution (b). Dilute 1.0 volume of reference solution (a) to 100.0 volumes with mobile phase.

Reference solution (c). Transfer 1.0 ml of reference solution (a) into a 100.0 ml volumetric flask, and dilute with test solution (b) to volume.

The relative retention times are about 0.6 for guanine and 1.0 for thioguanine respectively.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to guanine and thioguanine is not less than 3.0, in the chromatogram obtained with reference solution (c). In the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and test solution (b). In the chromatogram obtained with test solution (b) the area of any peak due to guanine is not more than 2.5 times the area of principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent).

Selenium. Not more than 30 ppm, determine by the oxygen flask method (2.3.34),

Test Solution. Burn 200 mg of the substance under examination using a 1000 ml combustion flask and using 25.0 ml of *dilute nitric acid* as the absorbing liquid, proceed as described under *oxygen flask combustion* (2.3.34). After completion of the combustion, add a few ml of *water* in the cup, loose the stopper, and rinse the stopper, and the sides of the flask with about 10.0 ml of *water*. Transfer the solution with the aid of about 20.0 ml of *water* to a 150 ml beaker, and heat gently to the boiling temperature. Boil for 10 minutes, and allow the solution to cool to room temperature.

Reference solution (a). Dissolve 40 mg of selenium in 100.0 ml of 50 per cent v/v solution of *nitric acid* in a 1000 ml volumetric flask, heat on a steam-bath, if necessary and make up the volume with *water*. Dilute 5.0 ml of the solution to 200.0 ml with *water*.

Reference solution (b). Dissolve 100 mg of *2,3-diamino-napthalene* and 500 mg of *hydroxylamine hydrochloride* in 100.0 ml of *0.1 M hydrochloric acid*.

Reference solution (c). Dilute 6.0 ml of reference solution (a) with 25.0 ml *dilute nitric acid* and 25.0 ml of *water*.

Treat the reference solution (c), the test solution, and the reagent blank consisting of 25.0 ml of *dilute nitric acid* and 25.0 ml of *water*, concomitantly, as follows. Add *ammonium hydroxide solution (0.5 per cent, v/v)* to adjusted to pH 2.0. Dilute with *water* to 60.0 ml and transfer to a low-actinic separator with the aid of 10.0 ml of *water*, adding the 10 ml of rinsings to the separator. Add 200 mg of *hydroxylamine hydrochloride*, swirl to dissolve, immediately add 5.0 ml of reference solution (b), insert the stopper, and swirl to mix. Allow the solution to stand at room temperature for 100 minutes. Add 5.0 ml of *cyclohexane*, shake vigorously for 2 minutes, and allow the layers to separate. Discard the aqueous layer, and centrifuge the cyclohexane extract to remove any dispersed *water*. Determine the absorbances of the

https://nhathuocngocanh.com/

cyclohexane extracts of the test solution and the reference solution (c) in a 1-cm cell at the wavelength of maximum absorbance at about 380 nm, with a suitable spectrophotometer, using the cyclohexane extract as the blank, and compare the absorbances, the absorbance of the test solution is not more than that of the reference solution (c)

Nitrogen (2.3.30). 40.2 to 43.1 per cent, determined on 100 mg using Method E.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.001401 g of N.

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with following modifications.

Solvent mixture. A mixture of 1 volume of *orthophosphoric acid* and 99 volumes of *water*.

Test solution (a). 0.04 per cent w/v solution of the substance under examination in *0.01 M sodium hydroxide*.

Test solution (b). Dilute 1.0 volume of test solution (a) to 10.0 volumes with solvent mixture.

Reference solution (a). A 0.04 per cent solution of *thioguanine IPRS* in *0.01 M sodium hydroxide*.

Reference solution (b). Dilute 1.0 volume of reference solution (a) to 10.0 volumes with solvent mixture.

Chromatographic system
- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A buffer solution of *0.05 M monobasic sodium phosphate* adjusted to pH 3.0 with *orthophosphoric acid*.
- flow rate: 2 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_5H_5N_5S$.

Storage. Store protected from moisture.

Labelling. Label it to indicate its state of hydration.

Thioguanine Tablets

Thioguanine Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of thioguanine, $C_5H_5N_5S$,.

CAUTION — Thioguanine is potentially cytotoxic; Great care should be taken in handling the powder and preparing the solutions.

Usual strength. 40 mg.

Identification

A. Shake a portion of the powdered tablets containing 0.5 g of thioguanine with 10 ml of *1 M sodium hydroxide*, and filter. Acidify the filtrate with *hydrochloric acid*, filter, and dissolve the precipitate in 25 per cent v/v of *ammonia water*. Evaporate to dryness, and dry the residue at 105° at a pressure not exceeding 0.1 psi for 5 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thioguanine IPRS* or with the reference spectrum of thioguanine.

B. In the Assay, the principal peaks in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, discarding about 10.0 ml of the filtrate.

Test solution. Transfer 2 ml of the filtrate and 2 ml of *1M hydrochloric acid* to a 20-ml volumetric flask, and dilute with *water* to volume.

Reference solution. A solution of *thioguanine IPRS* in *0.1M hydrochloric acid* suitably diluted with the same solvent to obtain a solution having same concentration as that of the test solution.

Measure the absorbance of the test solution at about 348 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_5H_5N_5S$ from the absorbance obtained from the reference solution.

Q. Not less than 75 per cent of the stated amount of $C_5H_5N_5S$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Weigh and powder 20 tablets, weigh a quantity of the powder containing 40 mg of Thioguanine with 10.0 ml of *0.01 M sodium hydroxide* and sonicate for 5 minutes, add sufficient mobile phase to produce 100.0 ml, mix and filter.

https://nhathuocngocanh.com/

Reference solution (a) A 0.04 per cent w/v solution each of *thioguanine IPRS* and *guanine IPRS* in 10 per cent v/v solution of *orthophosphoric acid*. Sonicate to dissolve.

Reference solution (b) Dilute 1.0 ml of reference solution (a) to 10.0 ml with mobile phase.

Reference solution (c). A 0.0008 per cent w/v solution of *thioguanine IPRS* and 0.016 per cent w/v solution of *guanine IPRS* in *0.01 M sodium hydroxide*.

Reference solution (d) Dilute 1.0 ml of reference solution (c) to 10.0 ml with mobile phase.

Inject reference solution (b). The test is not valid unless the resolution between thioguanine and guanine peaks is not less than 3.0.

Inject reference solution (d) and the test solution. In the chromatogram obtained with test solution the area of any peak due to guanine is not more than the area of principal peak in the chromatogram obtained with reference solution (d) (4.0 per cent), and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 22.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (4.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets, weigh a quantity of the powder containing 40 mg of Thioguanine with 100.0 ml of *0.01 M sodium hydroxide solution* and shake for 15 minutes. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). 0.04 per cent w/v of *thioguanine IPRS* in *0.01 M sodium hydroxide*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml in mobile phase.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a buffer solution prepared by dissolving 6.0 g of *anhydrous monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

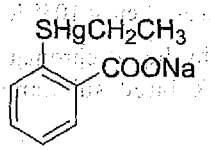
Inject reference solution (b) and the test solution.

Calculate the content of $C_5H_5N_5S$ in the tablets.

Storage. Store protected from moisture, at a temperature between 15° to 25°.

Thiomersal

Thimerosal



$C_9H_9HgNaO_2S$ Mol. Wt. 404.8

Thiomersal is the sodium salt of [(2-carboxyphenyl)thio] ethylmercury.

Thiomersal contains not less than 97.0 per cent and not more than 101.0 per cent of $C_9H_9HgNaO_2S$, calculated on the dried basis.

Category. Antiseptic; pharmaceutical aid (antimicrobial preservative).

Description. A light cream, crystalline powder.

Identification

A. Dissolve 0.1 g in 10 ml of *water* and add 2 ml of *silver nitrate solution*; a pale yellow precipitate is produced.

B. Dissolve 0.5 g in 10 ml of *water* and add 2 ml of *2 M hydrochloric acid*; a white precipitate is produced which, after washing with *water* and drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa, melts at about 110° (2.4.21).

Tests

pH (2.4.24). 6.0 to 8.0, determined in a 1.0 per cent w/v solution.

Inorganic mercury compounds. Not more than 0.7 per cent, determined by the following method.

NOTE — Protect the solutions from light.

Solution A. A 33.2 per cent w/v solution of *potassium iodide*.

Test solution. Dissolve 25 mg of the substance under examination in *water* and dilute to 25.0 ml with *water*.

Reference solution. A 0.0095 per cent w/v solution of *mercuric chloride* in *water*.

Label five 10-ml volumetric flasks A, B, C, D and E. Place 5 ml of the test solution in flasks A, B, C and D. To each of flasks C

https://nhathuocngocanh.com/

and D add 0.5 ml of the reference solution. Dilute the contents of flasks A and C to 10.0 ml with *water* (blank preparation A and C). Dilute the contents of flasks B and D to 10 ml with a freshly prepared solution A (test preparation B and reference preparation D). Place 5 ml of solution A in flask E. Dilute to 10 ml with *water* (blank preparation E). Measure the absorbance of each solution (A_a, A_b, A_c, A_d, A_e) at 323 nm (2.4.7), using *water* as the blank.

Calculate the content of inorganic mercury compounds, expressed as Hg, in the substance under examination from the expression

$$\frac{(A_b - A_a - A_e) \times m_R \times 0.1847}{(A_d - A_c - A_b + A_a) \times m_T}$$

Where, m_R = mass of mercuric chloride in the reference solution in milligrams,

m_T = mass of the substance under examination in milligrams.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours.

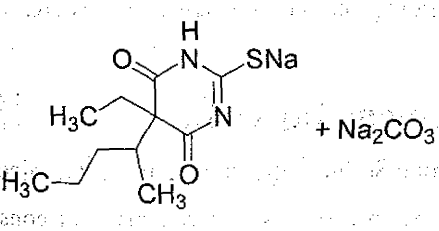
Assay. Weigh 0.5 g, transfer to a 100-ml long-necked flask, add 5 ml of *sulphuric acid* and heat gently until charring occurs; continue to heat and add *hydrogen peroxide solution (100 vol)* dropwise, until the mixture is colourless. Dilute with *water*, evaporate until slight fuming occurs, dilute to 10 ml with *water*, cool and titrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.02024 g of $C_9H_9HgNaO_2S$.

Storage. Store protected from light and moisture.

Thiopentone Sodium

Thiopental Sodium



$C_{11}H_{17}N_2NaO_2S$ Mol. Wt. 264.3

Thiopentone Sodium is a mixture of sodium (*RS*)-5-ethyl-5-(1-methylbutyl)-2-thiobarbiturate and anhydrous sodium carbonate.

Thiopentone Sodium contains not less than 84.0 per cent and not more than 87.0 per cent of $C_{11}H_{18}N_2O_2S$ and not less than 10.2 per cent and not more than 11.2 per cent of Na, both calculated on the dried basis.

Category. General anaesthetic.

Description. A yellowish white powder; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B and D may be omitted if tests A, C and E are carried out.

A. Acidify 10 ml of a 10 per cent w/v solution in *carbon dioxide-free water* with *2 M hydrochloric acid*; the solution effervesces. Shake the solution with 20 ml of *ether*, separate the ether layer, wash with 10 ml of *water* and dry over *anhydrous sodium sulphate*. Filter, evaporate the filtrate to dryness and dry the residue at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiopentone IPRS* or with the reference spectrum of thiopentone.

B. Complies with the test for identification of barbiturates (2.3.2), but using the following solutions.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *water*.

Reference solution. Dissolve 85 mg of *thiopentone IPRS* in 10 ml of *2 M sodium hydroxide* and dilute to 100 ml with *water*.

C. Acidify 5 ml of a 5 per cent w/v solution with *dilute acetic acid* and filter. Wash the precipitate with *water*, recrystallise from *water* and dry at 70°; the crystals melt at about 160° (2.4.21).

D. Dissolve 1 mg of the crystals obtained in test A in 1 ml of *0.1 M sodium hydroxide*. Add about 1 mg of *sodium nitroprusside* and, after 15 minutes, 1 ml of *dilute hydrochloric acid*; a reddish violet colour is produced.

E. It gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1), and not more intensely coloured than reference solution GYS3 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve 20.0 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase.

https://nhathuocngocanh.com/

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 10.0 ml with the mobile phase

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm)
- mobile phase: a mixture of 65 volumes of 0.1 per cent w/v solution of *phosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Allow the chromatography to proceed for twice the retention time of thiopental.

Name	Relative retention time	Correction factor
Thiopental impurity A[1]	0.3	—
Thiopental impurity B[2]	0.4	1.5
Thiopental impurity C[3]	0.9	—
Thiopental (retention time about: 20 minutes)	1.0	—
Thiopental impurity D[4]	1.3	—

[1]5-[(1*RS*)-1-methylbutyl]-2-thioxo-2,3-dihydropyrimidine-4,6(1*H*,5*H*)-dione,

[2]5-ethyl-5-[(1*RS*)-1-methylbutyl]pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione,

[3]5-ethyl-5-(1-ethylpropyl)-2-thioxo-2,3-dihydropyrimidine-4,6(1*H*,5*H*)-dione,

[4]mixture of (2*RS*,3*RS*)-2-(carbamothioylcarbamoyl)-2-ethyl-3-methylhexanoic acid and (2*RS*,3*SR*)-2-(carbamothioylcarbamoyl)-2-ethyl-3-methylhexanoic acid.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution the area of any peak corresponding to thiopental impurity C is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (3.0 per cent), the area of any peak corresponding to thiopental impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent), the area of any peak corresponding to thiopental impurity D is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent), the sum of the areas of any secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (5.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (0.05 per cent).

Chlorides (2.3.12). To 10 ml of solution A add 30 ml of *water* and 10 ml of *2 M nitric acid*. Shake successively with three quantities, each of 25 ml, of *ether*, discard the ether layers and heat the aqueous solution on water-bath to remove any residual ether. 30 ml of the aqueous layer complies with the limit test for chlorides (330 ppm).

Loss on drying (2.4.19). Not more than 2.5 per cent, determined on 0.5 g by drying in an oven at 100° at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. *For thiopentone* — Weigh 0.15 g, dissolve in 5 ml of water, add 2 ml of *1 M sulphuric acid* and extract with four quantities, each of 10 ml, of *chloroform*. Filter the combined chloroform extracts, evaporate the filtrate to dryness on a water-bath and dissolve the residue in 30 ml of *dimethylformamide*, previously neutralised with *0.1 M lithium methoxide*. Titrate immediately with *0.1 M lithium methoxide*, using 1 drop of a 0.2 per cent w/v solution of *thymol blue* in *methanol* as indicator, until a blue colour is obtained. Protect the solution from absorption of carbon dioxide during the titration.

1 ml of *0.1 M lithium methoxide* is equivalent to 0.02423 g of $C_{11}H_{18}N_2O_2S$.

For sodium — Weigh 0.4 g, dissolve in 30 ml of *water*, add 1 drop of *methyl red solution* and titrate with *0.05 M sulphuric acid* until the yellow colour changes to red. Boil gently for 2 minutes, cool and, if necessary, continue the titration with *0.05 M sulphuric acid* until the red colour is restored.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.002299 g of Na.

Thiopentone sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture.

Thiopentone Injection

Thiopentone Sodium Injection; Thiopental Injection

Thiopentone Injection is a sterile material consisting of Thiopentone Sodium with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

www.webofpharma.com

https://nhathuocngocanh.com/

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Thiopentone Injection contains thiopentone, $C_{11}H_{18}N_2O_2S$ that is not less than 77.0 per cent and not more than 92.0 per cent and sodium, Na that is not less than 9.4 per cent and not more than 11.8 per cent of the stated amount of thiopentone sodium.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. 250 mg; 500 mg; 1 g; 5 g.

Description. A yellowish white powder; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B and D may be omitted if tests A, C and E are carried out.

A. Acidify 10 ml of a 10 per cent w/v solution in *carbon dioxide-free water* with *2 M hydrochloric acid*; the solution effervesces. Shake the solution with 20 ml of *ether*, separate the ether layer, wash with 10 ml of *water* and dry over *anhydrous sodium sulphate*. Filter, evaporate the filtrate to dryness and dry the residue at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiopentone IPRS* or with the reference spectrum of thiopentone.

B. Complies with the test for identification of barbiturates (2.3.2), but using the following solutions.

Test solution. 0.1 per cent w/v solution of the substance under examination in *water*.

Reference solution. Dissolve 85 mg of *thiopentone IPRS* in 10 ml of *2 M sodium hydroxide* and dilute to 100 ml with *water*.

C. Acidify 5 ml of a 5 per cent w/v solution with *dilute acetic acid* and filter. Wash the precipitate with *water*, recrystallise from *water* and dry at 70°; the crystals melt at about 160° (2.4.21).

D. Dissolve 1 mg of the crystals obtained in test A in 1 ml of *0.1 M sodium hydroxide*. Add about 1 mg of *sodium nitroprusside* and, after 15 minutes, 1 ml of *dilute hydrochloric acid*; a reddish violet colour is produced.

E. It gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1), and not more intensely coloured than reference solution GYS3 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the contents of a sealed container containing 0.1 g of thiopental sodium in 80 ml of the mobile phase, add sufficient mobile phase to produce 100.0 ml filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 2.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3).
- mobile phase: a mixture of 65 volumes of *0.02 M orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Allow the chromatography to proceed for twice the retention time of thiopental.

Name	Relative retention time	Correction factor
Thiopental impurity A[1]	0.3	—
Thiopental impurity B[2]	0.4	1.6
Thiopental impurity C[3]	0.9	—
Thiopental (retention time: about 19 minutes)	1.0	—
Thiopental impurity D[4]	1.3	—

[1]5-[(1*RS*)-1-methylbutyl]-2-thioxo-2,3-dihydropyrimidine-4,6(1*H*,5*H*)-dione,

[2]5-ethyl-5-[(1*RS*)-1-methylbutyl]pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione,

[3]5-ethyl-5-(1-ethylpropyl)-2-thioxo-2,3-dihydropyrimidine-4,6(1*H*,5*H*)-dione,

[4]mixture of (2*RS*,3*RS*)-2-(carbamothioylcarbamoyl)-2-ethyl-3-methylhexanoic acid and (2*RS*,3*SR*)-2-(carbamothioylcarbamoyl)-2-ethyl-3-methylhexanoic acid.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

https://nhathuocngocanh.com/

Inject reference solution (a), (b) , (c) and the test solution. In the chromatogram obtained with test solution the area of any peak corresponding to thiopental impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to thiopental impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to thiopental impurity C is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any peak corresponding to thiopental impurity D is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the sum of the areas of any secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.4.19). Not more than 2.5 per cent, determined on 0.5 g by drying in an oven at 100° at a pressure of 1.5 to 2.5 kPa for 4 hours.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg of thiopentone sodium.

Assay. *For thiopentone* — Mixed the contents of 10 containers and Weigh 0.15 g, of the contents, dissolve in 5 ml of *water*, add 2 ml of *1 M sulphuric acid* and extract with four quantities, each of 10 ml, of *chloroform*. Filter the combined chloroform extracts, evaporate the filtrate to dryness on a water-bath and dissolve the residue in 30 ml of *dimethylformamide*, previously neutralised with *0.1 M lithium methoxide*. Titrate immediately with *0.1 M lithium methoxide*, using 1 drop of a 0.2 per cent w/v solution of *thymol blue* in *methanol* as indicator, until a blue colour is obtained. Protect the solution from absorption of carbon dioxide during the titration.

1 ml of *0.1 M lithium methoxide* is equivalent to 0.02423 g of $C_{11}H_{18}N_2O_2S$.

For sodium — Mixed the contents of 10 containers and Weigh 0.4 g of the contents, dissolve in 30 ml of *water*, add 1 drop of *methyl red solution* and titrate with *0.05 M sulphuric acid* until the yellow colour changes to red. Boil gently for 2 minutes, cool and, if necessary, continue the titration with *0.05 M sulphuric acid* until the red colour is restored

1 ml of *0.05 M sulphuric acid* is equivalent to 0.002299 g of Na.

Storage. Store in single dose containers.

Labelling. The label states the amount of active ingredient in terms of Thiopentone Sodium.

Thiotepa

$C_6H_{12}N_3PS$ Mol. Wt. 189.2

Thiotepa is tris(1-aziridinyl)phosphine sulphide.

Thiotepa contains not less than 97.0 per cent and not more than 102.0 per cent of $C_6H_{12}N_3PS$, calculated on the anhydrous basis.

Category. Anticancer.

Description. Fine, white, crystalline flakes.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiotepa IPRS* or with the reference spectrum of thiotepa.

B. Determine on 20 mg by the oxygen-flask method (2.3.34), using 5 ml of *1.25 M sodium hydroxide* as the absorbing liquid. When the process is complete, dilute to 25 ml with *water* (solution A). To 5 ml of solution A add 0.1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *1 M hydrochloric acid*, mix and add 0.05 ml of *barium chloride solution*; a turbidity is produced.

C. To 2 ml of solution A add 40 ml of *water* and 4 ml of *ammonium molybdate-sulphuric acid solution*, mix, add 0.1 g of *L-ascorbic acid* and boil for 1 minute; a blue colour is produced.

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.35 g of the substance under examination 100.0 ml of the *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Further dilute 1.0 ml to 10.0 ml with *water*.

Reference solution (b). Dissolve 10 mg of the substance under examination in 2 ml of *methanol* in a ground glass-stoppered tube, add 50 µl of a 0.1 per cent v/v solution of *orthophosphoric acid*, stopper the tube and heat in a water

https://nhathuocngocanh.com/

bath at 65° for 50 seconds (generation of methoxythiotepa). Allow the solution to cool and add 1 ml of *methanol*.

Reference solution (c). Dissolve 15 mg of the substance under examination in 10 ml of *water*, add 1 g of *sodium chloride*, boil in a water bath for 10 minutes and cool (generation of chloro- adduct).

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 15 volumes of *acetonitrile* and 85 volumes of *0.1 M phosphate buffer pH 7.0*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the two principal peaks is not less than 3. The relative retention time with reference to thiotepa for methoxythiotepa is about 1.3 and for chloro-adduct (thiotepa impurity A) is about 3.75.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to the chloro-adduct is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Water (2.3.43). Not more than 2.0 per cent, determined on 1.2 g.

Assay. Weigh 0.2 g into a stoppered flask, add 50 ml of a 20 per cent w/v solution of *sodium thiosulphate* and titrate immediately with *0.1 M hydrochloric acid*, using *methyl orange solution* as indicator, until a faint red colour persists for 10 seconds. Stopper the flask, allow to stand for 30 minutes and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Subtract the volume of *0.1 M sodium hydroxide* used from the volume of *0.1 M hydrochloric acid* used. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of *hydrochloric acid* required.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.006307 g of $C_6H_{12}N_3PS$.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°. At higher temperatures it tends to polymerise with loss of activity.

Thiotepa Injection

Thiotepa Injection is a sterile material consisting of Thiotepa with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Thiotepa Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of thiotepa, $C_6H_{12}N_3PS$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strength. 15 mg.

Description. A white powder.

Identification

A. Determine on 20 mg by the oxygen-flask method (2.3.34), using 5 ml of *1.25 M sodium hydroxide* as the absorbing liquid. When the process is complete, dilute to 25 ml with *water* (solution A). To 5 ml of solution A add 0.1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *1 M hydrochloric acid*, mix and add 0.05 ml of *barium chloride solution*; a turbidity is produced.

B. To 2 ml of solution A add 40 ml of *water* and 4 ml of *ammonium molybdate-sulphuric acid solution*, mix, add 0.1 g of *L-ascorbic acid* and boil for 1 minute; a blue colour is produced.

Tests

Appearance of solution. Dissolve a quantity containing 15 mg of Thiotepa in 4 ml of *water*; the solution is clear (2.4.1).

pH (2.4.24). 5.5 to 7.5, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Dissolve a quantity of the contents of the sealed container containing 15 mg of Thiotepa in 4 ml of *water*, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Further dilute 1.0 ml to 10.0 ml with *water*.

https://nhathuocngocanh.com/

Reference solution (b). Dissolve 10 mg of *thiotepa IPRS* in 2 ml of *methanol* in a ground-glass-stoppered tube, add 50 µl of a 0.1 per cent v/v solution of *orthophosphoric acid*, stopper the tube and heat in a water-bath at 65° for 50 seconds (generates methoxy-thiotepa). Allow the solution to cool and add 1 ml of *methanol*.

Reference solution (c). Dissolve 15 mg of *thiotepa RS* in 10 ml of *water*, add 1 g of *sodium chloride*, boil in a water-bath for 10 minutes and cool (generates chloro-adduct impurity).

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 15 volumes of *acetonitrile* and 85 volumes of *0.1 M mixed phosphate buffer pH 7.0*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The chromatogram obtained with reference solution (b) shows a peak corresponding to methoxy-thiotepa with a retention time relative to thiotepa of about 1.3 and the chromatogram obtained with reference solution (c) shows a peak corresponding to the chloro- adduct impurity with a retention time relative to thiotepa of about 3.1.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to the chloro-adduct impurity is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of not more than two such peaks is more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent).

Bacterial endotoxins (2.2.3). Not more than 6.25 Endotoxin Units per mg of Thiotepa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable quantity of the injection containing 0.15 g of Thiotepa in 100 ml of *water*.

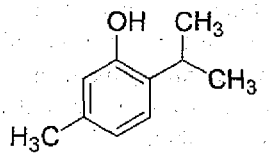
Reference solution. A 0.15 per cent w/v solution of *thiotepa IPRS* in *water*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *water* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Calculate the content of $C_6H_{12}N_3PS$ in the injection.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°. If solid matter separates from the constituted injection, the solution should not be used.

Thymol



$C_{10}H_{14}O$ Mol. Wt. 150.2

Thymol is 2-isopropyl-5-methylphenol.

Thymol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{14}O$.

Category. Pharmaceutical aid (antimicrobial preservative; antiseptic).

Description. Colourless crystals.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thymol IPRS* or with the reference spectrum of thymol.

B. Dissolve 0.2 g with heating in 2 ml of *2 M sodium hydroxide*, add 0.2 ml of *chloroform* and heat on a water-bath; a violet colour develops.

C. Dissolve about 2 mg in 1 ml of *anhydrous acetic acid*, add 0.15 ml of *sulphuric acid* and 0.05 ml of *nitric acid*; a bluish green colour develops.

D. Melting range (2.4.21). 48° to 52°.

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *2 M sodium hydroxide*. The solution is not more opalescent than opalescence standard OS4 (2.4.1), and not more intensely coloured than reference solution RS6 (2.4.1).

https://nhathuocngocanh.com/

Acidity. To 1.0 g in a glass-stoppered flask add 20 ml of *water*, boil until dissolution is complete, cool, stopper the flask and shake vigorously for 1 minute. Add a few crystals of the substance under examination to induce crystallisation, shake vigorously for 1 minute and filter. To 5 ml of the filtrate add 0.05 ml of *methyl red solution* and 0.05 ml of *0.01 M sodium hydroxide*; the solution is yellow.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g in sufficient *ethanol (95 per cent)* to produce 10 ml.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *ethanol (95 per cent)*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *ethanol (95 per cent)*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *ethanol (95 per cent)*.

Chromatographic system
- a glass column 4 m × 2 mm, packed with diatomaceous support (125 to 180 mesh) impregnated with a mixture suitable for the separation of free fatty acids (Such as FFAP),
- temperature:
  column 80° for 2 minutes, increase @ 8° to 240° stand for 15 minutes,
  inlet port at 250° and detector at 300°,
- flow rate: 30 ml per minute of the carrier gas.

Inject 1 µl of reference solution (a), (c) and the test solution.

In the chromatogram obtained with the test solution he sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Residue on evaporation. Evaporate 2.0 g on a water-bath and heat at 105° for 1 hour. The residue weighs not more than 1.0 mg (0.05 per cent).

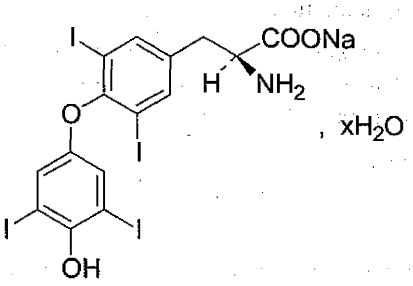
Assay. Weigh 0.1 g, transfer to an iodine flask and dissolve in 25 ml of *1 M sodium hydroxide*. Add 20 ml of hot *dilute hydrochloric acid* and immediately titrate with *0.05 M bromine* to within 1 to 2 ml of the calculated end-point. Warm the solution to about 75°, add 0.1 ml of *methyl orange solution* and shake vigorously. If the solution is red, continue the titration, dropwise and with shaking until the red colour is discharged. Repeat the alternate addition of *0.05 M bromine* and *methyl orange solution* until the red colour is discharged after the addition of the methyl orange solution.

1 ml of *0.05 M bromine* is equivalent to 0.003755 g of $C_{10}H_{14}O$.

Storage. Store protected from light and moisture.

Thyroxine Sodium

Levothyroxine Sodium; *L*-Thyroxine Sodium



$C_{15}H_{10}I_4NNaO_4,xH_2O$ Mol. Wt. 798.9 (anhydrous)

Thyroxine Sodium is sodium *O*⁴-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-*L*-tyrosinate and contains a variable quantity of water of crystallisation.

Thyroxine Sodium contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{15}H_{10}I_4NNaO_4$, calculated on the anhydrous basis.

Category. Thyroid hormone.

Description. A white or slightly brownish yellow powder, slightly coloured, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *levothyroxine sodium IPRS* or with the reference spectrum of levothyroxine sodium.

B. To 200 mg, add 2 ml of *1 M sulphuric acid*. Heat on a water-bath followed by heating carefully over a naked flame, increasing the temperature to about 600°. Continue ignition until most of the black particles have disappeared. Dissolve the residue in 2 ml of *water*, the solution gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. Dissolve 0.5 g in 23 ml of a gently boiling mixture of 4 volumes of *ethanol (95 per cent)* and 1 volume of *1 M hydrochloric acid*. Cool and dilute to 25 ml with the same mixture of solvents (solution A). The freshly prepared solution is not more intensely coloured than reference solution BYS3 (2.4.1).

Specific optical rotation (2.4.22). + 16.0° to + 20.0°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of mobile phase A and 60 volumes of *ethanol (95 per cent)*.

https://nhathuocngocanh.com/

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.0002 per cent w/v each of *levothyroxine sodium IPRS* and *liothyronine sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.0 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 0.1 per cent w/v solution of *orthophosphoric acid* in *water*,
  B. 0.1 per cent w/v solution of *orthophosphoric acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
10	70	30
40	20	80
50	20	80
55	70	30

Name	Relative retention time
Liothyronine[1]	0.5
levothyroxine (retention time about: 11 minutes)	1.0
levothyroxine impurity F[2]	2.0
levothyroxine impurity G[3]	2.4

[1](2S)-2-amino-3-[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl] propanoic acid (liothyronine),

[2](2S)-2-amino-3-[4-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenoxy]-3,5-diiodophenyl]propanoic acid,

[3]Unknown structure.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to levothyroxine and liothyronine is not less than 5.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to liothyronine is not more than the area of the corresponding peak of in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any peak corresponding to levothyroxine impurity F is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to levothyroxine impurity G is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the all the impurities is not more than 2.0 per cent. Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). 6.0 per cent to 12.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *0.1 M sodium hydroxide* and *methanol*.

Test solution. Dissolve 10 mg of the substance under examination in 40 ml of *0.1 M sodium hydroxide*. Shake for about 30 minutes, add 40 ml of *methanol*, cool, mix well and dilute to 100 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution. A 0.001 per cent w/v solution of *levothyroxine sodium IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 65 volumes of *water*, 1 volume of *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}I_4NNaO_4$.

Storage. Store protected from light and moisture.

Thyroxine Tablets

Thyroxine Sodium Tablets; Levothyroxine Tablets; Levothyroxine Sodium Tablets; L-Thyroxine Sodium Tablets

Thyroxine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous thyroxine sodium, $C_{15}H_{10}I_4NNaO_4$.

https://nhathuocngocanh.com/

Usual strengths. 12.5 µg; 25 µg; 50 µg; 75 µg; 100 µg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

NOTE — All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass. Modified peak vessels can be used to eliminate coning.

Apparatus No. 2 (Paddle),

Medium. 500 ml of 0.2 per cent w/v solution of *sodium lauryl sulphate* in *0.01 M hydrochloric acid,*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.01 per cent w/v solution of *levothyroxine sodium IPRS* in *methanol.* Dilute suitably with the dissolution medium to obtain a solution of about the similar concentration as the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile,* 65 volumes of *water* and 0.05 volume of *orthophosphoric acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 4.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{10}I_4NNaO_4$ in the medium.

Liothyronine Sodium. Determine by liquid chromatography (24.14).

Solvent mixture. 60 volumes of *methanol,* 40 volumes of *water* and 0.05 volume of *orthophosphoric acid.*

Solution A. Equal volumes of *0.02 M sodium hydroxide* and *methanol.*

Test solution. Disperse a quantity of powdered tablets containing 100 µg of Levothyroxine sodium in 10.0 ml of the mobile phase, add 2 glass beads and mix on a vortex mixer for 3 minutes. Centrifuge and use the supernatant.

Reference solution (a). A 0.04 per cent w/v solution of *levothyroxine sodium IPRS* in solution A.

Reference solution (b). A 0.04 per cent w/v solution of *liothyronine sodium IPRS* in solution A. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: 40 volumes of *acetonitrile,* 60 volumes of *water* and 0.05 volume of *orthophosphoric acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 100 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to levothyroxine and liothyronine is not less than 5.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for levothyroxine peak.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to liothyronine is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solutions.

Test solution. To one tablet, add 10 ml of solvent mixture and shake for about 30 minutes, dilute with solvent mixture to produce a solution containing 0.000125 per cent per cent w/v of Thyroxine Sodium.

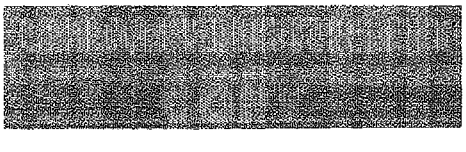
Reference solution. A 0.0125 per cent per cent w/v solution of *levothyroxine sodium IPRS* in a mixture of equal volumes of *0.1 M sodium hydroxide* and *methanol.* Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 600 volumes of *water,* 400 volumes of *acetonitrile* and 0.5 volume of *ortho phosphoric acid.*



https://nhathuocngocanh.com/

Test solution. Weigh and powder 20 or more tablets. Disperse a quantity of the powder containing about 1 mg of Thyroxine Sodium, in 40 ml of the solvent mixture with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *levothyroxine sodium IPRS* in a mixture of equal volumes of *0.1 M sodium hydroxide* and *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with a stationary phase consisting of porous silica particles (5 to 10 µm) to which nitrile groups are chemically bonded,
- mobile phase: a mixture of 65 volumes of *water*, 1 volume of *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

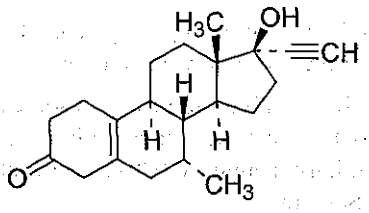
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous thyroxine sodium.

Tibolone



$C_{21}H_{28}O_2$ Mol. Wt. 312.5

Tibolone is 17-hydroxy-7α-methyl-19-nor-17α-pregn-5(10)-en-20-yn-3-one.

Tibolone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Category. Steroid with estrogenic and progestogenic properties.

Description. A white or almost white, crystalline powder or crystals. It shows polymorphism (2.5.11).

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tibolone IPRS* or with the reference spectrum of tibolone.

Tests

Specific optical rotation (2.4.22). + 100° to + 106°, determined on 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 75 volumes of *acetonitrile*.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *methanol*, 40 volumes of *acetonitrile* and 52 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 5 µl.

Name	Relative retention time	Correction factor
Tibolone impurity A[1]	0.22	1.7
Tibolone impurity B[2]	0.24	1.5
Tibolone impurity C[3]	0.58	2.1
Tibolone (retention time: about 14 minutes)	1.0	—
Tibolone impurity D[4]	1.12	—
Tibolone impurity E[5]	2.24	—

[1]10,17-dihydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one,
[2]10-hydroperoxy-17-hydroxy-7α -methyl-19-nor-10ξ,17α -pregn-4-en- 20-yn-3-one,
[3]17-hydroxy-7α -methyl-19-nor-10ξ,17α -pregn-4-en-20-yn-3-one,
[4]17-hydroxy-7β-methyl-19-nor-17α -pregn-5(10)-en-20-yn-3-one,
[5]3,3-dimethoxy-7α -methyl-19-nor-17α -pregn-5(10)-en-20-yn-17-ol.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to tibolone impurity A and E is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). The area of any peak due to tibolone impurity B is not more than 0.4 times

https://nhathuocngocanh.com/

the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent). The area of any peak due to tibolone impurity C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The area of any peak due to tibolone impurity D is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.25 g in 60 ml of *tetrahydrofuran*. Add 25 ml of a 10 per cent w/v solution of *silver nitrate*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03125 g of $C_{21}H_{28}O_2$.

Storage. Store at a temperature between 2° to 8°.

Tibolone Tablets

Tibolone Tablets contain not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of tibolone, $C_{21}H_{28}O_2$.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Usual strength. 2.5 mg.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of 0.25 per cent w/v solution of *sodium lauryl sulphate*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with a 0.25 per cent w/v solution of *sodium lauryl sulphate* to obtain a solution containing 0.0005 per cent w/v of Tibolone.

Reference solution. A 0.0005 per cent w/v solution of *tibolone IPRS* in a mixture of 1 volume of *methanol* and 99 volumes of 0.25 per cent w/v solution of *sodium lauryl sulphate*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 40°,
- mobile phase: a mixture of 23 volumes of *water* and 77 volumes of *methanol*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 200 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{28}O_2$, in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{28}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 25 mg of Tibolone in 40 ml of *ethanol* with the aid of ultrasound and dilute to 50.0 ml with *ethanol*, centrifuge and use the supernatant.

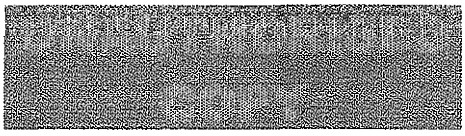
Reference solution (a). A 0.05 per cent w/v solution of *tibolone impurity standard IPRS (containing impurity B, impurity C and 1 per cent w/w of impurity A)* in *ethanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with *ethanol*.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm) (Such as Nova-pak C18),
- column temperature: 40°,
- mobile phase: a mixture of 28 volumes of *tetrahydrofuran* and 72 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (a) and (b). The test is not valid unless the chromatogram obtained with reference solution (a) closely resembles the chromatogram supplied with tibolone impurity standard RS and the resolution between the peaks due to tibolone impurity A and tibolone impurity B is not less than 2.0 and the signal-to-noise ratio of the peak due to tibolone impurity A is not less than 10 in the chromatogram obtained with reference solution (b).



https://nhathuocngocanh.com/

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to tibolone impurity A (10,17-dihydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one) is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any peak corresponding to tibolone impurity B (10-hydroperoxy-17-hydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one) is not more than the area of the peak due to tibolone impurity A in the chromatogram obtained with reference solution (a) (1.0 per cent). The area of any peak corresponding to tibolone impurity C (17-hydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one), multiplied with correction factor 0.79 is not more than 5 times the area of the peak due to tibolone impurity A in the chromatogram obtained with reference solution (a) (5.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the peak due to tibolone impurity A in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 6.5 times the area of the peak due to tibolone impurity A (6.5 per cent). Ignore any peak with an area less than the area of the peak due to tibolone impurity A in the chromatogram obtained with reference solution (b) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 powdered tablet in *ethanol* with the aid of ultrasound for 10 minutes to obtain a solution containing 0.01 per cent w/v of Tibolone and centrifuge.

Reference solution (a). A 0.01 per cent w/v solution of *tibolone IPRS* in *ethanol.*

Reference solution (b). A 0.05 per cent w/v solution of *tibolone impurity standard IPRS* in *ethanol.*

Use the chromatographic system as described under Related substances with the following modifications

- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tibolone impurity A and tibolone impurity B is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 25 mg of Tibolone in 40 ml of *ethanol* with the aid of ultrasound and dilute to 50.0 ml with *ethanol* and centrifuge.

Reference solution (a). A 0.05 per cent w/v solution of *tibolone IPRS* in *ethanol.*

Reference solution (b). A 0.05 per cent w/v solution of *tibolone impurity standard IPRS* in *ethanol.*

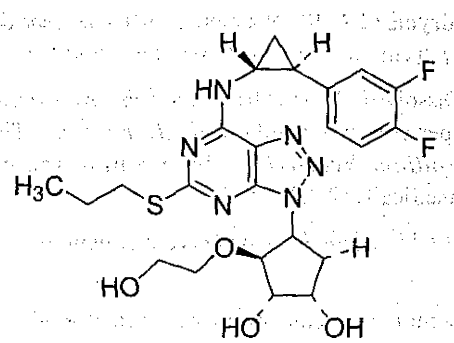
Use chromatographic system as described under Related substances using detection wavelength: 210 nm.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tibolone impurity A and tibolone impurity B is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{21}H_{28}O_2$ in the tablets.

Ticagrelor



$C_{23}H_{28}F_2N_6O_4S$ Mol. Wt. 522.6

Ticagrelor is 1,2-Cyclopentanediol, 3-[7-[[(1R,2S)-2-(3,4-difluorophenyl) cyclopropyl] amino]-5-(propylthio)-3H-1,2,3-triazolo[4,5-d] pyrimidin-3-yl]-5-(2-hydroxyethoxy)-(1*S*, 2*S*, 3*R*, 5*S*).

Ticagrelor contains not less than 97.5 per cent and not more than 102. 0 per cent of $C_{23}H_{28}F_2N_6O_4S$, calculated on anhydrous basis.

Category. Anti-platelet.

Description. A white or almost white to pale pink powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ticagrelor IPRS* or with the reference spectrum of ticagrelor.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Impurity E. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Buffer solution. Dissolve 156 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Test solution. Dissolve 150 mg of the substance under examination in 10 ml of equal volumes of *acetonitrile* and *water* and dilute to 50.0 ml with *water*. Centrifuge at 3500 rpm for 15 minutes or until a clear solution is obtained. Use the clear solution.

Reference solution. A 0.000045 per cent w/v solution of *ticagrelor impurity E IPRS ((R)-mandelate salt)* in *acetonitrile*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

NOTE — 1 mg of ticagrelor impurity E ((1R,2S)-2-(3,4-Difluorophenyl)cyclopropan-1-amine) corresponds to 1.9 mg of impurity E as mandelic acid salt).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (1.8 µm) (Such as Zorbax SB C-18)
- column temperature: 55°,
- mobile phase: A. a mixture of 89 volumes of *water*, 10 volumes of *acetonitrile* and 1 volume of the buffer solution,

  B. a mixture of 29 volumes of *water*, 70 volumes of *acetonitrile* 1 volume of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 222 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	94	6
8	94	6
9	0	100
20	0	100
20.1	94	6
25	94	6

The relative retention time with reference to ticagrelor (retention time- about 11.5 minutes) for ticagrelor impurity E is about 0.6.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity E is not more than the area of the principal peak in the chromatogram obtained with the reference solution (8 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Buffer solution. Dissolve 156 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.005 per cent w/v solution of *ticagrelor RS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v of *ticagrelor RS* and 0.0001 per cent w/v of *ticagrelor impurity B RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 3.0 mm packed with phenyl group bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 89 volumes of *water*, 10 volumes of *acetonitrile* and 1 volume of the buffer solution,

  B. a mixture of 29 volumes of *water*, 70 volumes of *acetonitrile* and 1 volume of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 0.65 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
2	80	20
42	25	75
47	25	75
47.1	80	20
55	80	20

Name	Relative retention time	Correction factor
Ticagrelor impurity A[1]	0.15	0.5
Ticagrelor	1.0	—
Ticagrelor impurity B[2]	1.06	—
Ticagrelor impurity C[3]	1.23	—
Ticagrelor impurity D[4]	1.49	—

[2](1*S*,2*S*,3*R*,5*S*)-3-({3-[(1*R*,2*S*)-2-(3,4-Difluorophenyl)cyclopropyl]-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-7-yl}amino)-5-(2-hydroxyethoxy) cyclopentane-1,2-diol,

[3]2-{[(1*S*,2*S*,3*S*,4*R*)-4-(7-{[(1*R*,2*S*)-2-(3,4-Difluorophenyl) cyclopropyl]amino}-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-3-yl)-2,3-dihydroxycyclopentyl]oxy}ethyl acetate,

[4]2-{[(3*aR*,4*S*,6*R*,6*aS*)-6-(7-{[(1*R*,2*S*)-2-(3,4-difluorophenyl) cyclopropyl]amino}-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-3-yl)-2,2-dimethyltetrahydro-4H-cyclopenta[d][1,3]dioxol-4-yl]oxy}ethanol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ticagrelor and ticagrelor impurity B is not less than 4.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ticagrelor impurity A and impurity B, each of, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to ticagrelor impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to ticagrelor impurity D is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.6 per cent, using platinum crucible.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14),

NOTE — Carry out the test protected from light.

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of *water*.

Buffer solution. Dissolve 156 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *ticagrelor IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm packed with phenyl group bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: a mixture of 56 volumes of *water*, 43 volumes of *acetonitrile* and 1 volume of the buffer solution,
- flow rate: 0.65 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}F_2N_6O_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ticagrelor Tablets

Ticagrelor Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ticagrelor, $C_{23}H_{28}F_2N_6O_4S$.

Usual strength. 90 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.2 per cent v/v of *polysorbate 80* in *water*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium if necessary, at the maximum at about 300 nm (2.4.7). Calculate the content of $C_{23}H_{28}F_2N_6O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *ticagrelor IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_{23}H_{28}F_2N_6O_4S$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

NOTE — protect the solution from light.

https://nhathuocngocanh.com/

Reference solution (a). A solution containing 0.05 per cent w/v of *ticagrelor IPRS* and 0.0001 per cent w/v of *ticagrelor related compound B IPRS* in the solvent mixture.

Reference solution (b). A 0.0001 per cent w/v solution of *ticagrelor IPRS* in the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Chromatographic system
- mobile phase: A. 1 volume of the buffer solution, 89 volumes of *water* and 10 volumes of *acetonitrile*, B. 1 volume of the buffer solution, 29 volumes of *water* and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
7	35	65
15	35	65
16	0	100
23	0	100

Ticagrelor	1.0
Ticagrelor related compound B[2*]	1.07
Ticagrelor related compound C[3*]	1.45
Ticagrelor related compound D[4*]	1.68

*Process impurity include for identification only and not included in the calculation of total degradation products,

[1](1*S*,2*S*,3*R*,5*S*)-3-{7-amino-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-3-yl}-5-(2-hydroxyethoxy)cyclopentane-1,2-diol,

[2](1*S*,2*S*,3*R*,5*S*)-3-({3-[1*R*,2*S*)-2-(3,4-Difluorophenyl)cyclopropyl]-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-7-yl}amino)-5-(2-hydroxyethoxy) cyclopentane-1,2-diol,

[3]2-{[(1*S*,2*S*,3*S*,4*R*)-4-(7-{[(1*R*,2*S*)-2-(3,4-Difluorophenyl) cyclopropyl]amino}-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-3-yl)-2,3-dihydroxycyclopentyl]oxy}ethyl acetate,

[4]2-{[(3*aR*,4*S*,6*R*,6*aS*)-6-(7-{[(1*R*,2*S*)-2-(3,4-difluorophenyl) cyclopropyl]amino}-5-(propylthio)-3*H*-[1,2,3]triazolo[4,5-d]pyrimidin-3-yl)-2,2-dimethyltetrahydro-4*H*-cyclopenta[d][1,3]dioxol-4-yl]oxy}ethanol.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to ticagrelor and ticagrelor related compound B is not less than 1.5 in the chromatogram obtained with reference solution (a), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b) and the signal to noise ratio for the principal peak is not less than 10.0 in the chromatogram obtained with reference solution (c). Ignore any peak with an area 0.5 time the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of *water*.

Buffer solution. 1 M sodium phosphate, adjusted to pH 3.0 with *orthophosphoric acid.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Ticagrelor with 60 ml of the solvent mixture, with the aid of ultrasound with intermittent shaking and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *ticagrelor IPRS* in solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (1.8 µm),
- column temperature: 55°,
- mobile phase: a mixture of 52 volumes of *acetonitrile* and 1 volume of the buffer solution and 47 volumes of *water*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{28}F_2N_6O_4S$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

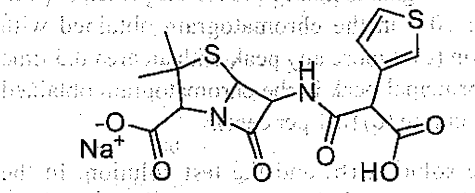
Ticarcillin Monosodium

Ticarcillin Monosodium Monohydrate



$C_{15}H_{15}N_2NaO_6S_2, H_2O$ Mol. Wt. 424.4

Ticarcillin Monosodium is 4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylicacid, 6-[(carboxy-3-thienylacetyl)amino]-3,3-dimethyl-7-oxo, monosodium salt, [2S-[2α, 5α, 6β (S*)]]-, monohydrate.

Ticarcillin Monosodium Monohydrate contains not less than 890 µg per mg of ticarcillin $C_{15}H_{16}N_2O_6S_2$, calculated on the anhydrous basis.

Category. Beta-Lactam Antibacterial.

Description. A white to pale yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ticarcillin monosodium monohydrate IPRS* or with the reference spectrum of ticarcillin monosodium.

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peak in the chromatogram obtained with the reference solution.

C. Specific optical rotation (see Test).

D. A 5 per cent w/v solution gives reaction (A) of sodium (2.3.1).

Tests

***N, N*-Dimethylaniline** (2.3.21). Not more than 20 ppm.

pH (2.4.24). 2.5 to 4.0, determined in a 1.0 per cent w/v solution of ticarcillin.

Specific optical rotation (2.4.22). + 181.0° to + 197.0°, determined in a 1.0 per cent w/v solution prepared by dissolving 6.9 g of *monobasic sodium phosphate* in 800 ml of *water* adjusted to pH 6.4 with *10 M sodium hydroxide* and dilute to 1000 ml with *water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 20 ml of mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution. A 0.002 per cent w/v solution of *ticarcillin monosodium monohydrate IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 1.3 g of *dibasic ammonium phosphate* in *water,* adjusted to pH 7.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,
  B. a mixture of 50 volumes of *methanol* and 50 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	30	70
40	30	70
45	100	0

Name	Relative retention time
Ticarcillin	0.95, 1.0
Ticarcillin related compound A[1]	2.1

[1]Decarboxy ticarcillin; (2,5-3,3-dimethyl-7-oxo-6[[(thiophen-3yl) acetyl]-4-thia-azabicyclo[3,2,0]heptane-2-carboxylic acid.

Inject the reference solution. The test is not valid unless the resolution between two ticarcillin peaks is not less than 2.0 and the relative standard deviation for replicate injections is not more than 5 per cent for the sum of ticarcillin peaks.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to ticarcillin related compound A is not more than twice the area of the sum of principal peaks in the chromatogram obtained with the reference solution (4.0 per cent) and the area of any other secondary peak is not more than 1.25 times the area of the sum of principal peaks in the chromatogram obtained with the reference solution (2.5 per cent).

Water (2.3.43). 4.0 per cent to 6.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 70 ml of the mobile phase, with the aid of ultrasound and dilute to 200.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *ticarcillin mono sodium monohydrate IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 25 cm × 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.3 gm of *dibasic ammonium phosphate* in 800 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and dilute to 1000 ml with the *water* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between two ticarcillin peaks is not less than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent for the sum of ticarcillin peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{16}N_2O_6S_2$.

Ticarcillin Monosodium Monohydrate intended for use in the manufacture of Parenteral Preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.05 Endotoxin unit per mg of ticarcillin.

Ticarcillin Monosodium Monohydrate intended for use in the manufacture of Parenteral Preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture, at a temperature between 2° to 8°.

Labelling. The label states whether it is intended for use in the manufacture of parenteral preparations.

Ticarcillin and Clavulanic Acid Injection

Clavulanic Acid and Ticarcillin Injection

Ticarcillin and Clavulanic Acid Injection is a sterile iso-osmotic solution of Ticarcillin Monosodium and Clavulanate Potassium in Water for Injections. It contains one or more suitable buffering agents and a tonicity adjusting agent.

Ticarcillin and Clavulanic Acid Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of ticarcillin, $C_{15}H_{16}N_2O_6S_2$ and not less than 85.0 per cent and not more than 120.0 per cent of the stated amount of clavulanic acid, $C_8H_9NO_5$.

Ticarcillin and Clavulanic Acid for Injection

Ticarcillin and Clavulanic acid for Injection is a sterile, dry mixture of Ticarcillin Monosodium and Clavulanate Potassium.

The constituted solution complies with the requirements for clarity of solution and particulate matter stated under Parenteral Preparations (Injections).

Usual Strength. Ticarcillin 3 g and Clavullanic acid 100 mg.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.5 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 0.07 Endotoxin Unit per mg of ticarcillin.

Sterility (2.2.11). Complies with the test for sterility.

Water (2.3.43). Not more than 4.2 per cent.

Other tests. Comply with the tests stated under Parenteral Preparations (Powders for Injections).

Assay. Determine by liquid chromatography (2.4.14).

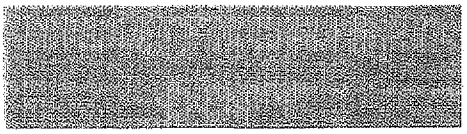
Sodium phosphate buffer pH 4.3. Dissolve 13.8 g of *monobasic sodium phosphate* in 900 ml of *water*, adjusted to pH 4.3 with *orthophosphoric acid* or *10 M sodium hydroxide*, dilute to 1000 ml with *water*.

Sodium phosphate buffer pH 6.4. Dissolve 6.9 g of *monobasic sodium phosphate* in 900 ml of *water*, adjusted to pH 6.4 with *10 M sodium hydroxide*, dilute 1000 ml with *water*.

Clavulanate lithium stock solution. A 0.06 per cent w/v solution of *clavulanate lithium IPRS* in *sodium phosphate buffer pH 6.4*.

Test solution. Dissolve a quantity of powder in sufficient *water* and dilute with *sodium phosphate buffer pH 6.4* to obtain a 0.09 per cent w/v solution of Ticarcillin.

Reference solution. Transfer about 100 mg of *ticarcillin monosodium monohydrate IPRS* to a 100-ml volumetric flask and add 150/J ml of *clavulanate lithium stock solution* (J is the ratio of the stated amount of ticarcillin to the stated amount of clavulanic acid in the powder) and dilute to 100.0 ml with *sodium phosphate buffer pH 6.4*.



https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 95 volumes of *sodium phosphate buffer pH 4.3* and 5 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention time with reference to ticarcillin for clavulanic acid is about 0.2.

Inject the reference solution. The test is not valid unless the column efficiency of the principal peaks is not less than 1000 theoretical plates; the tailing factor for the principal peaks are not more than 2.0; the resolution between the peaks due to ticarcillin and clavulanic acid is not less than 5.0; and the relative standard deviation for replicate injections is not more than 2.0 per cent.

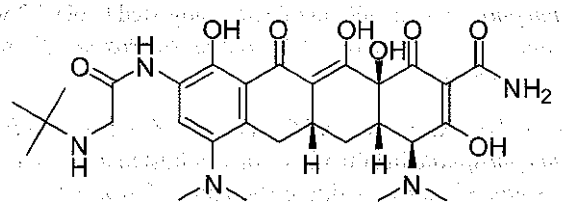
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{16}N_2O_6S_2$ and $C_8H_9NO_5$ in the injection.

Storage. Store in single dose or multiple dose containers.

Labelling. The label states (1) that the injection is to be thawed just prior to use; (2) conditions for proper storage of the resultant solution; (3) directs that the solution is not to be refrozen.

Tigecycline



$C_{29}H_{39}N_5O_8$ Mol. Wt. 585.7

Tigecycline is 2-Naphthacenecarboxamide,4,7-bis (dimethylamino)-9-[[[(1,1-dimethylethyl)amino]acetyl] amino]-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-(4*S*,4a*S*,5a*R*,12a*S*).

Tigecycline contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{29}H_{39}N_5O_8$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. An orange powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tigecycline IPRS* or with the reference spectrum of tigecycline.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

NOTE — Handle standard and sample under moisture controlled condition, to prevent degradation.

pH (2.4.24). 7.7 to 8.2, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). −240.0° to −215.0°, determined in a 0.1 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 4.35 g of *dibasic potassium phosphate* and 0.5 g of *sodium bisulphite* in 900 ml of *water*, adjusted to pH 8.0 with *1 M potassium hydroxide* and dilute to 1000 ml with *water*.

NOTE — Protect the solutions from light. Store these solutions at 10° immediately after preparation.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.0005 per cent w/v solution of *tigecycline IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v of *tigecycline IPRS* and 0.00024 per cent w/v of *tigecycline impurity B IPRS* in the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3µm) (Such as Phenomenex Luna C18),
- sample temperature: 10°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 4.58 g of *dibasic potassium phosphate* and 0.98 g of *disodium edetate* in 1000 ml of *water*, adjusted to pH 6.4 with *orthophosphoric acid* and 5 volumes of *acetonitrile*,

  B. a mixture of 50 volumes of a buffer solution prepared by dissolving 8.7 g of *dibasic potassium phosphate* and 1.96 g of *disodium edetate* in 1000 ml of *water*, adjusted to pH 6.4 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,

https://nhathuocngocanh.com/

– flow rate: 1 ml per minute,

[5](4*R*,4a*S*,5a*R*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11-dioxo-2-naphthacenecarboxamide,

[6](*S*)-4-({6-[2-(*tert*-Butylamino)acetamido]-8-(dimethylamino)-5-hydroxy-4-oxo-1,2,3,4-tetrahydronaphthalen-2-yl}methyl)-2,5-dihydroxy-3,6-dioxocyclohexa-1,4-dienecarboxamide,

[7](1*S*,4a*R*,4b*R*,10a*R*,11a*S*)-7-[2-(*tert*-Butylamino)acetamido]-9-(dimethylamino)-1,4,4a,6-tetrahydroxy-2,5,12-trioxo-1,2,4a,5,10,10a,11,11a-octahydro-1,4b-methanobenzo[*b*]fluorene-3-carboxamide.

Inject reference solution (a), (b) and (c).The test is not valid unless the resolution between the peaks due to tigecycline epimer and tigecycline impurity B is not less than 1.5, in the chromatogram obtained with reference solution (b), the tailing factor is between 0.7 to 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and the signal- to- noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to tigecycline open ring is not more than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent). The area of any peak corresponding to tigecycline 12-oxo-11-hydroxy, tigecycline quinine analog, tigecycline tricyclic analog and at relative retention time 0.12, 0.23, 0.5, 0.76, 1.5, 1.9, each of, is not morethan 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any peak corresponding to tigecycline impurity B and minocycline, each of, is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). The area of any peak corresponding to tigecycline epimer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.2 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.5 per cent, determined on 0.5 g in 10 ml of *dimethyl sulfoxide*.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 4.35 g of *dibasic potassium phosphate* and 0.5 g of *sodium bisulphite* in 900 ml of *water*, adjusted to pH 8.0 with *1 M potassium hydroxide* and dilute to 1000 ml with *water*.

NOTE — Protect the solutions from light. Store these solutions at 10° immediately after preparation.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *tigecycline IPRS* in the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (b). Dissolve 20 mg of *tigecycline IPRS* in 10 ml of *water*. Add 1 or 2 drops *trifluoro acetic acid* and heat the solution at about 65° for 15 minutes and cool. Dilute 5.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 10°,
- mobile phase: a mixture of 86 volumes of a buffer solution prepared by dissolving 4.35 g of *dibasic potassium phosphate* and 0.93 g of *disodium edetate* in 1000 ml of *water*, adjusted to pH 6.2 with *orthophosphoric acid* and 14 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to tigecycline and tigecycline epimer is not less than 3.0 in the chromatogram obtained with reference solution (b), the tailing factor is between 0.7 to 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{29}H_{39}N_5O_8$.

Tigecycline intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg of tigecycline.

Storage. Store protected from light and moisture, under nitrogen, at a temperature 2° to 8°.

Labelling. When it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

Tigecycline Injection

Tigecycline Injection is a sterile material consisting of Tigecycline with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections or other suitable solvent, immediately before use.

The constituted solution complies with the requirements for the Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Tigecycline Injection contains not less than 96.0 per cent and not more than 116.0 per cent of the stated amount of tigecycline, $C_{29}H_{39}N_5O_8$.

Usual strength. 50 mg per vial.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injections) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

NOTE — Handle standard and sample under moisture controlled condition, to prevent degradation.

pH (2.4.24). 4.5 to 5.5, determined in the reconstituted solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 4.35 g of *dibasic potassium phosphate* and 0.5 g of *sodium bisulphite* in 900 ml of *water*, adjusted to pH 8.0 with *1 M potassium hydroxide* and dilute to 1000 ml with *water*.

NOTE — Protect the solutions from light using low-actinic glass ware. Store these solutions at 10° immediately after preparation.

Test solution. Mix the content of 5 vials. Disperse a quantity containing 50 mg of Tigecycline in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.0005 per cent w/v solution of *tigecycline IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.05 per cent w/v of *tigecycline IPRS* and 0.00024 per cent w/v of *tigecycline impurity B IPRS* in the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- sample temperature: 10°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 4.58 g of *dibasic potassium phosphate* and 0.98 g of *disodium edetate* in 1000 ml of *water*, adjusted to pH 6.4 with *orthophosphoric acid* and 5 volumes of *acetonitrile*,

https://nhathuocngocanh.com/

B. a mixture of 50 volumes of buffer solution prepared by dissolving 8.7 g of *dibasic potassium phosphate* and 1.96 g of *disodium edetate* in 1000 ml of *water*, adjusted to pH 6.4 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,

– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 248 nm,
– injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
40	57	43
55	0	100
58	0	100
59	85	15
66	85	15

Name	Relative retention time
Tigecycline open ring[1,2]	0.36
Tigecycline 12-oxo-11-hydroxy[3]	0.55
Tigecycline impurity B[4]	0.64
Tigecycline epimer[5]	0.74
Tigecycline	1.0
Tigecycline quinine analog[6]	1.3
Minocycline	1.6
Tigecycline tricyclic analog[7]	1.7

[1]To be reported if there is a peak with maximum absorbance at either 390 or 640 nm. The impurity is quantitated at 248 nm. The system may resolve two peaks. The limit is for the sum of the two peaks,

[2](3*S*,4*R*)-7-[2-(*tert*-Butylamino)acetamido]-3-[4-carbamoyl-2-(dimethylamino)-3,5,6-trihydroxybenzyl]-5-(dimethylimino)-1,4,8-trihydroxy- 3,4,5,8-tetrahydronaphthalene-2-carboxylate,

[3](4*S*,4a*S*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)- 3,10,11,12a-tetrahydroxy-1,12-dioxo-1,4,4a,5,12,12a-hexahydro-2-naphthacenecarboxamide,

[4](4*S*,4a*S*,5a*R*,12a*S*)-9-Amino-4,7-bis(dimethylamino)-3,10,12,12a-tetrahydroxy-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride,

[5](4*R*,4a*S*,5a*R*,12a*S*)-9-[2-(*tert*-Butylamino)acetamido]-4,7-bis(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,10,12,12a-tetrahydroxy-1,11- dioxo-2-naphthacenecarboxamide,

[6](*S*)-4-({6-[2-(*tert*-Butylamino)acetamido]-8-(dimethylamino)-5-hydroxy-4-oxo-1,2,3,4-tetrahydronaphthalen-2-yl}methyl)-2,5-dihydroxy- 3,6-dioxocyclohexa-1,4-dienecarboxamide,

[7](1*S*,4a*R*,4b*R*,10a*R*,11a*S*)-7-[2-(*tert*-Butylamino)acetamido]-9-(dimethylamino)-1,4,4a,6-tetrahydroxy-2,5,12-trioxo-1,2,4a,5,10,10a,11,11a- octahydro-1,4b-methanobenzo[*b*]fluorene-3-carboxamide.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to tigecycline impurity B and tigecycline epimer is not less than 1.5, in the chromatogram obtained with reference solution (b), the tailing factor is between 0.7 to 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and signal-to- noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to tigecycline open ring is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any peak corresponding to tigecycline 12-oxo-11-hydroxy and tigecycline tricyclic analog,each of, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of any peak corresponding to tigecycline quinine analog is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to tigecycline impurity B is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent). The area of any peak corresponding to tigecycline epimer is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (6.0 per cent).

Sterility (2.2.11). Complies with the test for sterility.

Bacterial endotoxins (2.2.3). Not more than 1.75 Endotoxin Unit per mg of tigecycline.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 4.35 g of *dibasic potassium phosphate* and 0.5 g of *sodium bisulphite* in 900 ml of *water*, adjusted to pH 8.0 with *1 M potassium hydroxide* and dilute to 1000 ml with *water*.

NOTE — Protect the solutions from light using low-actinic glass ware. Store these solutions at 10° immediately after preparation.

Test solution. Mix the content of 5 vials. Disperse a quantity containing 50 mg of Tigecycline in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (a). A 0.01 per cent w/v solution of *tigecycline IPRS* in the solvent mixture.

Reference solution (b). Dissolve 10 mg of *tigecycline IPRS* in 10 ml of *water*. Add 1 or 2 drops *trifluoroacetic acid* and heat the solution at about 65° for 15 minutes and cool. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 10°,
- mobile phase: a mixture of 86 volumes of a buffer solution prepared bydissolving 4.35 g of *dibasic potassium phosphate* and 0.93 g of *disodium edetate* in 1000 ml of *water* adjusted to a pH of 6.2 with *orthophosphoric acid* and 14 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume: 20 µl.

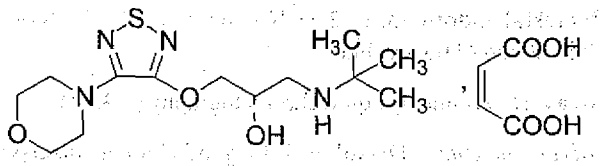
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to tigecycline and tigecycline epimer is not less than 3.0,in the chromatogram obtained with reference solution (b), the tailing factor is between 0.7 to 1.5 and the relative standard deviation for replicate injections is not more than 1.1 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{29}H_{39}N_5O_8$ in the injection.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Timolol Maleate



$C_{13}H_{24}N_4O_3S,C_4H_4O_4$ Mol. Wt. 432.5

Timolol Maleate is (*S*)-1-*tert*-butylamino-3-(4-morpholino-1,2,5-thiadiazol-3-yloxy)propan-2-ol hydrogen maleate.

Timolol Maleate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{24}N_4O_3S,C_4H_4O_4$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist (Antiglaucoma).

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *timolol maleate IPRS* or with the reference spectrum of timolol maleate.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Triturate 0.1 g with a mixture of 1 ml of *2 M sodium hydroxide* and 3 ml of *water* and shake with three quantities, each of 5 ml, of *ether*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; no violet-red colour is produced. Neutralise the remainder of the aqueous layer with *1 M sulphuric acid*, add 1 ml of *bromine water*, heat on a water-bath for 15 minutes, then heat to boiling and cool. To 0.2 ml of the solution add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; a violet-red colour is produced. Add 0.2 ml of a 10 per cent w/v solution of *potassium bromide* and heat on a water-bath for 5 minutes; the colour changes to violet-blue.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 3.8 to 4.3, determined in a 2.0 per cent w/v solution.

Specific optical rotation (2.4.22). −6.2° to −5.7°, determined in a 10.0 per cent w/v solution in *1 M hydrochloric acid*.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Solvent mixture. 10 volumes of *dichloromethane* and 30 volumes of *2-propanol*.

Test solution. Dissolve 30 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.3 per cent w/v solution of *timolol maleate IPRS* in the solvent mixture.

Reference solution (b). A 0.003 per cent w/v solution of *timolol impurity A IPRS ((R)-timolol IPRS)* in the solvent mixture.

Reference solution (c). Dilute 1 ml of reference solution (a) to 100 ml with the solvent mixture. Mix 1 ml of the solution with 1 ml of reference solution (b).

https://nhathuocngocanh.com/

Reference solution (d). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel OD for chiral separations (5 µm),
- mobile phase: a mixture of 2 volumes of *diethylamine*, 40 volumes of *2-propanol* and 960 volumes of *hexane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 297 nm,
- injection volume: 5 µl.

Timolol impurity A is eluted first. The retention times of the principal peaks due to (*S*)-enantiomer in the chromatograms obtained with the test solution and reference solution (a) are identical.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to timolol impurity A and the (*S*)-enantiomer is not less than 4.0.

Inject reference solution (d) and the test solution. The area of any peak due to timolol impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in mobile phase A and dilute to 20 ml with mobile phase A.

Reference solution (a). A 0.05 per cent w/v solution of *timolol maleate IPRS* in the mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of equal volumes of *methanol* and a 0.43 per cent w/v solution of *sodium octanesulphonate* previously adjusted to pH 3.0 with *glacial acetic acid*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	97.5	2.5
10	97.5	2.5
11	70	30
14.5	70	30
17	97.5	2.5

Name	Relative retention time	Correction factor
Maleic acid	0.1	—
Timolol impurity D[1]	0.3	0.6
Timolol impurity E[2]	0.4	—
Timolol impurity F[3]	0.6	—
Timolol impurity B[4]	0.7	—
Timolol (Retention time: about 5 minutes)	1.0	—
Timolol impurity C[5]	2.8	—

[1]4-(morpholin-4-yl)-1,2,5-thiadiazol-3-ol,

[2](2*Z*)-4-[(1*S*)-1-[[(1,1-dimethylethyl)amino]methyl]-2-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]ethoxy]-4-oxobut-2-enoic acid,

[3]4-(4-chloro-1,2,5-thiadiazol-3-yl)morpholine,

[4](2*RS*)-3-[(1,1-dimethylethyl)amino]-2-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-1-ol,

[5](2*RS*)-*N*-(1,1-dimethylethyl)-2,3-bis[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-1-amine.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to timolol impurities B, C, D, E, F is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and ignore any peak due to maleic acid.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.35 g in 60 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04325 g of $C_{13}H_{24}N_4O_3S, C_4H_4O_4$.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Timolol Eye Drops

Timolol Maleate Eye Drops

Timolol Eye Drops are a sterile solution of Timolol Maleate in Purified Water. They may contain suitable antimicrobial preservatives, buffering agents, stabilisers and suitable substances to increase the viscosity of the solution.

Timolol Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of timolol, $C_{13}H_{24}N_4O_3S$.

Usual strengths. The equivalent of 0.25 per cent w/v and 0.5 per cent w/v of timolol.

Identification

A. Add a volume containing 50 mg of timolol to an equal volume of *carbonate buffer pH 9.7* and extract with two quantities, each of 40 ml, of *dichloromethane*. Reserve the aqueous layer for test B. Filter the combined dichloromethane extracts with *anhydrous sodium sulphate* and evaporate to dryness. Dry the residue at 60° at a pressure of 2 kPa for 15 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *timolol maleate IPRS*, treated in the same manner or with the reference spectrum of timolol.

B. Filter the aqueous layer reserved in test A and evaporate to about 1 ml. Add 1 ml of *bromine solution*, heat in a water-bath for 10 minutes, boil, cool and add 0.1 ml of the solution to a solution of 10 mg *resorcinol* in 3 ml of *sulphuric acid*; a bluish black colour is produced on heating in a water-bath for 15 minutes.

Tests

pH (2.4.24). 6.5 to 7.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Use the undiluted eye drops.

Reference solution (a). Dilute 1 volume of the eye drops to 250 volumes with the mobile phase.

Reference solution (b). Dilute 1 volume of the eye drops to 500 volumes with the mobile phase.

Reference solution (c). A 0.3 per cent w/v solution of *maleic acid* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm × 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 57.5 volumes of *methanol* and 42.5 volumes of *0.02 M sodium octanesulphonate*, adjusted to pH 3.0 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Inject reference solution (c), for identification of peak due to maleic acid.

Inject reference solution (a), (b) and the test solution. Run the chromatogram of the test solution for 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak, other than the peak corresponding to maleic acid, is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.4 per cent) and not more than two such peaks have an area greater than that of the peak obtained with reference solution (b) (0.2 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. To a volume containing about 25 mg of timolol add *water* to produce 50.0 ml and mix. To 5.0 ml add 15 ml of *carbonate buffer pH 9.7* and extract with three quantities, each of 20 ml, and one quantity of 10 ml of *toluene*. Wash each extract successively with the same 10-ml volume of *carbonate buffer pH 9.7*. Combine the toluene extracts and extract with four quantities, each of 20 ml, of *0.05 M sulphuric acid*. Combine the extracts, dilute to 100.0 ml, filter and measure the absorbance of the filtrate at the maximum at about 295 nm (2.4.7), using as the blank a solution prepared by treating 5.0 ml of *water* in the same manner beginning at the words "add 15 ml of *carbonate buffer pH 9.7*...".

Calculate the content of $C_{13}H_{24}N_4O_3S$ taking 279 as the specific absorbance at 295 nm.

Storage. Store protected from light and moisture.

Labelling. The label states (1) the strength in terms of the equivalent amount of timolol; (2) the names and concentration of any added antimicrobial preservatives.

Timolol Tablets

Timolol Maleate Tablets

Timolol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of timolol maleate, $C_{13}H_{24}N_4O_3S,C_4H_4O_4$.

Usual strength. 10 mg.

Identification

A. To a quantity of the powdered tablets containing 70 mg of Timolol Maleate add 20 ml of *carbonate buffer pH 9.7* and extract with two quantities, each of 40 ml, of *dichloromethane*. Reserve the aqueous layer for test B. Dry the extracts with

https://nhathuocngocanh.com/

anhydrous sodium sulphate, evaporate to dryness using a rotary evaporator, dry the residue at 60° at a pressure of 2 kPa for 15 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *timolol maleate IPRS*, treated in the same manner or with the reference spectrum of timolol.

B. Filter the aqueous layer reserved in test A and evaporate to about 1 ml. Add 1 ml of *bromine water*, heat on a water-bath for 15 minutes, then heat to boiling and cool. Add 0.1 ml of the solution to a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; a bluish black colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 20 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *timolol maleate IPRS* in the dissolution medium to obtain a solution having the same concentration as that to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{13}H_{24}N_4O_3S,C_4H_4O_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{13}H_{24}N_4O_3S,C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Timolol Maleate with 10 ml of the mobile phase for 10 minutes and filter.

Reference solution (a). A 0.004 per cent w/v of *timolol maleate IPRS* with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 57.5 volumes of *methanol* and 42.5 volumes of *0.02 M sodium octanesulphonate*, adjusted to pH 3.0 with *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution. Run the chromatogram of the test solution for 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak, other than the peak corresponding to maleic acid, is not more than the area of the peak in the chromatogram obtained with reference solution (a) (0.4 per cent) and not more than two such peaks have an area more than that of the peak obtained with reference solution (b) (0.2 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 60 ml of the solvent mixture, with the aid of ultrasound and dilute to obtain a solution having the similar concentration of reference solution (a) with the solvent mixture.

Calculate the content of $C_{13}H_{24}N_4O_3S,C_4H_4O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

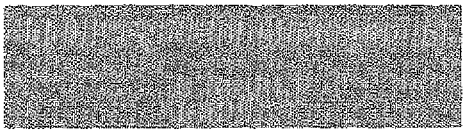
Solvent mixture. A mixture of 80 volumes of a buffer solution prepared by dissolving 11.04 g of *monobasic sodium phosphate* in 1000 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid* and 20 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Timolol Maleate in the solvent mixture, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *timolol maleate IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of *timolol maleate IPRS* and 0.001 per cent w/v *timolol related compound D IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 2.1 mm, packed with octadecylsilane bonded to porous silica (2.6 µm),
- mobile phase: A. a 0.05 per cent v/v solution of *trifluoroacetic acid* in *water*,
  B. a 0.05 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 10 µl.



https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	84	16
2.4	84	16
8.0	20	80
8.1	84	16
11	84	16

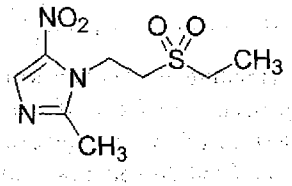
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to timolol maleate and timolol related compound D is not less than 2.5 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{24}N_4O_3S,C_4H_4O_4$ in the tablets.

Storage. Store protected from moisture.

Tinidazole



$C_8H_{13}N_3O_4S$ Mol. Wt. 247.3

Tinidazole is 1-[2-(ethylsulphonyl)ethyl]-2-methyl-5-nitroimidazole.

Tinidazole contains not less than 98.0 per cent and not more than 100.5 per cent of $C_8H_{13}N_3O_4S$, calculated on the dried basis.

Category. Antiprotozoal.

Description. Pale yellow crystals or a crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tinidazole IPRS* or with the reference spectrum of tinidazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at about 310 nm; absorbance at about 310 nm, about 0.35.

C. To about 5 mg, add 5 ml of *0.1 M hydrochloric acid*, 50 mg of *zinc powder*, 4 ml of *hydrochloric acid* and allow to stand for 30 minutes. Add 4 ml of a 1 per cent w/v solution of *vanillin*, heat on a boiling water-bath for 20 minutes, allow to cool to room temperature and dilute to 20 ml with *water*; a greenish yellow colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of *methanol* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg each of *tinidazole impurity A IPRS (2-methyl-5-nitro-1H-imidazole IPRS)* and *tinidazole impurity B IPRS (1-[2-(ethylsulphonyl)ethyl]-2-methyl-4-nitro-1H-imidazoleRS)* in 10 ml of *methanol* and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 3 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 20 volumes of *methanol* and 70 volumes of *water*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 20 µl.

The relative retention time with reference to tinidazole for tinidazole impurity A is about 0.6 and for tinidazole impurity B is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tinidazole impurity A and B is not less than 2.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to tinidazole impurity A and B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the

https://nhathuocngocanh.com/

area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.5 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using 0.15 ml of *nile blue A solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02473 g of $C_8H_{13}N_3O_4S$.

Storage. Store protected from light and moisture.

Tinidazole Tablets

Tinidazole Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tinidazole, $C_8H_{13}N_3O_4S$.

Usual strengths. 150 mg; 300 mg; 500 mg.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum at about 310 nm.

Extract a quantity of the powdered tablets containing 0.1 g of Tinidazole with 10 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

B. To about 5 mg add 5 ml of *0.1 M hydrochloric acid*, 50 mg of *zinc powder*, 4 ml of *hydrochloric acid* and allow to stand for 30 minutes. Add 4 ml of a 1 per cent w/v solution of *vanillin*, heat on a boiling water-bath for 20 minutes, allow to cool to room temperature and dilute to 20 ml with *water*; a greenish yellow colour is produced.

C. Melting range (2.4.21). 125° to 128°.

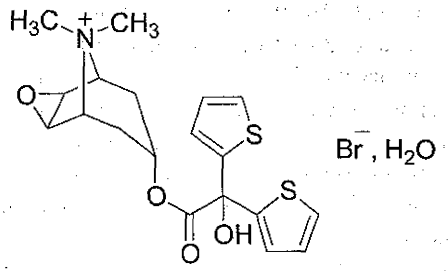
Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.15 g of Tinidazole, add 20 ml of *methanol*, shake well and add sufficient *methanol* to produce 100.0 ml. Mix well and filter. Dilute 10.0 ml of the solution to 100.0 ml with *methanol* and further dilute 10.0 ml of the solution to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 310 nm (2.4.7). Calculate the content of $C_8H_{13}N_3O_4S$ taking 356 as the specific absorbance at 310 nm.

Storage. Store protected from light and moisture.

Tiotropium Bromide Monohydrate



$C_{19}H_{22}BrNO_4S_2, H_2O$ Mol. Wt. 490.4

Tiotropium Bromide Monohydrate is (1*R*,2*R*,4*S*,5*S*,7*s*)-7-[[Hydroxy[di(thiophen-2-yl)]acetyl]oxy]-9,9-dimethyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]nonan-9-ium bromide monohydrate.

Tiotropium Bromide Monohydrate contains not less than 98.5 per cent and not more than 101.5 per cent of tiotropium bromide, $C_{19}H_{22}NO_4S_2Br$, calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white to off-whitepowder or crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tiotropium bromide monohydrate IPRS* or with the reference spectrum of tiotropium bromide monohydrate.

B. It gives reaction (a) of bromide (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Impurities G and H. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Dilute 1 ml of *3M hydrochloric acid* to 100 ml with *methanol*.

Mobile phase. A mixture of 10 volumes of *water*, 15 volumes of *anhydrous formic acid*, 35 volumes of *acetonitrile* and 50 volumes of *methylene chloride*.

https://nhathuocngocanh.com/

Test solution. Dissolve 0.4 g of the substances under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *tiotropium impurity mixture IPRS* (containing impurities G and H) in 1.0 ml of the solvent mixture.

Reference solution (b). Mix 0.1 ml of the test solution with 0.1 ml of reference solution (a).

Apply to the plate 10 µl of the test solution and reference solution (a), and 20 µl of reference solution (b). After development, dry the plate in air and expose to iodine vapors till spots appear (about 15 minutes), remove the plate and examine immediately. In the chromatogram obtained with the test solution, any secondary spot corresponding to, each of, tiotropium impurity G and H is not more intense than the corresponding spot of tiotropium impurity G and H in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots, of each, tiotropium impurity G and H and tiotropium with R_f values of about 0.33, 0.38 and 0.64, respectively.

Related substances.Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Dissolve 50 mg of the substance under examination in mobile phase B and dilute to 25.0 ml with mobile phase B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase B. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase B.

Reference solution (b). Dissolve 4 mg of *tiotropium for system suitability IPRS* (containing impurity C) in 2.0 ml of mobile phase B.

Chromatographic system

- a stainless steel column 15 cm x 3.0 mm packed with propylsilane bonded to porous silica (3.5 µm),
- column temperature; 50°,
- mobile phase A: dissolve 1.0 g of *sodium methanesulphonate* and 5.0 g of *potassium dihydrogen phosphate* in 980 ml of *water* adjusted to pH 3.0 with *dilute phosphoric acid* and dilute to 1000 ml with *water*,
  B: a mixture of 10 volumes of *methanol*, 40 volumes of *acetonitrile* and 50 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
3	90	10
17	80	20
28	25	75
30	25	75
35	90	10

The relative retention time with reference to tiotropium (retention time: about 15 minutes) for tiotropium impurity C is about 1.2.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to tiotropium and tiotropium impurity C is not less than 2.4.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of anysecondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 2.5 per cent to 4.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

*Test solution.*Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *tiotropium bromide monohydrate IPRS* equivalent to tiotropium bromide in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 5.5 with *dilute acetic acid* and 45 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the column efficiency in not less than 3000 theoretical plates, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{22}NO_4S_2,Br$.

Storage. Store protected from light and moisture.

Tiotropium Bromide Powder for Inhalation

Tiotropium Powder for Inhalation consists of Tiotropium Bromide Monohydrate in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Tiotropium Powder for Inhalation contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amount of tiotropium, $C_{19}H_{22}NO_4S_2$ per unit dose.

Usual strengths. 9 µg; 18 µg

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Powders for Inhalation).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of 0.05 per cent v/v *orthophosphoric acid* and 10 volumes of *acetonitrile*.

Test solution. Dissolve a quantity of the mixed contents of 20 capsules in sufficient of the solvent mixture to get a solution containing 1.8 µg per ml of Tiotropium.

Reference solution. A solution of *tiotropium bromide IPRS* equivalent to tiotropium 1.8 µg per ml in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 2 ml *triethylamine* in 1000 ml of *water* and adjusted to pH 2.5 with *orthophosphoric acid*, and 20 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 237 nm,
- inject 200 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4500 theoretical plates, the tailing factor is not more than 1.7 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{22}NO_4S_2$ per unit.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labelling. The label states the quantity of tiotropium per pre-metered unit.

Titanium Dioxide

TiO_2 Mol. Wt. 79.9

Titanium Dioxide contains not less than 98.0 per cent and not more than 100.5 per cent of TiO_2.

Category. Pharmaceutical aid and topical protectant.

Description. A white or almost white, infusible powder.

Identification

A. When strongly heated it becomes pale yellow; the colour is discharged on cooling.

B. To 0.5 g, add 5 g of *anhydrous sodium sulphate* and 10 ml of *water* and mix. Add 10 ml of *sulphuric acid* and boil gently until clear; cool, add slowly 30 ml of a 25 per cent v/v solution of *sulphuric acid* and dilute with *water* to 100 ml (solution A). To 5 ml of solution A add 0.1 ml of *strong hydrogen peroxide solution*; an orange-red colour is produced.

C. To 5 ml of solution A add 0.5 g of *zinc*, in granules; after 45 minutes a violet-blue colour is produced.

Tests

Appearance of solution. Solution A is not more opalescent than opalescence standard OS2 (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Shake 5.0 g with 50 ml of *carbon dioxide-free water* for 5 minutes and centrifuge until a clear solution is obtained. To 10 ml of the solution add 0.1 ml of *bromothymol blue solution*. Not more than 1.0 ml of either *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the solution.

Water-soluble substances. Not more than 0.5 per cent, determined by the following method. Boil 10.0 g for 5 minutes

https://nhathuocngocanh.com/

with 150 ml of *water* containing 0.5 g of *ammonium sulphate*. Cool, dilute to 200 ml with *water* and filter until a clear solution is obtained. Evaporate 100 ml of the filtrate to dryness ignite and weigh.

Arsenic (2.3.10). To 0.2 g in a 100 ml Kjeldahl flask, add 2 g of *anhydrous sodium sulphate*, 7 ml of *sulphuric acid* and 5 ml of *nitric acid*. Heat gently until a clear solution is obtained, cool, add 10 ml of *water*, cool again and add 5 g of *hydrazine reducing mixture* and 10 ml of *hydrochloric acid*. Immediately attach an air condenser and distil into 15 ml of cooled *water* until a total volume of 30 ml is obtained. Rinse the condenser with 5 ml of *water* and dilute the combined distillate and rinsings to 40 ml with *water*. 20 ml of the resulting solution complies with the limit test for arsenic. Use a mixture of 0.5 ml of *arsenic standard solution (1 ppm As)* and 24.5 ml of *water* to prepare the standard (5 ppm).

Barium. Shake 20.0 g with 30 ml of *hydrochloric acid*, add 100 ml of *distilled water* and boil. Filter while hot through a hardened filter paper until a clear filtrate is obtained. Wash the filter with 60 ml of *distilled water* and dilute the combined filtrate and washings to 200 ml with *distilled water*. To 10 ml of the solution add 1 ml of *1 M sulphuric acid*. After 30 minutes any opalescence is not more intense than that of a mixture of 10 ml of the test solution and 1 ml of *distilled water*.

Heavy metals (2.3.13). Dilute 10 ml of the solution prepared in the test for Barium to 20 ml with *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (1 ppm pb)*.

Iron. To 8 ml of solution A, add 4 ml of *water*, mix and add 0.05 ml of *bromine water*, allow to stand for 5 minutes, remove the excess of bromine with a current of air and add 3 ml of *potassium thiocyanate solution*. Any colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 4 ml of *iron standard solution (2 ppm Fe)* and 8 ml of a 20 per cent w/v solution of *sulphuric acid* (200 ppm).

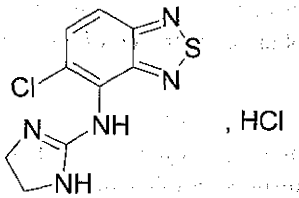
Assay. Weigh 0.5 g, transfer to a 300 ml Kjeldahl flask, add 5 g of *anhydrous sodium sulphate* and 10 ml of *water*, mix and add 10 ml of *sulphuric acid*. Boil gently until clear, cool, add slowly 40 ml of cooled *sulphuric acid* (25 per cent), cool again and dilute with *water* to 100.0 ml (solution B). To 300 g of *zinc*, in granules, add 300 ml of a 2 per cent w/v solution of *mercuric nitrate* and 2 ml of *nitric acid*, shake for 10 minutes and wash with *water*. Pack the zinc amalgam into a glass tube (400 mm x 20 mm) fitted with a tap and a filter plate. Pass through the column, at a rate of about 3 ml per minute, 100 ml of *1 M sulphuric acid* followed by 100 ml of *water*, ensuring that the amalgam is covered with liquid throughout. Pass slowly through the column, at a rate of about 3 ml per minute, 200 ml of *0.5 M sulphuric acid* followed by 100 ml of *water*. Collect the combined eluates in a 500-ml conical flask containing 50 ml of a 15 per cent w/v solution of *ferric ammonium sulphate* in *sulphuric acid (25 per cent)* and titrate immediately with *0.1 M ceric ammonium nitrate* using *ferroin solution* as indicator until a greenish colour is obtained (n_1 ml). Pass slowly through the column 100 ml of *0.5 M sulphuric acid* followed by 20.0 ml of solution B, wash with 100 ml of *0.5 M sulphuric acid* followed by 100 ml of water. Collect the combined eluates in a 500-ml conical flask containing 50 ml of a 15 per cent w/v solution of *ferric ammonium sulphate* in *sulphuric acid (25 per cent)*, rinse the lower end of the column with *water* and titrate immediately with *0.1 M ceric ammonium nitrate* using *ferroin solution* as indicator until a greenish colour is obtained (n_2 ml).

Calculate the percentage content of TiO_2 from the expression $3.99(n_2 - n_1)/w$

Where, *w* is the weight, in g, of the substance under examination used in the preparation of solution B.

Storage. Store protected from moisture. Avoid contact with aluminium.

Tizanidine Hydrochloride



$C_9H_8ClN_5S, HCl$ Mol. Wt. 290.2

Tizanidine Hydrochloride is 5-chloro-*N*-(2-imidazolin-2-yl)-2,1,3-benzothiadiazol-4-yl amine.

Tizanidine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_9H_8ClN_5S.HCl$, calculated on the dried basis.

Category. α-adrenergic agonist.

Description. A white to yellowish white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tizanidine hydrochloride IPRS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

C. It gives reaction (A) for chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.3, determined on 5.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *tizanidine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 80 volumes of buffer solution prepared by dissolving 3.5 g of *sodium-1-pentane sulphonate* in 1000 ml of *water*, adjusted to pH 3.0 with 12 per cent *orthophosphoric acid solution* or *1 M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency is not less than 5000 theoretical plates.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method A (20 ppm).

Total Chloride. 11.9 per cent to 12.5 per cent.

Weigh 0.5 g and dissolve in 50 ml of *water*. Titrate with *0.1 M silver nitrate*. Determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of chloride.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the same solvent.

Reference solution. A 0.01 per cent w/v solution of *tizanidine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water* adjusted to pH 7.5 with *5.3 M potassium hydroxide*, and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8ClN_5S.HCl$.

Storage. Store protected from light.

Tizanidine Tablets

Tizanidine Hydrochloride Tablets

Tizanidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tizanidine, $C_9H_8ClN_5S$.

Usual strengths. 2 mg; 4 mg; 6 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution

https://nhathuocngocanh.com/

medium if necessary, at the maximum at about 320 nm (2.4.7). Calculate the content of $C_9H_8ClN_5S$ in the medium from the absorbance obtained from a solution of known concentration of *tizanidine Hydrochloride IPRS* in the same medium.

Q. Not less than 70 per cent of the stated amount of $C_9H_8ClN_5S$.

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Crush one tablet and disperse in 50 ml *phosphate buffer pH 6.6*, dilute to 100.0 ml with *acetonitrile* and filter.

Reference solution. Dissolve about 10 mg of *tizanidine hydrochloride IPRS*, in 25 ml of *phosphate buffer pH 6.6* and dilute to 50.0 ml with *acetonitrile*. Dilute a suitable volume of the solution in a mixture of equal volumes of *phosphate buffer pH 6.6* and *acetonitrile* to obtain a concentration similar to the test solution.

Calculate the content of $C_9H_8ClN_5S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powdered tablet containing about 20 mg of Tizanidine, disperse in 50 ml *phosphate buffer pH 6.6* and dilute to 100.0 ml with *acetonitrile* and filter.

Reference solution. Weigh 10 mg of *tizanidine hydrochloride IPRS*, dissolve in 25 ml *phosphate buffer pH 6.6* and dilute to 50.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of *phosphate buffer pH 6.6* and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

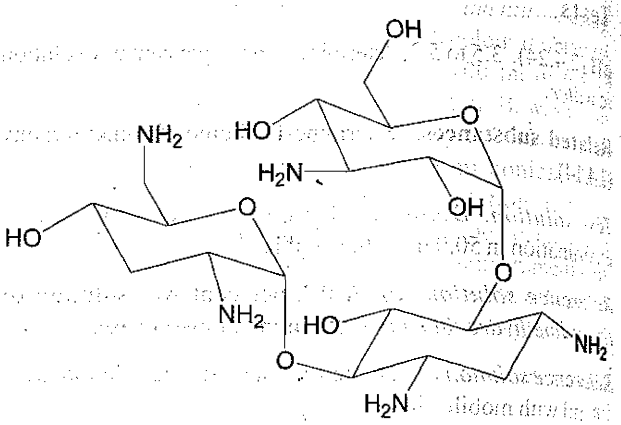
Inject the reference solution and the test solution.

Calculate the content of $C_9H_8ClN_5S$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of Tizanidine.

Tobramycin



$C_{18}H_{37}N_5O_9$ Mol. Wt. 467.3

Tobramycin is 6-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-2-deoxy-4-*O*-(2,6-diamino-2,3,6-trideoxy-α-D-*ribo*-hexopyranosyl)-D-streptamine, an antimicrobial substance produced by *Streptomyces tenebrarius* or by any other means.

Tobramycin has potency not less than 900 mcg of $C_{18}H_{37}N_5O_9$ per mg, calculated on anhydrous basis.

Category. Antibacterial.

Description. A white or almost white powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 60 volumes of *methanol*, 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform*.

Test solution. Dissolve 0.4 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.4 per cent w/v solution of *tobramycin IPRS* in *water*.

Reference solution (b). A solution containing 0.4 per cent w/v each of *kanamycin sulphate IPRS*, *neomycin sulphate IPRS* and *tobramycin IPRS* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air, spray with a mixture of equal volumes of a 46 per cent w/v solution of *sulphuric acid* and a 0.2 per cent w/v solution of *1,3-naphthalenediol* in *ethanol (95 per cent)* and heat at 105° for 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated principal spots.

https://nhathuocngocanh.com/

B. Dissolve about 5 mg in 5 ml of *water*, add 5 ml of a 0.1 per cent w/v solution of *ninhydrin* in *ethanol (95 per cent)* and heat in a water-bath for 3 minutes; a violet-blue colour develops.

Tests

pH (2.4.24). 9.0 to 11.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 138° to + 148°, determined in a 4.0 per cent w/v solution.

2-Methyl-1-propanol. Not more than 1.0 per cent w/w, determined by gas chromatography (2.4.13).

Test solution (a). A 10 per cent w/v solution of the substance under examination in *water*.

Test solution (b). A solution containing 10 per cent w/v of the substance under examination and 0.2 per cent v/v of *2-propanol* (internal standard).

Reference solution. A solution containing 0.1 per cent w/v of *2-methyl-1-propanol* and 0.2 per cent v/v of the internal standard.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with porous polymer beads (80 to 100 mesh) (Such as Porapak Q),
- temperature: column 165°,

Calculate the percentage w/w of 2-methyl-1-propanol.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of equal volumes of *strong ammonia solution*, *2-butanone* and *ethanol (95 per cent)*.

Test solution. Dissolve 0.8 g of the substance under examination in 100 ml of *0.02 M ammonia*.

Reference solution. A 0.008 per cent w/v solution of the substance under examination in *0.02 M ammonia*.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution (3 per cent Cl)* with *water* to contain 0.5 per cent w/v of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

2, 4-Dinitrofluorobenzene reagent. A 1.0 per cent w/v solution of *2,4-dinitrofluorobenzene* in *absolute alcohol*. This solution may be used for 5 days if refrigerated when not in use.

Tris (hydroxymethyl) aminomethane reagent. A 1.5 per cent w/v solution of *tris (hydroxymethyl) aminomethane* in *water*. This solution may be used for 1 month if refrigerated when not in use. To 40 ml of the solution add *dimethyl sulphoxide* with mixing, dilute with *dimethyl sulphoxide* to 200 ml, and mix. Use this reagent within 4 hours (*NOTE — If kept immersed in an ice –water bath below 10°, the reagent may be used for up to 8 hours*).

Test solution (a). Dissolve 55 mg of the substance under examination in 1 ml of *0.5M sulphuric acid* and sufficient *water* and dilute to 50.0 ml with *water*. Dilute 10.0 ml of the solution to 50.0 ml with *water*.

Test solution (b). To 4.0 ml of test solution (a), add 10 ml of *2,4 dinitrofluorobenzene reagent* and 10 ml of *tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flask in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 minutes. Remove the flasks from the bath, and allow to stand for 10 minutes. Add *acetonitrile* to about 2 ml below the 50 ml mark, allow to cool to room temperature, then dilute with *acetonitrile* to volume, and mix.

Reference solution (a). Dissolve 55 mg of *tobramycin IPRS* in 1 ml of *0.5M sulphuric acid* and enough *water* and dilute to 50.0 ml with *water*. Dilute 10.0 ml of the solution to 50.0 ml with *water*.

Reference solution (b). To 4.0 ml of reference solution (a), add 10 ml of *2,4 dinitrofluorobenzene reagent* and 10 ml of *tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flask in a constant temperature bath at 60 ± 2 °, and heat for 50 ± 5 minutes. Remove the flasks from the bath, and allow to stand for 10 minutes. Add *acetonitrile* to about 2 ml below the 50 ml mark, allow to cool to room temperature, then dilute with *acetonitrile* to volume, and mix.

Reference solution (c). A 0.024 per cent w/v solution of *p-naptholbenzein* in *acetonitrile*. Dilute 2.0 ml of the solution with reference solution (b) to 10.0 ml and use promptly.

Blank solution. To 4.0 ml of *water*, add 10 ml of *2,4 dinitrofluorobenzene reagent* and 10 ml of *tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flask in a constant temperature bath at 60 ± 2°, and heat for 50 ± 5 minutes. Remove the flasks from the bath, and allow to stand for 10 minutes. Add acetonitrile to about 2 ml below the 50 ml mark, allow to cool to room temperature, then dilute with *acetonitrile* to volume, and mix.

https://nhathuocngocanh.com/

NOTE — Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to and from the 60 ± 2° constant temperature bath at the same time.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (1.5 to 10 µm) (Such as Waters Bondapack),
- mobile phase : dissolve 2.0 g of *tris(hydroxymethyl) aminomethane* in about 800 ml of *water*. To this solution, add 20 ml of *0.5 M sulphuric acid*, dilute with *acetonitrile* to obtain 2000 ml of solution,
- flow rate : 1.2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume : 20 µl.

The relative retention time with respect to tobramycin for *p*-naphtholbenzein is about 0.6.

Inject the blank solution and record the responses to identify the solvent and reagent peaks.

Inject reference solution (b) and (c). The test is not valid unless resolution between the peaks due to p-naphtholbenzein and tobramycin is not less than 4.0 in the chromatogram obtained with reference solution (c) and relative standard deviation for replicate injection is not more than 2.0 per cent in reference solution (b).

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{18}H_{37}N_5O_9$.

Tobramycin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of tobramycin.

Tobramycin intended for use in the manufacture of parenteral preparations or eye drops without a further appropriate sterilisation procedure complies with the following additional requirements.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture. If the material is sterile, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the number of Units per mg; (2) where applicable, that it is sterile; (3) where applicable, that it is free from bacterial endotoxins and depressor substances.

Tobramycin Injection

Tobramycin Sulphate Injection

Tobramycin Injection is a sterile solution of Tobramycin Sulphate in Water for Injections or of Tobramycin in Water for Injections containing sufficient Sulphuric Acid to adjusted to pH 3.5 to 6.0.

Tobramycin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of tobramycin, $C_{18}H_{37}N_5O_9$.

Usual strengths. 10 mg per ml; 40 mg per ml.

Description. A colourless solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 60 volumes of *methanol*, 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform*.

Test solution. Dilute a suitable volume of the injection with *water* to produce a solution containing 0.4 per cent w/v solution of tobramycin.

Reference solution (a). A 0.4 per cent w/v solution of *tobramycin IPRS* in *water*.

Reference solution (b). A solution containing 0.4 per cent w/v each of *kanamycin sulphate IPRS*, *neomycin sulphate IPRS* and *tobramycin IPRS* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air, spray with a mixture of equal volumes of a 46 per cent w/v solution of *sulphuric acid* and a 0.2 per cent w/v solution of *1,3-naphthalenediol* in *ethanol (95 per cent)* and heat at 105° for 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated principal spots.

B. It gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of equal volumes of *strong ammonia solution*, *2-butanone* and *ethanol (95 per cent)*.

Test solution. Dilute a suitable volume of the injection with *0.01 M ammonia* to obtain a solution containing 40 mg of

https://nhathuocngocanh.com/

Tobramycin in 4 ml. Shake with 10 ml of *ether* and use the aqueous layer.

Reference solution. A 0.02 per cent w/v solution of the substance under examination in *0.02 M ammonia.*

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution (3 per cent Cl)* with *water* to contain 0.5 per cent w/v of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of tobramycin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by the microbiological assay of antibiotics, Method B (2.2.10).

Calculate the content of tobramycin in the injection, taking each 1000 Units found to be equivalent to 1 mg of tobramycin.

Tobramycin Inhalation Solution

Tobramycin Inhalation Solution is a sterile, non pyrogenic, preservative free solution of Tobramycin or Tobramycin Sulphate in Water for Injection containing *sodium chloride*.

Tobramycin Inhalation Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tobramycin $C_{18}H_{37}N_5O_9$.

Usual strength. 300 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution(b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution A 0.0192 per cent of the substance under examination in *water.*

Reference solution(a). A 0.11 per cent w/v solution of *tobramycin IPRS* in *water*, and adjusted to pH 6.0 with *0.5 M sulphuric acid,* and dilute with *water.*

Reference solution(b). A 0.022 per cent of tobramycin from the reference solution (a) in *water.*

Reference solution (c). Heat a portion of reference solution (a) in a suitable sealed glass container at 100° for 8-9 hours.Cool to room temperature, and dilute with *water* to obtain a 0.022 per cent w/v solution of tobramycin.

Reference solution(d). A 0.11 per cent w/v solution of *tobramycin IPRS* prepared by adding *0.5M sulphuric acid,* using 2.0 per cent of the final volume, and enough water to dissolve the tobramycin, and dilute with *water* to volume.

Reference solution(e). 0.00011 per cent of tobramycin from the reference solution (d) in *water.*

Blank.Water.

Derivatization procedure. Heat all solutions at the same temperature and for the same duration as indicated. Move all flasks to 60° constant water-bath at the same time. To separate 50 ml flasks, transfer 15.0 ml of reference solution(b), 15.0 ml of reference solution (c), 15.0 ml of reference solution (e), 15.0 ml of test solution, and 15.0 ml of blank. To each flask add 10 ml of *2,4-dinitrofluorobenzene reagent* and 10 ml of *tris(hydroxymethyl)aminomethane reagent*, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60°, and heat for 50 minutes. Remove the flasks from the bath, and allow to stand for 10 minutes, Add 2.0 ml of *acetonitrile* allow to cool to room temperature, and dilute with *acetonitrile*, to 50.0 ml. Allow the solutions to stand for 16 hours. The solutions thus obtained are derivatized reference solution (b), derivatized reference solution (c), reference solution (e), test solution, and blank solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group chemically bonded to porous silica (5 µm),
- mobile phase: A.a mixture of 5 volumes of *acetonitrile*, 95 volumes of *water* and 0.08 volumes of *ortho-phosphoric acid,*
  B.a mixture of 75 volumes of *acetonitrile,* 25 volumes of *water* and 0.08 volumes of *ortho-phosphoric acid,*
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 45 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	79	21
14	66	34
25	30	70
35	30	70
40	20	80
50	5	95
50.1	79	21
55	79	21

Name	Relative retention time
Specified unidentified impurity	0.36
Deoxystreptamine kanosaminide	0.66
Nebramine	0.94
Kanamycin B	0.96
Tobramycin	1.0

Inject derivatised reference solution (c).The test is not valid unless the capacity factor is not less than 15.5 for tobramycin, and the resolution is not less than 1.0 between the nebramine and kanamycin peaks.

Compare the derivatised reference solution (b) and (c) chromatograms to identify degradation peaks. Deoxystreptamine kanosaminide and nebramine will increase in response in derivatized reference solution (c)

Inject the derivatized reference solution (b), (e) and blank. The relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (e). Disregard any peak corresponding to those from the derivatised blank solution and substract the quantities of any such peaks found at the relative retention time of 0.36,0.66,0.94 from those found in the derivatized test solution.For unknown peak determination,disregards any peak found in the chromatogram of the derivatised test solution that correspond to those in the chromatogram of derivatised reference solution (b).

Inject reference solution (b) (e), the test solution and blank.The area of impurity due to specified unidentified impurity should not be more than 0.4 times the area of principal peak in the chromatogram obtained with reference solution (e) (0.25 per cent),The area of impurity due to deoxystreptamine kanosaminide should not be more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent),the area of impurity due to nebramine should not be more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.4 per cent),the area of any secondary unspecified impurity is not more than 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.1 per cent),the sum of areas of unspecified impurity is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent), the area of total impurity is not more than 1.74 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.0 per cent).

Content of sodium chloride. Sodium chloride contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sodium chloride.

Solution A. 2.0 g of gelatin and add 50.0 ml of *nitric acid* in 1000 ml of *water*.

Transfer 25 ml of tobramycin inhalation solution in a flask add 80 ml of *water* and 10 ml of solution A. titrate potentiometrically with *0.1 M silver nitrate* using silver electrode.

1ml of *0.1M silver nitrate* is equivalent to 0.005844 g of sodium chloride.

Light absorption (2.4.7). Absorbance of the sample at the maximum at about 410 nm in a 1-cm cell is not more than 0.30.

Other tests. Comply with the test stated under Inhalation Prepration and Parentral Preparation(Injections).

pH (2.4.24). 4.5 to 6.5.

Bacterial endotoxin (2.2.3). Not more than 60 Endotoxin Units per ml.

Sterility (2.2.11).Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.0192 per cent w/v of tobramycin from the inhalation solution in *water*.

Reference solution(a). A 0.11 per cent w/v solution of *tobramycin IPRS* prepared by adding *0.5M sulphuric acid*, using 2.0 per cent of the final volume, and enough *water* to dissolve the tobramycin, and dilute with *water* to volume.

Reference solution (b). A 0.022 per cent w/v of *tobramycin IPRS* from the reference solution (a) in *water*.

Blank. Water.

Derivatization procedure. Heat all solutions at the same temperature and for the same duration of time as indicated. Move all flasks to 60° constant water-bath at the same time. To separate 50 ml volumetric flasks, transfer 4.0 ml of the reference solution (b), 4.0 ml of the test solution, and 4.0 ml of the *water*. To each flask add 10 ml of *2,4-dinitrofluoro-benzene reagent* and 10 ml of *tris(hydroxymethyl) aminomethane* reagent, shake, and insert the stopper. Place the flasks in a constant temperature bath at 60°, and heat for 50 minutes. Remove the flasks from the bath, and allow to stand for 10 minutes. Add 2.0 ml of *acetonitrile* allow to cool to room temperature, then dilute with *acetonitrile* to 50.0 ml.

https://nhathuocngocanh.com/

The solutions thus obtained are the derivatized reference solution(b), derivatized test solution and derivatized blank solution, respectively.

Reference solution(c). A 0.024 per cent of *p-naphtholbenzein* in *acetonitrile*: Transfer 2.0 ml of the solution to a 10.0 ml volumetric flask, dilute with derivatized reference solution (b) to volume, and use promptly.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: Dissolve 2.0 g of *tris(hydroxymethyl) aminomethane* in about 800 ml of *water*. To this solution add 20 ml of *0.5 M sulphuric acid*, and dilute with *acetonitrile* to obtain 2000 ml of solution,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 20 µl.

Inject derivatized reference solution (b) and derivatized blank solution, and reference solution(c). The relative retention times for p-naphtholbenzein and tobramycin are about 0.6 and 1.0, respectively. Identify the solvent and reagent peaks using the derivatized blank solution. Resolution between p-naphtholbenzein and tobramycin is not less than 4.0 obtained with reference solution (c) and relative standard deviation is not more than 2.0 per cent for derivatized reference solution (b).

Inject the reference solution(b) and the test solution.

Calculate the contents of tobramycin, $C_{18}H_{37}N_5O_9$.

Storage. Store protected from light and keep in a refrigerator.

Tobramycin and Fluorometholone Acetate Ophthalmic Suspension

Tobramycin and Fluorometholone Acetate Ophthalmic Suspension is a sterile aqueous solution of Tobramycin Sulphate and Fluorometholone Acetate in a suitable aqueous vehicle. It may contain suitable buffers, dispersants, tonicity-adjusting agents and preservatives.

Tobramycin and Fluorometholone Acetate Ophthalmic Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the labelled amount of tobramycin $C_{18}H_{37}N_5O_9$ and not less than 90.0 per cent and not more than 115.0 per cent of the labelled amount of fluorometholone acetate $C_{24}H_{31}FO_5$.

Usual strength. Tobramycin 3.0 mg and Fluorometholone Acetate 1.0 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Solvent mixture. A mixture of 100 volumes of *butyl alcohol* and 1 volume of *pyridine*.

Mobile phase. A mixture of 60 volumes of *methanol*, 25 volumes of *chloroform* and 30 volumes of *ammonium hydroxide*.

Test solution. Allow the ophthalmic suspension to settle, and decant 1 ml of the supernatant liquid into a test tube. Add 0.1 g of sodium sulphate and centrifuge. Use the clear supernatant liquid.

Reference solution (a). A 0.6 per cent w/v solution of *tobramycin IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 3 µl of each solution. Allow the mobile phase to rise 8 cm. After development, dry the plate in air, heat the plate at 110° for 15 minutes, spray with 1.0 per cent w/v solution of *ninhydrin* in solvent mixture. The chromatogram obtained with the test solution exhibits a pink fluorescent band due to tobramycin. The Rf value of the principal spot in the chromatogram obtained with the test solution and the chromatogram obtained with reference solution (b), respectively, correspond to those of reference solution (a).

B. In the Assay for fluorometholone acetate, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.0.

Other tests. Comply with the tests stated under Eye Drops.

Assay. *For tobramycin* — Determine by liquid chromatography (2.4.14).

Solvent mixture A. A 1.0 per cent w/v solution of *2,4-dinitrofluorobenzene* in *alcohol*.

Solvent mixture B. A 1.5 per cent w/v solution of *tris (hydroxymethyl) aminomethane* in *water*.

Solvent mixture C. A 0.3 per cent w/v solution of *tris (hydroxymethyl) aminomethane* prepared as follows. Transfer 40 ml of solvent mixture B to a 200.0 ml volumetric flask, add *dimethyl sulphoxide* while mixing and dilute with *dimethylsulphoxide* to the volume.

NOTE — Use this reagent within 4 hours. If kept immersed in an ice-water bath below 10°, the reagent may be used up to 8 hours).

https://nhathuocngocanh.com/

Test solution. Dilute a measured volume of ophthalmic solution to obtain a solution having a concentration of 0.009 per cent w/v of Tobramycin in *water*.

Reference solution (a). Transfer an accurately weighed quantity of 55 mg of *tobramycin IPRS* to a 50.0 ml volumetric flask, add 1ml of *0.5M sulphuric acid* and sufficient *water* to dissolve and dilute to 50.0 ml with *water*.

Reference solution (b). Dilute reference solution (a) with the *water* to obtain a solution containing 0.022 per cent w/v of tobramycin.

Reference solution (c). A 0.024 per cent w/v solution of *p-naphtholbenzein* in *acetonitrile*.

NOTE — Use freshly prepared solution.

Reference solution (d). Dilute 2.0 ml of reference solution (c) to 10.0 ml with the derivatised reference solution (b).

Derivatise the solutions prior to analysis by transferring 4.0 ml of reference solution (b), 10.0 ml of test solution and 4.0 ml of *water* to separate 50 ml volumetric flask. Add 10 ml of solvent mixture A and 10 ml of solvent mixture C to each flask. Shake vigorously for few seconds and heat in a water-bath at 60°± 2° for 50 ± 5 minutes. Cool in cold *water* for 10 minutes and dilute with *acetonitrile*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.0 g of *tris(hydroxymethyl) aminomethane* in 400 ml of *water*, add 10 ml of *0.5M sulphuric acid*, dilute with *acetonitrile* to 1000 ml and mix. Cool and pass through a filter of 0.2 µm or finer pore size.
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 365 nm,
- injection volume: 20 µl.

The relative retention time with reference to tobramycin for p-naphtholbenzein is about 0.6.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to p-naphtholbenzein and tobramycin is not less than 4.0.

Inject the derivatised reference solution (b). The test is not valid unless the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the derivatised reference solution (b) and the test solution.

Calculate the content of $C_{18}H_{37}N_5O_9$ in Ophthalmic Suspension.

For fluorometholone acetate — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of ophthalmic solution to obtain a solution having a concentration of 0.004 per cent w/v of Fluorometholone Acetate in *acetonitrile*. Centrifuge and use the clear supernatant solution.

Reference solution (a). A 0.004 per cent w/v solution of *fluorometholone acetate IPRS* in *acetonitrile*.

Reference solution (b). A 0.004 per cent w/v solution each of *fluorometholone IPRS* and *fluorometholone acetate IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and *water*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to fluorometholone acetate for fluorometholone is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to fluorometholone and fluorometholone acetate is not less than 2.0.

Inject reference solution (a). The test is valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 1.35 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

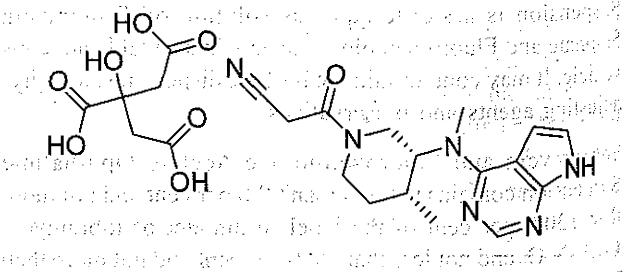
Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{31}FO_5$ in Ophthalmic Suspension.

Storage. Store in tightly closed container.

Labelling. The label states that the contents should be shaken before use.

Tofacitinib Citrate



$C_{22}H_{28}N_6O_8$ Mol. Wt. 504.5

Tofacitinib Citrate is 3-{(3*R*,4*R*)-4-methyl-3-[methyl(7*H*-pyrrolo[2,3-d]pyrimidin-4-yl)amino]piperidin-1-yl}-3-oxo propanenitrile 2-hydroxypropane-1,2,3-tricarboxylic acid.

https://nhathuocngocanh.com/

Tofacitinib Citrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{28}N_6O_8$, calculated on the anhydrous basis.

Category. Rheumatoid Arthritis.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tofacitinib citrate IPRS* or with the reference spectrum of tofacitinib citrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +26.0° to +32.0°, determined in a 0.25 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *water* and 20 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture, with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.0002 per cent w/v, each of, *DCT IPRS, diastereomer of tofacitinib citrate impurity IPRS* and 0.1 per cent w/v of *tofacitinib citrate IPRS* in the solvent mixture.

Reference solution (b). A 0.00015 per cent w/v solution of *tofacitinib citrate IPRS* in the solvent mixture.

Reference solution (c). Dilute 3.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as ACE 5 C-18-PFP),
- column temperature: 35°,
- mobile phase: A. a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	79	21
15	79	21
25	35	65
30	35	65
32	79	21
40	79	21

Name	Relative retention time	Correction factor
Citric acid	0.22	—
DCT[1]	0.34	0.67
Tofacitinib	1.0	—
Diastereomer of Tofacitinib Citrate[2]	1.18	—

[1] *N*-methyl-*N*[(3*R*,4*R*)-4-methylpiperidin-3yl]-7*H*-pyrrolo[2,3-d]pyrimidin-4-amine,

[2] 3-[(3*RS*, 4*SR*)-4-Methyl-3- [methyl (7*H*-pyrrolo[2,3-d]pyrimidin-4-yl)amino]piperidin-1-yl]-3-oxopropanenitrile.2-Hydroxy propane-1,2,3-tricarboxylic acid.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to tofacitinib and diastereomer of tofacitinib citrate impurity is not less than 3.5 in the chromatogram obtained with reference solution (a), the column efficiency is not less than 9000 theoretical plates, the tailing factor is not more than 1.5, the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to DCT and diastereomer of tofacitinib impurity, each of, is not more than 3.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0. 3 per cent) and the sum of areas of all the secondary peaks is not more than 6.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore the peak due to citric acid and any peak with an area less than 0.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *tofacitinib citrate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* and 1.75 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{28}N_6O_8$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Tofacitinib Tablets

Tofacitinib Citrate Tablets

Tofacitinib Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tofacitinib, $C_{16}H_{20}N_6O$.

Usual strength. 5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *tofacitinib citrate IPRS* in the dissolution medium to obtain a solution of concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* and 1.75 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*, and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{20}N_6O$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{20}N_6O$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *potassium hydroxide solution* and 20 volumes of *acetonitrile*.

Test solution. Disperse a quantity of powdered tablets containing 30 mg of Tofacitinib in the solvent mixture, with the aid of magnetic stirrer for about 30 minutes and dilute to 100.0 ml with the solvent mixture, filter.

Reference solution (a). A solution containing 0.0001 per cent w/v, each of, *DCT IPRS* and *diastereomer of tofacitinib citrate impurity IPRS* and 0.05 per cent w/v of *tofacitinib citrate IPRS* in the solvent mixture.

Reference solution (b). Dissolve a suitable quantity of *tofacitinib citrate IPRS* in the solvent mixture to obtain a solution containing 0.0003 per cent w/v of tofacitinib.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 20.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as ACE 5 C-18-PFP),

[1]*N*-methyl-*N*[(3*R*,4*R*)-4-methylpiperidin-3yl]-7*H*-pyrrolo[2,3-d] pyrimidin-4-amine,

[2]3-[(3*RS*,4*SR*)-4-Methyl-3-[methyl(7*H*-pyrrolo[2,3-d]pyrimidin-4-yl) amino]piperidin-1-yl]-3-oxopropanenitrile.2-Hydroxy propane-1,2,3-tricarboxylic acid.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to tofacitinib and diastereomer of tofacitinib citrate impurity is not less than 3.5 in the chromatogram obtained with reference solution (a), the column efficiency is not less than 9000 theoretical plates, the tailing factor is not more than 1.5, the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to DCT is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore the peak due to citric acid and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one intact tablet in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Inject the reference solution and test solution.

Calculate the content of $C_{16}H_{20}N_6O$ in the tablet.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Tofacitinib in the solvent mixture, with the aid of magnetic stirrer for about 45 minutes and dilute to 200.0 ml with the solvent mixture, filter. Dilute 2.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. Dissolve a suitable quantity of *tofacitinib citrate IPRS* in the solvent mixture to obtain a solution containing 0.005 per cent w/v of tofacitinib.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* and 1.75 g of *dipotassium hydrogen phosphate* in 1000 ml of *water*, and 20 volumes of *acetonitrile*,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 215 nm,
– injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{20}N_6O$ in the tablets.

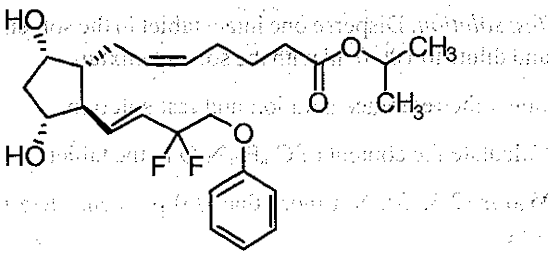
1 mg of tofacitinib citrate, $C_{22}H_{28}N_6O_8$ is equivalent to 0.619 mg of tofacitinib, $C_{16}H_{20}N_6O$.

https://nhathuocngocanh.com/

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Tofacitinib.

Tofluprost



$C_{22}H_{28}F_2O_5$ Mol Wt. 410.5

Tofluprost is Isopropyl (5*Z*)-7-{(1*R*,2*R*,3*R*,5*S*)-2-[(1*E*)-3,3-difluoro-4-phenoxybut-1-en-1-yl]-3,5-dihydroxycyclopentyl}-5-heptenoate.

Tofluprost contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{22}H_{28}F_2O_5$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. Yellow to light yellow oil.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 72 volumes of *methanol* and 28 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. *water*,
- B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 219 nm,
- injection volume: 60 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

4	28	72
8	20	80
13	20	80
14	28	72
22	28	72

Inject the test solution. The area of any secondary peak is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Water (2.4.43) . Not more than 2.0 per cent, determined on 10 mg by thermo gravimetric analysis.

Instrument condition

- temperature: 25° to 200° at the rate of 10° per minute,using nitrogen.

Determine weight loss of sample between 25° to 200°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 72 volumes of *methanol* and 28 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 10.0 ml of the solution to 20.0 ml with the solvent mixture

Reference solution. A 0.01 per cent w/v solution of *tofluprost IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A.*water*,
- B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 219 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	28	72
4	28	72
8	20	80
13	20	80
14	28	72
22	28	72

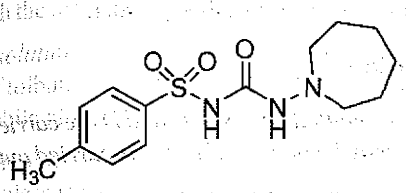
Inject the reference solution. The test is not valid unless, the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

https://nhathuocngocanh.com/

Inject reference solution and the test solution.

Calculate the content of $C_{22}H_{28}F_2O_5$.

Tolazamide



$C_{14}H_{21}N_3O_3S$ Mol. Wt. 311.4

Tolazamide is 1-perhydroazepin-1-yl-3-tolyl-*p*-sulphonylurea.

Tolazamide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{14}H_{21}N_3O_3S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolazamide IPRS* or with the reference spectrum of tolazamide.

B. When examined in the range 230 to 350 nm (2.4.7), a 0.04 per cent w/v solution in *ethanol (95 per cent)* exhibits maxima at 256 nm, 263 nm and 275 nm and a shoulder at 268 nm. The absorbances at the maxima are about 0.78, about 0.83 and about 0.62 respectively.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 200 volumes of *chloroform*, 100 volumes of *methanol*, 60 volumes of *cyclohexane* and 23 volumes of *13.5 M ammonia*.

Test solution. Dissolve 1.0 g of the substance under examination in 50 ml of *acetone*.

Reference solution. A 0.01 per cent w/v solution of *toluene-p-sulphonamide* in *acetone*.

Apply to the plate 10 µl of each solution. After removal of the plate, dry in a current of cold air, heat at 110° for 10 minutes, place the hot plate in a tank of chlorine gas prepared by the addition of *hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry it in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5 per cent w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to cold air. Spray the plate with a 0.5 per cent w/v solution of *potassium iodide* in *starch mucilage*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.5 g in 20 ml of *butan-2-one* with the aid of gentle heat. Allow to cool, add 30 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03114 g of $C_{14}H_{21}N_3O_3S$.

Tolazamide Tablets

Tolazamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tolazamide, $C_{14}H_{21}N_3O_3S$.

Usual strengths. 250 mg; 500 mg.

Identification

Triturate a quantity of the powdered tablets containing about 0.25 g of Tolazamide with 50 ml of *acetone* and filter. Evaporate the filtrate to dryness and dry the residue at 60° at a pressure of 2 kPa for 3 hours. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolazamide IPRS* or with the reference spectrum of tolazamide.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.05 M Tris (hydroxymethyl)aminomethane pH 7.6*, adjusted to pH 7.6 with *hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 224 nm (2.4.7). Calculate the content of $C_{14}H_{21}N_3O_3S$ in the medium from the absorbance obtained from a solution of known concentration of *tolazamide IPRS* in the dissolution medium.

https://nhathuocngocanh.com/

Q. Not less than 70 per cent of the stated amount of $C_{14}H_{21}N_3O_3S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 23 volumes of *13.5 M ammonia*, 60 volumes of *cyclohexane*, 100 volumes of *methanol* and 200 volumes of *chloroform*.

Test solution. Shake a quantity of the powdered tablets containing about 0.2 g of Tolazamide with 10 ml of *acetone* and filter.

Reference solution. A 0.01 per cent w/v solution of *toluene-p-sulphonamide* in *acetone*.

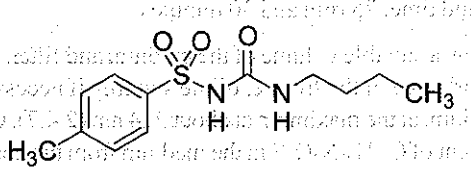
Apply to the plate 10 µl of each solution. After development, dry the plate in a current of cold air, heat at 110° for 10 minutes, place the hot plate in a tank of chlorine gas, prepared by the addition of *hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry the plate in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5 per cent w/v solution of *potassium iodide* in *starch mucilage* avoid prolonged exposure to cold air. Spray the plate with a 0.5 per cent w/v solution of *potassium iodide* in *starch mucilage*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing about 0.5 g of Tolazamide with 50 ml of *chloroform*, filter, wash the residue with *chloroform* and evaporate the combined filtrate and washings to dryness. Dissolve the residue in 20 ml of *butan-2-one* with the aid of gentle heat. Allow to cool, add 30 ml of *ethanol (95 per cent)* and titrate the resulting solution with *0.1 M sodium hydroxide*, using *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03114 g of $C_{14}H_{21}N_3O_3S$.

Tolbutamide



$C_{12}H_{18}N_2O_3S$ Mol. Wt. 270.4

Tolbutamide is 3-butyl-1-[(4-methylphenyl)sulphonyl]urea.

Tolbutamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{18}N_2O_3S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolbutamide IPRS* or with the reference spectrum of tolbutamide.

B. Dissolve 25 mg in sufficient *methanol* to produce 100.0 ml.

When examined in the range 245 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 258 nm, 263 nm and 275 nm and a shoulder at about 268 nm. Dilute the solution with *methanol* to produce a 0.001 per cent w/v solution. When examined in the range 220 nm to 235 nm, the resulting solution shows an absorption maximum at about 228 nm; absorbance at about 228 nm, about 0.50.

C. Boil 0.1 g with 8 ml of a 50 per cent v/v solution of *sulphuric acid* under a reflux condenser for 30 minutes. Make the solution strongly alkaline with *sodium hydroxide solution* and steam distil for 30 minutes, receiving the distillate in 20 ml of *0.1 M hydrochloric acid*. To 1 ml of the solution containing the distillate add 0.1 g of *sodium acetate* and 10 ml of *buffer solution pH 9.4*. Cool in an ice-bath for 10 minutes, add 1 ml of *diazotised nitroaniline solution*, set aside for 20 minutes and add dropwise 1 ml of *sodium hydroxide solution*; an orange-red colour is produced.

D. Boil 0.1 g with 8 ml of a 50 per cent v/v solution of *sulphuric acid* under a reflux condenser for 30 minutes. Cool in an ice-bath; a crystalline precipitate of *4-toluenesulphonylamide* is formed, which after recrystallisation from hot *water* and drying at 105° melts at 135° to 140° (2.4.21).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *1 M sodium hydroxide* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.5 to 5.5, determined in a solution prepared by dissolving 2.0 g in 50 ml of *carbon dioxide-free water* by heating at 70° for 5 minutes, cooling rapidly and filtering.

Non-sulphonyl urea. Dissolve 0.5 g in 1 ml of *dilute ammonia solution* and 9 ml of *water*; not more than a faint opalescence is produced.

Related substances. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.001 per cent w/v each of tolbutamide impurity A and tolbutamide impurity B in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a 0.14 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.5 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Tolbutamide impurity B[1]	0.2
Tolbutamide impurity A[2]	0.3
Tolbutamide (Retention time: about 18 minutes)	1.0

[1]toluenesulphonamide,

[2]toluenesulphonylurea.

For identification of impurities, use the chromatogram obtained with reference solution (b) to identify the peak due to tolbutamide impurities A and B.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tolbutamide impuritites A and B is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.5 g in a mixture of 40 ml of *ethanol (95 per cent)* and 20 ml of *water*. Titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02704 g of $C_{12}H_{18}N_2O_3S$.

Storage. Store protected from moisture.

Tolbutamide Tablets

Tolbutamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tolbutamide, $C_{12}H_{18}N_2O_3S$.

Usual strength. 500 mg.

Identification

Extract a quantity of the powdered tablets containing 1 g of Tolbutamide with 10 ml of *chloroform*, filter, evaporate the filtrate to dryness, scratching the sides of the vessel, if necessary, to induce crystallisation, and dry the residue at 105° for 30 minutes. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolbutamide IPRS* or with the reference spectrum of tolbutamide.

B. Boil 0.1 g of residue with 8 ml of a 50 per cent v/v solution of *sulphuric acid* under a reflux condenser for 30 minutes. Cool in an ice-bath; a crystalline precipitate of *4-toluenesulphonylamide* is formed, which after recrystallisation from hot *water* and drying at 105° melts at 135° to 140°.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of a solution containing 2.04 per cent w/v of *disodium hydrogen phosphate* and 0.135 per cent w/v of *potassium dihydrogen phosphate*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted if necessary, at the maximum at about 228 nm (2.4.7). Calculate the content of $C_{12}H_{18}N_2O_3S$ in the medium taking 417 as the specific absorbance at 228 nm.

Q. Not less than 70 per cent of the stated amount of $C_{12}H_{18}N_2O_3S$.

https://nhathuocngocanh.com/

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 8 volumes of *methanol* and 2 volumes of *anhydrous formic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Tolbutamide with 10 ml of *acetone* and filter.

Reference solution (a). A 0.015 per cent w/v solution of *4-toluenesulphonamide* in *acetone*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 5 µl of each of test solution and reference solution (a) and 10 µl of reference solution (b). After development, dry the plate in a current of warm air and heat at 110° for 10 minutes. While still hot, place the plate in a chromatographic tank with an evaporating dish containing a 5 per cent w/v solution of *potassium permanganate*, add an equal volume of *hydrochloric acid* and close the tank. Leave the plate in the tank for 2 minutes, then place it in a current of cold air until the excess of chlorine is removed and an area of coating below the line of application gives only a very faint blue colour with *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution* and allow to stand for 5 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows two clearly separated spots.

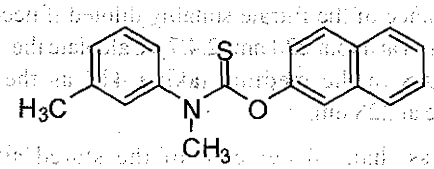
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.5 g of Tolbutamide, add 50 ml of *ethanol (95 per cent)*, previously neutralised to *phenolphthalein solution*, warm to dissolve, add 25 ml of *water* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein* solution as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02704 g of $C_{12}H_{18}N_2O_3S$.

Storage. Store protected from moisture.

Tolnaftate



$C_{19}H_{17}NOS$ Mol.Wt. 307.4

Tolnaftate is *O*-naphthalen-2-yl methyl(3-methylphenyl)-thiocarbamate.

Tolnaftate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{19}H_{17}NOS$, calculated on the dried basis.

Category. Antifungal.

Description. A white or yellowish white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolnaftate IPRS* or with the reference spectrum of tolnaftate.

B. Mix about 1 mg with 0.5 ml of *sulphuric acid*. Add 0.05 ml of *formaldehyde solution*. A greenish-blue colour develops.

C. Melting range (2.4.21). 109° to 112°.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *acetone* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Impurity D. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.4 g of the substance under examination in 2 ml of *dichloromethane*. Extract with 3 quantities, each of 3 ml, of *0.01 M hydrochloric acid*. Combine the aqueous phases and dilute to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). Dissolve 20 mg of tolnaftate impurity D (*N-methyl-m-toluidine*) in 50.0 ml of *dichloromethane*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *dichloromethane*. Take 2.0 ml of the solution and extract with 3 quantities, each of 3 ml, of *0.01 M hydrochloric acid*. Combine the aqueous phases and dilute to 10.0 ml with *0.01 M hydrochloric acid*.

Reference solution (c). Dissolve 10 mg of the substance under examination in 25 ml of *methanol*. Add 2 ml of the solution to 2 ml of reference solution (a) and dilute to 25 ml with *methanol*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.1 volume of *trifluoroacetic acid*, 10 volumes of *methanol* and 90 volumes of *water*,
  B. a mixture of 0.1 volume of *trifluoroacetic acid*, 10 volumes of *water* and 90 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,

https://nhathuocngocanh.com/

– spectrophotometer set at 254 nm,
– injection volume: 100 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
3	70	30
8	0	100
20	0	100

The relative retention time with reference to tolnaftate (retention time: about 15 minutes) for tolnaftate impurity D is about 0.25.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to tolnaftate impurity D and tolnaftate is not less than 5.0 and the tailing factor for the peak due to tolnaftate impurity D is not more than 1.9.

Inject reference solution (b) and the test solutiuon. In the chromatogram obtained with the test solution, the area of any peak corresponding to tolnaftate impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (20 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *methanol* and dilute to 25.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system
– a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: A. a mixture of 0.1 volume of *trifluoroacetic acid*, 30 volumes of *water* and 70 volumes of *methanol*,
B. a mixture of 0.1 volume of *trifluoroacetic acid*, 10 volumes of *water* and 90 volumes of *methanol*,
– a gradient programme using the conditions given below,
– flow rate: 1 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
12	100	0
30	0	100
33	0	100
35	100	0

The relative retention time with reference to tolnaftate (retention time is about 18 minutes) for tolnaftate impurity A is about 0.7.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Dissolve 50 mg in 250 ml of *methanol*. Dilute 2 ml of the solution to 50 ml with *methanol*. Measure the absorbance at the maximum at 257 nm (2.4.7).

Calculate the content of $C_{19}H_{17}NOS$ taking 720 as the specific absorbance at 257 nm.

Storage. Store protected from light.

Tolnaftate Cream

Tolnaftate Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tolnaftate, $C_{19}H_{17}NOS$.

Usual strength. 1 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Toluene.

Test solution. Evaporate 10 ml of the Solution A on steam bath to dryness and dissolve the residue in 1.0 ml of *ethanol (95 per cent)*.

Reference solution. A 0.1 per cent w/v solution of *tolnaftate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the

https://nhathuocngocanh.com/

chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Transfer a weighed quantity of the cream containing about 10 mg of Tolnaftate to a separator containing 75 ml of *chloroform*. Wash the chloroform solution successively with two 25 ml portions of *0.1 M hydrochloric acid* and 25 ml of *water*. Filter the chloroform layer through a chloroform–washed cotton pledget into a 100-ml volumetric flask. Add *chloroform* to volume and mix (Solution A). Dilute 5.0 ml of the solution with *chloroform* to 50 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7), using 0.001 per cent w/v solution of *tolnaftate IPRS* in *chloroform*.

Calculate the content of $C_{19}H_{17}NOS$ in the cream.

Storage. Store protected from moisture.

Tolnaftate Gel

Tolnaftate Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tolnaftate, $C_{19}H_{17}NOS$.

Usual strength. 1 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica GF254*.

Mobile phase. *Toluene*.

Test solution. Evaporate 10 ml of the Solution A on steam bath to dryness and dissolve the residue in 1.0 ml of *ethanol (95 per cent)*.

Reference solution. A 0.1 per cent w/v solution of *tolnaftate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Gels.

Assay. Transfer a weighed quantity of the gel containing about 10 mg of Tolnaftate to a separator containing 75 ml of *chloroform*. Wash the chloroform solution successively with two 25 ml portions of *0.1 M hydrochloric acid* and 25 ml of *water*. Dilute to 100 ml with *chloroform* and mix (Solution A). Dilute 5.0 ml of the solution with *chloroform* to 50 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7), using 0.001 per cent w/v solution of *tolnaftate IPRS* in *chloroform*.

Calculate the content of $C_{19}H_{17}NOS$ in the gel.

Storage. Store protected from moisture.

Tolnaftate Topical Powder

Tolnaftate Topical Powder contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of $C_{19}H_{17}NOS$.

Usual strength. 1 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. *Toluene*.

Test solution. Evaporate the 5.0 ml portion of the *methanol solution* reserved in the Assay, on a steam bath just to dryness and dissolve the residue in 1.0 ml of *alcohol*.

Reference solution. A 0.1 per cent w/v solution of *tolnaftate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.1 per cent w/v solution of *progesterone* in *methanol*.

Test solution. Transfer a weighed quantity of the topical powder containing about 5.0 mg of tolnaftate to a screw-capped, 50 ml centrifuge tube. Add 25 ml of *methanol*, place the cap on the tube and rotate on a rotating device for 10 minutes, and centrifuge at about 2000 rpm for 5 minutes, filter the supernatant and transfer 20 ml of the filtrate to 50-ml volumetric flask, retaining the remaining portion of the filtrate for identification test. Add 5.0 ml of internal standard solution to the flask and dilute to volume with *methanol* and mix.

Reference solution. A 0.02 per cent w/v solution of *tolnaftate IPRS* in *methanol*. To 20 ml of the solution add 5.0 ml of internal standard solution and dilute to 50.0 ml with *methanol*.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 2 volumes of *acetonitrile* and 1 volume of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time of progesterone and tolnaftate are about 0.7 minute and 1.0 minute respectively.

Inject the reference solution. The test is not valid unless the resolution between the tolnaftate and internal standard peak is not less than 3.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{17}NOS$ in the powder.

Storage. Store protected from moisture.

Tolnaftate Topical Solution

Tolnaftate Topical Solution contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of tolnaftate, $C_{19}H_{17}NOS$.

Usual strength. 1 per cent w/v.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Toluene.

Test solution. Evaporate 25 ml of solution A on steam bath to dryness and dissolve the residue in 1.0 ml of the *ethanol (95 per cent)*.

Reference solution. A 0.1 per cent w/v solution of *tolnaftate IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

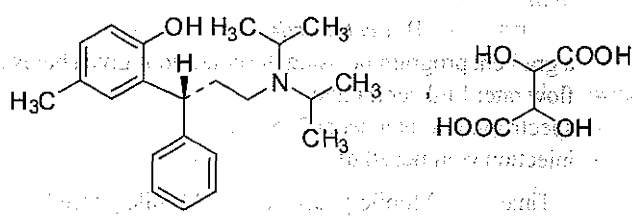
Tests

Assay. Take an measured volume containing about 10 mg of Tolnaftate, add 50 ml of *chloroform* and extract with 50 ml of *0.1 M sodium hydroxide*. Filter the chloroform layer through a chloroform-washed cotton pledget into a 250- ml volumetric flask and extract the aqueous layer with two 45 ml portions of *chloroform*, filtering each into the flask. Add *chloroform* to volume and mix (Solution A). Dilute 25 ml of the solution with *chloroform* to 100 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7), using 0.001 per cent w/v solution of *tolnaftate IPRS* in *chloroform*.

Calculate the content of $C_{19}H_{17}NOS$ in topical solution.

Storage. Store protected from moisture.

Tolterodine Tartrate



$C_{22}H_{31}NO,C_4H_6O_6$ Mol Wt. 475.6

Tolterodine Tartrate is 2-[(1*R*)-3-[bis(1-methylethyl)amino]-1-phenylpropyl]-4-methylphenol tartrate.

Tolterodine Tartrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{31}NO,C_4H_6O_6$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolterodine tartrate IPRS* or with the reference spectrum of tolterodine tartrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). + 27° to + 34°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *water* and dilute to 50.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution (a). Dissolve about 10 mg of *tolterodine tartrate IPRS* in 20 ml of *water* and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.03 per cent w/v solution of tartaric acid in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil),
- mobile phase: A. a *0.05 M potassium dihydrogen orthophosphate*, adjusted to pH 3.5 with *orthophosphoric acid*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
5	65	35
20	50	50
40	30	70
41	65	35
50	65	35

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to tartaric acid corresponding to the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in 20 ml of *water*, sonicate and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. Dissolve about 50 mg of *tolterodine tartrate IPRS* in 20.0 ml of *water*, sonicate and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil),
- mobile phase: A. a *0.05 M potassium dihydrogen orthophosphate*, adjusted to pH 3.5 with *orthophosphoric acid*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min)	Mobile Phase A (per cent v/v)	Mobile Phase B (per cent v/v)
0	65	35
5	65	35
20	50	50
21	65	35
25	65	35

Inject reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000 and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{31}NO.C_4H_6O_6$.

Storage. Store protected from moisture.

Tolterodine Tartrate Tablets

Tolterodine Tablets contain Tolterodine Tartrate.

Tolterodine Tartrate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of tolterodine tartrate, $C_{26}H_{37}NO_7$.

Usual strengths. 1 mg; 2 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

https://nhathuocngocanh.com/

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *gastric juice, artificial* (without enzyme) prepared by dissolving 2 g of *sodium chloride* in 80 ml of *1 M hydrochloric acid* and dilute to 1000 ml with *water*,

Speed and time. 50 rpm and 10 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution of *tolterodine tartrate IPRS* prepared by dissolving in *methanol* and diluted with the dissolution medium to get the similar concentration as that of the test solution.

Use chromatographic system as described under Assay using injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{37}NO_7$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{26}H_{37}NO_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Disperse a quantity of powdered tablets containing 10 mg of Tolterodine Tartrate in 1 ml of *methanol*, 5 ml of the solvent mixture with the aid of ultrasound and dilute to 10.0 ml with the solvent mixture, filter.

Reference solution (a). A 0.001 per cent w/v solution of *tolterodine tartrate IPRS* prepared by dissolving in *methanol* and diluted with the solvent mixture.

Reference solution (b). A 0.03 per cent w/v solution of *tartaric acid* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: A. dissolve 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
5	65	35
20	50	50
40	30	70
50	65	35

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore the peak due to tartaric acid corresponding to the peak in the chromatogram obtained with reference solution (b).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using following modification.

Test solution. Disperse 1 intact tablet in the mobile phase with the aid of ultrasound for 20 minutes and dilute to 10.0 ml with the mobile phase, filter. Dilute further with the mobile phase if necessary.

Calculate the content of $C_{26}H_{37}NO_7$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Tolterodine Tartrate in 70 ml of the mobile phase with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.01 per cent w/v solution of *tolterodine tartrate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of buffer solution prepared by mixing 2.2 ml of *orthophosphoric acid* to 1000 ml with *water*, adjusted to pH 3.0 with *triethylamine* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

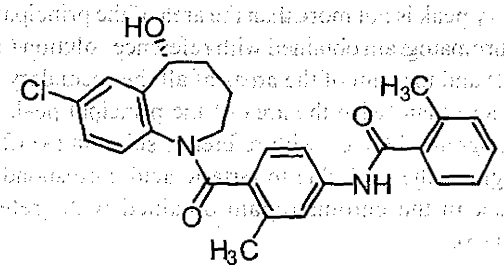
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{37}NO_7$ in the tablets.

Storage. Store at a temperature not exceeding 30°.

Tolvaptan



$C_{26}H_{25}ClN_2O_3$ Mol Wt 448.9

Tolvaptan is *N*-{4-{[(5*R*)-7-chloro-5-hydroxy-2,3,4,5-tetrahydro-1*H*-1-benzazepin-1-yl]carbonyl}-3-methylphenyl}-2-methylbenzamide.

Tolvaptan contains not less than 98.0 per cent and not more than 102.0 per cent, calculated on the anhydrous basis.

Category. Vasopressin Receptor Antagonist.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tolvaptan IPRS* or with the reference spectrum of tolvaptan.

B. In the assay, the principal peak in the chromatogram obtained with test solution corresponds to the the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of solution A and 50 volumes of *acetonitrile.*

Solution A. A mixture of 95 volumes of buffer prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* into 1000 ml of *water*, adjusted to pH 3.0 with *phosphoric acid* and 5 volume of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *tolvaptan IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 57 volumes of solution A and 43 volumes of a mixture of 95 volumes of *acetonitrile* and 5 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more be than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method D (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *tolvaptan IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

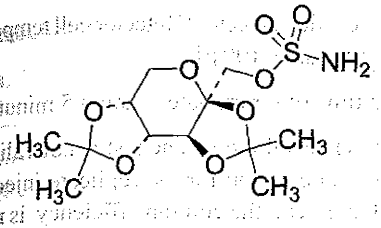
Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{25}ClN_2O_3$.

Storage. Store protected from moisture.

https://nhathuocngocanh.com/

Topiramate



$C_{12}H_{21}NO_8S$ Mol. Wt. 339.4

Topiramate is 2,3:4,5-di-*O*-1-isopropylidene-β-D-fructopyranose sulphamate.

Topiramate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{21}NO_8S$, calculated on the anhydrous basis.

Category. Anti-convulsant.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *topiramate IPRS* or with the reference spectrum of topiramate.

B. Melting range (2.4.21). 120° to 130°.

Tests

Specific optical rotation (2.4.22). – 36.0° to – 28.0°, determined in a 0.4 per cent w/v solution in *methanol* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 0.4 g of the substance under examination and dissolve in 10 ml of a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*.

Reference solution. A 0.1 per cent w/v solution each of *2,3:4,5-Bis-O-(1-methylethylidene)-beta-D-fructopyranose IPRS* (*topiramate impurity A IPRS*) and *2,3-O-(1-methylethylidene)-beta-D-fructopyranose sulphamate IPRS* (*topiramate impurity B IPRS*) in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- refractive index detector,
- detector cell temperature 50°,
- injection volume: 50 µl.

The retention times of topiramate impurity B and impurity A are about 2.9 and 4.5 minutes and the relative retention times with respect to topiramate are 0.54 and 0.84 respectively.

Inject the reference solution. The test is not valid unless the resolution between the peak due to topiramate impurity A and topiramate impurity B is not less than 3.

Inject the reference solution and the test solution. Run the chromatogram for 40 minutes. For the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: topiramate impurity A = 1.09; topiramate impurity B = 0.94. The area of any secondary peak due to topiramate impurity A and B is not more than 0.15 and the area of any other secondary peak is not more than 0.1 per cent. Ignore any peak due to lactose.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *topiramate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°
- mobile phase: a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate: 0.6 ml per minute,
- refractive index detector (Detector cell temperature: 50°)
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{21}NO_8S$

Storage. Store protected from light, at a temperature not exceeding 30°.

Topiramate Tablets

Topiramate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of topiramate, $C_{12}H_{21}NO_8S$.

https://nhathuocngocanh.com/

Usual strengths. 25 mg, 50 mg, 100 mg, 200 mg, 300 mg and 400 mg.

Identification

A. Weigh a quantity of the powdered tablets containing 1 g of Topiramate, disperse in 30 ml of *dichloromethane*, centrifuge at 2000 rpm for 10 minutes and filter. Evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *topiramate IPRS* or with the reference spectrum of topiramate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 500 ml of *water*.
Speed and time: 50 rpm and 45 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions described under test for Related substances.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve an weighed quantity of *topiramate IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Calculate the content of $C_{12}H_{21}NO_8S$ in the medium.

Q: Not less than 70 per cent of the stated amount of $C_{12}H_{21}NO_8S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. To a quantity of the powdered tablets containing 100 mg of Topiramate, add sufficient mobile phase to produce 100 ml, mix and centrifuge. Use the supernatant liquid.

Reference solution. A 0.1 per cent w/v solution of *topiramate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3),
- column temperature: 50°,
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- refractive index detector (Detector cell temperature 50°),
- injection volume: 100 µl.

The retention time of topiramate is about 5 minutes.

Inject the reference solution. The test is not valid unless the relative standard deviation for the replicate injections is not more than 2.0 per cent, the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0

Inject the test solution. The content of any individual impurity is not more than 1.0 per cent and the sum of areas of all impurities is not more than 2.0 per cent. Calculated by area normalisation. Ignore any peak due to identified excipients in the chromatogram obtained with the test solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 100 mg of Topiramate, disperse in 100.0 ml with the mobile phase and centrifuge. Use the supernatant liquid.

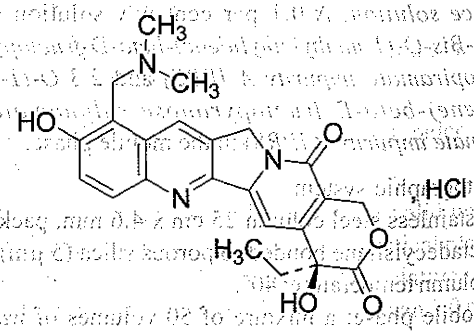
Reference solution. A 0.1 per cent w/v solution of *topiramate IPRS* in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{21}NO_8S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Topotecan Hydrochloride



$C_{23}H_{23}N_3O_5,HCl$ Mol. Wt. 457.9

Topotecan Hydrochloride is (4*S*)-10-[(dimethylamino) methyl]-4-ethyl-4,9-dihydroxy-1*H*-pyrano[3′,4′:6,7]indolizino[1,2-*b*]quinoline-3,14(4*H*,12*H*)-dione hydrochloride.

https://nhathuocngocanh.com/

Topotecan Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{23}H_{23}N_3O_5$,HCl, calculated on the anhydrous basis.

Category. Anticancer.

Description. A light yellow to greenish yellow powder.

CAUTION — Topotecan Hydrochloride is cytotoxic; extra care is required to prevent inhaling particles and exposing the skin to it.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *topotecan hydrochloride IPRS* or with the reference spectrum of topotecan hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.5 to 4.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +30.0° to +38.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Total chloride. 7.6 per cent to 8.1 per cent.

Weigh 0.5 g, dissolve in 10 ml of *methanol*, add 20 ml of *water* and 20 ml of *glacial acetic acid*. Titrate with *0.1 M silver nitrate solution* using *eosin yellow solution* as indicator. Colour changes from orange to dark pink.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *acetonitrile* and 70 volumes of a buffer solution prepared by diluting 1 ml of *trifluoroacetic acid* in 1000 ml of *water*.

Test solution. Dissolve 40 mg of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 0.04 per cent w/v solution of *topotecan hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the solvent mixture.

Reference solution (c). A solution containing 0.006 per cent w/v each of *10-hydroxy comptothecin IPRS* and *camptothecin IPRS* in *N,N'-dimethylformamide*. Add 1.0 ml of the solution to a 0.04 per cent w/v solution of *topotecan hydrochloride IPRS* in the solvent mixture.

Use the chromatographic system described under Assay.

Inject reference solution (c). The test is not valid unless the relative retention time for the 10-hydroxy camptothecin and camptothecin is about 1.87 and 2.62 with respect to topotecan hydrochloride and the relative response factors for 10-hydroxy camptothecin and camptothecin are about 0.79 and 0.85 with respect to topotecan hydrochloride.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.15 times the area of the peak in the chromatogram obtained with reference solution (b) (0.15 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 13.0 per cent, determined on 0.1 g.

Bacterial endotoxins (2.2.3). Not more than 16 Endotoxin Units per mg of topotecan hydrochloride.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g. 1 g is free from *Escherichia coli*, *Staphylococcus aureus* and *Pseudomonas aeruginosa*. 10 g is free from *Salmonella* and *Shigella*.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. a mixture of 30 volumes of *acetonitrile* and 70 volumes of a buffer solution, prepared by diluting 1 ml of *trifluoroacetic acid* to 1000 ml with *water*.

Test solution. Dissolve 10 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution. A 0.04 per cent w/v solution of *topotecan hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a solution of 1 ml of *trifluoroacetic acid* in 1000 ml of *water*,
  B. *acetonitrile*,
- flow rate: 1.2 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
28	70	30
38	70	30
43	85	15
48	85	15

https://nhathuocngocanh.com/

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{23}N_3O_5,HCl$.

Storage. Store protected from light, at a temperature between 2° to 8°.

Topotecan Injection

Topotecan Hydrochloride Injection

Topotecan Injection is a sterile, stabilised solution of Topotecan Hydrochloride in Water for Injection.

Topotecan Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the topotecan, $C_{23}H_{23}N_3O_5$.

Usual strength. 1 mg per ml.

Description. A clear, light yellow solution.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. It gives the reaction of chlorides (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5.

Bacterial endotoxins (2.2.3). Not more than 64.9 Endotoxin Unit per mg of topotecan.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Accurately measure the volume of injection containing 2 mg of Topotecan, dilute to 50.0 ml with mobile phase.

Reference solution. Dissolve 10 mg of *topotecan hydrochloride IPRS* in 5 ml of *water* and dilute to 25.0 ml with mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 78 volumes of *water*, 22 volumes of *acetonitrile* and 1 volume of *1 M hydrochloric acid*,
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

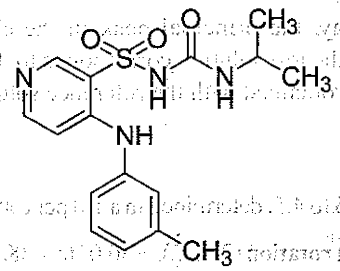
Inject the reference solution. The test is not valid unless the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{23}N_3O_5$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 2° to 8°.

Torsemide



$C_{16}H_{20}N_4O_3S$ Mol. Wt. 348.4

Torsemide is 3-pyridinesulfonamide, *N*-[[(1-methylethyl) amino]carbonyl]-4-[(3-methylphenyl)amino]-1-Isopropyl-3 [(4-*m*-toludino-3-pyridyl) sulfonyl] urea.

Torsemide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{20}N_4O_3S$, calculated on the anhydrous basis.

Category. Diuretic.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometery (2.4.6). Compare the spectrum with that obtained with *torsemide IPRS* or with the reference spectrum of torsemide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 38 mg of the substance under examination in 30 ml of *methanol*, with the aid of ultrasound for 10 minutes. Add 45 ml of *0.02 M potassium phosphate*

https://nhathuocngocanh.com/

buffer pH 3.5 and dilute to 100.0 ml with the mobile phase, filter.

Reference solution (a). Dissolve 9.5 mg, each of, *torsemide related compound A IPRS, torsemiderelated compound B IPRS* and *torsemide related compound C IPRS* in 30 ml of *methanol*, with the aid of ultrasound about 10 minutes and add 45 ml of *0.02 M potassium phosphate buffer pH 3.5* and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 3 mg, each of, *torsemide IPRS* and *torsemide related compound A IPRS* in 30 ml of *methanol*, with the aid of ultrasound for 10 minutes and add 45 ml of *0.02 M potassium phosphate buffer pH 3.5* and dilute to 100.0 ml with the mobile phase.

Use the chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to torsemide and torsemide related compound A is not less than1.0, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 10.0 per cent for the torsemide peak.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak for test solution. The area of any peak corresponding to torsemide related compound C is not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to torsemide related compound B is not more than 0.6 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to torsemide related compound A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

The area of any other secondary peak is not more than 0.1 per cent, the sum of the areas of all the secondary peaks excluding torsemide related compound A, B and C is not more than 0.2 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization method.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 38 mg of the substance under examination in 30 ml of *methanol*, mix and sonicate to dissolve. Add 45.0 ml of *0.02 M phosphate buffer pH 3.5*, cool to room temperature and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve 38 mg of *torsemide IPRS* in 30 ml of *methanol*, mix and sonicate to dissolve. Add 45 ml of *0.02 M phosphate buffer pH 3.5*, cool to room temperature and dilute to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 40 volumes of *methanol* and 60 volumes of *0.02 M phosphate buffer pH 3.5*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{20}N_4O_3S$.

Storage. Store protected from moisture.

Torsemide Tablets

Torsemide Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tosemide, $C_{16}H_{20}N_4O_3S$.

Usual strengths. 5 mg; 10 mg; 20 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak of the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

https://nhathuocngocanh.com/

Reference solution. A 0.055 per cent w/v solution of *torsemide IPRS* prepared by dissolving in *methanol* to fill 30 per cent of the volume of flask with the aid of ultrasound and add the buffer solution to fill 75 per cent of the volume of the flask. Dilute to volume with the mobile phase. Dilute the solution with the dissolution medium to obtain a solution having a final concentration similar to that of the test solution.

Use buffer solution and chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{20}N_4O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 40 mg of Torsemide in 30 ml of *methanol*, with the aid of ultrasound for 10 minutes. add 45 ml of *0.02 M potassium phosphate buffer* and dilute to 100.0 ml with the mobile phase, filter (*Prepare the solution immediately before use*).

Reference solution (a). Dissolve 10 mg of *torsemide related compound A IPRS* and 2 mg of *torsemide related compound E IPRS* in 30 ml of *methanol*, with the aid of ultrasound and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 40 mg of *torsemide IPRS* in 30 ml of *methanol*, with the aid of ultrasound. Add 45 ml of *0.02 M potassium phosphate buffer* and 4.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 40 mg of *torsemide IPRS* in 30 ml of *methanol*, with the aid of ultrasound for 10 minutes. Add 45 ml of *0.02 M potassium phosphate buffer* and dilute to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (e). Dilute 4.0 ml of reference solution (a) and 1.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- sample temperature: 6°,
- mobile phase: a mixture of 45 volumes of a solution containing 10 volumes of *acetonitrile* and 90 volumes of *methanol* and 55 volumes of a buffer solution prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume: 20 µl.

Name	Relative retention time
Torsemide related compound A[1]	0.39
Torsemide related compoundE[2]	0.50
Torsemide related compound C[3]*	0.62
Torsemide related compound D[4]*	0.75
Torsemide	1.0
Torsemide related compound B[5]*	1.96

*Process-related impurity controlled in the drug substance

[1]4-[(3-methlphenyl)amino]-3-pyridinesulphonamide,

[2]4-(3-Tolyl)-2H-pyrido[4,3-e][1,2,4]thiadiazin-3(4H)-one 1,1-dioxide

[3]N-(Ethylcarbamoyl)-4-(3-tolylamino)pyridine-3-sulfonamide,

[4]Ethyl {[4-(3-tolylamino)pyridin-3-yl]sulfonyl}carbamate,

[5]N-(Butylcarbamoyl)-4-(3-tolylamino)pyridine-3-sulfonamide.

Inject reference solution (b), (d) and (e). The test is not valid unless the resolution between the peaks due to torsemide impurity A and torsemide related compound E is not less than 2.5, the tailing factor is not more than 2.0 for torsemide peak in the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 5.0 per cent for torsemide peak in the chromatogram obtained with reference solution (e) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (d).

Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to torsemide related compound A is not more than 0.6 times the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.6 per cent), the area of any peak corresponding to torsemide related compound E is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.1 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions as described under Assay.

https://nhathuocngocanh.com/

Test solution. Disperse one tablet in *methanol* to fill 30 per cent of the volume of flask with the aid of ultrasound for 10 minutes. Add the buffer solution to fill 75 per cent of the volume of flask and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. Dissolve a quantity of *torsemide IPRS* in *methanol* to fill 30 per cent of the volume of flask with the aid of ultrasound for 10 minutes and add buffer solution to fill 75 per cent of the volume of the flask and dilute to volume with the mobile phase to obtain a solution of the same concentration as that of the test solution.

Calculate the content of $C_{16}H_{20}N_4O_3S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — The test solution is not stable at room temperature, it is stable for 15 hours at 6°.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 40 mg of Torsemide in *methanol* to fill 30 per cent of the volume of flask with the aid of ultrasound for 10 minutes. Add the buffer solution to fill 75 per cent of the volume of flask and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.04 per cent w/v solution of *torsemide IPRS* prepared by dissolving in *methanol* to fill 30 per cent of the volume of flask with the aid of ultrasound for 10 minutes and add the buffer solution to fill 75 per cent of the volume of the flask and dilute to volume with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of solution containing 10 volumes of *acetonitrile* and 90 volumes of *methanol* and 50 volumes of a buffer solution prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume: 20 µl.

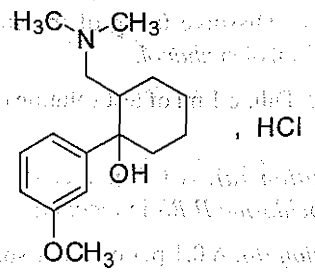
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{20}N_4O_3S$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Tramadol Hydrochloride



$C_{16}H_{26}ClNO_2$ Mol. Wt. 299.8

Tramadol Hyrochloride is (1*RS*,2*RS*)-2-[(dimethylamino)-methyl]-1-(3-methoxyphenyl)cyclohexanol hydrochloride.

Tramadol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{26}ClNO_2$, calculated on the anhydrous basis.

Category. Analgesic.

Description. A white or almost white, crystalline powder.

Identification

Test B may be omitted if tests A and C are carried out: Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tramadol hydrochloride IPRS* or with the reference spectrum of tramadol hydrochloride.

B. In the test for impurity E, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (a).

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Acidity. To 10 ml of 5 per cent w/v solution, add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M hydrochloric acid.* The solution is red. Not more than 0.4 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Optical rotation (2.4.22): −0.10° to +0.10°, determined on 5.0 per cent w/v solution.

Impurity E. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

https://nhathuocngocanh.com/

Mobile phase. A mixture of 1 volume of *concentrated ammonia*, 19 volumes of *2-propanol* and 80 volumes of *toluene*.

Test solution (a). Dissolve 0.1 g of the substances under examination in 2 ml of *methanol*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol*.

Reference solution (a). A 0.5 per cent w/v solution of *tramadol hydrochloride IPRS* in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *(2RS)-2-[(dimethylamino)methyl]cyclohexanone IPRS* (*tramadol impurity E IPRS*) in *methanol*. Dilute 1 ml of the solution to 10 ml with *methanol*.

Reference solution (c). A 0.5 per cent w/v solution of *(1RS,2SR)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl) cyclohexanol IPRS* (*tramadol impurity A IPRS*) in reference solution (a).

Saturate the plate for 20 minutes with *concentrated ammonia*. Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, expose the plate to iodine vapour for 1 hour, and examine under ultraviolet light at 254 nm. The chromatogram obtained with reference solution (c) shows 2 clearly separated spots. In the chromatogram obtained with test solution (a), any secondary spot corresponding to tramadol impurity E is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.15 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *tramadol impurity A IPRS* in 4.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 29.5 volumes of *acetonitrile* and 70.5 volumes of a mixture of 0.2 ml of *trifluoroacetic acid* and 100 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

The relative retention time with reference to tramadol for tramadol impurity A is about 0.85.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tramadol impurity A and tramadol is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to tramadol impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.18 g in 25 ml of *anhydrous acetic acid* and add 10 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02998 g of $C_{16}H_{26}ClNO_2$.

Storage. Store protected from light.

Tramadol Capsules

Tramadol Hydrochloride Capsules

Tramadol Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tramadol hydrochloride, $C_{16}H_{25}NO_2,HCl$.

Usual Strengths. 50 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *anhydrous formic acid*, 50 volumes of *acetone* and 50 volumes of *methanol*.

Test solution. Disperse the contents of capsules containing about 50 mg of Tramadol Hydrochloride in 25 ml of *methanol* and filter through a glass fiber filter (Such as Whatmann GF/A).

https://nhathuocngocanh.com/

Reference solution. A 0.2 per cent w/v solution of *tramadol hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose to iodine vapour until spots appear and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to spot obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse the contents of capsules containing about 0.5 g of Tramadol Hydrochloride in 80 ml of the mobile phase with the aid of ultrasound and dilute to 100 ml with the mobile phase, filter through a glass fiber filter (Such as Whatmann GF/A).

Reference solution (a). Dilute 2 ml of the test solution to 100 ml with the mobile phase. Dilute 1 ml of the solution to 10 ml with the mobile phase.

Reference solution (b). A 0.0015 per cent w/v solution of *(1RS,2SR)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl) cyclohexanol IPRS (tramadol impurity A IPRS)* in the mobile phase.

Reference solution (c). A solution containing 0.0015 per cent w/v each of *tramadol hydrochloride IPRS* and *tramadol impurity A IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *trifluoroacetic acid*, 30 volumes of *acetonitrile* and 69 volumes of *water*,
- flow rate: 1ml per minute,
- spectrophotometer set at 271 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to tramadol impurity A and tramadol hydrochloride is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram four times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak corresponding to tramadol impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of secondary peak other than tramadol impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules containing about 50 mg of Tramadol Hydrochloride in 150 ml of the mobile phase with the aid of ultrasound and dilute to 200 ml with the mobile phase, filter.

Reference solution (a). A 0.025 per cent w/v solution of *tramadol hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0015 per cent w/v each of *tramadol hydrochloride IPRS* and *tramadol impurity A IPRS* in the mobile phase.

Use the chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to tramadol impurity A and tramadol hydrochloride is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{25}NO_2,HCl$ in the Capsules.

Tramadol Prolonged-release Tablets

Tramadol Sustained-release Tablets, Tramadol Extended-release Tablets

Tramadol Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Tramadol Prolonged-release Tablets contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tramadol hydrochloride, $C_{16}H_{25}NO_2,HCl$.

Usual strengths. 50 mg; 100 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), using the plate coated with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *anhydrous formic acid*, 50 volumes of *acetone* and 50 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of tramadol hydrochloride with 25 ml of *methanol*, shake for 10 minutes, filter (such as Whatman GF/A).

https://nhathuocngocanh.com/

Reference solution. A 0.2 per cent w/v solution of *tramadol hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and expose to iodine vapour until the spots appear and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Tramadol Hydrochloride with 80 ml of mobile phase, mix with the aid of ultrasound, cool, add sufficient mobile phase to produce 100 ml and filter through a glass-fibre filter paper (such as Whatman GF/A).

Reference solution(a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase and further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.0015 per cent w/v solution of *tramadol impurity A IPRS ((1RS,2SR)-2-[(dimethylamino) methyl]-1-(3-methoxyphenyl)cyclohexanol IPRS)* in the mobile phase.

Reference solution (c). A 0.0015 per cent w/v solution each of *tramadol hydrochloride IPRS* and *tramadol impurity A IPRS ((1RS,2SR)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *trifluoroacetic acid* , 30 volumes of *acetonitrile* and 69 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 271 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless, the resolution between tramadol hydrochloride and tramadol impurity A is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak for the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to tramadol impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of tramadol hydrochloride with 150 ml of mobile phase, mix with the aid of ultrasound, cool, add sufficient mobile phase to produce 200.0 ml and filter through a glass-fibre filter paper (such as Whatman GF/A).

Reference solution. A 0.025 per cent w/v solution of *tramadol hydrochloride IPRS* in mobile phase.

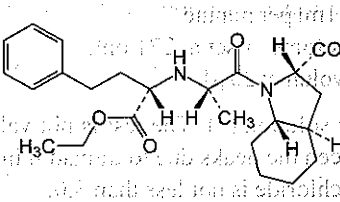
Inject reference solution (c). The test is not valid unless, the resolution between tramadol hydrochloride and tramadol impurity A is not less than 3.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{25}NO_2,HCl$ in the tablets.

Storage. Store protected from light and moisture, at temperature not exceeding 30°.

Trandolapril



$C_{24}H_{34}N_2O_5$ Mol. Wt. 430.5

Trandolapril is (2*S*,3a*R*,7a*S*)-1[(*S*)-2-[[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxo-propyl]octahydro-1*H*-indole-2-carboxylic acid.

Trandolapril contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{24}H_{34}N_2O_5$, calculated on the dried basis.

Category. Antihypertensive.

https://nhathuocngocanh.com/

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trandolapril IPRS* or with the reference spectrum of trandolapril.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 18.5° to – 16.5°, determined on 2.0 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution. A 0.0005 per cent w/v solution of *trandolapril IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 6.71 g of *monobasic potassium orthophosphate* in 1000 ml of *water*, 35 volumes of *acetonitrile* and 5 volumes of *methanol*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicates injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 50° for 3 hours under vacuum.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *trandolapril IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil C18),
- mobile phase: a mixture of 52 volumes of buffer solution prepared by dissolving 6.71 g of *monobasic potassium orthophosphate* in 1000 ml of *water*, 43 volumes of *acetonitrile* and 5 volumes of *methanol*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{34}N_2O_5$.

Storage. Store protected from light and moisture.

Trandolapril Tablets

Trandolapril Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of trandolapril, $C_{24}H_{34}N_2O_5$.

Usual strengths. 1 mg; 2 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range of 200 nm to 400 nm (2.4.7), a 0.05 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum as obtained with *trandolapril IPRS* of the same concentration.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 500 ml of *water*,
Speed and time: 50 rpm and 45 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve an weighed quantity of *trandolapril IPRS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay using 100 µl injection volume:

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{34}N_2O_5$.

Q. Not less than 80 per cent of the stated amount of $C_{24}H_{34}N_2O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Disperse a quantity of powdered tablets containing about 10 mg of Trandolapril in 10.0 ml of the mobile phase, shake and filter.

Reference solution. A 0.001 per cent w/v solution of *trandolapril IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as ACE C8),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 6.71 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, 35 volumes of *acetonitrile* and 5 volumes of *methanol*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following solutions.

Test solution. Disperse one tablet in the mobile phase, dilute to obtain a solution containing 0.005 per cent w/v of trandolapril in the mobile phase and filter.

Reference solution. Dissolve an weighed quantity of *trandolapril IPRS* in the mobile phase and dilute to obtain a solution having a known concentration similar to the test solution.

Calculate the content of $C_{24}H_{34}N_2O_5$ in the tablet.

Water (2.3.43). Not more than 7.0 per cent, determined on 0.5 g.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer 10 intact tablets in 100.0-ml volumetric flask, and disperse in about 80 ml of mobile phase with the aid of ultrasound for about 30 minutes. Cool and dilute to volume with mobile phase. Mix well and filter. Dilute suitably with mobile phase to obtain a solution containing 0.005 per cent w/v of trandalapril.

Reference solution. A 0.005 per cent w/v solution of *trandolapril IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 52 volumes of buffer solution prepared by dissolving 6.71 g of *monobasic potassium orthophosphate anhydrous* in 1000 ml of *water*, 43 volumes of *acetonitrile* and 5 volumes of *methanol*, adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

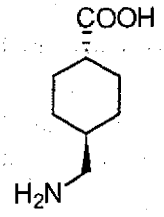
Calculate the content of $C_{24}H_{34}N_2O_5$ in the tablet.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the amount of Trandolapril.

https://nhathuocngocanh.com/

Tranexamic Acid



$C_8H_{15}NO_2$ Mol. Wt. 157.2

Tranexamic Acid is *trans*-4-(aminomethyl) cyclohexane-carboxylic acid.

Tranexamic Acid contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{15}NO_2$, calculated on the dried basis.

Category. Antifibrinolytic agent; Hemastatic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tranexamic acid IPRS* or with the reference spectrum of tranexamic acid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water* and dilute to 10.0 ml with *water*.

Reference solution (a). A 0.005 per cent w/v solution of *tranexamic acid IPRS* in *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *water*.

Reference solution (c). A solution containing 0.02 per cent w/v of *tranexamic acid IPRS* and 0.0002 per cent w/v of *tranexamic acid related compound C IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 18.3 g of *monobasic sodium phosphate* in 500 ml of *water*, add 8.3 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Tranexamic acid	1.0	—
Tranexamic acid related compound C[1]	1.1	0.005
Aminomethylbenzoic acid[2]	1.3	0.006
cis-Tranexamic acid[3]	1.5	1.21
Ditranexamic acid amine[4]	2.1	—

[1](RS)-4-(Aminomethyl)cyclohex-1-enecarboxylic acid,

[2]4-(Aminomethyl)benzoic acid,

[3]cis-4-(Aminomethyl)cyclohexanecarboxylic acid,

[4]*trans,trans*-4,4'-[Iminobis(methylene)]dicyclohexanecarboxylic acid.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to tranexamic acid and tranexamic acid related compound C is not less than 2.0 in the chromatogram obtained with reference solution (c), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak for test solution. The area of any peak corresponding to tranexamic acid related compound C, aminomethylbenzoic acid and ditranexamic acid amine, each of, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any peak corresponding to *cis*-Tranexamic acid is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and the sum of areas of all the secondary peaks is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in chromatogram obtained with reference solution (a) (0.025 per cent).

Chlorides (2.3.12). 1.8 g complies with the limit test for chlorides (140 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

https://nhathuocngocanh.com/

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 50.0 ml in *water*.

Reference solution. A 0.1 per cent w/v solution of *tranexamic acid IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 18.3 g of *monobasic sodium phosphate* in 500 ml of *water*, add 8.3 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 40 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Run the chromatogram 2.5 times the retention time of the principal peak.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NO_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Tranexamic Acid Injection

Tranexamic Acid Injection is a sterile solution of Tranexamic Acid in Water for Injections.

Tranexamic Acid Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tranexamic acid, $C_8H_{15}NO_2$.

Usual strength. 100 mg per ml.

Identification

Transfer the content of injection into a beaker and heat on a hot plate at 100° for 30 minute, until a paste appears. Then heat it in an oven to complete dryness at 110° for about 30 minute.

A. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tranexamic acid IPRS* or with the reference spectrum of tranexamic acid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.5 to 8.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute an accurately measured volume of injection with *water* to obtain a solution containing 1.0 per cent w/v of Tranexamic Acid.

Reference solution (a). A 0.005 per cent w/v solution of *tranexamic acid IPRS* in *water*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with *water*.

Reference solution (c). A solution containing 0.02 per cent w/v of *tranexamic acid IPRS* and 0.0002 per cent w/v of *tranexamic acid related compound C IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 18.3 g of *sodium dihydrogen orthophosphate* in 800 ml of *water*, add 8.3 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *dilute orthophosphoric acid*, diluted to 1000 ml with *water* and 40 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time
Tranexamic acid	1.0
Tranexamic acid related compound C[1]*	1.1
Aminomethylbenzoic acid[2]*	1.3
cis-Tranexamic acid[3]*	1.5
Ditranexamic acid amine[4]*	2.1

*For identification only. These are process impurities monitored in the drug substance and are not included in the total impurities.

[1](RS)-4-(Aminomethyl)cyclohex-1-enecarboxylic acid.

[2]4-(Aminomethyl)benzoic acid.

[3]cis-4-(Aminomethyl)cyclohexanecarboxylic acid.

[4]*trans,trans*-4,4'-[Iminobis(methylene)]dicyclohexanecarboxylic acid.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to tranexamic acid and tranexamic acid related compound C is not less than 2.0 in the chromatogram obtained with reference solution (c), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b). Inject reference solution (a) and the test solution. Run the chromatogram 3.3 times the retention time of the principal peak. The area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Units per mg of Tranexamic Acid.

Sterility (2.2.11). Complies with the test for sterility.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of minimum 3 vials and dilute a suitable volume of the sample with *water* to obtain a solution containing 0.1 per cent w/v of Tranexamic acid.

Reference solution. A 0.1 per cent w/v solution of *tranexamic acid IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 18.3 g of *sodium dihydrogen orthophosphate* in 800 ml of *water*. add 8.3 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *dilute orthophosphoric acid*, diluted to 1000 ml with *water* and 40 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NO_2$ in the injection.

Storage. Store at a temperature not exceeding 30°.

Tranexamic Acid Tablets

Tranexamic Acid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of tranexamic acid, $C_8H_{15}NO_2$.

Usual strengths. 250 mg; 500 mg.

Identification

Shake a quantity of the powdered tablets containing 75 mg of Tranexamic Acid with 1 ml of *water*, mix on a vortex mixer for a few seconds, and sonicate for 1 minute. Pass the suspension through a suitable filter onto a suitable watchglass. Evaporate the filtrate in an oven at 60° for 2 hours, and then stir gently with a glass rod. Dry in an oven at 60°for another 1 hour.

A. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tranexamic acid IPRS* or with the reference spectrum of tranexamic acid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *tranexamic acid IPRS* in the dissolution medium, to obtain a solution having known concentration similar to the test solution.

Use chromatographic system as described under Assay, with the following modifications.
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 10.5 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water*, add 8 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *orthophosphoric acid* and 20 volumes of *acetonitrile*,

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NO_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_8H_{15}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Tranexamic Acid in the mobile phase with

https://nhathuocngocanh.com/

the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *tranexamic acid IPRS* with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v of *tranexamic acid IPRS* and 0.0002 per cent w/v of *tranexamic acid related compound C IPRS* with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 10.5 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water*, add 8 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time
Tranexamic acid	1.0
Tranexamic acid related compound C[1*]	1.1
Tranexamic acid related compound D[2*]	1.2
Tranexamic acid related compound B[3]	1.5
Tranexamic acid related compound A[4]	2.3

*Process impurity controlled in the drug substance. It is included for identification purposes only and not be included in the total degradation products.

[1](RS)-4-(Aminomethyl)cyclohex-1-enecarboxylic acid,

[2]4-(Aminomethyl)benzoic acid,

[3]cis-4-(Aminomethyl)cyclohexanecarboxylic acid,

[4]*trans,trans*-4,4'-[Iminobis(methylene)]dicyclohexanecarboxylic acid.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to tranexamic acid and tranexamic acid related compound C is not less than 2.0 in the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram 5.3 times the retention time of the principal peak. The area of any peak corresponding to tranexamic acid related compound B, multiplied with correction factor of 1.2, is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any peak corresponding to tranexamic acid related compound A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.65 g of Tranexamic Acid in *water*, with the aid of ultrasound for 20 minutes with intermittent shaking and dilute to 250.0 ml with *water*.

Reference solution. A 0.26 per cent w/v solution of *tranexamic acid IPRS* in *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 85 volumes of a buffer solution prepared by dissolving 10.5 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water*, add 8 ml of *triethylamine* and 2.3 g of *sodium dodecyl sulphate*, adjusted to pH 2.5 with *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

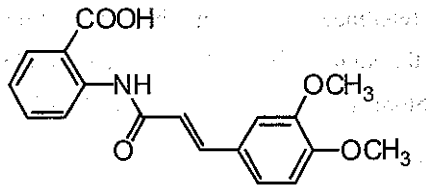
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{15}NO_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Tranilast



$C_{18}H_{17}NO_5$ Mol Wt. 327.3

Tranilast is 2-((*E*)-3-(3,4-Dimethoxyphenyl)acrylamido)benzoic acid.

https://nhathuocngocanh.com/

Tranilast contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{17}NO_5$, calculated on the dried basis.

Category. Antiallergic.

Description. A light yellow to green crystalline powder.

Identification

Melting range (2.4.21). 207° to 210°.

Tests

Related substances. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 30 ml of *methanol* and 70 ml of *benzene*.

Test solution. Dissolve about 1.0 g of the substance under examination in 5 ml of *dimethylformamide* and dilute to 100 ml with *ethanol (95 per cent)*.

Reference solution. Dilute 2.0 ml of the test solution to 100.0 ml with *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in hot air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with the reference solution (2.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

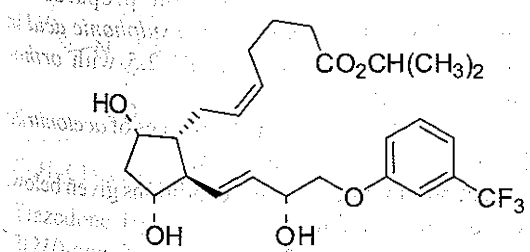
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° for 3 hours.

Assay. Dissolve 0.3 g in 50.0 ml of *ethanol*. Titrate with *0.1 M sodium hydroxide*, using *phenolphthalein* as an indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.032734 g of $C_{18}H_{17}NO_5$.

Storage. Store protected from moisture.

Travoprost



$C_{26}H_{35}F_3O_6$ Mol. Wt. 500.6

Travoprost is (5*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(1*E*,3*R*)-3-hydroxy-4-[3-(trifluromethyl)phenoxy]-1-butenyl]-cyclopentyl]-5-heptenoic acid 1-methylethyl ester.

Travoprost contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{26}H_{35}F_3O_6$, calculated on the anhydrous basis.

Category. Antiglaucoma.

Description. A colourless to yellowish oil.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *travoprost IPRS* or with the reference spectrum of travoprost.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *ethanol (95 per cent)* is not more intensely coloured than reference solution YS7 (2.4.1).

Specific optical rotation (2.4.22). + 52° to + 58°, determined on 2.0 per cent w/v solution in *ethanol* at 365 nm.

Related substances. Not more than 3.5 per cent of 5,6-trans-travoprost.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *acetonitrile* and dilute to 100.0 ml with *water*.

Reference solution. Dissolve 10 mg of *travoprost IPRS* in *acetonitrile* and dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 20.0 ml with *water*.

Use chromatographic system as described under Assay.

The relative retention time with reference to travoprost for 5,6-trans-travoprost is about 1.06.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 12 times the area of the principal peak in the chromatogram obtained with the reference solution (6.0 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *acetonitrile* and dilute to 100.0 ml with *water*.

https://nhathuocngocanh.com/

Reference solution. Dissolve 10 mg of *travoprost IPRS* in *acetonitrile* and dilute to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Hypersil ODS),
- column temperature: 50°,
- mobile phase: A. a mixture of 66 volumes of buffer solution prepared by diluting 1 ml of *orthophosphoric acid* to 1000 ml with *water*, adjusted to pH 5.0 with *1 M sodium hydroxide*, 30 volumes of *acetonitrile* and 4 volumes of *propanol-2-ol*,
  B. a mixture of 80 volumes of *acetonitrile*, 4 volumes of *propanol-2-ol* and 16 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent V/V)
0	100	0
5	80	20
50	80	20
70	0	100
80	0	100
82	100	0
90	100	0

Inject the reference solution. The test is not valid unless the resolution between the peaks due to travoprost and 5-trans-travoprost is not less than 1.5, the theoretical plates is not less than 1500, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{35}F_3O_6$.

Storage. Store protected from moisture, at a temperature between 2° and 8°.

Travoprost Eye Drops

Travoprost Eye Drops contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of travoprost, $C_{26}H_{35}F_3O_6$.

Usual strength. 40 µg per ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *benzene* and 40 volumes of *dioxane*.

Test solution. Extract eye drops containing about 0.8 mg of Travoprost with 20.0 ml of *chloroform* in a separating funnel. Collect the chloroform layer in a 250 ml beaker. Give three washings with chloroform. Evaporate the chloroform layer to dryness and add 3.0 ml of *methanol*.

Reference solution. Dissolve 20 mg of *travoprost IPRS* in 10 ml of *acetonitrile*, sonicate and dilute to 20.0 ml with *water*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate and spray with 10 per cent w/v solution of *phosphomolybdic acid* in *ethanol*, heat the plate at 110° for 15 minutes and examine immediately. The principal spot in the chromatogram obtained with the test solution corresponds to the spot obtained with the reference solution.

Tests

pH (2.4.24). 5.7 to 6.3.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dilute the eye drops, if necessary with the solvent mixture, to produce a solution containing 0.004 per cent w/v of travoprost.

Reference solution (a). A 0.004 per cent w/v solution of *travoprost IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature: 35°,
- sample temperature: 10°,
- mobile phase A: a buffer solution prepared by dissolving 1.5 g of *1-octane sodium sulphonic acid* in 1000 ml of *water*, adjusted to pH 2.5 with *ortho-phosphosric acid*,
  B: a mixture of 80 volumes of *acetonitrile* and 20 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
50	42	58
52	50	50
60	50	50

Equilibrate the column for at least 60 minutes with the mobile phase at the initial composition.

The relative retention time with respect to travoprost for 5,6-trans travoprost is 1.1 [*NOTE — Travaprost IPRS* contains a small percentage of the 5,6- trans isomer].

Inject reference solution (a). The test is not valid unless the resolution obtained between travoprost and 5,6-trans travoprost is not less than 1.5. The column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent) and the sum of areas of all the secondary peaks is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent).

Other tests. Comply with the tests stated under Eye Drops.

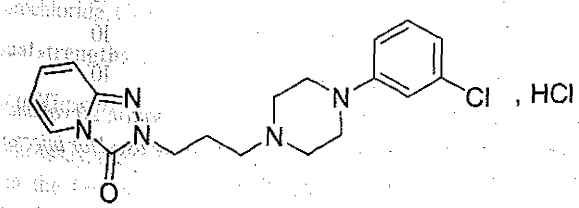
Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{26}H_{35}F_3O_6$.

Storage. Store at a temperature not exceeding 30°.

Trazodone Hydrochloride



$C_{19}H_{22}ClN_5O,HCl$ Mol. Wt. 408.3

Trazodone Hydrochloride is 1,2,4-Triazolo[(4,3-a]pyridin-3(2*H*)-one, 2-[3-[4-(3-chlorophenyl)-1-piperazinyl]propyl]-, monohydrochloride.

Trazodone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{22}ClN_5O,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. A white to off white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trazodone hydrochloride IPRS* or with the reference spectrum of trazodone hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of mobile phase A and 20 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.0001 per cent w/v solution of *trazodone hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0001 per cent w/v, each of, *trazodone related compound C IPRS* and *trazodone related compound D IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 7.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- mobile phase: A. a 0.01per cent v/v solution of *triethylamine* in *water*,
  B. a 0.01per cent v/v solution of *triethylamine* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
12	32	68
12.01	80	20
15	80	20

[1][1,2,4]Triazolo[4,3-a]pyridin-3(2*H*)-one,

[2]4-(3-Chlorophenyl)-1-[3-(3-oxo-[1,2,4]triazolo[4,3-a]pyridin-2(3*H*)-yl)propyl]piperazine 1-oxide,

[3]2-[3-(4-Phenylpiperazin-1-yl)propyl]-[1,2,4]triazolo[4,3-a]pyridin-3(2*H*)-one,

[4]2-{3-[4-(3-Chloro-4-ethylphenyl)piperazin-1-yl]propyl}-[1,2,4]triazolo[4,3-a]pyridin-3(2*H*)-one,

[5]1-(3-Chlorophenyl)-4-(3-isobutoxypropyl)piperazine,

[6]1,3-Bis(4-(3-chlorophenyl)piperazin-1-yl)propane.

NOTE — A mixture of 40 volumes of acetonitrile, 30 volumes of 2-propanol, 30 volumes of acetone and 0.2 volume of formic acid may be used for injector wash to minimize sample carry-over.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks corresponding to trazodone related compound C and trazodone is not less than 1.5 and the peaks corresponding to trazodone and trazodone related compound D is not less than 2.8 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to triazolopyridinone, trazodone n-oxide, deschloro trazodone, trazodone related compound C, trazodone related compound D, 4-ethyl trazodone, trazodone isobutyl ether analog and bispiperazine analog, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Limit of Trazodone related compound F and Cyclophosphamide related compound A. Determine by liquid chromatography/ mass spectrometry (2.4.39)

NOTE — Perform this test only if trazodone related compound F and cyclophosphamide related compound A are known process impurities.

Solvent mixture. 10 volumes of *acetonitrile*, 90 volumes of *water* and 0.1 volume of *formic acid*.

Test solution. Dissolve 1g of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution . A solution containing 0.00025 per cent w/v, each of, *trazodone related compound F IPRS* and *cyclophosphamide related compound A IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 7.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature : 40°,
- mobile phase: A. a 0.005 *M ammonium bicarbonate* in *water*,

B. *acetonitrile*,
- a gradient programme using the conditions given below,
- MS/MS (tandom mass spectrophotometer) set as, Ionization: Triple quadrupole ionization in positive ion mode.
  Aquisition mode: Multiple reaction monitoring (MRM) of the following mass transitions; cyclophosphamide related compound A 142 → 63 trazodone related compound F 273 → 120
- flow rate: 1.5 ml per minute,
- flow rate to ion source: 0.5 ml per minute,
- injection volume: Adjust between 5 and 50 µl , depending on the mass spectrometer.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
6.5	20	80
6.51	90	10
10.0	90	10

NOTE — A mixture of 80 volumes of 2-propanol, 20 volumes of water and 0.1 volume of formic acid may be used for injector wash to minimize sample carry over.

The relative retention time with reference to trazodone related compound F for cyclophosphamide related compound A is about 0.4.

Inject the reference solution. The test is not valid unless the signal-to-noise ratio is not less than100 for the trazodone

related compound F peak, and not less than 50 for the cyclophosphamide related compound A peak and the relative standard deviation for replicate injections is not more than 15.0 per cent for each of trazodone related compound F and cyclophosphamide related compound A peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to trazodone related compound F and cyclophosphamide related compound A, each of, is not more than 0.01 times the area of the principal peak in the chromatogram obtained with the reference solution (0.00025 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°, at a pressure of 50 mm of Hg for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Weigh accurately 0.1g of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *trazodone hydrochloride IPRS* in the solvent mixture.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{22}ClN_5O$, HCl.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Trazodone Tablets

Trazodone Hydrochloride Tablets

Trazodone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of trazodone hydrochloride, $C_{19}H_{22}ClN_5O$, HCl.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution .

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *trazodone hydrochloride IPRS* in the dissolution medium and dilute with the same medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 10 cm x 5 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *sodium hydroxide* and 75 volumes of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 246 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 900 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram 4.5 times the retention time of the principal peak.

Calculate the content of $C_{19}H_{22}ClN_5O$, HCl in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{22}ClN_5O$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 65 volumes of *methanol*, 35 volumes of *water* and 0.3 volume of *hydrochloric acid*.

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of trazodone in the solvent mixture, with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). An accurately weighed quantity of *trazodone hydrochloride IPRS* containing 0.0005 per cent w/v solution of trazodone in the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.00007 per cent w/v of *trazodone hydrochloride IPRS* and 0.00015 per cent w/v of *trazodone related compound C IPRS* in the solvent mixture.

[5]1,1-Bis{2-chloro-[4-(3-{1,2,4,-triazolo[4,3-a]pyridin-3-(2*H*)-on-2-yl}propyl)piperazine-1-yl]phenyl}ethane trihydrochloride,

[6]1-(3-chlorophenyl)-4-(3-chloropropyl)piperazine,

[7]1,3-Bis(4-(3-chlorophenyl)piperazin-1-yl)propane,

[8]1,4-bis(3-chlorophenyl)piperazine.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to trazodone related compound C and trazodone is not less than 2.5 in the chromatogram obtained with reference solution (b), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 20 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Dissolution with the following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Trazodone Hydrochloride in *0.01M hydrochloric acid*, with the aid of ultrasound for 30 minutes and dilute to 50.0 ml with *0.01 M hydrochloric acid*. Dilute 5.0 ml of the solution to 50.0 ml with *0.01M hydrochloric acid*.

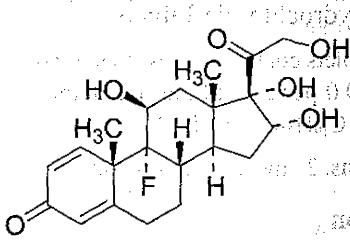
Reference solution. A 0.01 per cent w/v solution of *trazodone hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{22}ClN_5O$, HCl in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Triamcinolone



$C_{21}H_{27}FO_6$ Mol. Wt. 394.4

Triamcinolone is 9α-fluoro-11β,16α,17α,21-tetrahydroxypregna-1,4-diene-3,20-dione.

Triamcinolone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{21}H_{27}FO_6$, calculated on the dried basis.

https://nhathuocngocanh.com/

Category. Corticosteroid.

Description. A white or almost white, crystalline powder; slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triamcinolone IPRS* or with the reference spectrum of triamcinolone.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows an absorption maximum at about 238 nm; absorbance at about 238 nm, about 0.76.

C. Dissolve 1 mg in 6 ml of *ethanol (95 per cent)*, add 5 ml of a 1 per cent w/v solution of *butylated hydroxytoluene* in *ethanol (95 per cent)* and 5 ml of *1 M sodium hydroxide* and heat on a water-bath under a reflux condenser for 20 minutes; a pinkish lavender colour is produced.

Tests

Specific optical rotation (2.4.22). +65.0° to +72.0°, determined in a 1.0 per cent w/v solution in *dimethylformamide*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the following solutions immediately before use and protect from light.

Test solution. Dissolve 25 mg of the substance under examination in a mixture of equal volumes of *methanol* and *water* and dilute to 10 ml with the same solvent mixture.

Reference solution. Dilute 1 ml of the test solution to 100 ml with a mixture of equal volumes of *methanol* and *water*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with base-deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture prepared by mixing 525 ml of *methanol* with 400 ml of *water*, allowing to equilibrate, adjusting the volume to 1000.0 ml with *water* and mixing again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. Run the chromatogram 4.5 times the retention time of triamcinolone (about 11 minutes). In the chromatogram obtained with the test solution the area of any peak other than the principal peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent); not more than two such peaks have an area more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent); the sum of the areas of all the peaks other than the principal peak is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 0.8 g complies with the limit test for heavy metals, Method B (25 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Dissolve 25 mg in sufficient *ethanol (95 per cent)* to produce 100.0 ml and mix. Dilute 2.0 ml to 50.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{21}H_{27}FO_6$ taking 389 as the specific absorbance at 238 nm.

Storage. Store protected from light and moisture.

Triamcinolone Tablets

Triamcinolone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of triamcinolone, $C_{21}H_{27}FO_6$.

Usual strengths. 2 mg; 4 mg; 8 mg.

Identification

A. Dissolve 1 mg of the residue obtained in the test for Related substances in 6 ml of *ethanol (95 per cent)*, add 5 ml of a 1 per cent w/v solution of *butylated hydroxytoluene* in *ethanol (95 per cent)* and 5 ml of *1 M sodium hydroxide* and heat on a water-bath under a reflux condenser for 20 minutes; a pinkish lavender colour is produced.

B. In the Assay, the chromatogram obtained with the principal peak obtained with the test solution corresponds to the peak due to triamcinolone in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.01 M hydrochloric acid,*

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with

https://nhathuocngocanh.com/

the medium, at the maximum at about 238 nm (2.4.7). Calculate the content of $C_{21}H_{27}FO_6$ in the medium from the absorbance obtained from a solution of known concentration of *triamcinolone IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{27}FO_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 15 mg of Triamcinolone with 15 ml of *ethanol* for 15 minutes, filter under reduced pressure through a fine filter paper (such as Whatman No 42) and evaporate the filtrate to dryness using a rotary evaporator. Reserve 1 mg of the residue for Identification test A. Dissolve the remainder of the residue in 15 ml of *methanol*.

Reference solution (a). Dilute 4 ml of the test solution to 100 ml with *methanol*.

Reference solution (b). Dilute 5 ml of the test solution to 50 ml with *methanol*. Dilute 5 ml of the resulting solution to 50 ml with the same solvent.

Chromatographic system

- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of *methanol* and *water*, adjusted so that the retention time of triamcinolone is about 5 minutes (approximately equal volumes of *methanol* and *water*),
- flow rate: 2 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency determined from the principal peak is not less than 2000 theoretical plates.

Inject reference solution (b). Run the chromatogram 4 times the retention time of the triamcinolone peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such peak has an area more than that of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of any such peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet to a fine powder, add 100 ml of *ethanol (95 per cent)* and shake for 10 minutes. Filter, dilute 2.0 ml of the filtrate with sufficient *ethanol (95 per cent)* to produce a solution containing 0.002 per cent w/v of Triamcinolone and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{21}H_{27}FO_6$ in the tablet taking 389 as the specific absorbance at 238 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.06 per cent w/v solution of *testosterone* in *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 2.5 mg of Triamcinolone in 5.0 ml of internal standard solution and dilute to 25.0 ml with 50 per cent v/v of *methanol*. Shake for 15 minutes, mix with the aid of ultrasound for 10 minutes, centrifuge and use the supernatant liquid.

Reference solution. Add 5.0 ml of internal standard solution to 5.0 ml of a 0.05 per cent w/v solution of *triamcinolone IPRS* in *methanol* and dilute to 25.0 ml with 50 per cent v/v of *methanol*.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 70 volumes of *methanol*, 30 volumes of *water* and 0.1 volume of *glacial acetic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

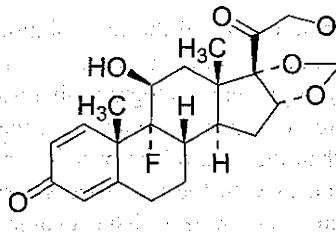
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of peak area ratio due to triamcinolone and internal standard for the replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{27}FO_6$ in the tablets, using peak area ratio of triamcinolone and internal standard.

Storage. Store protected from moisture.

Triamcinolone Acetonide



$C_{24}H_{31}FO_6$ Mol. Wt. 434.5

https://nhathuocngocanh.com/

Triamcinolone Acetonide is 9α-fluoro-11β,21-dihydroxy-16α,17α-isopropylidenedioxy-1,4-pregnadiene-3,20-dione.

Triamcinolone Acetonide contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{24}H_{31}FO_6$, calculated on the anhydrous basis.

Category. Corticosteroid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triamcinolone acetonide IPRS.*

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide.*

Mobile phase. A mixture of 115 volumes of *cyclohexane*, 56 volumes of *chloroform* and 29 volumes of *toluene.*

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *triamcinolone acetonide IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v).* Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Heat 0.5 ml of *chromic-sulphuric acid* in a test-tube (5 cm × about 6 mm) in a naked flame until white fumes are evolved; the solution wets the sides of the tube readily and there is no greasiness. Add about 2 mg of the substance under examination and again heat in a naked flame until white fumes appear; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

Light absorption (2.4.7). When examined in the range 230 nm to 360 nm, a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 239 nm; absorbance at about 239 nm, 0.34 to 0.37.

Specific optical rotation (2,4,22). + 100° to + 107°, determined in a 1.0 per cent w/v solution in *dioxan.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE – Carry out the test protected from light.

Test solution. Dissolve 25 mg of the substance under examination in 7 ml of *methanol* and dilute to 10 ml with *water.*

Reference solution (a). Dissolve 2 mg of *triamcinolone acetonide IPRS* and 2 mg of *triamcinolone* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Chromatographic system

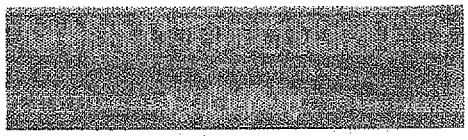
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture prepared by mixing 525 ml of *methanol* with 400 ml of *water*, allowing to equilibrate, adjusting the volume to 1000.0 ml with *water* and mixing again,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 10 minutes.

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are; triamcinolone, about 5 minutes and triamcinolone acetonide about 17 minutes. The test is not valid unless the resolution between the peaks corresponding to triamcinolone and triamcinolone acetonide is at least 15; if necessary, adjust the concentration of *methanol* in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography for 3.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution the area of any peak other than the principal peak is not more than 0.25 times the area of the principal peak in the



https://nhathuocngocanh.com/

chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks other than the principal peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.2 g.

Assay. Dissolve 25 mg in sufficient *ethanol* to produce 100.0 ml and mix. Dilute 5.0 ml to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 239 nm (2.4.7).

Calculate the content of $C_{24}H_{31}FO_6$ taking 354 as the specific absorbance at 239 nm.

Storage. Store protected from light and moisture.

Triamcinolone Acetonide Injection

Triamcinolone Acetonide Injection is a sterile suspension of Triamcinolone Acetonide in very fine particles in Water for Injections containing suitable dispersing agents.

Triamcinolone Acetonide Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of triamcinolone acetonide, $C_{24}H_{31}FO_6$.

Usual strength. 40 mg per ml.

Identification

Extract a volume containing about 50 mg of Triamcinolone Acetonide with two quantities, each of 10 ml, of *peroxide-free ether* and discard the ether extracts. Filter the aqueous layer through a sintered-glass filter, wash the residue with four quantities, each of 5 ml *of water* and dry at 105° for 1 hour. The residue complies with the following tests.

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triamcinolone acetonide IPRS* or with the reference spectrum of triamcinolone acetonide.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 115 volumes of *cyclohexane*, 56 volumes of *chloroform* and 29 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *triamcinolone acetonide IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Heat 0.5 ml of *chromic-sulphuric acid* in a test-tube (5 cm × about 6 mm) in a naked flame until white fumes are evolved; the solution wets the sides of the tube readily and there is no greasiness. Add about 2 mg of the substance under examination and again heat in a naked flame until white fumes appear; the solution does not wet the sides of the tube and does not pour easily from the tube.

Tests

pH (2.4.24). 5.0 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 4.4 Endotoxin Units per mg of triamcinolone acetonide.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake and mix contents of 10 containers. Dissolve a volume of the freshly mixed injection with 0.01 per cent w/v solution of prednisolone in *methanol* (internal standard) to obtain a final concentration of 0.02 per cent w/v of triamcinolone acetonide, shake and filter.

Reference solution (a). A solution containing 0.02 per cent w/v of *triamcinolone acetonide IPRS* in internal standard.

Reference solution (b). Prepare in the same manner as test solution but omitting the internal standard.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 56 volumes of *methanol* and 44 volumes of *water*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b) for identification of peak due to triamcinolone acetonide.

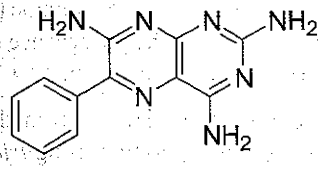
Inject reference solution (a). Adjust the flow rate of the mobile phase such that the separation of the triamcinolone acetonide and internal standard is optimised with a retention time of about 15 minutes for triamcinolone acetonide.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{31}FO_6$ in the injection.

Storage. Store protected from light.

Triamterene



$C_{12}H_{11}N_7$ Mol. Wt. 253.3

Triamterene is 2,4,7-triamino-6-phenylpteridine.

Triamterene contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{11}N_7$, calculated on the dried basis.

Category. Potassium sparing diuretic.

Description. A yellow, crystalline powder.

Identification

A. When examined in the range 250 nm to 380 nm (2.4.6), a 0.001 per cent w/v solution in a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *1 M hydrochloric acid* shows absorption maxima at about 262 nm and 360 nm, and a shoulder at about 285 nm.

B. A 0.1 per cent w/v solution in *anhydrous formic acid*, when examined under ultraviolet light at 365 nm shows an intense blue fluorescence. Solutions in other acids also exhibit a blue fluorescence.

Tests

Acidity. Boil 1.0 g with 20 ml of *water* for 5 minutes, cool, filter and wash the filter with three quantities, each of 10 ml, of *water*. Combine the filtrate and washings and add 0.3 ml of *phenolphthalein solution*. Not more than 1.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *nitrosotriaminopyrimidine IPRS (triamterene impurity A IPRS)* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve a suitable quantity of *2,7-diamino-6-phenylpteridin-4-ol IPRS (triamterene impurity B IPRS)* in 0.5 ml of the mobile phase with the aid of ultrasound. To this solution, add 0.5 ml of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.2 volume of *butylamine*, 20 volumes of *acetonitrile*, 20 volumes of *methanol* and 60 volumes of *water*, adjusted to pH 5.3 with *acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 320 nm and 355 nm,
- injection volume: 50 µl.

The relative retention time with reference to triamterene for triamterene impurity A is about 0.6, for triamterene impurity B is about 0.8 and for triamterene impurity C is about 1.7.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to triamterene impurity B and triamterene at 355 nm is not less than 1.5 in the chromatogram obtained with reference solution (c) if necessary, increase the quantity of water in the mobile phase and signal-to- noise ratio for the principal peak in the chromatogram obtained with reference solution (b) at 320 nm is not less than 10. Calculate the contents of the impurities in the test solution using the correction factors, 1.8 for triamterene impurity B and 1.5 for triamterene impurity C.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to triamterene impurity A at 320 nm is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (50 ppm). The area of any peak corresponding to triamterene impurities

https://nhathuocngocanh.com/

B and C at 355 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak at 355 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks at 355 nm is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak at 355 nm with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.15 g in 5 ml of *anhydrous formic acid*, add 100 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02533 g of $C_{12}H_{11}N_7$.

Storage. Store protected from light and moisture.

Triamterene Capsules

Triamterene Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of triamterene, $C_{12}H_{11}N_7$.

Usual strength. 50 mg.

Identification

The final solution obtained in the Assay has a bluish fluorescence and when examined in the range 250 nm to 380 nm (2.4.7), shows an absorption maximum at about 360 nm.

Tests

Dissolution (2.5.2),

Apparatus No. 2 (Paddle),

Medium. 900 ml of 1 per cent w/v solution of *polysorbate 20* in *0.1 M acetic acid*,

Speed and time. 100 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 357 nm (2.4.7). Calculate the content of $C_{12}H_{11}N_7$ in the medium from the absorbance obtained from a solution of known concentration of *triamterene IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{12}H_{11}N_7$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *ethyl acetate*, 10 volumes of *18 M ammonia* and 10 volumes of *methanol*.

Test solution. Dissolve a quantity of the contents of the capsules containing 0.1 g of Triamterene in sufficient *dimethyl sulphoxide* to produce 20 ml and dilute 2 ml to 50 ml with *methanol*.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the contents of 20 capsules containing about 0.1 g of Triamterene, dissolve in 50 ml of a mixture of equal volumes of *glacial acetic acid* and *water* with the aid of gentle heat, cool and add sufficient *water* to produce 500.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with *1 M acetic acid* and measure the absorbance of the resulting solution at the maximum at about 360 nm (2.4.7).

Calculate the content of $C_{12}H_{11}N_7$ from the absorbance obtained by repeating the operation using *triamterene IPRS* in place of the contents of the capsules.

Storage. Store protected from moisture.

Triamterene and Hydrochlorothiazide Tablets

Triamterene and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of triamterene, $C_{12}H_{11}N_7$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. Triamterene, 50 mg and Hydrochlorothiazide, 25 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

https://nhathuocngocanh.com/

Medium: 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *triamterene IPRS* and *hydrochlorothiazide IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 6.9 g of *sodium dihydrogen phosphate* and 1.43 g of *propylamine hydrochloride* in 1000 ml of *water*, adjusted to pH 5.5 with *1M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

The relative retention times with reference to triamterene for hydrochlorothiazide is about 0.65.

Inject the reference solution. The test is not valid unless the resolution between the hydrochlorothiazide and triamterene peaks is not less than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{11}N_7$ and $C_7H_8ClN_3O_4S_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{12}H_{11}N_7$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. A buffer solution prepared by dissolving 6.8 g of *sodium acetate trihydrate* in 1000 ml of *water*, adjusted to pH 5.0 with *glacial acetic acid*.

Solvent mixture B. 75 volumes of *acetonitrile* and 25 volumes of *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 150 mg of Hydrochlorothiazide in 60 ml of *acetonitrile* and 6 ml of *glacial acetic acid*, with the aid of ultrasound for 10 minutes. Cool and dilute to 100.0 ml with *water*.

Reference solution. A 0.015 per cent w/v solution of *benzothiadiazine related compound A (4-Amino-6-chloro-1,3-benzenedisulphonamide) IPRS* in *acetonitrile*. Transfer 10.0 ml of the solution to 100-ml volumetric flask, add 50 ml of *acetonitrile* and 6 ml of *glacial acetic acid* and dilute with *water* to volume.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 10 volumes of solvent mixture B and 90 volumes of solvent mixture A,
- flow rate: 2 ml per minute,
- spectrophotometer set 273 nm,
- injection volume: 10 µl.

The relative retention times with reference to benzothiadiazine related compound A for hydrochlorothiazide and triamterene are 1.5 and 10, respectively.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area any peak corresponding to benzothiadiazine related compound A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *acetonitrile*, 3.5 volumes of *glacial acetic acid* and 65 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 250 mg of hydrochlorothiazide in the solvent mixture, with the aid of ultrasound for 30 minutes and dilute to 500.0 ml with the solvent mixture and filter. Dilute 3.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.3 per cent w/v of *triamterene IPRS* and 0.15 per cent w/v of *hydrochlorothiazide IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.225 per cent w/v of *triamterene IPRS*, 0.15 per cent w/v of *hydrochlorothiazide IPRS* and 0.00075 per cent w/v of *benzothiadiazine related compound A IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 0.82 g of *sodium acetate*

https://nhathuocngocanh.com/

anhydrous in 1000 ml of *water*, adjusted to pH 4.5 with *glacial acetic acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 20 µl.

The relative retention time with reference to hydrochlorothiazide for benzothiadiazine related compound A, is about 0.93.

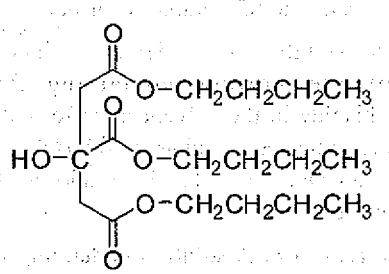
Inject reference solution (a) and reference solution (b). The test is not valid unless the resolution between the peaks due to hydrochlorothiazide and benzothiadiazine related compound A is not less than 1.5 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of hydrochlorothiazide peak.

Calculate the content of $C_{12}H_{11}N_7$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Tributyl Citrate



$C_{18}H_{32}O_7$ Mol. Wt. 360.5

Tributyl Citrate contains not less than 99.0 per cent of $C_{18}H_{32}O_7$, calculated on the anhydrous basis.

Category. Excipient.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tributyl citrate IPRS* or with the reference spectrum of tributyl citrate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Weight per ml (2.4.29). 1.037 to 1.045.

Refractive index (2.4.27). 1.443 to 1.445.

Acidity. Dissolve 32.0 g in 30 ml of *ethanol (95 per cent)*, previously neutralised to *bromothymol blue*, add *bromothymol blue solution* and titrate with *0.1 M sodium hydroxide* to a faint blue endpoint; not more than 1.0 ml is required.

Water (2.3.43). Not more than 0.2 per cent.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve about 300 mg of substance under examination in 10 ml of *toluene*.

Reference solution. A solution containing 3.0 per cent w/v of *tributyl citrate IPRS* and *acetyltributyl citrate IPRS* in *toluene*.

Chromatographic system
- a glass or stainless steel column 30 m x 0.32 mm, packed with bonded with a 0.5-µm layer of phase G42,
- temperature:
  column. 80° to 220° from 0.5 to 10 minutes,
  inlet port. 85° to 250° from 0.5 to 10 minutes (increased @ 20° per minute) and detector 275°,
- a flame ionisation detector,
- flow rate: 2.3 ml per minute of the nitrogen as the carrier gas.

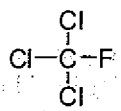
Inject 1 µl of the reference solution. The test is not valid unless the relative retention times with reference to acetyltributyl citrate for tributyl citrate is about 0.9, the resolution between the peaks corresponding to tributyl citrate and acetyltributyl citrate is not less than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject 1 µl of the reference solution and the test solution.

Calculate the content $C_{18}H_{32}O_7$.

Storage. Store protected from moisture.

Trichloromonofluoromethane



CCl_3F Mol. Wt. 137.4

Trichloromonofluoromethane contains not less than 99.6 per cent and not more than 100.0 per cent of CCl_3F, calculated on the anhydrous basis.

https://nhathuocngocanh.com/

Category. Pharmaceutical aid (Excipient).

Identification

Determine by infrared absorption spectrophotometry (2.4.6), compare the spectrum with the obtained with *trichloromonofluromethane IPRS* or with the reference spectrum of trichloromonofluromethane.

Tests

Boiling temperature. Transfer a 100 ml sample at about 24° to a tared, pear-shaped, 100-ml centrifuge tube containing a few boiling stones, and weigh. Suspend a thermometer in the liquid, and place the tube in a medium maintained at a temperature of 32° above the expected boiling temperature. When the thermometer reading becomes constant, record as the boiling temperature the thermometer reading after at least 5per cent of the substance under examination has distilled. Retain the remainder of the substance for the determination of High-Boiling Residues.

Water (2.3.43). Not more than 0.001 per cent (Method 3) with the following modifications (a) provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas dispersion tube connected to a sample cylinder; (b) dilute the reagent with anhydrous methanol to give a water equivalence factor of between 0.2 and 1.0 mg per ml, age this diluted solution for not less than 16 hours before sanitation; (c) obtain a 100 g sample as directed under inhalation preparation, and introduce the same into the titration vessel through the gas dispersion tube at a rate of about 100 ml of gas per minute.

High-boiling residues. Not more than 0.01 per cent, Allow 85 ml of the sample to distill as directed in the test for Approximate Boiling Temperature, and transfer the centrifuge tube containing the remaining 15 ml of substance to a medium maintained at a temperature 10° above the boiling temperature. After 30 minutes, remove the tube from the water-bath, blot dry, and weigh. Calculate the weight of the residue.

Inorganic chlorides. Place 5 ml of anhydrous *methanol* in a test tube, add 3 drops of a saturated solution of silver nitrate in anhydrous *methanol*, shake, and add 7 g of Trichloromono-fluoromethane; no opalescence or turbidity is produced.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Introduce the liquid phase of Trichloromono-fluoromethane into an evacuated headspace vial

Reference solution. Introduce a liquid-phase mixture of dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane into an evacuated headspace vial.

Chromatographic system
- a steel column 1.8 m x 2 mm, packed with support S12, containing 1 per cent phase G25,
- temperature:
  column 70° to 170° @10° per minute and 170° for 5 minutes,
  inlet port at 110° and detector at 200°,
- a flame ionisation detector,
- flow rate: 20 ml per minute of the nitrogen as carrier gas

Head-space conditions which may be used:
- bath temperature 100°,
- valve/loop temperature 105°,
- sampling time is 3 seconds.

The relative retention time with reference to trichloromonofluoromethane for dichlorodifluoromethane is about 0.5 and for dichlorotetrafluoroethane is about 0.8.

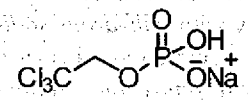
Inject the reference solution. The sum of these two peak areas is not more than 0.2 per cent of the total of all peak areas and the sum of the areas of all peaks other than that for trichloromonofluoromethane is not more than 0.4 per cent of the total of all peak areas.

Inject the reference solution and the test solution. The test is not valid unless the resolution between the peaks due dichlorotetrafluoroethane and trichloromonofluoromethane is not less than 2.0.

Calculate the content of CCl_3F.

Storage. Store protected from moisture and prevent exposure to excessive heat.

Triclofos Sodium



$C_2H_3Cl_3NaO_4P$ Mol. Wt. 251.4

Triclofos Sodium is sodium 2,2,2-trichloroethyl hydrogen orthophosphate.

Triclofos Sodium contains not less than 41.3 per cent and not more than 43.2 per cent of Cl and not less than 97.0 per cent and not more than 102.0 per cent of $C_2H_3Cl_3NaO_4P$, both calculated on the dried basis.

Category. Hypnotic.

Description. A white or almost white powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triclofos sodium IPRS* or with the reference spectrum of triclofos sodium.

B. It gives the reactions of sodium salts (2.3.1).

https://nhathuocngocanh.com/

C. Heat 0.1 g with 1 g of *anhydrous sodium carbonate* to a dull red heat and maintain for 10 minutes, cool, extract the residue with *water* and filter. The filtrate gives the reactions of chlorides (2.3.1) and of phosphates (2.3.1).

Tests

pH (2.4.24). 3.0 to 4.5, determined on a 2.0 per cent w/v solution.

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1).

Chlorides (2.3.12). Dissolve 0.5 g in 50 ml of *water*. 15 ml of the solution complies with the limit test for chlorides (0.17 per cent).

Phosphates. Not more than 1.0 per cent, calculated as PO_4, when determined by dissolving 25 mg in 10 ml of *water*, add 4 ml of *1 M sulphuric acid*, 1 ml of *ammonium molybdate solution* and 2 ml of *methylaminophenol-sulphite reagent* and allow to stand for 15 minutes and dilute to 25 ml with *water*, allow to stand for a further 15 minutes and measure the absorbance of the solution at 730 nm (2.4.7). Calculate the content of phosphate from a calibration curve prepared by treating suitable volumes of a 0.00143 per cent w/v solution of *potassium dihydrogen orthophosphate* in the same manner.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1 g by drying at 100°, at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *For Cl* — Mix 0.25 g with 1 g of *anhydrous sodium carbonate* in a nickel crucible about 3 cm in diameter, fill the crucible completely with *anhydrous sodium carbonate* and invert into a nickel crucible about 4 cm in diameter; cover the smaller crucible with *anhydrous sodium carbonate*, well pressed down, using 25 g of *anhydrous sodium carbonate* in all. Heat for 30 minutes at a dull red heat, cool, transfer to a 400 ml beaker, add 150 ml of *water* and boil gently for 10 minutes. Filter through absorbent cotton into a 600 ml beaker, washing the residue with hot *water*, until 400 ml of filtrate has been collected. Cool, cautiously add *nitric acid* until the solution is neutral to *litmus paper* and add 3 ml of *nitric acid* in excess. Add 50 ml of *0.1 M silver nitrate*, allow to stand until precipitation is complete, filter, wash the precipitate with *water* and titrate the combined filtrate and washings with *0.1 M ammonium thiocyanate* using *ammonium iron(III) sulphate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

For $C_2H_3Cl_3NaO_4P$ — Heat 0.2 g in a Kjeldahl flask with 2 ml of *sulphuric acid* and 2.5 ml of *nitric acid* until brown fumes cease to be evolved, cool, add 1 ml of *nitric acid* and heat again. Continue adding *nitric acid* and heating until brown fumes are no longer evolved and the solution is colourless when cold. Heat until dense, white fumes are evolved, cool, transfer the solution to a flask with the aid of 150 ml of *water*, add 50 ml of *citric-molybdic acid solution* and heat slowly to boiling. Swirling the flask continuously, add 25 ml of *quinoline solution* at first drop wise and then in a steady stream, heat on a water-bath for 5 minutes and cool. Filter, wash the precipitate with *water* until free from acid, transfer the precipitate to a flask with the aid of 100 ml of *water*, add 50 ml of *0.5 M sodium hydroxide* and shake until dissolved. Titrate the excess of alkali with *0.5 M hydrochloric acid* using *phenolphthalein-thymol blue solution* as indicator.

1 ml of *0.5 M sodium hydroxide* is equivalent to 4.835 mg of $C_2H_3Cl_3NaO_4P$. Correct the result for the content of phosphate, as determined by the test described above; 1 mg of PO_4 is equivalent to 2.65 mg of $C_2H_3Cl_3NaO_4P$.

Triclofos Oral Solution

Triclofos Oral Solution is a solution of Triclofos Sodium in a suitable flavoured vehicle.

Triclofos Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of $C_2H_3Cl_3NaO_4P$.

Identification

Disperse a quantity of the oral solution containing 0.25 g of Triclofos Sodium with 40 ml of *water*, add 5 ml of *1 M sulphuric acid* and extract with 25 ml of *isoamyl alcohol*. The extract complies with the following tests.

A. Evaporate 5 ml to dryness, heat the residue with 1 ml of a 50 per cent v/v solution of *sulphuric acid* and 1 ml of a 5.0 per cent w/v solution of *potassium permanganate* in a water-bath for 5 minutes, add 7 ml of *water* and decolourise the solution with 1 ml of a 5.0 per cent w/v solution of *oxalic acid*. To 1 ml, add 1 ml of *pyridine* and 1 ml of *2 M sodium hydroxide*, heat in a water-bath for 1 minute, stirring continuously; a pink colour is produced in the pyridine layer.

B. Evaporate 10 ml to dryness, heat the residue with 1 g of *anhydrous sodium carbonate* at a dull red heat for 10 minutes, cool, extract the residue with *water* and filter. The residue gives the reactions of chlorides (2.3.1) and of phosphates (2.3.1).

Tests

Other tests. Comply with the tests stated under Oral Liquids.

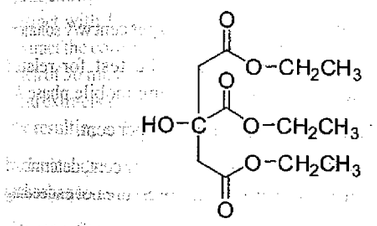
Assay. To a quantity containing 16 mg of Triclofos Sodium, add 15 ml of *water*, 1 ml of *1 M sodium hydroxide* and 15 ml of *ether*, shake for 1 minute, allow to separate, wash the ether layer with 1 ml of *water* and discard the ether solution. Add

2.5 ml of *1 M sulphuric acid* to the combined aqueous layer and washings, extract with four 10-ml quantities of *isoamyl alcohol*, allowing each extract to stand until good separation is achieved, combine the isoamyl alcohol extracts, remove any further water that separates and dilute to 50 ml with *isoamyl alcohol*. Transfer 10 ml of the solution to a 20 ml glass ampoule, add 10 ml of *alcoholic potassium hydroxide solution*, seal the ampoule, mix well and heat in an autoclave at 120° for 2 hours. Allow the ampoule to cool, transfer the contents to a flask with the aid of 20 ml of *2 M nitric acid* and add 25 ml of *0.02 M silver nitrate*. Titrate with *0.02 M ammonium thiocyanate* using *ammonium iron(III) sulphate solution* as indicator. Repeat the titration using 10 ml of *alcoholic potassium hydroxide solution* in place of the contents of the ampoule. The difference between the titrations represents the amount of silver nitrate required.

1 ml of *0.02 M silver nitrate* is equivalent to 1.676 mg of $C_2H_3Cl_3NaO_4P$.

Determine the weight per ml of the oral solution (2.4.29) and calculate the content of $C_2H_3Cl_3NaO_4P$.

Triethyl Citrate



$C_{12}H_{20}O_7$ Mol. Wt. 276.3

Triethyl Citrate is triethyl 2-hydroxypropane-1, 2, 3-tricarboxylate.

Triethyl Citrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{12}H_{20}O_7$, calculated on the anhydrous basis.

Category. Excipient.

Description. A clear, viscous, colourless or almost colourless, hygroscopic liquid.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triethyl citrate IPRS* or with the reference spectrum of triethyl citrate.

B. To 0.5 ml add 5 ml of *ethanol (95 per cent)* and 4 ml of *dilute sodium hydroxide solution*. Boil under reflux for about 10 minutes, 2 ml of the solution gives the reactions of citrates (2.3.1).

C. It gives the reactions of esters (2.3.1).

Tests

Appearance of solution. The substance under examination is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. Dilute 10 g with 10 ml of previously neutralized *ethanol (95 per cent)*. Add 0.5 ml of *bromothymol blue solution*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the color of the indicator to blue.

Refractive index (2.4.27). 1.440 to 1.446.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Disperse 1.0 ml of the substance under examination in 50.0 ml of *dichloromethane*.

Reference solution. Disperse 1.0 ml of the substance under examination and 0.5 ml of *methyl tridecanoate* in 50.0 ml of *dichloromethane*.

Chromatographic system
- a fused silica column 30 m x 0.32 mm, packed with poly (dimethyl) siloxane (5 µm),
- temperature:
  column 200°,
  injection port and detector at 220°,
- a flame ionization detector,
- linear velocity about 26 cm per second using nitrogen as carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to triethyl citrate and methyl tridecanoate is not less than 1.5.

Inject 1 µl each of the test solution and the reference solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 per cent the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all the secondary peaks is not more than 0.5 per cent the area of the principal peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than 0.04 per cent the area of the principal peak in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). Dissolve 4.0 g in 8 ml of *ethanol (95 per cent)* and dilute to 20 ml with *water*. 12 ml of the resulting solution complies with the limit test for the heavy metals,

https://nhathuocngocanh.com/

method D (5 ppm). Prepare the standard solution using *lead standard solution (1 ppm Pb)* obtained by diluting *lead standard solution (100 ppm Pb)* with a mixture of equal volumes of *ethanol (95 per cent)* and *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

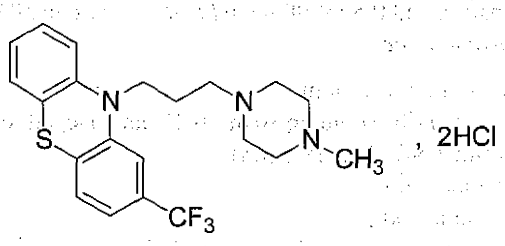
Water (2.3.43). Not more than 0.25 per cent, determined on 1.0 g.

Assay. To 1.5 g, add 25 ml of *2-propanol*, 50 ml of *water*, 25.0 ml of *1 M sodium hydroxide* and a few glass beads into a 250-ml borosilicate-glass flask fitted with a reflux condenser. Heat under a reflux condenser for 1 hour and allow to cool. Titrate with *1 M hydrochloric acid*, using 1 ml of *phenolphthalein solution* as indicator. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.0921 g of $C_{12}H_{20}O_7$.

Storage. Store protected from moisture.

Trifluoperazine Hydrochloride



, 2HCl

$C_{21}H_{24}F_3N_3S,2HCl$ Mol. Wt. 480.4

Trifluoperazine hydrochloride is 10-[3-(4-methylpiperazin-1-yl)propyl]-2-trifluoromethylphenothiazine dihydrochloride.

Trifluoperazine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{24}F_3N_3S$, 2HCl, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Description. A white to pale yellow, crystalline powder; slightly hygroscopic.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

A. Dissolve 20 mg in 10 ml of *water*, make the solution alkaline to *litmus paper* with *5 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *light petroleum (60° to 80°)*. Combine the extracts, wash with 10 ml of *water*, shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate carefully to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trifluoperazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of trifluoperazine.

B. Complies with the test for identification of phenothiazines (2.3.3), using as reference solution a 0.2 per cent w/v solution of *trifluoperazine hydrochloride IPRS* in *chloroform*.

C. When examined in the range 280 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.1 M hydrochloric acid* measured immediately after preparation shows an absorption maximum at about 305 nm. Dilute 10 ml of the solution to 100 ml with *0.1 M hydrochloric acid*. When examined in the range 230 nm to 280 nm, the resulting solution shows an absorption maximum at about 256 nm; absorbance at about 256 nm, about 0.65.

D. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; an orange colour is produced.

E. A 10 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 1.7 to 2.6, determined in a 10.0 per cent w/v solution.

Related substances. Complies with the test for related substances in phenothiazines (2.3.5), using mobile phase A.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.4 g in 50 ml of *anhydrous glacial acetic acid* add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02402 g of $C_{21}H_{24}F_3N_3S$, 2HCl.

Storage. Store protected from light and moisture.

Trifluoperazine Injection

Trifluoperazine Hydrochloride Injection

Trifluoperazine Injection is a sterile solution of Trifluoperazine Hydrochloride in Water for Injections.

Trifluoperazine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of trifluoperazine, $C_{21}H_{24}F_3N_3S$.

https://nhathuocngocanh.com/

Usual strength. The equivalent of 1 mg of trifluoperazine per ml.

Description. A clear, colourless solution.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in Assay shows an absorption maximum at about 256 nm.

Tests

pH (2.4.24). 4.0 to 5.0.

Bacterial endotoxins (2.2.3). Not more than 172.0 Endotoxin Units per mg of trifluoperazine.

Other tests. Comply with the tests stated under Parenteral preparations (Injections).

Assay. To an measured volume of the injection containing about 50 mg of trifluoperazine add 10 ml of *2 M sulphuric acid* and extract with three quantities, each of 25 ml, of *carbon tetrachloride*. Discard the carbon tetrachloride extract after each extraction. Add 10 ml of *strong ammonia solution* and extract with five quantities, each of 50 ml, of *cyclohexane*. Extract the combined cyclohexane extracts with five quantities, each of 50 ml, of *0.1 M hydrochloric acid*. Dilute the combined acid extracts to 500.0 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 256 nm (2.4.7).

Calculate the content of $C_{21}H_{24}F_3N_3S$ taking 743 as the specific absorbance at 256 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of trifluoperazine per ml.

Trifluoperazine Tablets

Trifluoperazine Hydrochloride Tablets

Trifluoperazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of trifluoperazine, $C_{21}H_{24}F_3N_3S$. The tablets are coated.

Usual strengths. The equivalent of 1 mg and 5 mg of trifluoperazine.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of trifluoperazine with 30 ml of *1 M hydrochloric acid* for 10 minutes, filter, make the filtrate alkaline to litmus paper with *5 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *light petroleum (60° to 80°)*. Combine the extracts, wash with 10 ml of *water*, shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate carefully to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trifluoperazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of trifluoperazine.

B. Extract a quantity of the powdered tablets containing 5 mg of trifluoperazine with 5 ml of *acetone*, filter and evaporate the filtrate to dryness. Add 2 ml of *sulphuric acid* to the residue and allow to stand for 5 minutes; an orange colour is produced.

Tests

Dissolution (2.5.2).

Apparatis No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm, 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 255 nm and at about 278 nm (2.4.7). Calculate the content of $C_{21}H_{24}F_3N_3S$ in the medium from the difference in absorbance at 255 nm and at 278 nm, obtained from a solution of known concentration of *trifluoperazine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{24}F_3N_3S$.

Uniformity of content. Complies with the test stated under Tablets.

Place one tablet in a 100-ml volumetric flask, add 50 ml of a mixture of 19 volumes of *water* and 1 volume of *hydrochloric acid*, shake until the tablet has completely disintegrated, dilute to volume with the same mixture, mix and filter, rejecting the first few ml of the filtrate. Dilute suitably, if necessary with the same solvent mixture and measure the absorbance of the resulting solution at the maximum at about 256 nm (2.4.7). Calculate the content of $C_{21}H_{24}F_3N_3S$ taking 743 as the specific absorbance at 256 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 5 mg of trifluoperazine, shake for 15 minutes with 400 ml of a mixture of 19 volumes of *water* and

https://nhathuocngocanh.com/

1 volume of *hydrochloric acid*, dilute to 500.0 ml with the same solvent mixture, mix and filter. Measure the absorbance of the filtrate at the maximum at about 256 nm (2.4.7).

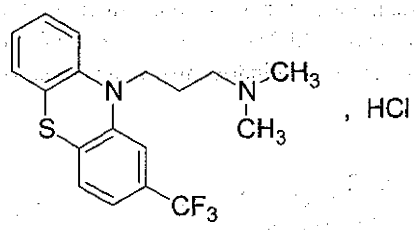
Calculate the content of $C_{21}H_{24}F_3N_3S$ taking 743 as the specific absorbance at 256 nm.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of trifluoperazine.

Triflupromazine Hydrochloride

Flupromazine Hydrochloride



$C_{18}H_{19}F_3N_2S, HCl$ Mol. Wt. 388.9

Triflupromazine Hydrochloride is 10-[3-(dimethylamino)-propyl)]-2-trifluoromethylphenothiazine hydrochloride.

Triflupromazine Hydrochloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{18}H_{19}F_3N_2S$, HCl, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Description. A white to pale yellowish brown, crystalline powder.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

A. Dissolve 20 mg in 10 ml of *water*, make the solution alkaline to *litmus paper* with *5 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *light petroleum (60° to 80°)*. Combine the extracts, wash with 10 ml of *water*, shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate carefully to dryness.

The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triflupromazine hydrochloride IPRS*, treated in the same manner or with the reference spectrum of triflupromazine hydrochloride.

B. Complies with the test for identification of phenothiazines (2.3.3), using as reference solution a 0.2 per cent w/v solution of *triflupromazine hydrochloride IPRS* in *chloroform*.

C. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 256 nm and a less well-defined maximum at about 305 nm.

D. A 10 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Related substances. Complies with the test for Related substances in phenothiazines (2.3.3), using *mobile phase A*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 0.8 g in 50 ml of *anhydrous glacial acetic acid* add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03889 g of $C_{18}H_{19}F_3N_2S$, HCl.

Storage. Store protected from light and moisture.

Triflupromazine Injection

Triflupromazine Hydrochloride Injection; Flupromazine Hydrochloride Injection; Flupromazine Injection

Triflupromazine Injection is a sterile solution of Triflupromazine Hydrochloride in Water for Injections.

Triflupromazine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of triflupromazine hydrochloride, $C_{18}H_{19}F_3N_2S$, HCl.

Usual strength. 10 mg per ml.

Description. A clear, almost colourless solution.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

A. To an appropriate quantity of the injection add sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.001 per cent w/v solution of Triflupromazine Hydrochloride.

https://nhathuocngocanh.com/

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 256 nm.

B. To a volume containing about 100 mg of Triflupromazine Hydrochloride add 5 ml of *8 M nitric acid* and mix; a pink to amber colour develops which quickly turns dark brown and then changes to a clear solution having a yellow tint.

Tests

pH (2.4.24). 3.5 to 5.2.

Bacterial endotoxins (2.2.3). Not more than 5.8 Endotoxin Units per mg of triflupromazine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To an measured volume of the injection containing about 20 mg of Triflupromazine Hydrochloride add sufficient of a mixture of 19 volumes of *water* and 1 volume of *hydrochloric acid* to produce 100.0 ml and mix. Dilute 5.0 ml of the solution to 100.0 ml with the same mixture and mix. Measure the absorbance of the resulting solution at the maximum at about 256 nm (2.4.7).

Calculate the content of $C_{18}H_{19}F_3N_2S$, HCl taking 700 as the specific absorbance at 256 nm.

Storage. Store protected from light.

Triflupromazine Tablets

Triflupromazine Hydrochloride Tablets; Flupromazine Hydrochloride Tablets; Flupromazine Tablets

Triflupromazine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of triflupromazine hydrochloride, $C_{18}H_{19}F_3N_2S$, HCl.

Usual strengths. 10 mg; 25 mg.

NOTE — In the following procedures, the test and standard specimens and the solutions containing them should be protected by carrying out the tests without delay and in subdued light.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Triflupromazine Hydrochloride with 30 ml of *1 M hydrochloric acid* for 10 minutes, filter, make the filtrate alkaline to *litmus paper* with *5 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *light petroleum (boiling range 60° to 80°)*. Combine the extracts, wash with 10 ml of water, shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate carefully to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triflupromazine hydrochloride IPRS*, treated in the same manner or with the reference spectrum of triflupromazine hydrochloride.

B. Extract a quantity of the powdered tablets containing 5 mg of Triflupromazine Hydrochloride with 5 ml of *acetone*, filter and evaporate the filtrate to dryness.

When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 256 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 100 rpm, 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{18}H_{19}F_3N_2S$,HCl in the medium from the absorbance obtained from a solution of known concentration of *triflupromazine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{19}F_3N_2S$.HCl.

Uniformity of content. Complies with the test stated under Tablets.

Crush one tablet and transfer to a 100-ml volumetric flask with the aid of a mixture of 19 volumes of *water* and 1 volume of *hydrochloric acid*. Shake well, dilute to volume with the same mixture and complete the procedure described under the Assay beginning at the words "mix and filter,...".

Calculate the content of $C_{18}H_{19}F_3N_2S$, HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Triflupromazine Hydrochloride and shake for 15 minutes with 200 ml of a mixture of 19 volumes of *water* and 1 volume of *hydrochloric acid*. Dilute to 500.0 ml with the same solvent mixture, mix and filter, rejecting the first few ml of the filtrate. Dilute 10.0 ml to 100.0 ml with the same solvent mixture. Measure the absorbance of the filtrate at the maximum at about 256 nm (2.4.7).

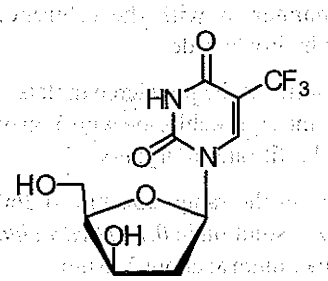
Calculate the content of $C_{18}H_{19}F_3N_2S$, HCl taking 700 as the specific absorbance at 256 nm.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Trifluridine

Triflurothymidene



$C_{10}H_{11}F_3N_2O_5$ Mol.Wt. 296.2

Trifluridine is 5-Trifluoromethyl-2'-deoxyuridine.

Trifluridine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{11}F_3N_2O_5$, calculated on the dried basis.

Category. Pyrimidine nucleoside analogue; antiviral (herpes viruses).

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trifluridine IPRS* or with the reference spectrum of trifluridine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +47.0° to +51.0°, determined in 3.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile* and 95 volumes of a *0.05 M sodium dihydrogen orthophosphate*, previously adjusted to pH 6.0 with *ammonia*.

Test solution. Dissolve 20 mg of substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-2),
- mobile phase: A. *0.05M sodium dihydrogen orthophosphate*, adjusted to pH 6.0 with *ammonia*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
3	95	5
10	85	15
15	85	15
16	95	5
25	95	5

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plate and the tailing factor is not more than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying under vacuum at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modifications.

Reference solution. A 0.02 per cent w/v solution of *trifluridine IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{11}F_3N_2O_5$.

Storage. Store protected from light.

Trifluridine Eye Drops

Trifluridine Eye Drops are a sterile solution of Trifluridine in Purified Water.

Trifluridine Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of trifluridine, $C_{10}H_{11}F_3N_2O_5$.

https://nhathuocngocanh.com/

Usual strength. 1.0 per cent w/v.

Identification

A. Evaporate a volume of the eye drops containing 0.1 g of Trifluridine to dryness using a rotary evaporator and dry at 60° under reduced pressure. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trifluridine IPRS* treated in the same manner or with the reference spectrum of trifluridine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.5.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of *acetonitrile* and 95 volumes of a *0.05M sodium dihydrogen orthophosphate*, adjusted to pH 6.0 with *ammonia*.

Test solution. Dilute the eye drops if necessary to obtain a solution containing 0.02 per cent w/v of Trifluridine in the solvent mixture.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes in the solvent mixture.

Reference solution (b). Dilute 1 volume of reference solution (a) to 10 volumes in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 2),
- mobile phase: A. *0.05M sodium dihydrogen orthophosphate*, adjusted to pH 6.0 with *ammonia*.
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
3	95	5
10	85	15
15	85	15
16	95	5
25	95	5

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modifications.

Reference solution. A 0.02 per cent w/v solution of *trifluridine IPRS* in the solvent mixture.

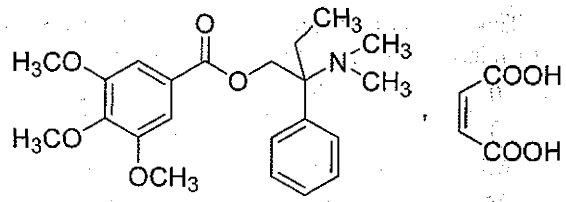
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{11}F_3N_2O_5$ in the eye drops.

Storage. Store protected from light, at a temperature between 2° to 8°.

Trimebutine Maleate



$C_{26}H_{33}NO_9$ Mol Wt. 503.5

Trimebutine MaleateArterolane Maleate is (2*RS*)-2-(dimethylamino)-2-phenylbutyl 3,4,5-trimethoxybenzoate (*Z*)-butenedioate.

Trimebutine MaleateArterolane Maleate contains not less than 99.0 per cent and not more than 101.5 per cent of $C_{26}H_{33}NO_9$, calculated on the dried basis.

Category. Treatment of irritable bowel syndrome.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trimebutine maleate IPRS* or with the reference spectrum of trimebutine maleate.

https://nhathuocngocanh.com/

Tests

Appearance of solution. A 0.5 per cent w/v solution in *acetone* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 0.24 g of *anhydrous sodium dihydrogen phosphate* in 180 ml of *water*, adjusted to pH 2.5 with *dilute orthophosphoric acid*, dilute to 200 ml with *water*. Add 50 ml of *acetonitrile* and mix.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 3.6 g of *anhydrous sodium dihydrogen phosphate* in 990 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000.0 ml with *water*;

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	78	22
3	78	22
6.5	65	35
15	60	40
35	60	40
40	78	22

Name	Relative retention time
Maleic acid	0.17
Trimebutine maleate impurity E[1]	0.9
Trimebutine maleate (Retention time about 12 minutes)	1.0
Trimebutine maleate impurity D[2]	1.3
Trimebutine maleate impurity C[3]	1.4

[1](2*RS*)-2-(methylamino)-2-phenylbutyl 3,4,5-trimethoxybenzoate,

[2](1*RS*)-1-[(dimethylamino)methyl]-1-phenylpropyl 3,4,5-trimethoxybenzoate,

[3]methyl 3,4,5-trimethoxybenzoate.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to trimebutine maleate impurity E is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent) and any peak due to maleic acid.

Heavy metals (2.3.13). *Solvent mixture.* 15 volumes of *water* and 85 volumes of *dioxan.*

Dissolve 2 g in 20 ml of a solvent mixture. 12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm), using 10 ml of *lead standard solution (1 ppm pb)* in the same solvent mixture.

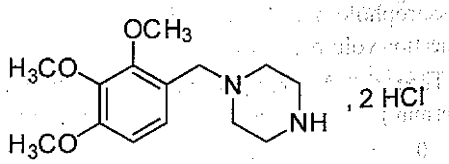
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 40 ml of *anhydrous acetic acid.* Titrate with *0.1 M perchloric acid.* Determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05035 g of $C_{26}H_{33}NO_9$.

Trimetazidine Hydrochloride



$C_{14}H_{22}N_2O_3, 2HCl$ Mol. Wt. 339.3

Trimetazidine Hydrochloride is 1-[(2,3,4-trimethoxyphenyl)-methyl]piperazine dihydrochloride.

Trimetazidine Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent, calculated on the dried basis.

Category. Antiischemic metabolic agent.

https://nhathuocngocanh.com/

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trimetazidine dihydrochloride IPRS* or with the reference spectrum of trimetazidine dihydrochloride.

B. It gives reaction (A) for chlorides (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 50.0 ml of *water*.

Reference solution. Dilute 2.0 ml of the test solution to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A. a mixture of 35.7 volumes of *methanol* and 64.3 volumes of a 0.29 per cent w/v solution of *sodium heptanesulphonate*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
50	75	25
52	95	5

Equilibrate the column for not less than 1 hour using 95 volumes of mobile phase A and 5 volumes of mobile phase B.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates. The relative retention time with reference to trimetazidine for (2,3,4-trimethoxyphenyl)methanol (trimetazidine impurity D) is about 0.2, for 2,3,4-trimethoxybenzaldehyde (trimetazidine impurity C) is about 0.4, for ethyl 4-(2,3,4-trimethoxybenzyl)piperazine-1-carboxylate (trimetazidine impurity H) is about 0.6, for 1-(3,4,5-trimethoxybenzyl)piperazine (trimetazidine impurity A) and *N*-methyltrimetazidine (trimetazidine impurity I) is about 0.9, for 1-(2,4,5-trimethoxybenzyl)piperazine (trimetazidine impurity E) is about 0.95, for 1-(2,4,6-trimethoxybenzyl) piperazine (trimetazidine impurity F) is about 1.4 and for 1,4-bis(2,3,4-trimethoxybenzyl) piperazine (trimetazidine impurity B) is about 1.8.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of each peak due to trimetazidine impurity A, B, C, D, E, F, H, I multiplied with correction factor 0.55 for impurity B, 0.37 for impurity C and 0.71 for impurity F is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Impurity G. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *concentrated ammonia* and 80 volumes of *ethanol (95 per cent)*.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol*.

Reference solution. Dissolve 22.6 mg of *piperazine hydrate* (trimetazidine impurity G) in 100 ml of *methanol*. Dilute 10 ml of the solution to 100 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate at 105° for 30 minutes and spray with *iodoplatinate reagent*. Any secondary spot corresponding to trimetazidine impurity G is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 2.5 per cent, determined on 1.0 g by drying in an oven at 105 ° over *diphosphorus pentoxide* at a pressure not exceeding 15 kPa.

Assay. Dissolve 0.12 g in 50.0 ml of *water*. Add 1 ml of *nitric acid* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.01696 g of $C_{14}H_{24}Cl_2N_2O_3$.

Storage. Store protected from moisture.

https://nhathuocngocanh.com/

Trimetazidine Tablets

Trimetazidine Hydrochloride Tablets

Trimetazidine Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of trimetazidine dihydrochloride, $C_{14}H_{22}N_2O_3,2HCl$.

Usual strength. 20 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. *Solvent mixture.* Mix 3 volumes of *ethanol (95 per cent)* and 1 volume of *water*.

Triturate a quantity of the powdered tablets containing 10 mg of Trimetazidine Hydrochloride with 10 ml of solvent mixture, filter and evaporate the filtrate to a low volume. Add 2 ml of *water* to residue and shake. To 1 ml of the solution add 1 ml of *p-benzoquinone*, boil gently for 2 to 3 minutes and cool. A red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 45 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw a suitable volume of the medium and filter. Dilute 4.0 ml of the filtrate to 25.0 ml with the *water*, further dilute 5.0 ml to 10.0 ml with *0.1 M hydrochloric acid*.

Reference solution. A solution containing 0.017 per cent w/v of *trimetazidine dihydrochloride IPRS* in *water*, further dilute 5 ml to 50.0 ml with *water*, further dilute 5.0 ml to 25.0 ml with *water*, further dilute 5.0 ml to 10.0 ml with *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 850 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusted to pH 3.0 with *ortho phosphoric acid* and 150 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_3,2HCl$.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{22}N_2O_3,2HCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *0.1 M hydrochloric acid* and 50 volumes of *ethanol* (95 per cent).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 15 mg of Trimetazidine Hydrochloride in about 75 ml of solvent mixture sonicate for 20 minutes and dilute to 100.0 ml with the solvent mixture and centrifuge. Dilute 5.0 ml of the solution to 50.0 ml with *0.1 M hydrochloric acid*.

Reference solution. Dilute 5.0 ml of 0.015 per cent w/v solution of *trimetazidine dihydrochloride IPRS* in the solvent mixture to 50.0 ml with *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 850 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 150 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

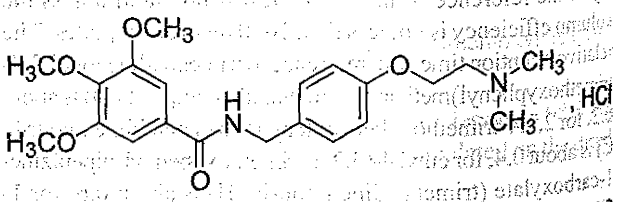
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{22}N_2O_3,2HCl$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Trimethobenzamide Hydrochloride



$C_{21}H_{29}ClN_2O_5$ Mol Wt. 424.9

https://nhathuocngocanh.com/

Trimethobenzamide Hydrochloride is *N*-{[4-(2-dimethylamino-ethoxy)phenyl]methyl}-3,4,5-trimethoxybenzamide hydrochloride.

Trimethobenzamide Hydrochloride contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{21}H_{29}ClN_2O_5$, calculated on the dried basis.

Category. Antiemetic

Description. A white to off-white powder.

Identification

In the Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *acetonitrile*.

Test solution. Dissolve about 50 mg of the substance under examination in solvent mixture and diluted to 50.0 ml with solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *trimethobenzamide hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.1 per cent v/v solution of *trifluoroacetic acid* in *water*
  B. 0.1 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
30	20	80
35	80	20
40	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject the test solution. In the chromatogram obtained with test solution the per cent area of any secondary peak is not more than 0.2 per cent and the total area per cent of peaks other than the principal peak is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

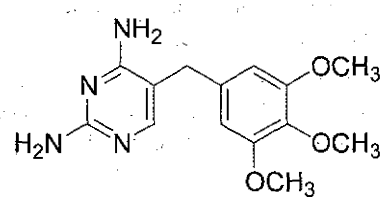
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.4 g in 50.0 ml of *glacial acetic acid*, add 15 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid* determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04249 g of $C_{21}H_{29}ClN_2O_5$

Trimethoprim



$C_{14}H_{18}N_4O_3$ Mol. Wt. 290.3

Trimethoprim is 5-(3,4,5-trimethoxybenzyl)pyrimidine-2,4-diamine.

Trimethoprim contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{14}H_{18}N_4O_3$, calculated on the dried basis.

Category. Antibacterial.

Description. A white or yellowish white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trimethoprim IPRS* or with the reference spectrum of trimethoprim.

B. Dissolve 25 mg in 25 ml of *ethanol (95 per cent)* and dilute 2.0 ml to 100 ml with *0.1 M sodium hydroxide*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 287 nm; absorbance at about 287 nm, about 0.49.

https://nhathuocngocanh.com/

C. Dissolve about 25 mg in 5 ml of *0.005 M sulphuric acid*, with heating if necessary, add 2 ml of a 1.6 per cent w/v solution of *potassium permanganate* in *0.1 M sodium hydroxide*. Heat to boiling and to the hot solution add 0.4 ml of *formaldehyde solution*. Mix, add 1 ml of *0.5 M sulphuric acid*, mix and heat to boiling. Cool and filter. Add 2 ml of *chloroform* to the filtrate and shake vigorously. The chloroform layer exhibits a green fluorescence when examined under ultraviolet light at 365 nm.

Tests

Appearance of solution. A 5.0 per cent w/v solution in a mixture of 10 volumes of *chloroform*, 9 volumes of *methanol* and 2 volumes of *water* is not more intensely coloured than reference solution BYS7 (2.4.1).

Related substances. A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of a 0.14 per cent w/v solution of *sodium perchlorate*, adjusted to pH 3.6 with *orthophosphoric acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Trimethoprim impurity C[1]	0.8	—
Trimethoprim impurity E[2]	0.9	0.53
Trimethoprim (Retention time: about 5 minutes)	1.0	—
Trimethoprim impurity A[3]	1.5	—
Trimethoprim impurity D[4]	2.0	—
Trimethoprim impurity G[5]	2.1	—
Trimethoprim impurity B[6]	2.3	0.43
Trimethoprim impurity J[7]	2.7	0.66
Trimethoprim impurity F[8]	4.0	—

[1](*RS*)-(2,4-diaminopyrimidin-5-yl)(3,4,5-trimethoxyphenyl) methanol,

[2]4-amino-5-(3,4,5-trimethoxybenzyl)pyrimidin-2-ol,

[3]*N*²-methyl-5-(3,4,5-trimethoxybenzyl)pyrimidine-2,4-diamine,

[4]2-amino-5-(3,4,5-trimethoxybenzyl)pyrimidin-4-ol,

[5]5-(4-ethoxy-3,5-dimethoxybenzyl)pyrimidine-2,4- diamine,

[6](2,4-diaminopyrimidin-5-yl)(3,4,5-trimethoxyphenyl)methanone,

[7]3,4,5-trimethoxybenzoic acid,

[8]5-(3-bromo-4,5-dimethoxybenzyl)pyrimidine-2,4-diamine.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 11 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). Ignore any peak with an area less than 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent) and peak corresponding to trimethoprim impurity H at relative retention time of about 10.3.

B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v each of *trimethoprim IPRS* and *trimethoprim impurity B IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with nitrile bonded to porous silica (5 µm),
- mobile phase: dissolve 1.14 g of *sodium hexane sulphonate* in 600 ml of a 1.36 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.1 with *orthophosphoric acid* and mix with 400 ml of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Trimethoprim (Retention time: about 4 minutes)	1.0	—
Trimethoprim impurity H[1]	1.8	0.5
Trimethoprim impurity I[2]	4.9	0.28

[1]methyl 3,4,5-trimethoxybenzoate,

[2]3-(phenylamino)-2-(3,4,5-trimethoxybenzyl)prop-2-enenitrile.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to trimethoprim and trimethoprim impurity B is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of all the secondary peaks is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent) and any peak due to trimethoprim impurity B at relative retention time of about 1.3.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02903 g of $C_{14}H_{18}N_4O_3$.

Storage. Store protected from light.

Trimethoprim Tablets

Trimethoprim Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of trimethoprim, $C_{14}H_{18}N_4O_3$.

Usual strengths. 100 mg; 200 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Trimethoprim with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trimethoprim IPRS* or with the reference spectrum of trimethoprim.

B. Shake a quantity of the powdered tablets containing 0.1 g of Trimethoprim with 60 ml of *0.1 M hydrochloric acid* for 20 minutes, add sufficient *0.1 M hydrochloric acid* to produce 100 ml, filter and dilute 5 ml of the filtrate to 250 ml with *0.1 M sodium hydroxide*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 287 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 271 nm (2.4.7). Calculate the content of $C_{14}H_{18}N_4O_3$ in the medium from the absorbance obtained from a solution of known concentration of *trimethoprim IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{14}H_{18}N_4O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Trimethoprim with 50 ml of the mobile phase, filter and use the filtrate.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 0.14 per cent w/v solution of *sodium perchlorate* in *methanol (60 per cent)* adjusted to pH 3.1 with *0.1 M hydrochloric acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

The column efficiency, determined using the peak due to trimethoprim in the chromatogram obtained with reference solution, should be at least 8,000 theoretical plates per metre.

In the chromatogram obtained with the test solution the sum of the areas of any secondary peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 0.1 g of Trimethoprim, add 100 ml of *glacial acetic acid*, shake for 20 minutes, dilute to 200.0 ml with *glacial acetic acid* and filter. To 5.0 ml of the filtrate add 15 ml of *glacial acetic acid* and dilute to 100.0 ml with *water*.

https://nhathuocngocanh.com/

Measure the absorbance of the resulting solution at the maximum at about 271 nm (2.4.7).

Calculate the content of $C_{14}H_{18}N_4O_3$ taking 204 as the specific absorbance at 271 nm.

Storage. Store protected from moisture.

Trimethoprim and Sulphamethoxazole Oral Suspension

Sulphamethoxazole and Trimethoprim Oral Suspension; Co-trimoxazole Oral Suspension; Co-trimoxazole Mixture

Trimethoprim and Sulphamethoxazole Oral Suspension is a suspension of Trimethoprim and Sulphamethoxazole in a suitable flavoured vehicle. It contains 5 parts of Sulphamethoxazole for 1 part, by weight, of Trimethoprim.

Trimethoprim and Sulphamethoxazole Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of trimethoprim, $C_{14}H_{18}N_4O_3$, and sulphamethoxazole, $C_{10}H_{11}N_3O_3S$.

Category. Antibacterial.

Usual strengths. Trimethoprim 40 mg and Sulphamethoxazole 200 mg in 5 ml; Trimethoprim 80 mg and Sulphamethoxazole 400 mg in 5 ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *chloroform*, 2 volumes of *methanol* and 1 volume of *dimethylformamide*.

Test solution. Add 20 ml of *methanol* (or a suitable volume of *methanol* to yield 0.4 per cent w/v solution of Trimethoprim) to 5 ml of the suspension, mix, shake with 10 g of *anhydrous sodium sulphate*, centrifuge and use the supernatant liquid.

Reference solution (a). A 2.0 per cent w/v solution of *sulphamethoxazole IPRS* in *methanol*.

Reference solution (b). A 0.4 per cent w/v solution of *trimethoprim IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. One of the principal spots in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the other corresponds to that in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 5.0 to 6.5.

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid Chromatography (2.4.14).

Test solution. Dilute a volume of oral suspension containing about 80 mg of sulphamethoxazole with 30 ml of *methanol* and sonicate for 10 minutes and dilute to 50.0 ml with *methanol* and filter. Dilute a volume of filtrate to obtain a solution containing 0.016 per cent w/v of sulphamethoxazole with the mobile phase.

Reference solution. Dilute 5 ml of a solution containing 0.032 percent w/v of *trimethoprim IPRS* and 0.16 percent w/v of *sulphamethoxazole IPRS* in *methanol* to 50.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: mix 700 ml of *water*, 200 ml of *acetonitrile*, and 1.0 ml of *triethylamine*, adjusted to pH 5.9 with *0.2 M sodium hydroxide* or *dilute glacial acetic acid* (1.0 per cent v/v) and dilute to 1000.0 ml with *water*, filter,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time for sulphamethoxazole with reference to trimethoprim is about 1.8.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to sulphamethoxazole and trimethoprim is not less than 5.0, the relative standard deviation for replicate injections is not more than 2.0 per cent and the tailing factor is not more than 2.0 for sulphamethoxazole and trimethoprim peaks.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_4O_3$ and $C_{10}H_{11}N_3O_3S$ in the oral suspension.

Storage. Store protected from light and moisture. The suspension should not be allowed to freeze.

Labelling. The label states (1) the content of Trimethoprim and of Sulphamethoxazole in each 5 ml of the suspension; (2) that the contents should be shaken before use; (3) that a suspension containing 40 mg of Trimethoprim and 200 mg of Sulphamethoxazole in 5 ml is meant for paediatric use.

Trimethoprim and Sulphamethoxazole Tablets

Sulphamethoxazole and Trimethoprim Tablets; Co-trimoxazole Tablets

Trimethoprim and Sulphamethoxazole Tablets contain 5 parts of Sulphamethoxazole for 1 part, by weight, of Trimethoprim.

https://nhathuocngocanh.com/

Trimethoprim and Sulphamethoxazole Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amounts of trimethoprim, $C_{14}H_{18}N_4O_3$, and sulphamethoxazole, $C_{10}H_{11}N_3O_3S$.

Category. Antibacterial.

Usual strengths. Trimethoprim 20 mg and Sulpha- methoxazole 100 mg; Trimethoprim 80 mg and Sulphamethoxazole 400 mg; Trimethoprim 160 mg and Sulphamethoxazole 800 mg.

Identification

A. To a quantity of the powdered tablets containing 50 mg of Trimethoprim add 30 ml of *0.1 M sodium hydroxide* and extract with two quantities, each of 50 ml, of *chloroform*. Wash the combined chloroform extracts with two quantities, each of 10 ml, of *0.1 M sodium hydroxide* and then with 10 ml of *water*. Combine the aqueous extract and washings (solution A) and reserve for test B. Shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate to dryness using a rotary evaporator.

The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trimethoprim IPRS* or with the reference spectrum of trimethoprim.

B. Filter solution A, add, dropwise, sufficient *2 M hydrochloric acid* to the filtrate to make it just acidic and extract with 50 ml of *ether*. Wash the ether layer with 10 ml of *water*, shake with 5 g of *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in the minimum volume of a 5 per cent w/v solution of *sodium carbonate*, add *1 M hydrochloric acid* dropwise until precipitation is complete and filter. Wash the residue sparingly with water and dry at 105°.

The residue complies with the following test. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphamethoxazole IPRS* or with the reference spectrum of sulphamethoxazole.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *chloroform*, 2 volumes of *methanol* and 1 volume of *dimethylformamide*.

Test solution. Shake a quantity of the powdered tablets containing 0.4 g of Sulphamethoxazole with 20 ml of *methanol* and filter.

Reference solution (a). A 2.0 per cent w/v solution of *sulphamethoxazole IPRS* in *methanol*.

Reference solution (b). A 0.4 per cent w/v solution of *trimethoprim IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. One of the principal spots in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the other corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a suitable quantity of *sulphamethoxazole IPRS* and *trimethoprim IPRS* in the dissolution medium to obtain a solution having the same concentration as that to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Calculate the content of $C_{14}H_{18}N4O_3$, and $C_{10}H_{11}N_3O_3S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_{18}N4O_3$, and $C_{10}H_{11}N_3O_3S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid Chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 160 mg of sulphamethoxazole with 50 ml of *methanol* and sonicate with intermittent shaking for 5 minutes and dilute to 100.0 ml with *methanol* and filter. Dilute a volume of filtrate to obtain a solution containing 0.016 per cent w/v of sulphamethoxazole with the mobile phase.

Reference solution. Dilute 5 ml of a solution containing 0.032 percent w/v of *trimethoprim IPRS* and 0.16 percent w/v of *sulphamethoxazole IPRS* in *methanol* to 50.0 ml with mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm packed with *octyldecylsilane* bonded to porous silica (5 µm),

https://nhathuocngocanh.com/

– mobile phase: mix 700 ml of *water*, 200 ml of *acetonitrile*, and 1.0 ml of *triethylamine*, adjusted to pH 5.9 with *0.2 M sodium hydroxide* or *dilute glacial acetic acid* (1.0 per cent v/v) and dilute to 1000 ml with *water*, filter,
– flow rate: 2 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

The relative retention time for sulphamethoxazole with reference to trimethoprim is about 1.8.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to sulphamethoxazole and trimethoprim is not less than 5.0, the relative standard deviation for replicate injections is not more than 2.0 per cent and the tailing factor is not more than 2.0 for sulfamethoxazole and trimethoprim peaks.

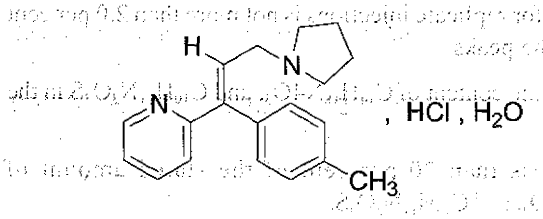
Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{18}N_4O_3$ and $C_{10}H_{11}N_3O_3S$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the quantities of Trimethoprim and of Sulphamethoxazole in each tablet.

Triprolidine Hydrochloride



, HCl , H_2O

$C_{19}H_{22}N_2,HCl,H_2O$ Mol. Wt. 332.9

Triprolidine Hydrochloride is (*E*)-2-(3-pyrrolidin-1-yl-1-(*p*-tolyl)prop-1-enyl)pyridine hydrochloride monohydrate.

Triprolidine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{22}N_2$, HCl, calculated on the anhydrous basis.

Category. Histamine H_1-receptor antagonist.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triprolidine hydrochloride IPRS* or with the reference spectrum of triprolidine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution shows absorption maxima at about 230 nm and 276 nm; absorbance at about 230 nm, about 0.50 and at about 276 nm, about 0.25.

C. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.05 M sulphuric acid* shows an absorption maximum at about 290 nm; absorbance at about 290 nm, about 0.6.

D. Dissolve 0.1 g in 2 ml of *2 M hydrochloric acid* and add 0.5 ml of *potassium mercuri-iodide solution*; a pale yellow precipitate is produced.

E. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of equal volumes of *2-butanone* and *dimethylformamide*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). Dissolve 10 mg of the substance under examination in 100 ml of *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *Z-triprolidine IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to Z-triprolidine is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.0 to 6.0 per cent, determined on 0.4 g.

Assay. Dissolve 0.25 g, in a mixture of 50 ml of *anhydrous glacial acetic acid*, 0.5 ml of *acetic anhydride* and add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01574 g of $C_{19}H_{22}N_2$, HCl.

Storage. Store protected from light and moisture.

https://nhathuocngocanh.com/

Triprolidine Tablets

Triprolidine Hydrochloride Tablets

Triprolidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of triprolidine hydrochloride, $C_{19}H_{22}N_2,HCl,H_2O$.

Usual strength. 10 mg.

Identification

A. Extract a quantity of the powdered tablets containing 10 mg of Triprolidine Hydrochloride with *ether*, filter, discard the ether extract and dry the residue. Extract the residue with *chloroform*, filter and evaporate the filtrate to dryness. Add 0.1 ml of *ether*, stir and allow to evaporate.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *triprolidine hydrochloride IPRS* or with the reference spectrum of triprolidine hydrochloride.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket).

Medium. 500 ml of acetate buffer pH 4.0 prepared by dissolving 2.45 g of *sodium acetate trihydrate* and 4.9 g of *glacial acetic acid* in 1000 ml of *water*.

Speed and time. 50 rpm, 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, dilute suitably if necessary with the medium, at the maximum at about 277 nm (2.4.7). Calculate the content of $C_{19}H_{22}N_2.HCl.H_2O$ in the medium from the absorbance obtained from a solution of known concentration of *triprolidine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{22}N_2.HCl.H_2O$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of equal volumes of *2-butanone* and *dimethylformamide*.

Test solution. Extract a quantity of powdered tablets containing 10 mg of Triprolidine Hydrochloride with *methanol*, filter, evaporate to dryness and dissolve the residue in 1 ml of *methanol*.

Reference solution (a). A 0.02 per cent w/v solution of *Z-triprolidine IPRS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of *triprolidine hydrochloride IPRS* in *methanol*.

Reference solution (c). A 0.01 per cent w/v solution of *triprolidine hydrochloride IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to Z-triprolidine is not more intense than the spot in the chromatogram obtained with reference solution (a) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (c).

Uniformity of content. Complies with the test stated under Tablets.

Take one tablet and transfer to a 50-ml volumetric flask, add 30 ml of water and sonicate for 15 minutes, make up to volume with water, mix and filter, rejecting the first few ml of filtrate. Pipette 25 ml of the filtrate and carry out the procedure mentioned under Assay begining at the words "add 1 g of sodium chloride ....."

Calculate the content of $C_{19}H_{22}N_2,HCl,H_2O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 7.5 mg of Triprolidine Hydrochloride, add 15 ml of *water* and 1 g of *sodium chloride*, shake for 2 to 3 minutes and add sufficient *5 M sodium hydroxide* to make it alkaline. Extract with four quantities, each of 20 ml, of *ether* and wash the combined extracts with two quantities, each of 5 ml, of a mixture of equal volumes of a saturated solution of *sodium chloride* and *water*. Extract the ether solution with 20 ml of *0.1 M hydrochloric acid*, wash the ether with two quantities, each of 5 ml, of *water* and add the washings to the acid extract. Heat on a water-bath for 30 minutes, cool and add sufficient *water* to produce 50.0 ml. Dilute 10.0 ml to 100.0 ml with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7).

Calculate the content of $C_{19}H_{22}N_2,HCl,H_2O$ taking 290 as the specific absorbance at 290 nm.

Storage. Store protected from light and moisture.

Trisodium Edetate Concentrate for Injection

Trisodium Edetate Concentrate for Injection is a sterile solution in Water for Injections containing 20 per cent w/v solution of trisodium edetate prepared by the interaction of

https://nhathuocngocanh.com/

Disodium Edetate and Sodium Hydroxide. It should be diluted with a suitable diluent in accordance with the manufacturer's instructions.

Trisodium Edetate Concentrate for Injection contains not less than 19.0 per cent w/v and not more than 21.0 per cent w/v solution of trisodium edetate, $C_{10}H_{13}N_2Na_3O_8$.

Category. Used in the treatment of hypercalcaemia.

Description. A colourless solution.

Identification

A. Dissolve 2 g in 25 ml of *water*, add 6 ml of *lead nitrate solution*, shake and add 3 ml of *potassium iodide solution*; no yellow precipitate is produced. Make alkaline to red litmus paper with *2 M ammonia* and add 5 ml of *ammonium oxalate solution*; no precipitate is produced.

B. Dissolve 0.5 g in 10 ml of *water*, add 0.5 ml of a 10 per cent w/v solution of *calcium chloride*, make alkaline to red litmus paper with *2 M ammonia* and add 3 ml of *ammonium oxalate solution*; no precipitate is produced.

C. Evaporate to dryness and ignite. The residue gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.0 to 8.0.

Bacterial endotoxins (2.2.3). If necessary, dilute the infusion with *water BET* to give a solution containing 10 mg per ml. The solution contains not more than 1.4 Endotoxin Unit per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Concentrated Solutions for Injection).

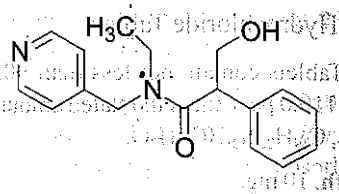
Assay. Dilute 10.0 ml to 100.0 ml with *water* and use the solution to titrate a mixture of 25.0 ml of *0.05 M magnesium sulphate* and 10 ml of *ammonia buffer pH 10.9* using *mordant black II mixed triturate* as indicator.

1 ml of *0.05 M magnesium sulphate* is equivalent to 0.01791 g of $C_{10}H_{13}N_2Na_3O_8$.

Storage. Store in hermetically-sealed, lead-free glass containers.

Labelling. The label states (1) the strength in terms of anhydrous trisodium edetate contained in a suitable dose-volume; (2) 'Trisodium Edetate Concentrate for Injection'; (3) that the solution must be diluted with either Sodium Chloride Intravenous Infusion or Dextrose Intravenous Infusion before administration.

Tropicamide



$C_{17}H_{20}N_2O_2$ Mol. Wt. 284.4

Tropicamide is (*RS*)-*N*-ethyl-3-hydroxy-2-phenyl-*N*-(pyrid-4-ylmethyl)propionamide

Tropicamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2O_2$, calculated on the dried basis.

Category. Mydriatic; cycloplegic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tropicamide IPRS* or with the reference spectrum of tropicamide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.003 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 254 nm; absorbance at about 254 nm, about 0.54.

C. Dissolve 5 mg in 3 ml of a mixture of 9 ml of *acetic anhydride*, 1 ml of *6 M acetic acid* and 0.1 g of *citric acid* and heat on a water-bath for 5 to 10 minutes; a reddish yellow colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 3 ml of *acetonitrile* and dilute to 50.0 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (b). Dissolve 5 mg each of tropicamide impurity A, *tropicamide impurity C IPRS* and *tropicamide impurity D IPRS* in 2 ml of *acetonitrile* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Reference solution (c). Dilute 1.5 ml of reference solution (b) to 10.0 ml with *water*.

Chromatographic system

– a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm),

https://nhathuocngocanh.com/

— column temperature: 40°,
— mobile phase: a mixture of 73 volumes of solution prepared by dissolving 0.135 g of *sodium dodecyl sulphate* and 3.4 ml of *orthophosphoric acid* in 950 ml of *water*, adjusted to pH 3.0 with *sodium hydroxide solution* and dilute to 1000 ml with *water* and 27 volumes of *acetonitrile*,
— flow rate: 0.8 ml per minute,
— spectrophotometer set at 210 nm and 254 nm,
— injection volume: 15 µl.

Name	Relative retention time	Correction factor
Tropicamide impurity C[1]	0.4	—
Tropicamide impurity A[2]	0.5	0.8
Tropicamide impurity D[3]	0.8	—
Tropicamide (Retention time: about 11 minutes)	1.0	—
Tropicamide impurity B[4]	2.3	0.6

[1]tropic acid,
[2]*N*-(pyridin-4-ylmethyl)ethanamine,
[3]phenylacetic acid,
[4]*N*-ethyl-2-phenyl-*N*-(pyridin-4-ylmethyl)propenamide.

Inject reference solution (b). The test is not valid unless the resolution at 210 nm between the peaks due to impurities C and A and impurities A and D is not less than 2.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to tropicamide impurity B at 254 nm is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The area of any peak corresponding to tropicamide impurity A at 254 nm is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.15 per cent). The area of any peak corresponding to tropicamide impurity C at 210 nm is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent). The area of any peak corresponding to tropicamide impurity D at 210 nm is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent), the area of any other secondary peak at 254 nm is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks other than tropicamide impurities C and D at 254 nm is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak at 254 nm, with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 80° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Dissolve 0.5 g in 80 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphthol-benzein* solution as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02844 g of $C_{17}H_{20}N_2O_2$.

Storage. Store protected from light and moisture.

Tropicamide Eye Drops

Tropicamide Eye Drops are a sterile solution of Tropicamide in Purified Water. They may contain stabilisers, suitable antimicrobial agents and suitable substances to increase the viscosity of the solution.

Tropicamide Eye Drops contain not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of tropicamide, $C_{17}H_{20}N_2O_2$.

Usual strengths. 0.5 per cent w/v; 1.0 per cent w/v.

Identification

A. Shake a volume containing 20 mg of Tropicamide with 10 ml of *chloroform*, dry the chloroform layer over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the residue in minimum quantity of *chloroform*, add dropwise to finely powdered *potassium bromide IR*, mix and dry at 60°.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tropicamide IPRS* or with the reference spectrum of tropicamide.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum at about 254 nm.

Tests

pH (2.4.24). 4.0 to 5.8.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 95 volumes of *chloroform*, 5 volumes of *methanol* and 0.5 volume of *strong ammonia solution*.

https://nhathuocngocanh.com/

Test solution. Extract a volume containing 50 mg of tropicamide with 10 ml of *chloroform,* filter through *sodium sulphate anhydrous* and dilute to 10.0 ml with *chloroform.*

Reference solution (a). Dilute 1 volume of the eye drops to 200 volumes with *water.*

Reference solution (b). Dilute 1 volume of the eye drops to 500 volumes with *water.*

Apply to the plate 40 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

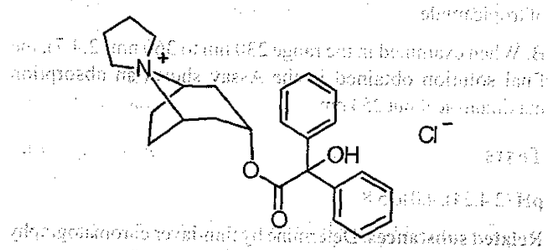
Other tests. Comply with the tests stated under Eye Drops.

Assay. To a volume containing about 30 mg of Tropicamide add sufficient *water* to produce 100.0 ml. To 10.0 ml of the resulting solution add 2 ml of a 10 per cent w/v solution of *anhydrous sodium carbonate* and extract with four quantities, each of 20 ml, of *chloroform.* Wash the combined *chloroform* extracts with 25 ml of *phosphate buffer pH 6.5.* Wash the aqueous layer with 10 ml of *chloroform,* combine the chloroform extracts and shake with four quantities, each of 20 ml, of *0.5 M sulphuric acid.* Combine the acid extracts, dilute to 100.0 ml with *0.5 M sulphuric acid* and measure the absorbance of the resulting solution at the maximum at about 254 nm (2.4.7).

Calculate the content of $C_{17}H_{20}N_2O_2$ taking 172 as the specific absorbance at 254 nm.

Storage. Store in a refrigerator (8° to 15°). It should not be allowed to freeze.

Trospium Chloride



$C_{25}H_{30}ClNO_3$ Mol.Wt. 428.0

Trospium Chloride is 3-(2-Hydroxy-2,2-diphenylacetoxy)spiro [bicyclo[3.2.1]octane-8,1'-pyrrolidin]-1'-ium chloride.

Trospium Chloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{25}H_{30}ClNO_3$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *trospium chloride IPRS* or with the reference spectrum of trospium chloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Solution A. A 10 per cent w/v solution in *carbon dioxide-free water.*

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution BS7 (2.4.1).

pH (2.4.24). 5.0 to 7.0, dilute 5.0 ml of solution A to 50.0 ml with *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.03 per cent w/v solution of *trospium impurity A IPRS* in the mobile phase.

Reference solution (b). A 0.15 per cent w/v solution of *trospium impurity B IPRS* in the mobile phase.

Reference solution (c). Dilute a mixture of 0.3 ml of the test solution, 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 1 volume of *triethylamine* and 3 volumes of *orthophosphoric acid* with 700 volumes of *water* and add 300 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time
Trospium impurity B[1]	0.7
Trospium (Retention time about 10 minutes)	1.0
Trospium impurity A[2]	1.9

[1](1R,3r,5S)-8'-azabicyclo[3.2.1]oct-3-yl hydroxydiphenylacetate,

[2]hydroxydiphenylacetic acid (benzilic acid).

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to trospium impurity B and trospium is not less than 3.0.

Inject reference solution (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak due to trospium impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any peak due to trospium impurity A is not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the peak due to trospium impurity B in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak due to trospium impurity B in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of peak due to trospium impurity B in the chromatogram obtained with reference solution (c) (0.05 per cent).

Impurity C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 1 volume of *glacial acetic acid* and 3.5 volumes of *hydrochloric acid* and 45 volumes of *acetonitrile.*

Test solution. Dissolve 0.2 g of the substance under examination in 2.0 ml of *methanol.*

Reference solution (a). Dissolve 1 mg of *trospium impurity C IPRS ((1R,3r,5S)-3-hydroxyspiro[8-azoniabicyclo[3.2.1] octane8,1-pyrrolidinium] IPRS)* in 2.0 ml of *methanol.*

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with *methanol.* To 50 µl of the solution, add 1 ml of reference solution (a).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a warm air until the odour of *acetic acid* is no longer perceptible. Spray the plate with *potassium iodobismuthate solution* and subsequently with a 0.5 per cent w/v solution of *sodium nitrite.* The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly visible and separated spots. Any spot corresponding to impurity C is not more intense than the area of the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50.0 ml of *water.* Titrate with *0.1 M silver nitrate* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.0428 g of $C_{25}H_{30}ClNO_3$.

Storage. Store protected from light.

Trospium Chloride Tablets

Trospium Chloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of trospium chloride, $C_{25}H_{30}ClNO_3$.

Usual strength. 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through 0.45 µm pore size filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and dilute, if necessary, with the dissolution medium.

Reference solution. A 0.05 per cent w/v solution of *trospium chloride IPRS* in the mobile phase. Dilute 4.0 ml of the solution to 100.0 ml with dissolution medium.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 350 volumes of *acetonitrile,* 1 volume of *triethylamine,* 3 volumes of *orthophosphoric acid* and 650 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

https://nhathuocngocanh.com/

Calculate the content of $C_{25}H_{30}ClNO_3$.

Q. Not less than 80 per cent of the stated amount of $C_{25}H_{30}ClNO_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Transfer a quantity of powder containing 150 mg of Trospium Chloride to 50.0 ml volumetric flask. Add about 30.0 ml of mobile phase and disperse with the aid of ultrasound for 30 minutes. Dilute to volume with the mobile phase. Filter this solution through 0.45 µm pore size filter.

Reference solution (a). A solution containing each of 0.001 per cent w/v of *trospium chloride IPRS, 0.0003 per cent w/v of trospium chloride impurity A IPRS* and 0.0015 per cent w/v of *trospium chloride impurity B IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0003 per cent w/v of *trospium chloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octaylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 300 volumes of *acetonitrile*, 1 volume of *triethylamine*, 3 volumes of *orthophosphoric acid* and 700 volumes of *water*,
- column temperature: 40°,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Nortropane benzilate (trospium chloride impurity B)	0.7	1.0
Trospium	1.0	—
Benzilic acid (trospium chloride impurity A)[1]	1.9	0.59

[1](1*R*,3r,5*S*)-8-azabicyclo[3.2.1]octan-3-ylhydroxydiphenylacetate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to trospium and trospium chloride impurity B is not less than 3.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to trospium chloride impurity B and trospium chloride impurity A are not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of Trospium Chloride in 75 ml of mobile phase, sonicate for about 30 minutes and dilute to 100.0 ml with the mobile phase. Further dilute with mobile phase to obtain a solution containing 0.01 per cent w/v of trospium chloride in the mobile phase, mix well and filter, rejecting the first few ml of the filtrate. Dilute 5.0 ml of the filtrate to 50.0 ml with mobile phase and mix well.

Reference solution. A 0.01 per cent w/v solution of *trospium chloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 350 volumes of *acetonitrile*, 1 volume of *triethylamine*, 3 volumes of *orthophosphoric acid* and 650 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

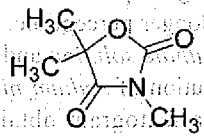
Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{30}ClNO_3$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Troxidone

Trimethadione



$C_6H_9NO_3$ Mol. Wt. 143.1

Troxidone is 3,5,5-trimethyloxazolidine-2,4-dione.

Troxidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_9NO_3$, calculated on the dried basis.

Category. Anticonvulsant.

Description. Colourless or almost colourless crystals.

https://nhathuocngocanh.com/

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *troxidone IPRS* or with the reference spectrum of troxidone.

B. To 2 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 1 ml of *barium hydroxide solution*; a white precipitate is produced which dissolves on the addition of 1 ml of *2 M hydrochloric acid*.

C. Dissolve 0.3 g in a mixture of 5 ml of *ethanolic potassium hydroxide solution* and 5 ml of *ethanol (95 per cent)* and allow to stand for 10 minutes. Add 0.05 ml of *phenolphthalein solution* and carefully add *hydrochloric acid* until the solution is neutral. Evaporate to dryness on a water-bath, shake the residue with four quantities, each of 5 ml, of *ether*, filter the combined ether extracts and evaporate the filtrate to dryness. The residue, after recrystallisation from 5 ml of *toluene* and drying, melts at about 80° (2.4.21).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *methyl red solution*. Not more than 0.1 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *anhydrous silica gel* for 6 hours.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Weigh 0.1 g of the substance under examination and dissolve in 10 ml of the solutions prepared by dissolving 0.125 g of *1-decanol* (internal standard) in sufficient *ethanol* to produce 25.0 ml (solution B).

Reference solution. Dissolve 0.1 g of *troxidone IPRS* in sufficient solution B to produce 10.0 ml.

Chromatographic system
- a stainless steel column 0.75 m x 3 mm, packed with porous polymer beads (120 to 150 µm),
- temperature:
  column 210°,
  inlet port at 240° and detector at 270°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the test solution and the reference solution.

Calculate the content of $C_6H_9NO_3$.

Storage. Store protected from light and moisture.

Troxidone Capsules

Trimethadione Capsules

Troxidone Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of troxidone, $C_6H_9NO_3$.

Usual strength. 250 mg.

Identification

To a quantity of the contents of the capsules containing 1 g of Troxidone add 25 ml of *ether*, set aside in a stoppered flask for 20 minutes, decant the ether through a filter, and if an insoluble residue remains, digest it with another 10-ml portion of *ether* as before, and filter into the first ether filtrate. Evaporate the ether extracts to dryness with the aid of a current of air and dry the residue at a pressure of 2 kPa for 2 hours. The residue complies with the following tests.

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *troxidone IPRS* or with the reference spectrum of troxidone.

B. To 2 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 1 ml of *barium hydroxide solution*; a white precipitate is produced which dissolves on the addition of 1 ml of *2 M hydrochloric acid*.

C. Dissolve 0.3 g in a mixture of 5 ml of *ethanolic potassium hydroxide solution* and 5 ml of *ethanol (95 per cent)* and allow to stand for 10 minutes. Add 0.05 ml of *phenolphthalein solution* and carefully add *hydrochloric acid* until the solution is neutral. Evaporate to dryness on a water-bath, shake the residue with four quantities, each of 5 ml, of *ether*, filter the combined ether extracts and evaporate the filtrate to dryness. The residue, after recrystallisation from 5 ml of *toluene* and drying, melts at about 80° (2.4.21).

Tests

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by gas chromatography (2.4.13).

Test solution. To a quantity of the contents of the capsules containing about 1.0 g of Troxidone add 25 ml of a 0.5 per cent w/v solution of *1-decanol* (internal standard) in *ethanol*

https://nhathuocngocanh.com/

(solution B), shake for 30 minutes, add sufficient of internal standard solution to produce 100.0 ml, mix and centrifuge. Use the supernatant liquid.

Reference solution. Dissolve 0.1 g of *troxidone IPRS* in sufficient solution B to produce 10.0 ml.

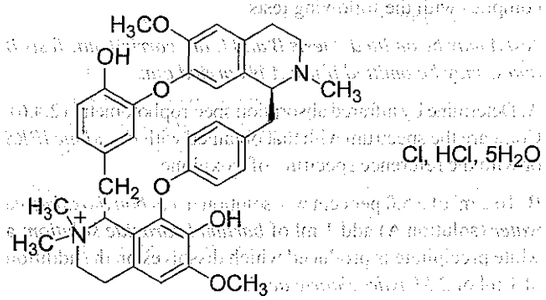
Chromatographic system
- a stainless steel column 0.75 m × 3 mm, packed with porous polymer beads (120 to 150 µm),
- temperature:
  column 210°,
  inlet port at 240° and detector at 270°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the test solution and the reference solution.

Calculate the content of $C_6H_9NO_3$ in the capsules.

Storage. Store protected from moisture.

Tubocurarine Chloride



$C_{37}H_{41}ClN_2O_6,HCl,5H_2O$ Mol. Wt. 771.7

Tubocurarine Chloride is 7′,12′-dihydroxy-6,6′-dimethoxy-2,2′,2′-trimethyltubocuraranium chloride hydrochloride pentahydrate.

Tubocurarine Chloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{37}H_{41}ClN_2O_6,HCl$, calculated on the anhydrous basis.

Category. General anaesthetic.

Description. A white or yellowish white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tubocurarine chloride IPRS* or with the reference spectrum of tubocurarine chloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution shows an absorption maximum at about 280 nm and a minimum at about 255 nm, absorbance at about 280 nm is 0.56 to 0.62, calculated on the anhydrous basis.

C. To 1 ml of a 2.5 per cent w/v solution add 0.2 ml of *ferric chloride solution* and heat in a water-bath for 1 minute; a green colour is produced; 1 ml of *water* treated in the same manner gives a brown colour.

D. To 20 ml of a 0.05 per cent w/v solution add 0.2 ml of *sulphuric acid* and 2 ml of a 1 per cent w/v solution of *potassium iodate*, mix and warm on a water-bath for 30 minutes; a yellow colour is produced.

E. It gives reaction (A) of chlorides and the reactions of alkaloids (2.3.1).

Tests

Appearance of solution. Dissolve 0.5 g in sufficient *carbon dioxide-free water* to produce 50.0 ml (solution A). Solution A is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.0 to 6.0, determined in Solution A.

Specific optical rotation (2.4.22). + 210° to + 222°, determined in solution A 3 hours after preparation.

Chloroform-soluble substances. Not more than 2 per cent, determined by the following method. Dissolve 0.25 g in 150 ml of *water* contained in a separating funnel with a grease-free stopcock. Add 5 ml of a saturated solution of *sodium bicarbonate* and extract with three quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with 10 ml of *water*, filter the *chloroform* solution into a tared beaker and wash the filter with two successive quantities, each of 5 ml, of *chloroform*. Add the washings to the filtrate. Remove the chloroform on a water-bath, dry the residue at 105° for 1 hour, cool and weigh. The residue does not dissolve in 10 ml of *water* but dissolves on the addition of 1 ml of *2 M hydrochloric acid*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. The lower layer of a mixture of equal volumes of *chloroform*, *methanol* and a 12.5 per cent w/v solution of *trichloroacetic acid*.

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *water*.

Reference solution (a). A 0.0375 per cent w/v solution of the substance under examination in *water*.

Reference solution (b). A 0.01875 per cent w/v solution of the substance under examination in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of cold air and spray with a mixture of 1 volume of *potassium ferricyanide solution*, 1 volume of *water* and 2 volumes of *ferric chloride solution*, prepared immediately before use. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.25 per cent, determined on 0.2 g.

Water (2.3.43). 9.0 to 12.0 per cent, determined on 0.3 g.

Assay. Dissolve 25 mg in sufficient *water* to produce 500.0 ml and measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7).

Calculate the content of $C_{37}H_{41}ClN_2O_6,HCl$ from the absorbance obtained by repeating the operation using 25 mg, weighed, of *tubocurarine chloride IPRS* in place of the substance under examination.

Storage. Store protected from moisture.

Tubocurarine Injection

Tubocurarine Chloride Injection

Tubocurarine Injection is a sterile solution of Tubocurarine Chloride in Water for Injections. It may contain suitable buffering agents.

Tubocurarine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of tubocurarine chloride, $C_{37}H_{41}ClN_2O_6,HCl,5H_2O$.

Usual strength. 10 mg per ml.

Description. A colourless or faintly coloured solution.

Identification

A. Mix a volume containing 15 mg of Tubocurarine Chloride with 5 ml of *acetone*, evaporate the liquid at a pressure of 2 kPa and add successive quantities of 2 ml of *acetone*, evaporating each quantity at a pressure of 2 kPa until a dry residue is obtained.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tubocurarine chloride IPRS* or with the reference spectrum of tubocurarine chloride.

B. Dilute 1 ml to 30 ml with *water*. To 1 ml of the resulting solution add 0.5 ml of *mercuric nitrate solution*; a cherry-red colour slowly develops.

Tests

pH (2.4.24). 4.0 to 6.0.

Optical rotation (2.4.22). + 0.172° to + 0.206° for each mg of tubocurarine chloride, $C_{37}H_{41}ClN_2O_6,HCl,5H_2O$ per ml stated on the label.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*

Mobile phase. The lower layer of a mixture of equal volumes of *chloroform*, *methanol* and a 12.5 per cent w/v solution of *trichloroacetic acid*.

Test solution. A volume of the injection containing 10 mg of Tubocurarine Chloride diluted to 1 ml.

Reference solution (a). Dilute 3 volumes of test solution to 200 volumes with *water*.

Reference solution (b). Dilute 1 volume of reference solution (a) to 2 volumes with *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of cold air and spray with a mixture of 1 volume of *potassium ferricyanide solution*, 1 volume of *water* and 2 volumes of *ferric chloride solution*, prepared immediately before use. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per mg of tubocurarine chloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a volume containing about 50 mg of Tubocurarine Chloride to 1000.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7).

Calculate the content of $C_{37}H_{41}ClN_2O_6,HCl,5H_2O$ taking 105 as the specific absorbance at 280 nm.

Storage. Store protected from moisture.

Tyrothricin is a mixture of antimicrobial linear and cyclic polypeptides, obtained from the fermentation broth of *Brevibacillus brevis* Dubos. It consists mainly of gramicidins and tyrocidins, other related compounds may be present in similar amount.

Tyrothricin has potency not less than 180 Units per mg and not more than 280 Units per mg, calculated on the dried basis.

Category. Polypeptide antibacterial.

Description. A white or almost white powder.

Identification

Test A may be omitted if a test B is carried out. Tests B may be omitted if test A is carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 2.5 volumes of *methanol*, 7.5 volumes of *butanol*, 20 volumes of *acetic acid*, 40 volumes of *butyl acetate* and 12 volumes of *water*.

Test solution. Dissolve 5 mg of the substance under examination in 4 ml of *ethanol (95 per cent)*.

Reference solution. Dissolve 5 mg of the *tyrothricin IPRS* in 4 ml of *ethanol (95 per cent)*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spots in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with reference solution.

Spray the plate with *dimethylaminobenzaldehyde solution*, heat the plate in warm air until spots appear and examine. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

The upper group corresponds to gramicidins, the lower group to tyrocidins.

B. Composition (as described under Tests).

Tests

Composition. Determine by liquid chromatography (2.4.14).

NOTE— Use freshly prepared solution and use immediately.

Test solution. Dissolve 5 mg of the substance under examination in 2 ml *methanol* and dilute to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of the *tyrothricin IPRS* in 2 ml of *methanol* and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 25 volumes of *ammonium sulphate* by dissolving 0.79 g in 1000 ml and 75 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 25 µl.

Name	Relative retention time
gramicidine C1	0.8
gramicidine C2	0.9
gramicidine A1 (retention time about 10 minutes)	1.0
gramicidine A2	1.1
tyrocidins	1.5 to 6

Inject reference solution (a). Run the chromatogram 6 times the retention time of principal peak of gramicidin A1.

Inject reference solution (b) and the test solution. The peaks to H_p and H_v valley ratio is not less than 3.0, where H_p = height

https://nhathuocngocanh.com/

above the baseline of the peak due to gramicidin A2 and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to gramicidin A1.

The sum of area of peaks for gramicidin other than principal peak in the chromatogram obtained with test solution is not less than 25.0 per cent and not greater than 50.0 per cent and sum of all the peaks for tyrocidins is not less than 50.0 per cent and not greater than 70.0 per cent and sum of the all peaks is not less than 85.0 per cent. Ignore any peak with the sum of the area due to gramicidins in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 1.5 per cent, determined on 1.0 g.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 60° under high vacuum for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method B (2.2.10). Use *gramicidin IPRS* as reference standard and prepare a test solution of tyrothricin containing about the same amount of gramicidin as the corresponding solution of *gramicidin IPRS* i.e. 5 times more concentrated.

Storage. Store protected from light and moisture.

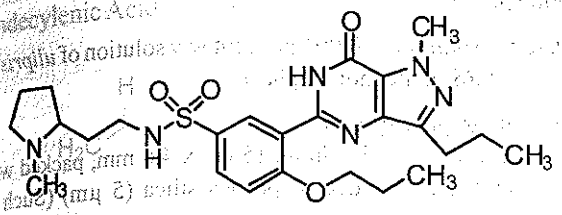
Udenafil



$C_{25}H_{36}N_6O_4S$ Mol Wt. 516.7

Udenafil is 5-{2-Propoxy-5-[*N*-2-(1-methylpyrolidin-2-yl)sulphamoyl]phenyl}-1-methyl-3-propyl-1,6-dihydro-7*H*-pyrazolo[4,3-d]pyrimidin-7-one

Udenafil contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{25}H_{36}N_6O_4S$, calculated on the dried basis.

Category. Erectile Dysfunction.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *udenafil IPRS* or with the reference spectrum of udenafil.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of mobile phase A and 60 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with solvent mixture.

Reference solution. A 0.0003 per cent w/v solution of *udenafil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. Dissolve 2.3 g of *ammonium dihyrogen orthophosphate* and 0.66 g of *diammonium hyrogen orthophosphate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 6.5 with *orthophosphoric acid*,

  B. a mixture of 85volumes of *acetonitrile* and 15volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
20	65	35
27	37	63
50	37	63
52	65	35
60	65	35

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of mobile phase A and 60 volumes of mobile phase B.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *udenafil IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.3 g of *ammonium dihyrogen orthophosphate* and 0.66 g of *diammonium hyrogen orthophosphate* in 1000 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 6.5 with *orthophosphoric acid*,

  B. a mixture of 85volumes of *acetonitrile* and 15volumes of *methanol*,

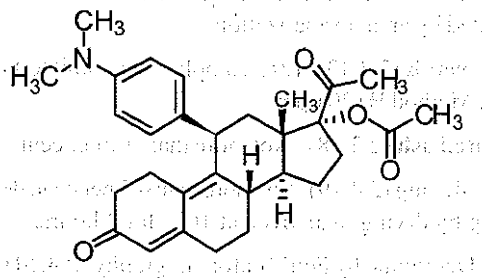
32	65	35
40	65	35

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates , the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{36}N_6O_4S$.

Ulipristal Acetate



$C_{30}H_{37}NO_4$ Mol Wt. 475.6

Ulipristal Acetate is 17α-acetoxy-11β-(4-dimetylaminophenyl)-3,20-dioxo-19-nor-4,9-pregnadiene.

Ulipristal Acetate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{37}NO_4$, calculated on dried basis.

Category. Selective progesterone receptor modulator (SPRM).

Description. A white to yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ulipristal acetate IPRS* or with the reference spectrum of ulipristal acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *ulipristal acetate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as inertsil),
- mobile phase: a mixture of 30 volumes of *water* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 307 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than the 2.0 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *ulipristal acetate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 25°,
- mobile phase: a mixture of 30 volumes of *water* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 307 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

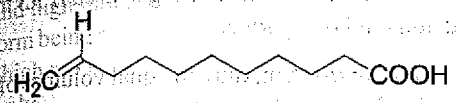
Inject the reference solution and the test solution.

Calculate the content of $C_{30}H_{37}NO_4$.

https://nhathuocngocanh.com/

Undecenoic Acid

Undecylenic Acid



$C_{11}H_{20}O_2$ Mol. Wt. 184.3

Undecenoic Acid is 10-undecenoic acid.

Undecenoic Acid contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{11}H_{20}O_2$.

Category. Antifungal (topical).

Description. A white or very pale yellow, crystalline mass or colourless or pale yellow liquid.

Identification

A. Dissolve 0.1 g in a mixture of 2 ml of *1 M sulphuric acid* and 5 ml of *glacial acetic acid* and add dropwise 0.25 ml of *potassium permanganate solution*; the colour of the permanganate solution is discharged.

B. Boil 2 g under a reflux condenser with 2 ml of freshly distilled *aniline* for 10 minutes, allow to cool, add 30 ml of *ether* and extract with three quantities, each of 20 ml, of *2 M hydrochloric acid* and then with 20 ml of *water*. Evaporate the organic layer to dryness on a water-bath. The residue, after recrystallising twice from *ethanol (70 per cent)* and drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 3 hours melts at 66° to 68°.

Tests

Congealing range (2.4.10). 21° to 24°.

Refractive index (2.4.27). 1.447 to 1.450.

Peroxide value (2.3.35). Not more than 10.

Iodine value (2.3.28). 131 to 140.

Fixed and mineral oils. Boil 1.0 g with 25 ml of *water* and 5 ml of *sodium carbonate solution* for 3 minutes. The hot solution is not more opalescent than opalescence standard OS2 (2.4.1).

Water-soluble acids. Shake 2.0 g with 20 ml of warm *water*, allow to separate and filter the aqueous layer through a moistened filter paper. To 5 ml of the filtrate add 0.01 ml of *dilute phenolphthalein solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

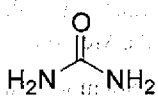
Sulphated ash (2.3.18). Not more than 0.15 per cent.

Assay. Dissolve 0.75 g in 10 ml of *ethanol (95 per cent)* and titrate with *0.5 M sodium hydroxide* using 0.1 ml of *dilute phenolphthalein solution* as indicator.

1 ml of *0.5 M sodium hydroxide* is equivalent to 0.09214 g of $C_{11}H_{20}O_2$.

Storage. Store protected from light and moisture.

Urea



CH_4N_2O Mol. Wt. 60.1

Urea is the diamide of carbonic acid.

Urea contains not less than 99.0 per cent and not more than 101.0 per cent of CH_4N_2O, calculated on the dried basis.

Category. Keratolytic.

Description. A white, crystalline powder or transparent crystals; slightly hygroscopic.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *urea IPRS* or with the reference spectrum of urea.

B. Heat 0.5 g in a test-tube; it liquefies, and ammonia is evolved which is recognised by its characteristic odour. Heat further until the liquid is turbid, cool and dissolve in 10 ml of *water*. Add 1 ml of a 10 per cent w/v solution of *sodium hydroxide* and 0.05 ml of *copper sulphate solution*; a reddish violet colour is produced.

C. Dissolve 0.1 g in 1 ml of *water* and add 1 ml of *nitric acid*; a white, crystalline precipitate is produced.

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Alkalinity. To 10 ml of a 5.0 per cent w/v solution (solution A) add 0.1 ml of *methyl red solution* and 0.4 ml of *0.01 M hydrochloric acid*; the resulting solution is red to orange.

Biuret. Not more than 0.1 per cent, determined by the following method. To 10 ml of a 20 per cent w/v solution add 5 ml of

https://nhathuocngocanh.com/

water, 0.5 ml of a 0.5 per cent w/v solution of *copper sulphate* and 0.5 ml of *10 M sodium hydroxide* and allow to stand for 5 minutes. Any reddish violet colour obtained is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of a 0.02 per cent w/v solution of *biuret* in place of the substance under examination.

Ethanol-insoluble matter. Not more than 0.04 per cent, determined by the following method. Dissolve 5.0 g in 50 ml of warm *ethanol (95 per cent)*, filter through a tared filter, wash the filter with 20 ml of warm *ethanol (95 per cent)* and dry at 105° for 1 hour.

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of *water* and 5 ml of *0.1 M hydrochloric acid*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Dissolve 0.5 g in sufficient of a 10 per cent v/v solution of *sulphuric acid* to produce 100.0 ml and mix. Place 5.0 ml of the resulting solution in a long-necked flask, add 10 ml of *sulphuric acid* and heat gently until evolution of gas ceases. Boil gently for 10 minutes, cool, cautiously add 40 ml of *water*, cool again and place in a steam-distillation apparatus. Add 50 ml of *10 M sodium hydroxide* and distil immediately by passing steam through the mixture. Continue the distillation for 1 hour, collecting the distillate in 40 ml of a 4 per cent w/v solution of *boric acid*. Titrate with *0.1 M hydrochloric acid*, using 0.25 ml of *methyl red-methylene blue solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.003003 g of CH_4N_2O.

Storage. Store protected from moisture.

Urea Cream

Urea Cream contains Urea in a suitable cream base.

Urea Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of urea, CH_4N_2O.

Usual strength. 10 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. For the first development use *2,2,4-trimethylpentane*. Dry the plate in air. For the second development use a mixture of 99 volumes of *ethanol* and 1 volume of *strong ammonia solution*.

Test solution. Disperse with heating a quantity of the cream containing 50 mg of Urea in 1 ml of *water*, cool, add 4 ml of *acetone*, mix and filter.

Reference solution (a). Dissolve 50 mg of *urea IPRS* in 1 ml of *water* and add 4 ml of *acetone*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with a solution containing 0.5 per cent w/v solution of *4-dimethylaminobenzaldehyde* and 0.5 per cent v/v of *sulphuric acid* in *ethanol*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows a single, compact spot.

B. To a quantity containing 0.1 g of Urea add 50 ml of *water* and heat until dispersed, cool in ice and filter through glass wool. Adjusted to pH 6.0 to 7.0 using *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* as necessary. To 5 ml add 5 ml of a 0.1 per cent w/v suspension of urease-active meal and allow to stand for 30 minutes in a stoppered flask at 37°. When the resulting solution is heated in a water-bath a vapour is produced that turns moist red *litmus paper* blue.

Tests

Other tests. Complies with the tests stated under Creams.

Assay. Weigh a quantity containing 42 mg of Urea, shake with 150 ml of hot *water* for 20 minutes, allow to cool and dilute to 500.0 ml with *water*. Filter through a fine glass microfibre filter paper or by any other means, transfer 1.0 ml of the filtrate to a 100-ml volumetric flask, add 2 ml of a 0.1 per cent w/v suspension of urease-active meal, stopper the flask and allow to stand for 15 minutes at 37°. Immediately add 25 ml of a solution containing 12 g of *sodium salicylate* and 0.24 g of *sodium nitroprusside* in 200 ml and 25 ml of a solution prepared by diluting a volume of *sodium hypochlorite solution* containing 0.66 g of available chlorine with *0.2 M sodium hydroxide* to 1000 ml. Mix well, allow to stand at 37° for 5 minutes and dilute to 100.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 665 nm (2.4.17), using as the blank a solution prepared in the same manner but using 1.0 ml of *water* in place of 1.0 ml of the filtrate.

Calculate the content of CH_4N_2O from the absorbance obtained by using 42 mg of urea RS in place of the substance under examination.

Storage. Store in accordance with the instructions of the manufacturer.

https://nhathuocngocanh.com/

Urokinase

Urokinase is an enzyme, obtained from human urine that activates plasminogen. It consists of a mixture of low molecular weight and high molecular weight forms, the high molecular weight form being predominant. The molecular weights of the low and high molecular weight forms are 33,000 and 54,000 respectively.

It is prepared in conditions designed to minimise microbial and viral contamination. In particular, adequate measures, such as heating the substance in solution at 60° for 10 hours, are taken to inactivate viruses.

Urokinase contains not less than 70,000 Units of urokinase activity per mg of protein.

Category. Fibrinolytic enzyme.

Description. A white or almost white, amorphous powder.

Identification

A. Place 0.5 ml of citrated human plasma and 0.5 ml of citrated bovine plasma in two separate haemolysis tubes maintained in a water-bath at 37°. To each tube add 0.1 ml of a solution of the substance under examination containing 1000 Units per ml in *phosphate buffer pH 7.4* and 0.1 ml of a solution of thrombin containing 20 Units per ml in *phosphate buffer pH 7.4* and shake immediately; in both tubes, a clot forms and lyses within 30 minutes.

B. Carry out a suitable immunodiffusion test.

Tests

Appearance of solution. A 0.1 per cent w/v solution in *water* is clear (2.4.1), and colourless (2.4.1).

Molecular fractions. Determine by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of *0.02 M phosphate buffer pH 8.0*.

Chromatographic system

- a column 90 cm × 16 mm, packed with a cross-linked dextran suitable for fractionation of proteins in the range of molecular weight from 4000 to 150,000 (Such as Sephadex G-100) at 5°,
- mobile phase: 1.75 per cent w/v solution of *sodium chloride* in *0.02 M phosphate buffer pH 8.0*,
- flow rate: 6 ml per hour,
- spectrophotometer set at 280 nm.

Apply 1 ml of the test solution to the column, rinse twice with 0.5 ml portions of the buffer and then carry out the elution. The eluate may be collected in 1 ml fractions. Plot the individual absorbances on a graph. Draw perpendicular lines towards the axis of the abscissae from the minima before the high molecular weight peak, between the high and the low molecular weight peaks, and after the low molecular weight peak. Combine separately the high and low molecular weight fractions and for each combined fraction determine the activity by the method described under Assay. The ratio of the activity in the combined high molecular weight fraction to that in the combined low molecular weight fraction is not less than 2.0.

Total protein. Determine by Method C for the determination of nitrogen (2.3.30), using 10 mg of the substance under examination and multiplying the result by 6.25 to obtain the content of protein.

Hepatitis-B surface antigen. Examine by a suitably sensitive method such as radio-immunoassay; hepatitis-B surface antigen is not detected.

Abnormal toxicity (2.2.1). Complies with the test, using a solution containing 2,500 Units in 0.5 ml of *saline solution*.

Thromboplastic contaminants. Dissolve suitable quantities of the substance under examination in *barbitone buffer pH 7.4* to obtain solutions containing 5000, 2500, 1250, 625 and 312 Units per ml. Into each of six haemolysis tubes, 1 cm in internal diameter, place 0.1 ml of citrated rabbit plasma. Add 0.1 ml of one of each of the solutions of the substance under examination to each of five of the tubes and 0.1 ml of *barbitone buffer pH 7.4* to the sixth (control). Incubate the six tubes at 25° ± 0.5° for 5 minutes and then add 0.1 ml of a 0.3675 per cent w/v solution of *calcium chloride*. Using a stop-watch, measure the clotting time for each solution and the control. Plot the shortening of the recalcification time (control clotting time minus clotting time for each solution) against log concentration. Extrapolate the best-fitting straight line through the five points until it reaches the log concentration axis. The urokinase activity at the intersection point represents the limit concentration for clotting activity (zero clotting activity). The zero clotting activity is not less than 150 Units per ml.

Vasoactive substances. Anesthetise a rabbit by intraperitoneal injection of 0.15 g of *phenobarbitone sodium* per kg of body weight. Dissolve in *normal saline solution* a sufficient quantity of the substance under examination to give a solution containing 40,000 Units per ml. Administer by intravenous infusion at a rate of 1 ml per minute a sufficient volume of the solution of the substance under examination such that the dose is 20,000 Units per kg of body weight. Measure the arterial pressure and heart rate at intervals of 15 minutes for 5 hours after the infusion. No significant and lasting alterations in arterial pressure or heart rate are produced, except those arising from the effects of the anaesthetic.

Assay. The potency of urokinase is determined by comparing its ability to activate human plasminogen to form plasmin with that of the Standard Preparation. The plasmin generated is

https://nhathuocngocanh.com/

determined by measurement of the time taken to lyse a fibrin clot under the conditions of a suitable method of Assay.

Standard Preparation

The Standard Preparation is the 1st International Reference Preparation for Urokinase, human, established in 1968, consisting of partially purified freeze-dried urokinase from human urine with lactose (supplied in ampoules containing 4800 Units of urokinase activity) or another suitable preparation the activity of which has been determined in relation to the International Reference Preparation.

Method

Unless otherwise prescribed, use *phosphate buffer pH 7.4* containing 3.0 per cent w/v solution of *bovine albumin* for the preparation of solutions and dilutions.

Prepare a solution of the Standard Preparation containing 1000 Units of urokinase activity per ml and prepare a solution of the preparation under examination expected to have the same concentration; keep the solutions in ice and use within 6 hours. Prepare three 1.5-fold serial dilutions of the solution of the Standard Preparation so that the longest clot-lysis time is less than 20 minutes and the shortest clot-lysis time is greater than 3 minutes. Prepare three similar dilutions of the solution of the preparation under examination. Keep the solutions in ice and use within 1 hour. Using 24 tubes 8 mm in diameter, label the tubes S_1, S_2, S_3 for the dilutions of the Standard Preparation and T_1, T_2, T_3 for the dilutions of the preparation under examination, allocating four tubes to each dilution. Place the tubes in ice. Into each tube introduce 0.2 ml of the appropriate dilution, 0.2 ml of *phosphate buffer pH 7.4* containing 3 per cent w/v solution of *bovine albumin* and 0.1 ml of a solution containing 20 Units of *thrombin* per ml. Place the tubes in a water-bath at 37° and allow to stand for 2 minutes to attain temperature equilibrium. Using an automatic pipette, introduce into the bottom of the first tube 0.5 ml of a 1.0 per cent w/v solution of *bovine euglobulin fraction* ensuring mixing. At 5-second intervals introduce successively into the remaining tubes 0.5 ml of a 1.0 per cent w/v solution of *bovine euglobulin fraction*. Using a stop-watch, measure for each tube the time in seconds that elapses between the addition of the euglobulin and the lysis of the clot.

Using the logarithms of the lysis times, calculate the result of the assay by standard statistical methods.

The estimated potency is not less than 90.0 per cent and not more than 111.0 per cent of the stated potency.

The fiducial limits of error are not less than 80.0 per cent and not more than 125.0 per cent of the stated potency.

Urokinase intended for use in the manufacture of parenteral preparations or ophthalmic preparations complies with the following additional requirements.

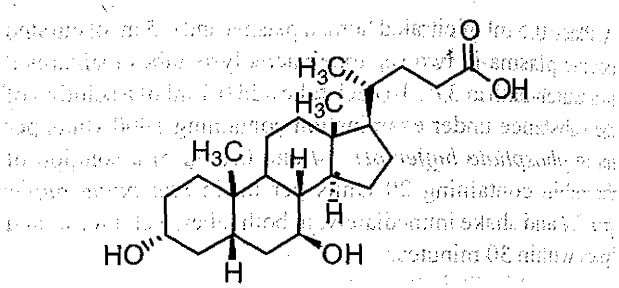
Bacterial endotoxins (2.2.3). Not more than 0.002 Endotoxin Unit per Unit of urokinase activity.

Sterility (2.2.11). Complies with the test for sterility, if the urokinase intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure.

Storage. Store protected from light in a refrigerator (2° to 8°). The containers should be sterile, tamper-evident and sealed so as to exclude microorganisms.

Labelling. The label states (1) the number of Units of urokinase activity in the container; (2) the number of Units of urokinase activity per mg of protein; (3) the storage conditions; (4) whether or not it is intended for use in the manufacture of parenteral preparations or ophthalmic preparations.

Ursodeoxycholic Acid



$C_{24}H_{40}O_4$ Mol. Wt. 392.6

Ursodeoxycholic Acid is 3α,7β-dihydroxy-5β-cholan-24-oic acid.

Ursodexoxycholic acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{24}H_{40}O_4$, calculated on the dried basis.

Category. Treatment of gallstones.

Description. A white or almost white powder.

Identification

Tests B and C may be omitted if test A is carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ursodeoxycholic acid IPRS* or with the reference spectrum of ursodeoxycholic acid.

B. In the test for Impurity C, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (a).

https://nhathuocngocanh.com/

C. Dissolve 10 mg in 1 ml of *sulphuric acid*. Add 0.1 ml of *formaldehyde solution* and allow to stand for 5 minutes, add 5 ml of *water*; the suspension obtained is greenish-blue.

Tests

Specific optical rotation (2.4.22). +58.0° to +62.0°, determined on 2.0 per cent w/v solution in *ethanol*.

Impurity C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Solvent mixture. 10 volumes of *water* and 90 volumes of *acetone*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *dichloromethane*.

Test solution (a). Dissolve 0.4 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). A 0.4 per cent w/v solution of *ursodeoxycholic acid IPRS* in the solvent mixture.

Reference solution (b). A 0.2 per cent w/v solution of *lithocholic acid IPRS (ursodeoxycholic acid impurity C IPRS)* in the solvent mixture (Solution A). Dilute 2.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (c). To 5.0 ml of solution A, add 10 mg of *chenodeoxycholic acid IPRS (ursodeoxycholic acid impurity A IPRS)* and dilute to 50.0 ml with the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 120° for 10 minutes and spray immediately with a 4.76 per cent w/v solution of *phosphomolybdic acid* in a mixture of 1 volume of *sulphuric acid* and 20 volumes of *glacial acetic acid* and heat at 120° until blue spots appear on a lighter background. In the chromatogram obtained with reference solution (c), the chromatogram shows 2 clearly separated spots. In the chromatogram obtained with test solution (a), any spot due to ursodeoxycholic acid impurity C is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *methanol* and 90 volumes of the mobile phase.

Test solution. Dissolve 60 mg of the substance under examination in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *acetonitrile*, 37 volumes of a 0.078 per cent w/v solution of *sodium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 40 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- refractometer detector at 35°,
- injection volume: 150 µl.

Name	Relative retention time
Ursodeoxycholic acid impurity H[1]	0.9
Ursodeoxycholic acid (Retention time: about 14 minutes)	1.0
Ursodeoxycholic acid impurity A[2]	2.8

[1] 3α,7α-dihydroxy-5α-cholan-24-oic acid,

[2] chenodeoxycholic acid.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to ursodeoxycholic acid impurity A is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Dissolve 0.35 g in 50 ml of *ethanol (95 per cent)*, previously neutralised to 0.2 ml of *phenolphthalein solution*.

https://nhathuocngocanh.com/

Add 50 ml of *water* and titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03926 g of $C_{24}H_{40}O_4$.

Ursodeoxycholic Acid Tablets

Ursodeoxycholic Acid Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of ursodeoxycholic acid, $C_{24}H_{40}O_4$.

Usual strengths. 150 mg; 300 mg and 600 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.1 g of Ursodeoxycholic Acid with 10 ml of *ethanol* (*95 per cent*), centrifuge and evaporate the supernatant liquid to dryness in a stream of nitrogen in a water-bath at room temperature. Dry the residue at room temperature at a pressure of 0.7 kPa for 2 hours. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ursodeoxycholic acid IPRS* or with the reference spectrum of ursodeoxycholic acid.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of phosphate buffer prepared by using 0.68 per cent w/v *potassium dihydrogen orthophosphate*, adjusted to pH 8.0 using *2 M sodium hydroxide*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 17 mg of *ursodeoxycholic acid IPRS* in 1 ml of *ethanol* (*95 per cent*) and dilute to 100.0 ml with the dissolution medium.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 280 volumes of *acetonitrile* and 720 volumes of a 0.05 M phosphate buffer prepared by dissolving 6.81 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 6.5 with *2 M sodium hydroxide*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 100 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{40}O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{40}O_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase A. A mixture of 5 volumes of *acetic acid*, 5 volumes of *methanol* and 90 volumes of *chloroform*.

Mobile phase B. A mixture of 1.25 volumes of *acetic acid*, 50 volumes of *ethyl acetate* and 50 volumes of *2,2,4-trimethylpentane*.

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Ursodeoxycholic Acid with 10 ml of *ethanol* (*95 per cent*) with the aid of ultrasound for 15 minutes, centrifuge.

Reference solution (a). A solution containing 0.01 per cent w/v of *lithocholic acid IPRS*, 0.05 per cent w/v of *cholic acid IPRS* and 0.15 per cent w/v of *chenodeoxycholic acid IPRS* in *methanol*. Dilute 1.0 ml of the solution to 10.0 ml with *acetone*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with *ethanol* (*95 per cent*).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm with mobile phase A, dry in air and then develop the plate to 8 cm in the same direction with mobile phase B. After removal of the plate, heat at 110° to 120° for 30 minutes. Spray immediately with a solution containing 5.0 per cent w/v of *phosphomolybdic acid* in a mixture of 5 ml of *sulphuric acid* and 95 ml of *glacial acetic acid*. Heat the plate for a further 5 to 10 minutes at 110° to 120° until dark blue spots appear on a white or pale blue background. In the chromatogram obtained with the test solution, the area of any spot corresponding to lithocholic acid is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.1 per cent), any spot corresponding to cholic acid is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.5 per cent). Any spot corresponding to chenodeoxycholic acid is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (1.5 per cent). Any other secondary spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Other tests. Comply with the tests stated under tablets.

https://nhathuocngocanh.com/

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A solution containing 535 ml of *water*, 6.0 g of *sodium dihydrogen orthophosphate dihydrate*, 2.0 g of *disodium hydrogen orthophosphate dihydrate*, 65 ml of *tetrabutylammonium hydroxide solution* and 400 ml of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.3 g of Ursodeoxycholic Acid in 20 ml of the solvent mixture with the aid of ultrasound for 15 minutes and filter.

Reference solution. A 1.5 per cent w/v solution of *ursodeoxycholic acid IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 500 volumes of *acetonitrile* and 500 volumes of a solution containing 1.2 per cent w/v of *sodium dihydrogen orthophosphate dihydrate*, 0.4 per cent w/v of *disodium hydrogen orthophosphate dihydrate* and 1.08 per cent w/v of *tetrabutylammonium hydrogen sulphate* in *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{40}O_4$ in the tablets.

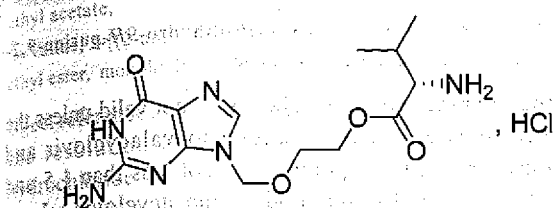
Valacyclovir Hydrochloride



$C_{13}H_{20}N_6O_4,HCl$ Mol. Wt. 360.8

Valacyclovir Hydrochloride is *L*-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy] ethyl ester, monohydrochloride.

Valacyclovir Hydrochloride contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{13}H_{20}N_6O_4.HCl$, calculated on the anhydrous basis.

Category. Antiviral

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valacyclovir hydrochloride IPRS* or with the reference spectrum of valacyclovir hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution gives the reaction (A) of chlorides (2.3.1).

Tests

Related substances.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254* (prewash the plate with *methanol*).

Mobile phase. A mixture of 54 volumes of *methylene chloride*, 34 volumes of *methanol*, 12 volumes of *tetrahydrofuran* and 3 volumes of *ammonia solution*.

Test solution. Dissolve 0.25 g of the substance under examination in 2 ml of *water*, with the aid of ultrasound for 20 minutes and dilute to 5.0 ml with *ethanol* and filter.

Reference solution (a). Dissolve 5 mg, each of, *valacyclovir related compound D IPRS* and *valacyclovir related compound G IPRS*, 10 mg, each of, *valacyclovir related compound E IPRS* and *valacyclovir related compound F IPRS* in 2 ml of *water* and 6 ml of *ethanol*, with the aid of ultrasound for 20 minutes and dilute to 10.0 ml with *ethanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *ethanol*.

Reference solution (c). Dilute 0.5 ml of reference solution (a) to 10.0 ml with *ethanol*.

Apply to the plate 4 µl of the test solution and reference solution (b) and (c). Allow the mobile phase to rise 10 cm. Dry the plate in air. Examine the plate under ultraviolet light at 254 nm and visually estimate the valacyclovir related compounds E and G in the sample using the appropriate reference solution spots. The chromatograms obtained with the reference solution (b) and (c) each show three clearly separated spots due to valacyclovir related compound D, E and G. Spray the plate with 0.01 per cent w/v of *fluorescamine* in *ethylene dichloride* and examine the plate under ultraviolet light at 365 nm to estimate the level of valacyclovir related compound F in the sample using the appropriate reference solution spot.

Name	Relative R_f value
Valacyclovir hydrochloride	1
Valacyclovir related compound D[1*]	1.1
Valacyclovir related compound E[2]	1.3
Valacyclovir related compound F[3]	1.8
Valacyclovir related compound G[4]	1.9

*This impurity is controlled in Method B of Related substances.

[1]2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-ethyl-*L*-valinate,

[2]2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-[(benzyloxy)carbonyl]-*L*-valinate,

[3]2-hydroxyethyl-*L*-valinate,

[4]*N*,*N*-dimethylpyridin-4-amine.

In the chromatogram obtained with the test solution, any spot corresponding to valacyclovir related compound E is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.2 per cent), any spot corresponding to valacyclovir related compound F is not more intense than the corresponding spot in the chromatogram obtained with reference solution (c) (0.1 per cent) and any spot corresponding to valacyclovir related compound G is not more intense than the corresponding spot in the chromatogram obtained with reference solution (c) (0.05 per cent).

B. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *ethanol* and 80 volumes of *water*.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

https://nhathuocngocanh.com/

Reference solution. A solution containing 0.04 per cent w/v of *valacyclovir hydrochloride IPRS*, 0.00008 per cent w/v of *valacyclovir related compound C IPRS* and 0.00016 per cent w/v of *acyclovir related compound A IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5µm),
- column temperature: 15°,
- mobile phase: A. a 0.3 per cent w/w solution of *trifluoroacetic acid* in *water*,
  B. a 0.3 per cent w/w solution of *trifluoroacetic acid* in *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
5	90	10
35	60	40
35.1	90	10
45	90	10

Name	Relative retention time
Guanine[1,2]	0.31
Acyclovir[1,3]	0.42
Acyclovir alaninate[4]	0.54
Valacyclovir	1.00
Valacyclovir related compound C[5]	1.06
Acyclovir related compound A[1,6]	1.09
Valacyclovir related compound D[7]	1.17
Acyclovir isoleucinate[8]	1.30
N-formyl valacyclovir[9]	1.61
Guaninyl valacyclovir[10]	1.66
Bis valacyclovir[11]	2.00

[1]This impurity is controlled in Method C of Related substances,

[2]2-amino-1*H*-purin-6(9*H*)-one (guanine),

[3]9-[(2-hydroxyethoxy)methyl]guanine (acyclovir),

[4]9-[(2-hydroxyethoxy)methyl]guanine *L*-alaninate,

[5]2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-methyl-*L*-valinate,

[6]2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl acetate,

[7]2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-ethyl-*L*-valinate,

[11]2,2'[Methylenebis[imino(6-oxo-1,6-dihydro-9*H*-purine-9,2-diyl)methylene-oxy]]diethyl di(*L*-valinate).

Inject the reference solution. The test is not valid unless the resolution between the peaks due to valacyclovir and valacyclovir related compound C is not less than 1.5 and valacyclovir related compound C and acyclovir related compound A is not less than 1.5 and the tailing factor is not more than 1.5 for valacyclovir peak.

Inject the test solution. The area of any peak corresponding to acyclovir alaninate, acyclovir isoleucinate and guaninyl valacyclovir, each of, is not more than 0.2 per cent, the area of any peak corresponding to valacyclovir related compound C, bis valacyclovir, each of is not more than 0.3 per cent, the area of any peak corresponding to valacyclovir related compound D is not more than 0.5 per cent, the area of any peak corresponding to N-formyl valacyclovir is not more than 0.8 per cent and the area of any other secondary peak is not more than 0.1 per cent, calculated by area normalization.

C. Determine by liquid chromatography (2.4.14),

Test solution. Dissolve 50 mg of the substance under examination in *0.05 M hydrochloric acid* and dilute to 100.0 ml with the *0.05 M hydrochloric acid*.

Reference solution (a). A 0.05 per cent w/v solution of *valacyclovir hydrochloride IPRS* in *0.05 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *0.05 M hydrochloric acid*.

NOTE — Valacyclovir hydrochloride IPRS contains a detectable quantity of D-valacyclovir.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, a crown ether coated on silica gel substrate. The active site is (S)—18-crown-6-ether (5 µm) (Such as Crown Pak CR (+)),
- column temperature: 10°,
- mobile phase: a mixture 19 volumes of *water*, 1 volume of *methanol* and 0.1 volume of *perchloric acid*,
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Guanine and acyclovir[1,2]	0.18	0.66
Acyclovir related compound A[3]	0.42	0.89
D-Valacyclovir[4]	0.55	—
Valacyclovir	1.0	—

[1]2-amino-1*H*-purin-6(9*H*)-one (guanine),

https://nhathuocngocanh.com/

9-[(2-hydroxyethoxy)methyl]guanine (acyclovir),
2-[(2-amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl acetate,
D-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl) methoxy]ethyl ester, monohydrochloride.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to valacyclovir hydrochloride and *D*-valacyclovir is not less than 2.0 in the chromatogram obtained with reference solution (a) and the relative standard deviation for replicate injections is not more than 5.0 per cent, in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to guanine and acyclovir is not more than twice the area of principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent), the area of any peak corresponding to acyclovir related compound A is not more than 0.2 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak due to *D*-valacyclovir is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

The sum of all the impurities from related substance test A, B and C is not more than 5.0 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent (for the anhydrous form) and 5.0 to 11.0 per cent (for the hydrous form).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances C.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to valacyclovir hydrochloride and *D*-valacyclovir is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{20}N_6O_4$,HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Valacyclovir Tablets

Valacyclovir Hydrochloride Tablets

Valacyclovir Tablets contain valacyclovir hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valacyclovir, $C_{13}H_{20}N_6O_4$.

Usual strengths. 500 mg; 1000 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Disperse a quantity of powdered tablets containing 0.1 g of Valacyclovir Hydrochloride in 10 ml of *water*. It gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with 0.1 per cent v/v solution of *orthophosphoric acid*.

Reference solution. Dissolve a quantity of *valacyclovir hydrochloride IPRS* in 0.1 per cent v/v solution of *orthophosphoric acid* and dilute with the same medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 5.0 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 95 volumes of 0.1 per cent v/v solution of *orthophosphoric acid* and 5 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

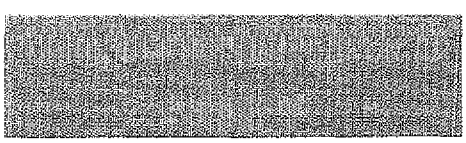
Calculate the content of $C_{13}H_{20}N_6O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{13}H_{20}N_6O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.1 per cent v/v solution of *orthophosphoric acid* in *water*.

Test solution. Disperse a quantity of powdered tablets containing 0.25 g of Valacyclovir Hydrochloride in 80 ml of *0.1 M hydrochloric acid*, with the aid of ultrasound with intermittent shaking and dilute to 100.0 ml with *0.1 M*



https://nhathuocngocanh.com/

hydrochloric acid. Dilute 1.0 ml of the solution to 25.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.01 per cent w/v solution of *valacyclovir hydrochloride IPRS* in the solvent mixture.

NOTE — Valacyclovir hydrochloride IPRS contains a detectable amount of D-valacyclovir.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, a crown ether coated silica gel substrate. The active site is (S)-=18-crown-6-ether,(5µm) (Such as Crownpak CR(+)),
- column temperature: 10°,
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of the solvent mixture,
- flow rate: 0.75 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Acyclovir[1]	0.56	0.71
D-Valacyclovir[2*]	0.82	—
Valacyclovir	1.00	—

*Process impurity included for identification only. To be controlled in drug substance.

[1]2-Amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*-purin-6-one.

[2]*D*-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy] ethyl ester, monohydrochloride.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peak due to *D*-valacyclovir and valacyclovir is not less than 1.3, the tailing factor is not more than 2.0 for valacyclovir peak in the chromatogram obtained with reference solution (a), and the relative standard deviation for replicate injection is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to acyclovir is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14). as described under Related substances using following modifications.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to *D*-valacyclovir and valacyclovir is not less than 1.3, the tailing factor is not more than 2.0 for the valacyclovir peak and the relative standard deviation for replicate injection is not more than 2.0 per cent.

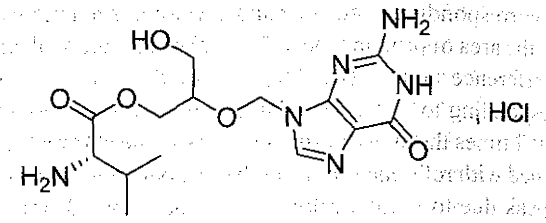
Inject reference solution (a) and the test solution.

Calculate the content of $C_{13}H_{20}N_6O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of valacyclovir.

Valganciclovir Hydrochloride



$C_{14}H_{22}N_6O_5,HCl$ Mol. Wt. 390.8

Valganciclovir Hydrochloride is *L*-Valine, ester with 9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]guanine, monohydrochloride.

Valganciclovir Hydrochloride contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{14}H_{22}N_6O_5,HCl$, calculated on the anhydrous and solvent free basis.

Category. Antiviral

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valganciclovir hydrochloride IPRS* or with the reference spectrum of valganciclovir hydrochloride.

B. When examined in the range of 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol*, shows an absorption maxima at the same wavelength as obtained with the same concentration of the reference solution.

C. A 5.0 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

Limit of isopropyl alcohol. Not more than 1.0 per cent.

Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.1 per cent v/v solution of *1,4-dioxane* in *dimethylformamide*.

https://nhathuocngocanh.com/

Test solution. Dissolve 100 mg of the substance under examination in 2.0 ml of internal standard solution.

Reference solution (a). Dilute 1.0 ml of *isopropyl alcohol* and 0.1 ml of *toluene* to 100.0 ml with *dimethylformamide.*

Reference solution (b). Dilute 0.1 ml of reference solution (a) to 2.0 ml with the internal standard solution.

Chromatographic system

- a capillary column 30 m x 0.53 mm, coated with 6 per cent cyanopropylphenyl- 94 per cent dimethylpolysiloxane (film thickness 3.0 µm) (Such as DB-624),
- temperature:
  - column. 40° for 10 minutes, 40° to 240° @ 25° per minute and hold at 240° for 15 minutes,
  - inlet port at 250° and detector at 300°,
- flame ionization detector,
- split ratio :1:15,
- flow rate: 10.5 ml per minute, using nitrogen as the carrier gas.
- injection volume: 0.5 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to 1,4-dioxane and toluene is not less than 8.0, the column efficiency is not less than 6000 theoretical plates for 1,4-dioxane peak and the relative standard deviation of peak area ratios of isopropyl alcohol to the 1,4-dioxane for replicate injections is not more than 15.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of isopropyl alcohol using ratio of peak area of isopropyl alcohol to that of peak area of 1,4-dioxane.

Related substances.

A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of *0.001 M hydrochloric acid.*

Reference solution. A solution containing 0.02 per cent w/v of *valganciclovir hydrochloride IPRS* and 0.001 per cent w/v of *methoxymethylguanine IPRS* in *0.001 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as zorbax SB C18),
- mobile phase: A. a buffer solution prepared by dissolving 11.5 g of *monobasic ammonium phosphate* in 900 ml of *water,* adjusted to pH 2.8 with *orthophosphoric acid* and dilute to 1000 ml with *water,*
  B. *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	92	8
5	92	8
15	80	20
30	30	70
30.1	92	8
45	92	8

Name	Relative retention time	Correction factor
Guanine*	0.28	0.53

Valganciclovir dimer* (stereisomer C)	2.54	—

*Specified impurity.

**Other identified impyrity.

*# Reported as the sum of diasteromers.

NOTE — The retention time for the second peak of valganciclovir is between 5 and 8.5 minutes.

Inject the reference solution. The test is not valid unless the resolution between the first peak of valganciclovir and methoxymethylguanine peak is not less than 1.0 and the resolution between the two peaks of valganciclovir (R and S esters of L-valine) is not less than 3.0, the column efficiency is not less than 8000 theoretical plates and the tailing factor is not more than 1.4 for the second peak of valganciclovir.

Inject the test solution. The area of any peak corresponding to bis-valine ester of ganciclovir, homologue of valganciclovir (H), homologue of valganciclovir (I), valganciclovir dimer (stereisomer A), valganciclovir dimer (stereisomer B) and valganciclovir dimer (stereisomer C), each of, is not more than 0.1 per cent, the area of any peak corresponding to

https://nhathuocngocanh.com/

monoacetoxyganciclovir and ganciclovir monopropionate, each of, is not more than 0.15 per cent, the area of any peak corresponding to guanine and homologue of valganciclovir (G), each of, is not more than 0.25 per cent, the area of any peak corresponding to methoxymethylguanine is not more than 0.3 per cent, the area of any peak corresponding to isovalganciclovir is not more than 0.5 per cent, the area of any peak corresponding to ganciclovir is not more than 1.5 per cent and the sum of the areas of peaks corresponding to bis valine ester of ganciclovir and ganciclovir mono propionate is not more than 0.25 per cent, the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all other secondary peaks is not more than 0.25 per cent, calculated by area normalization.

Diastereomer ratio. Using the chromatogram obtained with the test solution under Related substances A. Calculate the percentage of valganciclovir (*R* and *S* esters of *L*-valine) by the following expression.

$$100 \times \left(\frac{A_1}{A_1 + A_2} \right)$$

$$100 \times \left(\frac{A_2}{A_1 + A_2} \right)$$

where, A_1 and A_2 are the peak areas of the valganciclovir (*R* and *S* esters of *L*-valine). The diastereomer ratio is (45:55) to (55:45).

B. Determine by liquid chromatography (2.4.14), as described under Related substances test A with the following modifications.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with phenyl groups bonded to porous silica (3.5 µm) (Such as zorbax SB phenyl),
- mobile phase: A. a buffer solution prepared by diluting 2.5 ml of *triethylamine* to 1000 ml *water*, adjusted to pH 3.0 with *trifluoroacetic acid*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	93	7
10	93	7
20	70	30
21	93	7
35	93	7

Name	Relative retention time
Valganciclovir	1.00
Ganciclovir mono-*N*-methyl valinate	1.2

NOTE — The retention time for the second peak of valganciclovir is between 6 and 9 minutes.

Inject the reference solution. The test is not valid unless the resolution between the two peaks of valganciclovir (*R* and *S* esters of *L*-valine) is not less than 1.3, the column efficiency is not less than 8000 theoretical plates and the tailing factor is not more than 1.2 for the second peak of valganciclovir.

Inject the test solution. The area of any peak corresponding to ganciclovir mono-*N*-methyl valinate (sum of distereomers) is not more than 0.3 per cent, the area of any other secondary peak is not more than 0.1 per cent and the sum of areas of all other secondary peaks is not more than 0.25 per cent, calculated by area normalization.

The sum of all the impurities calculated under method A and B is not more than 3.0 per cent.

Enantiomeric purity. Not less than 97.0 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 10 mg of the substance under examination in *0.001 M hydrochloric acid* and dilute to 50.0 ml with *0.001 M hydrochloric acid*.

Reference solution. A solution containing 0.02 per cent w/v of *valganciclovir hydrochloride IPRS* and 0.002 per cent w/v of *D-valganciclovir IPRS* in *0.001 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with crown ether coated bonded to porous silica (5 µm) (Such as crownpack CR (+),
- mobile phase: a 1.62 per cent w/v solution of *perchloric acid* in *water*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to second peak of *D*-valine ester and first peak of valganciclovir is not less than 3.5, the column efficiency is not less than 1800 theoretical plates for the second peak of valganciclovir.

Inject the test solution and calculate the enantiomeric purity by the following expression.

$$100 \times \left(\frac{A}{A + B} \right)$$

https://nhathuocngocanh.com/

Where, A is the sum of the peak area of valganciclovir (*R* and *S* esters of L-valine) and B is the sum of the peak area of enantiomeric impurities (*R* and *S* esters of D-valine).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in *0.001 M hydrochloric acid* and dilute to 100.0 ml with *0.001 M hydrochloric acid*.

Reference solution (a). A 0.02 per cent w/v solution of *valganciclovir hydrochloride IPRS* in *0.001 M hydrochloric acid*.

Reference solution (b). A solution containing 0.02 per cent w/v of *valganciclovir hydrochloride IPRS* and 0.001 per cent w/v of *methoxymethylguanine IPRS* in *0.001 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Zorbax SB C-18),
- mobile phase: a mixture of 92 volumes of a buffer solution prepared by dissolving 11.5 g of *monobasic ammonium phosphate* in 900 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 8 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the first peak of valganciclovir and methoxymethylguanine peak is not less than 1.0 and the resolution between the two peaks of valganciclovir (*R* and *S* esters of L-valine) is not less than 3.0, the column efficiency is not less than 8000 theoretical plates for the second peak of valganciclovir and the tailing factor is not more than 1.4 for the second peak of valganciclovir in the chromatogram obtained with reference solution (b). The relative standard deviation of the correction factor (C) for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a), the correction factor (C) calculate by the following expression.

$$C = \frac{\left(\frac{W_s}{R_s}\right)}{100}$$

where, W_s is the weight (in mg) of *valganciclovir IPRS* in reference solution (a) preparation and R_s is the sum of the areas of the two peaks of valganciclovir diastereomers in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{22}N_6O_5$.HCl

Storage. Store protected from moisture, at temperature not exceeding 25°.

Valganciclovir Tablets

Valganciclovir Hydrochloride Tablets

Valganciclovir Tablets contain not less than 93.0 per cent and not more than 105.0 per cent of the stated amount of valganciclovir, $C_{14}H_{22}N_6O_5$.

Usual strength. 450 mg

Identification

A. When examined in the range of 200 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *0.001 M hydrochloric acid*, shows an absorption maximum as obtained with *valganciclovir hydrochloride IPRS* of the same concentration.

B. In the Assay, the diastereomeric peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through 10 µm polyethylene filter, dilute if necessary, with the dissolution medium. Measure the absorbance of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 254 nm (2.4.7) using 0.02 cm cuvette. Calculate the content of $C_{14}H_{22}N_6O_5$ in the medium from the absorbance obtained from a solution of known concentration of *valganciclovir hydrochloride IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{22}N_6O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 450 mg of valganciclovir in 800 ml of *0.001 M*

https://nhathuocngocanh.com/

hydrochloric acid, with the aid of ultrasound and dilute to 1000.0 ml with *0.001 M hydrochloric acid*.

Reference solution (a). A solution containing 0.001 per cent w/v of *ganciclovir mono-N-methyl valinate IPRS (2-(RS)-[(Guanin-9-yl)methoxy]-3-hydroxypropyl N-methyl-L-valinate)* and 0.78 per cent w/v of *valganciclovir hydrochloride IPRS* in *0.001M hydrochloric acid*. Dilute 1.0 ml of the solution to 100.0 ml with *0.001 M hydrochloric acid*.

Reference solution (b). A 0.009 per cent w/v solution of *valganciclovir hydrochloride IPRS* in *0.001 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, phenyl groups bonded to porous silica (3.5 µm) (Such as Zorbax SB phenyl),
- mobile phase: a mixture of 93 volumes of 0.25 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 3.0 with *trifluoroacetic acid* and 7 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Name	Relative retention time	Correction factor
Guanine	0.51	0.53
Ganciclovir	0.66	0.71
Valganciclovir[1]	1.0	—
Valganciclovir[2]	1.07	—
Ganciclovir mono-*N*-methyl valinate 1*	1.21	—
Ganciclovir mono-*N*-methyl valinate 2*	1.30	—
Methoxymethylguanine*	1.45	—
Isovalganciclovir[1]*	1.55	—
Isovalganciclovir[2]*	1.61	—
Ganciclovir divalinate*	2.13	—
Monoacetoxyganciclovir*	2.31	—
Isomonochloroganciclovir*	2.52	—
Homologue[1]*	2.69	—
Homologue[2]*	2.77	—

*Process impurity include for identification only and not included in the calculation of total degradation products.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due second diastereomeric valganciclovir and first ganciclovir mono-*N*-methyl valinate is not less than 2.0 in the chromatogram obtained with reference solution (a), the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 3.0 for the second diastereomeric valganciclovir peak and the relative standard deviation for replicate injections is not more than 2.0 per cent for the sum of the areas of two valganciclovir peaks in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to guanine is not more than 0.05 times the sum of the areas of valganciclovir diastereomers in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak corresponding to ganciclovir is not more than 0.1 times the sum of the areas of valganciclovir diastereomers in the chromatogram obtained with reference solution (b) (2.0 per cent). The area of any other secondary peak is not more than 0.2 per cent and the sum of areas of all other secondary peaks is not more than 0.5 per cent, calculated by area normalization.

The sum of all the impurities is not more than 3.5 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Disperse 5 intact tablets in 300 ml of *0.001 M hydrochloric acid*, with the aid of mechanical shaker until the tablets are fully disintegrated and dilute to 500.0 ml with *0.001 M hydrochloric acid*. Dilute 2.0 ml of the solution to 100.0 ml with *0.001 M hydrochloric acid* and filter.

Reference solution (b). A 0.01 per cent w/v solution of *valganciclovir hydrochloride IPRS* in *0.001 M hydrochloric acid*.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due second diastereomeric valganciclovir and first ganciclovir mono-N-methyl valinate is not less than 2.0 in the chromatogram obtained with reference solution (a), the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 3.0 for the second diastereomeric valganciclovir peak and the relative standard deviation for replicate injections is not more than 2.0 per cent for the sum of the areas of two valganciclovir peaks in the chromatogram obtained with reference solution (b).

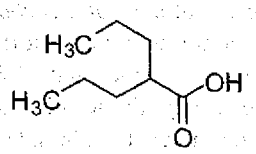
Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{22}N_5O_5$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

https://nhathuocngocanh.com/

Valproic Acid



$C_8H_{16}O_2$ Mol. Wt. 144.2

Valproic acid is 2-propylpentanoic acid.

Valproic acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_{16}O_2$.

Category. Anticonvulsant.

Description. A colourless or very slightly yellow liquid, slightly viscous.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valproic acid IPRS* or with the reference spectrum of valproic acid.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ether* and 50 volumes of *dichloromethane*.

Test solution. A 1.0 per cent w/v solution of the substance under examination in *methanol*.

Reference solution. A 1.0 per cent w/v solution of *valproic acid IPRS* in *methanol*.

Apply 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *bromocresol green solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. To 1 ml add 3.0 ml of dilute *sodium hydroxide solution*. Add 3.0 ml of *water* and 1.0 ml of a 10 per cent w/v solution of *cobalt nitrate*. A violet precipitate is formed, filter it. The precipitate dissolves in *dichloromethane*.

Tests

Appearance of solution. A 20.0 per cent w/v solution of valproic acid in 8.5 per cent w/v sodium hydroxide solution is clear (2.4.1) and not more intensely colored than reference solution YS5 (2.4.1).

Refractive index (2.4.27). 1.422 to 1.425.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.005 per cent w/v solution of *butyric acid* in *heptane*.

Test solution. A 5.0 per cent w/v solution of the substance under examination in the internal standard solution. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Reference solution. Dissolve 20 mg of the substance under examination and 20 mg of *2-(1-methylethyl)pentanoic acid (valproic acid impurity C) IPRS* in 10.0 ml of *heptane*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane*.

Chromatographic system
- a fused-silica capillary column 30 m x 0.53 mm, coated with wide-bore macrogol 20000 2-nitroterephthalate (0.5 µm),
- temperature.
  column 130° from 0-10 minutes and 130° - 190° from 10-30 minutes
- inlet port and detector 220°,
- a flame ionisation detector,
- flow rate: 8 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to valproic acid impurity C and valproic acid is not less than 3.0.

Inject 1µl of the reference solution and the test solution. In the chromatogram obtained with the test solution the area of peak due to any impurity is not more than the area of the peak due to the internal standard (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the peak due to the internal standard (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the peak due to the internal standard (0.01 per cent).

Heavy metals (2.3.13). Dissolve 2.0 g in 20 ml *ethanol (80 per cent)* and use 12 ml of the solution. The resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb)* obtained by diluting *lead standard solution (100 ppm Pb)* with *ethanol (80 per cent)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Dissolve 0.1g in 25 ml of *ethanol (95 per cent)*. Add 2 ml of *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01442 g of $C_8H_{16}O_2$.

Storage. Store protected from moisture.

https://nhathuocngocanh.com/

Valproic Acid Capsules

Valproic Acid Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valproic acid, $C_8H_{16}O_2$.

Usual strength. 250 mg.

Identification

A. In the Assay, the retention time ratio of the principal peak to the internal standard peak in the chromatogram obtained with the test solution and reference solution, are not more than 2.0 per cent.

B. Disperse a quantity of the content of capsules containing about 250 mg of valproic acid, add 20 ml of *1 M sodium hydroxide*, shake and allow the layers to separate. Filter the aqueous layer, add 4 ml of *hydrochloric acid*, mix and extract with 40 ml of *n-heptane*. Filter the *n-heptane* layer through glass wool and evaporate the solvent completely on a steam bath with the aid of a current of air. Transfer 2 drops of the residue to a test tube containing 0.5 ml, each of, 2 per cent v/v of *potassiumm iodide solution* and 4 per cent v/v of *potassium iodate solution* and mix, a yellow colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a 0.5 per cent w/v solution of *sodium lauryl sulphate* in simulated intestinal fluid prepared by dissolving 6.8 g of *monobasic sodium phosphate* in 250 ml *water*, mix and 77 ml of *0.2 M sodium hydroxide*, add 500 ml of *water*. Adjusted to pH 6.8 with *0.2 M sodium hydroxide* or *0.2 M hydrochloric acid* dilute to 1000 ml with *water*, adjusted to pH 7.5 with *5 M sodium hydroxide*,

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by gas chromatography (2.4.13) as described under Assay, using the following solutions.

Test solution. To 10 ml of the filtrate, add about 3.0 g of *sodium chloride*, and mix on a vortex mixer for 5 minutes. Add 1.0 ml of *6 M hydrochloric acid* and 5.0 ml of internal standard solution, shake and allow to separate, remove the *n-heptane* layer and filter. Discard the aqueous layer.

Reference solution. Weigh a quantity of *valproic acid IPRS* and dilute with the dissolution medium to obtain a solution having a concentration similar to that of the test solution. Take 10 ml of the solution and proceed as in test solution beginning with the words "add about 3.0 g.....".

Calculate the content of $C_8H_{16}O_2$ in the capsule.

Q. Not less than 85 per cent of the stated amount of $C_8H_{16}O_2$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Take 20 capsules in a container and add 150 ml of *dichloromethane*, cool in a *solid carbon dioxide-acetone mixture* until the contents have solidified. If necessary, transfer the mixture of capsules and *dichloromethane* to a blender jar and blend until all the solids are reduced to fine particles. Transfer the mixture to a 500-ml flask, add *n-heptane* to volume, mix and allow the solids to settle. Transfer an accurately measured volume of the solution, containing about 250 mg of valproic acid, to a 100-ml flask, dilute with *n-heptane* to volume and mix. Transfer 5.0 ml to a container equipped with a closure. Add 2.0 ml of internal standard solution, close the container and mix.

Reference solution. A 0.25 per cent w/v solution of *valproic acid IPRS* in *n-heptane*. Transfer 5.0 ml to a container equipped with a closure. Add 2.0 ml of internal standard solution, close the container and mix.

Internal standard solution. A 0.5 per cent w/v solution of *biphenyl* in *n-heptane*.

Chromatographic system

- a glass column 1.8 m x 2 mm, packed with 10 per cent phase G34 on 80 to 100 mesh support S1A,
- temperature: column. 150°, injection port and detector. 250°,
- a flame ionization detector,
- flow rate: 40 ml per minute using nitrogen as the carrier gas.

The relative retention time with reference to valproic acid for biphenyl is about 2.0.

Inject 2 µl of the reference solution. The test is not valid unless the resolution between the peak due to valproic acid and biphenyl is not less than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject 2 µl of the reference solution and the test solution.

Calculate the content of $C_8H_{16}O_2$ in the capsules.

Storage. Store protect from moisture, at a temperature not exceeding 30°.

Valproic Acid Oral Solution

Valproic Acid Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valproic acid, $C_8H_{16}O_2$.

Usual strengths. 40 mg per ml; 50 mg per ml.

Identification

A. In the Assay, the retention time ratio of the principal peak to the internal standard peak in the chromatogram obtained

https://nhathuocngocanh.com/

with the test solution and reference solution is not more than 2.0 per cent.

B. Dissolve a volume of solution containing about 250 mg of valproic acid in 40 ml of *water* and 2.0 ml of *hydrochloric acid*. Mix and extract with 40 ml of *n-heptane*. Filter the *n-heptane* layer through glass wool into a beaker, and evaporate the solvent completely on a steam bath with the aid of a current of air. Transfer 2 drops of the residue to a test tube containing 0.5 ml each 2 per cent v/v of *potassium iodide solution* and 4 per cent v/v solution of *potassium iodate solution* and mix; a yellow colour is produced.

Tests

pH (2.4.24). 7.0 to 8.0.

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve a volume of solution containing about 250 mg of valproic acid in 40 ml of *water*, add 2.0 ml of *hydrochloric acid* and extract with 80 ml of *n-heptane* until the aqueous layer is clear. Filter the *n-heptane* layer through glass wool with small portions of *n-heptane*, add the rinsings to the flask, dilute to 100.0 ml with *n-heptane* and mix. Transfer 5.0 ml to a container equipped with a closure. Add 2.0 ml of the internal standard solution, close the container and mix.

Reference solution. A 0.25 per cent w/v solution of *valproic acid IPRS* in *n-heptane*. Transfer 5.0 ml to a container equipped with a closure. Add 2.0 ml of internal standard solution and mix.

Internal standard solution. A 0.5 per cent w/v solution of *biphenyl* in *n-heptane*.

Chromatographic system
- glass column 1.8 m x 2 mm, packed with 10 per cent phase G34 on 80 to 1010 mesh support S1A,
- temperature:
  column, 150°,
  injection port and detector at 250°,
- a flame ionization detector,
- flow rate: 40 ml per minute using nitrogen as the carrier gas.

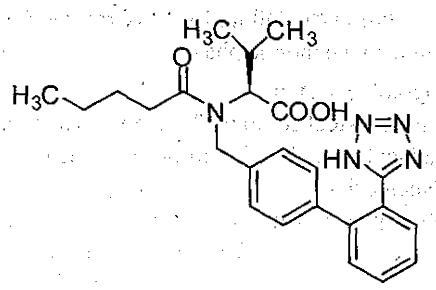
The relative retention time with reference to valproic acid for biphenyl is about 2.0.

Inject 2 µl of the reference solution. The test is not valid unless the resolution between valproic acid and biphenyl is not less than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject 2 µl each of the reference solution and the test solution. Calculate the content of $C_8H_{16}O_2$ in oral solution.

Storage. Store protected from moisture.

Valsartan



$C_{24}H_{29}N_5O_3$ Mol. Wt. 435.5

Valsartan is *N*-pentanonyl-*N*-[2′-(1*H*-tetrazol-5-yl)biphenyl-4-ylmethyl]-L-valine.

Valsartan contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{29}N_5O_3$, calculated on the anhydrous basis.

Category. Antihypertensive.

Production

As Nitrosamines are classified as probable human carcinogens, their presence in valsartan should be avoided or limited as much as possible. For this reason, manufacturers of valsartan for human use are expected to perform an assessment of the risk of *N*-nitrosamine formation and contamination during their manufacturing process; if this assessment identifies a potential risk, the manufacturing process should be modified to minimise contamination and a control strategy implemented to detect and control *N*-nitrosamine impurities in valsartan. The general chapter 5.11. Nitrosamine Impurities is available to assist manufacturers.

Description. A white to almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valsartan IPRS* or with the reference spectrum of valsartan.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −69.0° to −64.0°, determined in 1.0 per cent w/v solution in *methanol*, at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

https://nhathuocngocanh.com/

Reference solution (a). A 0.05 per cent w/v solution of *valsartan IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil),
- mobile phase: a mixture of 50 volumes of *water*, 50 volumes of *acetonitrile* and 0.1 volume of *glacial acetic acid*,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *valsartan IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Purospher 18e),
- mobile phase: a mixture of 50 volumes of *water*, 50 volumes of *acetonitrile* and 0.1 volume of *glacial acetic acid*,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{29}N_5O_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Valsartan Tablets

Valsartan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valsartan, $C_{24}H_{29}N_5O_3$.

Usual strengths. 40 mg; 80 mg; 160 mg; 320 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Valsartan with 40 ml of *methanol*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *valsartan IPRS* or with the reference spectrum of valsartan.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *phosphate buffer pH 6.8*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{24}H_{29}N_5O_3$ in the medium from the absorbance obtained from a solution of known concentration of *valsartan IPRS* prepared by dissolving in minimum amount of *methanol* and diluted with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{29}N_5O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Valsartan with 15 ml of mobile phase and dilute to 25.0 ml with the mobile phase, filter.

Reference solution (a). A 0.1 per cent w/v solution of *valsartan IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system as described under Assay.

https://nhathuocngocanh.com/

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Valsartan in 25 ml of the mobile phase and dilute to 100.0 ml with the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *valsartan IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *water*, 50 volumes of *acetonitrile* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{29}N_5O_3$ in the tablets.

Storage. Store protected from light and moisture.

Valsartan and Hydrochlorothiazide Tablets

Valsartan and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valsartan, $C_{24}H_{29}N_5O_3$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. Valsartan, 80 mg and Hydrochlorothiazide, 12.5 mg; Valsartan 160 mg, and Hydrochlorothiazide, 12.5 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *ethyl acetate*, 20 volumes of *dehydrated alcohol* and 10 volumes of a 25 per cent w/v solution of *ammonium hydroxide*.

Test solution. Disperse a quantity of powdered tablets containing about 20 mg of valsartan in 100.0 ml of *acetone*, sonicate for 15 minutes and filter.

Reference solution. A solution equivalent to test concentrations of *valsartan IPRS* and *hydrochlorothiazide IPRS* in *acetone*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 7 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of *phosphate buffer pH 6.8*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 250 nm for valsartan and 272 nm for hydrochlorothiazide (2.4.7). Calculate the content of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ in the medium from the absorbance obtained from a solution of known concentration of *valsartan IPRS* and *hydrochlorothiazide IPRS* in the same medium.

Calculate the content of valsartan dissolved by the formula:

$$\frac{(AT2 \times A1\ per\ cent\ H_{272\,nm}) - (AT1 \times A1\ per\ cent\ H_{250\,nm})}{(A1\ per\ cent\ V_{250\,nm} \times A1\ per\ cent\ H_{272\,nm}) - (A1\ per\ cent\ V_{272\,nm} \times A1\ per\ cent\ H_{250\,nm})} \times 12{,}500$$

Calculate the content of hydrochlorothiazide dissolved by the formula:

$$\frac{(AT1 \times A1\ per\ cent\ V_{250\,nm}) - (AT2 \times A1\ per\ cent\ V_{272\,nm})}{(A1\ per\ cent\ H_{272\,nm} \times A1\ per\ cent\ V_{250\,nm}) - (A1\ per\ cent\ H_{250\,nm} \times A1\ per\ cent\ V_{272\,nm})} \times 80{,}000$$

where, *AT1* = absorbance of the test solution at 272 nm,
AT2 = absorbance of the test solution at 250 nm,
$A1\ per\ cent\ V_{272\,nm}$ = absorptivity (1 per cent, 0.2 cm, 272 nm) of valsartan in medium,
$A1\ per\ cent\ V_{250\,nm}$ = absorptivity (1 per cent, 0.2 cm, 250 nm) of valsartan in medium,

https://nhathuocngocanh.com/

A1 per cent $H_{272\ nm}$ = absorptivity (1 per cent, 0.2 cm, 272 nm) of hydrochlorothiazide in medium,

A1 per cent $H_{250\ nm}$ = absorptivity (1 per cent, 0.2 cm, 250 nm) of hydrochlorothiazide in medium,

Q. Not less than 80 per cent of the stated amount of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of powdered tablets containing about 62.5 mg of Hydrochlorothiazide with 5.0 ml of *water* and 100 ml of solvent mixture, sonicate for 15 minutes and shake for 30 minutes. Dilute to 250 ml with the solvent mixture, centrifuge and dilute 25.0 ml of the supernatant to 200.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.003 per cent w/v of *benzothiadiazine impurity A (4-amino-6-chloro-1,3-benzenedisulphonamide) IPRS*, 0.006 per cent w/v of *hydrochlorothiazide IPRS*, 0.008 per cent w/v of *valsartan IPRS* and 0.02 per cent w/v of *valsartan impurity B (N-butyryl-N-{[2'-(1H-tetrazole-5-yl)biphenyl-4-yl]methyl}-L-valine) IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 10 ml of reference solution (b) to 100.0 ml with the solvent mixture.

Inject reference solutions (b) and (c). The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between valsartan impurity B and valsartan and between benzothiadiazine impurity A and hydrochlorothiazide is not less than 1.4. The relative standard deviation for replicate injections is not more than 10 per cent in the chromatogram obtained with reference solution (c).

Inject reference solution (a), (b) and (c) and the test solution. The area of the peak due to benzothiadiazine impurity A is not more than 1.0 per cent; the area of any secondary peak other than valsartan impurity A is not more than 0.2 per cent; and the sum of areas of all the secondary peaks other than valsartan impurity A is not more than 1.3 per cent. (Valsartan impurity A is the enantiomer of valsartan and coelutes with valsartan in this test.)

Uniformity of content. Complies with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solution as the test solution.

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse 1 tablet with 5.0 ml of *water* and about 100 ml of the solvent mixture, sonicate for 15 minutes and dilute to 200.0 ml with the solvent mixture. Centrifuge a portion of the solution and dilute a volume of the clear supernatant with the solvent mixture to obtain a 0.02 per cent w/v solution of valsartan.

Calculate the content of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 62.5 mg of Hydrochlorothiazide with 5.0 ml of *water* and 100 ml of solvent mixture, sonicate for 15 minutes and shake for 30 minutes. Dilute to 250 ml with the solvent mixture, centrifuge and dilute 25.0 ml of the supernatant to 200.0 ml with the solvent mixture. Dilute a suitable volume of the solution with the solvent mixture to obtain a 0.02 per cent w/v solution of Valsartan.

Reference solution. Transfer about 12.5 mg of *hydrochlorothiazide IPRS* to a 200 ml volumetric flask and add about 12.5 J mg of *valsartan IPRS*, J being the ratio of the stated amount, in mg, of valsartan to the stated amount, in mg, of hydrochlorothiazide per tablet. Add about 100 ml of solvent mixture, sonicate for 15 minutes, dilute to volume and mix. Transfer 25 ml of the solution to a 50 ml flask, dilute with solvent mixture to volume and mix. Dilute a suitable volume of the solution with the solvent mixture to obtain a 0.02 per cent w/v solution of *valsartan IPRS*.

Chromatographic system

- a stainless steel column 12.5 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 90 volumes of *water*, 10 volumes of *acetonitrile* and 0.1 volume of *trifluroacetic acid*,
  B. a mixture of 90 volumes of *acetonitrile*, 10 volumes of *water* and 0.1 volume of *trifluroacetic acid*,
- a gradient programme using the conditions given below,
- flow rate: 0.4 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
25	10	90
27	90	10
40	90	10

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

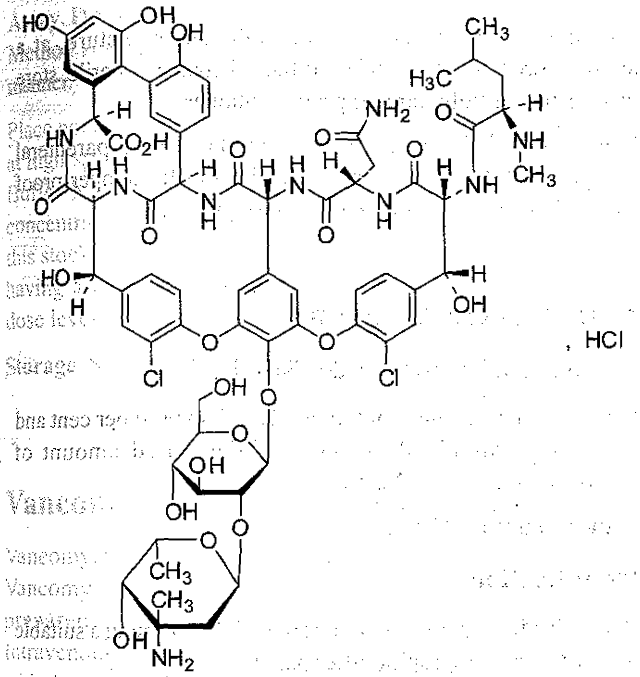
https://nhathuocngocanh.com/

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{29}N_5O_3$ and $C_7H_8ClN_3O_4S_2$ in the tablets.

Storage. Store protected from moisture.

Vancomycin Hydrochloride



$C_{66}H_{75}Cl_2N_9O_{24}$, HCl Mol.Wt. 1485.7

Vancomycin Hydrochloride is a mixture of related glycopeptides, consisting principally of the monohydrochloride of (3*S*,6*R*,7*R*,22*R*,23*S*,26*S*,30a*S*,36*R*,38a*R*)-3-(2-amino-2-oxoethyl)-44-[[2-*O*-(3-amino-2,3,6-trideoxy-3-*C*-methyl-β-L-*lyxo*-hexopyranosyl)-β-D-glucopyranosyl]oxy]-10,19-dichloro-7,22,28,30,32-pentahydroxy-6-[[(2*R*)-4-methyl-2-(methylamino)pentanoyl]amino]-2,5,24,38,39-pentaoxo-2,3,4,5,6,7,23,24,25,26,36,37,38,38a-tetradecahydro-22*H*-8,11:18,21-dietheno-23,36-(iminomethano)-13,16:31,35-dimetheno-1*H*,13*H*-[1,6,9]oxadiazacyclohexadecinol[4,5-*m*] [10,2,16]benzoxadiazacyclotetracosine-26-carboxylic acid (vancomycin B).

It is produced by certain strains of *Amycolatopsis orientalis* or obtained by any other means.

Vancomycin Hydrochloride contains not less than 1050 IU per mg of $C_{66}H_{75}Cl_2N_9O_{24}$, HCl, calculated on the anhydrous basis and not less than 93.0 per cent of vancomycin B.

Category. Antibacterial.

Description. A white or almost white hygroscopic powder.

Identification

A. In the test for Vancomycin B, the principal peak in the chromatogram obtained with test solution (a) corresponds to that in the chromatogram obtained with the reference solution.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1), absorbance of the solution at 450 nm (2.4.7) is not more than 0.1.

pH (2.4.24). 2.5 to 4.5, determined in a 5.0 per cent w/v solution in *carbondioxide-free water*.

Vancomycin B. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution (a). Dissolve 10 mg of the substance under examination in mobile phase A and dilute to 5.0 ml with mobile phase A.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with mobile phase A.

Test solution (c). Dilute 0.5 ml of test solution (b) to 20.0 ml with mobile phase A.

Reference solution. A 0.05 per cent w/v solution of *vancomycin hydrochloride IPRS* in *water.* Heat at 65° for 24 hours, allow to cool.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 1 volume of *tetrahydrofuran*, 7 volumes of *acetonitrile* and 92 volumes of buffer solution prepared by diluting 1 ml of *triethylamine* to 500 ml with *water*, adjusted to pH 3.2 with *orthophosphoric acid*,

  B. a mixture of 1 volume of *tetrahydrofuran*, 29 volumes of *acetonitrile* and 70 volumes of buffer solution,
- a gradient programme using conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
13	100	0
22	0	100
26	0	100
28	100	0

https://nhathuocngocanh.com/

Inject the reference solution and test solution (a), (b) and (c). The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with the reference solution is not less than 5.0, signal-to-noise ratio for the principal peak in the chromatogram obtained with test solution (c) is not less than 5.0 and the tailing factor for the peak due to vancomycin in the chromatogram obtained with the test solution (b) is not more than 1.6.

Calculate the percentage content of vancomycin B hydrochloride using the following expression:

$$\frac{A_b \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

where A_b = area of the peak due to vancomycin B in the chromatogram obtained with test solution (b);

A_t = sum of the areas of the peaks due to impurities in the chromatogram obtained with test solution (a).

Related substances. Determine by liquid chromatography (2.4.14), as described under Vancomycin B with following modifications.

Inject test solutions (a), (b) and (c). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than 4.0 per cent and the sum of areas of all the secondary peaks is not more than 7.0 per cent. Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with test solution (c) (0.1 per cent).

Calculate the percentage content of each impurity using the following expression:

$$\frac{\left(\frac{A_i}{25}\right) \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

A_i = area of the peak due to an impurity in the chromatogram obtained with test solution (a);

A_b = area of the peak due to vancomycin B in the chromatogram obtained with test solution (b);

A_t = sum of the areas of the peaks due to impurities in the chromatogram obtained with test solution (a).

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg.

Vancomycin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by the microbiological assay of antibiotics, Method A or Method B (2.2.10) using *vancomycin hydrochloride IPRS*.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°. If the substance is sterile, store in a sterile, air tight, tamper proof container.

If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-proof and sealed so as to exclude micro-organisms.

Vancomycin Capsules

Vancomycin Hydrochloride Capsules

Vancomycin Capsules contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of vancomycin, $C_{66}H_{75}Cl_2N_9O_{24}$.

Usual strength. 125 mg.

Identification

Determine by paper chromatography (2.4.15), using a suitable sheet of chromatographic filter paper.

Mobile phase. A mixture of 6 volumes of *butyl alcohol*, 4 volumes of *water* and 3 volumes of *pyridine*.

Test solution. Disperse the content of capsules containing about 100 mg of vancomycin in 100.0 ml of water.

Reference solution. A 0.1 per cent w/v solution of *vancomycin hydrochloride IPRS* in water.

Apply to the plate 5 µl of each solution. Develop by descending chromatography for about 7 hours. After development, dry the paper and place it on an inoculated agar surface of sufficient area to accommodate the paper and prepared for vancomycin assay described in microbiological assay of antibiotics (2.2.10) except to use Medium B. Remove the paper from the agar surface after 30 minutes and incubate the agar medium at 37° for 18 hours; clear zones of inhibition are produced at corresponding positions on the two chromatograms.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

https://nhathuocngocanh.com/

Medium: 900 ml of *water*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Carry out the method as described under Assay.

Q. Not less than 85 per cent of the stated amount of $C_{66}H_{75}Cl_2N_9O_{24}$.

Water (2.3.43). Not more than 8.0 per cent.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10) on a solution prepared in the following manner.

Place not less than 5 capsules in a glass blender jar and blend at high speed for 3 to 5 minutes with a sufficient volume of Buffer No. 3 to yield a stock solution having a convenient concentration of vancomycin. Dilute a measured volume of this stock solution with Buffer No. 3 to obtain a test dilution having a concentration assumed to be equal to the median dose level of the standard.

Storage. Store protected from moisture.

Vancomycin Intravenous Infusion

Vancomycin Intravenous Infusion is a sterile solution of Vancomycin Hydrochloride in Water for Injections. It is prepared by dissolving Vancomycin Hydrochloride for Intravenous Infusion in Water for Injections and then diluting with the requisite volume of a suitable diluent in accordance with the manufacturer's instructions.

Vancomycin Intravenous Infusion contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of vancomycin, $C_{66}H_{75}Cl_2N_9O_{24}$.

The intravenous infusion complies with the tests stated under Parenteral Preparations.

Storage. Vancomycin Intravenous Infusion should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

Usual strengths. 500 mg; 1 g.

Vancomycin Hydrochloride for Intravenous Infusion

Vancomycin Hydrochloride for Intravenous Infusion is a sterile material consisting of Vancomycin Hydrochloride with or without excipients. It is filled in a sealed container.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Vancomycin Hydrochloride for Intravenous Infusion contains not less than 88.0 per cent of Vancomycin B.

Identification

A. In the test for vancomycin B, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution of Vancomycin Hydrochloride is clear (2.4.1) and the absorbance of the solution at 450 nm (2.4.7) is not more than 0.1.

pH (2.4.24). 2.5 to 4.5, determined on a 5.0 per cent w/v solution of Vancomycin Hydrochloride.

Vancomycin B. Determine by liquid chromatography (2.4.14).

NOTE—Use the solutions within 4 hours of preparation.

Test solution (a). Dissolve a quantity of the substance under examination in sufficient mobile phase A to produce a solution containing 2,000 IU of vancomycin per ml.

Test solution (b). Dilute 1.0 ml of test solution (a) to 25.0 ml with mobile phase A.

Test solution (c). Dilute 1.0 ml of test solution (b) to 40.0 ml with mobile phase A.

Reference solution. A 0.05 per cent w/v solution of *vancomycin hydrochloride IPRS* in *water*. Heat at 65° for 24 hours and allow to cool.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: A. a mixture of 1 volumes of *tetrahydrofuran*, 7 volumes of *acetonitrile* and 92 volumes of buffer solution prepared by diluting 1 ml of *triethylamine* to 500 ml with *water*, adjusted to pH 3.2 with *orthophosphoric acid*,

  B. a mixture of 1 volume of *tetrahydrofuran*, 29 volumes of *acetonitrile* and 70 volumes of buffer solution,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
13	100	0
21	0	100
25	100	0
35	100	0

Inject the reference solution, test solution (b) and (c). The test is not valid unless in the chromatogram obtained with test solution (c), signal-to- noise ratio of the principal peak is not less than 5; the tailing factor of the vancomycin peak in the chromatogram obtained with test solution (b) is not more than 1.6 and the resolution between the two principal peaks in the chromatogram obtained with the reference solution is not less than 5.0.

Related substances. Determine by liquid chromatography (2.4.14), using test solutions (a), (b) and (c) as described under Vancomycin B.

Chromatographic system as described under Vancomycin B.

In the chromatogram obtained with test solution (a) calculate the content of each impurity.

The content of any impurity is not more than 4.0 per cent and the sum of the contents of any such impurities is not more than 12.0 per cent. Ignore any peak with an area less than that of the principal peak in the chromatogram obtained with test solution (c) (0.1 per cent).

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Bacterial endotoxins (2.2.3). Dissolve the contents of the sealed container in *tris-chloride buffer pH 7.4* prepared using *water BET* to give a solution containing 9000 Units of vancomycin per ml. Carry out the test on the resulting solution; the maximum allowable endotoxin concentration of the solution is 2.5 Units of endotoxins per ml. Carry out the test using the maximum valid dilution of the prepared solution calculated from the declared sensitivity of the lysate used in the test.

Assay. Determine the weight of the contents of ten containers as described under test for Uniformity of weight under Parenteral Preparations (Powders for Injection).

Determine on the mixed contents of ten containers by microbiological assay of antibiotics, Method A or Method B (2.2.10).

Labelling. The label states (1) the total number of Units of vancomycin in the container and (2) the number of Units of vancomycin per mg.

Vancomycin Oral Solution

Vancomycin Oral Solution is a solution of Vancomycin Hydrochloride in a suitable flavoured vehicle. It is prepared by dissolving Vancomycin Hydrochloride for Oral Solution in the requisite amount of a suitable diluent.

The oral solution complies with the tests stated under Oral Liquids.

Storage. Vancomycin Oral Solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

Usual strength. 50 mg per ml.

Vancomycin Hydrochloride for Oral Solution

Vancomycin Hydrochloride for Oral Solution is a dry powder consisting of Vancomycin Hydrochloride with or without excipients. It is filled in a sealed container.

The contents of the sealed container comply with the requirements stated under Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids and with the following requirements.

Vancomycin Hydrochloride for Oral Solution contains not less than 88.0 per cent of Vancomycin B.

Identification

A. In the test for Vancomycin B, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and the absorbance at 450 nm (2.4.7) is not more than 0.1.

pH (2.4.24). 2.5 to 4.5, determined on a 5.0 per cent w/v solution of Vancomycin Hydrochloride.

Vancomycin B. Determine by liquid chromatography (2.4.14).

NOTE—Use the solutions within 4 hours of preparation.

Test solution (a). Dissolve a quantity of the powder in mobile phase A to produce a solution containing 2,000 IU of vancomycin per ml.

Test solution (b). Dilute 1.0 ml of test solution (a) to 25.0 ml with mobile phase A.

Test solution (c). Dilute 1.0 ml of test solution (b) to 40.0 ml with mobile phase A.

Reference solution. A 0.05 per cent w/v solution of *vancomycin hydrochloride IPRS* in *water*. Heat at 65° for 24 hours and allow to cool.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: A. a mixture of 4 ml of *triethylamine* diluted with 1996 ml of *water*, adjusted to pH 3.2 with *orthophosphoric acid* (solution A), 10 volumes of *tetrahydrofuran* and 70 volumes of *acetonitrile* to 920 volumes of solution A,
  B. a mixture of 10 volumes of *tetrahydrofuran*, 290 volumes of *acetonitrile* and 700 volumes of solution A,

25	100	0
35	100	0

Inject each solution. The test is not valid unless in the chromatogram obtained with test solution (c) signal-to- noise ratio of the principal peak is not less than 5.0. The tailing factor of the principal peak in the chromatogram obtained with test solution (b) is not more than 1.6; and the resolution between the two principal peaks in the chromatogram obtained with the reference solution is not less than 5.0.

Related substances. Determine by liquid chromatography (2.4.14), using test solution (a), (b) and (c) as described under Vancomycin B.

Use chromatographic system as described under Vancomycin B.

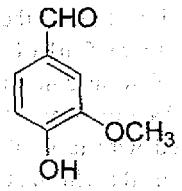
Inject the reference solution and test solution (c). The area of any secondary peak is not more than 4.0 per cent and the sum of the areas of all the secondary peaks is not more than 12.0 per cent. Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with the test solution (c) (0.1 per cent).

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine on the mixed contents of ten containers by the microbiological assay of antibiotics, Method A or Method B (2.2.10).

Labelling. The label states (1) the total number of Units of vancomycin in the container and (2) the number of Units of vancomycin per mg.

Vanillin



$C_8H_8O_3$ Mol. Wt. 152.2

Vanillin is 4-hydroxy-3-methoxybenzaldehyde.

Vanillin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_8O_3$, calculated on the dried basis.

Category. Pharmaceutical aid (flavouring agent).

Description. A white or slightly yellow powder or crystalline needles.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *vanillin IPRS* or with the reference spectrum of vanillin.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b). Examine the chromatograms in daylight after spraying.

C. To 5 ml of a saturated solution add 0.2 ml of *ferric chloride solution*; a blue colour is produced. Heat to 80°; the solution becomes brown and a white precipitate is produced on cooling.

D. Melting range (2.4.21). 81° to 84°.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely coloured than reference solution BS6 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 98.5 volumes of *dichloromethane*, 1 volume of *methanol* and 0.5 volume of *anhydrous acetic acid*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10.0 ml of *methanol*.

Test solution (b). Dissolve 0.2 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution (a). Dissolve 10 mg of the substance under examination in 100.0 ml of *methanol*.

https://nhathuocngocanh.com/

Reference solution (b). A 0.2 per cent w/v solution of *vanillin IPRS* in *methanol*.

Use an unsaturated tank and allow the mobile phase to rise 10 cm. Apply to the plate 5 µl of each solution. After development, dry the plate in cold air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Spray with *dinitrophenylhydrazine-aceto-hydrochloric solution* and examine in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

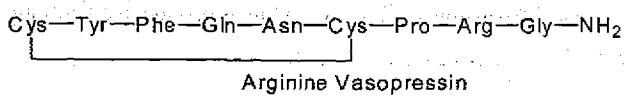
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* for 4 hours.

Assay. Weigh 0.12 g, dissolve in 20 ml of *ethanol (95 per cent)*, add 60 ml of *carbon dioxide-free water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01521 g of $C_8H_8O_3$.

Storage. Store protected from light and moisture.

Vasopressin



Arginine Vasopressin

Vasopressin, 8-L-arginine

$C_{46}H_{65}N_{15}O_{12}S_2$ Mol. Wt. 1084.2

Vasopressin is a polypeptide hormone having the properties of causing the contraction of vascular and other smooth muscles and of antidiuresis. It is prepared by chemical synthesis or by animal origin.

Vasopressin contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{46}H_{65}N_{15}O_{12}S_2$, calculated on anhydrous and acetic acid- free basis.

1 mg of anhydrous Vasopressin is equivalent to 410 Vasopressin Units.

Category. Antidiuretic.

Description. A white or almost white powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Acetic acid. Note more than 15.0 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of a 0.07 per cent v/v solution of *orthophosphoric acid* in *water*, adjusted to pH 3.0 with 42 per cent w/v solution of *sodium hydroxide* and 5 volumes of *methanol*.

Test solution. Prepare the solution as described under reference solution. The amount of material used can be adopted depending on the amount of acetic acid expected.

Reference solution. A 0.01 per cent w/v solution of *glacial acetic acid IPRS* in the solvent mixture (The concentration can be adjusted depending on the amount of acetate or acetic acid expected to be present in the substance under examination).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.07 per cent v/v solution of *orthophosphoric acid* in *water*, adjusted to pH 3.0 with 42 per cent w/v solution of *sodium hydroxide*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
10	50	50
20	50	50
22	95	5

The retention time of acetic acid peak is 3 to 4 minutes.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5 per cent.

Inject the reference solution and the test solution.

Calculate the content of acetic acid.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

https://nhathuocngocanh.com/

Inject the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 5 per cent of the area of the principal peak.

Microbial contamination (2.2.9). Total viable count not more than 200 cfu per g. For products of animal origin, 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Water (2.3.43). Not more than 8.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 10 mg of the substance under examination in 0.25 per cent v/v solution of *glacial acetic acid* and dilute to 25.0 ml with the *glacial acetic acid*.

Reference solution (a). Dissolve the entire contents of a vial of *vasopressin IPRS* in a known volume of 0.25 per cent v/v solution of *glacial acetic acid*.

Reference solution (b). A solution containing 0.0025 per cent w/v, each of, *lypressin IPRS* and *vasopressin IPRS* in 0.25 per cent v/v *glacial acetic acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 87 volumes of buffer solution prepared by dissolving 6.6 g of *dibasic ammonium phosphate* in about 950 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 13 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Equilibrate the column at least for 1 hour.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to vasopressin and the lypressin is not less than 1.1 and the relative standard deviation for replicate injections is not more than 2.0 per cent for vasopressin.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{46}H_{65}N_{15}O_{12}S_2$.

Storage. Store protected from moisture, preferably of type I glass and at a temperature between 2° to 8°.

Vasopressin Injection

Vasopressin Injection is sterile solution of vasopressin in suitable diluent.

Each ml of Vasopressin Injection contains an activity of not less than 90.0 per cent and not more than 110.0 per cent of the stated on the label in Vasopressin Units. It may contain a suitable preservative.

Usual strength. 20 Units per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 2.5 to 4.5.

Bacterial endotoxins (2.2.3). Less than 17.0 Endotoxin Units per Unit of Vasopressin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.0 g of *chlorobutanol* in 5.0 ml of *glacial acetic acid*, add 1.1 g of *sodium acetate*, 5.0 g of *ethanol (95 per cent)*, and dilute to 1000 ml with *water*.

Test solution. Dilute 2.0 ml (20 Units per ml) of the injection to 25.0 ml with 0.25 per cent w/v of *glacial acetic acid*.

Reference solution (a). Dissolve the contents of one vial of *vasopressin IPRS* in a known volume of the solvent mixture to obtain the same concentration of test solution.

Reference solution (b). A solution containing 0.0025 per cent w/v, each of, *lypressin IPRS* and *vasopressin IPRS* in 0.25 per cent v/v *glacial acetic acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temeperature: 40°,
- mobile phase: a mixture of 87 volumes of buffer solution prepared by dissolving 6.6 g of *dibasic ammonium phosphate* in about 950 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, dilute to 1000 ml with *water* and 13 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between vasopressin and lypressin is not less than 1.1 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

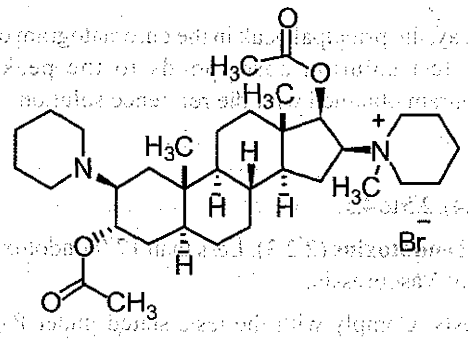
Calculate the content of $C_{46}H_{65}N_{15}O_{12}S_2$ in the injection.

Storage. Store in single-dose or multiple-dose containers, preferably of type I glass. Do not freeze.

Labelling. The label states (1) the number of Units of the Vasopressin Units per ml; (2) indicate its origin (animal or synthetic).

https://nhathuocngocanh.com/

Vecuronium Bromide



$C_{34}H_{57}BrN_2O_4$ Mol. Wt. 638

Vecuronium Bromide is 1-(3α,17β-Diacetoxy-2β-piperidino-5α-androstan-16β-yl)-1-methylpiperidinium bromide.

Vecuronium Bromide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{34}H_{57}BrN_2O_4$, calculated on the anhydrous basis.

Category. Non-depolarizing neuromuscular blocker.

Description. A white or almost white crystals or crystalline powder.

Identification

A. Complies with the test for Specific optical rotation.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *vecuronium bromide IPRS* or with the reference spectrum of vecuronium bromide.

C. It gives reaction (A) of bromides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in 0.5 per cent v/v of *hydrochloric acid* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Specific optical rotation (2.4.22). +30.5° to +35.0°, determined on 1.0 per cent w/v solution in *0.05 M hydrochloric acid*.

Impurity B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Dissolve 1 g of *sodium bromide* in 5 ml of *water*. Add 85 ml of *2- propanol*, then 10 ml of *acetonitrile*.

Test solution. Dissolve 0.1 g of the substance under examination in *dichloromethane* and dilute to 5.0 ml with *dichloromethane*.

Reference solution (a). A solution containing 0.1 per cent w/v, each of, the substance under examination and *vecuronium bromide impurity B IPRS (pancuronium bromide IPRS)* in *dichloromethane*.

Reference solution (b). A 0.005 per cent w/v solution of *vecuronium bromide impurity B IPRS* in *dichloromethane*.

Apply to the plate 1 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for 30 minutes and spray with a 0.25 per cent w/v solution of *iodine* in a mixture of equal volumes of *methanol* and *dichloromethane*. Any spot due to vecuronium bromide impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). The chromatogram obtained with reference solution (a) shows 2 clearly separated spots.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Dissolve 40 mg of the substance under examination in a 0.02 per cent w/v solution of *hydrochloric acid* in *methanol* and dilute to 20.0 ml with *methanol*.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with a 0.02 per cent w/v solution of *hydrochloric acid* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with a 0.02 per cent w/v solution of *hydrochloric acid* in *methanol*.

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 50.0 ml with a 0.02 per cent w/v solution of *hydrochloric acid* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of a 1.8 per cent w/v solution of *tetramethylammonium hydroxide*, adjusted to pH 6.5 with *orthophosphoric acid*, 250 volumes of *methanol* and 700 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Vecuronium impurity C[1]	0.8	1.4
Vecuronium impurity D[2]	0.9	—
Vecuronium (Retention time: about 5 minutes)	1.0	—
Vecuronium impurity E[3]	1.2	—
Vecuronium impurity A[4]	1.3	0.6

[1]1-[17β-(acetyloxy)-3α-hydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,

https://nhathuocngocanh.com/

1-[3α,17β-dihydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,

1-[3α-(acetyloxy)-17β-hydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,

2β,16β -bis(piperidin-1-yl)-5α -androstane-3α,17β -diyl diacetate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b), (c) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to vecuronium bromide impurities A, C, D, E is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the area of any other secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.3 g.

Assay. Dissolve 0.45 g in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0638 g of $C_{34}H_{57}BrN_2O_4$.

Vecuronium Bromide intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 10.0 Endotoxin Units per mg of vecuronium bromide.

Storage. Store protected from light and moisture.

Vecuronium Bromide Injection

Vecuronium Bromide Injection is a sterile material consisting of Vecuronium Bromide with or without auxiliary agents. It is supplied in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Vecuronium Bromide Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of vecuronium bromide, $C_{34}H_{57}BrN_2O_4$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Description. A white to off white lyophilized mass.

Identification

In the Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Solution A. Reconstitute the content of a vial with Water for Injections.

pH (2.4.24). 3.5 to 4.5, determined in solution A.

Light absorption (2.4.7). Not more than 0.1 at 420 nm, determined on solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. Dilute 8.5 ml of *concentrated hydrochloric acid* to 100 ml with *water*. Dilute 10 ml of the solution to 1000 ml with *acetonitrile*.

Solvent mixture B. Dissolve 1 g of *citric acid monohydrate* and 730 mg of *disodium hydrogen phosphate* in *water* and dilute to 100 ml with *water*.

Test solution. Reconstitute 10 vials with Water for Injections and dilute the solution containing 20 mg of vecuronium bromide to 50.0 ml with solvent mixture A, sonicate for 30 to 40 minutes, filter. Dilute 10.0 ml of the solution to 25.0 ml with solvent mixture A.

Reference solution (a). Dissolve 20 mg of *vecuronium bromide IPRS* in 5.0 ml of solvent mixture B and dilute to 50.0 ml with solvent mixture A, sonicate for 20 minutes, filter. Dilute 10.0 ml of the solution to 25.0 ml with solvent mixture A.

Reference solution (b). Transfer 25 mg of *vecuronium bromide IPRS* and 10 mg of *potassium carbonate* (previously dried at 105° for 30 minutes) in 25-ml volumetric flask and make up the volume with *methanol*. Shake vigorously, decant the solution and inject immediately.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) (Such as Hypersil silica),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of a solution prepared by dissolving 8.0 g of *sodium perchlorate* in

https://nhathuocngocanh.com/

6 ml of *water* an *dilute* to 1000 ml with *acetonitrile* and 40 volumes of a solution prepared by dissolving 160 mg of *ammonium chloride* in 100 ml of 25 per cent w/v *ammonium hydroxide solution* and dilute 8 ml of the solution to 1000 ml with *methanol*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 100 µl.

Name	Relative retention time
Vecuronium bromide (Retention time: about 5 minutes)	1.0
Vecuronium bromide mono impurity	1.15
Vecuronium bromide diol impurity	1.65

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to vecuronium bromide and vecuronium bromide mono impurity is not less than 1.5.

Inject the test solution. The area of any peaks due to vecuronium bromide mono impurity and diol impurity is not more than 1.0 per cent. The sum of the areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization method.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.1 g.

Bacterial Endotoxins (2.2.3). Not more than 50 Endotoxin Units per mg of Vecuronium Bromide.

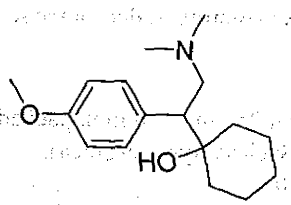
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to vecuronium bromide and vecuronium bromide mono impurity is not less than 1.5, the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{34}H_{57}BrN_2O_4$ in the injection.

Venlafaxine Hydrochloride



and enantiomer, HCl

$C_{17}H_{28}ClNO_2$ Mol. Wt. 313.9

Venlafaxine Hydrochloride is 1-[(1*RS*)-2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]cyclohexanol hydrochloride.

Venlafaxine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{28}ClNO_2$, calculated on the dried basis.

Category. Antidepressant.

Description. A white or almost white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *venlafaxine hydrochloride IPRS* or with the reference spectrum of venlafaxine hydrochloride.

NOTE —If the spectra obtained in the solid state show differences, dissolve the substance under examination and reference substance in *2-propanol*, evaporate to dryness and record new spectra using the residues.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Dissolve in 0.2 g in 10 ml of *carbon dioxide free water*. Add 0.05 ml of *methyl red solution* and 0.1 ml of 0.01M *hydrochloric acid*. The solution is pink. Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution(a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution(b). Dissolve the contents of a vial of *venlafaxine* for system suitability *IPRS* (containing impurities D and F) in 1.0 ml of the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 149 volumes of a buffer solution prepared by dissolving 1.7 g of *ammonium dihydrogen orthophosphate* in 149 ml of *water*, adjusted to pH 4.4 with *orthophosphoric acid* and 51 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Name	Relative retention time
Venlafaxine impurity D[1]	0.9
Venlafaxine (Retention time is about 9 minutes)	1.0
Venlafaxine impurity F[2]	3.4

[1](1-[(1*RS*)-1-(4-methoxyphenyl)-2-(methylamino)ethyl] cyclohexanol,
[2]((2*RS*)-2-(cyclohex-1-enyl)-2-(4-methoxyphenyl)-*N*,*N*-dimethyl-ethanamine.

Run the chromatogram 10 times the retention time of venlafaxine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to venlafaxine and venlafaxine impurity D is not less than 1.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to venlafaxine impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent), the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in a vacuum at 80° for 3 hours.

Assay. Weigh accurately about 0.25 g dissolve in a mixture of 5 ml of 0.01 M *hydrochloric acid* and 50 ml of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide*. Determining the end-point potentiometrically (2.4.25). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03139 g of $C_{17}H_{28}ClNO_2$.

Venlafaxine Prolonged-release Capsules

Venlafaxine Hydrochloride Prolonged-release Capsules

Venlafaxine Prolonged-release Capsules manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be same.

Venlafaxine Prolonged-release Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of venlafaxine, $C_{17}H_{27}NO_2$.

Usual strengths. 37.5 mg; 75 mg; 150 mg.

Identification

Solvent mixture. 30 volumes of *cyclohexane* and 70 volumes of *dichloromethane*.

Dissolve a quantity of the powdered tablets containing about 350 mg of venlafaxine in a 100 ml of the solvent mixture for 30 minutes, filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. Wash the residue with the solvent mixture, filter and dry the residue. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *venlafaxine hydrochloride IPRS* treated in the same manner or with the reference spectrum of venlafaxine hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered capsules containing 200 mg of venlafaxine in 80 ml of a 2.4 per cent v/v solution of *orthophosphoric acid* with the aid of ultrasound for 30 minutes, cool and dilute to 100.0 ml with *water* and centrifuge.

Reference solution (a). Dilute 1.0 ml of test solution to 500.0 ml with mobile phase A.

Reference solution (b). A 0.2 per cent w/v solution of *venlafaxine impurity IPRS* (containing impurity D and F) in mobile phase A.

Reference solution (c). Dilute 25.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Partisil ODS 3),
- mobile phase: A. a mixture of 1 volume of *triethylamine*, 20 volumes of *acetonitrile* and 80 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
  B: a mixture of 1 volume of *triethylamine*, 50 volumes of *acetonitrile* and 50 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
30	0	100
45	0	100
48	100	0
60	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to venlafaxine and venlafaxine impurity D is not less than 1.5.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to venlafaxine impurity D (1-[(1*RS*)-1-(4-methoxyphenyl)-2-(methylamino) ethyl] cyclohexanol) or venlafaxine impurity F ((2*RS*)-2-(cyclohex-1-enyl)-2-(4-methoxyphenyl)-*N*,*N*-dimethylethanamine) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of areas of all the secondary peaks is not more than 2.5 times of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the mixed contents of 20 capsules containing 175 mg of Venlafaxine in 100.0 ml of *methanol*, ultrasound for 30 minutes and filter. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v of *venlafaxine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *venlafaxine impurity IPRS* (containing impurity D) in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Zorbax Rx C18),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of a 1 per cent v/v solution of *triethylamine* previously adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity D and venlafaxine is not less than 1.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{27}NO_2$ in the Capsules.

1 mg of $C_{17}H_{27}NO_2$, HCl is equivalent to 0.884 mg of $C_{17}H_{27}NO_2$.

Labelling. The label states the strength in terms of the equivalent amount of venlafaxine.

Venlafaxine Prolonged-release Tablets

Venlafaxine Hydrochloride Prolonged-release Tablets

Venlafaxine Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be same.

Venlafaxine Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of venlafaxine, $C_{17}H_{27}NO_2$.

Usual strengths. 25 mg; 37.5 mg; 75 mg.

Identification

Solvent mixture. 30 volumes of *cyclohexane* and 70 volumes of *dichloromethane*.

Dissolve a quantity of the powdered tablets containing about 350 mg of venlafaxine in a 100 ml of the solvent mixture and shake for 30 minutes, filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. Wash the residue with the solvent mixture, filter and dry the residue. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *venlafaxine hydrochloride IPRS* treated in the same manner or with the reference spectrum of venlafaxine hydrochloride.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 200 mg of venlafaxine in 80 ml of a 2.4 per cent v/v solution of *orthophosphoric acid* with the aid of ultrasound for 30 minutes, cool and dilute to 100.0 ml with *water* and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A and further Dilute 1.0 ml of the solution to 5.0 ml with mobile phase A.

https://nhathuocngocanh.com/

Reference solution (b). A 0.2 per cent w/v solution of *venlafaxine impurity IPRS* (containing impurity D and F) in mobile phase A.

Reference solution (c). Dilute 25.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Partisil ODS 3),
- mobile phase: A. a mixture of 1 volume of *triethylamine*, 20 volumes of *acetonitrile* and 80 volumes of *water* adjusted to pH 3.5 with *orthophosphoric acid*.
  B: a mixture of 1 volume of *triethylamine*, 50 volumes of *acetonitrile* and 50 volumes of *water* adjusted to pH 3.5 with *orthophosphoric acid*.
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Name	Relative retention time
Venlafaxine impurity D[1]	0.8
Venlafaxine (Retention time is about 13 minutes)	1.0
Venlafaxine impurity F[2]	1.7

[1](1-[(1*RS*)-1-(4-methoxyphenyl)-2-(methylamino) ethyl] cyclohexanol,

[2]((2*RS*)-2-(cyclohex-1-enyl)-2-(4-methoxyphenyl)-*N*,*N*-dimethylethanamine.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to venlafaxine and venlafaxine impurity D is not less than 1.5.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to venlafaxine impurity D or venlafaxine impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 85 mg of Venlafaxine in 50.0 ml of *methanol* with the aid of ultrasound for 30 minutes, mix and filter. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *venlafaxine IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *venlafaxine impurity IPRS* (containing impurity D) in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Zorbax Rx C18),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of a 1 per cent v/v solution of *triethylamine* adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity D and venlafaxine is not less than 1.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{27}NO_2$ in the tablets.

1 mg of $C_{17}H_{27}NO_2$, HCl is equivalent to 0.884 mg of $C_{17}H_{27}NO_2$.

Labelling. The label states the strength in terms of the equivalent amount of venlafaxine.

Venlafaxine Tablets

Venlafaxine Hydrochloride Tablets

Venlafaxine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of venlafaxine, $C_{17}H_{27}NO_2$.

Usual strengths. 25 mg; 37.5 mg; 75 mg.

https://nhathuocngocanh.com/

Identification

Solvent mixture. 30 volumes of *cyclohexane* and 70 volumes of *dichloromethane.*

Dissolve a quantity of the powdered tablets containing about 350 mg of venlafaxine in a 100 ml of the solvent mixture with aid of ultrasound for 30 minutes, filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. Wash the residue with the solvent mixture, filter and dry the residue. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *venlafaxine hydrochloride IPRS* treated in the same manner or with the reference spectrum of venlafaxine hydrochloride.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Reject first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium to obtain a 0.0025 per cent w/v solution of venlafaxine. Measure the absorbance of the filtrate, at the maximum at about 274 nm (2.4.7). Calculate the content of $C_{17}H_{27}NO_2$ in the medium from the absorbance obtained from a solution having a known concentration of *venlafaxine hydrochloride IPRS* similar to the concentration of the test solution.

1 mg of $C_{17}H_{27}NO_2$,HCl is equivalent to 0.884 mg of $C_{17}H_{27}NO_2$.

Q. Not less than 75 per cent of the stated amount of $C_{17}H_{27}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 200 mg of venlafaxine in 80 ml of a 2.4 per cent v/v solution of *orthophosphoric acid* with the aid of ultrasound for 30 minutes, cool and dilute to 100.0 ml with *water* and centrifuge.

Reference solution (a). Dilute 1.0 ml of the test solution to 500.0 ml with mobile phase A.

Reference solution (b). A 0.2 per cent w/v solution of *venlafaxine impurity IPRS* (containing impurity D and F) in mobile phase A.

Reference solution (c). Dilute 25.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Partisil ODS 3);
- mobile phase: A. a mixture of 1 volume of *triethylamine*, 20 volumes of *acetonitrile* and 80 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid*;
  B: a mixture of 1 volume of *triethylamine*, 50 volumes of *acetonitrile* and 50 volumes of *water*, adjusted to pH 3.5 with *orthophosphoric acid*,
- a gradient programme using the conditions given below;
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
30	0	100
45	0	100
48	100	0
60	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to venlafaxine and venlafaxine impurity D is not less than 1.5.

Inject reference solutions (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to venlafaxine impurity D ((1-[(1*RS*)-1-(4-methoxyphenyl)-2-(methylamino) ethyl] cyclohexanol) or venlafaxine impurity F ((2*RS*)-2-(cyclohex-1-enyl)-2-(4-methoxyphenyl)-*N*,*N*-dimethylethanamine) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent of each), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Venlafaxine in 250.0 ml of a 0.2 per cent v/v solution of *orthophosphoric acid* with the aid of ultrasound for 30 minutes, cool, mix and centrifuge. Dilute 4.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). A 0.009 per cent w/v solution of *venlafaxine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *venlafaxine impurity IPRS* in the mobile phase.

https://nhathuocngocanh.com/

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm), (Such as Zorbax C8),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 1 per cent v/v solution of *triethylamine* previously adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity D and venlafaxine is not less than 1.0.

Inject reference solution (a) and the test solution.

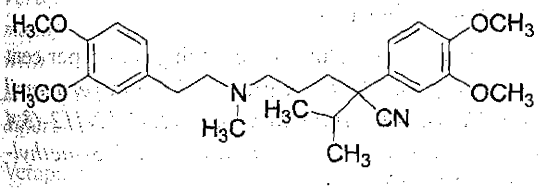
Calculate the content of $C_{17}H_{27}NO_2$ in the tablets.

1 mg of $C_{17}H_{27}NO_2$, HCl is equivalent to 0.884 mg of $C_{17}H_{27}NO_2$.

Labelling. The label states the strength in terms of the equivalent amount of venlafaxine.

Verapamil Hydrochloride

Verapamil Chloride; Iproveratril Hydrochloride



, HCl

$C_{27}H_{38}N_2O_4$, HCl, Mol. Wt. 491.1

Verapamil Hydrochloride is (*RS*)-2-(3,4-dimethoxyphenyl)-5-[[2-(3,4-dimethoxyphenyl)ethyl](methyl)amino]-2-(1-methylethyl)pentanenitrile hydrochloride.

Verapamil Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{27}H_{38}N_2O_4$, HCl, calculated on the dried basis.

Category. Calcium channel blocker.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *verapamil hydrochloride IPRS* or with the reference spectrum of verapamil hydrochloride.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 229 nm and 278 nm and there may be a shoulder at about 282 nm. The ratio of the absorbance at the maximum at about 278 nm to that at the maximum at about 229 nm is 0.35 to 0.39.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to verapamil in the chromatogram obtained with reference solution (a).

D. It gives reaction (B) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* prepared with the aid of gentle heat is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 5.0 per cent w/v solution prepared with the aid of gentle heat.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 63 volumes of mobile phase A and 37 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dissolve 5 mg, each of, of *verapamil hydrochloride IPRS* and *(2RS)-2-(3,4-dimethoxyphenyl)-2-[2-[[2-(3,4-dimethoxy-phenyl)ethyl](methyl)amino]ethyl]-3-methylbutanenitrile IPRS* (*verapamil impurity A IPRS*) in 20.0 ml of the solvent mixture. Dilute 1 ml of the solution to 10 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with palmitamidopropylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.7 per cent w/v solution of *dipotassium hydrogen phosphate* adjusted to pH 7.2 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

https://nhathuocngocanh.com/

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	63	37
22	63	37
27	35	65
35	35	65
36	63	37
50	63	37

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to verapamil and verapamil impurity A is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh 0.4 g, dissolve in 40 ml of *anhydrous glacial acetic acid*, add 6 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04911 g of $C_{27}H_{38}N_2O_4$, HCl.

Storage. Store protected from light and moisture.

Verapamil Injection

Verapamil Hydrochloride Injection; Verapamil Chloride Injection; Iproveratril Hydrochloride Injection

Verapamil Injection is a sterile solution of Verapamil Hydrochloride in Water for Injections.

Verapamil Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of verapamil hydrochloride, $C_{27}H_{38}N_2O_4$, HCl.

Usual strength. 2.5 mg per ml.

Identification

A. Dilute a volume containing 10 mg of Verapamil Hydrochloride to 5 ml with *0.1 M hydrochloric acid*, extract with 5 ml of *ether*, discard the ether extract and make the aqueous layer just alkaline with *2 M potassium carbonate*. Extract with 5 ml of *ether*, filter the ether layer through *anhydrous sodium sulphate* and evaporate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *verapamil hydrochloride IPRS* treated in the same manner or with the reference spectrum of verapamil.

B. To a volume containing 5 mg of Verapamil Hydrochloride add 0.2 ml of a 5 per cent w/v solution of *mercuric chloride*; a white precipitate is produced.

C. To a volume containing 5 mg of Verapamil Hydrochloride add 0.5 ml of *3 M sulphuric acid* and 0.2 ml of *dilute potassium permanganate solution*; a violet precipitate is produced which quickly dissolves to produce a very pale yellow solution.

Tests

pH (2.4.24). 4.5 to 6.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection with the mobile phase to obtain a solution containing 0.125 per cent w/v of Verapamil Hydrochloride.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *verapamil hydrochloride IPRS* and *verapamil impurity I ((2RS)-2-(3,4-dimethoxyphenyl)-2-[2-[[2-(3,4-dimethoxyphenyl)ethyl](methyl)amino]ethyl]-3-methylbutanenitrile) IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 1 volume of *n-heptylamine*, 4.7 volumes of *glacial acetic acid*, 58 volumes of *acetonitrile* and 137 volumes of *0.01 M sodium acetate*,
- flow rate: 0.85 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to verapamil and verapamil impurity I is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal

https://nhathuocngocanh.com/

peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 16.7 Endotoxin Units per mg of verapamil hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a measured volume containing 5 mg of Verapamil Hydrochloride to 100.0 ml with *0.01 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{27}H_{38}N_2O_4,HCl$ taking 118 as the specific absorbance at 278 nm.

Storage. Store protected from light.

Verapamil Hydrochloride Prolonged-release Tablets

Verapamil Hydrochloride Sustained-release Tablets; Verapamil Hydrochloride Extended-release Tablets

Verapamil Hydrochloride Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Verapamil Hydrochloride Prolonged-release Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of verapamil hydrochloride $C_{27}H_{38}N_2O_4,HCl$.

Usual strengths. 120 mg; 240 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Verapamil Hydrochloride with 25 ml of *0.1 M hydrochloric acid* for 10 minutes, filter, extract the filtrate with 25 ml of *ether*, discard the ether extract and make the aqueous layer just alkaline with *2 M potassium carbonate sesquihydrate*. Extract with 25 ml of *ether*, filter the ether layer through *anhydrous sodium sulphate* and evaporate to dryness. The residue complies with the following tests.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *verapamil hydrochloride IPRS* treated in the same manner or with the reference spectrum of verapamil.

B. Chlorides (2.3.12). Dissolve a quantity of powdered tablets containing 0.24 g of *verapamil hydrochloride* with 6 ml of *methanol* for a few minutes, allow to stand for 5 minutes and diluting 0.7 ml of the supernatant liquid to 2 ml with *water*. The resulting solution yields complies with the limit test for chlorides.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A equal volumes of *0.01 M hydrochloric acid* and *methanol*.

Test solution. Disperse a quantity of the powdered tablets containing 0.24 g of verapamil hydrochloride with 95.0 ml of the solvent mixture with the aid of ultrasound for 5 minutes shaking occasionally, dilute to 100.0 ml with solvent mixture and mix. Centrifuge 50 ml of the resulting solution, dilute the supernatant liquid with the solvent mixture to obtain 0.072 per cent w/v solution of verapamil hydrochloride and filter through 0.45 µm filter.

Reference solution(a). Dilute 1 volume of test solution to 200 volumes with solvent mixture.

Reference solution (b). Dilute 1 volume of reference solution(a) to 5 volumes with solvent mixture.

Chromatographic system
- a stainless steel column 12.5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature 40°,
- mobile phase: a mixture of 700 volumes of 0.082 per cent w/v solution of *anhydrous sodium acetate* and 3.3 per cent w/v solution of *anhydrous acetic acid*, 300 volume of *acetonitrile* and 3 volume of *2-heptylamine*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 20 µl.

Inject test solution (a). The area of any secondary peak is not more than 0.4 times the area of the principal peak in chromatogram obtained with the reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.12 g of verapamil hydrochloride in

https://nhathuocngocanh.com/

methanol, mix with the aid of ultrasound for 30 minutes and occasionally shaking for 10 minutes. Add sufficient *methanol* to obtain 0.048 per cent w/v solution of verapamil hydrochloride mix and filter.

Reference solution. A 0.048 per cent w/v solution of *verapamil hydrochloride IPRS* in the *methanol*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (10 µm),
- mobile phase: a mixture of 3 volumes of 0.164 per cent w/v solution of *anhydrous sodium acetate* previously adjusted to pH 7.0 with a 5 per cent v/v solution of *glacial acetic acid* and 7 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 25 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{38}N_2O_4$,HCl in the tablets.

Verapamil Tablets

Verapamil Hydrochloride Tablets; Verapamil Chloride Tablets; Iproveratril Hydrochloride Tablets

Verapamil Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of verapamil hydrochloride, $C_{27}H_{38}N_2O_4$, HCl.

Usual strengths. 40 mg; 80 mg; 120 mg; 160 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Verapamil Hydrochloride with 25 ml of *0.1 M hydrochloric acid*, filter, extract the filtrate with 25 ml of *ether*, discard the ether extract and make the aqueous layer just alkaline with *2 M potassium carbonate*. Extract with 25 ml of *ether*, filter the ether layer through *anhydrous sodium sulphate* and evaporate to dryness. The residue complies with the following tests.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *verapamil hydrochloride IPRS* treated in the same manner or with the reference spectrum of verapamil.

B. Shake a quantity of the powdered tablets containing 0.1 g of Verapamil Hydrochloride with 10 ml of *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of *water* (solution A). To 2 ml of the resulting solution add 0.2 ml of a 5 per cent w/v solution of *mercuric chloride*; a white precipitate is produced.

C. To 2 ml of solution A obtained in test B add 0.5 ml of *3 M sulphuric acid* and 0.2 ml of *dilute potassium permanganate solution*; a violet precipitate is produced which quickly dissolves to produce a very pale yellow solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.01 M hydrochloric acid*,
Speed and time: 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 278 nm and 300 nm (2.4.7). Calculate the content of verapamil hydrochloride, $C_{27}H_{38}N_2O_4S$,HCl in the medium from the difference in absorbance at 278 nm and 300 nm, obtained from a solution of known concentration of *verapamil hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{27}H_{38}N_2O_4S$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing about 0.24 g of Verapamil Hydrochloride with 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *verapamil hydrochloride IPRS* and *(2RS)-2-(3,4-dimethoxyphenyl)-2-[2-[[2-(3,4-dimethoxyphenyl)ethyl]-(methyl)amino]ethyl]-3-methylbutanenitrile (verapamil impurity A) IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 1 volume of n-*heptylamine*, 4.7 volumes of *glacial acetic acid*, 58 volumes of *acetonitrile* and 137 volumes of *0.01 M sodium acetate*,
- flow rate: 0.85 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to verapamil and verapamil impurity A is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram 4 times the retention time of the principal peak.

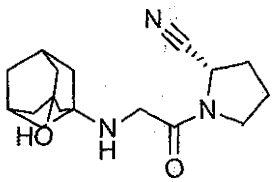
https://nhathuocngocanh.com/

In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Verapamil Hydrochloride, shake with 150 ml of *0.1 M hydrochloric acid* for 10 minutes, add sufficient *0.1 M hydrochloric acid* to produce 200.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{27}H_{38}N_2O_4$, HCl taking 118 as the specific absorbance at 278 nm.

Vildagliptin



$C_{17}H_{25}N_3O_2$ Mol. Wt. 303.4

Vildagliptin is (S)-1-[2-(3-Hydroxyadamant-1-ylamino)acetyl] pyrrolidine-2-carbonitrile.

Vildagliptin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{25}N_3O_2$, calculated on the dried basis.

Category. Antidiabetic.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *vildagliptin IPRS* or with the reference spectrum of vildagliptin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1) and not more intensely colored than reference solution BYS5 and GYS5 (2.4.1).

Enantiomeric purity. Not more than 0.5 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *n-hexane* and *ethanol.*

Test solution. Dissolve 100 mg of the substance under examination in 5 ml of *ethanol*, with the aid of ultrasound and dilute to 10.0 ml with *n-hexane.*

Reference solution (a). A 0.01 per cent w/v solution of *vildagliptin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the solvent mixture.

Reference solution (c). Dissolve 100 mg of *vildagliptin IPRS* and 1 mg of R-enantiomer of vildagliptin (1-[(3-Hydroxyadamant-1-ylamino)-acetyl]-pyrrolidine-(2R)-carbonitrile) in 5 ml of *ethanol*, with the aid of ultrasound and dilute to 10.0 ml with *n-hexane.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with amylase tris-3,5-dimethyl phenylcarbamate (10 µm) (Such as chiralpak AD),
- column temperature: 40°,
- mobile phase: a mixture of 90 volumes of *n-hexane*, 5 volumes of *ethanol*, 5 volumes of *methanol* and 0.1 volume of *trifluoroacetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 10 µl.

The relative retention time with reference to vildagliptin for R-enantiomer of vildagliptin is about 0.8.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to vildagliptin and R-enantiomer of vildagliptin is not less than 1.5 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to R-enantiomer of vildagliptin is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than the area of principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

https://nhathuocngocanh.com/

Diazabicycloundecene Impurity. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *acetonitrile* and 90 volumes of *water*.

Test solution. Dissolve 150 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. A 0.0015 per cent w/v solution of *diazabicycloundecene IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 3 mm, packed with octadecylsilane bonded to porous silica (3.5 µm), (Such as XTerra MS),
- column temperature: 60°,
- mobile phase: A. a buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 5.5 with *0.1M sodium hydroxide*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 217 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
3.5	95	5
3.6	20	80
9.5	20	80
9.6	95	5
15	95	5

The retention time of diazabicycloundecene impurity (*1,8-Diazabicyclo-[5.4.0]undec-7-en*) peck is about 2.5 minutes.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any peak corresponding to diazabicycloundecene impurity is not more than the area of principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of *water*, 5 volumes of *acetonitrile* and 0.1 volume of *orthophosphoric acid*.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.08 per cent w/v solution of *vildagliptin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.0004 per cent w/v solution of *vildagliptin impurity A, B, C* and *D IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 15 cm × 3.0 mm, packed with octadecylsilane bonded to porous silica (3.5 µm), (Such as XTerra MS),
- column temperature: 32°,
- mobile phase: A. a buffer solution prepared by dissolving 1.74 g of *dipotassium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 with *orthophosphoric acid*,
  B. a mixture of 75 volumes of *acetonitrile* and 25 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Vildagliptin impurity C[3]	1.14	0.7
Vildagliptin impurity D[4]	1.50	0.6

[1]2-(3-hydroxy-adamantan-1-yl)-1-imino-hexahydro-pyrrolo[1,2-a]pyrazin-4-one (Cyclic amidine),

[2]1-[(3-Hydroxyadamant-1-ylamino)-acetyl]-(2S)-prolinamide (Amide),

[3]2-(3-Hydroxy adamant-1-yl)-hexahydro-pyrrolo[1,2-a]pyrazine-1,4-dione (Diketopiperazine),

[4]1;1'-[(3-Hydroxyadamant-1-ylamino)-acetyl]-bis-pyrrolidine-(2S)-carbonitrile (Dialkylated byproduct).

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to vildagliptin and vildagliptin impurity C is not less than 2.0 in the chromatogram obtained with reference solution (c) and the relative standard

https://nhathuocngocanh.com/

deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to vildagliptin impurity A, C and D, each of, is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to vildagliptin impurity B is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more 0.1 times than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13): 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{25}N_3O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Vildagliptin Tablets

Vildagliptin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of vildagliptin, $C_{17}H_{25}N_3O_2$.

Usual strengths. 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.005 per cent w/v solution of *vildagliptin IPRS* in the dissolution medium.

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm), (Such as Waters XTerra MS 120 Å),
- column temperature: 35°,
- mobile phase: a mixture of 90 volumes of a buffer solution prepared by dissolving 1.3 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 with 10 per cent w/v solution of *dipotassium hydrogen phosphate* and 10 volumes of *acetonitrile*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{25}N_3O_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{25}N_3O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 90 volumes of *0.02 M hydrochloric acid* and 10 volumes of *acetonitrile*.

Buffer solution. Dissolve 1.3 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.5 with 10 per cent w/v solution of *dipotassium hydrogen phosphate*.

Test solution. Disperse a quantity of powdered tablets containing 50 mg of vildagliptin in the solvent mixture, with the aid of ultrasound and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *vildagliptin IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Reference solution (d). A solution containing 0.05 per cent w/v of *vildagliptin IPRS* and 0.0005 per cent w/v, each of, vildagliptin impurity A, B and C in the solvent mixture.

https://nhathuocngocanh.com/

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm), (Such as Waters, XTerra MS 120 Å),
- column temperature: 35°,
- mobile phase: A. a mixture of 40 volumes of the buffer solution, 60 volumes of *water*, 1.5 volumes of *methanol* and 1.5 volumes of *acetonitrile*,

  B. a mixture of 40 volumes of the buffer solution, 45 volumes of *acetonitrile* and 15 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

[1]2-(3-hydroxy-adamantan-1-yl)-1-imino-hexahydro-pyrrolo[1,2-a]pyrazin-4-one. (Cyclic amidine),

[2](S)1-[(3-Hydroxyadamant-1-ylamino)-acetyl]-2-prolinamide. (Amide),

[3]2-(3-Hydroxy adamantan-1-yl)-hexahydro-pyrrolo[1,2-a]pyrazine-1,4-dione. (Diketopiperazine).

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to vildagliptin impurity A and vildagliptin impurity B is not less than 2.5, tailing factor of vildagliptin peak is not more than 1.8 in the chromatogram obtained with reference solution (d), the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 10 for the principal peak in the chromatogram obtained with reference solution (c).

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to vildagliptin impurity B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent), the area of any peak corresponding to vildagliptin impurity A is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak corresponding to vildagliptin impurity C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more 0.2 times than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.2 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{25}N_3O_2$ in the tablets.

Storage. Store protected at a temperature not exceeding 30°.

Vildagliptin and Metformin Tablets

Vildagliptin and Metformin Hydrochloride Tablets

Vildagliptin and Metformin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of vildagliptin, $C_{17}H_{25}N_3O_2$ and metformin hydrochloride, $C_4H_{11}N_5,HCl$.

Usual strengths. Vildagliptin, 50 mg and Metformin hydrochloride, 500 mg; Vildagliptin, 50 mg and Metformin hydrochloride, 850 mg; Vildagliptin, 50 mg and Metformin hydrochloride, 1000 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution (a) and test solution (b) correspond to the principal peaks in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of *0.01 M hydrochloric acid*,

Speed and time. 100 rpm and 30 minutes.

https://nhathuocngocanh.com/

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by dissolving 1.7 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*. Add 8.0 g of *ammonium hexafluorophosphate* and mix.

Test solution (a). Use the filtrate.

Test solution (b). Use the filtrate, dilute if necessary, with the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the reference solution.

Reference solution. A solution containing 0.00556 per cent w/v, each of, *vildagliptin IPRS* and *metformin hydrochloride IPRS* in the dissolution medium.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to spherical silica (3.0 µm), (Such as Atlantis d C18 100 Å),
- column temperature: 40°,
- mobile phase: a mixture of 40 volumes of the buffer solution, 33 volumes of *water* and 27 volumes of *acetonitrile*,
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 for both the peaks.

Inject the reference solution and test solution (a) for vildagliptin and test solution (b) for metformin hydrochloride.

Calculate the content of $C_{17}H_{25}N_3O_2$ and $C_4H_{11}N_5$, HCl in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{25}N_3O_2$ and $C_4H_{11}N_5$,HCl .

Benzyltrimethylammonium hydroxide. Not more than 0.4 per cent.

Determine by gas chromatography (2.4.13).

NOTE — Use freshly prepared solutions.

Internal standard solution. A 0.5 per cent v/v solution of *benzyl alcohol* in *acetone*. Dilute 1.0 ml of the solution to 10.0 ml with *acetone*. Dilute 2.0 ml of the solution to 200.0 ml with *acetone*.

Test solution. Disperse a quantity of the powdered tablets containing 62.5 mg of Vildagliptin in the internal standard and vortex for 2 minutes. Then stir the solution for 45 minutes, with the aid of magnetic stirrer, dilute to 50.0 ml with the internal standard and centrifuge at 4000 rpm for 30 minutes. Use supernatant liquid.

Reference solution (a). A solution containing 0.000625 per cent w/v of *benzyltrimethylammonium hydroxide IPRS (1-amino-adamantan-3-ol)* in the internal standard solution.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with the internal standard solution.

Reference solution (c). A 0.125 per cent w/v solution of *vildagliptin IPRS* in reference solution (a).

Chromatographic system

- a fused-silica capillary column, 15 m x 0.25 mm coated with crossbond 5 per cent diphenyl and 95 per cent dimethylpolysiloxane with film thickness of 1.0 µm (Such as Rtx-5 amine),
- temperature:
  column 100° for 4 minutes, 100° to 290° @ 35° per minutes and hold at 290°, for 14 minutes,
- inlet port at 250° and detector at 300°,
- flame ionisation detector,
- split ratio of 5:1,
- flow rate: 1.0 ml per minute using nitrogen as the carrier gas,
- injection volume: 1 µl.

Inject reference solution (a), (b) and (c). The test is not valid unless the resolution between the peaks due to benzyltrimethyl ammonium hydroxide and benzyl alcohol is not less than 2.5 in the chromatogram obtained with reference solution (c), the relative standard deviation of the peak area ratio due to benzyltrimethylammonium hydroxide and internal standard for replicate injections is not more than 10.0 per cent in the chromatogram obtained with reference solution (a) and the signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution.

Calculate the content of benzyltrimethyl ammonium hydroxide, using ratio of the peak area of benzyltrimethyl ammonium hydroxide to that of peak area of the internal standard.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 1.7 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusted to pH 3.0 with *ortho phosphoric acid*, add 8 g of *ammonium hexafluorophosphate* and mix.

Solvent mixture. 90 volumes of *water*, 10 volumes of *acetonitrile* and 0.1 volume of *orthophosphoric acid*.

Solution A. 40 volumes of the buffer solution, 60 volumes of *water* and 2.5 volumes of *acetonitrile*.

https://nhathuocngocanh.com/

Test solution (a). Disperse 10 intact tablets in the solvent mixture, with the aid of magnetic stirrer for 45 minutes, dilute to 500.0 ml with the solvent mixture. Centrifuge to get a clear supernatant, filter. Dilute 10.0 ml of the filtrate to 20.0 ml with the solvent mixture.

Test solution (b). Dilute a suitable volume of test solution (a) with solution A to obtain a solution having 0.02 per cent w/v of Metformin Hydrochloride.

Reference solution (a). A solution containing 0.05 per cent w/v of *vildagliptin IPRS* and 0.02 per cent w/v of *metformin hydrochloride IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.005 per cent w/v solution of *dicyandiamide IPRS* in the solvent mixture.

Reference solution (d). Dilute 5.0 ml of reference solution (b) and 0.2 ml of reference solution (c) to 50.0 ml with the solvent mixture.

Reference solution (e). A solution containing 0.0125 per cent w/v, each of, *vildagliptin impurities A, B, C IPRS* and *dicyandiamide IPRS* in the solvent mixture. Dilute 2.0 ml of the solution to 50.0 ml with reference solution (a).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to spherical silica (3.0 µm) (Such as Waters, Atlantis d C18 100 Å),
- column temperature: 35°,
- mobile phase A: a mixture of 40 volumes of the buffer solution and 60 volumes of *water,*
  B: a mixture of 40 volumes of the buffer solution and 60 volumes of *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm (for vildagliptin) and 218 nm (for metformin hydrochloride),
- injection volume: 10 µl.

Vildagliptin	1.0	—

[1]1-cyanoguanidine,

[2]2-(3-hydroxy-adamantan-1-yl)-1-imino-hexahydro-pyrrolo[1,2-a]pyrazin-4-one. (Cyclic amidine),

[3](*S*)1-[(3-Hydroxyadamant-1-ylamino)-acetyl]-2-prolinamide. (Amide),

[4]2-(3-Hydroxy adamantan-1-yl)-hexahydro-pyrrolo[1,2-a]pyrazine-1,4-dione. (Diketopiperazine).

Inject reference solution (b), (d) and (e) at 210 nm. The test is not valid unless the resolution between the peaks due to vildagliptin impurity B and vildagliptin impurity A is not less than 1.8 in the chromatogram obtained with reference solution (e), the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent for both the peaks in the chromatogram obtained with reference solution (b). The signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (d) for all the three peaks.

Inject reference solution (b) and test solution (a) at 210 nm. In the chromatogram obtained with test solution (a), the area of any peak corresponding to vildagliptin impurity A and vildagliptin impurity C, each of, is not more than the area of vildagliptin peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak corresponding to vildagliptin impurity B is not more than twice the area of vildagliptin peak in the chromatogram obtained with reference solution (b) (2.0 per cent), the area of any other secondary peak is not more than 0.2 times the area of the vildagliptin peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3.5 times the area of vildagliptin peak in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore the peaks due to metformin hydrochloride and any peak with an area less than 0.05 times the area of the vildagliptin peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Inject reference solution (b) and test solution (b) at 218 nm. In the chromatogram obtained with the test solution (b), the area of any peak corresponding to dicyandiamide is not more than 0.02 times the area of principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent), the area of any other secondary peak is not more than 0.1 the area of the metformin hydrochloride peak in the chromatogram obtained with reference solution (b) (0.1 per cent), and the sum of the

https://nhathuocngocanh.com/

areas of all the secondary peaks is not more than 0.6 times the area of metformin hydrochloride peak in the chromatogram obtained with reference solution (b) (0.6 per cent). Ignore the peak due to vildagliptin.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4. 14), as described under Dissolution, using the following modifications.

Solvent mixture. 90 volumes of *water*, 10 volumes of *acetonitrile* and 0.1 volume of *orthophosphoric acid*.

Test solution. Disperse one intact tablet in the solvent mixture, with the aid of ultrasound and dilute to 200.0 ml with the solvent mixture, filter.

Reference solution. A 0.025 per cent w/v solution of *vildagliptin IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{25}N_3O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

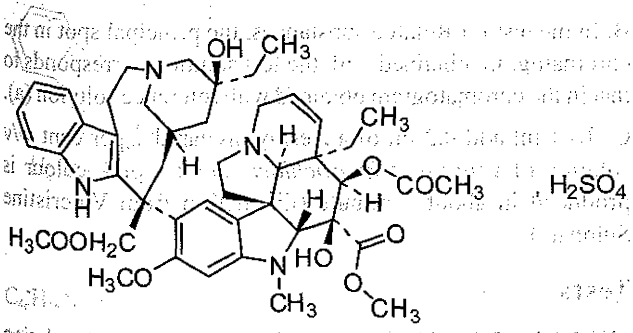
Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

Inject reference solution (a) and test solution (a) and (b).

Calculate the content of $C_{17}H_{25}N_3O_2$ in test solution (a) and $C_4H_{11}N_5$, HCl in test solution (b) in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Vinblastine Sulphate



$C_{46}H_{58}N_4O_9,H_2SO_4$ Mol. Wt. 909.1

Vinblastine Sulphate is methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-acetoxy-3a-ethyl-9-[(5*S*,7*R*,9*S*)-5-ethyl-5-hydroxy-9-methoxycarbonyl-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[(5,4-*b*)indol-9-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate sulphate.

Vinblastine Sulphate contains not less than 95.0 per cent and not more than 104.0 per cent of $C_{46}H_{58}N_4O_9$, H_2SO_4, calculated on the dried basis.

Category. Anticancer.

Description. A white or yellowish, amorphous or crystalline powder; very hygroscopic.

CAUTION— Handle Vinblastine Sulphate with great care since it is a potent cytotoxic agent. Avoid contact with eyes; irritant to tissues.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *vinblastine sulphate IPRS* or with the reference spectrum of vinblastine sulphate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

C. A 10 per cent w/v solution gives the reaction of sulphates (2.3.1).

Tests

Appearance of solution. A 0.5 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS5 (2.4.1).

pH (2.4.24). 3.5 to 5.0, determined in a 0.15 per cent w/v solution.
