##### ▶ Mycobutin (Pfizer Ltd)

**Rifabutin 150 mg** Mycobutin 150mg capsules | 30 capsule **[PoM]** £90.38 DT = £90.38

### Rifaximin

02-Dec-2020

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

#### ● INDICATIONS AND DOSE

**Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours**

##### ▶ BY MOUTH

▶ Adult: 200 mg every 8 hours for 3 days

**Reduction in recurrence of hepatic encephalopathy**

##### ▶ BY MOUTH

▶ Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction

- **INTERACTIONS** → Appendix 1: rifaximin

### ● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · ascites · constipation · depression · dizziness · dyspnoea · gastrointestinal

discomfort · gastrointestinal disorders · headaches · muscle complaints · nausea · oedema · skin reactions · vomiting

- ▶ **Uncommon** Anaemia · anxiety · appetite decreased · asthenia · balance impaired · concentration impaired · confusion · cough · diplopia · drowsiness · dry lips · dry mouth · dry throat · ear pain · fall · haematuria · hot flush · hyperhidrosis · hyperkalaemia · increased risk of infection · lymphocytosis · memory loss · muscle weakness · nasal complaints · neutropenia · oropharyngeal pain · pain · palpitations · polymenorrhoea · respiratory disorders · seizure · sensation abnormal · sleep disorders · sunburn · taste altered · urinary disorders · urine abnormalities · vertigo
- ▶ **Rare or very rare** Hypertension · hypotension
- ▶ **Frequency not known** Angioedema · syncope · thrombocytopenia · urine discolouration
- **ALLERGY AND CROSS-SENSITIVITY** [EVR](#) Contra-indicated if history of rifamycin hypersensitivity. ⚠
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
  - ▶ When used for hepatic encephalopathy Manufacturer advises caution in severe impairment (risk of increased exposure).
- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- NICE decisions**
  - ▶ Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Oral suspension

##### ▶ Rifaximin (Non-proprietary)

Rifaximin 20 mg per 1 ml Normix 100mg/5ml granules for oral suspension | 100 ml [PoM](#) [S](#)

## 2.1 Anthrax

### Anthrax

03-Apr-2021

#### Treatment and post-exposure prophylaxis

Anthrax is a notifiable disease in the UK. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 540. If anthrax infection is suspected, discuss with an infectious disease specialist and arrange urgent consultation. For community level outbreaks, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0141 300 1191).

*Inhalation or gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 608 or, in patients over 12 years, doxycycline p. 616 [unlicensed use] and combined with one or two other antibacterials (such as benzylpenicillin sodium p. 595, clindamycin, rifampicin, and vancomycin). Alternatively, the combination of amoxicillin p. 597 and

imipenem with cilastatin, or meropenem and chloramphenicol may be given.

*Cutaneous anthrax* should be treated with either oral ciprofloxacin [unlicensed use] or, in patients over 12 years, doxycycline [unlicensed use] for 7 days; treatment should be switched to amoxicillin if the infecting strain is susceptible.

Oral ciprofloxacin, doxycycline [unlicensed use], or amoxicillin may be given for *post-exposure prophylaxis*. Antibacterial prophylaxis should continue for up to 60 days, however a shorter period may be recommended. Vaccination against anthrax may be considered in selected cases. For further information, see Anthrax vaccine p. 1395.

## 2.2 Leprosy

### Leprosy

#### Management

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone p. 629 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 634, and clofazimine p. 629. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 612, minocycline p. 618 and clarithromycin p. 584, but none of these are active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 747 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 1036 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

## ANTIMYCOBACTERIALS

### Clofazimine

11-May-2021

#### ● INDICATIONS AND DOSE

**Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)**

▶ BY MOUTH

- Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

**Lepromatous lepra reactions (administered on expert advice)**

▶ BY MOUTH

- Adult: 300 mg daily for max. 3 months

**Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)**

▶ BY MOUTH

- Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses

- **INTERACTIONS** → Appendix 1: clofazimine

- **SIDE-EFFECTS** Abdominal pain · appetite decreased · dry eye · eye discolouration · fatigue · gastrointestinal disorders · hair colour changes (reversible) · headache · lymphadenopathy · nausea · photosensitivity reaction · red discolouration of body fluids · skin discolouration (including areas exposed to light) · skin reactions · splenic infarction · urine discolouration · visual impairment · vomiting (hospitalise if persistent) · weight decreased

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** May alter colour of milk; skin discoloration of infant.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** [EvGr](#) Use with caution in severe impairment. 

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14, 21

▶ **Clofazimine (Non-proprietary)**

Clofazimine 50 mg Lamprene 50mg capsules | 100 capsule [PoM](#) 

### Dapsone

05-May-2020

#### ● INDICATIONS AND DOSE

**Multibacillary leprosy in combination with rifampicin and clofazimine (3-drug regimen) Paucibacillary leprosy in combination with rifampicin (2-drug regimen)**

▶ BY MOUTH

- Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

**Dermatitis herpetiformis**

▶ BY MOUTH

- Adult: (consult product literature or local protocols)

**Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)**

▶ BY MOUTH

- Adult: 100 mg once daily

**Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia**

▶ BY MOUTH

- Adult: 100 mg daily

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia.

- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 1150 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis

- **INTERACTIONS** → Appendix 1: dapsone

- **SIDE-EFFECTS** Agranulocytosis · appetite decreased · haemolysis · haemolytic anaemia · headache · hepatic disorders · hypoalbuminaemia · insomnia · lepra reaction · methaemoglobinaemia · motor loss · nausea · peripheral neuropathy · photosensitivity reaction · psychosis · severe cutaneous adverse reactions (SCARs) · skin reactions · tachycardia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are dose-related. If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).

- **PREGNANCY** Folic acid p. 1112 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.

- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.

- **PATIENT AND CARER ADVICE**

**Blood disorders** On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 8

**Dapsone 50 mg** Dapsone 50mg tablets | 28 tablet [PoM](#) £36.22 DT = £6.58

**Dapsone 100 mg** Dapsone 100mg tablets | 28 tablet [PoM](#) £97.39 DT = £30.98

## 2.3 Lyme disease

### Lyme disease

14-Nov-2018

#### Description of condition

Lyme disease, also known as Lyme borreliosis, is an infection caused by bacteria called *Borrelia burgdorferi*. It is transmitted to humans by the bite of an infected tick. Ticks are mainly found in grassy and wooded areas including urban gardens and parks. Most tick bites do not cause Lyme disease, and the prompt and correct removal of the tick reduces the risk of infection.

Lyme disease usually presents with a characteristic erythema migrans rash. This usually becomes visible

1–4 weeks after a tick bite, but can appear from 3 days to 3 months, and last for several weeks. It may be accompanied by non-focal (non-organ related) symptoms, such as fever, swollen glands, malaise, fatigue, neck pain or stiffness, joint or muscle pain, headache, cognitive impairment, or paraesthesia.

Other signs and symptoms of Lyme disease may also appear months or years after the initial infection and are typically characterised by focal symptoms (relating to at least 1 organ system). These include neurological (affecting cranial nerves, peripheral and central nervous systems), joint (Lyme arthritis), cardiac (Lyme carditis), or skin (acrodermatitis chronica atrophicans) manifestations.

### Drug treatment

**[EvGr]** Patients diagnosed with Lyme disease should be given treatment with an antibacterial drug; the choice of drug should be based on presenting symptoms. In patients who present with focal symptoms, a discussion with, or referral to, a specialist should be considered but should not delay treatment.

In patients presenting with *erythema migrans rash with or without non-focal symptoms*, oral doxycycline p. 616 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 616 cannot be given, oral amoxicillin p. 597 should be used as an alternative. Oral azithromycin p. 583 [unlicensed indication] should be given if both doxycycline p. 616 and amoxicillin p. 597 are unsuitable.

In patients presenting with focal symptoms of *cranial nerve or peripheral nervous system involvement*, oral doxycycline p. 616 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 616 cannot be given, oral amoxicillin p. 597 should be used as an alternative.

In patients presenting with symptoms of *central nervous system involvement*, intravenous ceftriaxone p. 574 is recommended as first-line treatment. Oral doxycycline p. 616 [unlicensed indication] should be used as an alternative if ceftriaxone p. 574 cannot be given, or when switching to oral antibacterial treatment.

In patients with symptoms of *Lyme arthritis or acrodermatitis chronica atrophicans*, oral doxycycline p. 616 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 616 cannot be given, oral amoxicillin p. 597 should be used as an alternative. Intravenous ceftriaxone p. 574 should be given if both doxycycline p. 616 and amoxicillin p. 597 are unsuitable.

In patients with symptoms of *Lyme carditis who are haemodynamically stable*, oral doxycycline p. 616 [unlicensed indication] is recommended as first-line treatment. If doxycycline p. 616 cannot be given, intravenous ceftriaxone p. 574 should be used as an alternative.

In patients with symptoms of *Lyme carditis who are haemodynamically unstable*, intravenous ceftriaxone p. 574 is recommended. Oral doxycycline p. 616 [unlicensed indication] should be given when switching to oral antibacterial treatment. **[A]**

### Ongoing symptom management

**[EvGr]** If symptoms continue to persist or worsen after antibacterial treatment, patients should be assessed for possible alternative causes, re-infection with Lyme disease, treatment failure or non-adherence to previous antibacterial treatment, or progression to organ damage caused by Lyme disease (such as nerve palsy).

A second course of antibacterial treatment should be given to patients presenting with signs and symptoms of re-infection. In patients presenting with ongoing symptoms due to possible treatment failure, treatment with an alternative antibacterial drug should be considered. A third course of antibacterial treatment is not recommended, and further management should be discussed with a national

reference laboratory or suitable specialist depending on symptoms (for example, a rheumatologist or neurologist).

## 2.4 Methicillin-resistant *Staphylococcus aureus*

### MRSA

08-Mar-2012

#### Management

Methicillin-resistant *Staphylococcus aureus* (MRSA) are strains of *Staphylococcus aureus* that are resistant to a number of commonly used antibacterials including beta-lactam antibacterials (e.g. methicillin [now discontinued] and flucloxacillin). As with *Staph. aureus* colonisation, MRSA may colonise the skin, gut, or nose without displaying signs or symptoms of infection. Infection with MRSA can be difficult to manage; management includes appropriate infection control measures, adherence to local policies, and treatment guided by the sensitivity of the infecting strain. Consult a microbiologist or the local infection control team where appropriate.

**[EvGr]** Oral doxycycline p. 616, trimethoprim p. 625, ciprofloxacin p. 608, or co-trimoxazole p. 613 can be considered for lower *urinary-tract infections* caused by MRSA according to susceptibility. A **glycopeptide** can be considered for complicated urinary-tract infections. **[A]**

For information on the management of MRSA-associated *skin and soft-tissue infections*, *hospital-acquired pneumonia*, *septicaemia*, *endocarditis*, *osteomyelitis*, and *septic arthritis*, see the corresponding treatment summary: *Skin infections*, antibacterial therapy p. 554, *Respiratory system infections*, antibacterial therapy p. 551, *Blood infections*, antibacterial therapy p. 545, *Cardiovascular system infections*, antibacterial therapy p. 545, and *Musculoskeletal system infections*, antibacterial therapy p. 550.

For information on MRSA eradication of the nasal carriage, see Nose p. 1292.

## 2.5 Tuberculosis

### Tuberculosis

24-Oct-2019

#### Overview

Tuberculosis is a curable infectious disease caused by bacteria of the *Mycobacterium tuberculosis* complex (*M. tuberculosis*, *M. africanum*, *M. bovis* or *M. microti*) and is spread by breathing in infected respiratory droplets from a person with infectious tuberculosis. The most common form of tuberculosis infection is in the lungs (**pulmonary**) but infection can also spread and develop in other parts of the body (**extrapulmonary**).

The initial infection with tuberculosis clears in the majority of individuals. However, in some cases the bacteria may become dormant and remain in the body with no symptoms (**latent tuberculosis**) or progress to being

symptomatic (**active** tuberculosis) over the following weeks or months. In individuals with latent tuberculosis only a small proportion will develop active tuberculosis.

Many cases of tuberculosis can be prevented by public health measures and when clinical disease does occur most individuals can be cured if treated properly with the correct dose, combination and duration of treatment. Drug-resistant strains of tuberculosis are much harder to treat and significantly increase an individual's risk of long-term complications or death.

### Treatment phases, overview

The standard treatment of active tuberculosis is completed in two phases—an **initial phase** using four drugs and a **continuation phase** using two drugs, in fully sensitive cases. **EvGr** The management of tuberculosis should be under specialist care by clinicians with training in, and experience of, the specialised care of individuals with tuberculosis. This tuberculosis service should include specialised nurses and health visitors. **⚠**

Within the UK there are two regimens recommended for the treatment of tuberculosis: **unsupervised** or **supervised**. The choice of either regimen is dependent on a risk assessment to identify if an individual needs enhanced case management.

**EvGr** In all phases of treatment for tuberculosis, fixed-dose combination tablets should be used, and a daily dosing schedule should be considered in active tuberculosis. **⚠**

#### Initial phase

**EvGr** As standard treatment for individuals with active tuberculosis, offer rifampicin p. 634, ethambutol hydrochloride p. 638, pyrazinamide p. 640 and isoniazid p. 639 (with pyridoxine hydrochloride p. 1175) in the initial phase of therapy; modified according to drug susceptibility testing; and continued for 2 months.

Treatment should be started without waiting for culture results if clinical signs and symptoms are consistent with a tuberculosis diagnosis; consider completing the standard treatment even if subsequent culture results are negative. **⚠**

#### Continuation phase

**EvGr** After the initial phase, offer standard continuation treatment with rifampicin and isoniazid (with pyridoxine hydrochloride) for a further 4 months in individuals with active tuberculosis without central nervous system involvement. Longer treatment for 10 months should be offered in individuals with active tuberculosis of the central nervous system, with or without spinal involvement.

Treatment should be modified according to drug susceptibility testing. **⚠**

#### Unsupervised treatment

The unsupervised treatment regimen is for individuals who are likely to take antituberculosis drugs reliably and willingly without supervision.

#### Supervised treatment

For individuals requiring supervised treatment (directly observed therapy, DOT), this is offered as part of enhanced case management. **EvGr** A 3 times weekly dosing schedule can be considered in individuals with tuberculosis if they require enhanced case management and daily directly observed therapy is not available. Antituberculosis treatment dosing regimens of fewer than 3 times a week are not recommended.

Directly observed therapy should be offered to individuals who:

- have a current risk or history of non-adherence;
- have previously been treated for tuberculosis;
- have a history of homelessness, drug or alcohol misuse;
- are in prison or a young offender institution, or have been in the past 5 years;
- have a major psychiatric, memory or cognitive disorder;

- are in denial of the tuberculosis diagnosis;
- have multi-drug resistant tuberculosis;
- request directly observed therapy after discussion with the clinical team;
- are too ill to self-administer treatment. **⚠**

### Individuals with comorbidities or coexisting conditions, including the immunocompromised

**EvGr** Individuals with comorbidities or coexisting conditions (such as HIV, severe liver disease, chronic kidney disease, diabetes, eye disease or vision impairment, a history of alcohol or substance misuse, or who are pregnant or breastfeeding) should be managed by a specialist multidisciplinary team with experience in managing tuberculosis and the comorbidity or coexisting condition.

For individuals who are HIV-positive with active TB, treatment with the standard regimen should not routinely exceed 6 months, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Care should be taken to avoid drug interactions when co-prescribing antiretroviral and antituberculosis drugs. **⚠** For further information on the management of tuberculosis in HIV infection, see British HIV Association guideline:

**Management of tuberculosis in adults living with HIV** (available at [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines)).

### Extrapulmonary tuberculosis

#### Central nervous system tuberculosis

**EvGr** Individuals with central nervous system tuberculosis should be offered standard treatment with **initial phase** drugs for 2 months (see *Initial phase* for specific drugs). After completion of the initial treatment phase, standard treatment with **continuation phase** drugs should then be offered (see *Continuation phase* for specific drugs); and continued for a further 10 months. Treatment for tuberculous meningitis should be offered if clinical signs and other laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of *dexamethasone* or *prednisolone* should be offered at the same time as antituberculosis treatment, then slowly withdrawn over 4–8 weeks. **⚠** For additional information on corticosteroid use, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

**EvGr** Referral for surgery should only be considered in individuals who have raised intracranial pressure; or have spinal TB with spinal instability or evidence of spinal cord compression. **⚠**

#### Pericardial tuberculosis

**EvGr** An initial high dose of oral *prednisolone* should be offered to individuals with active pericardial tuberculosis, at the same time as antituberculosis treatment, then slowly withdrawn over 2–3 weeks. **⚠** For additional information on corticosteroid use, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

### Latent tuberculosis

Some individuals with latent tuberculosis are at increased risk of developing active tuberculosis (such as individuals who are HIV-positive, diabetic, injecting drug users, or receiving treatment with an anti-tumor necrosis factor alpha inhibitor). **EvGr** If for any reason these individuals do not have treatment for latent tuberculosis, they should be informed of the risks and symptoms of active tuberculosis. **⚠**

#### Close contacts

**EvGr** Anyone aged under 65 years who is a close contact (prolonged, frequent or intense contact, for example household contacts or partners) of a person with pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Drug treatment should be offered to all

**Recommended dosage for standard unsupervised 6-month treatment**

Rifampicin with isoniazid and pyrazinamide	<p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 40 kg 3 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast ;</li> <li>▶ body-weight 40–49 kg 4 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast ;</li> <li>▶ body-weight 50–64 kg 5 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast ;</li> <li>▶ body-weight 65 kg and above 6 tablets daily for 2 months (initial phase), use <i>Rifater</i><sup>®</sup> Tablets, preferably taken before breakfast</li> </ul>
Ethambutol hydrochloride	Adult: 15 mg/kg once daily for 2 months (initial phase)
Rifampicin with isoniazid	<p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i><sup>®</sup> 150/100 Tablets, preferably taken before breakfast ;</li> <li>▶ body-weight 50 kg and above 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use <i>Rifinah</i><sup>®</sup> 300/150 Tablets, preferably taken before breakfast</li> </ul>
<i>or</i> (if combination preparations not appropriate):	
Isoniazid	<p>Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 300 mg daily for 6 months (initial and continuation phases)</p>
Rifampicin	<p>Child:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day ;</li> <li>▶ body-weight 50 kg and above 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day</li> </ul> <p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 450 mg once daily for 6 months (initial and continuation phases) ;</li> <li>▶ body-weight 50 kg and above 600 mg once daily for 6 months (initial and continuation phases)</li> </ul>
Pyrazinamide	<p>Child:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day ;</li> <li>▶ body-weight 50 kg and above 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day</li> </ul> <p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 1.5 g once daily for 2 months (initial phase);</li> <li>▶ body-weight 50 kg and above 2 g once daily for 2 months (initial phase)</li> </ul>
Ethambutol hydrochloride	<p>Child: 20 mg/kg once daily for 2 months (initial phase)</p> <p>Adult: 15 mg/kg once daily for 2 months (initial phase)</p>
<p>In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride p. 638 due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (<i>Rifater</i><sup>®</sup>, <i>Rifinah</i><sup>®</sup>) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.</p>	

**Recommended dosage for intermittent supervised 6-month treatment**

Isoniazid	<p>Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p> <p>Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)</p>

Pyrazinamide	<p>Child:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase) ;</li> <li>▶ body-weight 50 kg and above 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)</li> </ul> <p>Adult:</p> <ul style="list-style-type: none"> <li>▶ body-weight up to 50 kg 2 g 3 times a week for 2 months (initial phase);</li> <li>▶ body-weight 50 kg and above 2.5 g 3 times a week for 2 months (initial phase)</li> </ul>
Ethambutol hydrochloride	<p>Child: 30 mg/kg 3 times a week for 2 months (initial phase)</p> <p>Adult: 30 mg/kg 3 times a week for 2 months (initial phase)</p>

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*<sup>®</sup>, *Rifinah*<sup>®</sup>) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

individuals aged under 65 years with evidence of latent tuberculosis, if the close contact has *suspected infectious* or *confirmed active* pulmonary or laryngeal drug-sensitive tuberculosis. [▲](#)

#### Immunocompromised

[EvGr](#) Individuals who are anticipated to be, or who are currently immunocompromised, should have a risk assessment carried out to establish whether tuberculosis testing should be offered. Take into account the severity and duration of their immunocompromise and any risk factors for tuberculosis (such as country of birth or recent contact with an index case with suspected infectious or confirmed pulmonary or laryngeal tuberculosis).

Individuals who are severely immunocompromised (such as those with HIV and a CD4 count of less than 200 cells/mm<sup>3</sup>, or who have had a solid organ or allogeneic stem cell transplant) should be tested for latent tuberculosis using an appropriate method. Individuals who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis. [▲](#) For further information on tuberculosis testing methods, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*).

#### Healthcare workers

[EvGr](#) Any new NHS employees who are new entrants from a high incidence country should be offered appropriate testing for latent tuberculosis. Those who are not new entrants from a high incidence country, but who will be in contact with patients or clinical materials should be offered appropriate testing for latent tuberculosis if prior BCG vaccination cannot be verified. [▲](#) For further information on tuberculosis testing methods, see NICE clinical guideline: **Tuberculosis** (see *Useful resources*) and Bacillus Calmette-Guérin vaccine p. 1396.

[EvGr](#) Those who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

For healthcare workers who are immunocompromised, follow standard advice for testing and treatment (see *Immunocompromised* above). [▲](#)

#### Treatment of latent tuberculosis

[EvGr](#) For individuals aged below 65 years, including those with HIV where treatment for latent tuberculosis is indicated, offer drug treatment with either 3 months of isoniazid (with pyridoxine hydrochloride p. 1175) and rifampicin or 6 months of isoniazid (with pyridoxine hydrochloride). [▲](#)

The choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. [EvGr](#) Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Individuals aged 35 to 65 years should only be offered treatment if hepatotoxicity is not a concern.

For individuals aged under 35 years offer treatment with 3 months of isoniazid (with pyridoxine hydrochloride) and rifampicin if hepatotoxicity is a concern after an assessment of both liver function (including transaminase levels) and risk factors.

For individuals where interactions with rifamycins are a concern (for example, in people with HIV or who those have had a transplant), offer treatment with 6 months of isoniazid (with pyridoxine hydrochloride).

Individuals with severe liver disease should be treated under the care of a specialist team. Careful monitoring of liver function is necessary in individuals with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs. [▲](#)

For advice on immunisation against tuberculosis, see Bacillus Calmette-Guérin vaccine p. 1396.

#### Treatment failure

Major causes of treatment failure include incorrect prescribing by the clinician and inadequate compliance by the infected individual. [EvGr](#) All individuals diagnosed with tuberculosis should have an allocated case manager to help with the development of a health and social care plan, supervision of treatment, and support with the completion of treatment. Multidisciplinary tuberculosis teams should implement strategies (such as random urine tests, pill counts, home visits, health education counselling, and language appropriate reminder services) to help with adherence to, and successful completion of treatment. [▲](#)

#### Treatment interruptions

A break in antituberculosis treatment of at least 2 weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. [EvGr](#) If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly. [▲](#)

#### Treatment interruptions due to drug-induced hepatotoxicity

[EvGr](#) Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once aspartate or alanine transaminase levels fall below twice the upper limit of normal, bilirubin levels have returned to the normal range, and hepatotoxic symptoms have resolved, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than 10 days. Start with ethambutol hydrochloride p. 638 and either isoniazid p. 639 (with pyridoxine hydrochloride) or rifampicin p. 634.

In individuals with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least 2 drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 562 (with or without a fluoroquinolone antibiotic, such as levofloxacin p. 610 or moxifloxacin p. 611), with ongoing monitoring by a liver specialist. [▲](#)

#### Treatment interruptions due to cutaneous reactions

[EvGr](#) If an individual with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least 2 drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist. [▲](#)

#### Drug-resistant tuberculosis

[EvGr](#) Treatment of drug-resistant tuberculosis should be managed by a multidisciplinary team with experience in such cases, and where appropriate facilities for infection-control exist. [▲](#) The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

#### Single drug-resistant tuberculosis

[EvGr](#) For single drug-resistance in individuals with tuberculosis with central nervous system involvement, refer to a specialist with experience in managing drug-resistant tuberculosis. [▲](#) For those without central nervous system involvement, the following treatment regimens are recommended:

#### Resistance to isoniazid:

- [EvGr](#) First 2 months (initial phase): rifampicin, pyrazinamide p. 640 and ethambutol hydrochloride;
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for 7 months (up to 10 months for extensive disease). [▲](#)

**Resistance to pyrazinamide:**

- [EvGr] First 2 months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for 7 months.

**Resistance to ethambutol hydrochloride:**

- [EvGr] First 2 months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid p. 639 (with pyridoxine hydrochloride p. 1175) for 4 months.

**Resistance to rifampicin below:**

- [EvGr] Offer treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive.

**Multi-drug resistant tuberculosis**

[EvGr] In multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin, with or without any other resistance*), positive cases of rifampicin resistance require treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility.

11-Nov-2021

**• INDICATIONS AND DOSE**

**Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child 1-11 months: 5–10 mg/kg twice daily
- ▶ Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)
- ▶ Adult: 0.6–1.2 g daily in 2–4 divided doses

**Endocarditis in combination with other drugs**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 0.6–1.2 g daily in 2–4 divided doses

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH
- ▶ Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- ▶ Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

- ▶ Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
- ▶ Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
- ▶ Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Adult (body-weight 50 kg and above): 600 mg daily for 3 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years**

- ▶ BY MOUTH
- ▶ Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

**Prevention of secondary case of *Haemophilus influenzae* type b disease**

- ▶ BY MOUTH
- ▶ Child 1-2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12–17 years: 600 mg once daily for 4 days
- ▶ Adult: 600 mg once daily for 4 days

**Prevention of secondary case of meningococcal meningitis**

- ▶ BY MOUTH
- ▶ Child 1-11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1-11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12-17 years: 600 mg every 12 hours for 2 days
- ▶ Adult: 600 mg every 12 hours for 2 days

**Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapsone (2-drug regimen)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- ▶ Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1: rifamycins

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Nausea · thrombocytopenia · vomiting
- ▶ **Uncommon** Diarrhoea · leucopenia
- ▶ **Frequency not known** Abdominal discomfort · acute kidney injury · adrenal insufficiency · agranulocytosis · appetite decreased · disseminated intravascular coagulation · dyspnoea · eosinophilia · eye disorders · flushing · gastrointestinal disorders · haemolytic anaemia · hepatitis · hypersensitivity · influenza · intracranial haemorrhage · menstrual disorder · muscle weakness · myopathy · oedema · pseudomembranous enterocolitis · red discolouration of body fluids · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · sputum discolouration · sweat changes · urine discolouration · vasculitis · wheezing

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Bone pain · hyperbilirubinaemia · psychotic disorder
- ▶ With oral use Psychosis

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure. Discontinue if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** E<sub>VG</sub> Contra-indicated in patients with rifamycin hypersensitivity. ⚠

**● CONCEPTION AND CONTRACEPTION**

**Important** Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function weekly for two weeks, then every two weeks for the next six weeks.

**Dose adjustments** Manufacturer advises maximum 8 mg/kg per day.

**● RENAL IMPAIRMENT**

- ▶ In children Use with caution if doses above 10 mg/kg daily.
- ▶ In adults Use with caution if dose above 600 mg daily.

**● MONITORING REQUIREMENTS**

- ▶ **Renal function** should be checked before treatment.
- ▶ **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored in patients on prolonged therapy.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

**● DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in adults For *intravenous infusion* (Rifadin<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
- ▶ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. Expert sources advise may be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL; infuse over 2–3 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

Flavours of syrup may include raspberry.

- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

**● PATIENT AND CARER ADVICE**

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**ANTIMYCOBACTERIALS > OTHER****Aminosalicylic acid**

12-May-2021

**● INDICATIONS AND DOSE****Multiple-drug resistant tuberculosis, in combination with other drugs**

- ▶ BY MOUTH

- ▶ Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

**Desensitisation regimen**

- ▶ BY MOUTH

- ▶ Adult: (consult product literature)

- **CAUTIONS** Peptic ulcer

- **INTERACTIONS** → Appendix 1: aminosalicylic acid

**● SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · hypersensitivity · nausea · skin reactions · vestibular syndrome · vomiting
- ▶ **Uncommon** Appetite decreased
- ▶ **Rare or very rare** Agranulocytosis · anaemia · crystalluria · gastrointestinal haemorrhage · headache · hepatic disorders · hypoglycaemia · hypothyroidism · leucopenia · methaemoglobinemia · peripheral neuropathy · taste metallic · tendon pain · thrombocytopenia · visual impairment · weight decreased
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies (highest risk during first trimester).

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** [EVR](#) Caution in mild to moderate impairment; avoid in severe impairment (accumulation of inactive metabolites). [M](#)
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.
  - ▶ Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Patients should be advised that the skeletons of the granules may be seen in the stools. Counselling advised on administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 9, 25

- ▶ **Granupas** (Eurocept International bv)

Aminosalicylic acid 1 gram per 1 gram Granupas gastro-resistant granules 4g sachets sugar-free | 30 sachet [POM](#) £331.00 DT = £331.00

## Bedaquiline

22-Jul-2021

### ● INDICATIONS AND DOSE

#### Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

- ▶ BY MOUTH

- ▶ **Adult:** Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · ventricular arrhythmia
- **CAUTIONS** Hypothyroidism · QTc interval (derived using Fridericia's formula) 450–500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure, history of symptomatic arrhythmias, bradycardia, congenital long QT syndrome)
- **INTERACTIONS** → Appendix 1: bedaquiline
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · diarrhoea · dizziness · headache · hepatic function abnormal · myalgia · nausea · QT interval prolongation · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** If syncope occurs, obtain ECG.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** [EVR](#) Caution if creatinine clearance less than 30 mL/minute, [M](#) see p. 21.

### ● MONITORING REQUIREMENTS

- ▶ Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
- ▶ Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
- ▶ Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

### ● PATIENT AND CARER ADVICE

- ▶ **Missed doses** If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

**Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ **Bedaquiline (Sirturo<sup>®</sup>)** for use as part of an appropriate combination regimen for pulmonary multidrug-resistant tuberculosis in adults and adolescent patients (12 years to less than 18 years of age and weighing at least 30 kg) when an effective treatment regimen cannot otherwise be composed for reasons of resistance or tolerability (September 2020) AWMSG No. 3726 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 4, 8, 21, 25

- ▶ **Sirturo** (Janssen-Cilag Ltd) ▼

## Capreomycin

22-Dec-2021

### ● INDICATIONS AND DOSE

#### Tuberculosis resistant to first-line drugs, in combination with other drugs

- ▶ BY DEEP INTRAMUSCULAR INJECTION

**Adult:** 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

- **CAUTIONS** Auditory impairment
- **INTERACTIONS** → Appendix 1: capreomycin
- **SIDE-EFFECTS** Eosinophilia · febrile disorders · hearing impairment · leucocytosis · leucopenia · nephrotoxicity · pain · pseudo-Bartter syndrome · skin reactions · thrombocytopenia · tinnitus · vertigo
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** [EVR](#) Caution (risk of nephrotoxicity and ototoxicity). [M](#)
- **Dose adjustments** [EVR](#) Reduce dose (consult product literature). [M](#)
- **MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.
- **MEDICINAL FORMS** No licensed medicines listed.

## Cycloserine

### ● INDICATIONS AND DOSE

**Tuberculosis resistant to first-line drugs, in combination with other drugs**

#### ► BY MOUTH

- Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

### PHARMACOKINETICS

- Cycloserine penetrates the CNS.

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

- **INTERACTIONS** → Appendix 1: cycloserine

- **SIDE-EFFECTS** Behaviour abnormal · coma · confusion · congestive heart failure · drowsiness · dysarthria · headache · hyperirritability · megaloblastic anaemia · memory loss · neurological effects · paraesthesia · paresis · psychosis · rash · reflexes increased · seizures · suicidal ideation · tremor · vertigo

### SIDE-EFFECTS, FURTHER INFORMATION CNS toxicity

Discontinue or reduce dose if symptoms of CNS toxicity occur.

**Rashes or allergic dermatitis** Discontinue or reduce dose if rashes or allergic dermatitis develop.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Increase interval between doses if creatinine clearance less than 50 mL/minute.  
**Monitoring** Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
  - Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre.
  - Monitor haematological, renal, and hepatic function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

#### ► Cycloserine (Non-proprietary)

Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PoM] £442.89 DT = £442.89

## Delamanid

10-May-2021

### ● INDICATIONS AND DOSE

**Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs**

#### ► BY MOUTH

- Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · serum albumin less than 28 g/litre
- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)
- **INTERACTIONS** → Appendix 1: delamanid

### ● SIDE-EFFECTS

- **Common or very common** Anxiety · appetite decreased · asthenia · chest pain · cough · depression · dyslipidaemia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · haemoptysis · headache · hyperhidrosis · hypertension · hypotension · malaise · muscle weakness · nausea · oropharyngeal pain · osteochondrosis · pain · palpitations · peripheral neuropathy · photophobia · psychotic disorder · QT interval prolongation · reticulocytosis · sensation abnormal · skin reactions · sleep disorders · throat irritation · tinnitus · tremor · vomiting
- **Uncommon** Aggression · atrioventricular block · balance impaired · dehydration · delusional disorder, persecutory type · dysphagia · extrasystole · hepatic function abnormal · increased risk of infection · lethargy · leucopenia · oral paraesthesia · psychiatric disorders · thrombocytopenia · urinary disorders
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
  - Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia's formula).
- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

Delamanid 50 mg Delyba 50mg tablets | 48 tablet [PoM] £1,250.00

## Ethambutol hydrochloride

26-Oct-2021

### ● INDICATIONS AND DOSE

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

#### ► BY MOUTH

- Child: 20 mg/kg once daily for 2 months (initial phase)
- Adult: 15 mg/kg once daily for 2 months (initial phase)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

#### ► BY MOUTH

- Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Optic neuritis · poor vision
- **CAUTIONS** Elderly · young children

**CAUTIONS, FURTHER INFORMATION**

- ▶ Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

● **INTERACTIONS** → Appendix 1: ethambutol

● **SIDE-EFFECTS**

- ▶ **Common or very common** Hyperuricaemia · nerve disorders · visual impairment
- ▶ **Rare or very rare** Nephritis tubulointerstitial
- ▶ **Frequency not known** Alveolitis allergic · appetite decreased · asthenia · confusion · dizziness · eosinophilia · fever · flatulence · gastrointestinal discomfort · gout · hallucination · headache · jaundice · leucopenia · nausea · nephrotoxicity · neutropenia · photosensitive lichenoid eruption · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin reactions · taste metallic · thrombocytopenia · tremor · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Amount too small to be harmful.

● **RENAL IMPAIRMENT** Risk of optic nerve damage. [EvGr](#)

Should preferably be avoided in patients with renal impairment. [M](#)

**Dose adjustments** [EvGr](#) If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week—monitor plasma-ethambutol concentration. [M](#) See p. 21.

● **MONITORING REQUIREMENTS**

- ▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
- ▶ Renal function should be checked before treatment.
- ▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.
- ▶ In children In young children, routine ophthalmological monitoring recommended.

● **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of ethambutol is required, the following strength is used: 400 mg/5 mL.

● **PATIENT AND CARER ADVICE**

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

Medicines for Children leaflet: Ethambutol for treatment of tuberculosis [www.medicinesforchildren.org.uk/medicines/ethambutol-for-treatments-of-tuberculosis/](http://www.medicinesforchildren.org.uk/medicines/ethambutol-for-treatments-of-tuberculosis/)

**Tablet****CAUTIONARY AND ADVISORY LABELS 8**▶ **Ethambutol hydrochloride (Non-proprietary)**

Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet [PoM](#) £17.00 DT = £11.51

Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet [PoM](#) £42.74 DT = £42.74

Combinations available: *Rifampicin with ethambutol, isoniazid and pyrazinamide*, p. 635

**Isoniazid**● **INDICATIONS AND DOSE****Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 300 mg daily for 6 months (initial and continuation phases)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive**

- ▶ INITIALLY BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month-11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12-17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin
- ▶ Adult: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

● **CONTRA-INDICATIONS** Drug-induced liver disease

● **CAUTIONS** Acute porphyrias p. 1150 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Peripheral neuropathy Pyridoxine hydrochloride p. 1175 should be given prophylactically in all patients from the start of treatment. Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection.

● **INTERACTIONS** → Appendix 1: isoniazid

● **SIDE-EFFECTS**

- ▶ **Uncommon** Hepatic disorders
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis · pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis

**SIDE-EFFECTS, FURTHER INFORMATION** Hepatitis more common in those aged over 35 years and those with a daily alcohol intake.

● **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

● **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. **Monitoring** In breast-feeding, monitor infant for possible toxicity.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatotoxicity).

**Monitoring** In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

- **RENAL IMPAIRMENT** EvGr Use with caution (risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 1175 recommended). M

**Dose adjustments** ▶ With intramuscular use or intravenous use EvGr Dose reduction may be required in severe impairment (consult product literature). M

- **MONITORING REQUIREMENTS**

- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

- **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.
- ▶ In children Doses may need to be recalculated to allow for weight gain in younger children.

- **PATIENT AND CARER ADVICE**

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

## Pyrazinamide

11-Nov-2021

- **INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH

- ▶ Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- ▶ Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
- ▶ Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
- ▶ Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- ▶ BY MOUTH

- ▶ Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- ▶ Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
- ▶ Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
- ▶ Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Acute attack of gout (in adults)
- **CAUTIONS** Diabetes · gout (in adults)
- **INTERACTIONS** → Appendix 1: pyrazinamide
- **SIDE-EFFECTS** Appetite decreased · arthralgia · dysuria · flushing · gout aggravated · hepatic disorders · malaise · nausea · peptic ulcer aggravated · photosensitivity reaction · sideroblastic anaemia · skin reactions · splenomegaly · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment, acute hepatic disease and for up to 6 months after occurrence of hepatitis (risk of increased exposure).
- **RENAL IMPAIRMENT**  
**Dose adjustments** ▶ In adults 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.  
▶ In children If estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>, use 25–30 mg/kg 3 times a week.  
**Monitoring** Monitor for gout in renal impairment.
- **MONITORING REQUIREMENTS**
- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- ▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ In children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. The RCPCH and NPPG recommend that, when a liquid special of pyrazinamide is required, the following strength is used: 500 mg/5 mL.

### ● PATIENT AND CARER ADVICE

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**Medicines for Children leaflet:** Pyrazinamide for the treatment of tuberculosis [www.medicinesforchildren.org.uk/medicines/pyrazinamide-for-the-treatment-of-tuberculosis/](http://www.medicinesforchildren.org.uk/medicines/pyrazinamide-for-the-treatment-of-tuberculosis/)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## 2.6 Urinary tract infections

### Urinary-tract infections

19-Oct-2020

#### Description of condition

Urinary-tract infections (UTIs) are common infections that can affect any part of the urinary tract. They occur more frequently in women, and are usually independent of any risk factor. UTIs are predominantly caused by bacteria from the gastrointestinal tract entering the urinary tract, with *Escherichia coli* being the most common cause. Infection due to *Candida albicans* is rare, but may occur in hospitalised patients who are immunocompromised or have an indwelling catheter.

Lower UTIs are associated with inflammation of the bladder (cystitis) and urethra (urethritis). In some patients infection can ascend the urinary tract and lead to an upper UTI. Upper UTIs affect the proximal part of the ureters (pyelitis) or the proximal part of the ureters and the kidneys (pyelonephritis), and can cause renal scarring, abscess or failure, and sepsis. The most common signs and symptoms of lower UTIs are dysuria, increased urinary frequency and urgency, urine that is strong smelling, cloudy or contains blood, and persistent lower abdominal pain. Upper UTIs usually present with accompanying loin pain and fever.

In pregnant women, asymptomatic bacteriuria is a risk factor for pyelonephritis and premature labour. UTIs in pregnancy have been associated with developmental delay and cerebral palsy in the infant, as well as fetal death.

Insertion of a catheter into the urinary tract increases the risk of developing a UTI, and the longer the catheter is in place for, further increases the risk of bacteriuria.

UTIs are considered recurrent after at least two episodes within 6 months or three or more episodes within 12 months.

Acute prostatitis is an infection of the prostate gland and is usually caused by a UTI. It can occur spontaneously or after certain medical procedures and can last for several weeks. Common symptoms include sudden onset of fever, acute urinary retention or irritative voiding symptoms. Possible complications include prostatic abscess, bacteraemia, epididymitis, and pyelonephritis. Chronic prostatitis is a complication of acute prostatitis and is defined as at least 3 months of urogenital pain usually associated with lower urinary tract symptoms.

### Aims of treatment

The aims of treatment are to relieve symptoms, treat the underlying infection, prevent systemic infection, and to reduce the risk of complications.

### Non-drug treatment

**[EvGr]** Patients with a UTI should be advised to drink plenty of fluids to avoid dehydration, and to use self-care strategies to reduce the risk of recurrent infections. These include wiping from front to back after defaecation, not delaying urination, and not wearing occlusive underwear.

To reduce the risk of recurrent infections, some women (non-pregnant) with recurrent UTIs may wish to try cranberry products (evidence of benefit uncertain) or D-mannose. Patients should be advised to consider the sugar content of these products. There is no evidence to support the use of cranberry products for the treatment of UTIs. **[A]**

### Drug treatment

**[EvGr]** When prescribing antibacterial therapy the severity of symptoms, risk of developing complications, previous urine culture and susceptibility results, and previous antibacterial use should be taken into consideration.

With the exception of pregnant women, asymptomatic bacteriuria is not routinely treated with antibacterials. **[A]**

For other considerations such as for patients receiving prophylactic antibacterial therapy, switching from *intravenous* to *oral* antibacterials, and for advice to give to patients, see Antibacterials, principles of therapy p. 540.

**[EvGr]** Reassess patients if symptoms worsen at any time, or do not start to improve within 48 hours of starting treatment.

Refer patients to hospital if they have any symptoms or signs suggestive of a more serious illness or condition.

Review choice of antibacterial when microbiological results are available, and change treatment as appropriate if susceptibility results indicate bacterial resistance.

Advise patients that paracetamol or ibuprofen can be used for pain relief. Where appropriate, codeine may be used in patients with acute pyelonephritis or prostatitis. **[A]**

There is no evidence to support the use of alkalinising agents for the treatment of UTIs.

### Lower urinary-tract infection

#### Non-pregnant women

**[EvGr]** Acute, uncomplicated lower UTIs in these individuals can be self-limiting and for some, delaying antibacterial treatment with a back-up prescription to see if symptoms will resolve, may be an option. Consider a back-up antibacterial prescription for use if symptoms worsen or do not improve within 48 hours **or** an immediate antibacterial prescription. **[A]**

#### Choice of antibacterial therapy

##### ● Oral first line :

▶ **[EvGr]** Nitrofurantoin p. 643, or trimethoprim p. 625 (if low risk of resistance). **[A]**

● **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):

▶ **[EvGr]** Nitrofurantoin (if not used first line), fosfomycin p. 622, pivmecillinam hydrochloride p. 603, or amoxicillin p. 597 (high rate of resistance, so only use if culture susceptible). **[A]**

#### Men

**[EvGr]** An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing. **[A]**

#### Choice of antibacterial therapy

##### ● Oral first line :

▶ **[EvGr]** Nitrofurantoin, or trimethoprim. **[A]**

- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):

▶ Consider pyelonephritis or prostatitis. See *pyelonephritis, acute*, or *prostatitis, acute* below for guidance.

### Pregnant women

**EvGr** An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing. **A**

#### Choice of antibacterial therapy

- **Oral first line** :
  - ▶ **EvGr** Nitrofurantoin. **A**
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
  - ▶ **EvGr** Amoxicillin (only if culture susceptible), or cefalexin p. 568. **A**
- **Alternative second line** :
  - ▶ **EvGr** Consult local microbiologist. **A**
- **Asymptomatic bacteriuria**:
  - ▶ **EvGr** Amoxicillin, cefalexin, or nitrofurantoin. **A**

### Prostatitis, acute

**EvGr** An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Refer patients to hospital if symptoms are not improving after 48 hours of treatment, or if they have any signs or symptoms suggestive of a more serious condition such as sepsis, acute urinary retention, or prostatic abscess. **A**

#### Choice of antibacterial therapy

- **Oral first line** :
  - ▶ **EvGr** Ciprofloxacin p. 608, or ofloxacin p. 612.
  - ▶ Alternative first line (if unable to take fluoroquinolones): trimethoprim. **A**
- **Oral second line** (on specialist advice):
  - ▶ **EvGr** Levofloxacin p. 610, or co-trimoxazole p. 613. **A**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **EvGr** Antibacterials may be combined if concerned about sepsis.
  - ▶ Amikacin p. 559, ceftriaxone p. 574, cefuroxime p. 571, ciprofloxacin, gentamicin p. 561, or levofloxacin. **A**
- **Intravenous second line** :
  - ▶ **EvGr** Consult local microbiologist. **A**

### Pyelonephritis, acute

**EvGr** An immediate antibacterial prescription should be given and a midstream urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for patients with acute pyelonephritis who are significantly dehydrated or are unable to take oral fluids and medicines, are pregnant, or have a higher risk of developing complications. **A**

### Non-pregnant women and men

#### Choice of antibacterial therapy

- **Oral first line** :
  - ▶ **EvGr** Cefalexin p. 568, or ciprofloxacin p. 608. If sensitivity known: co-amoxiclav p. 600, or trimethoprim p. 625. **A**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **EvGr** Antibacterials may be combined if concerned about susceptibility or sepsis.
  - ▶ Amikacin p. 559, ceftriaxone p. 574, cefuroxime p. 571, ciprofloxacin, or gentamicin p. 561. Co-amoxiclav may be used if given in combination or sensitivity known. **A**
- **Intravenous second line** :

▶ **EvGr** Consult local microbiologist. **A**

### Pregnant women

#### Choice of antibacterial therapy

- **Oral first line** :
  - ▶ **EvGr** Cefalexin. **A**
- **Intravenous first line** (if severely unwell or unable to take oral treatment):
  - ▶ **EvGr** Cefuroxime. **A**
- **Second line** or combining antibacterials if concerned about susceptibility or sepsis:
  - ▶ **EvGr** Consult local microbiologist. **A**

### Recurrent urinary-tract infection

**EvGr** For patients with recurrent UTIs, refer or seek specialist advice for men, pregnant women, patients with suspected cancer, those presenting with recurrent upper UTI, and those with recurrent lower UTI with an unknown cause.

For postmenopausal women experiencing recurrent UTIs, consider a vaginal oestrogen [unlicensed indication] at the lowest effective dose if behavioural and personal hygiene measures alone are not effective or appropriate. Treatment should be reviewed within 12 months. Oral oestrogens (hormone replacement therapy) should not be given to postmenopausal women specifically to reduce the risk of recurrent UTIs.

In non-pregnant women, consider a trial of antibacterial prophylaxis if behavioural and personal hygiene measures, and vaginal oestrogen (in postmenopausal women) are not effective or appropriate. Single-dose antibacterial prophylaxis [unlicensed indication] should be considered for use when exposed to an identifiable trigger. Daily antibacterial prophylaxis should be considered in non-pregnant women who have had no improvement after single-dose antibacterial prophylaxis, or who have no identifiable triggers.

With specialist advice, daily antibacterial prophylaxis should be considered for men and pregnant women if behavioural and personal hygiene measures alone are not effective or appropriate.

Advise patients about the risk of resistance with long-term antibacterial use, seeking medical help if symptoms of an acute UTI develop, and to return for review within 6 months.

Review the success and ongoing need for antibacterial prophylaxis at least every 6 months. If antibacterial prophylaxis is stopped, ensure the patient has rapid access to treatment if they develop an acute UTI. **A**

### Women and men

#### Choice of antibacterial therapy

- **Oral first line** :
  - ▶ **EvGr** Trimethoprim, or nitrofurantoin p. 643. **A**
- **Oral second line** :
  - ▶ **EvGr** Amoxicillin p. 597 [unlicensed indication], or cefalexin. **A**

### Catheter-associated urinary-tract infection

**EvGr** For people with a catheter-associated urinary-tract infection, consider removing or changing the catheter as soon as possible if it has been in place for longer than 7 days, without delaying antibacterial treatment. An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for patients with a catheter-associated UTI who are significantly dehydrated or unable to take oral fluids and medicines, are pregnant, have a higher risk of developing complications, have recurrent catheter-associated UTIs, or have bacteria resistant to oral antibacterials. **A**

**Non-pregnant women and men****Choice of antibacterial therapy**

- **Oral first line** (if **no** upper UTI symptoms):
  - ▶ [EvdGr](#) Amoxicillin (only if culture susceptible), nitrofurantoin, or trimethoprim (if low risk of resistance). [A](#)
- **Oral second line** (if **no** upper UTI symptoms and first-line not suitable):
  - ▶ [EvdGr](#) Pivmecillinam hydrochloride p. 603. [A](#)
- **Oral first line** (upper UTI symptoms):
  - ▶ [EvdGr](#) Cefalexin, ciprofloxacin, co-amoxiclav (if culture susceptible), or trimethoprim (if culture susceptible). [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment). [EvdGr](#) Antibacterials may be combined if concerned about susceptibility or sepsis.
  - ▶ Amikacin, ceftriaxone, cefuroxime, ciprofloxacin, gentamicin, or co-amoxiclav (only in combination, unless culture results confirm susceptibility). [A](#)
- **Intravenous second line**:
  - ▶ [EvdGr](#) Consult local microbiologist. [A](#)

**Pregnant women****Choice of antibacterial therapy**

- **Oral first line**:
  - ▶ [EvdGr](#) Cefalexin. [A](#)
- **Intravenous first line** (if severely unwell or unable to take oral treatment):
  - ▶ [EvdGr](#) Cefuroxime. [A](#)
- **Second line or combining if concerned about susceptibility or sepsis**:
  - ▶ [EvdGr](#) Consult local microbiologist. [A](#)

**ANTIBACTERIALS****Methenamine hippurate**

20-Aug-2020

**(Hexamine hippurate)**● **INDICATIONS AND DOSE****Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**

- ▶ BY MOUTH
- ▶ Adult: 1 g every 12 hours

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**

- ▶ BY MOUTH
- ▶ Adult: 1 g every 8–12 hours

- **CONTRA-INDICATIONS** Gout • metabolic acidosis • severe dehydration
- **INTERACTIONS** → Appendix 1: methenamine
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Epigastric discomfort • skin reactions
- **PREGNANCY** There is inadequate evidence of safety, but it has been in wide use for many years without apparent ill consequence, however, manufacturer advises it is preferable to avoid.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>—risk of hippurate crystalluria.
- **EFFECT ON LABORATORY TESTS** False results for urinary steroids, catecholamines and 5-hydroxyindole acetic acid can occur.
- **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

▶ **Methenamine hippurate (Non-proprietary)**

**Methenamine hippurate 1 gram** Methenamine hippurate 1g tablets | 60 tablet [P](#) £33.67 DT = £31.68

**Methenamine hippurate 1 gram** Hiprex 1g tablets | 60 tablet [P](#) £19.74 DT = £31.68

**Nitrofurantoin**

29-Mar-2022

● **INDICATIONS AND DOSE****Lower urinary-tract infections**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3 days
- ▶ Child 12–15 years: 50 mg 4 times a day for 3 days (7 days in pregnant women)
- ▶ Child 16–17 years: 50 mg 4 times a day for 3 days (7 days in males and pregnant women)
- ▶ Adult: 50 mg 4 times a day for 3 days (7 days in males and pregnant women)
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - ▶ Child 12–15 years: 100 mg twice daily for 3 days (7 days in pregnant women)

continued →

- ▶ Child 16–17 years: 100 mg twice daily for 3 days (7 days in males and pregnant women)
- ▶ Adult: 100 mg twice daily for 3 days (7 days in males and pregnant women)

**Urinary-tract infections (catheter-associated)**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 16–17 years: 50 mg 4 times a day for 7 days, to be used if modified-release preparations are unavailable
- ▶ Adult: 50 mg 4 times a day for 7 days, to be used if modified-release preparations are unavailable
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 16–17 years: 100 mg twice daily for 7 days
- ▶ Adult: 100 mg twice daily for 7 days

**Severe chronic recurrent urinary-tract infections**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg 4 times a day for 3–7 days
- ▶ Adult: 100 mg 4 times a day for 7 days

**Prophylaxis of recurrent urinary-tract infection**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12–15 years: 50–100 mg once daily, dose to be taken at night
- ▶ Child 16–17 years: 50–100 mg once daily, dose to be taken at night, alternatively 100 mg for 1 dose, following exposure to a trigger
- ▶ Adult: 50–100 mg once daily, dose to be taken at night, alternatively 100 mg for 1 dose, following exposure to a trigger

**Genito-urinary surgical prophylaxis**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after
- ▶ Adult: 100 mg twice daily on day of procedure and for 3 days after

- **UNLICENSED USE** [\[EvgR\]](#) Duration of treatment for lower urinary-tract infection differs from product literature and adheres to national guidelines. [\[A\]](#) See Urinary-tract infections p. 641 for further information. [\[EvgR\]](#) Nitrofurantoin can be given as a single dose for the prophylaxis of recurrent urinary tract infection following exposure to a trigger, [\[A\]](#) but this dosing regimen is not licensed. See Urinary-tract infections p. 641 for further information.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · G6PD deficiency · infants less than 3 months old

- **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency

- **INTERACTIONS** → Appendix 1: nitrofurantoin

- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · chronic pulmonary reaction (more common in elderly) · circulatory collapse · confusion · cough · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · euphoric mood · fever · granulocytopenia · haemolytic anaemia · headache · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · interstitial pneumonitis (more common in elderly) · leucopenia · lupus-like syndrome · nausea · nerve disorders · nystagmus · pancreatitis · psychotic disorder · pulmonary fibrosis (more common in elderly) · pulmonary hypersensitivity · pulmonary reaction (possible association with lupus erythematosus-like syndrome) · respiratory disorders · skin reactions · Stevens-Johnson syndrome · thrombocytopenia · urine discolouration · vertigo · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Acute pulmonary reactions usually occur within the first week of treatment and are reversible with cessation of therapy. Chronic pulmonary reactions can develop insidiously. Discontinue treatment with nitrofurantoin if pulmonary reactions occur.

- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.
  - ▶ In adults Avoid if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>; may be used with caution if eGFR 30–44 mL/minute/1.73 m<sup>2</sup> as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
  - ▶ In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m<sup>2</sup>; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m<sup>2</sup> as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to seek immediate medical attention if signs or symptoms of pulmonary, hepatic, haematological, or neurological adverse reactions develop. Medicines for Children leaflet: Nitrofurantoin for urinary tract infections [www.medicinesforchildren.org.uk/medicines/nitrofurantoin-for-urinary-tract-infections/](http://www.medicinesforchildren.org.uk/medicines/nitrofurantoin-for-urinary-tract-infections/) **Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

## 3 Fungal infection

### Antifungals, systemic use

29-Mar-2022

#### Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

#### Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 654 is the treatment of choice for aspergillosis; liposomal amphotericin B p. 647 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 646, or itraconazole p. 651, can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin B. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. Posaconazole p. 652 is licensed for use in patients with invasive aspergillosis who are refractory to, or intolerant of itraconazole or amphotericin B.

#### Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 649 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

*Oropharyngeal candidiasis* generally responds to topical therapy but oral therapy may be required in some cases; see Oropharyngeal fungal infections p. 1309 for further information.

For *invasive or disseminated candidiasis*, an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin B is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin B should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin B or an echinocandin. In refractory cases, flucytosine p. 655 can be used with intravenous amphotericin B.

#### Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin B by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin B. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

#### Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons.

Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin B by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

#### Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1326 are used more frequently than griseofulvin p. 655 because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

*Pityriasis versicolor* may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

#### Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome. Miconazole p. 647 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin B by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

#### Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption.

Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

### Imidazole antifungals

The imidazole antifungals include clotrimazole p. 896, econazole nitrate p. 896, ketoconazole p. 896, and tioconazole p. 1325. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 1310 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

### Polyene antifungals

The polyene antifungals include amphotericin B and nystatin p. 1311; neither drug is absorbed when given by mouth. Nystatin p. 1311 is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin B p. 647 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin B is toxic and side-effects are common. Lipid formulations of amphotericin B (*Abelcet*<sup>®</sup> and *AmBisome*<sup>®</sup>) are significantly less toxic and are recommended when the conventional formulation of amphotericin B is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin B is inadequate; lipid formulations are more expensive.

### Echinocandin antifungals

The echinocandin antifungals include anidulafungin below, caspofungin below and micafungin p. 647. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

### Other antifungals

Flucytosine p. 655 is used with amphotericin B in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 655 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1326 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

## ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

### Anidulafungin

24-Nov-2020

#### ● INDICATIONS AND DOSE

##### Invasive candidiasis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Bronchospasm · cholestasis · diarrhoea · dyspnoea · headache · hyperglycaemia · hypertension · hypokalaemia · hypotension · nausea · seizure · skin reactions · vomiting
- ▶ **Uncommon** Abdominal pain upper · coagulation disorder · vasodilatation
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Ecalta*<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

###### ▶ Anidulafungin (Non-proprietary)

**Anidulafungin 100 mg** Anidulafungin 100mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £299.98 (Hospital only)

###### ▶ *Ecalta* (Pfizer Ltd)

**Anidulafungin 100 mg** *Ecalta* 100mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £299.99 (Hospital only)

### Caspofungin

07-Aug-2020

#### ● INDICATIONS AND DOSE

##### Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight up to 81 kg): Loading dose 70 mg once daily for 1 day, then maintenance 50 mg once daily
- ▶ Adult (body-weight 81 kg and above): 70 mg once daily
- DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- ▶ Manufacturer advises increase dose to 70 mg daily with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin); no dose adjustment required for patients already on 70 mg daily.

- **INTERACTIONS** → Appendix 1: caspofungin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Arthralgia · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hyperhidrosis · nausea · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · anxiety · appetite decreased · arrhythmias · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · flushing · gastrointestinal discomfort · haematuria · hepatic disorders ·

hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · hypoxia · induration · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocytopenia · thrombophlebitis · tremor · vision blurred

► **FREQUENCY NOT KNOWN** Severe cutaneous adverse reactions (SCARs)

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** No information available for severe impairment.

**Dose adjustments** 70 mg on first day then 35 mg once daily in moderate impairment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cancidas<sup>®</sup>), manufacturer advises give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

##### ► Caspofungin (Non-proprietary)

**Caspofungin (as Caspofungin acetate) 50 mg** Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £238.87-£327.67 DT = £238.87 | 1 vial [PoM] £327.67 DT = £238.87 (Hospital only)

**Caspofungin (as Caspofungin acetate) 70 mg** Caspofungin 70mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £337.59-£416.78 (Hospital only) | 1 vial [PoM] £416.78

##### ► Cancidas (Merck Sharp & Dohme (UK) Ltd)

**Caspofungin (as Caspofungin acetate) 50 mg** Cancidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67 DT = £238.87 (Hospital only)

## Micafungin

28-Apr-2021

### ● INDICATIONS AND DOSE

#### Invasive candidiasis

##### ► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

#### Oesophageal candidiasis

##### ► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 3 mg/kg once daily
- Adult (body-weight 40 kg and above): 150 mg once daily

#### Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

##### ► BY INTRAVENOUS INFUSION

- Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

● **INTERACTIONS** → Appendix 1: micafungin

● **SIDE-EFFECTS** Anaemia · anxiety · appetite decreased · arrhythmias · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness ·

drowsiness · dyspnoea · electrolyte imbalance · eosinophilia · flushing · gastrointestinal discomfort · haemolysis · haemolytic anaemia · headache · hepatic disorders · hepatic failure (potentially life-threatening) · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · insomnia · leucopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · taste altered · thrombocytopenia · tremor · vomiting

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic impairment; avoid in severe impairment (limited information available).

● **RENAL IMPAIRMENT**  Use with caution; renal function may deteriorate. 

### ● MONITORING REQUIREMENTS

► Monitor renal function.

► Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Mycamine<sup>™</sup>), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

##### ► Micafungin (Non-proprietary)

**Micafungin (as Micafungin sodium) 50 mg** Micafungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £166.67-£196.08 (Hospital only)

**Micafungin (as Micafungin sodium) 100 mg** Micafungin 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £289.85-£341.00 (Hospital only)

##### ► Mycamine (Astellas Pharma Ltd)

**Micafungin (as Micafungin sodium) 50 mg** Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM] £196.08

**Micafungin (as Micafungin sodium) 100 mg** Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM] £341.00

## ANTIFUNGALS > POLYENE ANTIFUNGALS

### Amphotericin B

(Amphotericin)

06-Feb-2022

### ● INDICATIONS AND DOSE

#### ABELCET<sup>®</sup>

**Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin B or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin B, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients**

##### ► BY INTRAVENOUS INFUSION

- Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days continued →

**AMBISOME®**

**Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin B | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Aspergillosis**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Visceral leishmaniasis (unresponsive to the antimonial alone)**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®****Systemic fungal infections**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**● UNLICENSED USE**

**AMBISOME®** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: LIPOSOMAL AND LIPID-COMPLEX FORMULATIONS: NAME CHANGE TO REDUCE MEDICATION ERRORS (JULY 2020)

Serious harm and fatal overdoses have occurred following confusion between liposomal, pegylated-liposomal, lipid-complex, and conventional formulations of the same drug substance. Medicines with these formulations will explicitly include 'liposomal', 'pegylated-liposomal', or 'lipid-complex' within their name to reduce the risk of potentially fatal medication errors.

The MHRA reminds healthcare professionals that liposomal, pegylated-liposomal, lipid-complex, and conventional formulations containing the same drug substance are **not** interchangeable. Healthcare professionals are advised to make a clear distinction between formulations when prescribing, dispensing, administering, and communicating about amphotericin B. The product name and dose should be verified before administration and the maximum dose should not be exceeded.

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin B product and a test dose is advisable before the first infusion in a new course; the patient should be carefully observed for at least 30 minutes after the test dose.
- ▶ Infusion-related reactions Manufacturer advises prophylactic antipyretics or hydrocortisone can be used in patients who have previously experienced infusion-related reactions (in

whom continued treatment with amphotericin B is essential).

- **INTERACTIONS** → Appendix 1: amphotericin B
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal (discontinue) · hyposthenuria · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting
  - ▶ **Uncommon** Agranulocytosis · arrhythmias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
  - ▶ **Rare or very rare** Arthralgia · cardiac arrest · coagulation disorder · deafness · encephalopathy · eosinophilia · haemorrhage · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · tinnitus · vertigo · vision disorders · weight decreased
- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** [Evdg](#) Nephrotoxicity may be reduced with use of lipid formulation. [Dx](#)
- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.
- **DIRECTIONS FOR ADMINISTRATION**

**ABELCET® Amphotericin B (lipid complex)**

For *intravenous infusion*, manufacturer advises give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with Glucose 5% or use separate line.

**AMBISOME® Amphotericin B (liposomal)**

For *intravenous infusion*, manufacturer advises give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5 micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

**FUNGIZONE® Amphotericin B (as sodium deoxycholate complex)**

For *intravenous infusion*, manufacturer advises give intermittently in Glucose 5%. Reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–6 hours (initial test dose of 1 mg

over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

#### ● **PRESCRIBING AND DISPENSING INFORMATION**

Amphotericin B is available as *conventional, liposomal and lipid-complex* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Suspension for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Abelcet** (Teva UK Ltd)

Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 ml Abelcet 100mg/20ml concentrate for suspension for infusion vials | 10 vial [PoM](#) £775.04 (Hospital only)

#### **Powder for dispersion for infusion**

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

- ▶ **AmBisome** (Gilead Sciences Ltd)

Amphotericin B liposomal 50 mg AmBisome Liposomal 50mg powder for dispersion for infusion vials | 10 vial [PoM](#) £821.87 (Hospital only)

#### **Powder for solution for infusion**

- ▶ **Fungizone** (Neon Healthcare Ltd)

Amphotericin B 50 mg Fungizone 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) £16.21 DT = £16.21

## ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

### Fluconazole

10-Nov-2021

#### ● **INDICATIONS AND DOSE**

##### **Candidal balanitis**

- ▶ BY MOUTH

- ▶ Child 16–17 years: 150 mg for 1 dose
- ▶ Adult: 150 mg for 1 dose

##### **Vaginal candidiasis**

- ▶ BY MOUTH

- ▶ Adult: 150 mg for 1 dose

##### **Vulvovaginal candidiasis (recurrent)**

- ▶ BY MOUTH

- ▶ Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

##### **Mucosal candidiasis (except genital)**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
- ▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections
- ▶ BY MOUTH
- ▶ Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg

daily, increased dose only for unusually difficult infections

#### **Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis**

- ▶ BY MOUTH

- ▶ Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

#### **Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
- ▶ Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

#### **Prevention of fungal infections in immunocompromised patients**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
- ▶ Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

#### **Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

#### **Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**

##### **GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Dizziness · flatulence · hepatic disorders · seizure · taste altered
- ▶ **Rare or very rare** Agranulocytosis · alopecia · dyslipidaemia · hypokalaemia · leucopenia · neutropenia · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · torsade de pointes

##### **SPECIFIC SIDE-EFFECTS**

- ▶ **Uncommon**

- ▶ With parenteral use Anaemia · appetite decreased · asthenia · constipation · drowsiness · dry mouth · fever · hyperhidrosis · insomnia · malaise · myalgia · paraesthesia · vertigo

- ▶ **Rare or very rare**

- ▶ With parenteral use Angioedema · face oedema · tremor

- ▶ **Frequency not known**

- ▶ With oral use Cardio-respiratory distress · oedema

- ▶ **SIDE-EFFECTS, FURTHER INFORMATION** If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT** **[EvGr]** Use with caution. **[M]**  
**Dose adjustments** **[EvGr]** Usual initial dose then halve subsequent doses if creatinine clearance less than 50 mL/minute (consult product literature). **[M]** See p. 21.
- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).
- **DIRECTIONS FOR ADMINISTRATION**  
 ▶ With intravenous use in children For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE**  
 Medicines for Children leaflet: Fluconazole for yeast and fungal infections [www.medicinesforchildren.org.uk/medicines/fluconazole-for-yeast-and-fungal-infections/](http://www.medicinesforchildren.org.uk/medicines/fluconazole-for-yeast-and-fungal-infections/)
- **PROFESSION SPECIFIC INFORMATION**  
**Dental practitioners' formulary** Fluconazole Capsules 50 mg may be prescribed.  
 Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Infusion**▶ **Fluconazole (Non-proprietary)**

- **Fluconazole 2 mg per 1 ml** Fluconazole 200mg/100ml infusion bags | 10 bag **[PoM]** £65.00 (Hospital only)  
 Fluconazole 400mg/200ml infusion bags | 5 bag **[PoM]** £72.50 (Hospital only)

**Solution for infusion**

ELECTROLYTES: May contain Sodium

▶ **Fluconazole (Non-proprietary)**

- **Fluconazole 2 mg per 1 ml** Fluconazole 200mg/100ml solution for infusion vials | 1 vial **[PoM]** £35.00 DT = £29.28 (Hospital only)  
 Fluconazole 100mg/50ml solution for infusion vials | 5 vial **[PoM]** £12.60 (Hospital only)  
 Fluconazole 50mg/25ml solution for infusion vials | 1 vial **[PoM]** £20.00 DT = £20.00  
 Fluconazole 200mg/100ml solution for infusion bottles | 10 bottle **[PoM]** £427.40 | 20 bottle **[PoM]** £658.92

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9

▶ **Fluconazole (Non-proprietary)**

- **Fluconazole 10 mg per 1 ml** Fluconazole 50mg/5ml oral suspension | 35 ml **[PoM]** £29.66 DT = £27.76

▶ **Diflucan (Pfizer Ltd)**

- **Fluconazole 10 mg per 1 ml** Diflucan 50mg/5ml oral suspension | 35 ml **[PoM]** £16.61 DT = £27.76
- **Fluconazole 40 mg per 1 ml** Diflucan 200mg/5ml oral suspension | 35 ml **[PoM]** £66.42 DT = £66.42

**Capsule**

CAUTIONARY AND ADVISORY LABELS 9 (50 mg and 200 mg strengths only)

▶ **Fluconazole (Non-proprietary)**

- **Fluconazole 50 mg** Fluconazole 50mg capsules | 7 capsule **[PoM]** £0.96 DT = £0.95
- **Fluconazole 150 mg** Fluconazole 150mg capsules | 1 capsule **[PoM]** £8.50 DT = £0.78
- **Fluconazole 200 mg** Fluconazole 200mg capsules | 7 capsule **[PoM]** £6.02 DT = £4.42

▶ **Azocan (FDC International Ltd)**

- **Fluconazole 50 mg** Azocan 50mg capsules | 7 capsule **[PoM]** **[M]** DT = £0.95
  - **Fluconazole 150 mg** Azocan 150mg capsules | 1 capsule **[PoM]** **[M]** DT = £0.78
  - **Fluconazole 200 mg** Azocan 200mg capsules | 7 capsule **[PoM]** **[M]** DT = £4.42
- ▶ **Diflucan (Pfizer Ltd)**
- **Fluconazole 50 mg** Diflucan 50mg capsules | 7 capsule **[PoM]** £16.61 DT = £0.95
  - **Fluconazole 150 mg** Diflucan 150mg capsules | 1 capsule **[PoM]** £7.12 DT = £0.78
  - **Fluconazole 200 mg** Diflucan 200mg capsules | 7 capsule **[PoM]** £66.42 DT = £4.42

**Isavuconazole**

24-May-2022

- **DRUG ACTION** Isavuconazole (an active metabolite of isavuconazonium sulfate) is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

**INDICATIONS AND DOSE****Invasive aspergillosis | Mucormycosis in patients for whom amphotericin B is inappropriate**

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6-months

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Doses expressed as isavuconazole, though preparations contain the prodrug isavuconazonium sulfate. There is a significant difference between equivalent doses; 100 mg of isavuconazole is equivalent to 186.3 mg of isavuconazonium sulfate.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 - short QT syndrome

- **CAUTIONS** Elderly—limited information

- **INTERACTIONS** → Appendix 1: antifungals, azoles

**SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · asthenia · chest pain · confusion · delirium · diarrhoea · drowsiness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hepatic disorders · hyperbilirubinaemia · nausea · renal failure · respiratory disorders · skin reactions · thrombophlebitis · vomiting
- ▶ **Uncommon** Alopecia · anaemia · arrhythmias · back pain · circulatory collapse · constipation · depression · dizziness · encephalopathy · haemorrhage · hypersensitivity · hypoalbuminaemia · hypoglycaemia · hypotension · insomnia · leucopenia · malaise · malnutrition · neutropenia · palpitations · pancytopenia · paraesthesia · peripheral neuropathy · peripheral oedema · seizures · syncope · taste altered · thrombocytopenia · vertigo
- ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Infusion related reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

- **PREGNANCY** Manufacturer advises avoid unless severe or life-threatening infection—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor for drug toxicity.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use For *intravenous infusion*, manufacturer advises reconstitute each 200 mg with 5 mL Water for Injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.

● **HANDLING AND STORAGE**

▶ With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of confusion, syncope and dizziness.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**All Wales Medicines Strategy Group (AWMSG) decisions**

▶ **Isavuconazole (Cresemba®)** for the treatment of invasive aspergillosis in adults and the treatment of mucormycosis in adult patients for whom amphotericin B is inappropriate (January 2017) AWMSG No. 2433 Recommended

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

CAUTIONARY AND ADVISORY LABELS 3

## Itraconazole

04-Aug-2021

● **INDICATIONS AND DOSE**

**Vulvovaginal candidiasis**

▶ BY MOUTH

▶ Adult: 200 mg twice daily for 1 day

**Vulvovaginal candidiasis (recurrent)**

▶ BY MOUTH

▶ Adult: 50–100 mg daily for 6 months

**Oral or oesophageal candidiasis that has not responded to fluconazole**

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

**Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients**

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

**Systemic candidiasis where other antifungal drugs inappropriate or ineffective**

▶ BY MOUTH

▶ Adult: 100–200 mg once daily

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective**

▶ BY MOUTH

▶ Adult: 200 mg twice daily

**Pityriasis versicolor**

▶ BY MOUTH

▶ Adult: 200 mg once daily for 7 days

**Tinea pedis | Tinea manuum**

▶ BY MOUTH

▶ Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

**Tinea corporis | Tinea cruris**

▶ BY MOUTH

▶ Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

**Onychomycosis**

▶ BY MOUTH

▶ Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

**Aspergillosis**

▶ BY MOUTH

▶ Adult: 200 mg twice daily

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Histoplasmosis**

▶ BY MOUTH

▶ Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**

▶ BY MOUTH

▶ Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

▶ BY INTRAVENOUS INFUSION

▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

▶ BY MOUTH

▶ Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

▶ Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

● **UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

● **CONTRA-INDICATIONS** Acute porphyrias p. 1150

- **CAUTIONS** Active liver disease · elderly · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Susceptibility to congestive heart failure There have been reports of heart failure associated with itraconazole. Those at risk may include patients receiving higher daily doses and longer courses, patients with cardiac disease, patients with chronic lung disease, and patients receiving treatment with calcium channel blockers. Manufacturer advises avoid in patients with ventricular dysfunction, such as history of congestive heart failure, unless the infection is serious.
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - ▶ **Common or very common** Alopecia · constipation · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · heart failure · hepatic disorders · hyperbilirubinaemia · nausea · oedema · pulmonary oedema · skin reactions · vision disorders · vomiting
    - ▶ **Uncommon** Hearing loss · taste altered
    - ▶ **Rare or very rare** Angioedema · hypersensitivity vasculitis · hypertriglyceridaemia · pancreatitis · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
    - ▶ **Frequency not known** Peripheral neuropathy (discontinue)
  - **SPECIFIC SIDE-EFFECTS**
    - ▶ **Common or very common**
      - ▶ With intravenous use Chest pain · confusion · cough · dizziness · drowsiness · electrolyte imbalance · fatigue · gastrointestinal disorder · granulocytopenia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · hypotension · myalgia · pain · renal impairment · tachycardia · tremor · urinary incontinence
    - ▶ **Uncommon**
      - ▶ With intravenous use Dysphonia · numbness · thrombocytopenia
      - ▶ With oral use Flatulence · increased risk of infection · menstrual disorder
      - ▶ **Rare or very rare**
        - ▶ With oral use Erectile dysfunction · leucopenia · sensation abnormal · serum sickness · tinnitus · urinary frequency increased
  - **SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported very rarely — discontinue if signs of hepatitis develop.
  - **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.
  - **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).
  - **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Manufacturer advises use only in serious or life-saving situations where potential benefit outweighs risk of hepatotoxicity.
  - **RENAL IMPAIRMENT**
    - ▶ With oral use Manufacturer advises caution (risk of congestive heart failure).
    - ▶ With intravenous use Manufacturer advises caution in mild to moderate impairment (risk of congestive heart failure); avoid if creatinine clearance less than 30 mL/minute. See p. 21.
  - **Dose adjustments** ▶ With oral use Manufacturer advises dose adjustment may be considered (bioavailability possibly reduced).

- **MONITORING REQUIREMENTS**
  - ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
  - ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, or if history of hepatotoxicity with other drugs.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion (Sporanox<sup>®</sup>)*, manufacturer advises give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
  - ▶ With oral use For *oral liquid*, manufacturer advises do not take with food; swish around mouth and swallow, do not rinse afterwards.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.
- ▶ With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
- **Oral solution**
  - CAUTIONARY AND ADVISORY LABELS 9, 23
  - ▶ **Itraconazole (Non-proprietary)**
    - Itraconazole 10 mg per 1 mL** Itraconazole 50mg/5ml oral solution sugar free sugar-free | 150 mL [PoM](#) £68.03 DT = £64.88

## Posaconazole

21-Jul-2021

### ● INDICATIONS AND DOSE

**Invasive aspergillosis either refractory to, or in patients intolerant of, itraconazole or amphotericin B | Fusariosis either refractory to, or in patients intolerant of, amphotericin B | Chromoblastomycosis and mycetoma either refractory to, or in patients intolerant of, itraconazole | Coccidioidomycosis either refractory to, or in patients intolerant of, amphotericin B, itraconazole, or fluconazole**

#### ▶ BY MOUTH USING ORAL SUSPENSION

▶ **Adult:** 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, if unable to tolerate food

#### ▶ BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION

▶ **Adult:** Loading dose 300 mg twice daily on first day, then 300 mg once daily, switch from intravenous to oral route when appropriate

**Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)**

## ▶ BY MOUTH USING ORAL SUSPENSION

- Adult: Loading dose 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

**Prophylaxis of invasive fungal infections in patients at high risk and undergoing high-dose immunosuppressive therapy for haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome and expected to develop prolonged neutropenia**

## ▶ BY MOUTH USING ORAL SUSPENSION

- Adult: 200 mg 3 times a day, dose to be taken with food, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm<sup>3</sup>

## ▶ BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION

- Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm<sup>3</sup>, switch from intravenous to oral route when appropriate

**DOSE EQUIVALENCE AND CONVERSION**

- Posaconazole oral suspension is **not** interchangeable with tablets on a milligram-for-milligram basis.

**PHARMACOKINETICS**

- Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150
- **CAUTIONS** Administration by intravenous infusion, particularly by peripheral catheter—increased risk of QTc interval prolongation · body-weight over 120 kg—risk of treatment failure possibly increased · body-weight under 60 kg—risk of side effects increased · bradycardia · cardiomyopathy · history of QTc interval prolongation · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · drowsiness · dry mouth · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · nausea · neutropenia · sensation abnormal · skin reactions · taste altered · vomiting
  - ▶ **Uncommon** Alopecia · anaemia · aphasia · arrhythmias · burping · chest discomfort · confusion · cough · embolism and thrombosis · eosinophilia · feeling jittery · haemorrhage · hepatic disorders · hiccups · hyperglycaemia · hypoglycaemia · hypotension · leucopenia · lymphadenopathy · malaise · menstrual disorder · mucositis · nasal congestion · oedema · oral disorders · pain · palpitations · pancreatitis · peripheral neuropathy · QT interval prolongation · renal impairment · respiratory disorders · seizure · sleep disorders · splenic infarction · thrombocytopenia · tremor · vasculitis · vision disorders
  - ▶ **Rare or very rare** Adrenal insufficiency · breast pain · cardiac arrest · coagulation disorder · depression · encephalopathy · haemolytic uraemic syndrome · hearing impairment · heart failure · myocardial infarction · nephritis tubulointerstitial · pancytopenia · psychotic disorder · pulmonary hypertension · renal tubular acidosis · Stevens-Johnson syndrome · stroke · sudden cardiac death · syncope

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure, limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises monitor efficacy in severe impairment—variable exposure expected.
  - ▶ With intravenous use Manufacturer advises caution if creatinine clearance less than 50 mL/minute—intravenous vehicle may accumulate. See p. 21.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
  - ▶ Monitor liver function before and during therapy.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use Manufacturer advises for *intravenous infusion* (Noxafil<sup>®</sup>), give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose in infusion fluid to produce a final concentration of 1–2 mg/mL; give via a central venous catheter or peripherally inserted central catheter over approx. 90 minutes (can give a single dose via peripheral venous catheter if central access not established—dilute to a final concentration of 2 mg/mL and give over approx. 30 minutes).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **HANDLING AND STORAGE**
  - ▶ With intravenous use Manufacturer advises store in a refrigerator (2–8 °C).
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

## Voriconazole

02-Aug-2021

## ● INDICATIONS AND DOSE

**Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)**

## ▶ BY MOUTH

- ▶ Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- ▶ Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

## DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With intravenous use Manufacturer advises increase maintenance dose to 5 mg/kg every 12 hours with concurrent use of fosphenytoin, phenytoin or rifabutin.
- ▶ With oral use Manufacturer advises increase maintenance dose with concurrent use of fosphenytoin or phenytoin; 400 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg. Manufacturer advises if concurrent use of rifabutin is unavoidable, increase maintenance dose to 350 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150

- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

## GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Acute kidney injury · agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · hypoglycaemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle tone increased · nausea · neutropenia · oedema · oral disorders · pain · pulmonary oedema · respiratory disorders · seizure · sensation abnormal · skin reactions · syncope · tetany · thrombocytopenia · tremor · vision disorders · vomiting
- ▶ **Uncommon** Adrenal insufficiency · arthritis · brain oedema · duodenitis · encephalopathy · eosinophilia · gallbladder disorders · hearing impairment · hypothyroidism · influenza like illness · lymphadenopathy · lymphangitis · movement disorders · nephritis · nerve disorders · pancreatitis · parkinsonism · phototoxicity · proteinuria · pseudomembranous enterocolitis · QT interval prolongation · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · taste altered · thrombophlebitis · tinnitus · vertigo
- ▶ **Rare or very rare** Angioedema · cardiac conduction disorders · disseminated intravascular coagulation · hyperthyroidism
- ▶ **Frequency not known** Cutaneous lupus erythematosus · periorstitis (more common in transplant patients) · squamous cell carcinoma (more common in presence of phototoxicity)

## SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION **Hepatotoxicity**

Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

**Phototoxicity** Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in severe impairment (no information available).

**Dose adjustments** Manufacturer advises use usual initial loading dose then halve maintenance dose in mild to moderate cirrhosis.

- **RENAL IMPAIRMENT** <sup>[EvGr]</sup> Intravenous vehicle may accumulate if creatinine clearance less than 50 mL/minute—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required). <sup>[M]</sup> See p. 21.

● **MONITORING REQUIREMENTS**

- ▶ Monitor renal function.
- ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion*, manufacturer advises reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE** Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

17-Nov-2020

● **INDICATIONS AND DOSE****Systemic yeast and fungal infections | Adjunct to amphotericin B in severe systemic candidiasis and in other severe or long-standing infections**▶ **BY INTRAVENOUS INFUSION**

- Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

**Cryptococcal meningitis (adjunct to amphotericin B)**▶ **BY INTRAVENOUS INFUSION**

- Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

- **UNLICENSED USE** Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: FLUCYTOSINE (ANCOTIL®): NEW CONTRA-INDICATION IN PATIENTS WITH DPD DEFICIENCY (OCTOBER 2020)**  
Patients with partial or complete dihydropyrimidine dehydrogenase (DPD) deficiency are at increased risk of severe and fatal toxicity during treatment with fluoropyrimidines. Healthcare professionals are advised that pre-treatment testing for DPD deficiency is not required in order to avoid delay in antimycotic therapy with flucytosine. However, if drug toxicity is confirmed or suspected, testing of DPD activity and withdrawal of treatment should be considered. Flucytosine is contra-indicated in patients with known complete DPD deficiency.

- **CONTRA-INDICATIONS** Complete dihydropyrimidine dehydrogenase deficiency
- **CAUTIONS** Blood disorders · elderly · partial dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1: flucytosine
- **SIDE-EFFECTS** Agranulocytosis · aplastic anaemia · blood disorder · cardiotoxicity · confusion · diarrhoea · hallucination · headache · hepatic disorders · leucopenia · nausea · rash · sedation · seizure · thrombocytopenia · toxic epidermal necrolysis · ventricular dysfunction · vertigo · vomiting
- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.

● **RENAL IMPAIRMENT**

**Dose adjustments** Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration.

**Monitoring** In renal impairment liver- and kidney-function tests and blood counts required weekly.

● **MONITORING REQUIREMENTS**

- ▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- ▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises give over 20–40 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for infusion**

ELECTROLYTES: May contain Sodium

▶ **Ancotil** (Viatris UK Healthcare Ltd)**Flucytosine 10 mg per 1 mL** Ancotil 2.5g/250mL solution for infusion bottles | 5 bottle [PoM] £151.67 (Hospital only)**Griseofulvin**

16-Jan-2020

● **INDICATIONS AND DOSE****Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate**▶ **BY MOUTH**

- Adult: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

**Tinea capitis caused by *Trichophyton tonsurans***▶ **BY MOUTH**

- Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · systemic lupus erythematosus (risk of exacerbation)
- **INTERACTIONS** → Appendix 1: griseofulvin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · epigastric discomfort · headache · nausea · vomiting
  - ▶ **Uncommon** Appetite decreased · confusion · coordination abnormal · dizziness · drowsiness · insomnia · irritability · peripheral neuropathy · photosensitivity reaction · skin reactions · taste altered · toxic epidermal necrolysis
  - ▶ **Rare or very rare** Anaemia · hepatic disorders · leucopenia · neutropenia · systemic lupus erythematosus (SLE)
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration
- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).
- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of deterioration); avoid in severe impairment.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

## 3.1 Pneumocystis pneumonia

### Pneumocystis pneumonia

**Overview**

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment****Mild to moderate disease**

Co-trimoxazole p. 613 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 629 with trimethoprim p. 625 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 581 and primaquine p. 672 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease**

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 657 given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

**Adjunctive therapy**

In moderate to severe infections associated with HIV infection, prednisolone p. 747 is given by mouth for 5 days (alternatively, hydrocortisone p. 744 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection.

Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

**ANTIPROTOZOALS**

### Atovaquone

09-Sep-2021

● **INDICATIONS AND DOSE****Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole**► **BY MOUTH**

- **Adult:** 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

**Prophylaxis against pneumocystis pneumonia**► **BY MOUTH**

- **Adult:** 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.

- **CAUTIONS** Elderly · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy) · other causes of pulmonary disease should be sought and treated

- **INTERACTIONS** → Appendix 1: antimalarials

● **SIDE-EFFECTS**

- **Common or very common** Anaemia · angioedema · bronchospasm · diarrhoea · headache · hypersensitivity · hyponatraemia · insomnia · nausea · neutropenia · skin reactions · throat tightness · vomiting
- **Frequency not known** Stevens-Johnson syndrome

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in significant impairment and monitor closely—no information available.
- **RENAL IMPAIRMENT** **[EvGr]** Caution in significant impairment (no information available). **[M]**

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

## Pentamidine isetionate

05-Oct-2021

### ● INDICATIONS AND DOSE

**Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)**

▶ BY INTRAVENOUS INFUSION

• Adult: 4 mg/kg once daily for at least 14 days

**Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)**

▶ BY INHALATION OF NEBULISED SOLUTION

• Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis (specialist use only)**

▶ BY DEEP INTRAMUSCULAR INJECTION

• Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

**Cutaneous leishmaniasis (specialist use only)**

▶ BY DEEP INTRAMUSCULAR INJECTION

• Adult: 3–4 mg/kg 1–2 times a week until condition resolves

**Trypanosomiasis (specialist use only)**

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

• Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

● **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution.

● **CAUTIONS** Anaemia · bradycardia · cardiac disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia

● **INTERACTIONS** → Appendix 1: pentamidine

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · local reaction · nausea · rash · taste altered
- ▶ **Rare or very rare** QT interval prolongation
- ▶ **Frequency not known** Pancreatitis acute (can be severe and sometimes fatal)

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by inhalation Cough · dyspnoea · respiratory disorders
- ▶ With parenteral use Acute kidney injury · anaemia · azotaemia · electrolyte imbalance · flushing · haematuria · hyperglycaemia · induration · leucopenia · localised pain · myopathy · syncope · thrombocytopenia · vomiting
- ▶ **Rare or very rare**
- ▶ With parenteral use Arrhythmia (can be severe and sometimes fatal) · pancreatitis (can be severe and sometimes fatal)
- ▶ **Frequency not known**
- ▶ When used by inhalation Angioedema · appetite decreased · bradycardia · fatigue · renal failure
- ▶ With parenteral use Arrhythmias · perioral hypoaesthesia · sensation abnormal · Stevens-Johnson syndrome

● **PREGNANCY** Manufacturer advises avoid unless essential.

● **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** EvGr Use with caution. M

**Dose adjustments** EvGr Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses. M See p. 21.

### ● MONITORING REQUIREMENTS

- ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- ▶ Carry out laboratory monitoring according to product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, manufacturer advises reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

● **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for injection**

▶ **Pentacarinat** (Sanofi)

Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial PoM £158.86

## 4 Helminth infection

### Helminth infections

#### Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

#### Threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 659 is the drug of choice for treating threadworm infection in patients of all ages over 6 months.

It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

### Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 659 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

### Tapeworm infections

#### Taenicides

**Niclosamide** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 660 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

#### Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

### Hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also effective in children.

### Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*<sup>®</sup>) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

### Filaricides

**Diethylcarbamazine** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the

first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 659 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

### Cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (thiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

### Strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

## ANTHELMINTICS

### Albendazole

#### ● INDICATIONS AND DOSE

##### Chronic *Strongyloides* infection

###### ► BY MOUTH

- Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

##### Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

###### ► BY MOUTH

- Adult: (consult product literature)

##### Hookworm infections

###### ► BY MOUTH

- Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

## Diethylcarbamazine

### ● INDICATIONS AND DOSE

**Wuchereria bancrofti infections | Brugia malayi infections**

- ▶ BY MOUTH
- ▶ Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

**Loa loa infections**

- ▶ BY MOUTH
- ▶ Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

- **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.
- **MEDICINAL FORMS** No licensed medicines listed.

## Ivermectin

20-Aug-2020

### ● INDICATIONS AND DOSE

**Chronic Strongyloides infection**

- ▶ BY MOUTH
- ▶ Adult: 200 micrograms/kg daily for 2 days

**Onchocerciasis**

- ▶ BY MOUTH
- ▶ Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until the adult worms die out

**Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone**

- ▶ BY MOUTH
- ▶ Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- **UNLICENSED USE** Ivermectin is unlicensed.
- **INTERACTIONS** → Appendix 1: ivermectin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Skin reactions
  - ▶ **Frequency not known** Abnormal sensation in eye · anaemia · appetite decreased · asthenia · asthma exacerbated · chest discomfort · coma · confusion · conjunctival haemorrhage · constipation · diarrhoea · difficulty standing · difficulty walking · dizziness · drowsiness · dyspnoea · encephalopathy · eosinophilia · eye inflammation · faecal incontinence · fever · gastrointestinal discomfort · headache · hepatitis · hypotension · joint disorders · leucopenia · lymphatic abnormalities · Mazzotti reaction aggravated · myalgia · nausea · oedema · pain · psychiatric disorder · seizure · severe cutaneous adverse reactions (SCARs) · stupor · tachycardia · tremor · urinary incontinence · vertigo · vomiting

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**5 Protozoal infection****Antiprotozoal drugs****Amoebicides**

Metronidazole p. 590 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

**Trichomonacides**

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

**Antigiardial drugs**

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 540.

**Leishmaniocides**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin B p. 647 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin B (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin B, is also likely to be effective but less information is available.

Pentamidine isetionate p. 657 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

## Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

## Toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 674 and sulfadiazine p. 614, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 581 or clarithromycin p. 584 or azithromycin p. 583. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

## 5.1 Malaria

### Malaria, prophylaxis

05-Aug-2021

#### Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the PHE Guidelines for malaria prevention in travellers from the United Kingdom, 2021. The advice is aimed at residents of the UK who travel to endemic areas.

For specialist centres offering advice on specific malaria-related problems, see Malaria, treatment p. 667.

The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For guidance on risk assessment when advising on malaria prevention, see PHE: **Guidelines for malaria prevention in travellers from the United Kingdom** (see *Useful resources*).

#### Protection against bites

**Prophylaxis is not absolute**, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases.

Mosquito bed nets impregnated with a pyrethroid insecticide (such as permethrin p. 1329), improve protection and should be used unless sleeping in a well screened room, or the room is fitted with functioning air conditioning and sufficiently well sealed into which mosquitoes cannot enter; vaporised insecticides are also useful. Long sleeves, long trousers, and socks worn after sunset also provide protection against bites.

Insect repellents give protection against bites, but attention to the correct application of product is required.

Diethyltoluamide (DEET) is available in various preparations, including sprays and modified-release formulations. A 50% DEET-based insect repellent is recommended as the first choice; there is no further increase in duration of protection beyond a DEET concentration of 50%. DEET is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. For alternative options if DEET is not tolerated or is unavailable, see PHE: **Guidelines for malaria prevention in travellers from the United Kingdom** (see *Useful resources*).

#### Length of prophylaxis

Prophylaxis should generally be started before travel into an endemic area; 1 week before travel for chloroquine p. 669 and proguanil hydrochloride p. 672; 2–3 weeks before travel for mefloquine p. 671; and 1–2 days before travel for atovaquone with proguanil hydrochloride p. 669 or doxycycline p. 616. Prophylaxis should be continued for **4 weeks after leaving the area** (except for atovaquone with proguanil hydrochloride prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine and proguanil hydrochloride may be used. However, there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for use up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or atovaquone with proguanil hydrochloride may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice may be sought for long-term prophylaxis.

#### Return from malarial region

It is important to consider that any illness that occurs within 1 year and **especially within 3 months of return** might be malaria, even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness after their return they should see a doctor early, and specifically mention their risk of exposure to malaria.

Malaria is a notifiable disease in England, Northern Ireland, and Wales. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 540.

#### Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see *interactions* information for doxycycline.

#### Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

#### Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, pregnant individuals must be informed about the risks and benefits of effective

**Key to recommended regimens for prophylaxis against malaria**

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

**Specific recommendations**

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May–November	1
	Very low risk below 2000 m from December–April	1
Algeria	No risk	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half, including Okavango Delta area	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguaçu Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	Low risk in Yunnan and Hainan provinces	1
	Very low risk in southern and some central provinces, including Anhui, Guizhou, Hena, Hubei, and Jiangsu below 1500 m	1
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-

	Low risk from July–October in areas below 1200 m	1
	Very low risk all year in Harare and Bulawayo	1

prophylaxis. Chloroquine and proguanil hydrochloride can be given during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined. In the case of proguanil hydrochloride, folic acid p. 1112 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that it is used during pregnancy. If travelling to high risk areas or there is resistance to other drugs, mefloquine may be considered during the second or third trimester of pregnancy. Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contraindicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. Atovaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that atovaquone with proguanil hydrochloride is used during pregnancy.

**Breast-feeding**

Some antimalarials should be avoided when breast feeding, see individual drug monographs for details.

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

**Anticoagulants**

Travellers taking warfarin sodium p. 155 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

There is relatively limited experience of chemoprophylaxis in those travellers taking direct oral anticoagulants (DOACs).

**Other medical conditions**

For additional information on malaria prophylaxis in patients with other medical conditions, see PHE: **Guidelines**

**for malaria prevention in travellers from the United Kingdom** (see *Useful resources*). Patients already taking hydroxychloroquine sulfate p. 1190 for another indication, and for whom chloroquine p. 669 would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

**Emergency standby treatment**

Travellers on prophylaxis and visiting remote, malarious areas should carry standby emergency treatment if they are likely to be more than 24 hours away from medical care. Standby emergency treatment should also be considered in long-term travellers living in or visiting remote, malarious areas that may be far from appropriate medical attention; this does not replace the need to consider prophylaxis. Self-medication should be **avoided** if medical help is accessible.

In order to use standby treatment appropriately, the traveller should be provided with **written instructions** which include seeking urgent medical attention if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller due to concerns over drug resistance and to minimise drug toxicity.

**Malaria prophylaxis, specific recommendations**

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see *Recommended regimens for prophylaxis against malaria*, and PHE: **Guidelines for malaria prevention in travellers from the United Kingdom** (see *Useful resources*).

Some countries not listed in *Recommended regimens for prophylaxis against malaria* may experience occasional instances of malaria transmission. For further guidance, see the National Travel Health Network and Centre ([nathnac.net/](http://nathnac.net/)) or TRAVAX ([www.travax.nhs.uk/](http://www.travax.nhs.uk/)).

### Important

Settled immigrants (or long-term visitors) in the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

### Treatment of malaria

Malaria is a notifiable disease in England, Northern Ireland, and Wales. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 540.

The recommendations on treatment reflect UK malaria treatment guidelines 2016, agreed by UK malaria specialists. They are aimed for residents of the UK and for use in a non-endemic setting.

Expert advice must be sought in all patients suspected to have malaria. If malaria is diagnosed in a returned traveller, other members of the family or travelling group should be advised that they may have shared the same exposure risk and they should seek medical attention if they develop symptoms.

If the infective species is **not known**, or if the infection is **mixed** and includes falciparum parasites, initial treatment should be as for *falciparum malaria*.

### Falciparum malaria

Falciparum malaria is caused by *Plasmodium falciparum*. Patients with falciparum malaria should usually be admitted

to hospital initially due to the risk of rapid deterioration even after starting treatment.

Artemisinin combination therapy is recommended for the treatment of uncomplicated *P. falciparum* malaria. Artemether with lumefantrine p. 668 is the drug of choice; artemimol with piperazine phosphate p. 668 is a suitable alternative. Oral quinine p. 673 or atovaquone with proguanil hydrochloride p. 669 can be used if an artemisinin combination therapy is not available. Quinine is highly effective but poorly-tolerated in prolonged treatment and should be used in combination with an additional drug, usually oral doxycycline p. 616 (or clindamycin p. 581 [unlicensed]) in pregnant women and young children).

Severe or complicated falciparum malaria should be managed in a high dependency unit or intensive care setting. Intravenous **artesunate** (available for 'named-patient' use from infectious disease units or specialist tropical disease centres) is indicated in all patients with severe or complicated falciparum malaria, or those at high-risk of developing severe disease (such as if more than 2% of red blood cells are parasitized), or if the patient is unable to take oral treatment. Following a minimum of 24 hours of intravenous **artesunate** treatment, and when the patient has improved and is able to take oral treatment, a full course of artemisinin combination therapy should be given. A full course of oral quinine with doxycycline (or clindamycin [unlicensed]), or atovaquone with proguanil hydrochloride are suitable alternatives.

Treatment of severe or complicated falciparum malaria should not be delayed whilst obtaining artesunate. Quinine by intravenous infusion [unlicensed] should be given if artesunate is not immediately available; it should be continued until the patient can take oral quinine to complete a full course. Oral doxycycline (or clindamycin [unlicensed]) should also be given when the patient can swallow.

In most parts of the world, *P. falciparum* is now resistant to chloroquine p. 669 which should not therefore be used for treatment. Mefloquine p. 671 is also no longer recommended for treatment because of concerns about adverse effects and non-completion of courses.

Specialist advice should be sought when considering the use of pyrimethamine with sulfadoxine as an alternative drug in combination with quinine.

### Pregnancy

Falciparum malaria in pregnancy carries a higher risk of severe disease; it requires prompt treatment by specialists in hospital and close observation. Uncomplicated falciparum malaria in the second and third trimesters of pregnancy should be treated with artemether with lumefantrine p. 668. Quinine with clindamycin [unlicensed indication] can be used in all trimesters. Quinine can increase the risk of uterine contractions and hypoglycaemia.

Severe or complicated falciparum malaria is associated with a high risk of fatality, pregnancy loss, and complications. Due to efficacy, treatment with intravenous artesunate in any trimester of pregnancy is preferred; intravenous quinine (with clindamycin) can be used as an alternative.

### Non-falciparum malaria

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale*, *P. malariae*, and *P. knowlesi*. *P. knowlesi* is present in the Asia-Pacific region.

Either an artemisinin combination therapy (such as artemether with lumefantrine p. 668 or artemimol with piperazine phosphate p. 668) or chloroquine can be used for the treatment of non-falciparum malaria. Chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam. Chloroquine can still be used for treatment of non-falciparum malaria from these regions with appropriate follow-up, however artemisinin combination therapy may be preferred.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. For a radical cure, primaquine p. 672 [unlicensed] is given with chloroquine treatment; the dose is dependent on the infecting organism. Patients should be screened for G6PD deficiency before initiating primaquine treatment, as primaquine may cause haemolysis in G6PD deficient individuals.

Severe or complicated non-falciparum malaria should be treated with parenteral artesunate or quinine [unlicensed] as for treatment of severe or complicated falciparum malaria.

#### Pregnancy

Chloroquine can be given for non-falciparum malaria treatment throughout pregnancy. Artemisinin combination therapy can be used in the second and third trimesters, and quinine may be used in the first trimester if there is concern about chloroquine-resistant *P. vivax*. In the case of *P. vivax* or *P. ovale* however, the radical cure with primaquine should be postponed until the pregnancy (and breast-feeding) is over; instead weekly chloroquine prophylaxis should be continued until delivery or completion of breast-feeding.

## ANTIPROTOZOALS > ANTIMALARIALS

### Artemether with lumefantrine

09-Sep-2021

#### ● INDICATIONS AND DOSE

**Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria**

##### ► BY MOUTH

- Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in Acute porphyrias p. 1150 · electrolyte disturbances (correct before and during treatment)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · gait abnormal · headache · movement disorders · myalgia · nausea · palpitations · QT interval prolongation · sensation abnormal · skin reactions · sleep disorders · vomiting
  - **Uncommon** Drowsiness
  - **Frequency not known** Angioedema
- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor ECG and plasma potassium concentration.
- **RENAL IMPAIRMENT** EvGr Caution in severe impairment (limited information available)—monitor ECG and plasma potassium concentration. ⚠
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet PoM £22.50 DT = £22.50

## Artemimol with piperazine phosphate

(Piperazine tetrphosphate with dihydroartemisinin)

26-Jan-2022

#### ● INDICATIONS AND DOSE

**Treatment of uncomplicated falciparum malaria**

##### ► BY MOUTH

- Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Adult (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Adult (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
  - **INTERACTIONS** → Appendix 1: antimalarials
  - **SIDE-EFFECTS**
    - **Common or very common** Anaemia · arrhythmias (in adults) · asthenia · conjunctivitis (in children) · eosinophilia · fever · headache (uncommon in children) · leucocytosis (in children) · leucopenia (in children) · neutropenia (in children) · QT interval prolongation · thrombocytopenia (in children)
    - **Uncommon** Abdominal pain (very common in children) · appetite decreased (very common in children) · arthralgia · cardiac conduction disorder · cough (very common in children) · diarrhoea (very common in children) · dizziness (in adults) · epistaxis (in children) · hepatic disorders · hypochromia (in children) · increased risk of infection (very common in children) · lymphadenopathy (in children) · myalgia (in adults) · nausea · rhinorrhoea (in children) · seizure · skin reactions (very common in children) · splenomegaly (in children) · stomatitis (in

children) · thrombocytosis (in children) · vomiting (very common in children)

- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in jaundice or in moderate to severe failure (no information available)—monitor ECG and plasma potassium concentration.
- **RENAL IMPAIRMENT** EVGR Caution in moderate to severe impairment (no information available)—monitor ECG and plasma potassium concentration. M
- **MONITORING REQUIREMENTS**
  - ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT<sub>C</sub> interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
  - ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in children who are vomiting, in females, or in the elderly.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with arteminol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

Arteminol 40 mg, Piperazine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet PoM £40.00

## Atovaquone with proguanil hydrochloride

03-Aug-2021

### ● INDICATIONS AND DOSE

**Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected [using 250 mg/100 mg tablets]**

#### ▶ BY MOUTH

- ▶ Adult (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected [using 62.5 mg/25 mg tablets]**

#### ▶ BY MOUTH

- ▶ Adult (body-weight 30–39 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**Treatment of acute uncomplicated falciparum malaria [using 250 mg/100 mg tablets] | Treatment of non-falciparum malaria [using 250 mg/100 mg tablets]**

#### ▶ BY MOUTH

- ▶ Adult: 4 tablets once daily for 3 days

### DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 250 mg/100 mg tablet contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.
- ▶ Each 62.5 mg/25 mg tablet contains 62.5 mg of atovaquone and 25 mg of proguanil hydrochloride.

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · appetite decreased · cough · depression · diarrhoea · dizziness · fever · headache · nausea · skin reactions · sleep disorders · vomiting
  - ▶ **Uncommon** Alopecia · anxiety · blood disorder · hyponatraemia · oral disorders · palpitations
  - ▶ **Frequency not known** Hallucination · hepatic disorders · photosensitivity reaction · seizure · Stevens-Johnson syndrome · tachycardia · vasculitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk. See also *Pregnancy* in Malaria, prophylaxis p. 661.
- **BREAST FEEDING** Use only if no suitable alternative available.
- **RENAL IMPAIRMENT** EVGR Avoid for malaria prophylaxis (and if possible for malaria treatment) if creatinine clearance less than 30 mL/minute, M see p. 21.
- **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

#### ▶ Atovaquone with proguanil hydrochloride (Non-proprietary)

**Proguanil hydrochloride 100 mg, Atovaquone 250 mg** Proguanil 100mg / Atovaquone 250mg tablets | 12 tablet PoM £31.78 DT = £31.78

#### ▶ Malarone (GlaxoSmithKline UK Ltd)

**Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg** Malarone Paediatric 62.5mg/25mg tablets | 12 tablet PoM £6.26 DT = £6.26  
**Proguanil hydrochloride 100 mg, Atovaquone 250 mg** Malarone 250mg/100mg tablets | 12 tablet PoM £25.21 DT = £31.78

## Chloroquine

18-Mar-2022

### ● INDICATIONS AND DOSE

**Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)**

#### ▶ BY MOUTH USING TABLETS

- ▶ Adult: 155 mg daily; maximum 2.5 mg/kg per day

#### Prophylaxis of malaria

##### ▶ BY MOUTH USING SYRUP

- ▶ Child (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

continued →

- ▶ Child (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16.5–24 kg): 150 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 225 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ BY MOUTH USING TABLETS
- ▶ Child (body-weight up to 6 kg): 38.75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 6–9 kg): 77.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 10–15 kg): 116.25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 25–44 kg): 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

#### Treatment of non-falciparum malaria

- ▶ BY MOUTH
- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- ▶ Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

#### *P. vivax* or *P. ovale* infection during pregnancy while radical cure is postponed

- ▶ BY MOUTH
- ▶ Adult: 310 mg once weekly

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as chloroquine base.
- ▶ Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate). Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

#### DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With oral use in adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF Publications may differ from those in product literature.

#### IMPORTANT SAFETY INFORMATION

- ▶ In adults  
Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

#### MHRA/CHM ADVICE: HYDROXYCHLOROQUINE, CHLOROQUINE: INCREASED RISK OF CARDIOVASCULAR EVENTS WHEN USED WITH MACROLIDE ANTIBIOTICS; REMINDER OF PSYCHIATRIC REACTIONS (FEBRUARY 2022)

An observational study has shown that co-administration of azithromycin with hydroxychloroquine in patients with rheumatoid arthritis was associated with an increased risk of cardiovascular events (including angina or chest pain and heart failure) and mortality. Healthcare professionals are reminded to consider the benefits and risks of co-prescribing systemic macrolides with chloroquine because of its similar safety profile to hydroxychloroquine. If such use cannot be avoided, caution is recommended in patients with risk factors for cardiac events and they should be advised to seek urgent medical attention if any signs or symptoms develop.

A European safety review has reported that psychiatric reactions associated with chloroquine (including rare cases of suicidal behaviour) typically occurred within the first month of treatment; events have been reported in patients with no history of psychiatric disorders. Healthcare professionals are reminded to be vigilant for psychiatric reactions, and counsel patients and carers to seek medical advice if any new or worsening mental health symptoms develop.

- **CAUTIONS** Acute porphyrias p. 1150 · diabetes (may lower blood glucose) · G6PD deficiency · long-term therapy (risk of retinopathy and cardiomyopathy) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (may lower seizure threshold)—avoid for prophylaxis of malaria if history of epilepsy · severe gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Cardiomyopathy · hallucination · hepatitis
- ▶ **Frequency not known** Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · behaviour abnormal · bone marrow disorders · concentration impaired · confusion · corneal deposits · delusions · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · interstitial lung disease · mania · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · photosensitivity reaction · psychiatric disorder · psychosis · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · suicidal behaviour · thrombocytopenia · tinnitus · tongue protrusion · vision disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.
- Overdose** Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).
- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not

necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in cirrhosis.
- **RENAL IMPAIRMENT** Manufacturers advise caution. **Dose adjustments** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose.
- **MONITORING REQUIREMENTS**
  - ▶ In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines on monitoring for chloroquine and hydroxychloroquine retinopathy (*Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Monitoring* 2020). Chloroquine appears to be more retinotoxic than hydroxychloroquine. Annual monitoring (including fundus autofluorescence and spectral domain optical coherence tomography) is recommended in all patients who have taken chloroquine for longer than 1 year.
  - ▶ In children Expert sources advise ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** *Tablets* can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Oral solution

##### CAUTIONARY AND ADVISORY LABELS 5

- ▶ **Malarivon** (Wallace Manufacturing Chemists Ltd)  
Chloroquine phosphate 16 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml **[POM]** £30.00 DT = £30.00

#### Tablet

##### CAUTIONARY AND ADVISORY LABELS 5

- ▶ **Avloclor** (Alliance Pharmaceuticals Ltd)  
Chloroquine phosphate 250 mg Avloclor 250mg tablets | 20 tablet **[P]** £8.59 DT = £8.59

## Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 669, proguanil hydrochloride p. 672.

#### ● INDICATIONS AND DOSE

##### Prophylaxis of malaria

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: antimalarials
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Form unstated

- ▶ **Paludrine/Avloclor** (Alliance Pharmaceuticals Ltd)  
Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet **[P]** £13.50

## Mefloquine

13-Apr-2021

#### ● INDICATIONS AND DOSE

##### Treatment of malaria

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

##### Prophylaxis of malaria

- ▶ BY MOUTH
- ▶ Child (body-weight 5-15 kg): 62.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16-24 kg): 125 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25-44 kg): 187.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 25-44 kg): 187.5 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2-3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature.
  - ▶ In children Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions
  - avoid for standby treatment if history of convulsions
  - history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · infants less than 3 months (limited experience) · not recommended in infants under 5 kg · traumatic brain injury
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vision disorders · vomiting
  - ▶ **Frequency not known** Acute kidney injury · agranulocytosis · alopecia · aplastic anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · behaviour abnormal ·

cardiac conduction disorders · cataract · chest pain · chills · concentration impaired · confusion · cranial nerve paralysis · delusional disorder · depersonalisation · drowsiness · dyspnoea · encephalopathy · eye disorder · fever · flushing · gait abnormal · hallucination · hearing impairment · hepatic disorders · hyperacusia · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nephritis · nerve disorders · oedema · palpitations · pancreatitis · paraesthesia · pneumonia · pneumonitis · psychosis · seizure · self-endangering behaviour · speech disorder · Stevens-Johnson syndrome · suicidal behaviours · syncope · thrombocytopenia · tinnitus · tremor · vertigo

- **ALLERGY AND CROSS-SENSITIVITY** E<sub>VG</sub>r Contra-indicated in patients with hypersensitivity to quinine. M
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).
- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
- **BREAST FEEDING** Present in milk but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—elimination may be prolonged.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Expert sources advise tablet may be crushed and mixed with food such as jam or honey just before administration.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.  
A patient alert card should be provided.

**Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.  
**Tablet**  
CAUTIONARY AND ADVISORY LABELS 10, 21, 27  
▶ **Lariam** (Neon Healthcare Ltd)  
**Mefloquine (as Mefloquine hydrochloride)** 250 mg Lariam 250mg tablets | 8 tablet PoM £14.53 DT = £14.53

## Primaquine

05-Aug-2020

### ● INDICATIONS AND DOSE

**Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium vivax* infection**

- ▶ BY MOUTH
- ▶ Adult: 30 mg daily for 14 days

**Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium ovale* infection**

- ▶ BY MOUTH
- ▶ Adult: 15 mg daily for 14 days

**Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium vivax* infection in patients with mild G6PD deficiency (administered on expert advice)**

**Adjunct in the treatment of non-falciparum malaria caused by *Plasmodium ovale* infection in patients with mild G6PD deficiency (administered on expert advice)**

- ▶ BY MOUTH
- ▶ Adult: 45 mg once weekly for 8 weeks

**Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)**

- ▶ BY MOUTH
- ▶ Adult: 30 mg daily, this combination is associated with considerable toxicity

- **UNLICENSED USE** Not licensed.
- **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. rheumatoid arthritis, lupus erythematosus)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Arrhythmia · dizziness · gastrointestinal discomfort · haemolytic anaemia (in G6PD deficiency) · leucopenia · methaemoglobinaemia (in NADH methaemoglobin reductase deficiency) · nausea · QT interval prolongation · skin reactions · vomiting
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.
- **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension  
**Tablet**  
▶ **Primaquine (Non-proprietary)**  
**Primaquine (as Primaquine phosphate)** 7.5 mg Primaquine 7.5mg tablets | 100 tablet N  
**Primaquine (as Primaquine phosphate)** 15 mg Primaquine 15mg tablets | 100 tablet PoM N (Hospital only)

## Proguanil hydrochloride

04-Aug-2020

### ● INDICATIONS AND DOSE

**Prophylaxis of malaria**

- ▶ BY MOUTH
- ▶ Child (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 6–9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 10–15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

- ▶ Child (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 25–44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

● **UNLICENSED USE** Proguanil doses in BNF Publications may differ from those in product literature.

● **INTERACTIONS** → Appendix 1: antimalarials

● **SIDE-EFFECTS** Alopecia · angioedema · bone marrow disorders · cholestasis · constipation · diarrhoea · fever · gastric disorder · megaloblastic anaemia · oral disorders · skin reactions · vasculitis

● **PREGNANCY** Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

● **BREAST FEEDING** Amount in milk probably too small to be harmful when used for malaria prophylaxis.

● **RENAL IMPAIRMENT**

**Dose adjustments** ▶ In children Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m<sup>2</sup>. Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m<sup>2</sup>. Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m<sup>2</sup>; increased risk of haematological toxicity in severe impairment.

▶ In adults 100 mg once daily if eGFR 20–60 mL/minute/1.73m<sup>2</sup>, 50 mg on alternate days if eGFR 10–20 mL/minute/1.73m<sup>2</sup>, 50 mg once weekly if eGFR less than 10 mL/minute/1.73m<sup>2</sup>; increased risk of haematological toxicity in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

● **PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

▶ **Paludrine** (Alliance Pharmaceuticals Ltd)

Proguanil hydrochloride 100 mg Paludrine 100mg tablets | 98 tablet [P] £11.95 DT = £11.95

## Quinine

27-Jul-2020

● **INDICATIONS AND DOSE**

**Nocturnal leg cramps**

▶ BY MOUTH

▶ Adult: 200–300 mg once daily, to be taken at bedtime

### Non-falciparum malaria

▶ BY INTRAVENOUS INFUSION

▶ Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

### Falciparum malaria

▶ BY MOUTH

▶ Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

▶ Adult: 600 mg every 8 hours for 5–7 days, to be given together with or followed by either doxycycline or clindamycin

▶ BY INTRAVENOUS INFUSION

▶ Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

### Falciparum malaria (in intensive care unit)

▶ BY INTRAVENOUS INFUSION

▶ Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

### DOSE EQUIVALENCE AND CONVERSION

▶ When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.

▶ Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

● **UNLICENSED USE** Injection not licensed.

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

● **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus

● **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · elderly (monitor ECG during parenteral treatment) · electrolyte disturbance ·

G6PD deficiency · heart block (monitor ECG during parenteral treatment)

- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Abdominal pain · agitation · agranulocytosis · angioedema · asthma · atrioventricular conduction changes · bronchospasm · cardiotoxicity · cerebral impairment · coagulation disorders · coma · confusion · death · diarrhoea · dyspnoea · fever · flushing · gastrointestinal disorder · haemoglobinuria · haemolysis · haemolytic uraemic syndrome · headache · hearing impairment · hypersensitivity · loss of consciousness · muscle weakness · myasthenia gravis aggravated · nausea · ocular toxicity · oedema · pancytopenia · photosensitivity reaction · QT interval prolongation · renal impairment · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting

**Overdose** Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1473.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
  - ▶ With oral use Manufacturer advises caution (risk of prolonged half-life).
  - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
  - ▶ With oral use Manufacturer advises dose reduction or increased dose interval.
- **RENAL IMPAIRMENT**
  - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
  - ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
  - ▶ In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in adults For *intravenous infusion*, expert sources advise give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

#### Tablet

##### ▶ Quinine (Non-proprietary)

**Quinine sulfate 200 mg** Quinine sulfate 200mg tablets | 28 tablet **[PoM]** £2.90 DT = £1.62

**Quinine bisulfate 300 mg** Quinine bisulfate 300mg tablets | 28 tablet **[PoM]** £17.34 DT = £16.68

**Quinine sulfate 300 mg** Quinine sulfate 300mg tablets | 28 tablet **[PoM]** £2.48 DT = £2.13

## 5.2 Toxoplasmosis

### ANTIPROTOZOALS

#### Pyrimethamine

13-Jan-2022

##### ● INDICATIONS AND DOSE

##### **Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)**

- ▶ BY MOUTH
- ▶ Adult: 50 mg once daily until delivery

- **CAUTIONS** History of seizures—avoid large loading doses · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · diarrhoea · dizziness · headache · leucopenia · nausea · skin reactions · thrombocytopenia · vomiting
  - ▶ **Uncommon** Fever
  - ▶ **Rare or very rare** Abdominal pain · oral ulceration · pancytopenia · pneumonia eosinophilic · seizure
- **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.
- **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available).
  - Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## 6 Viral infection

### 6.1 Coronavirus

#### COVID-19

19-May-2022

##### Description of condition

COVID-19 is the syndrome caused by a novel coronavirus, SARS-CoV-2, which was originally detected late 2019 in Wuhan, Hubei Province, China. SARS-CoV-2 is primarily transmitted between people through respiratory particles, direct human contact, and contact with contaminated surfaces. A person can be infected when respiratory particles are inhaled, or come into contact with the eyes, nose or mouth.

COVID-19 is predominantly a respiratory illness with a range of symptoms of varying severity. Common symptoms include fever, a new continuous cough, loss or change in sense of smell or taste, loss of appetite, nausea or vomiting, diarrhoea, shortness of breath, fatigue, muscle aches, headache, sore throat, and nasal congestion or rhinorrhoea. Atypical symptoms such as delirium and reduced mobility may present in elderly and immunocompromised

individuals, often without a fever. COVID-19 infection varies in severity from asymptomatic or mild upper respiratory tract infection in some individuals, to severe pneumonia and critical disease in others. Patients with COVID-19 may deteriorate rapidly, and life-threatening complications include thromboembolic events, cardiac disease, acute kidney injury, sepsis, septic shock, and acute respiratory and multi-organ failure. Individuals who are older, male, from deprived areas, or from black, Asian and minority ethnic groups are at higher risk of severe disease and death. The risk also increases in pregnancy and in those with obesity, certain underlying co-morbidities, frailty, impaired immunity, or a reduced ability to cough and clear secretions.

After acute infection with COVID-19, individuals may experience prolonged symptoms that persist for more than 4 weeks (known as 'long COVID'). For guidance on the management of 'long COVID', see NICE, SIGN and the Royal College of General Practitioners (RCGP) COVID-19 rapid guideline: **Managing the long-term effects of COVID-19** (available at: [www.nice.org.uk/guidance/ng188](http://www.nice.org.uk/guidance/ng188)).

COVID-19 vaccination significantly reduces the risk of infection, hospitalisation, and death. However, fully vaccinated individuals can still become infected with SARS-CoV-2. For information on vaccination against COVID-19, see COVID-19 vaccines p. 1397.

## Management

COVID-19 is a notifiable disease in the UK. For further information, see *Notifiable diseases* in Antimicrobials, principles of therapy p. 540.

For guidance on infection prevention and control, and sampling and diagnostics, see the UKHSA collection: **Coronavirus (COVID-19): guidance** (available at: [www.gov.uk/government/collections/coronavirus-covid-19-list-of-guidance](http://www.gov.uk/government/collections/coronavirus-covid-19-list-of-guidance)).

Recommendations on the management of COVID-19 reflect *NICE—Managing COVID-19 rapid guideline* (NG191, v23.1 April 2022). For the most up to date guidance, see [www.nice.org.uk/guidance/ng191](http://www.nice.org.uk/guidance/ng191).

## Drug treatment

Individuals with COVID-19 have an increased risk of venous thromboembolism (VTE). For guidance on the prophylaxis and management of VTE, see NICE rapid guideline: **Managing COVID-19** (see *Useful resources*) and SIGN rapid guideline: **Prevention and management of venous thromboembolism in patients with COVID-19** (available at: [www.sign.ac.uk/our-guidelines/prevention-and-management-of-venous-thromboembolism-in-covid-19/](http://www.sign.ac.uk/our-guidelines/prevention-and-management-of-venous-thromboembolism-in-covid-19/)).

Dexamethasone p. 743 should be offered to patients with COVID-19 who need supplemental oxygen, or who have a level of hypoxia that requires supplemental oxygen but are unable to have or tolerate it. If dexamethasone is unsuitable or unavailable, either hydrocortisone p. 744 or prednisolone p. 747 can be used.

Tocilizumab p. 1195 should be offered to hospitalised patients with COVID-19 who are having or have completed a course of corticosteroids, unless corticosteroids are unsuitable, and who meet the eligibility criteria. If tocilizumab is unsuitable or unavailable, sarilumab [unlicensed] may be considered.

Other available treatment options for COVID-19 include antivirals (such as remdesivir p. 677, or molnupiravir p. 676, or nirmatrelvir with ritonavir p. 677), or SARS-CoV-2 neutralising monoclonal antibodies (such as sotrovimab p. 676).

Antibacterials are not recommended for preventing or treating pneumonia if it is likely to be caused by SARS-CoV-2, another virus, or a fungal infection. Empirical antibacterials should be started if a secondary bacterial infection is suspected in patients with COVID-19. For guidance on the management of suspected or confirmed

bacterial pneumonia, see Respiratory system infections, antibacterial therapy p. 551.

Antifungals should only be offered for treatment of COVID-19-associated pulmonary aspergillosis (CAPA) if diagnosis is confirmed, or CAPA is suspected and a multidisciplinary team or local protocols support starting treatment.

For further guidance on the management of non-hospitalised patients at risk of severe disease and hospitalised patients, see NICE rapid guideline: **Managing COVID-19** (see *Useful resources*), NHS England: **Rapid Clinical Policy development: COVID-19** (available at: [www.england.nhs.uk/coronavirus/clinical-policy/](http://www.england.nhs.uk/coronavirus/clinical-policy/)), and MHRA: **Coronavirus (COVID-19) Alerts and Registration** (available at: [www.cas.mhra.gov.uk/Help/CoronavirusAlerts.aspx](http://www.cas.mhra.gov.uk/Help/CoronavirusAlerts.aspx)).

For guidance on the management of COVID-19 infection in pregnancy, including therapies that should be offered to pregnant or postpartum females with COVID-19, see Royal College of Obstetricians and Gynaecologists, Royal College of Midwives, Royal College of Paediatrics and Child Health, PHE and Public Health Scotland guidance: **Coronavirus (COVID-19) infection and pregnancy** (available at: [www.rcog.org.uk/en/guidelines-research-services/guidelines/coronavirus-pregnancy/](http://www.rcog.org.uk/en/guidelines-research-services/guidelines/coronavirus-pregnancy/)).

For information on the fetal and neonatal risks of exposure to COVID-19 treatments, see UK Teratology Information Service (UKTIS): **Medications used to treat COVID-19 in pregnancy** (available at: [www.medicinesinpregnancy.org/bumps/monographs/MEDICATIONS-USED-TO-TREAT-COVID-19-IN-PREGNANCY/](http://www.medicinesinpregnancy.org/bumps/monographs/MEDICATIONS-USED-TO-TREAT-COVID-19-IN-PREGNANCY/)).

For breastfeeding advice on drugs that may be used for COVID-19, see UK Drugs in Lactation Advisory Service (UKDILAS) guidance on the Specialist Pharmacy Service website (available at: [www.sps.nhs.uk/articles/breastfeeding-with-covid-19-infection/](http://www.sps.nhs.uk/articles/breastfeeding-with-covid-19-infection/)).

## Management of COVID-19 symptoms

Patients with a cough should be encouraged to avoid lying on their backs, if possible, because this may make coughing less effective. Cough should be initially managed using simple non-drug measures (such as honey). For cough that is distressing in a patient with COVID-19, consider short-term use of a cough suppressant (such as codeine phosphate or morphine).

Patients with fever should be advised to drink fluids regularly to avoid dehydration, and to take antipyretics (such as paracetamol or ibuprofen) as appropriate (whilst both fever and other symptoms that antipyretics would help treat are present).

Reversible causes of breathlessness (such as pulmonary oedema, pulmonary embolism, chronic obstructive pulmonary disorder, and asthma) should be identified and treated accordingly. When other significant medical pathology has been excluded or further investigation is inappropriate, non-drug management (such as relaxation and breathing techniques, and changing body positioning) may help to manage breathlessness as part of supportive care. If hypoxia is the likely cause of breathlessness, consider a trial of oxygen therapy if appropriate.

Reversible causes of anxiety should be addressed by discussing the patient's concerns. Consider a trial of a benzodiazepine (such as lorazepam) to manage anxiety or agitation.

Reversible causes of delirium should be assessed—see NICE guideline: **Delirium: prevention, diagnosis and management** (available at: [www.nice.org.uk/guidance/cg103](http://www.nice.org.uk/guidance/cg103)).

For further guidance on the management of COVID-19 symptoms, and for information on end of life care, see NICE rapid guideline: **Managing COVID-19** (see *Useful resources*).

**Useful Resources**

COVID-19 rapid guideline: managing COVID-19. National Institute for Health and Care Excellence. NICE guideline 191. April 2022.

**ANTIVIRALS > SARS-COV-2 NEUTRALISING MONOCLONAL ANTIBODIES****Sotrovimab**

31-Jan-2022

- **DRUG ACTION** Sotrovimab is an engineered human immunoglobulin monoclonal antibody that binds to the spike protein receptor binding domain of SARS-CoV-2, which prevents the virus from entering human cells.

**INDICATIONS AND DOSE**

**COVID-19 in patients who do not require oxygen supplementation and are at an increased risk of severe COVID-19 infection**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult (body-weight 40 kg and above): 500 mg as a single dose, to be initiated as soon as possible after diagnosis and within 5 days of symptom onset

**SIDE-EFFECTS**

- ▶ **Common or very common** Bronchospasm · hypersensitivity · infusion related reaction · skin reactions

- **PREGNANCY** [EVR](#) Use only if potential benefit outweighs risk—no information available. [M](#)
- **BREAST FEEDING** Specialist sources indicate use with caution—no information available. Large molecular weight suggests limited excretion into milk. Monitor breast-fed infants for adequate feeding and hypersensitivity reactions.
- **DIRECTIONS FOR ADMINISTRATION** [EVR](#) For *intravenous infusion* (Xevudy<sup>®</sup>), dilute in 50 mL or 100 mL Glucose 5% or Sodium Chloride 0.9% and administer over 30 minutes through an in-line 0.2 micron filter. [M](#)

- **PRESCRIBING AND DISPENSING INFORMATION** Sotrovimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

*NHS England Interim Clinical Commissioning Policy: Antivirals or neutralising monoclonal antibodies for non-hospitalised patients with COVID-19* (available at: [www.england.nhs.uk/coronavirus/publication/interim-clinical-commissioning-policy-neutralising-mono-clonal-antibodies-or-antivirals-for-non-hospitalised-patients-with-covid-19/](http://www.england.nhs.uk/coronavirus/publication/interim-clinical-commissioning-policy-neutralising-mono-clonal-antibodies-or-antivirals-for-non-hospitalised-patients-with-covid-19/)).

- **HANDLING AND STORAGE** Store in a refrigerator (2°C–8°C) and protect from light—consult product literature about storage after dilution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Polysorbates

- ▶ **Sotrovimab (non-proprietary)** ▼

Sotrovimab 62.5 mg per 1 mL Xevudy 500mg/8mL concentrate for solution for infusion vials | 1 vial [PoM](#) £2,209.00 (Hospital only)

**ANTIVIRALS > OTHER****Molnupiravir**

18-Mar-2022

- **DRUG ACTION** Molnupiravir (a prodrug) is a ribonucleoside analogue that increases the number of mutations in viral RNA thus preventing multiplication of the virus.

**INDICATIONS AND DOSE**

**Mild to moderate COVID-19 [with at least 1 risk factor for developing severe illness]**

- ▶ BY MOUTH
- ▶ Adult: 800 mg twice daily for 5 days, treatment to be started as soon as possible after diagnosis and within 5 days of symptom onset

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY 2022)**

The safety of COVID-19 antiviral treatment, such as molnupiravir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies, where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to molnupiravir during pregnancy or around the time of conception, or of partners on molnupiravir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to self-report), even if some time has passed since the end of molnupiravir treatment.

An exposed pregnancy should be reported by telephone to UKTIS—for more information, see the UKTIS Registry website (available at: [www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/](http://www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/)).

**SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea
- ▶ **Uncommon** Skin reactions · vomiting
- **CONCEPTION AND CONTRACEPTION** [EVR](#) Females of childbearing potential should use effective contraception during treatment and for 4 days after last treatment. [M](#)
- **PREGNANCY** [EVR](#) Avoid—toxicity in *animal* studies. See also *Important safety information*. [M](#)
- **BREAST FEEDING** [EVR](#) Avoid during treatment and for 4 days after last treatment—no information available. [M](#)
- **PATIENT AND CARER ADVICE**  
**Missed doses** If a dose is more than 10 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

## Nirmatrelvir with ritonavir

17-Mar-2022

### (PF-07321332 with ritonavir)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ritonavir p. 714.

- **DRUG ACTION** Nirmatrelvir is a peptidomimetic inhibitor of coronavirus 3C-like protease which prevents multiplication of SARS-CoV-2. Ritonavir inhibits CYP3A-mediated metabolism of nirmatrelvir thereby increasing the plasma concentration of nirmatrelvir.

#### ● INDICATIONS AND DOSE

**COVID-19 in patients who do not require oxygen supplementation and are at an increased risk of severe COVID-19 infection**

##### ► BY MOUTH

- Adult: 300 mg (two pink tablets) and 100 mg (one white tablet) twice daily for 5 days, to be initiated as soon as possible after SARS-CoV-2 positive result and within 5 days of symptom onset, for each dose, nirmatrelvir (pink tablets) and ritonavir (white tablet) to be taken together

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY 2022)

The safety of COVID-19 antiviral treatment, such as nirmatrelvir with ritonavir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies, where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to nirmatrelvir with ritonavir during pregnancy or around the time of conception, or of partners on nirmatrelvir with ritonavir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to self-report), even if some time has passed since the end of nirmatrelvir with ritonavir treatment.

An exposed pregnancy should be reported by telephone to UKTIS—for more information, see the UKTIS Registry website (available at: [www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/](http://www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/)).

- **CAUTIONS** Hepatitis · liver enzyme abnormalities · pre-existing liver diseases · uncontrolled or undiagnosed HIV-1 infection

#### CAUTIONS, FURTHER INFORMATION

- HIV-1 infection EVGr As nirmatrelvir is co-administered with ritonavir, there may be a risk of developing resistance to HIV protease inhibitors in patients with uncontrolled or undiagnosed HIV-1 infection. M

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors · nirmatrelvir

#### ● SIDE-EFFECTS

- **Common or very common** Diarrhoea · taste altered · vomiting

- **CONCEPTION AND CONTRACEPTION** EVGr Effectiveness of combined hormonal contraceptives may be reduced; alternative contraceptive methods or an additional barrier method is recommended during treatment and until completion of one menstrual cycle after stopping treatment. M

- **PREGNANCY** EVGr Avoid. M See also *Important safety information*.

- **BREAST FEEDING** EVGr Avoid during treatment and for 7 days after last treatment. M

- **HEPATIC IMPAIRMENT** EVGr Avoid in severe impairment (no information available). M

- **RENAL IMPAIRMENT** EVGr Caution in moderate impairment; avoid in severe impairment (increased exposure). M

**Dose adjustments** EVGr Reduce dose to 150 mg nirmatrelvir (one pink tablet) and 100 mg ritonavir (one white tablet) twice daily in moderate impairment. M

#### ● PATIENT AND CARER ADVICE

**Missed doses** If a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Form unstated

CAUTIONARY AND ADVISORY LABELS 9

- **Nirmatrelvir with ritonavir (non-proprietary)** ▼  
Paxlovid 150mg/100mg tablets | 30 tablet POM S

## Remdesivir

23-May-2022

- **DRUG ACTION** Remdesivir is an RNA polymerase inhibitor that disrupts the production of viral RNA, preventing multiplication of SARS-CoV-2.

#### ● INDICATIONS AND DOSE

**COVID-19 in patients hospitalised with pneumonia and requiring low-flow supplemental oxygen (under close medical supervision)**

##### ► BY INTRAVENOUS INFUSION

- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for up to 5 days in total, treatment should be initiated within 10 days of initial COVID-19 symptoms, consider stopping treatment if no improvement after 48 hours, course may be repeated if readmitted with COVID-19—consult interim clinical commissioning policy for further details (see *Prescribing and dispensing information*)

**COVID-19 in immunocompromised patients hospitalised with pneumonia (under close medical supervision)**

##### ► BY INTRAVENOUS INFUSION

- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for up to 10 days in total following a multidisciplinary assessment, consider stopping treatment if no improvement after 48 hours, course may be repeated if readmitted with COVID-19—consult interim clinical commissioning policy for further details (see *Prescribing and dispensing information*)

**COVID-19 in patients at increased risk of progression to severe illness (under close medical supervision)**

##### ► BY INTRAVENOUS INFUSION

- Adult: Loading dose 200 mg daily for 1 dose, then maintenance 100 mg once daily for 3 days in total, treatment should be initiated within 7 days of initial COVID-19 symptoms

- **UNLICENSED USE** [EvGr] Remdesivir is used in the doses provided in the BNF for the treatment of COVID-19, ◊ but these may differ from those licensed.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: COVID-19 ANTIVIRALS: REPORTING TO THE UK COVID-19 ANTIVIRALS PREGNANCY REGISTRY (FEBRUARY 2022)

The safety of COVID-19 antiviral treatment, such as remdesivir, during pregnancy has not been established. The MHRA, in collaboration with the UK Teratology Information Service (UKTIS), is operating the UK COVID-19 Antivirals Pregnancy Registry to collect information about and enable follow-up of reported exposures to COVID-19 antivirals in pregnancy; it is also collecting information on the outcomes of pregnancies, where conception occurred during or shortly after paternal exposure to antiviral treatment.

Healthcare professionals in England, Scotland, and Wales (as well as patients and their partners) are advised to report exposure to remdesivir during pregnancy or around the time of conception, or of partners on remdesivir around the time of conception. Healthcare professionals in Northern Ireland cannot currently report on behalf of a pregnant female or their partner but should encourage them to self-report. Since exposure can occur in very early pregnancy before pregnancy is recognised, healthcare professionals are advised to report (or to encourage patients to self-report), even if some time has passed since the end of remdesivir treatment.

An exposed pregnancy should be reported by telephone to UKTIS—for more information, see the UKTIS Registry website (available at: [www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/](http://www.medicinesinpregnancy.org/bumps/COVID-19-Antivirals-Pregnancy-Registry/)).

- **INTERACTIONS** → Appendix 1: remdesivir
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Headache · nausea · rash
  - ▶ **Rare or very rare** Hypersensitivity · infusion related reaction
  - ▶ **Frequency not known** Sinus bradycardia
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises slower infusion rates, with a maximum infusion time of up to 120 minutes, to prevent signs and symptoms of hypersensitivity. If significant hypersensitivity occurs, discontinue immediately.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment.
- **PREGNANCY** [EvGr] Avoid unless potential benefit outweighs risk—no information available. ◊ See also *Important safety information*.
- **BREAST FEEDING** Specialist sources indicate use with caution—limited information. Minimal oral absorption expected, but monitor breast-fed infants for adverse reactions such as diarrhoea, rash, hypotension, liver and renal impairment (increased risk of accumulation due to long half-life).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available)—treatment should not be started if ALT is  $\geq 5$  times the upper limit of normal. If ALT increases during treatment, remdesivir may need to be withheld, consult product literature for further information.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>— *Veklury*<sup>®</sup> formulation excipient (sulfolbutylether beta cyclodextrin sodium) may accumulate. See p. 21.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function at baseline and periodically during treatment as indicated.
- ▶ Manufacturer advises monitor eGFR at baseline and periodically during treatment as indicated—severe renal toxicity in animal studies.
- **DIRECTIONS FOR ADMINISTRATION** [EvGr] For *intravenous infusion*, reconstitute each vial with 19 mL Water for Injections, then dilute in Sodium Chloride 0.9%; give over 30–120 minutes. ◊ For further information on dilution and infusion rates—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** *NHS England Interim Clinical Commissioning Policy: Remdesivir for patients hospitalised due to COVID-19 (adults and children 12 years and older)* (available at: [www.england.nhs.uk/coronavirus/documents/interim-clinical-commissioning-policy-remdesivir-for-patients-hospitalised-due-to-covid-19-adults-and-adolescents-12-years-and-older/](http://www.england.nhs.uk/coronavirus/documents/interim-clinical-commissioning-policy-remdesivir-for-patients-hospitalised-due-to-covid-19-adults-and-adolescents-12-years-and-older/)).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

EXCIPIENTS: May contain Sulfolbutylether beta cyclodextrin sodium

## 6.2 Hepatitis

26-May-2021

### Hepatitis

#### Overview

Acute infectious hepatitis is a notifiable disease in the UK. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 540.

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis usually involves symptomatic supportive care. Early treatment of acute hepatitis C may reduce the risk of chronic infection and progression of liver disease. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections is available, see Hepatitis A vaccine p. 1401 and Hepatitis B vaccine p. 1402.

#### Chronic hepatitis B

Treatment of chronic hepatitis B infection should be initiated by a specialist.

[EvGr] Entecavir p. 679, peginterferon alfa p. 680, tenofovir alafenamide p. 679, and tenofovir disoproxil p. 709 are options for the treatment of chronic hepatitis B infection.

Entecavir and tenofovir disoproxil can be used in patients with decompensated liver disease. ◊

Other drugs licensed for the treatment of chronic hepatitis B infection include adefovir dipivoxil p. 680 and lamivudine p. 708.

[EvGr] If drug-resistance emerges during treatment, consider switching to, or adding another antiviral drug to which the virus is sensitive; ensure the antiviral drug does not share cross-resistance. ◊ Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy.

Duration of treatment is dependent on several factors including response (e.g. viral suppression, antigen loss, seroconversion), patient characteristics (e.g. liver disease), and treatment tolerability. [EvGr] Treatment is usually continued long-term in patients with decompensated liver disease. ◊

For information on the treatment of HIV and chronic hepatitis B co-infection, see HIV infection p. 694.

## Chronic hepatitis C

Treatment of chronic hepatitis C infection should be initiated by a specialist. Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. **EvGr** All patients with chronic hepatitis C infection should be assessed for treatment with direct-acting antiviral agents. **A**

Sofosbuvir p. 684 in combination with ribavirin (with or without peginterferon alfa), sofosbuvir with velpatasvir p. 685 (with or without ribavirin), sofosbuvir with velpatasvir and voxilaprevir p. 685, and glecaprevir with pibrentasvir p. 685 are licensed for the treatment of chronic hepatitis C infection of all genotypes.

Ledipasvir with sofosbuvir p. 683 (with or without ribavirin) is licensed for the treatment of chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6.

Elbasvir with grazoprevir p. 681 (with or without ribavirin) is licensed for the treatment of chronic hepatitis C infection of genotypes 1 or 4.

Other drugs licensed for the treatment of chronic hepatitis C infection include ribavirin p. 682 in combination with peginterferon alfa, or peginterferon alfa as monotherapy if ribavirin is contra-indicated or not tolerated.

## 6.3 Hepatitis infections

### 6.3a Chronic hepatitis B

**Other drugs used for Chronic hepatitis B** Lamivudine, p. 708 · Tenofovir disoproxil, p. 709

#### ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Entecavir

11-Aug-2021

#### ● INDICATIONS AND DOSE

**Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues**

▶ BY MOUTH

▶ Adult: 500 micrograms once daily

**Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance**

▶ BY MOUTH

▶ Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

**Chronic hepatitis B in patients with decompensated liver disease**

▶ BY MOUTH

▶ Adult: 1 mg once daily

● **CAUTIONS** HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy' · lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

**CAUTIONS, FURTHER INFORMATION** Manufacturer advises review treatment and consider discontinuation if deterioration in liver function occurs (risk of lactic acidosis)—consult product literature.

#### ● SIDE-EFFECTS

▶ **Common or very common** Diarrhoea · dizziness · drowsiness · dyspepsia · fatigue · headache · insomnia · nausea · vomiting

▶ **Uncommon** Alopecia · rash

▶ **Frequency not known** Lactic acidosis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

#### ● RENAL IMPAIRMENT

**Dose adjustments** **EvGr** Reduce dose if creatinine clearance less than 50 mL/minute (consult product literature). **M** See p. 21.

● **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to be taken at least 2 hours before or 2 hours after food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

▶ Entecavir for the treatment of chronic hepatitis B (August 2008) NICE TA153 Recommended

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

▶ **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution sugar-free | 210 ml **PoM** £423.80 DT = £423.80

#### Tablet

▶ **Entecavir (Non-proprietary)**

Entecavir (as Entecavir monohydrate) 500 microgram Entecavir 500microgram tablets | 30 tablet **PoM** £363.26 DT = £363.26 | 30 tablet **PoM** £363.26-£396.68 DT = £363.26 (Hospital only)

Entecavir (as Entecavir monohydrate) 1 mg Entecavir 1mg tablets | 30 tablet **PoM** £363.26 DT = £363.26 | 30 tablet **PoM** £363.26 DT = £363.26 (Hospital only)

▶ **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet **PoM** £363.26 DT = £363.26

Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet **PoM** £363.26 DT = £363.26

#### ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

F 702

### Tenofovir alafenamide

01-Dec-2020

#### ● INDICATIONS AND DOSE

**Chronic hepatitis B (initiated by a specialist)**

▶ BY MOUTH

▶ Adult: 25 mg once daily (for duration of treatment consult product literature)

● **CAUTIONS** Decompensated liver disease · HIV co-infection

● **INTERACTIONS** → Appendix 1: tenofovir alafenamide

#### ● SIDE-EFFECTS

▶ **Common or very common** Abdominal distension · arthralgia

▶ **Frequency not known** Hepatitis aggravated (during or following treatment) · nephrotoxicity

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (no information available).

- **PRE-TREATMENT SCREENING** Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.
- **PATIENT AND CARER ADVICE**  
**Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

▶ **Vemlidy** (Gilead Sciences Ltd) ▼

**Tenofovir alafenamide (as Tenofovir alafenamide fumarate)**  
25 mg Vemlidy 25mg tablets | 30 tablet [PoM] £325.73

**ANTIVIRALS > NUCLEOTIDE ANALOGUES****Adefovir dipivoxil**

18-Aug-2021

● **INDICATIONS AND DOSE**

**Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir**

▶ BY MOUTH

▶ Adult: 10 mg once daily

● **CAUTIONS** Elderly

**CAUTIONS, FURTHER INFORMATION** Manufacturer advises review treatment and consider discontinuation if deterioration in liver function occurs (risk of lactic acidosis)—consult product literature.

● **INTERACTIONS** → Appendix 1: adefovir● **SIDE-EFFECTS**

▶ **Common or very common** Asthenia · diarrhoea · flatulence · gastrointestinal discomfort · headache · nausea · renal impairment · skin reactions · vomiting

▶ **Frequency not known** Bone fracture · bone pain · hypophosphataemia · myopathy · nephrotoxicity · osteomalacia · pancreatitis · proximal renal tubulopathy

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT** [EvGr] Caution if creatinine clearance less than 30 mL/minute (use only if potential benefit outweighs risk, limited information available); no information available if creatinine clearance less than 10 mL/minute. ⚠

**Dose adjustments** [EvGr] 10 mg every 48 hours if creatinine clearance 30–50 mL/minute; 10 mg every 72 hours if creatinine clearance 10–30 mL/minute. ⚠ See p. 21.

● **MONITORING REQUIREMENTS**

▶ Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

▶ Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Hepsera** (Gilead Sciences Ltd)

**Adefovir dipivoxil 10 mg** Hepsera 10mg tablets | 30 tablet [PoM]  
£252.22 DT = £252.22

**IMMUNOSTIMULANTS > INTERFERONS****Peginterferon alfa**

15-Dec-2021

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

● **INDICATIONS AND DOSE**

PEGASYS®

**Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** For contra-indications consult product literature.
- **CAUTIONS** For cautions consult product literature.
- **INTERACTIONS** → Appendix 1: interferons
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite abnormal · arrhythmias · arthralgia · arthritis · asthenia · ataxia · behaviour abnormal · breast pain · chest discomfort · chills · concentration impaired · confusion · constipation · cough · crying · dehydration · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysphagia · dysphonia · dyspnoea · ear pain · eye discomfort · eye disorders · eye inflammation · feeling abnormal · fever · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hair texture abnormal · headaches · hearing impairment · hyperbilirubinaemia · hypertension · hyperthyroidism · hyperuricaemia · hypotension · hypothyroidism · increased risk of infection · influenza like illness · leucopenia · lymphadenopathy · malaise · memory loss · menstrual cycle irregularities · mood altered · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nasal complaints · nausea · neutropenia · oedema · oral disorders · ovarian disorder · pain · palpitations · photosensitivity reaction · prostatitis · respiratory disorders · sensation abnormal · sepsis · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat complaints · thrombocytopenia · tinnitus · tremor · urinary disorders · urine abnormal · vaginal disorder · vasodilation · vertigo · vision disorders · vomiting · weight decreased
  - ▶ **Uncommon** Diabetes mellitus · hallucination · hypersensitivity · hypertriglyceridaemia · myocardial infarction · nerve disorders · pancreatitis · psychosis · sarcoidosis · suicidal behaviours · thyroiditis
  - ▶ **Rare or very rare** Angioedema · bone marrow disorders · cardiac inflammation · cardiomyopathy · cerebral ischaemia · CNS haemorrhage · coma · congestive heart failure · diabetic ketoacidosis · embolism and thrombosis · encephalopathy · facial paralysis · injection site necrosis · ischaemic heart disease · myopathy · renal failure · retinopathy · seizure (more common with high doses in the elderly) · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · ulcerative colitis · vasculitis

► **Frequency not known** Homicidal ideation · pericardial effusion · peripheral ischaemia · pulmonary arterial hypertension · pure red cell aplasia · solid organ transplant rejection · tongue discolouration

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

● **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Manufacturers advise avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment and decompensated cirrhosis.

● **RENAL IMPAIRMENT**

**Dose adjustments** See p. 21.

Manufacturer advises reduce dose if creatinine clearance less than 30 mL/minute (consult product literature).

● **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

● **NATIONAL FUNDING/ACCESS DECISIONS**

## 6.3b Chronic hepatitis C

**Other drugs used for Chronic hepatitis C** Peginterferon alfa, p. 680

### ANTIVIRALS > HCV INHIBITORS

#### Elbasvir with grazoprevir

31-Aug-2020

● **DRUG ACTION** Elbasvir is an HCV NS5A inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● **INDICATIONS AND DOSE**

**Chronic hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)**

► BY MOUTH

► **Adult:** 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

#### DOSE EQUIVALENCE AND CONVERSION

► Dose expressed as x/y mg elbasvir/grazoprevir.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)**

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)**

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

● **CAUTIONS** Hepatitis B co-infection · re-treatment following previous exposure to elbasvir with grazoprevir, or to drugs of the same classes (NS5A inhibitors or NS3/4A inhibitors other than telaprevir, simeprevir, boceprevir)—efficacy not demonstrated

● **INTERACTIONS** → Appendix 1: elbasvir · grazoprevir

● **SIDE-EFFECTS**

► **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · constipation · depression · diarrhoea · dizziness · dry mouth · gastrointestinal discomfort · headache · insomnia · irritability · myalgia · nausea · pruritus · vomiting

► **Uncommon** Anaemia · transient ischaemic attack

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function before treatment, at week 8 in all patients, at week 12 in patients receiving 16 weeks of treatment, and then as clinically indicated—consider discontinuing treatment if alanine aminotransferase (ALT) is greater than 10 times the upper limit of normal; discontinue treatment if ALT elevation is accompanied by signs or symptoms of hepatic impairment or inflammation.

**● PATIENT AND CARER ADVICE**

Hepatic effects Manufacturer advises that patients and their carers should consult a healthcare professional if signs and symptoms of hepatic dysfunction occur (including fatigue, weakness, lack of appetite, nausea and vomiting, jaundice or discoloured faeces).

Vomiting Manufacturer advises if vomiting occurs within 4 hours of a dose, an additional dose should be taken.

**Missed doses** Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**● NATIONAL FUNDING/ACCESS DECISIONS**

**ANTIVIRALS > NUCLEOSIDE ANALOGUES****Ribavirin**

20-Nov-2020

**(Tribavirin)****● INDICATIONS AND DOSE****Bronchiolitis**

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

**Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

**COPEGUS<sup>®</sup> TABLETS****Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 75 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- ▶ Adult (body-weight 75 kg and above): 600 mg twice daily

**Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
- ▶ Adult (body-weight 81–105 kg): 600 mg twice daily
- ▶ Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening

**Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)**

- ▶ BY MOUTH
- ▶ Adult: Usual dose 400 mg twice daily

**REBETOL<sup>®</sup> CAPSULES****Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- ▶ Adult (body-weight 81–104 kg): 600 mg twice daily
- ▶ Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

**REBETOL<sup>®</sup> ORAL SOLUTION****Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**

- ▶ BY MOUTH
- ▶ Adult (body-weight up to 65 kg): 400 mg twice daily
- ▶ Adult (body-weight 65–80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- ▶ Adult (body-weight 81–104 kg): 600 mg twice daily
- ▶ Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

**● UNLICENSED USE**

- ▶ When used by inhalation in children Inhalation licensed for use in children (age range not specified by manufacturer).
- ▶ With intravenous use in children Intravenous preparation not licensed.

**● CONTRA-INDICATIONS**

- ▶ With systemic use Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · severe cardiac disease (in adults) · severe, uncontrolled cardiac disease in children with chronic hepatitis C · unstable or uncontrolled cardiac disease in previous 6 months (in adults)

**● CAUTIONS**

- ▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt · severe dental disorders (in adults) · severe ocular disorders (in adults) · severe periodontal disorders (in adults) · severe psychiatric effects (in adults)

- **INTERACTIONS** → Appendix 1: ribavirin

**● SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye

pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · lymphadenopathy · malaise · memory loss · mood altered · muscle complaints · muscle weakness · nasal congestion · nausea · neutropenia · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · respiratory disorders · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat pain · thrombocytopenia · tinnitus · tremor · vasodilation · vertigo · vision disorders · vomiting · weight decreased

- ▶ **Uncommon** Dehydration · diabetes mellitus · hallucination · hearing loss · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal behaviours · thyroiditis
- ▶ **Rare or very rare** Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hepatic failure (discontinue) · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
- ▶ **Frequency not known** Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · tongue discolouration · ulcerative colitis

**SIDE-EFFECTS, FURTHER INFORMATION** Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

#### ● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

● **PREGNANCY** Avoid; teratogenicity in *animal* studies.

- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.

● **BREAST FEEDING** Avoid—no information available.

● **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.

- ▶ In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>—monitor haemoglobin concentration closely.
- ▶ In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m<sup>2</sup>—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.

#### ● MONITORING REQUIREMENTS

- ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- ▶ With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- ▶ With systemic use in children Test thyroid function before treatment and then every 3 months.
- ▶ With oral use in children Eye examination recommended before treatment. Eye examination also recommended

during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- NICE decisions**
  - ▶ Peginterferon alfa and ribavirin for the treatment of chronic hepatitis C (September 2010) NICE TA200 Recommended with restrictions
  - ▶ Peginterferon alfa and ribavirin for treating chronic hepatitis C in children and young people (November 2013) NICE TA300 Recommended
- **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicine containing the same drug.

## ANTIVIRALS > NUCLEOTIDE ANALOGUES

### Ledipasvir with sofosbuvir

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 684.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

#### ● INDICATIONS AND DOSE

**Chronic hepatitis C infection (initiated by a specialist)**

- ▶ BY MOUTH

- ▶ Adult: 90/400 mg once daily, for duration of treatment consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose of concurrent H<sub>2</sub>-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- ▶ Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.

- **CAUTIONS** Retreatment following treatment failure—efficacy not established

- **INTERACTIONS** → Appendix 1: ledipasvir · sofosbuvir

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · headache · rash
- ▶ **Frequency not known** Angioedema · arrhythmia · Stevens-Johnson syndrome
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

### ● PATIENT AND CARER ADVICE

**Vomiting** If vomiting occurs within 5 hours of administration, an additional dose should be taken.  
**Missed doses** If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)**

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)**

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of

treatment and modify diabetic medication or doses when necessary;

- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CAUTIONS** Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contraindications to peginterferon alfa who require urgent treatment.

- **INTERACTIONS** → Appendix 1: sofosbuvir

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastroesophageal reflux disease · headaches · influenza like illness · insomnia · irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased
- ▶ **Frequency not known** Arrhythmia · hepatitis B reactivation · Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** See p. 21. [EvGr] Caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (accumulation may occur; limited information available). ⚠
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

### ● PATIENT AND CARER ADVICE

**Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ **Sofosbuvir for treating chronic hepatitis C [with peginterferon alfa and ribavirin for adults with genotype 1, 3, 4, 5, or 6; with ribavirin for adults with genotype 2 or 3] (February 2015)** NICE TA330 Recommended with restrictions
- ▶ **Sofosbuvir for treating chronic hepatitis C [with ribavirin for adults with genotype 1, 4, 5, or 6] (February 2015)** NICE TA330 Not recommended
- ▶ **Scottish Medicines Consortium (SMC) decisions**
- ▶ **Sofosbuvir (Sovaldi®) in combination with other medicinal products for the treatment of chronic hepatitis C (CHC) in adults (June 2014)** SMC No. 964/14 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Sovaldi** (Gilead Sciences Ltd) ▼

**Sofosbuvir 400 mg** Sovaldi 400mg tablets | 28 tablet [PoM] £11,660.98

## Sofosbuvir with velpatasvir

04-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 684.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and velpatasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

### ● INDICATIONS AND DOSE

#### Chronic hepatitis C infection, with or without ribavirin (initiated by a specialist)

##### ► BY MOUTH

- Adult: 400/100 mg once daily for 12 weeks (may extend to 24 weeks in some circumstances—consult product literature)

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose of concurrent H<sub>2</sub>-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take 4 hours after sofosbuvir with velpatasvir.

#### DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg sofosbuvir/velpatasvir.

- **CAUTIONS** Hepatitis B co-infection
- **INTERACTIONS** → Appendix 1: sofosbuvir · velpatasvir
- **SIDE-EFFECTS**
  - Common or very common Rash
  - Uncommon Angioedema
  - Frequency not known Atrioventricular block · bradycardia · fatigue · headache · nausea · Stevens-Johnson syndrome
- **PATIENT AND CARER ADVICE** Vomiting Manufacturer advises if vomiting occurs within 3 hours of administration, an additional dose should be taken.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

#### NICE decisions

- Sofosbuvir-velpatasvir for treating chronic hepatitis C (January 2017) NICE TA430 Recommended
- **Scottish Medicines Consortium (SMC) decisions**
- Sofosbuvir with velpatasvir (*Eplclusa*<sup>®</sup>) for the treatment of chronic hepatitis C virus (HCV) infection in adults [with genotype 3 chronic HCV infection] (November 2016) SMC No. 1195/16 Recommended with restrictions
- Sofosbuvir with velpatasvir (*Eplclusa*<sup>®</sup>) for the treatment of chronic hepatitis C virus (HCV) infection in adults [with genotype 2, 5 or 6 chronic HCV infection, or decompensated cirrhosis, irrespective of chronic HCV genotype] (October 2017) SMC No. 1271/17 Recommended with restrictions
- Sofosbuvir with velpatasvir (*Eplclusa*<sup>®</sup>) for the treatment of chronic hepatitis C virus (HCV) infection in adults [with genotype 1 or 4 chronic HCV infection] (April 2018) SMC No. 1271/17 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## ANTIVIRALS > PROTEASE INHIBITORS, HEPATITIS

## Glecaprevir with pibrentasvir

08-Dec-2021

### ● INDICATIONS AND DOSE

#### Chronic hepatitis C (specialist use only)

##### ► BY MOUTH

- Adult: 300/120 mg once daily, for duration of treatment, consult product literature

#### DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg glecaprevir/pibrentasvir.

### IMPORTANT SAFETY INFORMATION

#### HEPATITIS B INFECTION

Cases of hepatitis B reactivation, sometimes fatal, have been reported in patients co-infected with hepatitis B and C viruses; manufacturer advises to assess patients for hepatitis B prior to initiation of therapy and manage according to current clinical guidelines.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)**

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- **CAUTIONS** Hepatitis B infection · post-liver transplant patients · re-treatment of patients with prior exposure to NS3/4A- or NS5A-inhibitors—efficacy not established
- **INTERACTIONS** → Appendix 1: glecaprevir · pibrentasvir
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Asthenia · diarrhoea · headache · nausea
  - ▶ **Uncommon** Angioedema
  - ▶ **Frequency not known** Hepatitis B reactivation · pruritus · transient ischaemic attack
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (risk of increased exposure).
- **PATIENT AND CARER ADVICE**
  - Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

**NICE decisions**

- ▶ Glecaprevir-pibrentasvir for treating chronic hepatitis C (January 2018) NICE TA499 Recommended with restrictions
- **Scottish Medicines Consortium (SMC) decisions**
  - ▶ Glecaprevir with pibrentasvir (*Maviret*<sup>®</sup>) for the treatment of chronic hepatitis C virus (HCV) infection in adults (November 2017) SMC No. 1278/17 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pibrentasvir 40 mg, Glecaprevir 100 mg Maviret 100mg/40mg tablets | 84 tablet [PoM](#) £12,993.66

## 6.4 Herpesvirus infections

### Herpesvirus infections

07-Sep-2020

#### Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1.

[EVGr](#) Topical antiviral treatment is not routinely recommended in immunocompetent individuals with uncomplicated infection of the lips (herpes labialis or cold sores) or herpetic gingivostomatitis. However, some patients may find application of a topical antiviral drug helpful when used from the onset of the prodromal phase. Oral paracetamol p. 477 and/or ibuprofen p. 1232 may be given to relieve pain and fever. Other preparations that may be considered for symptom relief include topical anaesthetics or analgesics, and mouthwashes. Oral antiviral treatment may be considered in patients with severe, frequent or persistent oral infection.

Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth.

Individuals suspected of having ocular herpes simplex infection should be referred for urgent, same-day specialist referral; treatment should not be initiated whilst awaiting review. If same-day review is not possible, specialist advice should be sought, which may include topical antiviral treatment in primary care. Some optometrists with appropriate expertise and training can initiate topical antiviral treatment in certain suspected cases.

Refer or seek specialist advice for treatment of herpes simplex infection in pregnancy. [A](#)

#### Varicella-zoster infections

Chickenpox is an acute disease caused by the varicella-zoster virus. [EVGr](#) Specialist advice on the management of chickenpox (varicella) in neonates should be sought due to the higher risk of severe disease and complications. Chickenpox in otherwise healthy children is usually self-limiting and complications are rare; antiviral treatment is not routinely recommended.

Chickenpox is more severe in adolescents (aged 14 years and over) and adults than in children; antiviral treatment started within 24 hours of the onset of rash may be considered, particularly for those with severe infection or at risk of complications. Specialist advice should be sought on the diagnosis and management of chickenpox in immunocompromised patients. [A](#)

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia.

[EVGr](#) Immediate specialist advice should be sought for the treatment of chickenpox during pregnancy. [A](#)

Public Health England advise that individuals at high risk of severe chickenpox (neonates, infants, pregnant women, or immunocompromised patients) who have been exposed to the varicella-zoster virus, may require post-exposure prophylaxis with varicella-zoster immunoglobulin p. 1390 or an antiviral (unlicensed) to reduce the impact of chickenpox infection, and risk of complications (such as pneumonitis). For further information, see *Varicella-zoster immunoglobulin* in *Immunoglobulins* p. 1383.

Shingles (herpes zoster) is a viral infection of an individual nerve and the skin surface affected by the nerve. The infection is caused by the reactivation of the varicella-zoster virus, the same virus that causes chickenpox. [EVGr](#) Oral antiviral treatment should be offered to patients with shingles who are immunocompromised, have non-truncal involvement (e.g. neck, limbs, perineum), or to those with

moderate to severe pain or rash. Consider oral antiviral treatment for patients aged over 50 years to reduce the risk of post-herpetic neuralgia. Treatment with the antiviral should be started within 72 hours of the onset of rash. Immunocompromised patients with severe or widespread infection, or severely immunocompromised patients, or patients with shingles in the ophthalmic distribution of the trigeminal nerve, should be admitted to hospital or specialist advice should be sought. **A**

Chronic pain which persists after the rash has healed (post-herpetic neuralgia) requires specific management. For further information, see Neuropathic pain p. 516.

The risk and incidence of varicella-zoster infections can be reduced through vaccination of selected individuals. For further information, see Varicella-zoster vaccines p. 1415.

### Drug choice

Aciclovir below is active against herpesviruses but does not eradicate them. **EvGr** Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. **A** Aciclovir eye ointment is licensed for herpes simplex infections of the eye.

**EvGr** Famciclovir p. 689, a prodrug of penciclovir, is similar to aciclovir and may be used in the treatment of herpes zoster and genital herpes.

Valaciclovir p. 690 is an ester of aciclovir, which may be used in the treatment of herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); **A** it is also licensed for preventing cytomegalovirus disease following solid organ transplantation.

Intravenous foscarnet sodium p. 693 is licensed for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients. Oral inosine pranobex below is also licensed for mucocutaneous infections due to the herpes simplex virus.

### Cytomegalovirus infection

Cytomegalovirus (CMV) is a member of the herpesvirus group. In immunocompetent patients, CMV infection is often asymptomatic and self-limiting therefore treatment is not always required. In immunocompromised patients, such as those with AIDS and transplant recipients, the infection manifests more severely causing diseases associated with greater morbidity and mortality.

Drugs licensed for use in the management of CMV disease include ganciclovir p. 691 (related to aciclovir), cidofovir p. 690, foscarnet sodium, letermovir p. 693, valaciclovir, and valganciclovir p. 692 (an ester of ganciclovir). There is a possibility of ganciclovir resistance in those who repeatedly have a poor treatment response or when viral excretion continues despite treatment.

### ANTIVIRALS > INOSINE COMPLEXES

## Inosine pranobex

27-Apr-2021

(Inosine acedoben dimepranol)

#### ● INDICATIONS AND DOSE

##### Mucocutaneous herpes simplex

###### ► BY MOUTH

- Adult: 1 g 4 times a day for 7–14 days

##### Adjunctive treatment of genital warts

###### ► BY MOUTH

- Adult: 1 g 3 times a day for 14–28 days

##### Subacute sclerosing panencephalitis

###### ► BY MOUTH

- Adult: 50–100 mg/kg daily in 6 divided doses

- **CAUTIONS** History of gout · history of hyperuricaemia · history of urolithiasis
- **SIDE-EFFECTS** Arthralgia · constipation · diarrhoea · drowsiness · epigastric discomfort · fatigue · headache · insomnia · malaise · nausea · nervousness · polyuria · skin reactions · vertigo · vomiting
- **PREGNANCY** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.
- **LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 9

##### ► Immunovir (Kora Healthcare)

Inosine acedoben dimepranol 500 mg Immunovir 500mg tablets | 100 tablet **PoM** £39.50 DT = £39.50

### ANTIVIRALS > NUCLEOSIDE ANALOGUES

## Aciclovir

27-Apr-2022

(Acyclovir)

#### ● INDICATIONS AND DOSE

##### Herpes simplex, treatment (non-genital)

###### ► BY MOUTH

- Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

##### Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired

###### ► BY MOUTH

- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

##### Herpes simplex, treatment in encephalitis

###### ► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 8 hours for at least 14 days (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment

##### Herpes simplex, treatment in the immunocompromised

###### ► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours usually for 5 days, higher dose to be used only if resistant organisms suspected

##### Herpes simplex, suppression

###### ► BY MOUTH

- Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation)

##### Herpes simplex, prophylaxis in the immunocompromised

###### ► BY MOUTH

- Adult: 200–400 mg 4 times a day

###### ► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg every 8 hours

##### Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

###### ► BY MOUTH

- Adult: 800 mg 5 times a day for 7 days

###### ► BY INTRAVENOUS INFUSION

- Adult: 5 mg/kg every 8 hours usually for 5 days

continued →

**Varicella zoster (chickenpox), treatment in encephalitis | Herpes zoster (shingles), treatment in encephalitis**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours given for 10–14 days, possibly longer if also immunocompromised or if severe infection

**Varicella zoster (chickenpox), treatment in immunocompromised**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours usually for 5 days

**Herpes zoster (shingles), treatment in immunocompromised**

## ▶ BY MOUTH

- ▶ Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours usually for 5 days

**Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated**

## ▶ BY MOUTH

- ▶ Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

**Genital herpes simplex, treatment of first episode**

## ▶ BY MOUTH

- ▶ Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete), alternatively 400 mg 3 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Genital herpes simplex, treatment of first episode, in immunocompromised or HIV-positive**

## ▶ BY MOUTH

- ▶ Adult: 400 mg 5 times a day for 7–10 days (longer if new lesions appear during treatment or if healing incomplete)

**Severe genital herpes simplex, treatment, initial infection**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours usually for 5 days, higher dose to be used only if resistant organisms suspected

**Genital herpes simplex, treatment of recurrent infection**

## ▶ BY MOUTH

- ▶ Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

**Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

- ▶ Adult: 400 mg 3 times a day for 5–10 days

**DOSES AT EXTREMES OF BODY-WEIGHT**

- ▶ With intravenous use To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

**● UNLICENSED USE**

- ▶ With intravenous use Intravenous infusion not licensed for herpes zoster.
- ▶ With oral use Attenuation of chickenpox is an unlicensed indication.
- ▶ With systemic use Aciclovir doses in BNF Publications may differ from those in product literature.

- **CAUTIONS** Elderly (risk of neurological reactions) · maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

**● SIDE-EFFECTS****▶ Common or very common**

- ▶ With intravenous use Nausea · photosensitivity reaction · skin reactions · vomiting

- ▶ With oral use Abdominal pain · diarrhoea · dizziness · fatigue · fever · headache · nausea · photosensitivity reaction · skin reactions · vomiting

**▶ Uncommon**

- ▶ With intravenous use Anaemia · leucopenia · thrombocytopenia

**▶ Rare or very rare**

- ▶ With intravenous use Abdominal pain · agitation · angioedema · ataxia · coma · confusion · diarrhoea · dizziness · drowsiness · dysarthria · dyspnoea · encephalopathy · fatigue · fever · hallucination · headache · hepatic disorders · inflammation localised · psychosis · renal impairment · renal pain · seizure · tremor

- ▶ With oral use Agitation · anaemia · angioedema · ataxia · coma · confusion · drowsiness · dysarthria · dyspnoea · encephalopathy · hallucination · hepatic disorders · leucopenia · psychosis · renal impairment · renal pain · seizure · thrombocytopenia · tremor

**▶ Frequency not known**

- ▶ With intravenous use Crystalluria

- ▶ With oral use Alopecia · crystalluria

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

**Dose adjustments** ▶ With intravenous use Use normal intravenous dose every 12 hours if eGFR

25–50 mL/minute/1.73 m<sup>2</sup> (every 24 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup>). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- ▶ With oral use For *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m<sup>2</sup> (every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>). For *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

**● DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion Zovirax IV*<sup>®</sup>, *Aciclovir IV* (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

**● PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With oral use Flavours of oral liquid preparations may include banana, or orange.
- ▶ When used for Herpes simplex, suppression Interrupt therapy every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences.

**● PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary** ▶ With oral use Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Genital herpes, suppression in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

▶ Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Genital herpes infection, treatment of first episode**

## ▶ BY MOUTH

▶ Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete

**Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

▶ Adult: 500 mg twice daily for 10 days

**Genital herpes infection, treatment of recurrent infection**

## ▶ BY MOUTH

▶ Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day

**Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

▶ Adult: 500 mg twice daily for 5–10 days

**Herpes simplex infection (non-genital), treatment in immunocompromised patients**

## ▶ BY MOUTH

▶ Adult: 500 mg twice daily for 7 days

- **UNLICENSED USE** Famciclovir doses in BNF may differ from those in product literature.
- **INTERACTIONS** → Appendix 1: famciclovir
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · skin reactions · vomiting
  - ▶ **Uncommon** Angioedema · confusion · drowsiness
  - ▶ **Rare or very rare** Hallucination · jaundice cholestatic · palpitations · thrombocytopenia
- **PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** No information available—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises efficacy may be decreased in severe impairment (risk of impaired conversion to active metabolite, no information available).
- **RENAL IMPAIRMENT**  
**Dose adjustments** [EvGr] Reduce dose (consult product literature). ⚠
- **PRESCRIBING AND DISPENSING INFORMATION** Famciclovir is a pro-drug of penciclovir.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

## Valaciclovir

09-Jun-2020

## ● INDICATIONS AND DOSE

**Herpes zoster infection, treatment**

## ▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

## ▶ BY MOUTH

- ▶ Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

**Herpes simplex, treatment of first infective episode**

## ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

**Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

- ▶ Adult: 1 g twice daily for 10 days

**Herpes simplex, treatment of recurrent infections**

## ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily for 3–5 days

**Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

- ▶ Adult: 1 g twice daily for 5–10 days

**Herpes labialis treatment**

## ▶ BY MOUTH

- ▶ Adult: Initially 2 g, then 2 g after 12 hours

**Herpes simplex, suppression of infections**

## ▶ BY MOUTH

- ▶ Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients**

## ▶ BY MOUTH

- ▶ Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Genital herpes, reduction of transmission (administered on expert advice)**

## ▶ BY MOUTH

- ▶ Adult: 500 mg once daily, to be taken by the infected partner

**Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used**

## ▶ BY MOUTH

- ▶ Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **CAUTIONS** Elderly (risk of neurological reactions) · maintain adequate hydration (especially with high doses)
- **INTERACTIONS** → Appendix 1: valaciclovir
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
  - ▶ **Uncommon** Abdominal discomfort · agitation · confusion · dyspnoea · haematuria · hallucination · leucopenia · level of consciousness decreased · renal pain · thrombocytopenia · tremor
  - ▶ **Rare or very rare** Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
  - ▶ **Frequency not known** Microangiopathic haemolytic anaemia

**SIDE-EFFECTS, FURTHER INFORMATION** Neurological reactions more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with doses of 4 g or more per day (no information available).
- **RENAL IMPAIRMENT** Maintain adequate hydration.
 

**Dose adjustments** For *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m<sup>2</sup> (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>); 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

For *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>, initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m<sup>2</sup>, initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>, 500 mg as a single dose).

For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

For *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>.

Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

▶ **Valaciclovir (Non-proprietary)**

**Valaciclovir (as Valaciclovir hydrochloride) 500 mg** Valaciclovir 500mg tablets | 10 tablet [PoM] £22.06 DT = £14.43 | 42 tablet [PoM] £63.25-£81.89

## 6.4a Cytomegalovirus infections

## ANTIVIRALS &gt; NUCLEOSIDE ANALOGUES

## Cidofovir

20-Mar-2019

- **DRUG ACTION** Cidofovir is a selective inhibitor of human cytomegalovirus (HCMV) DNA polymerase which inhibits viral DNA synthesis and thereby suppresses HCMV replication.

## ● INDICATIONS AND DOSE

**Cytomegalovirus retinitis in patients with AIDS (in combination with probenecid) (specialist use only)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg once weekly for 2 weeks, then maintenance 5 mg/kg every 2 weeks, maintenance treatment to be started 2 weeks after completion of induction treatment

- **CONTRA-INDICATIONS** Concomitant administration with potentially nephrotoxic drugs—discontinue potentially

nephrotoxic drugs at least 7 days before starting cidofovir - patients unable to receive probenecid

- **CAUTIONS** Diabetes mellitus (increased risk of ocular hypotony) · ensure concomitant use of probenecid and Sodium Chloride 0.9%

#### CAUTIONS, FURTHER INFORMATION

- ▶ Probenecid and Sodium Chloride 0.9% Manufacturer advises oral probenecid and intravenous Sodium Chloride 0.9% must be administered with each cidofovir dose to prevent nephrotoxicity (consult cidofovir product literature for information on probenecid dosing and recommendations on intravenous hydration); see *Prescribing and dispensing information* for details on obtaining probenecid.

- **INTERACTIONS** → Appendix 1: cidofovir

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · asthenia · chills · diarrhoea · dyspnoea · eye inflammation · fever · headache · nausea · neutropenia · ocular hypotony · proteinuria · rash · renal failure · vomiting
- ▶ **Uncommon** Fanconi syndrome acquired
- ▶ **Frequency not known** Hearing impairment · nephrotoxicity · pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises intravenous sodium chloride 0.9% prehydration and concomitant oral probenecid for prevention of nephrotoxicity; consider treatment interruption, or discontinuation if changes in renal function occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises ensure effective contraception during and after treatment in women; men should be advised to use barrier contraception during and for 3 months after treatment. Cidofovir may cause impaired fertility in males—reduced testes weight and hypospermia observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid (no information available).

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance is less than or equal to 55 mL/minute or if proteinuria is greater than or equal to 100 mg/dL. See p. 21.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor serum creatinine, urine protein levels, and white blood cell count before each cidofovir dose.
- ▶ Manufacturer advises regular eye examinations (increased risk of iritis, ocular hypotony, and uveitis).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, dilute with 100 mL Sodium Chloride 0.9% and mix thoroughly; give at a constant rate over 1 hour via an infusion pump.

- **PRESCRIBING AND DISPENSING INFORMATION** Probenecid is available from "special-order" manufacturers or specialist importing companies—in case of difficulties, the cidofovir manufacturer (Tillomed) advises contacting their local representative. See probenecid product literature for prescribing information for probenecid, including information on interactions.

#### ● HANDLING AND STORAGE

Caution in handling Manufacturer advises cidofovir should be considered a potential carcinogen and must be handled with caution (consult product literature); if contact with skin or mucous membranes occurs, wash thoroughly with water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Cidofovir (non-proprietary)** ▼

**Cidofovir 75 mg per 1 mL** Cidofovir 375mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] 

## Ganciclovir

15-Dec-2020

#### ● INDICATIONS AND DOSE

##### Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

##### Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

##### Treatment of cytomegalovirus disease [in immunocompromised patients]

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy

- **INTERACTIONS** → Appendix 1: ganciclovir

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

- ▶ **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment

- ▶ **Rare or very rare** Agranulocytosis · hallucination

- **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in patients hypersensitive to valganciclovir.

Caution in patients hypersensitive to aciclovir, valaciclovir, or famciclovir. 

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause

temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature. See p. 21.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.
- **HANDLING AND STORAGE**  
Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

ELECTROLYTES: May contain Sodium

##### ► Ganciclovir (Non-proprietary)

**Ganciclovir (as Ganciclovir sodium) 500 mg** Ganciclovir 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £115.00-£125.95 (Hospital only) | 5 vial [PoM] £125.95

##### ► Cymevene (Neon Healthcare Ltd)

**Ganciclovir (as Ganciclovir sodium) 500 mg** Cymevene 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £148.83 (Hospital only)

## Valganciclovir

06-Aug-2021

### ● INDICATIONS AND DOSE

#### Cytomegalovirus retinitis [induction and maintenance treatment in patients with AIDS]

##### ► BY MOUTH

► Adult: Initially 900 mg twice daily for 21 days, then maintenance 900 mg daily, induction regimen may be repeated if retinitis progresses

#### Prevention of cytomegalovirus disease [following solid organ transplantation from a cytomegalovirus positive donor]

##### ► BY MOUTH

► Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

#### DOSE EQUIVALENCE AND CONVERSION

► Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- **INTERACTIONS** → Appendix 1: Valganciclovir

### ● SIDE-EFFECTS

- **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hallucination · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment
- **ALLERGY AND CROSS-SENSITIVITY** [EvGr] Contra-indicated in patients hypersensitive to ganciclovir.  
Caution in patients hypersensitive to aciclovir, valaciclovir, or famciclovir. ⚠
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. *Ganciclovir* may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with *ganciclovir* in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—*ganciclovir* present in milk in *animal* studies.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Manufacturer advises reduce dose if creatinine clearance less than 60 mL/minute—consult product literature. See p. 21.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **PRESCRIBING AND DISPENSING INFORMATION**  
Valganciclovir is a pro-drug of ganciclovir.  
Flavours of oral liquid formulations may include tutti-frutti.
- **HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days.  
Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Oral solution

450mg tablets | 60 tablet [PoM] £1,081.46 DT = £1,027.40

## ANTIVIRALS > OTHER

### Foscarnet sodium

27-Apr-2021

#### ● INDICATIONS AND DOSE

##### Cytomegalovirus disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

##### Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.
- **CAUTIONS** Conditions where excess sodium should be avoided · ensure adequate hydration
- **INTERACTIONS** → Appendix 1: foscarnet
- **SIDE-EFFECTS**
- ▶ **Common or very common** Aggression · anaemia · anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · confusion · constipation · coordination abnormal · dehydration · depression · diarrhoea · dizziness · electrolyte imbalance · fever · gastrointestinal discomfort · genital discomfort (due to high concentrations excreted in urine) · genital ulceration (due to high concentrations excreted in urine) · haemorrhage · headache · hepatic function abnormal · hypertension · hypotension · leucopenia · malaise · muscle contractions involuntary · myalgia · nausea (reduce infusion rate) · neutropenia · numbness · oedema · palpitations · pancreatitis · paraesthesia (reduce infusion rate) · peripheral neuropathy · proteinuria · renal impairment · seizure · sepsis · skin reactions · thrombocytopenia · thrombophlebitis · tremor · urinary disorders · vomiting
- ▶ **Uncommon** Acidosis · angioedema · glomerulonephritis · nephropathy · pancytopenia
- ▶ **Frequency not known** Anaphylactoid reaction · diabetes insipidus · muscle weakness · myopathy · oesophageal ulcer · QT interval prolongation · renal pain · renal tubular acidosis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Manufacturer advises caution.  
**Dose adjustments** Manufacturer advises dose reduction (consult product literature).
- **MONITORING REQUIREMENTS**
- ▶ Monitor electrolytes, particularly calcium and magnesium.
- ▶ Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Foscavir*®), manufacturer advises give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution *via* central venous line only);

infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Foscavir** (Clinigen Healthcare Ltd)

Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle [PoM] £119.85 (Hospital only)

### Letermovir

31-Aug-2020

- **DRUG ACTION** Letermovir is a cytomegalovirus DNA terminase complex inhibitor that interferes with cytomegalovirus genome formation and virion maturation.

#### ● INDICATIONS AND DOSE

##### Prevention of cytomegalovirus reactivation and disease [in recipients of an allogeneic haematopoietic stem cell transplant who are seropositive for the human cytomegalovirus] (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 480 mg once daily for 100 days post-transplant, start within 28 days post-transplant, treatment beyond 100 days may be considered in some patients—consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 240 mg once daily with concurrent use of ciclosporin.

- **INTERACTIONS** → Appendix 1: letermovir
- **SIDE-EFFECTS**
- ▶ **Common or very common** Diarrhoea · nausea · vomiting
- ▶ **Uncommon** Abdominal pain · appetite decreased · fatigue · headache · muscle spasms · peripheral oedema · taste altered · vertigo
- **CONCEPTION AND CONTRACEPTION** The effect on human fertility is not known—impairment of fertility has been observed in *animal* studies.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate impairment in those with co-existing moderate or severe renal impairment, and in severe impairment (risk of increased exposure).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website
- **NICE decisions**
- ▶ Letermovir for preventing cytomegalovirus disease after a stem cell transplant (July 2019) NICE TA591 Recommended
- ▶ **Scottish Medicines Consortium (SMC) decisions**
- ▶ Letermovir (*Prevymis*®) for prophylaxis of cytomegalovirus (CMV) reactivation and disease in adult CMV-seropositive recipients [R+] of an allogeneic haematopoietic stem cell transplant (March 2019) SMC No. 1338/18 Recommended
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

Letermovir 240 mg Prevymis 240mg tablets | 28 tablet [PoM]  
£3,723.16 (Hospital only)

## 6.5 HIV infection

### HIV infection

15-Nov-2021

#### Overview

The human immunodeficiency virus (HIV) is a retrovirus that causes immunodeficiency by infecting and destroying cells of the immune system, particularly the CD4 cells. Acquired immune deficiency syndrome (AIDS) occurs when the number of CD4 cells fall to below 200 cells/microlitre; opportunistic infections and malignancies (AIDS-defining illnesses) can develop. The prognosis of HIV and AIDS has greatly improved due to more effective and better tolerated antiretroviral therapy (ART). The greatest risk to excess mortality and morbidity is delayed HIV diagnosis and treatment.

#### Aims of treatment

Treatment aims to achieve an undetectable viral load, to preserve immune function, to reduce the mortality and morbidity associated with chronic HIV infection, and to reduce onward transmission of HIV, whilst minimising drug toxicity. Treatment with a combination of ART aims to improve the physical and psychological well-being of infected people.

#### Initiation of treatment

**EVGr** All patients with suspected or diagnosed HIV should be reviewed promptly by a HIV specialist.

All patients diagnosed as being HIV positive should be offered immediate treatment, irrespective of CD4 cell counts. **⚡** Commitment to, and strict adherence to treatment over many years is required. Low adherence can be associated with drug resistance, progression to AIDS, and death. The treatment regimen should take into account dosing convenience, potential drug interactions, clinical symptoms, and comorbidities.

**EVGr** Treatment of HIV infection in *treatment-naïve* patients is initiated with a combination of two nucleoside reverse transcriptase inhibitors (NRTIs) as a backbone regimen plus *one* of the following as a third drug: an integrase inhibitor (INI), a non-nucleoside reverse transcriptase inhibitor (NNRTI), or a boosted protease inhibitor (PI).

The regimen of choice contains a backbone of emtricitabine p. 706 and either tenofovir disoproxil p. 709 or tenofovir alafenamide p. 679. An alternative backbone regimen is abacavir p. 702 and lamivudine p. 708. The third drug of choice is either atazanavir p. 711 or darunavir p. 712 both boosted with ritonavir p. 714, or dolutegravir p. 696, or elvitegravir p. 698 boosted with cobicistat p. 715, or raltegravir p. 698, or rilpivirine p. 701. Efavirenz p. 699 may be used as an alternative third drug.

Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases as part of fully suppressive combination ART. Regimens of choice are tenofovir disoproxil and emtricitabine, or tenofovir alafenamide p. 679 and emtricitabine. **⚡** For further information see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines).

#### Switching therapy

**EVGr** Deterioration of the condition (including clinical, virological, and CD4 cell count changes) may require a change in therapy. The choice of an alternative regimen should be guided by factors such as the response to previous treatment, tolerability, drug-drug interactions and the possibility of drug resistance. **⚡** For further information

see British HIV Association guidelines for the treatment of HIV-1-positive adults with antiretroviral therapy available at [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines).

#### HIV infection in pregnancy

**EVGr** Management of HIV infection in pregnancy should focus on the well-being of the women living with HIV, by ensuring that their ART regimen maximally suppresses viral replication as early as possible (if possible before conception) in order to minimise vertical transmission of HIV. Information on the teratogenic potential of most antiretroviral drugs is limited, however, all pregnant women living with HIV who conceive whilst on effective ART should continue this treatment throughout their pregnancy. All other women should start ART during their pregnancy. The recommended regimen is a NRTI backbone of either tenofovir disoproxil or abacavir with either emtricitabine or lamivudine; the third drug should be efavirenz or atazanavir boosted with ritonavir. All treatment options require careful assessment by a specialist. **⚡** For further information, including alternative ART options, see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines).

**EVGr** Pregnancies in women with HIV and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at [www.ucl.ac.uk/nshpc/](http://www.ucl.ac.uk/nshpc/) and to the Antiretroviral Pregnancy Registry at [www.apregistry.com](http://www.apregistry.com). **⚡**

#### HIV infection and breast-feeding

**EVGr** Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided. **⚡** For further information see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines).

#### HIV infection, pre-exposure prophylaxis

The risk of acquiring HIV is increased in:

- men or transgender individuals who have unprotected anal intercourse with men;
- sexual partners of people who are HIV-positive with a detectable viral load; and
- HIV-negative heterosexual individuals who have unprotected intercourse with a HIV-positive person, and are likely to repeat this with the same person or another person with a similar status.

**EVGr** Emtricitabine with tenofovir disoproxil p. 707 may be appropriate for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk. Tenofovir disoproxil alone is an alternative for HIV-negative heterosexual individuals when emtricitabine is contra-indicated. **⚡** For further information see British HIV Association and British Association for Sexual Health and HIV guidelines on the use of HIV pre-exposure prophylaxis (PrEP) available at: [www.bhiva.org/guidelines](http://www.bhiva.org/guidelines).

#### HIV infection, post-exposure prophylaxis

The Department of Health advises prompt prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases. National guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), [www.gov.uk/government/publications/eaga-guidance-on-hiv-post-exposure-prophylaxis](http://www.gov.uk/government/publications/eaga-guidance-on-hiv-post-exposure-prophylaxis) and local ones may also be available.

**EVGr** Prompt prophylaxis with antiretroviral drugs [unlicensed indication] may also be appropriate following potential sexual exposure to HIV where there is a significant risk of viral transmission. The recommended treatment for

post-exposure prophylaxis is emtricitabine with tenofovir disoproxil plus raltegravir for 28 days.  For further information see British Association for Sexual Health and HIV guidelines for the use of HIV post-exposure prophylaxis following sexual exposure available at [www.bashh.org](http://www.bashh.org).

### Drug treatment

Drugs that are licensed for the treatment of HIV/AIDS are listed below according to drug class.

**Nucleoside reverse transcriptase inhibitors** (NRTI or 'nucleoside analogue'): abacavir (ABC); emtricitabine (FTC), lamivudine (3TC); tenofovir alafenamide fumarate (TAF) p. 679, tenofovir disoproxil fumarate (TDF), and zidovudine (AZT) p. 710.

**Non-nucleoside reverse transcriptase inhibitors** (NNRTI): doravirine (DOR) p. 699, efavirenz (EFV), etravirine (ETR) p. 700, nevirapine (NVP) p. 700, and rilpivirine (RPV) p. 701.

**Protease inhibitors** (PI): atazanavir (ATZ), darunavir (DRV), fosamprenavir (FOS-APV) p. 713, lopinavir (LPV), ritonavir (RTV), saquinavir (SQV), and tipranavir (TPV) p. 715.

**CCR5 antagonists**: maraviroc (MVC) p. 715.

**Integrase inhibitors** (INI): bictegrovir (BIC), cabotegravir (CAB) p. 696, dolutegravir (DTG) p. 696, elvitegravir (EVG) p. 698, and raltegravir (RAL).

**Fusion inhibitors**: enfuvirtide (T-20) below.

**Attachment inhibitors**: fostemsavir below (FTR).

**Pharmacokinetic enhancers**: cobicistat (c) p. 715, and low-dose ritonavir (r). They boost the concentrations of other antiretrovirals metabolised by CYP3A4.

## ANTIVIRALS > HIV-ATTACHMENT INHIBITORS

### Fostemsavir

16-Nov-2021

- **DRUG ACTION** Fostemsavir is a prodrug of temsavir which inhibits the attachment of HIV to the host cell.

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs for resistant infection**

- ▶ BY MOUTH
- ▶ Adult: 600 mg twice daily

- **CAUTIONS** Risk factors for QT-interval prolongation
- **INTERACTIONS** → Appendix 1: fostemsavir
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Central nervous system immune reconstitution inflammatory response · diarrhoea · dizziness · drowsiness · fatigue · flatulence · gastrointestinal discomfort · headache · immune reconstitution inflammatory syndrome · insomnia · myalgia · nausea · skin reactions · taste altered · vomiting
- **PREGNANCY**  Avoid—limited information available. 
- **HEPATIC IMPAIRMENT**  Caution in patients with chronic hepatitis B or C (increased risk of severe hepatic side-effects)—monitor liver function. 
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of headache, dizziness, and somnolence.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Rukobia** (ViiV Healthcare UK Ltd) ▼  
Fostemsavir 600 mg Rukobia 600mg modified-release tablets | 60 tablet  £2,900.00

## ANTIVIRALS > HIV-FUSION INHIBITORS

### Enfuvirtide

04-Sep-2020

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 90 mg twice daily

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastrooesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection · influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased
- ▶ **Frequency not known** Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

#### SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity

Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); increased risk of hepatic side effects in patients with chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, manufacturer advises reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Fuzeon** (Roche Products Ltd)  
Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial  £1,081.57 (Hospital only)

## ANTIVIRALS &gt; HIV-INTEGRASE INHIBITORS

## Cabotegravir

04-Feb-2022

- **DRUG ACTION** Cabotegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**● **HIV-1 infection [oral lead-in therapy, in combination with rilpivirine] (specialist use only)**

## ▶ BY MOUTH

- ▶ Adult: 30 mg once daily for approximately 1 month (at least 28 days) then, if tolerated, switch to intramuscular treatment with cabotegravir and rilpivirine at month 2, for oral dose recommendations if cabotegravir injection and rilpivirine injection are missed—consult product literature

● **HIV-1 infection [in combination with rilpivirine prolonged-release injection] (specialist use only)**

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 600 mg for 1 dose at month 2, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 400 mg every month from month 3 onwards, maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to 2-monthly maintenance injections, or if injections are missed—consult product literature, alternatively initially 600 mg for 2 doses at months 2 and 3, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 600 mg every 2 months from month 5 onwards, the injection at month 3 and maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to monthly maintenance injections, or if injections are missed—consult product literature

- **CAUTIONS** Co-infection with hepatitis B or C · risk factors for virological failure

● **CAUTIONS, FURTHER INFORMATION**

- ▶ Risk factors for virological failure [\[EvGr\]](#) Use with caution in patients with HIV-1 subtype A6/A1 or BMI of 30 kg/m<sup>2</sup> or more, if treatment history uncertain and pre-treatment resistance analyses absent. [⚠](#)

- **INTERACTIONS** → Appendix 1: cabotegravir

● **SIDE-EFFECTS**● **GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · asthenia · depression · diarrhoea · dizziness · feeling hot · fever · flatulence · gastrointestinal discomfort · headache · malaise · myalgia · nausea · skin reactions · sleep disorders · vomiting · weight increased
- ▶ **Uncommon** Drowsiness · hepatotoxicity

● **SPECIFIC SIDE-EFFECTS**

- ▶ With intramuscular use Pancreatitis

● **PREGNANCY**

- ▶ With oral use [\[EvGr\]](#) Avoid unless potential benefit outweighs risk—no information available. [⚠](#)
- ▶ With intramuscular use [\[EvGr\]](#) Avoid unless potential benefit outweighs risk—may remain in systemic circulation for up to 12 months or longer after last prolonged-release injection. [⚠](#)

● **BREAST FEEDING**

- ▶ With oral use [\[EvGr\]](#) Avoid—present in milk in *animal* studies. [⚠](#)

- ▶ With intramuscular use [\[EvGr\]](#) Avoid—may be present in milk for up to 12 months or longer after last prolonged-release injection. [⚠](#)

- **HEPATIC IMPAIRMENT** [\[EvGr\]](#) Caution in severe impairment (no information available). [⚠](#)

- **MONITORING REQUIREMENTS** [\[EvGr\]](#) Monitor liver function—discontinue treatment if hepatotoxicity develops. [⚠](#)

● **TREATMENT CESSATION**

- ▶ With intramuscular use [\[EvGr\]](#) May remain in circulation for up to 12 months or longer; start an alternative regimen no later than 1 month after monthly regimen or 2 months after 2-monthly regimen. [⚠](#)

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer cabotegravir tablets.

- **Missed doses** If an oral dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 4 hours of taking an oral dose, a replacement dose should be taken.

- **Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness and somnolence.

● **NATIONAL FUNDING/ACCESS DECISIONS**

- For full details see funding body website

● **NICE decisions**

- ▶ Cabotegravir with rilpivirine for treating HIV-1 (January 2022) NICE TA757 Recommended

● **Scottish Medicines Consortium (SMC) decisions**

- ▶ Cabotegravir (*Vocabria*<sup>®</sup>) prolonged-release injection in combination with rilpivirine prolonged-release injection, for the treatment of HIV-1 infection in adults who are virologically suppressed (plasma HIV-1 RNA concentration less than 50 copies/mL) on a stable antiretroviral regimen without present or past evidence of viral resistance to, and no prior virological failure with agents of the NNRTI and INI class (October 2021) SMC No. SMC2376 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● **Prolonged-release suspension for injection**

- EXCIPIENTS: May contain Polysorbates

- ▶ **Vocabria** (ViiV Healthcare UK Ltd) ▼

## Dolutegravir

12-Nov-2021

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**● **HIV infection without resistance to other inhibitors of HIV integrase [in combination with other antiretroviral drugs] (specialist use only)**

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 50 mg once daily
- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Adult: 30 mg once daily

● **HIV infection in patients with resistance to other inhibitors of HIV integrase [in combination with other antiretroviral drugs] (specialist use only)**

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 50 mg twice daily, dose to be taken with food

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
  - ▶ Adult: 30 mg twice daily, dose to be taken with food
- HIV infection [in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)] (specialist use only)**

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected
- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Adult: 30 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ *Tivicay*<sup>®</sup> film-coated tablets and *Tivicay*<sup>®</sup> dispersible tablets are **not** bioequivalent. Follow correct dosing recommendations for the dosage form when switching formulations.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DOLUTEGRAVIR (*TIVICAY*<sup>®</sup>, *TRIUQUEQ*<sup>®</sup>, *JULUCA*<sup>®</sup>): UPDATED ADVICE ON INCREASED RISK OF NEURAL TUBE DEFECTS (OCTOBER 2020)

The MHRA has updated its safety recommendations based on an ongoing European review evaluating cases of neural tube defects in babies born to mothers who became pregnant during dolutegravir treatment that found a smaller increased risk than previously thought, almost comparable to other HIV drugs.

Healthcare professionals are advised to counsel women of childbearing potential on the possible risk of neural tube defects with dolutegravir, including consideration of effective contraceptive measures. The benefits and risks of continuing treatment in women who are trying to become pregnant should be discussed with the patient. If pregnancy is confirmed in the first trimester during treatment, the benefits and risks of continuing dolutegravir versus switching to another antiretroviral regimen should also be discussed, considering the gestational age and the critical time period of neural tube defect development.

- **INTERACTIONS** → Appendix 1: dolutegravir
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Arthralgia · hepatic disorders · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal behaviours

#### SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity

Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** [Evg](#) Specialist sources indicate dolutegravir may be considered from 6 weeks' gestation if expected benefit outweighs risk—see *Important Safety Information*. Higher dose folic acid is recommended due to increased risk of neural tube defects—see *Prevention of neural tube defects (in those in the high-risk group who wish to become*

*pregnant or who are at risk of becoming pregnant)* in folic acid p. 1112. [A](#)

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** [Evg](#) *Tivicay*<sup>®</sup> dispersible tablets may be dispersed in water and given within 30 minutes, or swallowed whole one at a time. Do not chew, cut, or crush. [M](#)
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir film-coated tablets and dispersible tablets.  
**Missed doses** If a dose is more than 20 hours late on the once-daily regimen (or more than 8 hours late on the twice-daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.  
**Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**  
▶ Dolutegravir (*Tivicay*<sup>®</sup>) for use in combination with other antiretroviral medicinal products for the treatment of Human Immunodeficiency Virus (HIV) infected adults (May 2014) SMC No. 961/14 Recommended  
**All Wales Medicines Strategy Group (AWMSG) decisions**  
▶ Dolutegravir (*Tivicay*<sup>®</sup>) for the treatment of Human Immunodeficiency Virus (HIV) infected adults in combination with other anti-retroviral medicinal products (October 2017) AWMSG No. 3373 Recommended  
▶ Dolutegravir 5 mg dispersible tablets (*Tivicay*<sup>®</sup>) in combination with other anti-retroviral medicinal products for the treatment of Human Immunodeficiency Virus (HIV) infected adults, adolescents and children of at least 4 weeks of age or older and weighing at least 3 kg (September 2021) AWMSG No. 4611 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Dispersible tablet

- ▶ *Tivicay* (ViiV Healthcare UK Ltd)

Dolutegravir (as Dolutegravir sodium) 50 mg *Tivicay* 50mg tablets | 30 tablet [PoM](#) | £498.75 DT = £498.75 (Hospital only)

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 703 · *Lamivudine with dolutegravir*, p. 708

## Dolutegravir with rilpivirine

19-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, dolutegravir p. 696, rilpivirine p. 701.

#### ● INDICATIONS AND DOSE

##### HIV-1 infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 50/25 mg once daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg dolutegravir/rilpivirine.

- **INTERACTIONS** → Appendix 1: dolutegravir · NNRTIs

### ● PATIENT AND CARER ADVICE

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ **Dolutegravir / rilpivirine film-coated tablet (*Juluca*®)** for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults who are virologically suppressed (HIV-1 RNA <50 copies/mL) on a stable antiretroviral regimen for at least six months with no history of virological failure and no known or suspected resistance to any non-nucleoside reverse transcriptase inhibitor (NNRTI) or integrase strand transfer inhibitor (INSTI) (September 2018) SMC No. 5MC2091 Recommended

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ **Dolutegravir / rilpivirine (*Juluca*®)** for treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults who are virologically suppressed (HIV-1 RNA <50 copies/mL) on stable antiretroviral regimen for at least six months with no history of virological failure and no known or suspected resistance to any non-nucleoside reverse transcriptase inhibitor or integrase inhibitor (December 2018) AWMSG No. 2850 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Dolutegravir (as Dolutegravir sodium) 50 mg Juluca 50mg/25mg tablets | 30 tablet [PoM](#) £699.02 (Hospital only)

## Elvitegravir

17-May-2019

- **DRUG ACTION** Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

### ● INDICATIONS AND DOSE

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir**

#### ▶ BY MOUTH

- ▶ Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir**

#### ▶ BY MOUTH

- ▶ Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

- **CAUTIONS** Elderly—limited information available

- **INTERACTIONS** → Appendix 1: elvitegravir

### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · fatigue · headache · nausea · rash · vomiting
- ▶ **Uncommon** Depression · dizziness · drowsiness · flatulence · gastrointestinal discomfort · insomnia · paraesthesia · suicidal ideation (in patients with history of depression or psychiatric illness) · taste altered
- ▶ **Frequency not known** Hyperglycaemia · osteonecrosis · weight increased

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

- **PREGNANCY** Manufacturer advises avoid unless essential—limited data available.

### ● PATIENT AND CARER ADVICE

**Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

- **MEDICINAL FORMS** No licensed medicines listed.

Combinations available: *Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide*, p. 704 · *Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil*, p. 705

## Raltegravir

10-Nov-2020

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

### ● INDICATIONS AND DOSE

**HIV-1 infection (initiated by a specialist)**

#### ▶ BY MOUTH USING TABLETS

- ▶ Adult: 400 mg twice daily, alternatively 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

- **CONTRA-INDICATIONS** Pre-term neonates—no information available

- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

- **INTERACTIONS** → Appendix 1: raltegravir

### ● SIDE-EFFECTS

- ▶ **Common or very common** Akathisia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
  - ▶ **Uncommon** Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis · gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy · nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal behaviours · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased
  - ▶ **Frequency not known** Osteonecrosis
- SIDE-EFFECTS, FURTHER INFORMATION** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available), and in patients with chronic hepatitis B or C (consider interrupting or discontinuing treatment if impairment worsens; increased risk of hepatic side-effects).
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**
  - ▶ Raltegravir (*Isentress*<sup>®</sup>) for the treatment of HIV in adults (May 2010) SMC No. 613/10 Recommended with restrictions
  - ▶ Raltegravir 600 mg film-coated tablets (*Isentress*<sup>®</sup>) in combination with other anti-retroviral medicinal products for the treatment of human immunodeficiency virus (HIV-1) infection in adults and paediatric patients weighing at least 40 kg (November 2017) SMC No. 1280/17 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Isentress** (Merck Sharp & Dohme (UK) Ltd)

Raltegravir 400 mg Isentress 400mg tablets | 60 tablet **[PoM]**

£471.41 DT = £471.41 (Hospital only)

**ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS****Doravirine**

30-Mar-2021

● **INDICATIONS AND DOSE**

**HIV-1 infection in combination with other antiretroviral drugs (initiated by a specialist)**

- ▶ BY MOUTH

- ▶ Adult: 100 mg once daily

● **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil, or telotristat ethyl is unavoidable, increase dose to 100 mg twice daily. Manufacturer advises 100 mg twice daily with rifabutin.

- **INTERACTIONS** → Appendix 1: NNRTIs

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatocellular injury · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Anxiety · arthralgia · concentration impaired · confusion · constipation · depression · electrolyte imbalance · hypertension · malaise · memory loss · mood altered · muscle tone increased · myalgia · paraesthesia · suicidal ideation
- ▶ **Rare or very rare** Acute kidney injury · adjustment disorder · aggression · chest pain · chills · dyspnoea · hallucination · pain · rash pustular · renal disorder · thirst · tonsillar hypertrophy · urolithiasis

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● **PATIENT AND CARER ADVICE**

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, and somnolence.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Doravirine (*Pifeltro*<sup>®</sup>) in combination with other antiretroviral medicinal products, for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without past or present evidence of resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class (March 2021) SMC No. SMC2332 Recommended

**All Wales Medicines Strategy Group (AWMSG) decisions**

- ▶ Doravirine (*Pifeltro*<sup>®</sup>) in combination with other antiretroviral medicinal products, for the treatment of adults infected with HIV-1 without past or present evidence of resistance to the NNRTI class (September 2020) AWMSG No. 3109 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 25, 3

Doravirine 100 mg Pifeltro 100mg tablets | 30 tablet **[PoM]** £471.41 (Hospital only)

**Combinations available:** *Lamivudine with tenofovir disoproxil and doravirine*, p. 709

**Efavirenz**

27-Apr-2021

● **INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- ▶ BY MOUTH USING CAPSULES

- ▶ Adult: 600 mg once daily

- ▶ BY MOUTH USING TABLETS

- ▶ Adult: 600 mg once daily

- **CAUTIONS** Acute porphyrias p. 1150 · elderly · history of psychiatric disorders · history of seizures · risk of QT interval prolongation

- **INTERACTIONS** → Appendix 1: NNRTIs

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Behaviour abnormal · confusion · flushing · gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal behaviours · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
- ▶ **Rare or very rare** Delusions · photosensitivity reaction
- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION** **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

**CNS effects** Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

**Abnormal hepatic function** Manufacturer advises interrupt or discontinue treatment if transaminases more than 5 times the upper limit of normal.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Manufacturer advises avoid in severe impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food—consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.
- **PATIENT AND CARER ADVICE**  
Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 23

#### ► Efavirenz (Non-proprietary)

Efavirenz 600 mg Efavirenz 600mg tablets | 30 tablet [PoM](#)  
£23.97-£452.94 (Hospital only)

Combinations available: *Efavirenz with emtricitabine and tenofovir disoproxil*, p. 704

females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**  
Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.  
Vomiting If vomiting occurs 4 hours after taking tablets, no additional dose should be taken and the next dose should be taken at the usual time.  
Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

## Etravirine

15-Oct-2021

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs (including a boosted protease inhibitor) in patients previously treated with antiretrovirals (initiated by a specialist)**

- BY MOUTH
- Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150
  - **CAUTIONS** Elderly
  - **INTERACTIONS** → Appendix 1: NNRTIs
  - **SIDE-EFFECTS**
    - **Common or very common** Anaemia · anxiety · appetite decreased · asthenia · constipation · diabetes mellitus · diarrhoea · drowsiness · dry mouth · dyslipidaemia · dyspnoea exertional · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperglycaemia · hypersensitivity · hypertension · memory loss · myocardial infarction · nausea · peripheral neuropathy · renal failure · sensation abnormal · skin reactions · sleep disorders · stomatitis · sweat changes · thrombocytopenia · vision blurred · vomiting
    - **Uncommon** Angina pectoris · angioedema · atrial fibrillation · bronchospasm · concentration impaired · confusion · gynaecomastia · haematemesis · hepatic disorders · immune reconstitution inflammatory syndrome · pancreatitis · seizure · syncope · tremor · vertigo
    - **Rare or very rare** Haemorrhagic stroke · severe cutaneous adverse reactions (SCARs) · Stevens-Johnson syndrome (especially in children and adolescents)
    - **Frequency not known** Osteonecrosis
- SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in

## Nevirapine

27-Apr-2021

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs (initial dose)**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

**HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 200 mg twice daily
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 400 mg once daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · post-exposure prophylaxis
- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm<sup>3</sup> or in men with CD4 cell count greater than 400 cells/mm<sup>3</sup> unless potential benefit outweighs risk.
- **INTERACTIONS** → Appendix 1: NNRTIs
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
  - ▶ **Uncommon** Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
  - ▶ **Frequency not known** Eosinophilia · osteonecrosis · weight increased
- SIDE-EFFECTS, FURTHER INFORMATION** **Hepatic effects** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.
 

**Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.
- **HEPATIC IMPAIRMENT** For *modified-release* preparations, manufacturer advises avoid (no information available). For *immediate-release* preparations, manufacturer advises caution in moderate impairment and chronic hepatitis (increased risk of hepatic side effects; consider interrupting or discontinuing treatment if hepatic function worsens); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid *modified-release* preparation—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
  - ▶ Rash Monitor closely for skin reactions during first 18 weeks.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.
 

**Missed doses** If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed

dose should not be taken and the next dose should be taken at the usual time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

**Oral suspension**

  - ▶ **Viramune** (Boehringer Ingelheim Ltd)  
**Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml** Viramune 50mg/5ml oral suspension | 240 ml [PoM] £50.40 (Hospital only)

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

  - ▶ **Nevirapine (Non-proprietary)**  
**Nevirapine 400 mg** Nevirapine 400mg modified-release tablets | 30 tablet [PoM] £52.13-£170.00 DT = £80.19 (Hospital only)

**Tablet**

  - ▶ **Nevirapine (Non-proprietary)**

## Rilpivirine

04-Feb-2022

### ● INDICATIONS AND DOSE

#### ● HIV-1 infection [in combination with other antiretroviral drugs] (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily, dose to be taken with food

#### ● HIV-1 infection [oral lead-in therapy, in combination with cabotegravir] (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily for approximately 1 month (at least 28 days) with food then, if tolerated, switch to intramuscular treatment with cabotegravir and rilpivirine at month 2, for oral dose recommendations if cabotegravir injection and rilpivirine injection are missed—consult product literature

#### ● HIV-1 infection [in combination with cabotegravir prolonged-release injection] (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 900 mg for 1 dose at month 2, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 600 mg every month from month 3 onwards, maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to 2-monthly maintenance injections, or if injections are missed—consult product literature, alternatively initially 900 mg for 2 doses at months 2 and 3, to be started on the last day of oral lead-in therapy with cabotegravir and rilpivirine, then maintenance 900 mg every 2 months from month 5 onwards, the injection at month 3 and maintenance injections may be administered up to 7 days before or after the scheduled dose. Cabotegravir and rilpivirine injections to be administered into separate gluteal muscle sites, for dose recommendations if switching to monthly maintenance injections, or if injections are missed—consult product literature

- **CAUTIONS** Acute porphyrias p. 1150 · co-infection with hepatitis B or C · risk factors for virological failure
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Risk factors for virological failure [EVR](#) Use with caution in patients with HIV-1 subtype A6/A1 or BMI of 30 kg/m<sup>2</sup> or more, if treatment history uncertain and pre-treatment resistance analyses absent. 

- **INTERACTIONS** → Appendix 1: NNRTIs

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression · dizziness · drowsiness · gastrointestinal discomfort · headache · nausea · sleep disorders · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ With intramuscular use Anxiety · asthenia · diarrhoea · feeling hot · fever · flatulence · malaise · myalgia · skin reactions · weight increased
  - ▶ With oral use Appetite decreased · dry mouth · fatigue · rash
- ▶ **Uncommon**
  - ▶ With intramuscular use Hepatotoxicity
  - ▶ With oral use Immune reconstitution inflammatory syndrome
- ▶ **Frequency not known**
  - ▶ With intramuscular use Pancreatitis

### ● PREGNANCY

- ▶ With oral use [EvGr](#) Use only if potential benefit outweighs risk—no toxicity observed in *animal* studies. If used, monitoring of viral load is recommended. [M](#)
- ▶ With intramuscular use [EvGr](#) Avoid unless potential benefit outweighs risk—no information available. May remain in systemic circulation for up to 4 years after last prolonged-release injection. If used, monitoring of viral load is recommended. [M](#)

### ● BREAST FEEDING

- ▶ With oral use [EvGr](#) Avoid—present in milk in *animal* studies. [M](#)
- ▶ With intramuscular use [EvGr](#) Avoid—may be present in milk for up to 4 years after last prolonged-release injection. [M](#)

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **MONITORING REQUIREMENTS** [EvGr](#) Monitor liver function in patients with hepatitis C—limited information available. [M](#)

### ● TREATMENT CESSATION

- ▶ With intramuscular use [EvGr](#) May remain in circulation for up to 4 years; start an alternative regimen no later than 1 month after monthly regimen or 2 months after 2-monthly regimen. [M](#)

- **HANDLING AND STORAGE** Store rilpivirine prolonged-release injection (*Rekambys*<sup>®</sup>) in a refrigerator (2°C to 8°C)—may be stored unopened at room temperature (below 25°C) for up to 6 hours before use.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer rilpivirine tablets.

**Missed doses** If an oral dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 4 hours of taking an oral dose, a replacement dose should be taken.

**Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness and somnolence.

### ● NATIONAL FUNDING/ACCESS DECISIONS

## ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

### Nucleoside reverse transcriptase inhibitors

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia (may require transfusion) · asthenia · diarrhoea · dizziness · fever · flatulence · headache · insomnia · nausea · neutropenia · skin reactions · vomiting

- ▶ **Uncommon** Angioedema · pancreatitis

- ▶ **Rare or very rare** Lactic acidosis

- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis · weight increased

**SIDE-EFFECTS, FURTHER INFORMATION** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

#### ● PREGNANCY

**Monitoring** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

[F](#) above

## Abacavir

28-Apr-2021

#### ● INDICATIONS AND DOSE

##### HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease

- **INTERACTIONS** → Appendix 1: NRTIs

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · lethargy

- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

- ▶ **Frequency not known** Hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** Life-threatening hypersensitivity reactions have been reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat,

acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

- **ALLERGY AND CROSS-SENSITIVITY** [EvGr](#) Caution—increased risk of hypersensitivity reaction in presence of HLA-B\*5701 allele. [M](#)
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; consider avoiding in moderate to severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **PRE-TREATMENT SCREENING** Test for HLA-B\*5701 allele before treatment or if restarting treatment and HLA-B\*5701 status not known.
- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.
- **PATIENT AND CARER ADVICE** Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment. Patients should be provided with an alert card and advised to keep it with them at all times.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

EXCIPIENTS: May contain Propylene glycol

- ▶ **Ziagen** (ViiV Healthcare UK Ltd)

**Abacavir (as Abacavir sulfate) 20 mg per 1 ml** Ziagen 20mg/ml oral solution sugar-free | 240 ml [PoM](#) £55.72 (Hospital only)

#### Tablet

- ▶ **Abacavir (Non-proprietary)**

**Abacavir (as Abacavir sulfate) 300 mg** Abacavir 300mg tablets | 60 tablet [PoM](#) £177.60-£177.61 (Hospital only)

- ▶ **Ziagen** (ViiV Healthcare UK Ltd)

**Abacavir (as Abacavir sulfate) 300 mg** Ziagen 300mg tablets | 60 tablet [PoM](#) £208.95 (Hospital only)

## Abacavir with dolutegravir and lamivudine

28-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 702, lamivudine p. 708, dolutegravir p. 696.

### ● INDICATIONS AND DOSE

#### HIV infection

- ▶ BY MOUTH
- ▶ Adult (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: dolutegravir · NRTIs
- **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 50 mL/minute (consult product literature). [M](#) See p. 21.
- **PATIENT AND CARER ADVICE**  
**Missed doses** If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Triumeq** (ViiV Healthcare UK Ltd)

**Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg** Triumeq 50mg/600mg/300mg tablets | 30 tablet [PoM](#) £798.16 (Hospital only)

## Abacavir with lamivudine

28-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 702, lamivudine p. 708.

### ● INDICATIONS AND DOSE

#### HIV infection in combination with other antiretrovirals

- ▶ BY MOUTH
- ▶ Adult (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: NRTIs
- **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 50 mL/minute (consult product literature). [M](#) See p. 21.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

**Lamivudine 300 mg, Abacavir 600 mg** Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet [PoM](#) £352.25 DT = £190.00 (Hospital only)

- ▶ **Kivexa** (ViiV Healthcare UK Ltd)

**Lamivudine 300 mg, Abacavir 600 mg** Kivexa 600mg/300mg tablets | 30 tablet [PoM](#) £352.25 DT = £190.00 (Hospital only)

## Abacavir with lamivudine and zidovudine

28-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 702, lamivudine p. 708, zidovudine p. 710.

### ● INDICATIONS AND DOSE

#### HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: NRTIs
- **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 50 mL/minute (consult product literature). [M](#) See p. 21.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Trizivir** (ViiV Healthcare UK Ltd)

**Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg** Trizivir tablets | 60 tablet [PoM](#) £509.06 (Hospital only)

## Bictegravir with emtricitabine and tenofovir alafenamide

20-Oct-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 706, tenofovir alafenamide p. 679.

### ● INDICATIONS AND DOSE

#### HIV-1 infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

● **INTERACTIONS** → Appendix 1: bictegravir · NRTIs · tenofovir alafenamide

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Depression · diarrhoea · dizziness · fatigue · headache · nausea · sleep disorders
- ▶ **Uncommon** Anaemia · angioedema · anxiety · arthralgia · flatulence · gastrointestinal discomfort · hyperbilirubinaemia · skin reactions · vomiting

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance is less than 30 mL/minute—limited information available. See p. 21.

#### ● PATIENT AND CARER ADVICE

**Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Bictegravir-emtricitabine-tenofovir alafenamide (*Biktarvy*<sup>®</sup>) for the treatment of adults infected with HIV-1 without any known mutations associated with resistance to the individual components (September 2018) SMC No. SMC2093 Recommended

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Bictegravir/emtricitabine/tenofovir alafenamide (*Biktarvy*<sup>®</sup>) for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without present or past evidence of viral resistance to the integrase inhibitor class, emtricitabine or tenofovir (December 2018) AWMSG No. 3414 Recommended with restrictions

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Efavirenz with emtricitabine and tenofovir disoproxil

25-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 709, efavirenz p. 699, emtricitabine p. 706.

### ● INDICATIONS AND DOSE

#### HIV infection stabilised on antiretroviral therapy for more than 3 months

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

● **INTERACTIONS** → Appendix 1: NNRTIs · NRTIs · tenofovir disoproxil

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (increased risk of hepatic side-effects).

● **RENAL IMPAIRMENT** EvGr Avoid if creatinine clearance less than 50 mL/minute. M See p. 21.

#### ● PATIENT AND CARER ADVICE

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

- ▶ Efavirenz with emtricitabine and tenofovir disoproxil (Non-proprietary)

Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg *Atripla* 600mg / Emtricitabine 200mg / Tenofovir disoproxil 245mg tablets | 30 tablet PoM £479.58-£532.87 (Hospital only)

- ▶ *Atripla* (Gilead Sciences Ltd)

Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg *Atripla* 600mg/200mg/245mg tablets | 30 tablet PoM £532.87 (Hospital only)

## Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

22-Oct-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 706, elvitegravir p. 698, cobicistat p. 715, tenofovir alafenamide p. 679.

### ● INDICATIONS AND DOSE

#### HIV-1 infection (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

### ● IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)**

Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in *Genvoya*<sup>®</sup> and *Stribild*<sup>®</sup>) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

● **INTERACTIONS** → Appendix 1: cobicistat · elvitegravir · NRTIs · tenofovir alafenamide

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · depression · suicidal behaviours
- ▶ **Frequency not known** Nephrotoxicity · osteonecrosis · weight increased

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.

● **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women

who become pregnant during therapy should be switched to an alternative regimen.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available. See p. 21.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.
- **PATIENT AND CARER ADVICE**  
**Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
 For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**  
 ▶ Elvitegravir, cobicistat, emtricitabine, tenofovir alafenamide (*Genvoya*<sup>®</sup>) for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1) without any known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir (May 2016) SMC No. 1142/16 Recommended  
**All Wales Medicines Strategy Group (AWMSG) decisions**  
 ▶ Elvitegravir / cobicistat / emtricitabine / tenofovir alafenamide (*Genvoya*<sup>®</sup>) for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1) without any known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir (July 2016) AWMSG No. 2248 Recommended
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

26-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 709, emtricitabine p. 706, cobicistat p. 715, elvitegravir p. 698.

### • INDICATIONS AND DOSE

#### HIV infection

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)

Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in *Genvoya*<sup>®</sup> and *Stribild*<sup>®</sup>) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure

and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · elvitegravir · NRTIs · tenofovir disoproxil
- **SIDE-EFFECTS**  
 ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · electrolyte imbalance · flatulence · gastrointestinal discomfort · headache · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hypertriglyceridaemia · nausea · neutropenia · pain · rash pustular · skin reactions · sleep disorders · vomiting  
 ▶ **Uncommon** Anaemia · angioedema · depression (in patients with history of depression or psychiatric illness) · muscle weakness · myopathy · pancreatitis · proteinuria · renal failure · renal tubular disorders · suicidal ideation (in patients with history of depression or psychiatric illness)  
 ▶ **Rare or very rare** Acute tubular necrosis · hepatic disorders · lactic acidosis · nephritis · nephrogenic diabetes insipidus · osteomalacia  
 ▶ **Frequency not known** Autoimmune disorder · Grave's disease · inflammation · osteonecrosis · weight increased
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** **[EvGr]** If creatinine clearance less than 90 mL/minute, only *initiate Stribild*<sup>®</sup> if other treatments cannot be used (avoid *initiating Stribild*<sup>®</sup> if creatinine clearance less than 70 mL/minute). If creatinine clearance less than 70 mL/minute, only *continue Stribild*<sup>®</sup> if potential benefit outweighs risk (discontinue *Stribild*<sup>®</sup> if creatinine clearance less than 50 mL/minute). **[EvGr]** See p. 21.
- **MONITORING REQUIREMENTS** Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer *Stribild*<sup>®</sup>.  
**Missed doses** If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ *Stribild* (Gilead Sciences Ltd)

Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg *Stribild* 150mg/150mg/200mg/245mg tablets | 30 tablet **[PoM]** £879.51 (Hospital only)

## Emtricitabine (FTC)

F 702  
26-Jul-2021

### ● INDICATIONS AND DOSE

#### HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH USING CAPSULES
- ▶ Adult: 200 mg once daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Adult: 240 mg once daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 240 mg oral solution  $\equiv$  200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · dyspepsia · hyperbilirubinaemia · hyperglycaemia · hypersensitivity · hypertriglyceridaemia · pain · rash pustular

### ● HEPATIC IMPAIRMENT

- ▶ **Monitoring** On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

### ● RENAL IMPAIRMENT

- ▶ **Dose adjustments** See p. 21.

Manufacturer advises reduce dose or increase dosage interval if creatinine clearance less than 30 mL/minute (consult product literature).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include candy.

### ● PATIENT AND CARER ADVICE

- ▶ **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

ELECTROLYTES: May contain Sodium

- ▶ **Emtriva** (Gilead Sciences Ltd)

Emtricitabine 10 mg per 1 mL Emtriva 10mg/ml oral solution sugar-free | 170 mL [PoM] £39.53 (Hospital only)

#### Capsule

- ▶ **Emtriva** (Gilead Sciences Ltd)

Emtricitabine 200 mg Emtriva 200mg capsules | 30 capsule [PoM] £138.98 (Hospital only)

Combinations available: *Darunavir with cobicistat, emtricitabine and tenofovir alafenamide*, p. 713

## Emtricitabine with rilpivirine and tenofovir alafenamide

21-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 701, tenofovir alafenamide p. 679.

### ● INDICATIONS AND DOSE

#### HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

- **INTERACTIONS** → Appendix 1: NNRTIs · NRTIs · tenofovir alafenamide

### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · depression · diarrhoea · dizziness · drowsiness · dry mouth · fatigue ·

- flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Anaemia · angioedema · arthralgia · immune reconstitution inflammatory syndrome
- ▶ **Frequency not known** Conjunctivitis · drug reaction with eosinophilia and systemic symptoms (DRESS) · eosinophilia · fever · osteonecrosis · QT interval prolongation · weight increased

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available. See p. 21.
- **PATIENT AND CARER ADVICE** Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ **Emtricitabine/rilpivirine/tenofovir alafenamide (Odefsey®)** for the treatment of HIV-1 without known mutations associated with resistance to the non nucleoside reverse transcriptase inhibitor class, tenofovir or emtricitabine, and with a viral load HIV-1 RNA of 100,000 copies/mL or less (October 2016) SMC No. 1189/16 Recommended

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ **Emtricitabine/rilpivirine/tenofovir alafenamide (Odefsey®)** for the treatment of HIV-1 without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor class, tenofovir or emtricitabine, and with a viral load HIV-1 RNA of 100,000 copies/mL or less (November 2016) AWMSG No. 3031 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 21

### ● INDICATIONS AND DOSE

#### HIV-1 infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil or telotristat ethyl is unavoidable, increase doravirine dose to 100 mg twice daily. Manufacturer advises increasing doravirine dose to 100 mg twice daily with rifabutin. The extra doravirine 100 mg dose should be taken approximately 12 hours after the dose of *Delstrigo*<sup>®</sup>.

- **INTERACTIONS** → Appendix 1: NNRTIs · NRTIs · tenofovir disoproxil
- **PREGNANCY** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 50 mL/minute. See p. 21.

### ● PATIENT AND CARER ADVICE

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, and somnolence.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Doravirine / lamivudine / tenofovir disoproxil fumarate (*Delstrigo*<sup>®</sup>) for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without past or present evidence of resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, lamivudine, or tenofovir (March 2021) SMC No. SMC2333 Recommended

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Doravirine / lamivudine / tenofovir disoproxil fumarate (*Delstrigo*<sup>®</sup>) for the treatment of adults infected with HIV-1 without past or present evidence of resistance to the NNRTI class, lamivudine, or tenofovir (September 2020) AWMSG No. 3648 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## Tenofovir disoproxil

23-Aug-2021

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease**

- ▶ BY MOUTH
- ▶ Adult: 245 mg once daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension
- ▶ **Uncommon** Proximal renal tubulopathy
- ▶ **Rare or very rare** Acute tubular necrosis · hepatic disorders · nephritis · nephrogenic diabetes insipidus · renal impairment

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (limited information available).

### ● RENAL IMPAIRMENT

**Dose adjustments** [EvGr] *Granules*: 132 mg once daily if creatinine clearance 30–50 mL/minute; 66 mg once daily if creatinine clearance 20–30 mL/minute; 33 mg once daily if creatinine clearance 10–20 mL/minute (limited information available; consult product literature).

*Tablets*: 245 mg every 2 days if creatinine clearance 30–50 mL/minute; 245 mg every 3–4 days if creatinine clearance 10–30 mL/minute (limited information available; consult product literature). ⚠

See p. 21.

### ● MONITORING REQUIREMENTS

- ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

● **DIRECTIONS FOR ADMINISTRATION** *Granules*: Manufacturer advises mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules. **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ **Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009)** NICE TA173 Recommended

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Zidovudine

02-Sep-2021

### (Azidothymidine; AZT)

#### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- ▶ BY MOUTH
- ▶ Adult: 250–300 mg twice daily

#### Prevention of maternal-fetal HIV transmission

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

**HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

● **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature)

● **CAUTIONS** Elderly · lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B<sub>12</sub> deficiency (increased risk of neutropenia)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Manufacturer advises discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

● **INTERACTIONS** → Appendix 1: NRTIs

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Leucopenia · malaise · myalgia
- ▶ **Uncommon** Bone marrow disorders · dyspnoea · generalised pain · myopathy · thrombocytopenia
- ▶ **Rare or very rare** Alertness decreased · anxiety · appetite decreased · cardiomyopathy · chest pain · chills · cough · depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · taste altered · urinary frequency increased

▶ **Frequency not known** Lipoatrophy

**SIDE-EFFECTS, FURTHER INFORMATION** **Anaemia and myelosuppression** If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

**Lipodystrophy syndrome** Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

**Dose adjustments** Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

#### ● RENAL IMPAIRMENT

**Dose adjustments** See p. 21.

**[EvGr]** Reduce oral dose to 100 mg 3–4 times daily (300–400 mg daily) or intravenous dose to 1 mg/kg 3–4 times daily if creatinine clearance is less than 10 mL/minute. **[M]**

● **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intermittent intravenous infusion*, manufacturer advises dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

● **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

▶ **Retrovir** (ViiV Healthcare UK Ltd)

**Zidovudine 10 mg per 1 ml** Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial **[PoM]** £52.48 (Hospital only)

#### Oral solution

▶ **Retrovir** (ViiV Healthcare UK Ltd)

**Zidovudine 10 mg per 1 ml** Retrovir 100mg/10ml oral solution sugar-free | 200 ml **[PoM]** £20.91 (Hospital only)

**Capsule**▶ **Zidovudine (Non-proprietary)**

**Zidovudine 100 mg** Zidovudine 100mg capsules | 60 capsule [PoM](#) £53.31 (Hospital only)

▶ **Retrovir** (ViiV Healthcare UK Ltd)

**Zidovudine 100 mg** Retrovir 100mg capsules | 100 capsule [PoM](#) £104.54 (Hospital only)

**Zidovudine 250 mg** Retrovir 250mg capsules | 40 capsule [PoM](#) £104.54 (Hospital only)

**Zidovudine with lamivudine**

29-Jul-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 710, lamivudine p. 708.

**INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs**▶ **BY MOUTH**

▶ Adult: 1 tablet twice daily

● **INTERACTIONS** → Appendix 1: NRTIs● **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 50 mL/minute (consult product literature). [M](#) See p. 21.● **DIRECTIONS FOR ADMINISTRATION**

**COMBIVIR® TABLETS** Manufacturer advises tablets may be crushed and mixed with semi-solid food or liquid just before administration.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.**Tablet**▶ **Zidovudine with lamivudine (Non-proprietary)**

**Lamivudine 150 mg, Zidovudine 300 mg** Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet [PoM](#) £240.10-£255.10 DT = £300.12 (Hospital only)

▶ **Combivir** (ViiV Healthcare UK Ltd)

**Lamivudine 150 mg, Zidovudine 300 mg** Combivir 150mg/300mg tablets | 60 tablet [PoM](#) £300.12 DT = £300.12 (Hospital only)

**ANTIVIRALS > PROTEASE INHIBITORS, HIV****Protease inhibitors**● **CONTRA-INDICATIONS** Acute porphyrias p. 1150● **CAUTIONS** Haemophilia (increased risk of bleeding)● **SIDE-EFFECTS**

▶ **Common or very common** Anaemia · angioedema · anxiety · appetite abnormal · arthralgia · asthenia · diabetes mellitus · diarrhoea · dizziness · dyslipidaemia · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic disorders · hypersensitivity · hypertension · muscle complaints · nausea · neutropenia · oral ulceration · pancreatitis · peripheral neuropathy · seizure · skin reactions · sleep disorders · syncope · taste altered · thrombocytopenia · urinary frequency increased · vomiting

▶ **Uncommon** Alopecia · drowsiness · dry mouth · dyspnoea · hyperglycaemia · immune reconstitution inflammatory syndrome · malaise · myocardial infarction · osteonecrosis · weight increased

▶ **Rare or very rare** Stevens-Johnson syndrome

● **HEPATIC IMPAIRMENT** In general, manufacturers advise use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir**

15-Dec-2020

**INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**▶ **BY MOUTH**

▶ Adult: 300 mg once daily

**HIV infection in combination with other antiretroviral drugs—with cobicistat**▶ **BY MOUTH**

▶ Adult: 300 mg once daily

● **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation● **INTERACTIONS** → Appendix 1: HIV-protease inhibitors● **SIDE-EFFECTS**

▶ **Uncommon** Chest pain · chronic kidney disease · depression · disorientation · drug reaction with eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · torsade de pointes

▶ **Rare or very rare** Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation

**SIDE-EFFECTS, FURTHER INFORMATION** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

● **PREGNANCY** [EvGr](#) Theoretical risk of hyperbilirubinaemia in neonate if used at term. [M](#) For use with cobicistat, see atazanavir with cobicistat below.

**Monitoring** In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.**Capsule**

## Darunavir

15-Dec-2020

### ● INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

#### ▶ BY MOUTH

- ▶ Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells  $\times 10^6$ /litre

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat**

#### ▶ BY MOUTH

- ▶ Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells  $\times 10^6$ /litre

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir**

#### ▶ BY MOUTH

- ▶ Adult: 800 mg once daily

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat**

#### ▶ BY MOUTH

- ▶ Adult: 800 mg once daily

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

### ● SIDE-EFFECTS

- ▶ **Uncommon** Angina pectoris · arrhythmias · burping · chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing · gout · gynaecomastia · haemorrhage · herpes simplex · hypothyroidism · leucopenia · memory loss · mood altered · muscle weakness · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · QT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · urinary disorders · urine abnormalities · vertigo
- ▶ **Rare or very rare** Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY**  Use with caution in patients with sulfonamide sensitivity. 

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen. For use with cobicistat, see darunavir with cobicistat below or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 713.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

### ● PATIENT AND CARER ADVICE

Vomiting  If vomiting occurs more than 4 hours after a dose is taken, the missed dose should not be taken and the next dose should be taken at the normal time. 

Missed doses  If a dose is more than 6 hours late on the twice-daily regimen (or more than 12 hours late on the once-daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. 

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Darunavir with cobicistat

09-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, cobicistat p. 715, darunavir above.

### ● INDICATIONS AND DOSE

**HIV infection, in combination with other antiretroviral drugs (initiated by a specialist)**

#### ▶ BY MOUTH

- ▶ Adult: 800/150 mg once daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg of darunavir/cobicistat.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018)**  
Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in *Rezolsta*<sup>®</sup> and *Symtuza*<sup>®</sup>) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be

associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **CONTRA-INDICATIONS** Treatment-experienced patients with 1 or more darunavir resistance-associated mutations, plasma HIV-RNA concentration of 100 000 copies/mL or greater, or CD4 count less than 100 cells  $\times$  10<sup>6</sup>/litre
- **CAUTIONS** Elderly
- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen. Darunavir with ritonavir may be considered as an alternative.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**  
▶ Darunavir/cobicistat (*Rezolsta*<sup>®</sup>) in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults aged 18 years or older. Genotypic testing should guide its use (August 2015) SMC No. 1081/15 Recommended  
**All Wales Medicines Strategy Group (AWMSG) decisions**  
▶ Darunavir with cobicistat (*Rezolsta*<sup>®</sup>) in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg) (November 2020) AWMSG No. 3779 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

Cobicistat 150 mg, Darunavir (as Darunavir ethanolate) 800 mg Rezolsta 800mg/150mg tablets | 30 tablet [PoM] £317.24 (Hospital only)

## Darunavir with cobicistat, emtricitabine and tenofovir alafenamide

10-Aug-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, darunavir p. 712, cobicistat p. 715, emtricitabine p. 706, tenofovir alafenamide p. 679.

#### ● INDICATIONS AND DOSE

##### HIV infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Adult: 1 tablet once daily

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018)  
Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in *Rezolsta*<sup>®</sup> and *Symtuza*<sup>®</sup>) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors · NRTIs · tenofovir alafenamide

- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **RENAL IMPAIRMENT** [EvGr] Avoid if creatinine clearance less than 30 mL/minute (no information available). ⚠ See p. 21.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**  
▶ Darunavir, cobicistat, emtricitabine, tenofovir alafenamide (*Symtuza*<sup>®</sup>) for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg) (January 2018) SMC No. 1290/18 Recommended  
**All Wales Medicines Strategy Group (AWMSG) decisions**  
▶ Darunavir / cobicistat / emtricitabine / tenofovir alafenamide (*Symtuza*<sup>®</sup>) for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg) (March 2018) AWMSG No. 2418 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tenofovir alafenamide (as Tenofovir alafenamide fumarate) 10 mg, Cobicistat 150 mg, Emtricitabine 200 mg, Darunavir (as Darunavir ethanolate) 800 mg Symtuza 800mg/150mg/200mg/10mg tablets | 30 tablet [PoM] £672.97 (Hospital only)

## Fosamprenavir

03-Aug-2020

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

#### ● INDICATIONS AND DOSE

##### HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Adult: 700 mg twice daily

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Oral paraesthesia  
**SIDE-EFFECTS, FURTHER INFORMATION** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.

- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.  
**Dose adjustments** Manufacturer advises dose reduction to 450 mg twice daily in moderate impairment and 300 mg twice daily in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises in adults, oral suspension should be taken on an empty stomach.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Telzir** (ViiV Healthcare UK Ltd)  
**Fosamprenavir (as Fosamprenavir calcium) 700 mg** Telzir 700mg tablets | 60 tablet [PoM] £258.97 (Hospital only)

## F 711

**Lopinavir with ritonavir**

21-Dec-2021

● **INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs**

- ▶ **BY MOUTH USING TABLETS**
- ▶ **Adult:** 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors
- ▶ **BY MOUTH USING ORAL SOLUTION**
- ▶ **Adult:** 5 mL twice daily
- DOSE EQUIVALENCE AND CONVERSION**
- ▶ Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Common or very common** Increased risk of infection · leucopenia · lymphadenopathy · menstrual cycle irregularities · migraine · muscle weakness · myopathy · night sweats · pain · sexual dysfunction
- ▶ **Uncommon** Atherosclerosis · atrioventricular block · cholangitis · constipation · deep vein thrombosis · haemorrhage · hyperbilirubinaemia · hypogonadism · nephritis · stomatitis · stroke · tinnitus · tremor · tricuspid valve incompetence · vasculitis · vertigo · visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

- **PREGNANCY** For *tablets*, manufacturer advises only use if potential benefit outweighs risk—toxicity in *animal* studies (recommendation also supported by specialist sources). Avoid *oral solution* due to high alcohol and propylene glycol content.

- **HEPATIC IMPAIRMENT** For *oral solution*, manufacturer advises avoid due to propylene glycol content (risk of toxicity). For *tablets*, manufacturer advises avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** [EvGr] Avoid *oral solution* due to high propylene glycol content. ⚠

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor liver function before and during treatment.
- ▶ For *oral solution*, manufacturer advises monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).

- **PRESCRIBING AND DISPENSING INFORMATION** For *oral solution*, manufacturer advises high alcohol (42% v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.

- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Lopinavir 200 mg, ritonavir 50 mg tablet (Kaletra®)** for the treatment of HIV-1 infected adults and children above the age of 2 years in combination with other antiretroviral agents (November 2006) SMC No. 326/06 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- ▶ **Kaletra** (AbbVie Ltd)  
**Ritonavir 25 mg, Lopinavir 100 mg** Kaletra 100mg/25mg tablets | 60 tablet [PoM] £76.85 (Hospital only)  
**Ritonavir 50 mg, Lopinavir 200 mg** Kaletra 200mg/50mg tablets | 120 tablet [PoM] £285.41 (Hospital only)

## F 711

**Ritonavir**

16-Jun-2020

● **INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

**Low-dose booster to increase effect of other protease inhibitors**

- ▶ **BY MOUTH**
- ▶ **Adult:** 100–200 mg 1–2 times a day

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Common or very common** Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · vision blurred

- ▶ **Rare or very rare** Toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

● **PREGNANCY**

**Dose adjustments** Only use low-dose booster to increase the effect of other protease inhibitors.

- **HEPATIC IMPAIRMENT** When used as a *low-dose booster*, manufacturer advises caution in severe impairment; avoid in decompensated liver disease. When used in *high-doses*, manufacturer advises avoid in severe impairment.

**Dose adjustments** Manufacturer advises consult product literature of co-administered protease inhibitor.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Ritonavir (Non-proprietary)**

Ritonavir **100 mg** Ritonavir 100mg tablets | 30 tablet **[PoM]** £16.52-£19.44 (Hospital only)

- ▶ **Norvir** (AbbVie Ltd)

Ritonavir **100 mg** Norvir 100mg tablets | 30 tablet **[PoM]** £19.44 (Hospital only)

F 711

05-Jun-2020

**Tipranavir**● **INDICATIONS AND DOSE**

**HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir**

- ▶ BY MOUTH USING CAPSULES
- ▶ Adult: 500 mg twice daily

- **CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (consider delaying treatment if serum transaminases are greater than 5 times the upper limit of normal—consult product literature) - patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
- ▶ **Uncommon** Hyperamylasaemia · influenza like illness · renal failure
- ▶ **Rare or very rare** Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- ▶ **Frequency not known** Bleeding tendency
- SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every 2 weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment, then every 2 weeks for 1 month, then every 4 weeks until 24 weeks, then every 8 to 12 weeks thereafter.
- **MEDICINAL FORMS** No licensed medicines listed.

**ANTIVIRALS > OTHER****Maraviroc**

31-Aug-2020

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.
- **INDICATIONS AND DOSE**
- CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals**
- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1: maraviroc

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
- ▶ **Uncommon** Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
- ▶ **Rare or very rare** Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Fever · hypersensitivity · immune reconstitution inflammatory syndrome · organ dysfunction · osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION** Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**Hepatotoxicity** Manufacturer advises consider discontinuation if signs or symptoms of acute hepatitis, or increased liver transaminases with systemic symptoms of hypersensitivity occur.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment and in patients with chronic hepatitis (increased risk of hepatic side-effects; limited information available).
- **RENAL IMPAIRMENT** If eGFR less than 80 mL/minute/1.73 m<sup>2</sup>, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
- ▶ Maraviroc (*Celsentri*<sup>®</sup>) for treatment-experienced adult patients infected with only CCR5-tropic HIV-1 detectable (October 2008) SMC No. 458/08 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Celsentri** (ViiV Healthcare UK Ltd)

## 6.6 Influenza

### Influenza

29-Nov-2021

#### Description of condition

Influenza is a highly infectious, acute respiratory infection caused by influenza viruses, of which there are three types (A, B, and C). Influenza A is more virulent and occurs more frequently; influenza B presents a milder course of disease but still has the potential to cause outbreaks; and influenza C causes mild or asymptomatic disease, similar to the common cold. Types A and B can be further categorised into subtypes depending on their principle H and N antigens. Transmission occurs via droplets, aerosols, or direct contact with respiratory secretions from an infected person, and the usual incubation period is 1–3 days.

Symptoms usually appear suddenly and may include chills, fever, headache, extreme fatigue, and myalgia. Dry cough, sore throat and nasal congestion may also be present. Complications are usually respiratory in nature and may include bronchitis, secondary bacterial pneumonia, or otitis media (in children); non-respiratory complications are rarer, and may be cardiac or neurological in nature.

Although influenza is usually self-limiting with recovery occurring within 2–7 days, it can be severe in some patients. Influenza is classified as uncomplicated or complicated, with the latter described as either requiring hospitalisation, having signs or symptoms of a lower respiratory-tract infection, central nervous system involvement, or exacerbation of an underlying condition. The risk of more serious illness is greater for those in at-risk groups, such as children aged under 6 months; pregnant females (including females up to 2 weeks post-partum); adults aged over 65 years; patients with long-term conditions such as respiratory, renal, hepatic, neurological or cardiac disease, diabetes mellitus, or morbid obesity (BMI ≥ 40 kg/m<sup>2</sup>); or those with severe immunosuppression.

For further information on at-risk groups, see **Public Health England (PHE) guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza** (see *Useful resources*).

Other types of influenza include pandemic influenza, avian influenza, and swine influenza. For information and guidance on their management, see [www.gov.uk/government/collections/pandemic-flu-public-health-response](http://www.gov.uk/government/collections/pandemic-flu-public-health-response), [www.gov.uk/government/collections/avian-influenza-guidance-data-and-analysis](http://www.gov.uk/government/collections/avian-influenza-guidance-data-and-analysis), and [www.gov.uk/guidance/swine-influenza](http://www.gov.uk/guidance/swine-influenza).

#### Aims of treatment

The management of influenza aims to reduce the duration and severity of illness, reduce the risk of complications, and to prevent infection.

#### Management

The antivirals oseltamivir p. 718 and zanamivir p. 719 are used for both treatment and post-exposure prophylaxis of influenza, although there is evidence that some strains of influenza are more likely to develop resistance to oseltamivir. In general, the risk of developing oseltamivir resistance is considered to be greater for influenza A(H1N1)pdm09 compared to other strains (such as influenza A(H3N2) and influenza B), with the risk of resistance being higher in patients who are severely immunosuppressed. Specialist advice regarding the management of influenza for individual patients can be obtained from local infection specialists where required. Additional advice can also be obtained from PHE's regional public health virologist and Respiratory Virus Unit. A consultant microbiologist or virologist can be consulted for advice on the resistance risk of individual influenza subtypes, and information on the dominant circulating strain can be found in PHE's weekly influenza reports at: [www.gov.uk/government/collections/weekly-national-flu-reports](http://www.gov.uk/government/collections/weekly-national-flu-reports).

Amantadine hydrochloride is not recommended for the treatment or post-exposure prophylaxis of influenza A.

#### Treatment of suspected or confirmed influenza

Where treatment with oseltamivir is indicated, it should be started as soon as possible, ideally within 48 hours of symptom onset. There is evidence to suggest that the risk of mortality may be reduced even if treatment is started up to 5 days after symptom onset; treatment initiation beyond 48 hours of onset is unlicensed and clinical judgement should be used. Where treatment with inhaled zanamivir is indicated, it should also be started as soon as possible, ideally within 48 hours (36 hours in children) of symptom onset; treatment initiation beyond this time is unlicensed and clinical judgement should be used. Where treatment with intravenous zanamivir is indicated, it should be commenced as soon as possible and within 6 days of symptom onset.

#### Uncomplicated influenza

Patients with uncomplicated influenza are usually managed in the community or accident and emergency departments. All patients should be advised about the symptoms of complicated influenza and to seek medical attention if their condition worsens.

For patients who are otherwise healthy (excluding pregnant females), no antiviral treatment is usually needed. For those considered to be at serious risk of developing complications, offer oseltamivir.

For patients in an at-risk group (including pregnant females but excluding those who are severely immunosuppressed), offer oseltamivir—do not wait for laboratory test results to treat. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For further information, see **PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza** (see *Useful resources*).

For severely immunosuppressed patients, consider the subtype of influenza causing the infection, or if not yet known, take into account the current dominant circulating strain. Offer oseltamivir first-line unless the strain has a higher risk for oseltamivir resistance, in which case inhaled zanamivir should be offered. For patients unable to use inhaled zanamivir due to underlying severe respiratory disease or inability to use the device (including children under 5 years), offer oseltamivir and assess response to therapy.

For patients with suspected or confirmed oseltamivir resistant influenza, offer inhaled zanamivir. For patients unable to use inhaled zanamivir, consider intravenous zanamivir [unlicensed indication].

#### Complicated influenza

All patients should be tested and treated, often in hospital—do not wait for laboratory test results to treat. For patients who are not severely immunosuppressed, oseltamivir should be offered first-line. If there is a risk of reduced gastrointestinal absorption, or if initial oseltamivir treatment is unsuccessful, offer inhaled zanamivir. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For further information, see **PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza** (see *Useful resources*).

For severely immunosuppressed patients, consider the dominant circulating strain of influenza to guide treatment. Offer oseltamivir first-line unless the strain has a higher risk for developing oseltamivir resistance, in which case inhaled zanamivir should be offered.

For patients with suspected or confirmed oseltamivir resistant influenza, offer inhaled zanamivir.

For patients unable to use inhaled zanamivir, or for those with severe complicated illness such as multi-organ failure, consider intravenous zanamivir p. 719.

#### Post-exposure prophylaxis

Contacts in an at-risk group who are not adequately protected through vaccination (either due to infection by a different circulating strain or exposure within 14 days post-vaccination), should be offered prophylaxis following exposure to a person in the same household or residential setting with influenza-like illness (when influenza is circulating). Certain populations that are susceptible to localised outbreaks (such as those in care homes, prisons or detention centres), may be considered for antiviral prophylaxis regardless of vaccination status. For information on prophylaxis in these settings, refer to individual guidelines available at: [www.gov.uk/government/collections/seasonal-influenza-guidance-data-and-analysis](http://www.gov.uk/government/collections/seasonal-influenza-guidance-data-and-analysis).

Prophylaxis should be started as soon as possible following exposure—ideally within 48 hours for oseltamivir p. 718 and 36 hours for inhaled zanamivir. Initiation beyond these times is unlicensed and specialist advice should be sought.

For patients in an at-risk group (including pregnant females but excluding severely immunosuppressed patients and children aged under 5 years), offer oseltamivir first-line regardless of the risk for resistance of the circulating or index case strain. For pregnant females who meet additional criteria for requiring zanamivir first-line, treatment should be discussed with a local infection specialist. For patients exposed to a strain with suspected or confirmed oseltamivir resistance, offer inhaled zanamivir.

For severely immunosuppressed patients (excluding children aged under 5 years), offer oseltamivir if the risk for oseltamivir resistance is low. However, if the risk for oseltamivir resistance is high, suspected or confirmed, offer inhaled zanamivir. For patients at higher risk of oseltamivir resistance who are unable to use inhaled zanamivir (due to underlying severe respiratory disease or inability to use the device), offer oseltamivir and advise patients to seek immediate medical attention if symptoms develop subsequently. For patients exposed to suspected or confirmed oseltamivir resistant influenza who are unable to use inhaled zanamivir, specialist advice should be sought and patients monitored closely for influenza-like illness, with arrangements made for prompt treatment if symptoms develop.

For children aged under 5 years in an at-risk group (including severely immunosuppressed children), offer oseltamivir first-line regardless of the risk of resistance for

the circulating or index case strain. However, if the child is exposed to suspected or confirmed oseltamivir resistant influenza, monitor closely for influenza-like illness and promptly commence treatment if symptoms develop (see *Treatment of suspected or confirmed influenza*); seek specialist advice if the child is severely immunosuppressed.

Specialist advice is available through local health protection teams and public health virologists.

For further information, see **PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza** (see *Useful resources*).

For information on vaccination against influenza, see Influenza vaccine p. 1404.

#### Useful Resources

Recommendations reflect *PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza*. Public Health England, September 2019.

### ANTIVIRALS > INFLUENZA > CAP-DEPENDENT ENDONUCLEASE INHIBITORS

#### Baloxavir marboxil

12-Jan-2022

- **DRUG ACTION** Baloxavir marboxil (a pro-drug of baloxavir) reduces replication of influenza A and B viruses by inhibiting viral cap-dependent endonuclease.

#### ● INDICATIONS AND DOSE

##### Post-exposure prophylaxis of influenza

###### ▶ BY MOUTH

- ▶ Child 12–17 years (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- ▶ Child 12–17 years (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- ▶ Adult (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure
- ▶ Adult (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours following exposure

##### Treatment of influenza

###### ▶ BY MOUTH

- ▶ Child 12–17 years (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- ▶ Child 12–17 years (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- ▶ Adult (body-weight up to 79 kg): 40 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset
- ▶ Adult (body-weight 80 kg and above): 80 mg for 1 dose, to be taken as soon as possible within 48 hours of symptom onset

- **INTERACTIONS** → Appendix 1: baloxavir marboxil

#### ● SIDE-EFFECTS

- ▶ **Uncommon** Urticaria
- ▶ **Frequency not known** Angioedema

- **PREGNANCY** EVGR Avoid—limited information available.

- **BREAST FEEDING** EVGR Avoid—present in milk in *animal* studies. M

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## ▶ BY MOUTH

- ▶ Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- ▶ Child 1-12 years (body-weight up to 15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Child 1-12 years (body-weight 16-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Child 1-12 years (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Child 1-12 years (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Child 13-17 years (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Child 13-17 years (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Adult (body-weight 24-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic
- ▶ Adult (body-weight 41 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks (or up to 12 weeks if immunocompromised) during an epidemic

**Treatment of influenza**

## ▶ BY MOUTH

- ▶ Child 1-11 months: 3 mg/kg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 1-12 years (body-weight 16-23 kg): 45 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 1-12 years (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 1-12 years (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 13-17 years (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Child 13-17 years (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Adult (body-weight 24-40 kg): 60 mg twice daily for 5 days (10 days if immunocompromised)
- ▶ Adult (body-weight 41 kg and above): 75 mg twice daily for 5 days (10 days if immunocompromised)

**UNLICENSED USE**

- ▶ In children Public Health England advises oseltamivir is used in the doses provided in BNF for Children for the prevention of influenza in children 1-12 years of age weighing less than 10 kg, but these are not licensed.

- **INTERACTIONS** → Appendix 1: oseltamivir

**SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · gastrointestinal discomfort · herpes simplex · nausea · sleep disorders · vertigo · vomiting
- ▶ **Uncommon** Arrhythmia · consciousness impaired (in adults) · seizure · skin reactions
- ▶ **Rare or very rare** Angioedema · anxiety · behaviour abnormal · confusion · delirium · delusions · haemorrhage · hallucination · hepatic disorders · self-injurious behaviour · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · visual impairment

- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

**RENAL IMPAIRMENT**

- ▶ In adults Avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.
- ▶ In children Avoid for *treatment* and *prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m<sup>2</sup>.  
**Dose adjustments** ▶ In adults For *treatment*, use 30 mg twice daily if eGFR 30-60 mL/minute/1.73 m<sup>2</sup> (30 mg once daily if eGFR 10-30 mL/minute/1.73 m<sup>2</sup>). For *prevention*, use 30 mg once daily if eGFR 30-60 mL/minute/1.73 m<sup>2</sup> (30 mg every 48 hours if eGFR 10-30 mL/minute/1.73 m<sup>2</sup>).  
▶ In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30-60 mL/minute/1.73 m<sup>2</sup> (40% of normal dose once daily if estimated glomerular filtration rate 10-30 mL/minute/1.73 m<sup>2</sup>). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30-60 mL/minute/1.73 m<sup>2</sup> (40% of normal dose every 48 hours if estimated glomerular filtration rate 10-30 mL/minute/1.73 m<sup>2</sup>).

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, manufacturer advises capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

Public Health England advises that oseltamivir oral suspension should be reserved for children under the age of 1 year. Children over 1 year of age, adults with swallowing difficulties, and those receiving nasogastric oseltamivir, should use capsules which can be opened and mixed into an appropriate sugary liquid.

## Zanamivir

28-Oct-2020

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

### ● INDICATIONS AND DOSE

#### Post-exposure prophylaxis of influenza

- ▶ BY INHALATION OF POWDER

▶ Child 5-17 years: 10 mg once daily for 10 days

▶ Adult: 10 mg once daily for 10 days

#### Prevention of influenza during an epidemic

- ▶ BY INHALATION OF POWDER

▶ Child 5-17 years: 10 mg once daily for up to 28 days

▶ Adult: 10 mg once daily for up to 28 days

#### Treatment of influenza

- ▶ BY INHALATION OF POWDER

▶ Child 5-17 years: 10 mg twice daily for 5 days

▶ Adult: 10 mg twice daily for 5 days

**Treatment of influenza [complicated and potentially life-threatening, resistant to other treatments, and/or other treatments are unsuitable] | Treatment of influenza [uncomplicated, resistant to other treatments, and inhaled formulation unsuitable]**

- ▶ BY INTRAVENOUS INFUSION

▶ Child 6 months-5 years: 14 mg/kg twice daily for 5 to 10 days

▶ Child 6-17 years: 12 mg/kg twice daily (max. per dose 600 mg) for 5 to 10 days

▶ Adult: 600 mg twice daily for 5 to 10 days

### ● UNLICENSED USE

- ▶ With intravenous use Public Health England advises intravenous zanamivir may be used for the treatment of uncomplicated influenza, but it is not licensed for this indication.

### ● CAUTIONS

- ▶ When used by inhalation Asthma · chronic pulmonary disease · uncontrolled chronic illness

### CAUTIONS, FURTHER INFORMATION

- ▶ Asthma and chronic pulmonary disease

- ▶ When used by inhalation Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions

- ▶ **Uncommon** Oropharyngeal oedema

- ▶ **Rare or very rare** Face oedema · severe cutaneous adverse reactions (SCARs)

- ▶ **Frequency not known** Behaviour abnormal · delirium · hallucination · level of consciousness decreased · seizure

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Diarrhoea · hepatocellular injury

- ▶ **Uncommon**

- ▶ When used by inhalation Bronchospasm · dehydration · dyspnoea · presyncope · throat tightness

- ▶ **Frequency not known**

- ▶ When used by inhalation Psychiatric disorder

**SIDE-EFFECTS, FURTHER INFORMATION** Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (e.g. during a pandemic)—limited information available; *animal* studies do not indicate toxicity.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk (e.g. during a pandemic)—limited information available; present in low levels in milk in *animal* studies.

### ● RENAL IMPAIRMENT

**Dose adjustments** ▶ With intravenous use Manufacturer advises reduce dose if creatinine clearance less than 80 mL/minute—consult product literature for details. See p. 21.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ When used by inhalation Manufacturer advises other inhaled drugs should be administered before zanamivir.

- ▶ With intravenous use Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 200 micrograms/mL with Sodium Chloride 0.9%; give over 30 minutes.

### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ When used by inhalation Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ Osetamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158 Recommended with restrictions

- ▶ Osetamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Zanamivir (*Dectova*<sup>®</sup>) for the treatment of complicated and potentially life-threatening influenza A or B virus infection in patients (aged 6 months and older) when the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient (December 2019) SMC No. SMC2204 Recommended

**All Wales Medicines Strategy Group (AWMSG) decisions**

- ▶ Zanamivir (*Dectova*<sup>®</sup>) for the treatment of complicated and potentially life-threatening influenza A or B virus infection in patients (aged 6 months and older) when the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient (October 2019) AWMSG No. 4130 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Dectova** (GlaxoSmithKline UK Ltd) ▼

Zanamivir 10 mg per 1 ml Dectova 200mg/20ml solution for infusion vials | 1 vial [PoM] £27.83 (Hospital only)

**Inhalation powder**

- ▶ **Relenza** (GlaxoSmithKline UK Ltd)

Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister [PoM] £16.36 DT = £16.36

## 6.7 Respiratory syncytial virus

### Respiratory syncytial virus

**Management in children**

Ribavirin p. 682 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at [www.gov.uk/dh](http://www.gov.uk/dh).

**DRUGS FOR RESPIRATORY DISEASES >****MONOCLONAL ANTIBODIES****Palivizumab**

14-Dec-2020

**● INDICATIONS AND DOSE**

**Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1-23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered

during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

**Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1-23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

**● SIDE-EFFECTS**

- ▶ Common or very common Apnoea
- ▶ Uncommon Seizure · thrombocytopenia · urticaria
- ▶ Frequency not known Hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY** PHE advises avoid if previous anaphylactic reaction to another humanised monoclonal antibody.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Synagis** (AstraZeneca UK Ltd)

Palivizumab 100 mg per 1 ml Synagis 100mg/1ml solution for injection vials | 1 vial [PoM] £563.64

Synagis 50mg/0.5ml solution for injection vials | 1 vial [PoM] £306.34 (Hospital only)

## 1 Antidiuretic hormone disorders

### Posterior pituitary hormones and antagonists

14-Sep-2020

#### Posterior pituitary hormones

##### Diabetes insipidus

Vasopressin p. 724 (antidiuretic hormone, ADH) is used in the treatment of *pituitary ('cranial') diabetes insipidus* as its analogue desmopressin p. 722. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic and partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 336 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin. The MHRA/CHM have released important safety information on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour. For further information, see Epilepsy p. 330.

##### Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response.

Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 888, another posterior pituitary hormone, is indicated in obstetrics.

#### Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 615 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 724 is a vasopressin  $V_2$ -receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

## 1.1 Diabetes insipidus

**Other drugs used for Diabetes insipidus** Chlortalidone, p. 250

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

### Desmopressin

26-Oct-2021

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

#### ● INDICATIONS AND DOSE

##### Diabetes insipidus, treatment

- ▶ BY MOUTH
  - ▶ Child 1-23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
  - ▶ Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
  - ▶ Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
  - ▶ Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
  - ▶ Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Child 1-23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
  - ▶ Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
  - ▶ Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
  - ▶ Adult: 10–40 micrograms daily in 1–2 divided doses
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: 1–4 micrograms daily

##### Primary nocturnal enuresis

- ▶ BY MOUTH
  - ▶ Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
  - ▶ Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
  - ▶ Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

##### Postoperative polyuria or polydipsia

- ▶ BY MOUTH
  - ▶ Adult: Dose to be adjusted according to urine osmolality

##### Polyuria or polydipsia after hypophysectomy

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: Dose to be adjusted according to urine osmolality

##### Idiopathic nocturnal polyuria in females

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: 25 micrograms daily, to be taken 1 hour before bedtime

##### Idiopathic nocturnal polyuria in males

- ▶ BY SUBLINGUAL ADMINISTRATION
  - ▶ Adult: 50 micrograms daily, to be taken 1 hour before bedtime

##### Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 200 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

##### Nocturia associated with multiple sclerosis (when other treatments have failed)

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

##### Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - ▶ Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

##### Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

##### Fibrinolytic response testing

- ▶ BY INTRANASAL ADMINISTRATION
  - ▶ Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
  - ▶ Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

##### Lumbar-puncture-associated headache

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - ▶ Adult: (consult product literature)

- **UNLICENSED USE**
  - ▶ In children Consult product literature for individual preparations. Oral use of *DDAVP* intravenous injection is not licensed.
- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion · von Willebrand's Disease Type IIB (may result in pseudothrombocytopenia)
- **CAUTIONS** Avoid fluid overload · cardiovascular disease (not indicated for nocturia associated with multiple sclerosis) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) · epilepsy · hypertension (not indicated for nocturia associated with multiple sclerosis) · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards  
**CAUTIONS, FURTHER INFORMATION** Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.
- **INTERACTIONS** → Appendix 1: desmopressin
- **SIDE-EFFECTS**  
**GENERAL SIDE-EFFECTS**
  - ▶ **Common or very common** Hyponatraemia (on administration without restricting fluid intake) · nausea
  - ▶ **Frequency not known** Abdominal pain · aggression (in children) · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased
- SPECIFIC SIDE-EFFECTS**
  - ▶ With intranasal use Epistaxis · nasal congestion · rhinitis
  - ▶ With intravenous use Vasodilation
- SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.
- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT**  Caution; antidiuretic effect may be reduced. 
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** Desmopressin oral lyophilisates are for sublingual administration.  
Expert sources advise *DDAVP*® and *Desmotabs*® tablets may be crushed.  
Expert sources advise *DDAVP*® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.  
Expert sources advise *DDAVP*® injection may be administered orally.
- ▶ With intravenous use For *intravenous infusion* (*DDAVP*®, *Octim*®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*® intranasal solution.

- **PATIENT AND CARER ADVICE**  
Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).  
Medicines for Children leaflet: Desmopressin for bedwetting [www.medicinesforchildren.org.uk/medicines/desmopressin-for-bedwetting/](http://www.medicinesforchildren.org.uk/medicines/desmopressin-for-bedwetting/)

## Vasopressin

05-Oct-2021

### (Antidiuretic hormone (ADH))

- **DRUG ACTION** Vasopressin is an endogenous hormone with a direct antidiuretic effect on the kidney; it is given in the synthetic form of argipressin.

#### ● INDICATIONS AND DOSE

##### **Pituitary diabetes insipidus**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5–20 units every 4 hours, dose expressed as argipressin

##### **Initial control of oesophageal variceal bleeding**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 20 units, dose to be administered over 15 minutes, dose expressed as argipressin

##### **DOSE EQUIVALENCE AND CONVERSION**

- ▶ Argipressin 1 unit is equivalent to vasopressin 1 unit.

- **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution
- **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine
- **SIDE-EFFECTS** Abdominal pain · angina pectoris · bronchospasm · cardiac arrest · chest pain · diarrhoea · flatulence · fluid imbalance · gangrene · headache · hyperhidrosis · hypertension · musculoskeletal chest pain · nausea · pallor · peripheral ischaemia · tremor · urticaria · vertigo · vomiting
- **PREGNANCY** Oxytocic effect in third trimester.
- **BREAST FEEDING** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion* (argipressin), manufacturer advises give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### **Solution for injection**

##### ▶ **Vasopressin (Non-proprietary)**

**Argipressin 20 unit per 1 ml** Argipressin 20units/1ml solution for injection ampoules | 10 ampoule **[PoM]** £754.86-£950.00 (Hospital only)

## 1.2 Syndrome of inappropriate antidiuretic hormone secretion

**Other drugs used for Syndrome of inappropriate antidiuretic hormone secretion** Demeclocycline hydrochloride, p. 615

### DIURETICS > SELECTIVE VASOPRESSIN V<sub>2</sub>-RECEPTOR ANTAGONISTS

## Tolvaptan

20-Apr-2022

- **DRUG ACTION** Tolvaptan is a vasopressin V<sub>2</sub>-receptor antagonist.

#### ● INDICATIONS AND DOSE

##### **JINARC<sup>®</sup>**

**Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 4 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)**

##### ▶ BY MOUTH

- ▶ Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

##### **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ For *Jinarc<sup>®</sup>*, manufacturer advises reduce dose with concurrent use of potent CYP3A4 inhibitors—if daily dose 90 mg or 120 mg, reduce to 30 mg once daily (can be further reduced to 15 mg once daily if not tolerated); if daily dose 60 mg, reduce to 15 mg once daily. Manufacturer also advises reduce dose with concurrent use of moderate CYP3A4 inhibitors or ciprofloxacin—if daily dose 120 mg, reduce to 60 mg daily (45 mg in morning and 15 mg taken 8 hours later); if daily dose 90 mg, reduce to 45 mg daily (30 mg in morning and 15 mg taken 8 hours later); if daily dose 60 mg, reduce to 30 mg daily (15 mg in morning and 15 mg taken 8 hours later).

##### **SAMSCA<sup>®</sup>**

**Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion (initiated in hospital or under specialist supervision)**

##### ▶ BY MOUTH

- ▶ Adult: Initially 15 mg once daily, increased if necessary up to 60 mg once daily, a reduced starting dose of 7.5 mg once daily should be considered for patients at risk of overly rapid correction of serum-sodium concentration

- **CONTRA-INDICATIONS** Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion

#### ● CAUTIONS

**GENERAL CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (do not initiate if the criteria for permanent discontinuation are met—consult product literature) · diabetes mellitus · patients at risk of

dehydration (ensure adequate fluid intake) · urinary outflow obstruction (increased risk of acute retention)

#### SPECIFIC CAUTIONS

- ▶ When used for autosomal dominant polycystic kidney disease Serum-sodium abnormalities (correct before treatment initiation)
- ▶ When used for hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion Patients at risk of demyelination syndromes (e.g hypoxia, alcoholism and malnutrition)

● **INTERACTIONS** → Appendix 1: tolvaptan

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · gastrointestinal discomfort · gastroesophageal reflux disease · gout · headache · hepatic disorders · hyperglycaemia · hypernatraemia · hyperuricaemia · insomnia · muscle spasms · palpitations · polydipsia · skin reactions · thirst · urinary disorders · weight decreased
- ▶ **Frequency not known** Acute hepatic failure (cases requiring liver transplantation reported)

**SIDE-EFFECTS, FURTHER INFORMATION** Interrupt treatment and perform liver-function tests promptly if symptoms of hepatic impairment occur (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus)—consult product literature.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment; avoid if abnormal liver-function tests and/or signs or symptoms of liver injury meet the requirements for permanent discontinuation—consult product literature.
- **RENAL IMPAIRMENT** No information available in severe impairment. [EvGr](#) For *Jinarc*<sup>®</sup>, discontinue if progression to CKD stage 5. [⚠](#)

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor volume, fluid and electrolyte status (risk of dehydration); monitor electrolytes at least every 3 months during long-term therapy.
- ▶ When used for Autosomal dominant polycystic kidney disease Manufacturer advises monitor liver function tests and for symptoms of liver injury. Liver enzymes and bilirubin must be measured and reviewed before treatment initiation, monthly for 18 months, and every 3 months thereafter; interrupt treatment if abnormalities occur—consult product literature for further information including the criteria for permanent discontinuation. Manufacturer advises evaluate uric acid concentration before treatment initiation and as clinically indicated during treatment; monitor urine osmolality periodically.
- ▶ When used for Hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion Manufacturer advises monitor liver function tests and for symptoms of liver injury; interrupt treatment if abnormalities occur. Manufacturer advises monitor serum-sodium concentration no later than 6 hours after treatment initiation, then monitor serum-sodium and volume status at least every 6 hours during the first 1–2 days of treatment and until dose stabilised. If serum-sodium correction exceeds 6 mmol/litre during the first 6 hours or 8 mmol/litre in the first 6–12 hours, frequency of monitoring should be increased; interrupt or discontinue treatment if serum-sodium increases by 12 mmol/litre or greater in 24 hours or 18 mmol/litre or greater in 48 hours.

● **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Jinarc*<sup>®</sup> has provided training materials for healthcare professionals to use prior to prescribing

tolvaptan in order to minimise the risk of irreversible hepatotoxicity and to highlight the importance of pregnancy prevention.

- **PATIENT AND CARER ADVICE** For *Jinarc*<sup>®</sup>, morning dose to be taken 30 minutes before food, second dose can be taken with or without food. Risk minimisation materials For *Jinarc*<sup>®</sup>, a patient brochure and alert card should be provided.

## 2 Bone metabolism disorders

### Osteoporosis

03-Feb-2021

#### Description of condition

Osteoporosis is a progressive bone disease characterised by low bone mass measured by bone mineral density (BMD), and microarchitectural deterioration of bone tissue. This leads to an increased risk of fragility fractures (fractures resulting from low-level trauma). Osteoporosis is considered severe if there have been one or more fragility fractures.

Osteoporosis occurs most commonly in postmenopausal women, men over 50 years, and in patients taking long-term oral corticosteroids (glucocorticoids). Other risk factors for osteoporosis include increasing age, vitamin D deficiency and low calcium intake, lack of physical activity, low body mass index (BMI), cigarette smoking, excess alcohol intake, parental history of hip fractures, a previous fracture at a site characteristic of osteoporotic fractures, and early menopause. Some diseases are also known to be associated with osteoporosis such as rheumatoid arthritis and diabetes. Certain medications may also increase the risk of fracture in some patients, through mechanisms such as induction of liver enzymes which interfere with vitamin D metabolism.

#### Aims of treatment

A combination of lifestyle changes and drug treatment aims to prevent fragility fractures in patients with osteoporosis.

#### Lifestyle changes

[EvGr](#) Patients should be encouraged to increase their level of physical activity, stop smoking, maintain a normal BMI level (between 20–25 kg/m<sup>2</sup>), and reduce their alcohol intake to improve their bone health and reduce the risk of fragility fractures. [⚠](#) For guidance on stopping smoking, see Smoking cessation p. 531.

[EvGr](#) Patients at risk of osteoporosis should also ensure an adequate intake of calcium and vitamin D. Calcium should preferably be obtained through increasing dietary intake;

supplements may be used if necessary. A daily dietary supplement of vitamin D may be considered for those at increased risk of deficiency.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at high risk of vitamin D deficiency and may benefit from calcium and vitamin D treatment. [▲](#) Elderly patients also have an increased risk of falls (see Prescribing in the elderly p. 29).

### Drug treatment

[EvGr](#) Choice of treatment is generally determined by the spectrum of anti-fracture effects across skeletal sites, patient preference and suitability. [▲](#)

Some recommendations on the management of osteoporosis from the National Osteoporosis Guideline Group (NOGG)—Clinical guideline for the prevention and treatment of osteoporosis (July 2019), and Scottish Intercollegiate Guidelines Network (SIGN)—Management of osteoporosis and the prevention of fragility fractures (SIGN 142, January 2021) differ. Recommendations in BNF publications are based on the NOGG guideline, and differences with SIGN (2021) have been highlighted.

#### Postmenopausal osteoporosis

[EvGr](#) The oral bisphosphonates alendronic acid p. 728 and risedronate sodium p. 730 are considered as first-line options for most patients with postmenopausal osteoporosis due to their broad spectrum of anti-fracture efficacy. Alendronic acid and risedronate sodium have been shown to reduce occurrence of vertebral, non-vertebral and hip fractures. SIGN (2021) also recommend that ibandronic acid p. 729 may be considered as an alternative oral bisphosphonate. Parenteral bisphosphonates or denosumab p. 734 are alternative options for women who are intolerant of oral bisphosphonates or in whom they are unsuitable, with raloxifene hydrochloride p. 814 or strontium ranelate p. 733 as additional alternative options.

Hormone replacement therapy (HRT) may also be considered as an additional alternative option, but its use is generally restricted to younger postmenopausal women with menopausal symptoms who are at high risk of fractures. This is due to the risk of adverse effects such as cardiovascular disease and cancer in older postmenopausal women and women on long-term HRT therapy. SIGN (2021) also recommend tibolone p. 819 as an option in younger postmenopausal women, particularly those with menopausal symptoms.

Teriparatide p. 734 is reserved for postmenopausal women with severe osteoporosis at very high risk of fractures, particularly vertebral fractures. SIGN (2021) also recommend romosozumab p. 736 as an option for postmenopausal women with severe osteoporosis who have previously experienced a fragility fracture and are at imminent risk of another (within 24 months). In postmenopausal women with at least one severe or two moderate low-trauma vertebral fractures, teriparatide or romosozumab are recommended over oral bisphosphonates. [▲](#)

#### Glucocorticoid-induced osteoporosis

Glucocorticoid treatment is strongly associated with bone loss and increased risk of fractures. The greatest rate of bone loss occurs early after initiation of glucocorticoids and increases with the dose and duration of therapy. [EvGr](#) Bone-protection treatment should be started at the onset of glucocorticoid treatment in patients who are at high risk of a fracture.

Women aged  $\geq 70$  years, OR with a previous fragility fracture, OR who are taking large doses of glucocorticoids (prednisolone  $\geq 7.5$  mg daily or equivalent) should be considered for bone-protection treatment. Men aged  $\geq 70$  years with a previous fragility fracture, OR who are taking large doses of glucocorticoids, should also be considered for treatment. For some premenopausal women and younger men (particularly those with a previous history

of fracture or who are receiving large doses of glucocorticoids), bone-protection treatment may be appropriate. SIGN (2021) recommends that bone-protection treatment should be considered in all men and women taking large doses of glucocorticoids (prednisolone  $\geq 7.5$  mg daily or equivalent) for 3 months or longer.

The oral bisphosphonates alendronic acid or risedronate sodium are first-line treatment options. Zoledronic acid p. 732, denosumab or teriparatide are alternative options in patients intolerant of oral bisphosphonates or in whom they are unsuitable.

If glucocorticoid treatment is stopped, the need to continue bone-protection treatment should be reviewed. However, bone-protection treatment should be continued with long-term glucocorticoid treatment. Complex cases of glucocorticoid-induced osteoporosis should be referred to a specialist. [▲](#)

#### Osteoporosis in men

[EvGr](#) The oral bisphosphonates alendronic acid or risedronate sodium are recommended as first-line treatments for osteoporosis in men. Zoledronic acid or denosumab are alternatives in men who are intolerant of oral bisphosphonates or in whom they are unsuitable; teriparatide or strontium ranelate are additional alternative options. [▲](#)

Men having androgen deprivation therapy for prostate cancer have an increased fracture risk. [EvGr](#) Fracture risk assessment should be considered when starting this therapy. A bisphosphonate can be offered to men with confirmed osteoporosis; denosumab may be considered as an alternative if bisphosphonates are unsuitable or not tolerated. [▲](#)

#### Bisphosphonates: treatment duration

[EvGr](#) Some patients may benefit from a bisphosphonate-free period as their therapeutic effects last for some time after cessation of treatment, although there is limited evidence to support this.

Bisphosphonate treatment should be reviewed after 5 years of treatment with alendronic acid, risedronate sodium or ibandronic acid, and after 3 years of treatment with zoledronic acid. Based on fracture-risk assessment, continuation beyond this period can generally be recommended for patients who are over 75 years of age, have a history of previous hip or vertebral fracture, have had one or more fragility fractures during treatment, or who are taking long-term glucocorticoid treatment. Due to limited evidence, recommendations on duration are based on limited extension studies in postmenopausal women. There is no evidence for treatment beyond 10 years; management of these patients should be on a case-by-case basis with specialist input as appropriate. [▲](#)

Calcitriol, p. 1178

## ANABOLIC STEROIDS

## Nandrolone

22-Jul-2021

## ● INDICATIONS AND DOSE

**Osteoporosis in postmenopausal women (but not recommended)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult (female): 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1: nandrolone
- **SIDE-EFFECTS** Clitoris enlarged · dysphonia · hepatic disorders · hepatic neoplasm · hirsutism · hypertension · libido increased · nausea · oedema · skin reactions · sodium retention · urine flow decreased · virilism (with high doses including voice changes - sometimes irreversible)
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (discontinue treatment if hepatic function worsens or if oedema, with or without congestive heart failure, develops).
- **RENAL IMPAIRMENT**  Use with caution (increased risk of fluid retention and heart failure). 
- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

- ▶ **Deca-Durabolin** (Aspen Pharma Trading Ltd)

**Nandrolone decanoate 50 mg per 1 ml** Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule  £3.17 DT = £3.17 

## BISPHOSPHONATES

Bisphosphonates 

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for

patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients with cancer and patients with poor dental status should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients at Risk of Medication-related Osteonecrosis of the Jaw: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, March 2017 (available at [www.sdcep.org.uk/published-guidance/medication-related-osteonecrosis-of-the-jaw/](http://www.sdcep.org.uk/published-guidance/medication-related-osteonecrosis-of-the-jaw/)).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

## ● CAUTIONS

- ▶ Elderly with oral use Prescription potentially inappropriate (STOPP criteria) in patients with a current or recent history of upper gastrointestinal disease or bleeding (risk of relapse/exacerbation of oesophagitis, oesophageal ulcer or oesophageal stricture). See also Prescribing in the elderly p. 29.

## ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Anaphylactic reaction · angioedema · bronchospasm · oesophageal stenosis (discontinue) · osteonecrosis

- ▶ **Rare or very rare** Atypical femur fracture · Stevens-Johnson syndrome
- **PATIENT AND CARER ADVICE**  
Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.  
Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.  
Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

727

## Alendronic acid (Alendronate)

21-Jul-2021

### ● INDICATIONS AND DOSE

#### Treatment of postmenopausal osteoporosis

##### ▶ BY MOUTH

- ▶ Adult (female): 10 mg daily, alternatively 70 mg once weekly.

#### Treatment of osteoporosis in men

##### ▶ BY MOUTH

- ▶ Adult (male): 10 mg daily.

#### Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

##### ▶ BY MOUTH

- ▶ Adult (female): 10 mg daily.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Gastrointestinal disorders · joint swelling · vertigo
  - ▶ **Uncommon** Haemorrhage
  - ▶ **Rare or very rare** Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- SIDE-EFFECTS, FURTHER INFORMATION** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**  Avoid if creatinine clearance less than 35 mL/minute.  See p. 21.
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on

an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.  
Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

### Oral solution

#### ▶ Alendronic acid (Non-proprietary)

Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose  £31.56 DT = £30.07

### Effervescent tablet

#### ▶ Binosto (Thornton & Ross Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet  £11.60 DT = £11.60

### Tablet

#### ▶ Alendronic acid (Non-proprietary)

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet  £7.68 DT = £5.29

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet  £22.80 DT = £0.74

#### ▶ Fosamax Once Weekly (Organon Pharma (UK) Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet  £22.80 DT = £0.74

## Alendronic acid with colecalciferol

12-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid above, colecalciferol p. 1179.

### ● INDICATIONS AND DOSE

#### Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency

##### ▶ BY MOUTH

- ▶ Adult (female): 1 tablet once weekly.

- **INTERACTIONS** → Appendix 1: bisphosphonates · vitamin D substances
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- ▶ **Alendronic acid with colecalciferol (Non-proprietary)**

**Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg** Alendronic acid 70mg / Colecalciferol 70microgram tablets | 4 tablet [PoM] £22.80 DT = £22.80

- ▶ **Bentex** (Consilient Health Ltd)

**Colecalciferol 140 microgram, Alendronic acid (as Alendronate sodium) 70 mg** Bentex 70mg/5,600unit tablets | 4 tablet [PoM] £4.25 DT = £4.25

- ▶ **Fosavance** (Organon Pharma (UK) Ltd)

**Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg** Fosavance tablets | 4 tablet [PoM] £22.80 DT = £22.80

F 727

27-Oct-2021

## Ibandronic acid

- **INDICATIONS AND DOSE**

### Reduction of bone damage in bone metastases in breast cancer

- ▶ **INITIALLY BY MOUTH**

- ▶ **Adult:** 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

### Hypercalcaemia of malignancy

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

### Treatment of postmenopausal osteoporosis

- ▶ **INITIALLY BY MOUTH**

- ▶ **Adult (female):** 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

- **CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS** Hypocalcaemia

**SPECIFIC CONTRA-INDICATIONS**

- ▶ With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)

- **CAUTIONS**

**GENERAL CAUTIONS** Atypical femoral fractures

**SPECIFIC CAUTIONS**

- ▶ With intravenous use Cardiac disease (avoid fluid overload)
- ▶ With oral use Upper gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Acute phase reaction
- ▶ **Uncommon** Asthma exacerbated
- ▶ **Rare or very rare** Face oedema

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
  - ▶ With intravenous use Bundle branch block · cataract · increased risk of infection · joint disorder · oral disorders · osteoarthritis · parathyroid disorder · thirst
  - ▶ With oral use Gastrointestinal disorders · muscle cramps · musculoskeletal stiffness
- ▶ **Uncommon**
  - ▶ With intravenous use Acrochordon · affective disorder · altered smell sensation · anxiety · blood disorder · cardiovascular disorder · cerebrovascular disorder · cholelithiasis · cystitis · deafness · hyperaesthesia · hypothermia · injury · memory loss · migraine · muscle tone increased · myocardial ischaemia · palpitations · pelvic pain · pulmonary oedema · radiculopathy · renal cyst · sleep disorder · stridor · thrombophlebitis · urinary retention · weight decreased
- ▶ **Rare or very rare**
  - ▶ With intravenous use Anaphylactic shock

- ▶ **Frequency not known**

- ▶ With oral use Oesophagitis erosive (discontinue)

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** [EvGr] When used for postmenopausal osteoporosis, avoid if creatinine clearance less than 30 mL/minute. (M)

**Dose adjustments** See p. 21.

- ▶ With intravenous use [EvGr] When used for bone metastases, if creatinine clearance 30–49 mL/minute reduce dose to 4 mg; if creatinine clearance less than 30 mL/minute reduce dose to 2 mg. Dilute requisite dose in 500 mL infusion fluid and give over 1 hour. (M)

- ▶ With oral use [EvGr] When used for bone metastases, if creatinine clearance 30–49 mL/minute reduce dose to 50 mg on alternative days; if creatinine clearance less than 30 mL/minute reduce dose to 50 mg once weekly. (M)

- **MONITORING REQUIREMENTS** Monitor renal function and serum calcium, phosphate and magnesium.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturers advise tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for *Bonviva*<sup>®</sup> tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For intravenous infusion (*Bondronat*<sup>®</sup>), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; for hypercalcaemia of malignancy, dilute requisite dose in 500 mL infusion fluid and give over 2 hours. For the reduction of bone damage in bone metastases, dilute requisite dose in 100 mL infusion fluid and give over at least 15 minutes.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

Patient reminder card A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

F 727

**Pamidronate disodium**

21-Jul-2021

(Formerly called  
**aminohydroxypropylidenediphosphonate  
disodium (APD)**)

● **INDICATIONS AND DOSE****Hypocalcaemia of malignancy**▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

**Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma**▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

**Paget's disease of bone**▶ **BY INTRAVENOUS INFUSION**

▶ **Adult:** 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

● **CAUTIONS** Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

● **INTERACTIONS** → Appendix 1: bisphosphonates

● **SIDE-EFFECTS**

- ▶ **Common or very common** Decreased leucocytes · drowsiness · flushing · hypertension · insomnia · paraesthesia · tetany · thrombocytopenia
- ▶ **Uncommon** Agitation · dyspnoea · hypotension · muscle cramps · seizure
- ▶ **Rare or very rare** Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
- ▶ **Frequency not known** Atrial fibrillation

**SIDE-EFFECTS, FURTHER INFORMATION** Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (no information available).

● **RENAL IMPAIRMENT**

**Dose adjustments** [EvGr] Max. infusion rate 20 mg/hour.

Avoid if creatinine clearance less than 30 mL/minute, except in life-threatening hypercalcaemia if benefit outweighs risk. ⚠ See p. 21.

[EvGr] If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. ⚠

● **MONITORING REQUIREMENTS**

- ▶ Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- ▶ Assess renal function before each dose.

● **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous infusion* (*Pamidronate disodium*, Hospira, Medac, Wockhardt), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Pamidronate disodium* (Medac, Hospira, Wockhardt), manufacturer advises dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

● **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**▶ **Pamidronate disodium (Non-proprietary)**

**Pamidronate disodium 3 mg per 1 ml** Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 (Hospital only)

Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial [PoM] £55.00-£59.66 (Hospital only)

Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only)

Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)

**Pamidronate disodium 9 mg per 1 ml** Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial [PoM] £170.45 (Hospital only)

**Pamidronate disodium 15 mg per 1 ml** Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule [PoM] £119.32  
Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule [PoM] £119.32

Pamidronate disodium 90mg/6ml solution for infusion ampoules | 1 ampoule [PoM] £170.46 DT = £170.46

Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoule [PoM] £119.32

F 727

**Risedronate sodium**

21-Jul-2021

● **INDICATIONS AND DOSE****Paget's disease of bone**▶ **BY MOUTH**

▶ **Adult:** 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

**Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

## ► BY MOUTH

- Adult (female): 5 mg daily, alternatively 35 mg once weekly.

**Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women**

## ► BY MOUTH

- Adult (female): 5 mg daily.

**Treatment of osteoporosis in men at high risk of fractures**

## ► BY MOUTH

- Adult (male): 35 mg once weekly.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia) · upper gastrointestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Uncommon** Gastrointestinal disorders
  - **Rare or very rare** Glossitis
  - **Frequency not known** Amblyopia · apnoea · chest pain · corneal lesion · dry eye · hypersensitivity · hypersensitivity vasculitis · increased risk of infection · leg cramps · liver disorder · muscle weakness · neoplasms · nocturia · tinnitus · toxic epidermal necrolysis · weight decreased
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 30 mL/minute. [⚠](#) See p. 21.
- **MONITORING REQUIREMENTS**
  - Correct hypocalcaemia before starting.
  - Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets. Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - Bisphosphonates for treating osteoporosis (updated July 2019) NICE TA464 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**► **Risedronate sodium (Non-proprietary)**

**Risedronate sodium 5 mg** Risedronate sodium 5mg tablets | 28 tablet [PoM](#) £24.78 DT = £18.88

**Risedronate sodium 30 mg** Risedronate sodium 30mg tablets | 28 tablet [PoM](#) £155.28 DT = £155.28

**Risedronate sodium 35 mg** Risedronate sodium 35mg tablets | 4 tablet [PoM](#) £19.12 DT = £1.28

- **Actonel** (Accord Healthcare Ltd, Teva UK Ltd)  
**Risedronate sodium 5 mg** Actonel 5mg tablets | 28 tablet [PoM](#) £17.99 DT = £18.88
- Risedronate sodium 35 mg** Actonel Once a Week 35mg tablets | 4 tablet [PoM](#) £19.12 DT = £1.28
- Actonel 35mg tablets | 4 tablet [PoM](#) [Ⓢ](#) DT = £1.28

**Risedronate with calcium carbonate and colecalciferol**

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 730, calcium carbonate p. 1138, colecalciferol p. 1179.

● **INDICATIONS AND DOSE****Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

## ► BY MOUTH

- Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

- **INTERACTIONS** → Appendix 1: bisphosphonates · calcium salts · vitamin D substances
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Manufacturer advises granules should be stirred into a glass of water and after dissolution complete taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** *Actonel Combi*<sup>®</sup> effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca<sup>2+</sup> 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate with calcium carbonate and colecalciferol tablets and granules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Form unstacked**

- **Actonel Combi** (Theramex HQ UK Ltd)  
Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply [PoM](#) £19.12

727

**Sodium clodronate**

05-Aug-2021

● **INDICATIONS AND DOSE****Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

## ► BY MOUTH

- Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520<sup>®</sup>**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

## ► BY MOUTH

- Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

- **CONTRA-INDICATIONS** Acute severe gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment · upper gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates
  - **SIDE-EFFECTS** Proteinuria · respiratory disorder
  - **PREGNANCY** Avoid.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.  
**Dose adjustments** See p. 21.  
 Manufacturer advises reduce dose to 1200 mg daily if creatinine clearance 30–50 mL/minute (consult product literature).  
 Manufacturer advises use half normal dose if creatinine clearance 10–30 mL/minute.
  - **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
  - **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid food or fluids (other than plain water) for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
  - **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.
- 
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## CAUTIONARY AND ADVISORY LABELS 10

F 727

**Zoledronic acid**

20-Jul-2021

● **INDICATIONS AND DOSE****Prevention of skeletal related events in advanced malignancies involving bone (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 4 mg every 3–4 weeks, calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Tumour-induced hypercalcaemia (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 4 mg for 1 dose

**Paget's disease of bone (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 5 mg for 1 dose, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

**Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: 5 mg once yearly as a single dose, in patients with a recent low-trauma hip fracture, the dose should be given at least 2 weeks after hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D

**Fracture prevention in osteopenia (hip or femoral neck)**

- ▶ BY INTRAVENOUS INFUSION

▶ Elderly (female): 5 mg once every 18 months as a single dose.

- **UNLICENSED USE** [E<sub>VG</sub>R](#) Zoledronic acid is used for fracture prevention in women with osteopenia, [A](#) but is not licensed for this indication.

- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function

- **INTERACTIONS** → Appendix 1: bisphosphonates

● **SIDE-EFFECTS**

- ▶ **Common or very common** Flushing

▶ **Uncommon** Anaphylactic shock · anxiety · arrhythmias · chest pain · circulatory collapse · cough · drowsiness · dry mouth · dyspnoea · haematuria · hyperhidrosis · hypertension · hypotension · leucopenia · muscle spasms · proteinuria · respiratory disorders · sensation abnormal · sleep disorder · stomatitis · syncope · thrombocytopenia · tremor · vision blurred · weight increased

- ▶ **Rare or very rare** Confusion · Fanconi syndrome acquired · pancytopenia

- ▶ **Frequency not known** Acute phase reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (limited information available).

- **RENAL IMPAIRMENT** [E<sub>VG</sub>R](#) Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if creatinine clearance less than 30 mL/minute (or if serum creatinine greater than 265 micromol/litre). Avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if creatinine clearance less than 35 mL/minute. [M](#)

**Dose adjustments** [E<sub>VG</sub>R](#) In advanced malignancies involving bone, if creatinine clearance 50–60 mL/minute reduce dose to 3.5 mg every 3–4 weeks; if creatinine clearance 40–50 mL/minute reduce dose to 3.3 mg every 3–4 weeks; if creatinine clearance 30–40 mL/minute reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. [M](#) See p. 21.

● **MONITORING REQUIREMENTS**

- ▶ Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.

▶ Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ When used for Prevention of skeletal related events in advanced malignancies involving bone or Tumour-induced hypercalcaemia For *intravenous infusion*, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line. If using 4 mg/5 mL concentrate for solution for infusion or preparing a reduced dose of 4 mg/100 mL solution for infusion for patients with renal impairment, dilute requisite dose according to product literature.

▶ When used for Paget's disease of bone or Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women For *intravenous infusion*, give via a vented infusion line over at least 15 minutes.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

#### ● INDICATIONS AND DOSE

##### Hypercalcaemia of malignancy

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

##### Paget's disease of bone

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional

circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

#### Prevention of acute bone loss due to sudden immobility

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- **CONTRA-INDICATIONS** Hypocalcaemia

- **CAUTIONS** History of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

- **INTERACTIONS** → Appendix 1: calcitonins

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · diarrhoea · dizziness · fatigue · flushing · headache · musculoskeletal pain · nausea · secondary malignancy (long term use) · taste altered · vomiting
- ▶ **Uncommon** Hypersensitivity · hypertension · influenza like illness · oedema · polyuria · skin reactions · visual impairment
- ▶ **Rare or very rare** Bronchospasm · throat swelling · tongue swelling
- ▶ **Frequency not known** Hypocalcaemia · tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid; inhibits lactation in *animals*.
- **RENAL IMPAIRMENT** [EvGr](#) Use with caution in end-stage renal disease (reduced renal metabolism; limited information available). [⚠](#)
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion*, manufacturer advises give intermittently in Sodium Chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Calcitonin (salmon) (Non-proprietary)

**Calcitonin (salmon) 50 unit per 1 ml** Calcitonin (salmon) 50units/1ml solution for injection ampoules | 5 ampoule [PoM](#) £167.50 DT = £167.50

**Calcitonin (salmon) 100 unit per 1 ml** Calcitonin (salmon) 100units/1ml solution for injection ampoules | 5 ampoule [PoM](#) £220.00 DT = £220.00

**Calcitonin (salmon) 200 unit per 1 ml** Calcitonin (salmon) 400units/2ml solution for injection vials | 1 vial [PoM](#) £352.00

### Strontium ranelate

09-Oct-2020

- **DRUG ACTION** Strontium ranelate stimulates bone formation and reduces bone resorption.

#### ● INDICATIONS AND DOSE

**Severe osteoporosis in men and postmenopausal women at increased risk of fractures [when other treatments are contra-indicated or not tolerated] (initiated by a specialist)**

▶ BY MOUTH

- ▶ Adult: 2 g once daily, dose to be taken in water and at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or permanent immobilisation · uncontrolled hypertension

- **CAUTIONS** Risk factors for cardiovascular disease—assess before and every 6–12 months during treatment · Risk factors for venous thromboembolism (discontinue in patients who become immobile)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of cardiovascular events · Manufacturer advises treatment should be stopped if ischaemic heart disease, peripheral arterial disease, or cerebrovascular disease develops, or if hypertension is uncontrolled.

- **INTERACTIONS** → Appendix 1: strontium

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · arthralgia · bronchial hyperreactivity · consciousness impaired · constipation · diarrhoea · dizziness · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatitis · hypercholesterolaemia · insomnia · memory loss · muscle complaints · myocardial infarction · nausea · pain · paraesthesia · peripheral oedema · skin reactions · vertigo · vomiting

- ▶ **Uncommon** Alopecia · confusion · dry mouth · fever · lymphadenopathy · malaise · oral disorders · seizure

- ▶ **Rare or very rare** Bone marrow failure · eosinophilia · severe cutaneous adverse reactions (SCARs)

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—data suggest present in human milk.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute. See p. 21.

- **EFFECT ON LABORATORY TESTS** Manufacturer advises may interfere with colorimetric assay of calcium in blood and urine—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Granules should be stirred into at least 30 mL of water, and taken immediately at bedtime on an empty stomach; avoid food for at least 2 hours before treatment, particularly calcium-containing products e.g. milk.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer strontium ranelate granules.

Severe allergic reactions · Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Granules

EXCIPIENTS: May contain Aspartame

- ▶ **Strontium ranelate (Non-proprietary)**

Strontium ranelate 2 gram · Strontium ranelate 2g granules sachets sugar free sugar-free | 28 sachet [PoM] £149.91 DT = £149.91

## CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

### Teriparatide

01-Jun-2021

#### ● INDICATIONS AND DOSE

**Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

- **CONTRA-INDICATIONS** Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · asthenia · chest pain · depression · dizziness · dyspnoea · gastrointestinal disorders · headache · hypercholesterolaemia · hyperhidrosis · hypotension · muscle complaints · nausea · pain · palpitations · sciatica · syncope · vertigo · vomiting
- ▶ **Uncommon** Arthralgia · emphysema · hypercalcaemia · hyperuricaemia · nephrolithiasis · tachycardia · urinary disorders · weight increased

- ▶ **Rare or very rare** Oedema · renal impairment · urticaria generalised

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **RENAL IMPAIRMENT** [EvGr] Caution in moderate impairment; avoid if severe. (M)

- **PRESCRIBING AND DISPENSING INFORMATION** Teriparatide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

#### NICE decisions

- ▶ Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA161 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Teriparatide (Non-proprietary)**

Teriparatide 250 microgram per 1 ml · Teriparatide 600micrograms/2.4ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £231.10 DT = £271.88

Terroso 20micrograms/80microlitres solution for injection 2.4ml cartridge with pen | 1 cartridge [PoM] £239.25

## DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

### Denosumab

04-Nov-2020

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

#### ● INDICATIONS AND DOSE

PROLIA®

**Osteoporosis in postmenopausal women and in men at increased risk of fractures | Bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures | Bone loss associated with long-term systemic glucocorticoid therapy in patients at increased risk of fracture**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 60 mg every 6 months, supplement with calcium and Vitamin D, to be administered into the thigh, abdomen or upper arm

**XGEVA®****Prevention of skeletal related events in patients with bone metastases**

## ► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

**Giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity**

## ► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)**

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW; MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)**

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

**Osteonecrosis of the jaw** Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (osteoporosis indication)
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental

mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

**Hypocalcaemia** Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
  - within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
  - if suspected symptoms of hypocalcaemia occur
- All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

**MHRA/CHM ADVICE: DENOSUMAB: REPORTS OF OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (JUNE 2017)**

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

**MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR GIANT CELL TUMOUR OF BONE: RISK OF CLINICALLY SIGNIFICANT HYPERCALCAEMIA FOLLOWING DISCONTINUATION (JUNE 2018)**

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 9 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation, consider periodic assessment of serum calcium, re-evaluate the patient's calcium and vitamin D supplementation requirements, and advise patients to report symptoms of hypercalcaemia.

Denosumab is not recommended in patients with growing skeletons.

**MHRA/CHM ADVICE: DENOSUMAB (XGEVA®) FOR ADVANCED MALIGNANCIES INVOLVING BONE: STUDY DATA SHOW NEW PRIMARY MALIGNANCIES REPORTED MORE FREQUENTLY COMPARED TO ZOLEDRONIC ACID (ZOLEDRONATE) (JUNE 2018)**

A pooled analysis has shown an increased rate of new primary malignancies in patients given Xgeva® (1-year cumulative incidence 1.1%) compared with those given zoledronic acid (0.6%), when used for the prevention of skeletal-related events with advanced malignancies involving bone. No treatment-related pattern in individual cancers or cancer groups were apparent.

**MHRA/CHM ADVICE: DENOSUMAB 60 MG (PROLIA®): INCREASED RISK OF MULTIPLE VERTEBRAL FRACTURES AFTER STOPPING OR DELAYING ONGOING TREATMENT (AUGUST 2020)**

Cases of multiple vertebral fractures have been reported in patients within 18 months of discontinuation or interruption of ongoing denosumab 60 mg treatment for osteoporosis. The MHRA advises healthcare professionals not to discontinue denosumab without a specialist review, and to evaluate patients' individual risk and benefit factors before initiating treatment, particularly in those at increased risk of vertebral fractures (such as patients with previous vertebral fracture). Healthcare professionals should re-evaluate the need for continued treatment periodically based on expected benefits and potential risks of treatment on an individual basis, particularly after 5 or more years of use.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **XGEVA®** Unhealed lesions from dental or oral surgery
- **CAUTIONS** Risk factors for osteonecrosis of the external auditory canal · risk factors for osteonecrosis of the jaw—consider temporary interruption of denosumab if occurs during treatment
- **PROLIA®**
  - ▶ When used for osteoporosis in postmenopausal women Rebound increase in bone turnover on discontinuation (increased risk of fracture)
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Rebound increase in bone turnover on discontinuation
  - ▶ When used for osteoporosis in postmenopausal women [EvGr](#) Following discontinuation, transition to an alternative antiresorptive therapy should be considered to prevent rebound increase in bone turnover, bone loss and increased fracture risk. [⚠](#)
- **INTERACTIONS** → Appendix 1: denosumab
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal discomfort · cataract · constipation · hypocalcaemia (including fatal cases) · increased risk of infection · pain · sciatica · second primary malignancy · skin reactions
  - ▶ **Uncommon** Cellulitis (seek prompt medical attention) · hypercalcaemia (on discontinuation)
  - ▶ **Rare or very rare** Atypical femur fracture · hypersensitivity · osteonecrosis
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies; risk of toxicity increases with each trimester.
- **BREAST FEEDING** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute, see p. 21.
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- **PATIENT AND CARER ADVICE**
  - ▶ **Atypical femoral fractures** Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.
  - ▶ **Osteonecrosis of the jaw** All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.
  - ▶ **Hypocalcaemia** All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

Patient reminder card A patient reminder card should be provided (risk of osteonecrosis of the jaw).

#### PROLIA®

##### Missed doses

- ▶ When used for osteoporosis in postmenopausal women [EvGr](#) Treatment should be given within 1 month of scheduled date. [⚠](#)

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

##### NICE decisions

- ▶ **Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)** NICE TA204 Recommended with restrictions
- ▶ **Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012)** NICE TA265 Recommended with restrictions
- **Scottish Medicines Consortium (SMC) decisions**
  - ▶ **Denosumab (Prolia®) for osteoporosis in postmenopausal women at increased risk of fractures (December 2010)** SMC No. 651/10 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sorbitol

##### ▶ Prolia (Amgen Ltd)

**Denosumab 60 mg per 1 ml** Prolia 60mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £183.00 DT = £183.00

##### ▶ Xgeva (Amgen Ltd)

## Romosozumab

03-Dec-2020

- **DRUG ACTION** Romosozumab is a humanised monoclonal antibody that inhibits sclerostin, thereby increasing bone formation and decreasing bone resorption.

#### ● INDICATIONS AND DOSE

##### Severe osteoporosis in postmenopausal women at increased risk of fractures (specialist use only)

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 210 mg once a month for 12 months, supplement with calcium and vitamin D, to be administered as two consecutive 105 mg injections at different injection sites into the thigh, abdomen or upper arm
- **CONTRA-INDICATIONS** History of myocardial infarction or stroke—discontinue if occurs during treatment · hypocalcaemia
- **CAUTIONS** Risk factors for cardiovascular disease · risk factors for osteonecrosis of the jaw—consider temporary interruption of romosozumab if occurs during treatment
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · headache · hypersensitivity · increased risk of infection · muscle spasms · neck pain · skin reactions
  - ▶ **Uncommon** Cataract · hypocalcaemia · myocardial infarction · stroke
  - ▶ **Rare or very rare** Angioedema
  - ▶ **Frequency not known** Atypical femur fracture · cardiovascular event · osteonecrosis of jaw
- **RENAL IMPAIRMENT** Manufacturer advises monitor serum calcium concentration in patients with severe renal impairment, or in those receiving dialysis—increased risk of hypocalcaemia.
- **MONITORING REQUIREMENTS** Manufacturer advises to correct hypocalcaemia before therapy is initiated. Monitor for signs and symptoms of hypocalcaemia during therapy.

**● PRESCRIBING AND DISPENSING INFORMATION**

Romosozumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

The manufacturer of *Evenity*<sup>®</sup> has provided a *Prescriber Guide*.

**● HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside the refrigerator.

**● PATIENT AND CARER ADVICE**

Atypical femoral fractures. Manufacturer advises patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment.

Osteonecrosis of the jaw. Manufacturer advises patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling. Hypocalcaemia. Manufacturer advises patients should be advised to report symptoms of hypocalcaemia.

Patients should receive a package leaflet and patient alert card.

## 3 Corticosteroid responsive conditions

### CORTICOSTEROIDS

#### Corticosteroids, general use

22-Mar-2022

**Overview**

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective, corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 744 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 744 and fludrocortisone acetate is of benefit in adrenal insufficiency resulting from septic shock.

Dexamethasone p. 743 and betamethasone p. 742 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 25). However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

Corticosteroids are no longer recommended for the routine emergency treatment of anaphylaxis. For guidance on the management of anaphylaxis, see Antihistamines, allergen immunotherapy and allergic emergencies p. 299.

[EVR](#) Corticosteroids are preferably used by inhalation in the management of asthma and chronic obstructive pulmonary disease (COPD). Systemic therapy along with bronchodilators is required for treatment of acute asthma attacks, in some very severe cases of chronic asthma, and exacerbations of COPD. [A](#)

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in palliative care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

**Side-effects**

**MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)**

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider

referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

#### Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

#### Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae
- in addition high doses are associated with avascular necrosis of the femoral head
- muscle wasting (proximal myopathy) can also occur
- corticosteroid therapy is also weakly linked with peptic ulceration and perforation
- psychiatric reactions may also occur

#### Managing side-effects

Side-effects can be minimised by using the lowest effective dose for the minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

For information on the cessation of oral corticosteroid treatment, see *Treatment cessation*, for systemic corticosteroids (e.g. prednisolone p. 747).

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk.

For guidance on the management of adrenal insufficiency and adrenal crisis (acute adrenal insufficiency), see Adrenal insufficiency below.

systems such as those involved in metabolic activity, water and electrolyte balance, and the body's response to stress. Symptoms of adrenal insufficiency can be mild, non-specific, and may include fatigue, gastrointestinal upset, anorexia, weight loss, musculoskeletal symptoms, salt cravings, and dizziness or syncope due to hypotension.

Adrenal insufficiency is classified as either primary, secondary, or tertiary, and results from disorders that affect the adrenal cortex (e.g. Addison's disease, congenital adrenal hyperplasia), the anterior pituitary gland (e.g. pituitary tumour or subarachnoid haemorrhage), or the hypothalamus (e.g. HPA axis suppression), respectively.

Some drugs can also cause adrenal insufficiency, with the systemic use of glucocorticoids being the most common cause due to suppression of the HPA axis. If glucocorticoids are stopped or decreased too quickly after prolonged use, endogenous glucocorticoid production may not be sufficient to meet the body's needs. Some patients on glucocorticoid therapy (oral, inhaled, topical, intranasal, and intra-articular) are at particular risk of adrenal insufficiency. For further information on those at risk, see The Society for Endocrinology Steroid Emergency Card Working Group and Specialist Pharmacy Services guidance: **Exogenous steroids, adrenal insufficiency and adrenal crisis—who is at risk and how should they be managed safely** (see *Useful resources*).

Adrenal insufficiency can lead to adrenal crisis (acute adrenal insufficiency) if not identified and treated. Adrenal crisis can also occur in patients at risk of adrenal insufficiency when glucocorticoid levels are insufficient, such as when exogenous glucocorticoids have been omitted, delayed, or given at inadequate doses. This may occur particularly during times of increased need (e.g. surgery, infection, or trauma) as patients are unable to mount a stress response by increasing endogenous glucocorticoid production. Life-threatening symptoms such as severe dehydration, hypotension, hypovolaemic shock, altered consciousness, seizures, stroke, or cardiac arrest may develop; if left untreated, adrenal crisis may lead to death or permanent disability.

### NHS Improvement Patient Safety Alert: Steroid Emergency Card to support early recognition and treatment of adrenal crisis in adults (August 2020)

A patient-held **Steroid Emergency Card** has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card. For further information, see NHS Improvement Patient Safety Alert: **Steroid Emergency Card to support early recognition and treatment of adrenal crisis in adults** (available at: [www.england.nhs.uk/publication/national-patient-safety-alert-steroid-emergency-card-to-support-early-recognition-and-treatment-of-adrenal-crisis-in-adults/](http://www.england.nhs.uk/publication/national-patient-safety-alert-steroid-emergency-card-to-support-early-recognition-and-treatment-of-adrenal-crisis-in-adults/)).

The Steroid Treatment Card is unaffected by the introduction of the Steroid Emergency Card. For further information on the Steroid Emergency Card and Steroid Treatment Card, see *Patient and Carer advice* in drug monographs.

#### Aims of treatment

Treatment aims to reduce symptoms, reduce the risk of complications such as adrenal crisis, and to improve overall quality of life.

## Adrenal insufficiency

22-Mar-2022

### Description of condition

Adrenal insufficiency occurs as a result of inadequate production of steroid hormones in the adrenal cortex of the adrenal glands. Glucocorticoids (e.g. cortisol) and mineralocorticoids (e.g. aldosterone) are the two main groups of steroid hormones produced by the adrenal cortex; their production is primarily regulated by the hypothalamic-pituitary-adrenal (HPA) axis and renin-angiotensin system, respectively. These hormones affect a number of body

## Management of adrenal insufficiency

Recommendations on the management of adrenal insufficiency are from the *Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee—Guidance for the prevention and emergency management of adult patients with adrenal insufficiency (July 2020)*.

If adrenal crisis (acute adrenal insufficiency) is suspected, prompt treatment should be given without delay. For further information, see *Adrenal Crisis*.

Adrenal insufficiency is treated by physiological glucocorticoid replacement with mainly hydrocortisone p. 744 (most similar to cortisol), prednisolone, and rarely dexamethasone. Patients with primary adrenal insufficiency usually also require mineralocorticoid replacement with fludrocortisone acetate p. 744 due to aldosterone deficiency.

Some patients, usually those with secondary or tertiary adrenal insufficiency, including treatment with exogenous steroids or other drugs (such as some antifungals and antiretroviral medication), may have a suboptimal cortisol response but do not require maintenance glucocorticoid replacement.

### Glucocorticoid replacement during stress

All patients with adrenal insufficiency and patients considered to be at risk of adrenal insufficiency should be educated on the importance of 'stress' glucocorticoid doses (increased doses) for the prevention of adrenal crisis during times of stress (e.g. surgical or invasive procedures), in order to maintain cortisol levels as close to the physiological concentration as possible. Patients with adrenal insufficiency who do not usually require maintenance glucocorticoids should still be advised of the likely need for glucocorticoid replacement during times of stress.

In patients with adrenal insufficiency and intercurrent illness, 'sick day rules' should be followed. For patients who are unwell with moderate intercurrent illness (e.g. fever or infection requiring antibacterials), the patient's daily glucocorticoid dose should generally be doubled. Patients with adrenal insufficiency on long-acting hydrocortisone preparations should switch to short-acting, more rapidly absorbed preparations during an intercurrent illness. For severe intercurrent illness (e.g. persistent vomiting from gastrointestinal viral illnesses), intramuscular or intravenous hydrocortisone should be given. Patients with adrenal insufficiency are at higher risk of glucocorticoid deficiency if they are vomiting or have diarrhoea. Patients with established adrenal insufficiency and their family/carers should be provided with a hydrocortisone emergency injection kit, be trained in the administration of intramuscular hydrocortisone, and advised to go to hospital if vomiting or diarrhoeal illness persist.

For further information on the management of patients who are undergoing surgery or an invasive procedure, or those with intercurrent illness, see the *Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee: Guidance for the prevention and emergency management of adult patients with adrenal insufficiency* (see *Useful resources*).

For information on glucocorticoid cover during stress and sick day rules for patients on exogenous steroids who are at an increased risk of adrenal insufficiency, see the *Society for Endocrinology Steroid Emergency Card Working Group and Specialist Pharmacy Services guidance: Exogenous steroids, adrenal insufficiency and adrenal crisis—who is at risk and how should they be managed safely* (see *Useful resources*).

## Management of adrenal crisis

Recommendations on the management of adrenal crisis are from the *Royal College of Physicians Patient Safety Committee and Society for Endocrinology Clinical Committee—Guidance*

for the prevention and emergency management of adult patients with adrenal insufficiency (July 2020).

Adrenal crisis (acute adrenal insufficiency) is a medical emergency. All patients who are considered to be at risk of, or suspected of having adrenal crisis should be treated immediately, especially pregnant women; investigations can be initiated once the patient is clinically stable. There is no adverse consequence of initiating a life-saving bolus dose of hydrocortisone treatment.

Treatment involves prompt glucocorticoid replacement with hydrocortisone p. 744, and rehydration using a crystalloid fluid (e.g. sodium chloride 0.9%). For patients usually on fludrocortisone, high-dose hydrocortisone has sufficient mineralocorticoid effect to cover this.

Particular care is required in patients with diabetes insipidus and adrenal insufficiency related to hypothalamic-pituitary disease who are treated with desmopressin, as they are at risk of uncontrolled diabetes insipidus if doses of desmopressin are omitted or hyponatraemia if excess fluid is given.

All patients should be referred to an endocrinologist for advice on ongoing treatment and education around 'sick day rules' prior to hospital discharge.

## Glucocorticoid therapy

### Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 744 is so high that its anti-inflammatory activity is of no clinical relevance.

### Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg

≡ Betamethasone 750 micrograms

≡ Deflazacort 6 mg

≡ Dexamethasone 750 micrograms

≡ Hydrocortisone 20 mg

≡ Methylprednisolone 4 mg

≡ Prednisone 5 mg

≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 744, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency

management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 747 and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 742 and dexamethasone p. 743 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclomethasone dipropionate p. 45 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 742 has a high glucocorticoid activity; it is derived from prednisolone.

BSPED Paediatric Steroid Treatment Card is available at: [www.endocrinology.org/adrenal-crisis](http://www.endocrinology.org/adrenal-crisis).

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

**CONTRA-INDICATIONS, FURTHER INFORMATION** For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · long-term use · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (in children) · osteoporosis (post-menopausal women and the elderly at risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · thromboembolic disorders · ulcerative colitis

**CAUTIONS, FURTHER INFORMATION** For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
  - if used instead of inhaled corticosteroids for maintenance therapy in moderate to severe COPD (unnecessary exposure to long-term side-effects)
  - as long-term (longer than 3 months) monotherapy for rheumatoid arthritis (risk of side-effects)
  - for treatment of osteoarthritis other than for periodic intra-articular injections for monoarticular pain (risk of side-effects)
  - with concurrent NSAIDs without proton pump inhibitor prophylaxis (increased risk of peptic ulcer disease)
 See also Prescribing in the elderly p. 29.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · electrolyte imbalance · fatigue · fluid retention · gastrointestinal discomfort · headache · healing impaired · hirsutism · hypertension · increased risk of infection · menstrual cycle irregularities · mood altered · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · weight increased
  - ▶ **Uncommon** Adrenal suppression · alkalosis hypokalaemic · appetite increased · bone fractures · diabetic control impaired · eye disorders · glaucoma · haemorrhage · heart failure · hyperhidrosis · leucocytosis · myopathy · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
  - ▶ **Rare or very rare** Malaise · tendon rupture
  - ▶ **Frequency not known** Chorioretinopathy · growth retardation (very common in children) · intracranial pressure increased with papilloedema (usually after withdrawal) · telangiectasia
- SIDE-EFFECTS, FURTHER INFORMATION** **Adrenal suppression** During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any

## Corticosteroids (systemic)

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and pericocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

NHS IMPROVEMENT PATIENT SAFETY ALERT: STEROID EMERGENCY CARD TO SUPPORT EARLY RECOGNITION AND TREATMENT OF ADRENAL CRISIS IN ADULTS (AUGUST 2020)

A patient-held **Steroid Emergency Card** has been developed for patients with adrenal insufficiency and steroid dependence who are at risk of adrenal crisis. It aims to support healthcare staff with the early recognition of patients at risk of adrenal crisis and the emergency treatment of adrenal crisis. All eligible patients should be issued a Steroid Emergency Card. Providers that treat patients with acute physical illness or trauma, or who may require emergency treatment, elective surgery, or other invasive procedures, should establish processes to check for risk of adrenal crisis and confirm if the patient has a Steroid Emergency Card.

PAEDIATRIC STEROID TREATMENT CARD FOR CHILDREN WITH ADRENAL INSUFFICIENCY (NOVEMBER 2020)

The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The

significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment.

**Infections** Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

**Psychiatric reactions** Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. **Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.
- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure).

- **RENAL IMPAIRMENT** In general, manufacturers advise caution.
- **MONITORING REQUIREMENTS**
  - ▶ In children The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
- **TREATMENT CESSATION**
  - ▶ In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
    - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
    - been given repeat doses in the evening;
    - received more than 3 weeks' treatment;
    - recently received repeated courses (particularly if taken for longer than 3 weeks);
    - taken a short course within 1 year of stopping long-term therapy;
    - other possible causes of adrenal suppression.
 Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.
    - ▶ During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.
    - ▶ In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
      - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week *or* 2 mg/kg daily for 1 week *or* 1 mg/kg daily for 1 month;
      - been given repeat doses in the evening;
      - received more than 3 weeks' treatment;
      - recently received repeated courses (particularly if taken for longer than 3 weeks);
      - taken a short course within 1 year of stopping long-term therapy;
      - other possible causes of adrenal suppression.
 Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.
      - ▶ During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m<sup>2</sup> daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.
  - **PATIENT AND CARER ADVICE** Advice for patients A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of

potential side-effects including adrenal suppression, immunosuppression, and psychiatric reactions (for further details, see *Side-effects, further information*).

**Steroid Treatment Card** Steroid Treatment Cards should be issued where appropriate to support communication of the risks associated with treatment and to record details of the prescriber, drug, dosage, and duration of treatment.

Steroid treatment cards are available for purchase from the NHS Print online ordering portal [www.nhsforms.co.uk](http://www.nhsforms.co.uk).

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing [stockorders.dppas@apsgroup.co.uk](mailto:stockorders.dppas@apsgroup.co.uk) or by fax on 0131 629 9967.

**Steroid Emergency Card**

- ▶ In adults Steroid Emergency Cards should be issued to patients with adrenal insufficiency and steroid dependence for whom missed doses, illness, or surgery puts them at risk of adrenal crisis. The Royal College of Physicians and the Society for Endocrinology advise that the following patients are considered at risk of adrenal insufficiency and should be given a Steroid Emergency Card:

- those with primary adrenal insufficiency;
- those with adrenal insufficiency due to hypopituitarism requiring corticosteroid replacement;
- those taking corticosteroids at doses equivalent to, or exceeding, prednisolone 5 mg daily for 4 weeks or longer across all routes of administration (oral, topical, inhaled, intranasal, or intra-articular);
- those taking corticosteroids at doses equivalent to, or exceeding, prednisolone 40 mg daily for longer than 1 week, or repeated short oral courses;
- those taking a course of oral corticosteroids within 1 year of stopping long-term therapy.

The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients.

Steroid Emergency Cards are available for purchase from the NHS Print online ordering portal [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or Primary Care Support England (PCSE) online.

Paediatric Steroid Treatment Card for children with adrenal insufficiency

- ▶ In children The British Society for Paediatric Endocrinology and Diabetes (BSPED) has developed a Paediatric Steroid Treatment Card which should be issued to children with adrenal insufficiency and steroid dependence. The card includes a management summary for the emergency treatment of adrenal crisis and can be issued by any healthcare professional managing such patients. The BSPED Paediatric Steroid Treatment Card is available at: [www.endocrinology.org/adrenal-crisis](http://www.endocrinology.org/adrenal-crisis).

## Betamethasone

08-Mar-2022

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia**

- ▶ BY MOUTH
- ▶ Adult: Usual dose 0.5–5 mg daily
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 4–20 mg, repeated up to 4 times in 24 hours

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Hiccups · myocardial rupture (following recent myocardial infarction) · oedema · Stevens-Johnson syndrome
- **PREGNANCY**
  - ▶ With systemic use Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion* (as sodium phosphate, give continuously or intermittently or *via drip tubing in Glucose 5% or Sodium chloride 0.9%*).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

- ▶ **Betamethasone (Non-proprietary)**

**Betamethasone (as Betamethasone sodium phosphate)**

500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 30 tablet [PoM](#) | £7.00 sugar-free | 100 tablet [PoM](#) | £58.15 DT = £58.15

### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Betamethasone (Non-proprietary)**

**Betamethasone (as Betamethasone sodium phosphate) 4 mg per**

1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule [PoM](#) | £81.19 DT = £67.66

F 740

## Deflazacort

08-Mar-2022

- **DRUG ACTION** Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- ▶ BY MOUTH
- ▶ Adult: Maintenance 3–18 mg daily

**Suppression of inflammatory and allergic disorders (acute disorders)**

- ▶ BY MOUTH
- ▶ Adult: Initially up to 120 mg daily

**Inflammatory and allergic disorders**

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- ▶ Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
  - ▶ Uncommon Oedema
  - ▶ Frequency not known Hypotension

### HEPATIC IMPAIRMENT

**Dose adjustments** Manufacturer advises adjust to the minimum effective dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

### Tablet

CAUTIONARY AND ADVISORY LABELS 5, 10

- ▶ **Calort** (Sanofi)

**Deflazacort 6 mg** Calcort 6mg tablets | 60 tablet [PoM](#) | £15.82 DT = £15.82

17-May-2022

## Dexamethasone

- **DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

### ● INDICATIONS AND DOSE

#### Suppression of inflammatory and allergic disorders

- ▶ BY MOUTH
- ▶ Adult: 0.5–10 mg daily

#### Mild croup

- ▶ BY MOUTH
- ▶ Child: 150 micrograms/kg for 1 dose

#### Severe croup (or mild croup that might cause complications)

- ▶ INITIALLY BY MOUTH
- ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

#### Congenital adrenal hyperplasia (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Consult specialist for advice on dosing
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Consult specialist for advice on dosing

#### Overnight dexamethasone suppression test

- ▶ BY MOUTH
- ▶ Adult: 1 mg for 1 dose, to be given at night

#### Adjunctive treatment of suspected bacterial meningitis (starting before or with first dose of antibacterial)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 10 mg every 6 hours continued for 4 days in patients with pneumococcal meningitis, discontinue treatment if another cause of meningitis is suspected or confirmed

#### Symptom control of anorexia in palliative care

- ▶ Adult: 2–4 mg daily

#### Dysphagia due to obstruction by tumour in palliative care

- ▶ Adult: 8 mg daily

#### Dyspnoea due to bronchospasm or partial obstruction in palliative care

- ▶ Adult: 4–8 mg daily

#### Adjunct in the treatment of nausea and vomiting in palliative care

- ▶ BY MOUTH
- ▶ Adult: 8–16 mg daily

#### Headaches due to raised intracranial pressure in palliative care

- ▶ Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

#### Pain due to nerve compression in palliative care

- ▶ Adult: 8 mg daily

#### Cerebral oedema associated with brain tumours

- ▶ BY MOUTH
- ▶ Adult: 0.5–10 mg daily
- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours until symptoms subside, subsequently, dose may be reduced after 2–4 days and then gradually discontinued over 5–7 days

#### Life-threatening cerebral oedema

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 41.5 mg, then 6.6 mg every 2 hours for 3 days, then 3.3 mg every 2 hours for 1 day, then 3.3 mg every 4 hours for 4 days, then reduced in steps of 3.3 mg daily, continue dose reduction to discontinue over the following 7–10 days or change to oral dexamethasone maintenance if required

#### COVID-19 requiring supplemental oxygen

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 6 mg once daily for 10 days, or until the day of discharge if this is sooner

- **UNLICENSED USE** [Evgr](#) Dexamethasone is used for the treatment of suspected bacterial meningitis, [A](#) but is not licensed for this indication.

- **INTERACTIONS** → Appendix 1: corticosteroids

#### ● SIDE-EFFECTS

- ▶ With oral use: Hypocues · hyperglycaemia · hypotension · myocardial rupture (following recent myocardial infarction) · protein catabolism
- ▶ With parenteral use: Hypotension · perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)

- **PREGNANCY** Dexamethasone readily crosses the placenta.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use in children: For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.
- ▶ With intravenous use in children: For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.
- ▶ With intravenous use in adults: For *intravenous infusion* (*Dexamethasone*, Hospira) give continuously or intermittently or *via* drip tubing in Glucose 5% or Sodium Chloride 0.9%.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**Palliative care** For further information on the use of dexamethasone in palliative care, see [www.medicinescomplete.com/#content/palliative/systemic-corticosteroids](http://www.medicinescomplete.com/#content/palliative/systemic-corticosteroids).

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Dexamethasone for croup [www.medicinesforchildren.org.uk/medicines/dexamethasone-for-croup/](http://www.medicinesforchildren.org.uk/medicines/dexamethasone-for-croup/)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Soluble tablet

08-Mar-2022

**Fludrocortisone acetate**

- **DRUG ACTION** Fludrocortisone has very high mineralocorticoid activity and insignificant glucocorticoid activity.

● **INDICATIONS AND DOSE****Neuropathic postural hypotension**

- ▶ BY MOUTH
- ▶ Adult: 100–400 micrograms daily

**Mineralocorticoid replacement in adrenocortical insufficiency**

- ▶ BY MOUTH
- ▶ Adult: 50–300 micrograms once daily

**Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)**

- ▶ BY MOUTH
- ▶ Adult: 50 micrograms daily

- **UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Conjunctivitis · idiopathic intracranial hypertension · muscle weakness · thrombophlebitis
- **HEPATIC IMPAIRMENT**

**Monitoring** Monitor patient closely in hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 10

▶ **Fludrocortisone acetate (Non-proprietary)****Fludrocortisone acetate 100 microgram** Fludrocortisone 100microgram tablets | 30 tablet [PoM] £13.60 DT = £8.06 | 100 tablet [PoM] £12.00

F 740

**Hydrocortisone**

17-May-2022

- **DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

● **INDICATIONS AND DOSE****Thyrotoxic crisis (thyroid storm)**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 100 mg every 6 hours, to be administered as sodium succinate

**Adrenocortical insufficiency resulting from septic shock**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 50 mg every 6 hours, given in combination with fludrocortisone

**Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 100–300 mg, to be administered as sodium succinate

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia**

## ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommenced after surgery

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery**

## ▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by (by intravenous injection) 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

**Adrenocortical insufficiency in Addison's disease or following adrenalectomy**

## ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

**Adrenal crisis**

- ▶ INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 100 mg, then (by continuous intravenous infusion) 200 mg every 24 hours, diluted in Glucose 5%, alternatively (by intramuscular injection or by intravenous injection) 50 mg every 6 hours, dose increased to 100 mg every 6 hours in patients who are severely obese

**Severe inflammatory bowel disease**

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 100–500 mg 3–4 times a day or when required

**Replacement in adrenocortical insufficiency**

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning
- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 20–30 mg daily in divided doses, adjusted according to response

**Acute hypersensitivity reactions | Angioedema**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
- ▶ Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
- ▶ Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

**Severe acute asthma | Life-threatening acute asthma**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**COVID-19 requiring supplemental oxygen [when dexamethasone cannot be used or is unavailable]**

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 50 mg every 8 hours for 10 days, or until the day of discharge if this is sooner; may be continued for up to 28 days in patients with septic shock

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ With oral use
- ▶ When switching from immediate-release hydrocortisone tablets to modified release *Plenadren*<sup>®</sup> use same total daily dose. Bioavailability of *Plenadren*<sup>®</sup> lower than immediate release tablets—monitor clinical response.

● **INTERACTIONS** → Appendix 1: corticosteroids● **SIDE-EFFECTS**

- ▶ With oral use Dyslipidaemia · hypotension · myocardial rupture (following recent myocardial infarction) · oedema

- ▶ With parenteral use Hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction)

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- ▶ With intravenous use in adults For *intravenous infusion (Solu-Cortef*<sup>®</sup>), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

● **Scottish Medicines Consortium (SMC) decisions**

- ▶ Hydrocortisone (*Plenadren*<sup>®</sup>) for the treatment of adrenal insufficiency in adults (December 2016) SMC No. 848/12 Not recommended

● **LESS SUITABLE FOR PRESCRIBING**

- ▶ With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

● **EXCEPTIONS TO LEGAL CATEGORY**

- ▶ With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 10, 22, 25

F 740

**Methylprednisolone**

09-Mar-2022

- **DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effects.

● **INDICATIONS AND DOSE****Suppression of inflammatory and allergic disorders | Cerebral oedema associated with malignancy**

## ▶ BY MOUTH

▶ Adult: Initially 2–40 mg daily

## ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 10–500 mg

**Treatment of graft rejection reactions**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: Up to 1 g daily for up to 3 days

**Treatment of relapse in multiple sclerosis**

## ▶ BY MOUTH

▶ Adult: 500 mg once daily for 5 days

**Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)**

## ▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily for 3–5 days

**DEPO-MEDRONE®****Suppression of inflammatory and allergic disorders**

## ▶ BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

● **UNLICENSED USE**

- ▶ With intravenous use or oral use [EvGr] Not licensed for use by mouth for the treatment of multiple sclerosis relapse. Not licensed for use by intravenous infusion for the treatment of multiple sclerosis relapse for durations longer than 3 days. ⚠ Methylprednisolone doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (*SOLU-MEDRONE*® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

- ▶ With intramuscular use or intravenous use An EU-wide review has concluded that *Solu-Medrone*® 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

MHRA/CHM ADVICE: *SOLU-MEDRONE*® 40 MG (METHYLPREDNISOLONE AS SODIUM SUCCINATE): CHANGE FROM LACTOSE-CONTAINING TO A LACTOSE-FREE FORMULATION—RISK OF SERIOUS ALLERGIC REACTIONS IF FORMULATIONS ARE CONFUSED (NOVEMBER 2020)

- ▶ With intramuscular use or intravenous use *Solu-Medrone*® 40 mg powder and solvent for solution for injection has been reformulated to a lactose-free preparation in which the lactose is replaced with sucrose. There is a risk of serious allergic reactions if the new lactose-free preparation is confused with the lactose-containing preparation. Healthcare professionals should take extra care to ensure that patients who have been treated with the lactose-free preparation do not inadvertently receive the lactose-containing preparation. They should also be aware of the transition to the lactose-free preparation in their respective practices, and the precautionary measures taken by the manufacturer to differentiate between the packaging and labelling of the old (lactose-containing) and new (lactose-free) formulations to help avoid potential medication errors. Prescribers are advised to ensure patients who are allergic to cow's milk proteins and require the new lactose-free formulation are prescribed *Solu-Medrone*® injection 40 mg lactose free or methylprednisolone injection 40 mg lactose free.

● **CAUTIONS**

- ▶ With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse
- ▶ With systemic use Systemic sclerosis (increased incidence of scleroderma renal crisis)

- **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**▶ **Common or very common**

▶ With oral use Depressed mood

▶ **Frequency not known**

▶ With oral use Confusion · delusions · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · hypotension · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction) · oedema · schizophrenia · suicidal ideation · withdrawal syndrome

▶ With parenteral use Confusion · delusions · depressed mood · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · hypotension · Kaposi's sarcoma · lipomatosis · oedema · schizophrenia · suicidal thoughts · vomiting · withdrawal syndrome

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion* (as sodium succinate) (*Solu-Medrone*®), give continuously or intermittently or *via* drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With intramuscular use or intravenous use For warnings about the different formulations of *Solu-Medrone*® 40 mg, see *Important safety information*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Prednisolone**

23-May-2022

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

● **INDICATIONS AND DOSE****Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)**

## ▶ BY MOUTH

- ▶ Adult: 30 mg daily for 7–14 days

**Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)**

## ▶ BY MOUTH

- ▶ Child: 1–2 mg/kg

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**

## ▶ BY MOUTH

- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

**Mild to moderate acute asthma | Severe or life-threatening acute asthma**

## ▶ BY MOUTH

- ▶ Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- ▶ Child 12–17 years: 40–50 mg daily for at least 5 days
- ▶ Adult: 40–50 mg daily for at least 5 days

**Suppression of inflammatory and allergic disorders**

## ▶ BY MOUTH

- ▶ Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

**Suppression of inflammatory and allergic disorders (initial dose in severe disease)**

## ▶ BY MOUTH

- ▶ Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

**Idiopathic thrombocytopenic purpura**

## ▶ BY MOUTH

- ▶ Adult: 1 mg/kg daily, gradually reduce dose over several weeks

**Ulcerative colitis | Crohn's disease**

## ▶ BY MOUTH

- ▶ Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

**Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal stages of multibacillary leprosy)**

## ▶ BY MOUTH

- ▶ Adult: Initially 40–60 mg daily, dose to be instituted at once

**Generalised myasthenia gravis (when given on alternate days)**

## ▶ BY MOUTH

- ▶ Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis in ventilated patients (when given on alternate days)**

## ▶ BY MOUTH

- ▶ Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis (when giving daily)**

## ▶ BY MOUTH

- ▶ Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

**Ocular myasthenia**

## ▶ BY MOUTH

- ▶ Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

**Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration**

## ▶ BY MOUTH

- ▶ Adult: 7.5 mg daily

**Polymyalgia rheumatica**

## ▶ BY MOUTH

- ▶ Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Giant cell (temporal) arteritis**

## ▶ BY MOUTH

- ▶ Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

continued →

**Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus**

## ▶ BY MOUTH

- ▶ Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

**Symptom control of anorexia in palliative care**

## ▶ BY MOUTH

- ▶ Adult: 15–30 mg daily

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**

## ▶ BY MOUTH

- ▶ Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

**Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration**

## ▶ BY MOUTH

- ▶ Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

**Proctitis**

## ▶ BY RECTUM USING RECTAL FOAM

- ▶ Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

## ▶ BY RECTUM USING SUPPOSITORIES

- ▶ Adult: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

**Distal ulcerative colitis**

## ▶ BY RECTUM USING RECTAL FOAM

- ▶ Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal complications of Crohn's disease**

## ▶ BY RECTUM USING SUPPOSITORIES

- ▶ Adult: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

**Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease**

## ▶ BY RECTUM USING ENEMA

- ▶ Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

**COVID-19 requiring supplemental oxygen [when dexamethasone cannot be used or is unavailable]**

## ▶ BY MOUTH

- ▶ Adult: 40 mg once daily for 10 days, or until the day of discharge if this is sooner

**IMPORTANT SAFETY INFORMATION****SAFE PRACTICE**

- ▶ With systemic use  
Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

**● CONTRA-INDICATIONS**

- ▶ With rectal use Abdominal or local infection · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

**● CAUTIONS**

- ▶ With rectal use Systemic absorption may occur with rectal preparations

- ▶ With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity) · systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)

- **INTERACTIONS** → Appendix 1: corticosteroids

**● SIDE-EFFECTS**

- ▶ With oral use Diarrhoea · dizziness · dyslipidaemia · lipomatosis · protein catabolism · scleroderma renal crisis

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

**Monitoring** ▶ With systemic use Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

**Monitoring** ▶ With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

**● MONITORING REQUIREMENTS**

- ▶ With systemic use Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

**● PRESCRIBING AND DISPENSING INFORMATION**

- ▶ When used for Asthma For choice of therapy, see Asthma, acute p. 260 and Asthma, chronic p. 256.

**Palliative care** For further information on the use of prednisolone in palliative care, see [www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids](http://www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids).

**● PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Prednisolone for asthma [www.medicinesforchildren.org.uk/medicines/prednisolone-for-asthma/](http://www.medicinesforchildren.org.uk/medicines/prednisolone-for-asthma/)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, enema

**Foam**▶ **Prednisolone (Non-proprietary)**

**Prednisolone (as Prednisolone sodium metasulfobenzoate)**  
20 mg per 1 application Prednisolone 20mg/application foam enema | 14 dose [PoM](#) £204.95 DT = £204.95

**Gastro-resistant tablet**

CAUTIONARY AND ADVISORY LABELS 5, 10, 25

▶ **Prednisolone (Non-proprietary)**

**Prednisolone 1 mg** Prednisolone 1mg gastro-resistant tablets | 30 tablet [PoM](#) £8.52-£11.85 DT = £11.85 | 100 tablet [PoM](#) £29.38-£43.75

£7.45 DT = £7.45

## 3.1 Cushing's syndrome and disease

### Cushing's syndrome

07-Apr-2021

**Management**

Cushing's syndrome results from chronic exposure to excess cortisol; exogenous corticosteroid use is the most common cause. Endogenous causes include adrenocorticotropic hormone (ACTH)-secreting pituitary tumours (Cushing's disease), cortisol-secreting adrenal tumours, and rarely, ectopic ACTH-secreting tumours. Most types of endogenous Cushing's syndrome are treated surgically.

Metyrapone p. 750 is licensed for the management of Cushing's syndrome.

Ketoconazole below is licensed for the treatment of endogenous Cushing's syndrome.

**Other drugs used for Cushing's syndrome and disease**  
Pasireotide, p. 1026

**ENZYME INHIBITORS****Ketoconazole**

04-Feb-2020

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 $\alpha$ -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropic tumour cells in patients with Cushing's disease.

**INDICATIONS AND DOSE****Endogenous Cushing's syndrome (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

**IMPORTANT SAFETY INFORMATION****CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation · Acute porphyrias p. 1150 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- **CAUTIONS** Pre-treatment liver enzymes should not exceed 2 times the normal upper limit · risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
- ▶ **Common or very common** Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vomiting
- ▶ **Uncommon** Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
- ▶ **Rare or very rare** Fever · hepatic disorders · taste altered
- ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynaecomastia · hot flush ·

insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discoloration

**SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use. Manufacturer advises reduce dose if hepatic enzymes increased to less than 3 times the upper limit of normal—consult product literature; discontinue permanently if hepatic enzymes at least 3 times the upper limit of normal.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
  - ▶ Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
  - ▶ Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected.
- **PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.  
**Driving and skilled tasks** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- ▶ **Ketoconazole (non-proprietary)** ▼  
Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet (PbM) £480.00–£515.00 DT = £497.50

## Metyrapone

14-Dec-2020

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 $\beta$ -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

#### ● INDICATIONS AND DOSE

**Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: 750 mg every 4 hours for 6 doses

#### Management of Cushing's syndrome (specialist supervision in hospital)

- ▶ BY MOUTH
- ▶ Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

**Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 1150 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** → Appendix 1: metyrapone
- **SIDE-EFFECTS**
  - ▶ Common or very common Dizziness · headache · hypotension · nausea · sedation · vomiting
  - ▶ Rare or very rare Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
  - ▶ Frequency not known Alopecia · bone marrow failure · hypertension
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of delayed response).
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.  
**Capsule**  
CAUTIONARY AND ADVISORY LABELS 21  
▶ **Metopirone** (HRA Pharma UK & Ireland Ltd)  
Metyrapone 250 mg Metopirone 250mg capsules | 100 capsule (PbM) £363.66 DT = £363.66

## Osilodrostat

30-Jun-2021

- **DRUG ACTION** Osilodrostat is a potent inhibitor of 11 $\beta$ -hydroxylase, the enzyme that catalyses the last step of cortisol synthesis in the adrenal gland, thereby lowering cortisol levels.

#### ● INDICATIONS AND DOSE

**Endogenous Cushing's syndrome (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: 2 mg twice daily, increased, if tolerated, in steps of 1–2 mg initially, no more frequently than once every 1–2 weeks, adjusted according to response; usual maintenance 2–7 mg twice daily (max. per dose 30 mg twice daily), for dose reduction or treatment interruption due to low cortisol levels or QT-interval prolongation—consult product literature
- ▶ Adult (patients of Asian origin): 1 mg twice daily, increased, if tolerated, in steps of 1–2 mg initially, no more frequently than once every 1–2 weeks, adjusted according to response; usual maintenance 2–7 mg twice daily (max. per dose 30 mg twice daily), for dose reduction or treatment interruption due to low cortisol levels or QT-interval prolongation—consult product literature.

- **CAUTIONS** Patients of Asian origin (increased bioavailability) · risk factors for QT-interval prolongation
- **INTERACTIONS** → Appendix 1: osilodrostat
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · adrenal hypofunction · appetite decreased · diarrhoea · dizziness · fatigue · headache · hirsutism · hypokalaemia · hypotension · malaise · nausea · oedema · QT interval prolongation · skin reactions · syncope · tachycardia · vomiting
- **CONCEPTION AND CONTRACEPTION** EvGr Females of childbearing potential should use effective contraception during treatment and for at least 1 week after last treatment. M
- **PREGNANCY** EvGr Avoid—toxicity in *animal* studies. M
- **BREAST FEEDING** EvGr Discontinue breast-feeding during treatment and for at least 1 week after last treatment—no information available. M
- **HEPATIC IMPAIRMENT** EvGr Caution (limited information available)—consider more frequent monitoring of adrenal function during dose titration. M  
**Dose adjustments** EvGr In moderate impairment, a starting dose of 1 mg twice daily is recommended. In severe impairment, a starting dose of 1 mg once daily in the evening, increased initially to 1 mg twice daily, is recommended. M
- **MONITORING REQUIREMENTS**
  - ▶ EvGr Measure cortisol levels every 1–2 weeks until adequate response maintained, and as clinically indicated thereafter, with additional monitoring during periods of increased cortisol demand. Dose reduction or treatment interruption may be required—consult product literature.
  - ▶ Obtain ECG prior to treatment, within the first week, and as clinically indicated thereafter; monitor more frequently if risk factors for QT-interval prolongation are present. If the QTc interval exceeds 480 milliseconds prior to or during treatment, cardiology consultation is recommended. Dose reduction or treatment interruption may be required—consult product literature.
  - ▶ Monitor electrolyte concentrations periodically during treatment. M
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the signs and symptoms of hypocortisolism. **Driving and skilled tasks** Patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Isturisa** (Recordati Rare Diseases UK Ltd) ▼

- Osilodrostat (as Osilodrostat phosphate) 1 mg Isturisa 1mg tablets | 60 tablet PoM S (Hospital only)
- Osilodrostat (as Osilodrostat phosphate) 5 mg Isturisa 5mg tablets | 60 tablet PoM S (Hospital only)
- Osilodrostat (as Osilodrostat phosphate) 10 mg Isturisa 10mg tablets | 60 tablet PoM S (Hospital only)

## 4 Diabetes mellitus and hypoglycaemia

### 4.1 Diabetes mellitus

#### Diabetes

05-Jun-2017

##### Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads

to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes p. 752 and Type 2 diabetes p. 755 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery, see Diabetes, pregnancy and breast-feeding p. 760) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

##### Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at [www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive](http://www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive).

##### Advice from the DVLA

The DVLA recommends (2018) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood-glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood-glucose should always be above 5 mmol/litre while driving. If blood-glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood-glucose is less than 4 mmol/litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;
- switch off the engine, remove keys from the ignition, and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood-glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide, repaglinide p. 772).

**Note:** additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

##### Alcohol

Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

##### Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*<sup>®</sup> or as *Rapilose*<sup>®</sup> OGTT oral solution.

### HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

### Diagnosis

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes below and Type 2 diabetes p. 755 and is now also used for diagnosis of type 2 diabetes. [EvdGr](#) HbA1c should not be used for diagnosis in those with suspected type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hyperglycaemia;
- acute pancreatic damage;
- end-stage chronic kidney disease;
- HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion. [A](#)

### Monitoring

[EvdGr](#) HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 755).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood-glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months. [A](#)

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin

estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

### Advanced Pharmacy Services

Patients with diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 16.

## Type 1 diabetes

11-Aug-2021

### Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m<sup>2</sup>, age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

### Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 757). [EvdGr](#) The target for glycaemic control should be individualised for each patient, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hypoglycaemia.

Aim for a target HbA1c concentration of 48 mmol/mol (6.5%) or lower in patients with type 1 diabetes. Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed. [A](#)

- [EvdGr](#) a fasting blood-glucose concentration of 5–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating; [A](#)
- a blood-glucose concentration above 5 mmol/litre when driving, as recommended by the Driver and Vehicle Licensing Agency (DVLA).

### Overview

[EvdGr](#) Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 757). [A](#) Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle

with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

**EvGr** In patients who have a BMI of 25 kg/m<sup>2</sup> or above (23 kg/m<sup>2</sup> or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, consider metformin hydrochloride p. 761 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a dietitian. Dietary advice should include information on weight control, cardiovascular risk, hypoglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, disordered eating, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme. **▲**

### Insulin therapy in type 1 diabetes

**EvGr** All patients with type 1 diabetes require insulin therapy (see also **Insulin p. 754**). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens. **▲**

#### Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

#### Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

#### Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

#### Recommended insulin regimens

**EvGr** Patients with type 1 diabetes should be offered multiple daily injection basal-bolus insulin regimens as the **first line choice**. Twice-daily insulin detemir p. 787 should be offered as the long-acting basal insulin therapy, unless the patient is already meeting their agreed treatment goals on another insulin regimen. Once-daily insulin glargine p. 787 (100 units/ml) may be prescribed if insulin detemir is not tolerated, or if a twice-daily regimen is not acceptable to the patient. Insulin degludec p. 786 may also be offered as an alternative once-daily regimen if there is particular concern about nocturnal hypoglycaemia. A once-daily ultra-long acting insulin (such as insulin degludec, or insulin glargine 300 units/ml) may be offered as an alternative for patients who need help with injection administration from a carer or healthcare professional.

Other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed treatment goals. Non-basal-bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are **not** recommended for adults with *newly diagnosed* type 1 diabetes.

A rapid-acting insulin analogue is recommended as the mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine

use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

**Alternatively**, if a multiple daily injection basal-bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily *human* mixed insulin regimen and have hypoglycaemia that affects their quality of life, a trial of a twice-daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to patients who suffer disabling hypoglycaemia while attempting to achieve their target HbA<sub>1c</sub> concentration, or, who have high HbA<sub>1c</sub> concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team. **▲**

#### Insulin requirements

**EvGr** The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations. **▲**

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. These factors should be considered before changes are made to a previously optimised regimen.

Infection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

#### Risks of hypoglycaemia with insulin

**EvGr** Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see **Hypoglycaemia p. 792**).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients' awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score. **▲**

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see **Driving** under **Diabetes p. 751**).

**EvGr** To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired hypoglycaemia awareness. If recurrent

severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre. 

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

### Hypodermic equipment

 Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

 Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: [www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff](http://www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff)
- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)
- Scottish Drug Tariff: [www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff)

### Useful Resources

Type 1 diabetes in adults: diagnosis and management. National Institute for Health and Care Excellence. Clinical guideline NG17. August 2015, updated July 2021. [www.nice.org.uk/guidance/ng17](http://www.nice.org.uk/guidance/ng17)

## Insulin

16-Sep-2021

### Overview

For recommended insulin regimens see Type 1 diabetes p. 752 and Type 2 diabetes p. 755.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

### Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such

as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

### Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

 Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration. 

### Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

#### Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin above (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 783, insulin glulisine p. 784 and insulin lispro p. 784).

#### Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

*When injected subcutaneously*, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

*When injected intravenously*, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis and peri-operatively.

#### Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

 For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence

of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. [⚠](#)

### Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 785) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 752 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 785, biphasic insulin aspart p. 786 and biphasic insulin lispro p. 786).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

### Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin, insulin zinc suspension, insulin detemir p. 787, insulin glargine p. 787, insulin degludec p. 786) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

## Type 2 diabetes

05-Feb-2021

### Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

### Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA<sub>1c</sub> at or below the target value set for each individual patient.

### Overview

[EVR](#) Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietitian where appropriate). For guidance on reducing cardiovascular risk, see Cardiovascular disease risk assessment and prevention p. 206. Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone. [⚠](#)

### Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. [EVR](#) The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient's comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see *Drug treatment, antidiabetic drugs* (below). [⚠](#)

[⚠](#) Metformin hydrochloride p. 761 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. [EVR](#) The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated. [⚠](#)

The **sulfonylureas** (glibenclamide, gliclazide p. 779, glimepiride p. 779, glipizide p. 780, tolbutamide p. 780) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasma-insulin concentrations.

Acarbose p. 761 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 780.

The meglitinides, nateglinide and repaglinide p. 772, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonylureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see *Important safety information* under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (gliptins), alogliptin p. 763, linagliptin p. 764, sitagliptin p. 765, saxagliptin p. 764, and vildagliptin p. 766, do not appear to be associated with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 772, dapagliflozin p. 774, and empagliflozin p. 775, may be suitable for some patients when first-line options are not appropriate. [EVR](#) Canagliflozin and empagliflozin can be beneficial in patients with type 2 diabetes and established cardiovascular disease. [⚠](#) Sodium glucose co-transporter 2 inhibitors are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, dulaglutide p. 767, exenatide p. 768, liraglutide p. 769 and lixisenatide p. 770, should be reserved for combination therapy when other treatment options have failed. [EVR](#) Liraglutide has proven cardiovascular benefit and should be considered in patients with type 2 diabetes and established cardiovascular disease. [⚠](#)

## Drug treatment, antidiabetic drugs

**EvGr** Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA<sub>1c</sub> concentration of 48 mmol/mol (6.5%) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA<sub>1c</sub> concentration of 53 mmol/mol (7.0%). Targets may differ and should be individualised and agreed with each patient. **⚠**

**Note:** **EvGr** Consider relaxing the target HbA<sub>1c</sub> level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA<sub>1c</sub> concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA<sub>1c</sub> to 58 mmol/mol (7.5%) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbA<sub>1c</sub> concentration target of 53 mmol/mol (7.0%) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities). **⚠**

### Initial treatment

**EvGr** Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use. **⚠**

If metformin is contra-indicated or not tolerated, see *Alternative non-metformin regimens* below.

### First intensification of treatment

**EvGr** If metformin hydrochloride (alongside modification to diet) does not control HbA<sub>1c</sub> to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulphonylurea (glibenclamide, gliclazide, glimepiride, glipizide, tolbutamide);
- Pioglitazone;
- a dipeptidylpeptidase-4 inhibitor (linagliptin, saxagliptin, sitagliptin, or vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulphonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences. **⚠**

**EvGr** Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulphonylurea is indicated, a shorter-acting sulphonylurea, such as gliclazide or tolbutamide should be prescribed. **⚠**

The place in therapy of alogliptin (a dipeptidylpeptidase-4 inhibitor) is not yet known.

### Second intensification of treatment

**EvGr** If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- Metformin hydrochloride and a dipeptidylpeptidase-4 inhibitor and a sulphonylurea;
- Metformin hydrochloride and pioglitazone and a sulphonylurea;
- Metformin hydrochloride and a sulphonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- Metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 772 or

empagliflozin p. 775; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

**Alternatively**, it may be appropriate to start **insulin**-based treatment at this stage—see *Drug treatment, insulin*. **⚠**

### Glucagon-like peptide-1 receptor agonists

**EvGr** If triple therapy with metformin hydrochloride p. 761 and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a **glucagon-like peptide-1 receptor agonist** may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulphonylurea.

These should only be prescribed for patients who have a BMI of 35 kg/m<sup>2</sup> or above (adjusted for ethnicity) and who also have specific psychological or medical problems associated with obesity; or for those who have a BMI lower than 35 kg/m<sup>2</sup> but for whom insulin therapy would have significant occupational implications or if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related comorbidities.

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0%] in HbA<sub>1c</sub> and a weight loss of at least 3% of initial body-weight).

Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team. **⚠**

### Alternative non-metformin regimens

**EvGr** If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a sulphonylurea (glibenclamide, gliclazide p. 779, glimepiride p. 779, glipizide p. 780, or tolbutamide p. 780) (first choice), or
- a dipeptidylpeptidase-4 inhibitor (linagliptin p. 764, saxagliptin p. 764, sitagliptin p. 765, or vildagliptin p. 766), or
- Pioglitazone p. 780. **⚠**

### The sodium glucose co-transporter 2 inhibitors

canagliflozin, dapagliflozin p. 774, or empagliflozin are also options for **monotherapy** when metformin is contra-indicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulphonylurea nor pioglitazone is appropriate.

**EvGr** Repaglinide p. 772 is also an effective alternative option for single therapy, but it has a limited role in treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin. **⚠**

### Intensification

**EvGr** If the initial single drug does not control HbA<sub>1c</sub> to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulphonylurea; or
- Pioglitazone and a sulphonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see *Drug treatment, insulin*. **⚠**

## Drug treatment, insulin

**EvGr** When indicated for intensification, insulin (see also, Insulin p. 754) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated.

Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 785 injected once or twice daily, according to requirements;
- a human isophane insulin in combination with a short-acting insulin, administered either separately or as a pre-mixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA<sub>1c</sub> is 75 mmol/mol (9.0% or higher);
- Insulin detemir p. 787 or insulin glargine p. 787 as an alternative to human isophane insulin. This can be preferable if a *once daily* injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a short-acting human *analogue* insulin (rather than short-acting human *soluble insulin*) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

When starting insulin therapy, bedtime basal insulin should be initiated and the dose titrated against morning (fasting) glucose. Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate. [↗](#)

### Advanced Pharmacy Services

Patients with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 16.

Patient decision aid: Type 2 diabetes in adults: controlling your blood glucose by taking a second medicine—what are your options? National Institute for Health and Care Excellence. December 2015.

[www.nice.org.uk/about/what-we-do/our-programmes/nice-guidance/nice-guidelines/shared-decision-making](http://www.nice.org.uk/about/what-we-do/our-programmes/nice-guidance/nice-guidelines/shared-decision-making)

## Diabetic complications

15-Dec-2021

### See also

Diabetes p. 751

Type 1 diabetes p. 752

Type 2 diabetes p. 755

Diabetic foot infections, antibacterial therapy p. 546. For guidance on other diabetic foot problems, see NICE guideline **Diabetic foot problems** (available at: [www.nice.org.uk/guidance/ng19](http://www.nice.org.uk/guidance/ng19)).

### Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease.

[Evg](#) Other risk factors for cardiovascular disease that should also be addressed are: smoking, hypertension, obesity, and dyslipidaemia. [↗](#) Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid-regulating drugs. For full guidance on the assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 206.

### Diabetic nephropathy

[Evg](#) In diabetic patients with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Provided there are no contra-indications, all diabetic patients who have confirmed nephropathy with an albumin:creatinine ratio (ACR) of 3 mg/mmol or more should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. In patients with chronic kidney disease (CKD) and proteinuria, ACE inhibitors or angiotensin-II receptor antagonists should be given as monotherapy to reduce the rate of progression of CKD. For patients with type 2 diabetes and CKD who are already on an ACE inhibitor or angiotensin-II receptor antagonist, add on therapy with a sodium glucose co-transporter 2 inhibitor should be offered if the ACR is over 30mg/mmol; for patients with an ACR of 3–30mg/mmol, add on therapy should be considered. [↗](#)

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes in Hypertension p. 155.

### Diabetic neuropathy

Optimal diabetic control is beneficial for the management of painful neuropathy. [Evg](#) However, *acute* painful diabetic neuropathy can occur in patients with type 1 diabetes who have a rapid improvement in blood glucose control. This is usually self-limiting and simple analgesics (such as paracetamol p. 477) along with other measures (such as bed cradles) are recommended as first line treatments. If the response is inadequate, other treatment options for painful diabetic neuropathy should be considered. Simple analgesia may be continued until the effects of additional treatments have been established.

Monotherapy with antidepressant drugs, including tricyclics (such as amitriptyline hydrochloride p. 404 and imipramine hydrochloride p. 408 [unlicensed use]), duloxetine p. 399, and venlafaxine p. 400 [unlicensed use] should be considered in patients for the treatment of painful diabetic peripheral neuropathy. Antiepileptic drugs, such as pregabalin p. 353 and gabapentin p. 343, can also be considered. Opioid analgesics in combination with gabapentin can be considered if pain is not controlled with monotherapy. [↗](#)

In *autonomic neuropathy*, diabetic diarrhoea can often be managed by tetracycline p. 619 [unlicensed use], or codeine phosphate p. 487 as the best alternative; other anti-diarrhoeal preparations can also be tried. Erythromycin p. 587 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use].

In *neuropathic postural hypotension*, increased salt intake and the use of the mineralocorticoid fludrocortisone acetate p. 744 [unlicensed use] may help by increasing plasma

volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1231 and ephedrine hydrochloride p. 294 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

**Gustatory sweating** can be treated with an antimuscarinic such as propantheline bromide p. 92; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1358).

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] offers effective relief.

See also the management of Erectile dysfunction p. 878.

### Visual impairment

**EvGr** Optimal diabetic and blood pressure control should be maintained to prevent onset and progression of diabetic eye disease. **A** see Hypertension p. 155, Type 1 diabetes p. 752, and Type 2 diabetes p. 755 for target thresholds.

## Diabetic hyperglycaemic emergencies

26-Aug-2021

### Description of condition

Diabetic ketoacidosis (DKA) and the hyperosmolar hyperglycaemic state (HHS), previously referred to as hyperosmolar non-ketotic (HONK) coma) are medical emergencies with significant morbidity and mortality. HHS has a higher mortality than DKA.

The major precipitating factor for both DKA and HHS is infection. Other precipitating factors for DKA include discontinuation of or inadequate insulin therapy, acute illness such as myocardial infarction and pancreatitis, new onset of diabetes, or stress (e.g. trauma, surgery); and for HHS, these include inadequate insulin or oral antidiabetic therapy, acute illness in a patient with known diabetes, or stress.

DKA develops rapidly (within hours), and mainly occurs in individuals with type 1 diabetes, with around a third of cases occurring in those with type 2 diabetes. Unlike DKA, HHS can take days to develop and consequently the dehydration and metabolic disturbances are more severe at presentation. HHS typically occurs in the elderly, but can also occur in younger adults and adolescents, often as the initial presentation of type 2 diabetes.

DKA is characterised by **hyperglycaemia** (blood glucose above 11 mmol/L or known diabetes mellitus), **ketonaemia** (capillary or blood ketone above 3 mmol/L or significant ketonuria of 2+ or more), and **acidosis** (bicarbonate less than 15 mmol/L and/or venous pH less than 7.3). Common signs and symptoms of DKA include dehydration due to polydipsia and polyuria, weight loss, excessive tiredness, nausea, vomiting, abdominal pain, Kussmaul respiration (rapid and deep respiration) with acetone breath, and reduced consciousness.

Characteristic features of HHS are **hypovolaemia**, **marked hyperglycaemia** (blood glucose above 30 mmol/L without significant hyperketonaemia or acidosis), and **hyperosmolality** (osmolality above 320 mosmol/kg); however, a mixed picture of DKA and HHS may occur. Common signs and symptoms of HHS include dehydration due to polyuria and polydipsia, weakness, weight loss, tachycardia, dry mucous membranes, poor skin turgor, hypotension, acute cognitive impairment, and in severe cases, shock.

### Aims of treatment

The treatment of DKA aims to restore circulatory volume, correct electrolyte imbalance and hyperglycaemia, clear ketones and suppress ketogenesis, identify and treat any precipitating causes, and prevent complications.

The treatment of HHS aims to correct fluid and electrolyte losses, hyperosmolality and hyperglycaemia, identify and treat any underlying or precipitating causes, and prevent complications.

### Diabetic ketoacidosis

Individuals with suspected DKA should be diagnosed promptly and managed intensively—the diabetes specialist team should be involved as soon as possible after admission to hospital (ideally within 24 hours). Those who are elderly, pregnant, aged 18–25 years, have heart or renal failure, or other serious comorbidities, require specialist input.

The initial drug management of DKA involves intravenous fluid replacement, followed by intravenous insulin; patients who normally take long-acting insulin should continue their usual dose(s) throughout treatment. Potassium replacement and glucose administration may also be required to prevent subsequent hypokalaemia and hypoglycaemia, depending on potassium levels and blood glucose concentrations, respectively.

For further information on the management of DKA, see JBDS guideline: **The management of diabetic ketoacidosis in adults** (see *Useful resources*).

### Hyperosmolar hyperglycaemic state

Individuals with suspected HHS should be diagnosed promptly and managed intensively—the diabetes specialist team should be involved as soon as possible after admission to hospital. All patients should be reviewed promptly by a senior clinician familiar with the treatment of HHS.

The initial drug management of HHS involves intravenous fluid replacement, followed by intravenous insulin. For patients with significant ketonaemia or ketonuria, insulin can be started earlier. Potassium should be replaced or omitted as required.

For further information on the management of HHS, see JBDS guideline: **The management of the hyperosmolar hyperglycaemic state (HHS) in adults with diabetes** (see *Useful resources*).

## Diabetes, surgery and medical illness

16-Sep-2021

### Management of diabetes during surgery

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. **EvGr** All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission. **E**

**Note:** The following recommendations provide general guidance for the management of diabetes during surgery. **Local protocols and guidelines should be followed where they exist.**

**Use of insulin during surgery****Elective surgery—minor procedures in patients with good glycaemic control**

**EvGr** Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5%) and are undergoing *minor procedures*, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management, monitoring and control of electrolytes and avoidance of hyperchloraemic metabolic acidosis). On the day before the surgery, the patient's usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20%. **⚡**

**Elective surgery—major procedures or poor glycaemic control**

**EvGr** Patients usually treated with insulin, who are either undergoing *major procedures* (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable rate intravenous insulin infusion (continued until the patient is eating/drinking and stabilised on their previous glucose-lowering medication).

The aim is to achieve and maintain glucose concentration within the usual target range (6–10 mmol/litre; but up to 12 mmol/litre is acceptable) by infusing a constant rate of glucose-containing fluid as a substrate, while also infusing insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the *day before surgery*, once daily long-acting insulin analogues should be given at 80% of the usual dose; otherwise the patient's usual insulin should be given as normal;
- on the *day of surgery and throughout the intra-operative period*, once daily long-acting insulin analogues should be continued at 80% of the usual dose; all other insulin should be stopped until the patient is eating and drinking again after surgery;
- on the *day of surgery*, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride p. 1130 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient's fluid requirements. To prevent hypoglycaemia, this infusion must **not** be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 782 in sodium chloride 0.9% p. 1131 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary blood-glucose measurement. Hourly blood-glucose measurement should be taken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood-glucose concentrations within the usual target range (6–10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20% p. 1132 should be given if blood-glucose drops below 6 mmol/litre, and blood-glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood-glucose drops below 4 mmol/litre, intravenous glucose 20% should be adjusted and blood-glucose checked every 15 minutes, until blood-glucose is above 6 mmol/litre (testing can then revert to hourly). If blood-glucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis.

**Conversion back to a subcutaneous insulin** should not begin until the patient can eat and drink without nausea or vomiting. Once the patient's previous insulin regimen is re-started, the usual insulin dose may require adjustment, as

insulin requirements can change due to post-operative stress, infection or altered food intake.

**Previous subcutaneous basal-bolus regimens**, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30–60 minutes **after** the first meal-time short-acting insulin dose. If the patient was previously on a **long-acting insulin analogue**, this should have been continued throughout the operative period at 80% of the normal dose, and should now just continue at that same dose until the patient leaves hospital; only the short-acting insulin needs to be restarted as above.

**Previous subcutaneous twice-daily mixed insulin regimens**, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30–60 minutes after the first subcutaneous insulin dose has been given.

Patients who were **previously managed with a continuous subcutaneous insulin infusion** should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients **not previously prescribed insulin**, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient's sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period. **⚡**

**Emergency surgery**

**EvGr** Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have blood-glucose, blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoacidosis is present, recommendations for diabetes ketoacidosis should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). **⚡**

**Use of antidiabetic drugs during surgery**

**EvGr** Manipulation of antidiabetic drug may **not** be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a *variable rate intravenous insulin infusion* p. 782 should be used as for *major elective surgery* (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

**When insulin is required and given during surgery**, acarbose p. 761, meglitinides, sulfonylureas, pioglitazone p. 780, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

In suitable cases, acarbose, nateglinide and repaglinide p. 772 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, **dipeptidylpeptidase-4 inhibitors (gliptins)** and **glucagon-like peptide-1 receptor agonists** can be taken as normal during the whole peri-operative period.

**Sodium glucose co-transporter 2 inhibitors** should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

**Sulfonylureas** are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood-glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 761 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m<sup>2</sup> and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood-glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin should not be recommenced until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m<sup>2</sup>. If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m<sup>2</sup>, metformin should be omitted on the day of the procedure and for the following 48 hours. **⚠**

#### Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

## Diabetes, pregnancy and breast-feeding

04-Apr-2022

### Description of condition

Diabetes in pregnancy is associated with increased risks to the woman (such as pre-eclampsia and rapidly worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

### Management of pre-existing diabetes

**EvGr** Women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA<sub>1c</sub> concentration below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 1112. **⚠**

### Overview

#### Oral antidiabetic drugs

**EvGr** All oral antidiabetic drugs, except metformin hydrochloride p. 761, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Women with diabetes may be treated with metformin hydrochloride p. 761 as an adjunct or alternative to insulin in the preconception period and during pregnancy when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride p. 761 can be continued immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 755. All other antidiabetic drugs should be avoided while breast-feeding. **⚠**

#### Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 783 and insulin lispro p. 784) can be associated with fewer episodes of hypoglycaemia, a reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

**EvGr** Isophane insulin p. 785 is the first-choice for long-acting insulin during pregnancy, however in women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 787 or insulin glargine p. 787), it may be appropriate to continue using them throughout pregnancy.

Continuous subcutaneous insulin infusion p. 782 (insulin pump therapy) may be appropriate for pregnant women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 782 without significant disabling hypoglycaemia.

All women treated with insulin p. 782 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant women with Type 1 diabetes p. 752 should also be prescribed glucagon p. 793 for use if needed.

Women with pre-existing diabetes treated with insulin p. 782 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose. **⚠**

#### Medication for diabetic complications

**EvGr** Angiotensin-converting enzyme inhibitors and angiotensin II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed (see *Hypertension in pregnancy* under Hypertension p. 155). Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy. **⚠**

#### Gestational diabetes

**EvGr** Women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first

attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride below may be prescribed. Insulin p. 782 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin p. 782 immediately, with or without metformin hydrochloride below, in addition to a change in diet and exercise.

Women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications such as macrosomia or hydramnios should be considered for immediate insulin p. 782 treatment, with or without metformin hydrochloride below.

Women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth. 

### Useful Resources

Diabetes in pregnancy: management from preconception to the postnatal period. National Institute for Health and Care Excellence. NICE guideline NG3. February 2015 (updated December 2020).

## BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

### Acarbose

13-Jul-2021

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

#### ● INDICATIONS AND DOSE

**Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Disorders of digestion or absorption · hernia (condition may deteriorate) · inflammatory bowel disease · predisposition to intestinal obstruction

- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

- **INTERACTIONS** → Appendix 1: acarbose

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea (may need to reduce dose) · gastrointestinal discomfort · gastrointestinal disorders

- ▶ **Uncommon** Nausea · vomiting

- ▶ **Rare or very rare** Hepatic disorders · oedema

- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION** Antacids containing magnesium and aluminium salts unlikely to be beneficial for treating side effects.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT**  Avoid if creatinine clearance less than 25 mL/minute.  See p. 21.

- **MONITORING REQUIREMENTS** Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Acarbose (Non-proprietary)

**Acarbose 50 mg** Acarbose 50mg tablets | 90 tablet  £14.58 DT = £14.58

**Acarbose 100 mg** Acarbose 100mg tablets | 90 tablet  £38.84 DT = £25.29

## BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

### Metformin hydrochloride

22-Apr-2022

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]**

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Child 10–17 years (specialist use only):** Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- ▶ **Adult:** Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

**Type 2 diabetes mellitus [reduction in risk or delay of onset]**

##### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult 18–74 years:** Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, for further information on risk factors—consult product literature

#### Polycystic ovary syndrome

##### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult (initiated by a specialist):** Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

- **UNLICENSED USE**  Metformin is used in the doses provided in BNF publications for the treatment of type 2

diabetes mellitus,  but these may differ from those licensed.

 Metformin is used for the treatment of polycystic ovary syndrome,  but is not licensed for this indication.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METFORMIN IN PREGNANCY: STUDY SHOWS NO SAFETY CONCERNS (MARCH 2022)

European and CHM reviews of data from a large cohort study of Finnish population registries did not identify any safety issues with the use of metformin during pregnancy. Product literature for single-ingredient metformin preparations was subsequently updated to permit its use as an adjunct or alternative to insulin during pregnancy and the periconception period, if clinically indicated.

- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)
- **CAUTIONS** Risk factors for lactic acidosis
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.
  - ▶ Elderly Prescription potentially inappropriate (STOPP criteria) if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (risk of lactic acidosis). See also Prescribing in the elderly p. 29.
- **INTERACTIONS** → Appendix 1: metformin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
  - ▶ **Rare or very rare** Hepatitis · lactic acidosis (discontinue) · skin reactions · vitamin B12 absorption decreased
- **SIDE-EFFECTS, FURTHER INFORMATION** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.
- **PREGNANCY**  Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.
  - ◆ See also *Important safety information*.
- **BREAST FEEDING**  May be used during breast-feeding in women with pre-existing diabetes. ◆
- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.
- **RENAL IMPAIRMENT** See p. 21.
  - ▶ In adults Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m<sup>2</sup>.
- **Dose adjustments**
  - ▶ In children Manufacturer advises consider dose reduction in moderate impairment.
  - ▶ In adults Manufacturer advises reduce dose in moderate impairment—consult product literature.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ When used for Type 2 diabetes mellitus in adults The maximum dose for metformin immediate-release medicines in the BNF differs from product licence and is based on clinical experience. Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of

metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur. Medicines for Children leaflet: Metformin for diabetes [www.medicinesforchildren.org.uk/medicines/metformin-for-diabetes/](http://www.medicinesforchildren.org.uk/medicines/metformin-for-diabetes/)
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - ▶ **GLUCOPHAGE® SR** For full details see funding body website
  - ▶ **Scottish Medicines Consortium (SMC) decisions**
    - ▶ Metformin hydrochloride (*Glucophage SR®*) for type 2 diabetes mellitus (October 2009) SMC No. 148/04 Recommended with restrictions
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution
- **Modified-release tablet**
  - CAUTIONARY AND ADVISORY LABELS 21, 25
  - ▶ **Metformin hydrochloride (Non-proprietary)**
    - **Metformin hydrochloride 500 mg** Metformin 500mg modified-release tablets | 28 tablet  £1.00-£2.51 | 56 tablet   DT = £1.71

## BLOOD GLUCOSE LOWERING DRUGS >

### DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

**Alogliptin**

27-Apr-2022

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

● **INDICATIONS AND DOSE**

**Type 2 diabetes mellitus in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control**

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.
- ▶ Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CAUTIONS** History of pancreatitis · not recommended in moderate to severe heart failure (limited experience)

- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · gastroesophageal reflux disease · headache · increased risk of infection · skin reactions
- ▶ **Frequency not known** Angioedema · hepatic function abnormal · pancreatitis acute · Stevens-Johnson syndrome
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.
- **ALLERGY AND CROSS-SENSITIVITY** [EVGr] Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors. ⚠
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT**
- Dose adjustments** [EVGr] Reduce dose to 12.5 mg once daily if creatinine clearance 30–50 mL/minute.
- Reduce dose to 6.25 mg once daily if creatinine clearance less than 30 mL/minute. ⚠
- See p. 21.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Vipidia** (Takeda UK Ltd)
- Alogliptin (as Alogliptin benzoate) 6.25 mg** Vipidia 6.25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60
- Alogliptin (as Alogliptin benzoate) 12.5 mg** Vipidia 12.5mg tablets | 28 tablet [PoM] £26.60 DT = £26.60
- Alogliptin (as Alogliptin benzoate) 25 mg** Vipidia 25mg tablets | 28 tablet [PoM] £26.60 DT = £26.60

**Alogliptin with metformin**

03-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin above, metformin hydrochloride p. 761.

● **INDICATIONS AND DOSE**

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors · metformin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Vipdomet** (Takeda UK Ltd)
- Alogliptin (as Alogliptin benzoate) 12.5 mg, Metformin hydrochloride 1 gram** Vipdomet 12.5mg/1000mg tablets | 56 tablet [PoM] £26.60 DT = £26.60

## Linagliptin

27-Apr-2022

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control**

► BY MOUTH

- Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CAUTIONS** History of pancreatitis
- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors
- **SIDE-EFFECTS**
  - **Uncommon** Cough · nasopharyngitis
  - **Rare or very rare** Angioedema · skin reactions
  - **Frequency not known** Pancreatitis
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

### Scottish Medicines Consortium (SMC) decisions

- **Linagliptin (Trajenta<sup>®</sup>) for the treatment of type 2 diabetes mellitus to improve glycaemic control in adults (January 2012)** SMC No. 746/11 Recommended with restrictions
- **Linagliptin (Trajenta<sup>®</sup>) for the treatment of type 2 diabetes mellitus to improve glycaemic control in adults in combination with insulin with or without metformin, when this regimen alone, with diet and exercise, does not provide adequate glycaemic control (May 2015)** SMC No. 850/13 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Trajenta** (Boehringer Ingelheim Ltd)  
Linagliptin 5 mg Trajenta 5mg tablets | 28 tablet [POM] £33.26 DT = £33.26

Combinations available: *Empagliflozin with linagliptin*, p. 776

## Linagliptin with metformin

20-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin above, metformin hydrochloride p. 761.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin**

► BY MOUTH

- Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors · metformin
  - **NATIONAL FUNDING/ACCESS DECISIONS**
- For full details see funding body website

### Scottish Medicines Consortium (SMC) decisions

- **Linagliptin with metformin (Jentadueto<sup>®</sup>) for the treatment of adult patients with type 2 diabetes mellitus in combination with insulin (i.e. triple combination therapy) as an adjunct to diet and exercise to improve glycaemic control when insulin and metformin alone do not provide adequate glycaemic control (June 2015)** SMC No. 1057/15 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 21

- **Jentadueto** (Boehringer Ingelheim Ltd)  
Linagliptin 2.5 mg, Metformin hydrochloride 850 mg Jentadueto 2.5mg/850mg tablets | 56 tablet [PoM] £33.26 DT = £33.26
- **Linagliptin 2.5 mg, Metformin hydrochloride 1000 mg** Jentadueto 2.5mg/1000mg tablets | 56 tablet [PoM] £33.26 DT = £33.26

## Saxagliptin

24-May-2022

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control**

► BY MOUTH

- Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CAUTIONS** History of pancreatitis · moderate to severe heart failure (limited experience)
  - **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors
  - **SIDE-EFFECTS**
    - **Common or very common** Abdominal pain · dizziness · fatigue · headache · increased risk of infection · skin reactions · vomiting
    - **Uncommon** Pancreatitis
    - **Rare or very rare** Angioedema
    - **Frequency not known** Constipation · nausea
  - SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.
  - **ALLERGY AND CROSS-SENSITIVITY** [EvGr] Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors. ⚠
  - **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
  - **BREAST FEEDING** Avoid—present in milk in *animal* studies.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).
  - **RENAL IMPAIRMENT** [EvGr] Caution if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>. Avoid in end-stage renal disease requiring haemodialysis. ⚠  
**Dose adjustments** [EvGr] Reduce dose to 2.5 mg once daily if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>; ⚠ see p. 21.
  - **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
- For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Saxagliptin** (*Onglyza*®) in adults with type 2 diabetes mellitus to improve glycaemic control as triple oral therapy in combination with metformin plus a sulfonylurea when this regimen alone, with diet and exercise, does not provide adequate glycaemic control (December 2013) SMC No. 918/13 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Onglyza** (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg Onglyza 2.5mg tablets | 28 tablet [POM] £31.60 DT = £31.60

Saxagliptin (as Saxagliptin hydrochloride) 5 mg Onglyza 5mg tablets | 28 tablet [POM] £31.60 DT = £31.60

**Saxagliptin with dapagliflozin** 25-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 764, dapagliflozin p. 774.

**INDICATIONS AND DOSE****Type 2 diabetes mellitus not controlled by metformin and/or a sulfonylurea with either saxagliptin or dapagliflozin**

- ▶ BY MOUTH

▶ Adult 18–74 years: 5/10 mg once daily

▶ Adult 75 years and over: Initiation not recommended

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Dose of concomitant sulfonylurea may need to be reduced.

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Dose expressed as x/y mg saxagliptin/dapagliflozin.

- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors · sodium glucose co-transporter 2 inhibitors
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT**  
Dose adjustments Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m<sup>2</sup> (ineffective).
- **PATIENT AND CARER ADVICE**  
Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website  
**Scottish Medicines Consortium (SMC) decisions**
- ▶ **Saxagliptin/dapagliflozin** (*Qtern*®) in adults with type 2 diabetes mellitus: to improve glycaemic control when metformin and/or sulfonylurea and one of the monocomponents of *Qtern*® do not provide adequate glycaemic control; when already being treated with the free combination of dapagliflozin and saxagliptin (July 2017) SMC No. 1255/17 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Qtern** (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 5 mg, Dapagliflozin (as Dapagliflozin propanediol monohydrate) 10 mg Qtern 5mg/10mg tablets | 28 tablet [POM] £49.56 DT = £49.56

**Saxagliptin with metformin**

25-Aug-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 764, metformin hydrochloride p. 761.

**INDICATIONS AND DOSE****Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin**

- ▶ BY MOUTH

▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

- **INTERACTIONS** → Appendix 1: dipeptidylpeptidase-4 inhibitors · metformin

- **NATIONAL FUNDING/ACCESS DECISIONS**

## BLOOD GLUCOSE LOWERING DRUGS

### GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

## Dulaglutide

17-Feb-2022

- **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy [if metformin inappropriate]**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 0.75 mg once weekly

**Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs [if existing treatment fails to achieve adequate glycaemic control]**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 1.5 mg once weekly; increased if necessary to 3 mg once weekly after at least 4 weeks, then increased if necessary to 4.5 mg once weekly after another 4 weeks, a starting dose of 0.75 mg once weekly may be considered for potentially vulnerable patients; maximum 4.5 mg per week

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)**

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available
- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · atrioventricular block · burping · constipation · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · hypoglycaemia · nausea · sinus tachycardia · vomiting
  - ▶ **Uncommon** Dehydration · gallbladder disorders
  - ▶ **Rare or very rare** Anaphylactic reaction · angioedema · pancreatitis acute (discontinue)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** **[EvGr]** Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> (limited information available), **[M]** see p. 21.
- **PRESCRIBING AND DISPENSING INFORMATION** Dulaglutide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** **Refrigerated storage** is usually necessary (2 °C – 8 °C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30 °C.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop. Dehydration Patients should be informed of the potential risk of dehydration in relation to gastro-intestinal side-effects and advised to take precautions to avoid fluid depletion. **Missed doses** If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Dulaglutide (Trulicity<sup>®</sup>)** for use in adults with type 2 diabetes mellitus to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicinal products including insulin, when these, together with diet and exercise, do not provide adequate glycaemic control (January 2016) SMC No. 1110/15 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Exenatide**

29-Sep-2021

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination**

- ▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

- ▶ BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES

▶ **Adult:** 2 mg once weekly

**Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)**

- ▶ BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Dose of concomitant sulfonylurea may need to be reduced.

**PHARMACOKINETICS**

- ▶ Effect of *modified-release* exenatide injection (*Bydureon*<sup>®</sup>) may persist for 10 weeks after discontinuation.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE:** GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are

advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- **CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · skin reactions · vomiting
  - ▶ **Uncommon** Alopecia · burping · drowsiness · hyperhidrosis · renal impairment · taste altered
  - ▶ **Frequency not known** Angioedema · pancreatitis acute
- **SIDE-EFFECTS, FURTHER INFORMATION** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if diagnosed.
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** [EvGr] For *immediate-release* injection, use with caution if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute. For *modified-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. ◊ See p. 21.
- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer exenatide injection. Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop. **Missed doses** If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer **after** a meal.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
  - ▶ Exenatide (*Byetta*<sup>®</sup>) for the treatment of type 2 diabetes mellitus (July 2007) SMC No. 376/07 Recommended with restrictions
  - ▶ Exenatide (*Byetta*<sup>®</sup>) for the treatment of type 2 diabetes mellitus in combination with metformin and a thiazolidinedione (March 2011) SMC No. 684/11 Recommended with restrictions
  - ▶ Exenatide (*Bydureon*<sup>®</sup>) for the treatment of type 2 diabetes mellitus (January 2012) SMC No. 748/11 Recommended with restrictions
  - ▶ Exenatide (*Byetta*<sup>®</sup>) as adjunctive therapy to basal insulin with or without metformin and/or pioglitazone in adults with type 2 diabetes who have not achieved adequate glycaemic control with these agents (June 2012) SMC No. 785/12 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Byetta** (AstraZeneca UK Ltd)

**Exenatide 250 microgram per 1 ml** Byetta 5micrograms/0.02ml solution for injection 1.2ml pre-filled pens | 1 pre-filled disposable injection [PoM] £81.89 DT = £81.89

Byetta 10micrograms/0.04ml solution for injection 2.4ml pre-filled pens | 1 pre-filled disposable injection [PoM] £81.89 DT = £81.89

## Liraglutide

07-Nov-2021

- **DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

#### SAXENDA<sup>®</sup>

**Adjunct in weight management [in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m<sup>2</sup> or more, or in individuals with a BMI of 27 kg/m<sup>2</sup> or more in the presence of at least one weight-related comorbidity]**

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 0.6 mg once daily, then increased in steps of 0.6 mg, dose to be increased at intervals of at least 1 week up to a maintenance dose of 3 mg once daily or the maximum tolerated dose has been reached. Consider discontinuation if escalation to the next dose is not tolerated for 2 consecutive weeks. Discontinue if at least 5% of initial body-weight has not been lost after 12 weeks at maximum dose; maximum 3 mg per day

#### VICTOZA<sup>®</sup>

**Type 2 diabetes mellitus [monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs]**

▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary to 1.8 mg once daily, for information on use with other antidiabetic drugs—consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or sulfonylurea may need to be reduced.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)**

- ▶ When used for Type 2 diabetes mellitus Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of a glucagon-like peptide-1 (GLP-1) receptor agonist and insulin, particularly after discontinuation or rapid dose reduction of concomitant insulin. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease

**SAXENDA<sup>®</sup>** Concomitant use with other products for weight management · elderly 75 years or over (limited information) · obesity secondary to endocrinological or eating disorders

**VICTOZA<sup>®</sup>** Diabetic ketoacidosis

- **CAUTIONS** Severe congestive heart failure (no information available) · thyroid disease
- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · asthenia · burping · constipation · diarrhoea · dizziness · dry mouth · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · insomnia · nausea · skin reactions · taste altered · toothache · vomiting
  - ▶ **Uncommon** Dehydration · malaise · pancreatitis · renal impairment · tachycardia
  - ▶ **Frequency not known** Angioedema · dyspnoea · hypotension · oedema · palpitations · pancreatitis acute (discontinue permanently) · thyroid disorder

**SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies (recommendation also supported by tertiary sources).
- **BREAST FEEDING** Manufacturer advises avoid—no information available; *animal* studies suggest that transfer into milk is low, but excretion into human milk not known (a tertiary source confirms lack of information in human lactation, but also states that risk to infants appears to be negligible. [EVRG](#) Blood glucose monitoring of the infant should be considered) .
- **HEPATIC IMPAIRMENT**

**SAXENDA<sup>®</sup>** Manufacturer advises use with caution in mild to moderate impairment; avoid in severe impairment (risk of decreased exposure).

**VICTOZA<sup>®</sup>** Manufacturer advises avoid in severe impairment (risk of decreased exposure).
- **RENAL IMPAIRMENT**

**SAXENDA<sup>®</sup>** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute. See p. 21.

**VICTOZA<sup>®</sup>** Manufacturer advises avoid in end-stage renal disease.

- **PRESCRIBING AND DISPENSING INFORMATION** Liraglutide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—after first use can also be stored below 30°C and used within 1 month; keep cap on pen to protect from light.
- **PATIENT AND CARER ADVICE** Patients and their carers should be given advice on how to administer liraglutide injection. Patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop. Patients and their carers should be informed of the potential risk of dehydration in relation to gastrointestinal side-effects and advised to take precautions to avoid fluid depletion; they should also be informed of the symptoms of cholelithiasis and cholecystitis, and of increased heart rate.

**SAXENDA**<sup>®</sup>

**Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Patients and carers should be cautioned on the effects of driving and performance of skilled tasks—increased risk of dizziness, particularly during first 3 months of treatment.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

- **NICE decisions**

- ▶ **Liraglutide for managing overweight and obesity (December 2020)** NICE TA664 Recommended with restrictions

- **Scottish Medicines Consortium (SMC) decisions**

- ▶ **Liraglutide (Saxenda<sup>®</sup>) as an adjunct to a reduced-calorie diet and increased physical activity for weight management in adult patients with an initial Body Mass Index (BMI) of 30 kg/m<sup>2</sup> or more (obese), or 27 kg/m<sup>2</sup> to less than 30 kg/m<sup>2</sup> (overweight) in the presence of at least one weight-related comorbidity (October 2021)** SMC No. SMC2378 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**

- ▶ **Saxenda** (Novo Nordisk Ltd)

**Liraglutide 6 mg per 1 ml** Saxenda 6mg/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £117.72 | 5 pre-filled disposable injection [PoM] £196.20

- ▶ **Victoza** (Novo Nordisk Ltd)

**Liraglutide 6 mg per 1 ml** Victoza 6mg/ml solution for injection 3ml pre-filled pens | 2 pre-filled disposable injection [PoM] £78.48 DT = £78.48 | 3 pre-filled disposable injection [PoM] £117.72

Combinations available: *Insulin degludec with liraglutide*, p. 787

## Lixisenatide

29-Sep-2021

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

- **INDICATIONS AND DOSE**

**Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs**

- ▶ **BY SUBCUTANEOUS INJECTION**

- ▶ **Adult:** Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Dose of concomitant sulfonylurea or insulin may need to be reduced.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)**

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of insulin and the glucagon-like peptide-1 (GLP-1) receptor agonist exenatide, liraglutide, or dulaglutide, particularly after discontinuation or rapid dose reduction of concomitant insulin. The MHRA has not currently received any UK reports of diabetic ketoacidosis with the GLP-1 receptor agonists lixisenatide and semaglutide but this risk cannot be excluded. Healthcare professionals are advised

that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastro-intestinal disease
  - **CAUTIONS** History of pancreatitis
  - **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Back pain · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · headache · increased risk of infection · nausea · vomiting
    - ▶ **Uncommon** Urticaria
    - ▶ **Frequency not known** Pancreatitis acute
  - **SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
  - **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.
  - **PREGNANCY** Avoid—toxicity in *animal studies*.
  - **BREAST FEEDING** Avoid—no information available.
  - **RENAL IMPAIRMENT** [EvG] Avoid if creatinine clearance less than 30 mL/minute (no information available). ⚠ See p. 21.
  - **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer lixisenatide injection. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.
- Missed doses** If a dose is missed, inject within 1 hour before the next meal—do not administer **after** a meal.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
  - **Scottish Medicines Consortium (SMC) decisions**
    - ▶ **Lixisenatide (Lyxumia<sup>®</sup>) for the treatment of adults with type 2 diabetes mellitus to achieve glycaemic control in combination with oral glucose-lowering medicinal products and/or basal insulin when these, together with diet and exercise, do not provide adequate glycaemic control (September 2013)** SMC No. 903/13 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Lyxumia** (Sanofi)

**Lixisenatide 50 microgram per 1 ml** Lyxumia 10micrograms/0.2ml solution for injection 3ml pre-filled pens | 1 pre-filled disposable injection [PoM] £31.67 DT = £31.67

**Lixisenatide 100 microgram per 1 ml** Lyxumia 20micrograms/0.2ml solution for injection 3ml pre-filled pens | 2 pre-filled disposable injection [PoM] £57.93 DT = £57.93

Combinations available: *Insulin glargine with lixisenatide*, p. 788

## Semaglutide

16-Feb-2021

● **DRUG ACTION** Semaglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus [monotherapy (if metformin inappropriate) or in combination with other antidiabetic drugs]**

#### ► BY SUBCUTANEOUS INJECTION

► **Adult:** Initially 0.25 mg once weekly for 4 weeks, then increased to 0.5 mg once weekly for at least 4 weeks, then increased if necessary to 1 mg once weekly, for information on use with other antidiabetic drugs—consult product literature

#### ► BY MOUTH

► **Adult:** Initially 3 mg once daily for 1 month, then increased to 7 mg once daily for at least 1 month, then increased if necessary to 14 mg once daily, dose to be taken on an empty stomach, for information on use with other antidiabetic drugs—consult product literature, one 14 mg tablet should be used to achieve a 14 mg dose; use of two 7 mg tablets to achieve a 14 mg dose has not been studied and is therefore not recommended; maximum 14 mg per day

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises dose of concomitant insulin or sulfonyleurea may need to be reduced.

### DOSE EQUIVALENCE AND CONVERSION

► Oral semaglutide 14 mg once daily is comparable to subcutaneous semaglutide 0.5 mg once weekly. Due to the high pharmacokinetic variability of oral semaglutide, the effect of switching between oral and subcutaneous semaglutide cannot easily be predicted.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: GLP-1 RECEPTOR AGONISTS: REPORTS OF DIABETIC KETOACIDOSIS WHEN CONCOMITANT INSULIN WAS RAPIDLY REDUCED OR DISCONTINUED (JUNE 2019)**

Serious and life-threatening cases of diabetic ketoacidosis have been reported in patients with type 2 diabetes mellitus on a combination of insulin and the glucagon-like peptide-1 (GLP-1) receptor agonist exenatide, liraglutide, or dulaglutide, particularly after discontinuation or rapid dose reduction of concomitant insulin. The MHRA has not currently received any UK reports of diabetic ketoacidosis with the GLP-1 receptor agonists lixisenatide and semaglutide but this risk cannot be excluded. Healthcare professionals are advised that any dose reduction of insulin should be done in a stepwise manner with careful blood glucose self-monitoring, particularly when GLP-1 receptor agonist therapy is initiated. Patients should be informed of the risk factors for and signs and symptoms of diabetic ketoacidosis, and advised to seek immediate medical attention if these develop.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Diabetic retinopathy (in patients treated with insulin) · history of pancreatitis · severe congestive heart failure (no information available)
- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists
- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased · burping · cholelithiasis · constipation · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · hypoglycaemia (in combination with insulin or sulfonyleurea) · nausea · vomiting · weight decreased

- **Uncommon** Pancreatitis acute · taste altered
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least two months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information in severe impairment).
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use Manufacturer advises tablets should be taken whole on an empty stomach, with a sip of water (up to half a glass, equivalent to 120 mL). Patients should wait at least 30 minutes after a dose before eating, drinking, or taking other oral medicines—intake with food or large volumes of water decreases the absorption of semaglutide.
- **PRESCRIBING AND DISPENSING INFORMATION** Semaglutide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **HANDLING AND STORAGE**
  - With subcutaneous use Manufacturer advises store injection pens in a refrigerator (2–8°C)—after first use can also be stored below 30°C; keep cap on pen to protect from light.
- **PATIENT AND CARER ADVICE** Patients and their carers should be given advice on how to administer semaglutide tablets and injection.
  - Acute pancreatitis Patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop.
  - Missed doses** ► With subcutaneous use If a dose is more than 5 days late, the missed dose should not be taken and the next dose should be administered at the normal time.
  - With oral use If a dose is missed, the missed dose should not be taken and the next dose should be taken at the normal time.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - For full details see funding body website
  - Scottish Medicines Consortium (SMC) decisions**
  - **Semaglutide (Ozempic<sup>®</sup>)** for the treatment of adults with insufficiently controlled type 2 diabetes mellitus as an adjunct to diet and exercise (January 2019) SMC No. SMC2092 Recommended with restrictions
  - **Semaglutide (Rybelsus<sup>®</sup>)** for the treatment of adults with insufficiently controlled type 2 diabetes to improve glycaemic control as an adjunct to diet and exercise: as monotherapy when metformin is considered inappropriate due to intolerance or contra-indications; or in combination with other medicinal products for the treatment of diabetes (September 2020) SMC No. SMC2287 Recommended with restrictions

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### ► **Ozempic** (Novo Nordisk Ltd) ▼

## BLOOD GLUCOSE LOWERING DRUGS >

### MEGLITINIDES

## Repaglinide

04-Jun-2021

#### ● DRUG ACTION Repaglinide stimulates insulin secretion.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)**

##### ▶ BY MOUTH

▶ Adult: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

**Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug**

##### ▶ BY MOUTH

▶ Adult: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

#### ● CONTRA-INDICATIONS Ketoacidosis

#### ● CAUTIONS Debilitated patients · elderly (no information available) · malnourished patients

**CAUTIONS, FURTHER INFORMATION** Manufacturer advises patients exposed to stress (including fever, trauma, infection or surgery) may require treatment interruption and temporary replacement with insulin to maintain glycaemic control.

#### ● INTERACTIONS → Appendix 1: meglitinides

#### ● SIDE-EFFECTS

#### ▶ Common or very common Abdominal pain · diarrhoea · hypoglycaemia

#### ▶ Rare or very rare Cardiovascular disease · constipation · hepatic function abnormal · vasculitis · vision disorders · vomiting

#### ▶ Frequency not known Acute coronary syndrome · hypoglycaemic coma · nausea · skin reactions

#### ● PREGNANCY Avoid.

#### ● BREAST FEEDING Avoid—present in milk in *animal* studies.

#### ● HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment (risk of increased exposure).

#### ● RENAL IMPAIRMENT [EvGr](#) Use with caution.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

#### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

## BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

## Canagliflozin

22-Feb-2022

#### ● DRUG ACTION Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

##### ▶ BY MOUTH

▶ Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.
- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious

illnesses; treatment may be restarted once the patient's condition has stabilised

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)**

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

**MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)**

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)**

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Elderly (risk of volume depletion) · elevated haematocrit · hypotension · risk of volume depletion
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Volume depletion Correct hypovolaemia before starting treatment.
- **INTERACTIONS** → Appendix 1: sodium glucose co-transporter 2 inhibitors
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Balanoposthitis · constipation · dyslipidaemia · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · nausea · thirst · urinary disorders · urosepsis

- ▶ **Uncommon** Dehydration · dizziness postural · hypotension · lower limb amputations · renal failure · skin reactions · syncope
- ▶ **Rare or very rare** Anaphylactic reaction · angioedema · diabetic ketoacidosis (discontinue immediately)
- ▶ **Frequency not known** Fournier's gangrene (discontinue and initiate treatment promptly)

**SIDE-EFFECTS, FURTHER INFORMATION** Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** [E<sub>VG</sub>r](#) Caution if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Avoid initiation when baseline eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. [M](#) [D](#)  
**Dose adjustments** [E<sub>VG</sub>r](#) Limit dose to 100 mg once daily when eGFR less than 60 mL/minute/1.73 m<sup>2</sup>; consider addition of other hypoglycaemic agents if further glycaemic control needed. If eGFR falls to less than 30 mL/minute/1.73 m<sup>2</sup> during treatment, continue with 100 mg once daily. [M](#) [D](#) See p. 21.
- **MONITORING REQUIREMENTS** [E<sub>VG</sub>r](#) Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter. [M](#) [D](#)
- **PATIENT AND CARER ADVICE** Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased

insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients

- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)**

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)**

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

**MHRA/CHM ADVICE: FORXIGA<sup>®</sup> (DAPAGLIFLOZIN) 5 MG SHOULD NO LONGER BE USED FOR THE TREATMENT OF TYPE 1 DIABETES MELLITUS (NOVEMBER 2021)**

Dapagliflozin 5 mg is no longer authorised for the treatment of patients with type 1 diabetes mellitus (T1DM) and should no longer be used in this population. Discontinuation of dapagliflozin in patients with T1DM must be made by or in consultation with a physician specialised in diabetes care as soon as clinically practical. After stopping dapagliflozin, frequent blood glucose monitoring is recommended, and the insulin dose should be increased carefully to minimise the risk of hypoglycaemia.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Elderly (risk of volume depletion) · hypotension · raised haematocrit · risk of volume depletion
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Volume depletion Correct hypovolaemia before starting treatment.
- **INTERACTIONS** → Appendix 1: sodium glucose co-transporter 2 inhibitors
- **SIDE-EFFECTS**
- ▶ **Common or very common** Back pain · balanoposthitis · diabetic ketoacidosis (discontinue immediately) · dizziness · dyslipidaemia · hypoglycaemia (in combination with insulin or sulfonylurea) · increased risk of infection · rash · urinary disorders
- ▶ **Uncommon** Constipation · dry mouth · genital pruritus · hypovolaemia · thirst · vulvovaginal pruritus · weight decreased

- ▶ **Rare or very rare** Angioedema · Fournier's gangrene (discontinue and initiate treatment promptly)

**SIDE-EFFECTS, FURTHER INFORMATION** Interrupt treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** [EvGr](#) Caution in severe impairment (risk of increased exposure; limited information available). [M](#)
- **Dose adjustments** [EvGr](#) Initially 5 mg daily in severe impairment, increased if tolerated to 10 mg daily. [M](#)
- **RENAL IMPAIRMENT** See p. 21. [EvGr](#) Avoid initiation if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>. [M](#)
- ▶ When used for type 2 diabetes mellitus [EvGr](#) Consider additional antidiabetic drugs with dapagliflozin if eGFR less than 45 mL/minute/1.73 m<sup>2</sup> (reduced efficacy). [M](#)
- **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these

- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)**

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)**

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Complicated urinary tract infections—consider temporarily interrupting treatment · elderly · hypotension · risk of volume depletion

#### CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion [\[EvGr\]](#) Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs. [\[M\]](#)

**Ertugliflozin**

22-Feb-2022

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**● INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily; increased to 15 mg once daily if necessary and if tolerated, dose to be taken in the morning

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use ertugliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved

- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illness; treatment may be restarted once the patient's condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: MONITOR KETONES IN BLOOD DURING TREATMENT INTERRUPTION FOR SURGICAL PROCEDURES OR ACUTE SERIOUS MEDICAL ILLNESS (MARCH 2020)

New recommendations have been issued following a European review of peri-operative diabetic ketoacidosis in patients taking SGLT2 inhibitors. Healthcare professionals are advised to monitor ketone levels during SGLT2 inhibitor treatment interruption in patients who have been hospitalised for major surgery or acute serious illness—measurement of blood ketone levels is preferred to urine. Treatment may be restarted once ketone levels are normal and the patient's condition has stabilised.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER'S GANGRENE (NECROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier's gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier's gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Dehydration · elderly (risk of volume depletion) · history of hypotension

#### CAUTIONS, FURTHER INFORMATION

- ▶ Volume depletion Manufacturer advises correct hypovolaemia before starting treatment—consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1: sodium glucose co-transporter 2 inhibitors
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Hypoglycaemia (in combination with insulin or sulfonylurea) · hypovolaemia · increased risk of infection · polydipsia · thirst · urinary disorders · vulvovaginal pruritus
  - ▶ **Rare or very rare** Diabetic ketoacidosis (discontinue immediately)
  - ▶ **Frequency not known** Fournier's gangrene (discontinue and initiate treatment promptly) · lower limb amputations · phimosis

**SIDE-EFFECTS, FURTHER INFORMATION** Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT**  Avoid initiation if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Frequent monitoring of renal function required if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR is persistently less than 45 mL/minute/1.73 m<sup>2</sup>.  See p. 21.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises to determine renal function before treatment and periodically thereafter.

- ▶ Manufacturer advises monitor volume status and electrolytes during treatment in patients at risk of volume depletion.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

#### NICE decisions

- ▶ **Ertugliflozin as monotherapy or with metformin for treating type 2 diabetes (March 2019)** NICE TA572 Recommended with restrictions
- ▶ **Ertugliflozin with metformin and a dipeptidyl peptidase-4 inhibitor for treating type 2 diabetes (June 2019)** NICE TA583 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ **Ertugliflozin (Steglatro<sup>®</sup>) in adults with type 2 diabetes mellitus as an adjunct to diet and exercise to improve glycaemic control: as monotherapy in patients for whom the use of metformin is considered inappropriate due to intolerance or contra-indications; in addition to other medicinal products for the treatment of diabetes (January 2019)** SMC No. SMC2102 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Steglatro** (Merck Sharp & Dohme (UK) Ltd) ▼  
**Ertugliflozin** (as Ertugliflozin L-pyroglytamic acid) 5 mg Steglatro 5mg tablets | 28 tablet  £29.40 DT = £29.40  
**Ertugliflozin** (as Ertugliflozin L-pyroglytamic acid)  
 15 mg Steglatro 15mg tablets | 28 tablet  £29.40 DT = £29.40

## BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

### Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain · elderly · G6PD deficiency
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria) if prescribed a **long-acting** sulfonylurea (e.g. glibenclamide, chlorpropamide, glimepiride) in type 2 diabetes mellitus (risk of prolonged hypoglycaemia). See also Prescribing in the elderly p. 29.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · hypoglycaemia · nausea
  - ▶ **Uncommon** Hepatic disorders · vomiting
  - ▶ **Rare or very rare** Agranulocytosis · erythromegaly · granulocytopenia · haemolytic anaemia · leucopenia · pancytopenia · thrombocytopenia
  - ▶ **Frequency not known** Allergic dermatitis (usually in the first 6–8 weeks of therapy) · constipation · photosensitivity reaction · skin reactions · visual impairment
- **HEPATIC IMPAIRMENT** In general, manufacturers advise avoid in severe impairment (increased risk of hypoglycaemia).
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

- **PATIENT AND CARER ADVICE** The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.  
**Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

F 778

## Gliclazide

10-Mar-2020

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - **Adult:** Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - **Adult:** Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyria p. 1150
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Anaemia · angioedema · dyspepsia · gastrointestinal disorder · hypersensitivity vasculitis · hyponatraemia · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Modified-release tablet

##### CAUTIONARY AND ADVISORY LABELS 25

#### ▶ Gliclazide (Non-proprietary)

- **Gliclazide 30 mg** Gliclazide 30mg modified-release tablets | 28 tablet [PoM] £2.81-£3.34 DT = £2.81 | 56 tablet [PoM] £6.61

  - **Gliclazide 40 mg** Zicon 40mg tablets | 28 tablet [PoM] £3.36 DT = £1.38

F 778

27-Feb-2020

## Glimepiride

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

### ● CAUTIONS

- ▶ **Porphyria** Sulfonylureas should be avoided where possible in Acute porphyria p. 1150 but glimepiride is thought to be safe.

- **INTERACTIONS** → Appendix 1: sulfonylureas

### ● SIDE-EFFECTS

- ▶ **Rare or very rare** Gastrointestinal discomfort · hypersensitivity vasculitis
- ▶ **Frequency not known** Drug cross-reactivity
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **MONITORING REQUIREMENTS** Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

#### ▶ Glimepiride (Non-proprietary)

- **Glimepiride 1 mg** Glimepiride 1mg tablets | 30 tablet [PoM] £4.33 DT = £0.88
- **Glimepiride 2 mg** Glimepiride 2mg tablets | 30 tablet [PoM] £7.13 DT = £1.00
- **Glimepiride 3 mg** Glimepiride 3mg tablets | 30 tablet [PoM] £10.75 DT = £1.04
- **Glimepiride 4 mg** Glimepiride 4mg tablets | 30 tablet [PoM] £14.24 DT = £1.15

F 778

27-Feb-2020

## Glipizide

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

- Adult: Initially 2.5–5 mg daily, adjusted according to response. Dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

### ● CAUTIONS

- Porphyria Sulfonyleureas should be avoided where possible in Acute porphyrias p. 1150 but glipizide is thought to be safe.

- **INTERACTIONS** → Appendix 1: sulfonyleureas

### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain upper
- **Uncommon** Dizziness · drowsiness · tremor · vision disorders
- **Frequency not known** Confusion · headache · hyponatraemia · malaise
- **PREGNANCY** The use of sulfonyleureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment.
- Dose adjustments** Manufacturer advises consider initial dose of 2.5 mg daily and conservative maintenance dosing in mild to moderate impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► Glipizide (Non-proprietary)

**Glipizide 5 mg** Glipizide 5mg tablets | 28 tablet [PoM] £2.86 DT = £1.26 | 56 tablet [PoM] £2.14-£3.15

##### ► Minodiab (Pfizer Ltd)

**Glipizide 5 mg** Minodiab 5mg tablets | 28 tablet [PoM] £1.26 DT = £1.26

## Tolbutamide

F 778

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

- Adult: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1150

- **INTERACTIONS** → Appendix 1: sulfonyleureas

### ● SIDE-EFFECTS

- **Rare or very rare** Aplastic anaemia · blood disorder
- **Frequency not known** Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · headache · hypersensitivity (usually in the first 6–8 weeks of therapy) · paraesthesia · tinnitus · weight increased
- **PREGNANCY** The use of sulfonyleureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- **BREAST FEEDING** The use of sulfonyleureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

##### ► Tolbutamide (Non-proprietary)

**Tolbutamide 500 mg** Tolbutamide 500mg tablets | 28 tablet [PoM] £41.80 DT = £35.33

## BLOOD GLUCOSE LOWERING DRUGS > THIAZOLIDINEDIONES

## Pioglitazone

31-Mar-2020

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus (alone or combined with metformin or a sulfonyleurea, or with both, or with insulin)

##### ► BY MOUTH

- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonyleurea or insulin may need to be reduced.

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

#### PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and

treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

● **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria

● **CAUTIONS** Concomitant use with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer · risk factors for heart failure

**CAUTIONS, FURTHER INFORMATION**

▶ Elderly For thiazolidenediones, prescription potentially inappropriate (STOPP criteria) in patients with heart failure (risk of exacerbation).

See also Prescribing in the elderly p. 29.

● **INTERACTIONS** → Appendix 1: pioglitazone

● **SIDE-EFFECTS**

▶ **Common or very common** Bone fracture · increased risk of infection · numbness · visual impairment · weight increased

▶ **Uncommon** Bladder cancer · insomnia

▶ **Frequency not known** Macular oedema

**SIDE-EFFECTS, FURTHER INFORMATION** Rare reports of liver dysfunction; discontinue if jaundice occurs.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

● **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

● **PATIENT AND CARER ADVICE**

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

## Pioglitazone with metformin

03-Feb-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, pioglitazone p. 780, metformin hydrochloride p. 761.

● **INDICATIONS AND DOSE**

**Type 2 diabetes not controlled by metformin alone**

▶ **BY MOUTH**

▶ **Adult:** 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

● **INTERACTIONS** → Appendix 1: metformin · pioglitazone

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

▶ **Pioglitazone with metformin (Non-proprietary)**

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin hydrochloride 850 mg** Pioglitazone 15mg / Metformin 850mg tablets | 56 tablet [POM] £44.36 DT = £40.81

▶ **Competact (Neon Healthcare Ltd)**

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin hydrochloride 850 mg** Competact 15mg/850mg tablets | 56 tablet [POM] £35.89 DT = £40.81

## INSULINS

### Insulins

**IMPORTANT SAFETY INFORMATION**

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

**NHS NEVER EVENT: OVERDOSE OF INSULIN DUE TO ABBREVIATIONS OR INCORRECT DEVICE (JANUARY 2018)**

The words 'unit' or 'international units' should **not** be abbreviated.

Specific insulin administration devices should always be used to measure insulin i.e. insulin syringes and pens.

Insulin should **not** be withdrawn from an insulin pen or pen refill and then administered using a syringe and needle.

**MHRA/CHM ADVICE: INSULINS (ALL TYPES): RISK OF CUTANEOUS AMYLOIDOSIS AT INJECTION SITE (SEPTEMBER 2020)**

A European review concluded that injection of insulin (all types) can lead to deposits of amyloid protein under the skin (cutaneous amyloidosis) at the injection site. Insulin-derived cutaneous amyloidosis interferes with insulin absorption, and administration of insulin at an affected site may affect glycaemic control. The MHRA advises healthcare professionals should consider cutaneous amyloidosis as a differential diagnosis to lipodystrophy when patients present with subcutaneous lumps at an insulin injection site. Patients should be reminded to rotate injection sites within the same body region to reduce or prevent the risk of cutaneous amyloidosis and other skin reactions. Patients should also be advised that injecting into an affected 'lumpy' area may reduce the effectiveness of insulin. Those currently injecting into a 'lumpy' area should contact their doctor before changing injection site due to the risk

of hypoglycaemia; blood glucose should be closely monitored after changing injection site, and dose adjustment of insulin or other antidiabetic medication may be required.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Oedema
- ▶ **Uncommon** Lipodystrophy
- ▶ **Frequency not known** Cutaneous amyloidosis
- Overdose** Overdose causes hypoglycaemia.

#### ● PREGNANCY

**Dose adjustments** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

#### ● BREAST FEEDING

**Dose adjustments** During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased.
- **RENAL IMPAIRMENT** The compensatory response to hypoglycaemia is impaired in renal impairment.  
**Dose adjustments** [EvoG](#) Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. [EvoG](#)

#### ● MONITORING REQUIREMENTS

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
- ▶ In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy and cutaneous amyloidosis. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers.
- **PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.  
Units The word 'unit' should **not** be abbreviated.
- **PATIENT AND CARER ADVICE**  
Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed

on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from [www.nhsforms.co.uk/](http://www.nhsforms.co.uk/). Further information is available at [www.england.nhs.uk/improvement-hub/publication/safe-use-of-insulin-and-you/](http://www.england.nhs.uk/improvement-hub/publication/safe-use-of-insulin-and-you/).

**Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

## INSULINS > RAPID-ACTING

F 781

### Insulin

#### (Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** According to requirements

##### Diabetic ketoacidosis | Diabetes during surgery

- ▶ BY INTRAVENOUS INFUSION
- ▶ **Adult:** (consult local protocol)

- **INTERACTIONS** → Appendix 1: insulin
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Skin reactions
  - ▶ **Rare or very rare** Refraction disorder
- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.
  - ▶ With intravenous use For *intravenous infusion* give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website

**NICE decisions**

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151**  
Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**▶ **Insulin (Non-proprietary)**

**Insulin human 500 unit per 1 ml** Humulin R 500units/ml solution for injection 20ml vials | 1 vial [PoM] [Σ]

Humulin R KwikPen 500units/ml solution for injection 3ml pre-filled pens | 2 pre-filled disposable injection [PoM] [Σ]

▶ **Actrapid** (Novo Nordisk Ltd)

**Insulin human (as Insulin soluble human) 100 unit per**

**1 ml** Actrapid 100units/ml solution for injection 10ml vials | 1 vial [PoM] £7.48 DT = £15.68

▶ **Humulin S** (Eli Lilly and Company Ltd)

**Insulin human (as Insulin soluble human) 100 unit per**

**1 ml** Humulin S 100units/ml solution for injection 10ml vials | 1 vial [PoM] £15.68 DT = £15.68

Humulin S 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08

▶ **Hypurin Porcine Neutral** (Wockhardt UK Ltd)

**Insulin porcine (as Insulin soluble porcine) 100 unit per**

**1 ml** Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial [PoM] £39.39 DT = £39.39

Hypurin Porcine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £59.08 DT = £59.08

▶ **Insuman Infusaf** (Sanofi)

**Insulin human 100 unit per 1 ml** Insuman Infusaf 100units/ml solution for injection 3.15ml cartridges | 5 cartridge [PoM] £250.00 DT = £250.00

▶ **Insuman Rapid** (Sanofi)

**Insulin human (as Insulin soluble human) 100 unit per**

**1 ml** Insuman Rapid 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08

Combinations available: *Biphasic insulin aspart*, p. 786 · *Biphasic insulin lispro*, p. 786 · *Biphasic isophane insulin*, p. 785 · *Insulin degludec*, p. 786 · *Insulin degludec with liraglutide*, p. 787 · *Insulin detemir*, p. 787 · *Insulin glargine*, p. 787 · *Insulin glargine with lixisenatide*, p. 788 · *Isophane insulin*, p. 785

**Insulin aspart****(Recombinant human insulin analogue—short acting)**● **INDICATIONS AND DOSE****FIASP®****Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1-17 years: According to requirements
- ▶ Adult: According to requirements

**NOVORAPID®****Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION

- ▶ Child: According to requirements
- ▶ Adult: According to requirements

**PHARMACOKINETICS**

- ▶ *Fiasp®* and *NovoRapid®* are **not** interchangeable due to differences in bioavailability; *Fiasp®* has a quicker onset of action and shorter duration.

● **UNLICENSED USE**

- ▶ In children Not licensed for use in children under 1 year.

● **INTERACTIONS** → Appendix 1: insulin● **SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Refraction disorder

● **PREGNANCY** Not known to be harmful—may be used during pregnancy.● **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

Manufacturer advises for *intravenous infusion of Fiasp®*, give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to 0.5-1 unit/mL with infusion fluid.

Manufacturer advises for *intravenous infusion of NovoRapid®*, give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to 0.05-1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin aspart is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin aspart preparations.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151**  
Recommended

## Insulin lispro

18-Feb-2020

### (Recombinant human insulin analogue—short acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer shortly before meals or when necessary shortly after meals, according to requirements
- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

#### ● INTERACTIONS → Appendix 1: insulin

- **PREGNANCY** Not known to be harmful—may be used during pregnancy.

- **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
- ▶ With intravenous use in adults For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.
- ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin lispro is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

## INSULINS > INTERMEDIATE-ACTING

F 781

### Biphasic isophane insulin

05-Oct-2021

#### (Biphasic Isophane Insulin Injection—intermediate acting)

##### ● INDICATIONS AND DOSE

###### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulin

##### ● SIDE-EFFECTS

- ▶ Rare or very rare Angioedema
- ▶ Frequency not known Hypokalaemia · weight increased

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Humulin M3** (Eli Lilly and Company Ltd)  
**Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml** Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08

## Isophane insulin

### (Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

##### ● INDICATIONS AND DOSE

###### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulin

- **PREGNANCY** Recommended where longer-acting insulins are needed.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)  
**Insulin human (as Insulin isophane human) 100 unit per 1 ml** Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68 DT = £15.68  
Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08
- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)  
**Insulin human (as Insulin isophane human) 100 unit per 1 ml** Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Porcine Isophane** (Wockhardt UK Ltd)  
**Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml** Hypurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £39.39 DT = £39.39  
Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £59.08 DT = £59.08
- ▶ **Insulatard** (Novo Nordisk Ltd)  
**Insulin human (as Insulin isophane human) 100 unit per 1 ml** Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48 DT = £15.68
- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)  
**Insulin human (as Insulin isophane human) 100 unit per 1 ml** Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £20.40 DT = £21.70

- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)  
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT = £19.08
- ▶ **Insuman Basal** (Sanofi)  
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08
- ▶ **Insuman Basal SoloStar** (Sanofi)  
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £19.80 DT = £21.70

## INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

781

### Biphasic insulin aspart (Intermediate-acting insulin)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 10 minutes before or soon after a meal, according to requirements
- ▶ Adult: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulin

#### ● SIDE-EFFECTS

- ▶ Uncommon Skin reactions

- ▶ **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)  
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.89 DT = £29.89
- ▶ **NovoMix 30 Penfill** (Novo Nordisk Ltd)  
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT = £28.79

### Biphasic insulin lispro (Intermediate-acting insulin)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- ▶ Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1: insulin

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

- ▶ **Humalog Mix25** (Eli Lilly and Company Ltd)  
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61 DT = £16.61  
Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)  
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98
- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)  
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)  
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

## INSULINS > LONG-ACTING

781

### Insulin degludec

22-Oct-2020

#### (Recombinant human insulin analogue—long acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: Dose to be given according to requirements
- ▶ Adult: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulin

#### ● SIDE-EFFECTS

- ▶ Rare or very rare Urticaria

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*<sup>®</sup>) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

- For full details see funding body website

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Insulin degludec (*Tresiba*<sup>®</sup>) for treatment of diabetes mellitus in adult patients where treatment with a basal insulin analogue is considered appropriate (October 2016) AWMSG No. 3158 Recommended with restrictions
- ▶ Insulin degludec (*Tresiba*<sup>®</sup>) for treatment of diabetes mellitus in adolescents and children from the age of 1 year where treatment with a basal insulin analogue is considered appropriate (October 2016) AWMSG No. 3158 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Tresiba FlexTouch** (Novo Nordisk Ltd)  
Insulin degludec 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £46.60 DT = £46.60  
Insulin degludec 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £55.92 DT = £55.92

▶ **Tresiba Penfill** (Novo Nordisk Ltd)

**Insulin degludec 100 unit per 1 ml** Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60 DT = £46.60

## Insulin degludec with liraglutide

22-Oct-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec p. 786, liraglutide p. 769.

### ● INDICATIONS AND DOSE

**As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

**When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists · insulin

- **PATIENT AND CARER ADVICE** Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Insulin degludec/liraglutide (*Xultophy*<sup>®</sup>)** for treatment of adults with type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control (October 2015) SMC No. 1088/15 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **Xultophy** (Novo Nordisk Ltd)

**Liraglutide 3.6 mg per 1 ml, Insulin degludec 100 unit per 1 ml** Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £95.53 DT = £95.53

## Insulin detemir

24-Nov-2020

(Recombinant human insulin analogue—long acting)

### ● INDICATIONS AND DOSE

**Diabetes mellitus**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 1-17 years: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulin

### ● SIDE-EFFECTS

- ▶ **Uncommon** Refraction disorder

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 785 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Insulin detemir (*Levemir*<sup>®</sup>)** for the treatment of diabetes mellitus (March 2016) SMC No. 1126/16 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **Levemir FlexPen** (Novo Nordisk Ltd)

**Insulin detemir 100 unit per 1 ml** Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £42.00 DT = £42.00

▶ **Levemir InnoLet** (Novo Nordisk Ltd)

**Insulin detemir 100 unit per 1 ml** Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £44.85 DT = £42.00

▶ **Levemir Penfill** (Novo Nordisk Ltd)

**Insulin detemir 100 unit per 1 ml** Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT = £42.00

781

## Insulin glargine

18-Nov-2020

(Recombinant human insulin analogue—long acting)

### ● INDICATIONS AND DOSE

**Diabetes mellitus**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

#### TOUJEO<sup>®</sup>

**Diabetes mellitus**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulin

### ● SIDE-EFFECTS

- ▶ **Rare or very rare** Myalgia · sodium retention · taste altered

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Insulin glargine (*Lantus*<sup>®</sup>)** for the treatment of diabetes mellitus in adults, adolescents and children aged 2 years and above (April 2013) SMC No. 860/13 Recommended with restrictions
- ▶ **Insulin glargine (*Toujeo*<sup>®</sup>)** for the treatment of type 1 or type 2 diabetes mellitus in adults aged 18 years and above (September 2015) SMC No. 1078/15 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **Insulin glargine (Non-proprietary)**

**Insulin glargine 100 unit per 1 ml** Abasaglar Tempo Pen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] DT = £34.75

- ▶ **Abasaglar** (Eli Lilly and Company Ltd)  
**Insulin glargine 100 unit per 1 ml** Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT = £34.75
- ▶ **Abasaglar KwikPen** (Eli Lilly and Company Ltd)  
**Insulin glargine 100 unit per 1 ml** Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £35.28 DT = £34.75
- ▶ **Lantus** (Sanofi)  
**Insulin glargine 100 unit per 1 ml** Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £34.75 DT = £34.75  
 Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £34.75 DT = £34.75  
 Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £25.69 DT = £25.69
- ▶ **Semglee** (Viatris UK Healthcare Ltd) ▼  
**Insulin glargine 100 unit per 1 ml** Semglee 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.99 DT = £34.75
- ▶ **Toujeo** (Sanofi)  
**Insulin glargine 300 unit per 1 ml** Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £32.14 DT = £32.14
- ▶ **Toujeo DoubleStar** (Sanofi)  
**Insulin glargine 300 unit per 1 ml** Toujeo 300units/ml solution for injection 3ml pre-filled DoubleStar pens | 3 pre-filled disposable injection [PoM] £64.27 DT = £64.27

## Insulin glargine with lixisenatide

09-Nov-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin glargine p. 787, lixisenatide p. 770.

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus [in combination with metformin]

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: glucagon-like peptide-1 receptor agonists · insulin
- **PRESCRIBING AND DISPENSING INFORMATION** *Suliqua*<sup>®</sup> is available in two pen strengths, providing different dosing options. To avoid medication errors, the prescriber must ensure that the correct strength and number of dose steps is prescribed. The manufacturer of *Suliqua*<sup>®</sup> has provided a healthcare professional guide and letter which includes important information on dosing.
- **PATIENT AND CARER ADVICE** Manufacturer advises check pen label before each administration to avoid medication error.  
 A patient guide should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
 For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**  
 ▶ Insulin glargine with lixisenatide (*Suliqua*<sup>®</sup>) in combination with metformin for the treatment of adults with type II diabetes mellitus (T2DM), to improve glycaemic control when this has not been provided by metformin alone or metformin combined with another oral glucose-lowering medicinal product or with basal insulin (April 2020) SMC No. SMC2235 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Suliqua** (Sanofi) ▼  
**Lixisenatide 33 microgram per 1 ml, Insulin glargine 100 unit per 1 ml** Suliqua 100units/ml / 33micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £48.60 DT = £48.60

**Lixisenatide 50 microgram per 1 ml, Insulin glargine 100 unit per 1 ml** Suliqua 100units/ml / 50micrograms/ml solution for injection 3ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £67.50 DT = £67.50

## 4.1a Diabetes, diagnosis and monitoring

### Diabetes mellitus, diagnostic and monitoring devices

#### Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*<sup>®</sup> but this should be followed by confirmation in the laboratory, since false positive results are common.

#### Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

## Urine ketone testing strips

### ● URINE KETONES TESTING STRIPS

**GlucOx KetoRx Sticks 2GK testing strips** (GlucOx Ltd)  
50 strip • NHS indicative price = £2.25 • Drug Tariff (Part IXr)

**Ketostix testing strips** (Ascensia Diabetes Care UK Ltd)  
50 strip • NHS indicative price = £3.06 • Drug Tariff (Part IXr)

## Urine protein testing strips

### ● URINE PROTEIN TESTING STRIPS

**Albustix testing strips** (Siemens Medical Solutions Diagnostics Ltd)  
50 strip • NHS indicative price = £4.10 • Drug Tariff (Part IXr)

**Medi-Test Protein 2 testing strips** (BHR Pharmaceuticals Ltd)  
50 strip • NHS indicative price = £3.31 • Drug Tariff (Part IXr)

## 4.2 Hypoglycaemia

### Hypoglycaemia

17-Jun-2021

#### Description of condition

Hypoglycaemia is a lower than normal blood-glucose concentration. It results from an imbalance between glucose supply, glucose utilisation, and existing insulin concentration. It can be defined as 'mild' if the episode is self-treated and 'severe' if assistance is required. For the purposes of hospital inpatients diagnosed with diabetes, anyone with a blood-glucose concentration less than 4 mmol/litre should be treated.

Hypoglycaemia is the most common side-effect of insulin and sulfonylureas in the treatment of all types of diabetes mellitus and presents a major barrier to satisfactory long-term glycaemic control. Metformin hydrochloride p. 761, pioglitazone p. 780, the dipeptidylpeptidase-4 inhibitors (gliptins), sodium-glucose co-transporter-2 inhibitors, and glucagon-like peptide-1 receptor agonists, prescribed without insulin or sulfonylurea therapy, are unlikely to result in hypoglycaemia. Hypoglycaemia should be excluded in any person with diabetes who is acutely unwell, drowsy, unconscious, unable to co-operate, or presenting with aggressive behaviour or seizures.

#### Treatment of hypoglycaemia

For a quick reference resource with doses for the treatment of hypoglycaemia, see *Hypoglycaemia* in Medical emergencies in the community p. 1842.

**EvGr** Adults with symptoms of hypoglycaemia who have a blood-glucose concentration greater than 4 mmol/litre, should be treated with a small carbohydrate snack such as a slice of bread or a normal meal, if due.

Any patient with a blood-glucose concentration less than 4 mmol/litre, with or without symptoms, and who is **conscious and able to swallow**, should be treated with a fast-acting carbohydrate by mouth. Fast-acting carbohydrates include *Lift<sup>®</sup>* glucose liquid (previously *Glucोजुice<sup>®</sup>*), glucose tablets, glucose 40% gels (e.g. *Glucogel<sup>®</sup>*, *DextroGel<sup>®</sup>*, or *Rapilose<sup>®</sup>*), pure fruit juice, and sugar (sucrose) dissolved in an appropriate volume of water. Oral glucose formulations p. 1132 are preferred as absorption occurs more quickly. Orange juice should not be given to patients following a low-potassium diet due to chronic kidney disease, and sugar dissolved in water is not effective for patients taking acarbose which prevents the breakdown of sucrose to glucose. **EvGr** Chocolates and biscuits should be avoided if possible, as they have a lower sugar content and their high fat content may delay stomach emptying. **⚠**

**EvGr** If necessary, repeat treatment after 15 minutes, up to a maximum of 3 treatments in total. Once blood-glucose concentration is above 4 mmol/litre and the patient has recovered, a snack providing a long-acting carbohydrate should be given to prevent blood glucose from falling again (e.g. two biscuits, one slice of bread, 200–300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Insulin should not be omitted if due, but the dose regimen may need review.

Hypoglycaemia which does not respond (blood-glucose concentration remains below 4 mmol/litre after 30–45 minutes or after 3 treatment cycles), should be treated with intramuscular glucagon below or glucose 10% intravenous infusion. In alcoholic patients, thiamine supplementation should be given with, or following, the administration of intravenous glucose to minimise the risk of Wernicke's encephalopathy.  $\text{E}$

Glucagon is a polypeptide hormone produced by the alpha cells of the islets of Langerhans, which increases blood-glucose concentration by mobilising glycogen stored in the liver. The manufacturer advises that it is ineffective in patients whose liver glycogen is depleted, therefore should not be used in anyone who has fasted for a prolonged period or has adrenal insufficiency, chronic hypoglycaemia, or alcohol-induced hypoglycaemia.  $\text{EvGr}$  Glucagon may also be less effective in patients taking a sulfonylurea; in these cases, intravenous glucose will be required.  $\text{E}$

$\text{EvGr}$  In an emergency, if the patient has a decreased level of consciousness caused by hypoglycaemia, intramuscular glucagon can be given by a family member or friend who has been shown how to use it.  $\text{A}$   $\text{EvGr}$  If glucagon is not effective after 10 minutes, glucose 10% intravenous infusion should be given.  $\text{E}$

Hypoglycaemia which causes **unconsciousness** is an emergency.  $\text{EvGr}$  Patients who are unconscious, having seizures, or who are very aggressive, should have any intravenous insulin stopped, and be treated initially with glucagon. If glucagon is unsuitable, or there is no response after 10 minutes, glucose 10% intravenous infusion, or alternatively glucose 20% intravenous infusion should be given.  $\text{E}$  Glucose 50% intravenous infusion is not recommended as it is hypertonic, thus increases the risk of extravasation injury, and is viscous, making administration difficult.

$\text{EvGr}$  A long-acting carbohydrate should be given as soon as possible once the patient has recovered and their blood-glucose concentration is above 4 mmol/litre (e.g. two biscuits, one slice of bread, 200–300 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate-containing meal if due). Patients who have received glucagon require a larger portion of long-acting carbohydrate to replenish glycogen stores (e.g. four biscuits, two slices of bread, 400–600 mL of milk (not soya or other forms of 'alternative' milk, e.g. almond or coconut), or a normal carbohydrate containing meal if due). Glucose 10% intravenous infusion should be given to patients who are nil by mouth.

If an insulin injection is due, it should **not** be omitted; however, a review of the usual insulin regimen may be required. Patients who self-manage their insulin pump may need to adjust their pump infusion rate. If the patient was on intravenous insulin, continue to check blood-glucose concentration every 15 minutes until above 3.5 mmol/litre, then re-start intravenous insulin after review of the dose regimen. Concurrent glucose 10% intravenous infusion should be considered.  $\text{E}$

Hypoglycaemia caused by a sulfonylurea or long-acting insulin, may persist for up to 24–36 hours following the last dose, especially if there is concurrent renal impairment.

$\text{EvGr}$  Blood-glucose monitoring should be continued for at least 24–48 hours.  $\text{E}$

## GLYCOGENOLYTIC HORMONES

### Glucagon

10-Nov-2021

#### ● INDICATIONS AND DOSE

##### **Diabetic hypoglycaemia**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Child 1 month–8 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 9–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

##### **Severe hypotension, heart failure or cardiogenic shock due to acute overdosage of beta-blockers**

► INITIALLY BY INTRAVENOUS INJECTION

- Child: 50–150 micrograms/kg (max. per dose 10 mg), administered over 1–2 minutes, followed by (by intravenous infusion) 50 micrograms/kg/hour, titrated according to response
- Adult: 5–10 mg, administered over 1–2 minutes, followed by (by intravenous infusion) 50–150 micrograms/kg/hour, titrated according to response

##### **Diagnostic aid**

► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: (consult product literature)

##### **DOSE EQUIVALENCE AND CONVERSION**

- 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** TOXBASE advises glucagon is used for the treatment of severe hypotension, heart failure or cardiogenic shock due to acute overdosage of beta-blockers, but it is not licensed for this indication.
- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma
- **INTERACTIONS** → Appendix 1: glucagon
- **SIDE-EFFECTS**
  - **Common or very common** Nausea
  - **Uncommon** Vomiting
  - **Rare or very rare** Abdominal pain · hypertension · hypotension · tachycardia
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, TOXBASE advises reconstituted solution may be used undiluted or diluted in Glucose 5%. Incompatibility For *intravenous infusion*, expert sources advise do not add to infusion fluids containing calcium—precipitation may occur.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Glucagon for hypoglycaemia [www.medicinesforchildren.org.uk/medicines/glucagon-for-hypoglycaemia/](http://www.medicinesforchildren.org.uk/medicines/glucagon-for-hypoglycaemia/)
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### **Powder and solvent for solution for injection**

- **GlugaGen Hypokit** (Novo Nordisk Ltd)

Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial  $\text{POM}$  £11.52 DT = £11.52

## 4.2a Chronic hypoglycaemia

### GLYCOGENOLYTIC HORMONES

#### Diazoxide

17-May-2021

##### ● INDICATIONS AND DOSE

##### Chronic intractable hypoglycaemia

###### ► BY MOUTH

- Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **SIDE-EFFECTS** Abdominal pain · albuminuria · appetite decreased (long term use) · arrhythmia · azotaemia · cardiomegaly · cataract · constipation · diabetic hyperosmolar coma · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal symptoms · fever · fluid retention · galactorrhoea · haemorrhage · headache · heart failure · hirsutism · hyperglycaemia · hyperuricaemia (long term use) · hypogammaglobulinaemia · hypotension · ileus · ketoacidosis · leucopenia · libido decreased · musculoskeletal pain · nausea · nephritic syndrome · oculoerythric crisis · pancreatitis · parkinsonism · pulmonary hypertension · skin reactions · sodium retention · taste altered · thrombocytopenia · tinnitus · vision disorders · voice alteration (long term use) · vomiting

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

##### ● RENAL IMPAIRMENT

- **Dose adjustments** [EVR](#) Dose reduction may be required.

##### ● MONITORING REQUIREMENTS

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

##### Tablet

- **Eudemine** (RPH Pharmaceuticals AB)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM](#) £72.55  
DT = £72.55

##### Capsule

- **Diazoxide (Non-proprietary)**

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule [PoM](#) [S](#)

it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 1025) are more effective.

Cabergoline p. 453 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide below has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

### Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

## Quinagolide

19-Apr-2021

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D<sub>2</sub> agonist.

##### ● INDICATIONS AND DOSE

##### Hyperprolactinaemia

###### ► BY MOUTH

- Adult: Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

- **UNLICENSED USE** Not licensed for the suppression of lactation.

- **CAUTIONS** Acute porphyrias p. 1150 · history of psychotic illness · history of serious mental disorders

##### CAUTIONS, FURTHER INFORMATION

- Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** → Appendix 1: dopamine receptor agonists

##### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · appetite decreased · constipation · diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
- **Rare or very rare** Acute psychosis · drowsiness

- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.

- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

- **BREAST FEEDING** Suppresses lactation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).

- **RENAL IMPAIRMENT** [EVR](#) Avoid (no information available).

- **MONITORING REQUIREMENTS** Monitor blood pressure for a few days after starting treatment and following dosage increase.

## 5 Dopamine responsive conditions

### DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

#### Dopamine-receptor agonists

##### Overview

Bromocriptine p. 452 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Form unstated

## 6 Gonadotrophin responsive conditions

### Gonadotrophins

#### Gonadotrophin-affecting drugs

Danazol is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

Cetrorelix below and ganirelix below are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

#### Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding.

#### Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 1028 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

#### Cetrorelix

22-Apr-2021

##### ● INDICATIONS AND DOSE

**Adjunct in the treatment of female infertility (initiated under specialist supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Ovarian hyperstimulation syndrome
- ▶ **Uncommon** Headache · hypersensitivity · nausea

- **PREGNANCY** Avoid in confirmed pregnancy.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.

- **RENAL IMPAIRMENT** [EvGr] Use with caution in mild to moderate impairment; avoid in severe impairment (no information available). ⊕

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

##### ▶ Cetrotide (Merck Serono Ltd)

**Cetrorelix (as Cetrorelix acetate) 250 microgram** Cetrotide 250microgram powder and solvent for solution for injection vials | 1 vial [PoM] £27.13 DT = £27.13

#### Ganirelix

22-Apr-2021

##### ● INDICATIONS AND DOSE

**Adjunct in the treatment of female infertility (initiated under specialist supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 250 micrograms once daily, dose to be administered in the morning (or each continued →

afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy)

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Headache · malaise · nausea
- ▶ **Rare or very rare** Dyspnoea · facial swelling · hypersensitivity
- ▶ **Frequency not known** Abdominal distension · ovarian hyperstimulation syndrome · pelvic pain
- **PREGNANCY** Avoid in confirmed pregnancy—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (no information available).
- **RENAL IMPAIRMENT** [EvGr](#) Avoid in moderate to severe renal impairment (no information available). [M](#)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Fyremadel** (Ferring Pharmaceuticals Ltd)  
Ganirelix 500 microgram per 1 ml Fyremadel  
250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) [S](#) (Hospital only)

## Relugolix with estradiol and norethisterone acetate

12-Oct-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 815, norethisterone p. 823.

- **DRUG ACTION** Relugolix is a non-peptide gonadotropin-releasing hormone (GnRH) receptor antagonist that prevents follicular growth and development, thereby reducing production of oestrogen and progesterone. Relugolix is combined with the oestrogen estradiol to reduce symptoms related to lowered levels of oestrogen, and the progestogen norethisterone to counteract estradiol-induced endometrial hyperplasia.

#### ● INDICATIONS AND DOSE

##### Moderate to severe uterine fibroids

- ▶ **BY MOUTH**
- ▶ **Adult:** 1 tablet once daily, dose to be taken at around the same time each day, starting within 5 days of the onset of menstrual bleeding, consider discontinuing treatment when patient enters menopause

- **CONTRA-INDICATIONS** Osteoporosis
- **CAUTIONS** History of depression (discontinue if severe depression recurs) · risk factors for osteoporosis (dual X-ray absorptiometry (DXA) scan recommended before starting)
- **INTERACTIONS** → Appendix 1: estradiol · norethisterone · relugolix
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · breast cyst · dyspepsia · hot flush · irritability · libido decreased · menstrual cycle irregularities · sweat changes · uterine haemorrhage
- ▶ **Uncommon** Uterine myoma expulsion
- ▶ **Frequency not known** Bone loss · embolism and thrombosis · uterine leiomyoma prolapse
- **CONCEPTION AND CONTRACEPTION** [EvGr](#) *Ryego*<sup>®</sup> inhibits ovulation and provides adequate contraception when used

for at least 1 month at the recommended dose. Effective non-hormonal contraception is recommended for the first month after initiation of treatment and for 7 days following 2 or more consecutive missed doses. Patients should not take other hormonal contraceptives while being treated with *Ryego*<sup>®</sup>. Ovulation returns rapidly after discontinuing *Ryego*<sup>®</sup>. An alternative method of contraception should start immediately after discontinuing treatment. [M](#)

- **PREGNANCY** [EvGr](#) Avoid—relugolix showed embryotoxicity in animal studies. [M](#)
- **BREAST FEEDING** [EvGr](#) Avoid during treatment and for 2 weeks following last treatment—relugolix present in milk in animal studies. [M](#)
- **MONITORING REQUIREMENTS** [EvGr](#) A dual X-ray absorptiometry (DXA) scan is recommended after 1 year of treatment. [M](#)
- **PATIENT AND CARER ADVICE** Advise patients to contact their doctor if they experience mood changes and depressive symptoms during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Ryego** (Gedeon Richter (UK) Ltd) ▼  
Norethisterone acetate 500 microgram, Estradiol (as Estradiol hemihydrate) 1 mg, Relugolix 40 mg Ryego 40mg/1mg/0.5mg tablets | 28 tablet [PoM](#) £72.00 | 84 tablet [PoM](#) £216.00

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

### Buserelin

04-Sep-2020

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

#### ● INDICATIONS AND DOSE

##### Endometriosis

- ▶ **BY INTRANASAL ADMINISTRATION**
- ▶ **Adult:** 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

##### Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Adult:** 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)
- ▶ **BY INTRANASAL ADMINISTRATION**
- ▶ **Adult:** 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually

about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

#### Advanced prostate cancer

##### ▶ INITIALLY BY SUBCUTANEOUS INJECTION

- ▶ Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

#### ● CONTRA-INDICATIONS

- ▶ When used for endometriosis Undiagnosed vaginal bleeding · use longer than 6 months (do not repeat)
- ▶ When used for pituitary desensitisation Undiagnosed vaginal bleeding

- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression · mood altered
- ▶ **Rare or very rare** Auditory disorder · hypotension · leucopenia · pituitary tumour benign · thrombocytopenia · tinnitus
- ▶ **Frequency not known** Alopecia · anxiety · appetite change · breast abnormalities · broken nails · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry eye · dysuria · embolism and thrombosis · fatigue · feeling of pressure behind the eyes · follicle recruitment increased · galactorrhoea · gastrointestinal discomfort · gynaecomastia · hair changes · headache · hot flush · hydronephrosis · hyperhidrosis · increased risk of fracture · lymphostasis · memory loss · menopausal symptoms · menstrual cycle irregularities · muscle weakness in legs · musculoskeletal discomfort · nausea · oedema · osteoporosis · ovarian and fallopian tube disorders · pain · painful sexual intercourse · palpitations · paraesthesia · QT interval prolongation · sexual dysfunction · shock · skin reactions · sleep disorder · testicular atrophy · thirst · tumour activation temporary · uterine leiomyoma degeneration · vision disorders · vomiting · vulvovaginal disorders · weight changes

##### SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Altered smell sensation · epistaxis · hoarseness · nasal irritation · taste altered

**SIDE-EFFECTS, FURTHER INFORMATION** During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intranasal use Manufacturer advises avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- ▶ With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Suprecur** (Neon Healthcare Ltd)

**Buserelin (as Buserelin acetate) 1 mg per 1 ml** Suprecur  
5.5mg/5.5ml solution for injection vials | 2 vial **PoM** £33.02 DT = £34.37

- ▶ **Suprefact** (Neon Healthcare Ltd)

**Buserelin (as Buserelin acetate) 1 mg per 1 ml** Suprefact  
5.5mg/5.5ml solution for injection vials | 2 vial **PoM** £34.37 DT = £34.37

#### Spray

- ▶ **Suprecur** (Neon Healthcare Ltd)

**Buserelin (as Buserelin acetate) 150 microgram per 1 dose** Suprecur 150micrograms/dose nasal spray | 168 dose **PoM** £105.16 DT = £105.16

## Goserelin

24-Jul-2020

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

#### ● INDICATIONS AND DOSE

##### ZOLADEX LA<sup>®</sup>

**Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

##### ZOLADEX<sup>®</sup>

**Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

#### Endometriosis

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

#### Endometrial thinning before intra-uterine surgery

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

#### Before surgery in women who have anaemia due to uterine fibroids

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

continued →

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)**

## ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

● **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)

● **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men

● **SIDE-EFFECTS**

▶ **Common or very common** Alopecia · arthralgia · bone pain · breast abnormalities · depression · glucose tolerance impaired · gynaecomastia · headache · heart failure · hot flush · hyperhidrosis · mood altered · myocardial infarction · neoplasm complications · paraesthesia · sexual dysfunction · skin reactions · spinal cord compression · vulvovaginal disorders · weight increased

▶ **Uncommon** Hypercalcaemia (in women) · ureteral obstruction

▶ **Rare or very rare** Ovarian and fallopian tube disorders · pituitary haemorrhage · pituitary tumour · psychotic disorder

▶ **Frequency not known** Abdominal cramps · body hair change · constipation · diarrhoea · fatigue · hepatic function abnormal · interstitial pneumonia · muscle complaints · nausea · nervousness · peripheral oedema (when used for gynaecological conditions) · premature menopause · pulmonary embolism · QT interval prolongation · sleep disorder · uterine leiomyoma degeneration · voice alteration · vomiting · vulvovaginal infection · withdrawal bleed

**SIDE-EFFECTS, FURTHER INFORMATION** Tumour flare can occur when androgen deprivation therapy is initiated.

● **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **MONITORING REQUIREMENTS** Men at risk of tumour 'flare' should be monitored closely during the first month of therapy for prostate cancer.

● **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Implant**

▶ **Zoladex** (AstraZeneca UK Ltd)

**Goserelin (as Goserelin acetate) 3.6 mg** Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [POM] £70.00 DT = £70.00

▶ **Zoladex LA** (AstraZeneca UK Ltd)

**Goserelin (as Goserelin acetate) 10.8 mg** Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [POM] £235.00 DT = £235.00

**Leuprorelin acetate**

26-Feb-2021

● **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● **INDICATIONS AND DOSE****PROSTAP 3 DCS<sup>®</sup>****Prostate cancer (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 11.25 mg every 3 months

**Endometriosis (specialist use only)**

▶ BY INTRAMUSCULAR INJECTION

▶ **Adult:** 11.25 mg every 3 months for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Pre- and perimenopausal breast cancer (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 11.25 mg every 3 months, for further information on use with adjuvant treatments, consult product literature

**PROSTAP SR DCS<sup>®</sup>****Prostate cancer (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** 3.75 mg every month

**Endometriosis (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** 3.75 mg every month for maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Endometrial thinning before intra-uterine surgery (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

**Reduction of size of uterine fibroids and of associated bleeding before surgery (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** 3.75 mg every month usually for 3–4 months (maximum 6 months)

**Preservation of ovarian function (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** Initially 3.75 mg as a single dose 2 weeks before starting chemotherapy, followed by 3.75 mg every month for the duration of chemotherapy treatment

**Pre- and perimenopausal breast cancer (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 3.75 mg every month, for further information on use with adjuvant treatments, consult product literature

**STALADEX<sup>®</sup> 10.72MG****Prostate cancer (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 10.72 mg every 3 months, to be administered under the skin of the abdomen

## ● CONTRA-INDICATIONS

**GENERAL CONTRA-INDICATIONS** Undiagnosed vaginal bleeding

### SPECIFIC CONTRA-INDICATIONS

- ▶ When used for endometriosis Use longer than 6 months (do not repeat)
- **CAUTIONS** Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · arthralgia · bone pain · breast abnormalities · depression · dizziness · fatigue · gynaecomastia · headache · hepatic disorders · hot flush · hyperhidrosis · injection site necrosis · insomnia · mood altered · muscle weakness · nausea · paraesthesia · peripheral oedema · sexual dysfunction · testicular atrophy · vulvovaginal dryness · weight change
  - ▶ **Uncommon** Alopecia · diarrhoea · fever · myalgia · palpitations · visual impairment · vomiting
  - ▶ **Rare or very rare** Haemorrhage
  - ▶ **Frequency not known** Anaemia · glucose tolerance impaired · hypertension · hypotension · interstitial lung disease · leucopenia · paralysis · pulmonary embolism · QT interval prolongation · seizure · spinal fracture · thrombocytopenia · urinary tract obstruction

**SIDE-EFFECTS, FURTHER INFORMATION** In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid—teratogenic in *animal* studies.

- **BREAST FEEDING** Avoid.

## ● MONITORING REQUIREMENTS

- ▶ Monitor liver function.
- ▶ Monitor prostate-specific antigen serum levels.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

## ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

### Scottish Medicines Consortium (SMC) decisions

- ▶ Leuprorelin acetate (*Prostap*<sup>®</sup> DCS) as adjuvant treatment in combination with tamoxifen or an aromatase inhibitor, of endocrine responsive early stage breast cancer in pre- and perimenopausal women at higher risk of disease recurrence (February 2021) SMC No. SMC2319 Recommended
- ▶ Leuprorelin acetate (*Prostap*<sup>®</sup> DCS) as treatment in pre- and perimenopausal women with advanced breast cancer suitable for hormonal manipulation (February 2021) SMC No. SMC2320 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Implant

- ▶ *Staladex* (Tipharm Ltd)

Leuprorelin (as Leuprorelin acetate) 10.72 mg *Staladex* 10.72mg implant pre-filled syringes | 1 pre-filled disposable injection [PoM] £208.79 DT = £208.79

### Powder and solvent for suspension for injection

- ▶ *Prostap* 3 DCS (Takeda UK Ltd)

Leuprorelin acetate 11.25 mg *Prostap* 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT = £225.72

- ▶ *Prostap SR DCS* (Takeda UK Ltd)

Leuprorelin acetate 3.75 mg *Prostap SR DCS* 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT = £75.24

## Nafarelin

04-Aug-2020

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

## ● INDICATIONS AND DOSE

### Endometriosis

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ **Adult (female):** 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

### Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)

- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)

## ● SIDE-EFFECTS

- ▶ **Common or very common** Artificial menopause · breast abnormalities · chest pain · depression · dyspnoea · emotional lability · headaches · hirsutism · hot flush · hypersensitivity · hypertension · hypotension · insomnia · myalgia · oedema · oestrogen deficiency · paraesthesia · rhinitis · seborrhoea · sexual dysfunction · skin reactions · uterine haemorrhage · vulvovaginal dryness · weight changes
- ▶ **Uncommon** Alopecia · arthralgia · ovarian cyst (may require discontinuation)
- ▶ **Frequency not known** Ovarian hyperstimulation syndrome · palpitations · vision blurred

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Synarel** (Pfizer Ltd)

Nafarelin (as Nafarelin acetate) 200 microgram per

1 dose Synarel 200micrograms/dose nasal spray | 60 dose **POm**  
£52.43 DT = £52.43**Triptorelin**

04-Mar-2021

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• **INDICATIONS AND DOSE****DECAPEPTYL® SR 11.25MG****Advanced prostate cancer (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 11.25 mg every 3 months

**Endometriosis**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 11.25 mg every 3 months for maximum 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**DECAPEPTYL® SR 22.5MG****Advanced prostate cancer (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 22.5 mg every 6 months

**DECAPEPTYL® SR 3MG****Advanced prostate cancer (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks

**Endometriosis**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Reduction in size of uterine fibroids**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Premenopausal breast cancer [as combination therapy] (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 3 mg every 4 weeks for up to 5 years, initiated 6–8 weeks before starting aromatase inhibitor—for further information, consult product literature

**GONAPEPTYL DEPOT®****Advanced prostate cancer**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every 4 weeks

**Endometriosis | Reduction in size of uterine fibroids**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**SALVACYL®****Male hypersexuality with severe sexual deviation**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 11.25 mg every 12 weeks

- **CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) · undiagnosed vaginal bleeding

**SALVACYL®** Severe osteoporosis

- **CAUTIONS**  
**GENERAL CAUTIONS** History of depression · patients with metabolic bone disease (decrease in bone mineral density can occur)

**SPECIFIC CAUTIONS**

- ▶ When used for breast cancer Risk factors for osteoporosis
- ▶ When used for male hypersexuality with severe sexual deviation Risk factors for osteoporosis
- ▶ When used for prostate cancer Risk factors for osteoporosis · risk of spinal cord compression in men · risk of ureteric obstruction in men

**SALVACYL®** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an anti-androgen before stopping treatment · transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen• **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · asthenia · depression · diabetes mellitus · dizziness · dry mouth · embolism · gastrointestinal discomfort · gynaecomastia · haemorrhage · headache · hot flush · hyperhidrosis · hypersensitivity · hypertension · joint disorders · menstrual cycle irregularities · mood altered · muscle complaints · nausea · oedema · ovarian and fallopian tube disorders · pain · painful sexual intercourse · pelvic pain · sexual dysfunction · skin reactions · sleep disorders · weight changes
- ▶ **Uncommon** Alopecia · appetite abnormal · asthma exacerbated · chills · confusion · constipation · diarrhoea · drowsiness · dyspnoea · flatulence · gout · muscle weakness · taste altered · testicular disorders · tinnitus · vertigo · vision disorders · vomiting
- ▶ **Rare or very rare** Abnormal sensation in eye · chest pain · difficulty standing · fever · hypotension · influenza like illness · musculoskeletal stiffness · nasopharyngitis · orthopnoea · osteoarthritis · QT interval prolongation
- ▶ **Frequency not known** Angioedema · malaise

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**  
With intramuscular use Bone disorders · bone fracture · breast abnormalities · glucose tolerance impaired · hyperglycaemia · musculoskeletal disorder · seborrhoea · sensation abnormal · urinary disorders · vulvovaginal disorders
- ▶ With subcutaneous use Dysuria · vulvovaginal dryness
- ▶ **Uncommon**  
With intramuscular use Broken nails · central nervous system haemorrhage · cerebral ischaemia · concentration impaired · cystocele · dry eye · fluid retention · hirsutism · hyperlipidaemia · memory impairment · myocardial ischaemia · oral ulceration · palpitations · syncope · thrombocytosis · tremor
- ▶ With subcutaneous use Paraesthesia
- ▶ **Frequency not known**  
With subcutaneous use Bone disorder · breast pain · memory loss

**SIDE-EFFECTS, FURTHER INFORMATION** During the initial stage increased production of testosterone may be associated with progression of prostate cancer. In

susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS**

- ▶ When used for Prostate cancer Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **PRESCRIBING AND DISPENSING INFORMATION**

**DECAPEPTYL<sup>®</sup> SR 22.5MG** Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

**DECAPEPTYL<sup>®</sup> SR 3MG** Each vial includes an overage to allow accurate administration of 3 mg dose.

**DECAPEPTYL<sup>®</sup> SR 11.25MG** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Triptorelin (*Decapeptyl<sup>®</sup> SR 3 mg*) as adjuvant treatment, in combination with tamoxifen or an aromatase inhibitor, of endocrine responsive early stage breast cancer in women at high risk of recurrence who are confirmed as premenopausal after completion of chemotherapy (October 2019) SMC No. SMC2186 Recommended

**All Wales Medicines Strategy Group (AWMSG) decisions**

- ▶ Triptorelin (*Decapeptyl<sup>®</sup> SR*) as adjuvant treatment to radiotherapy in patients with high-risk localised or locally advanced prostate cancer and as neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer (March 2017) AWMSG No. 1658 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- ▶ **Decapeptyl SR** (Ipsen Ltd)

**Triptorelin (as Triptorelin acetate) 3 mg** Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM] £69.00 DT = £69.00

**Triptorelin 11.25 mg** Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00 DT = £207.00

**Triptorelin (as Triptorelin embonate) 22.5 mg** Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM] £414.00 DT = £414.00

- ▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)

**Triptorelin (as Triptorelin acetate) 3.75 mg** Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £81.69 DT = £81.69

- ▶ **Salvacyl** (Ipsen Ltd)

**Triptorelin 11.25 mg** Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £248.00 DT = £207.00

## 7 Hypothalamic and anterior pituitary hormone related disorders

### Hypothalamic and anterior pituitary hormones

26-Mar-2021

#### Anterior pituitary hormones

##### Corticotrophins

Tetracosactide p. 802 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenal insufficiency. For guidance on the management of adrenal insufficiency, see Adrenal insufficiency p. 738.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

##### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, or follicle-stimulating hormone alone (as in **folliotropin**), are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 826, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

##### Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatotropin p. 806, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

##### Hypothalamic hormones

Gonadorelin p. 802 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility and in breast and prostate cancer.

## 7.1 Adrenocortical function testing

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

#### Tetracosactide

22-Apr-2021

##### (Tetracosactrin)

##### ● INDICATIONS AND DOSE

##### Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

▶ Adult: 250 micrograms for 1 dose

##### Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

▶ Adult: 1 mg for 1 dose

##### Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

▶ Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent tuberculosis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolism · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

##### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.
- ▶ Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- ▶ Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distension · abscess · adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) ·

hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder · seizure · skin reactions · tendon rupture · thromboembolism · vasculitis necrotising · vertigo · vomiting · weight increased

- **ALLERGY AND CROSS-SENSITIVITY** [E<sub>VG</sub>R](#) Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients. [M](#)
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** For *depot injection*, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- **RENAL IMPAIRMENT** [E<sub>VG</sub>R](#) Use with caution in renal failure. [M](#)
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.  
Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ **Synacthen** (Atrahs Pharma UK Ltd)

Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [P<sub>OM</sub>](#) £38.00 DT = £38.00

##### Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Synacthen Depot** (Atrahs Pharma UK Ltd)

Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [P<sub>OM</sub>](#) £346.28 DT = £346.28

## 7.2 Assessment of pituitary function

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

#### Gonadorelin

01-Mar-2021

##### (Gonadotrophin-releasing hormone; GnRH; LH-RH)

##### ● INDICATIONS AND DOSE

##### Assessment of pituitary function

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS**
- ▶ **Uncommon** Pain · skin reactions · swelling
- ▶ **Rare or very rare** Abdominal discomfort · bronchospasm · dizziness · eye erythema · flushing · headache · nausea · tachycardia
- ▶ **Frequency not known** Menorrhagia · sepsis · thrombophlebitis

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

##### ► Gonadorelin (Non-proprietary)

Gonadorelin (as Gonadorelin hydrochloride)

100 microgram Gonadorelin 100microgram powder for solution for injection vials | 1 vial [PoM](#) £75.00 (Hospital only)

## 7.3 Gonadotrophin replacement therapy

### GONADOTROPHINS

#### Choriogonadotropin alfa

22-May-2020

(Human chorionic gonadotropin)

##### ● INDICATIONS AND DOSE

**Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

► BY SUBCUTANEOUS INJECTION

► Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Active thromboembolic disorders · ectopic pregnancy in previous 3 months · hypothalamus malignancy · mammary malignancy · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · ovarian malignancy · pituitary malignancy · undiagnosed vaginal bleeding · uterine malignancy
- **CAUTIONS** Acute porphyrias p. 1150
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · fatigue · headache · nausea · ovarian hyperstimulation syndrome · vomiting
  - **Uncommon** Breast pain · depression · diarrhoea · irritability · restlessness
  - **Rare or very rare** Rash · shock · thromboembolism

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Ovitrelle (Merck Serono Ltd)

Choriogonadotropin alfa 500 microgram per 1 ml Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £37.66 DT = £37.66 [CD4-2](#)

Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM](#) £37.66 DT = £37.66 [CD4-2](#)

#### Follitropin alfa

06-Oct-2020

(Recombinant human follicle stimulating hormone)

##### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

► BY SUBCUTANEOUS INJECTION

► Adult (female): Adjusted according to response.

##### Hypogonadotrophic hypogonadism

► BY SUBCUTANEOUS INJECTION

► Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1150 · history of tubal disease

##### ● SIDE-EFFECTS

- **Common or very common** Acne · diarrhoea · gastrointestinal discomfort · gynaecomastia · headache · nausea · ovarian and fallopian tube disorders · varicocele · vomiting · weight increased
- **Rare or very rare** Asthma exacerbated · thromboembolism
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **PATIENT AND CARER ADVICE**

**Conception and contraception** Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Bemfola (Gedeon Richter (UK) Ltd)

**Follitropin alfa 600 unit per 1 ml** Bemfola 75units/0.125ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM](#) £25.85 DT = £25.85

Bemfola 225units/0.375ml solution for injection pre-filled pens |

1 pre-filled disposable injection [PoM](#) £77.55 DT = £77.55

Bemfola 450units/0.75ml solution for injection pre-filled pens | 1 pre-

filled disposable injection [PoM](#) £155.10 DT = £169.20

Bemfola 300units/0.5ml solution for injection pre-filled pens | 1 pre-

filled disposable injection [PoM](#) £103.40 DT = £112.80

Bemfola 150units/0.25ml solution for injection pre-filled pens | 1 pre-

filled disposable injection [PoM](#) £51.70 DT = £51.70

##### ► Gonal-f (Merck Serono Ltd)

**Follitropin alfa 600 unit per 1 ml** Gonal-f 900units/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM](#) £338.40 DT = £338.40

Gonal-f 300units/0.5ml solution for injection pre-filled pens | 1 pre-

filled disposable injection [PoM](#) £112.80 DT = £112.80

Gonal-f 450units/0.75ml solution for injection pre-filled pens | 1 pre-

filled disposable injection [PoM](#) £169.20 DT = £169.20

##### ► Ovaleap (Theramex HQ UK Ltd)

**Follitropin alfa 600 unit per 1 ml** Ovaleap 450units/0.75ml solution

for injection cartridges | 1 cartridge [PoM](#) £141.00 (Hospital only)

Ovaleap 900units/1.5ml solution for injection cartridges |

1 cartridge [PoM](#) £282.00 (Hospital only)

Ovaleap 300units/0.5ml solution for injection cartridges |

1 cartridge [PoM](#) £94.00 (Hospital only)

#### Powder and solvent for solution for injection

##### ► Gonal-f (Merck Serono Ltd)

**Follitropin alfa 75 unit** Gonal-f 75unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £25.22 DT = £25.22

**Follitropin alfa 450 unit** Gonal-f 450unit powder and solvent for

solution for injection vials | 1 vial [PoM](#) £151.32 DT = £151.32

**Follitropin alfa 1050 unit** Gonal-f 1,050unit powder and solvent for

solution for injection vials | 1 vial [PoM](#) £353.06 DT = £353.06

## Follitropin alfa with lutropin alfa

22-May-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, follitropin alfa p. 803, lutropin alfa below.

### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult (female): Adjusted according to response.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

ELECTROLYTES: May contain Sodium

▶ **Pergoveris** (Merck Serono Ltd)

**Lutropin alfa 75 unit, Follitropin alfa 150 unit** Pergoveris

150unit/75unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £72.35

## Follitropin delta

06-Sep-2017

- **DRUG ACTION** Follitropin delta is a recombinant human follicle stimulating hormone, which causes development of multiple mature follicles.

### ● INDICATIONS AND DOSE

**Superovulation treatment for assisted conception (such as in vitro fertilisation) (initiated under specialist supervision)**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult (female): Initial dosing based on serum anti-Müllerian hormone concentration and body-weight—consult product literature.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1150 · history of tubal disease (increased risk of ectopic pregnancy)

### ● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · headache · nausea · ovarian hyperstimulation syndrome · pelvic disorders · uterine pain
- ▶ **Uncommon** Abdominal discomfort · breast abnormalities · constipation · diarrhoea · dizziness · drowsiness · mood swings · vaginal haemorrhage · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** If ovarian hyperstimulation syndrome occurs, the patient should be advised to withhold hCG and avoid intercourse or use barrier contraceptive methods for at least 4 days.

- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.
- **BREAST FEEDING** Manufacturer advises avoid—not indicated during breastfeeding.
- **MONITORING REQUIREMENTS** Manufacturer advises regular monitoring of ovarian response with ultrasound alone, or in combination with serum estradiol levels. Frequent monitoring of follicular development is required to reduce the risk of ovarian hyperstimulation syndrome during treatment, and for at least 2 weeks after triggering of final follicular maturation—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer recommends the cartridge should be used with the

*Rekovele*® injection pen. The first injection should be performed under direct medical supervision; self-administration should only be performed by patients who are well motivated, adequately trained and have access to expert advice.

- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin delta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator.
- **PATIENT AND CARER ADVICE** **Conception and contraception** Manufacturer advises that patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

▶ **Rekovele** (Ferring Pharmaceuticals Ltd) ▼

**Follitropin delta 33.33 microgram per 1 ml** Rekovele

36micrograms/1.08ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM](#) £354.94

Rekovele 72micrograms/2.16 ml solution for injection pre-filled pens

| 1 pre-filled disposable injection [PoM](#) £709.89

Rekovele 12micrograms/0.36ml solution for injection pre-filled pens

| 1 pre-filled disposable injection [PoM](#) £118.31

## Lutropin alfa

22-May-2020

(Recombinant human luteinising hormone)

### ● INDICATIONS AND DOSE

**Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene (in conjunction with follicle-stimulating hormone) | Superovulation treatment for assisted conception (such as in vitro fertilisation) (in conjunction with follicle-stimulating hormone)**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Mammary carcinoma · ovarian carcinoma · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · tumours of hypothalamus · tumours of pituitary · undiagnosed vaginal bleeding · uterine carcinoma
- **CAUTIONS** Acute porphyrias p. 1150
- **SIDE-EFFECTS**
- ▶ **Common or very common** Breast pain · diarrhoea · gastrointestinal discomfort · headache · nausea · ovarian and fallopian tube disorders · pelvic pain · vomiting
- ▶ **Rare or very rare** Thromboembolism

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Powder and solvent for solution for injection

▶ **Luveris** (Merck Serono Ltd)

**Lutropin alfa 75 unit** Luveris 75unit powder and solvent for solution for injection vials | 1 vial [PoM](#) £31.38

## Menotrophin

06-Oct-2020

### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION

► Adult (female): Adjusted according to response.

### **Hypogonadotrophic hypogonadism**

► BY DEEP INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

► Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1150 · history of tubal disease

### ● SIDE-EFFECTS

► **Common or very common** Gastrointestinal discomfort · headache · nausea · ovarian and fallopian tube disorders · pelvic pain · uterine pain

► **Uncommon** Breast abnormalities · diarrhoea · dizziness · fatigue · hot flush · vomiting

► **Rare or very rare** Skin reactions

► **Frequency not known** Arthralgia · pain · thromboembolism · vision disorder

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● **PRESCRIBING AND DISPENSING INFORMATION** Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

### ● PATIENT AND CARER ADVICE

**Conception and contraception** Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

► **Menopur** (Ferring Pharmaceuticals Ltd)

**Menotrophin 75 unit** Menopur 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £180.18 DT = £180.18

**Menotrophin 150 unit** Menopur 150unit powder and solvent for solution for injection vials | 10 vial [PoM] £360.36 DT = £360.36

**Menotrophin 600 unit** Menopur 600unit powder and solvent for solution for injection vials | 1 vial [PoM] £144.14 DT = £144.14

**Menotrophin 1200 unit** Menopur 1,200unit powder and solvent for solution for injection vials | 1 vial [PoM] £288.29 DT = £288.29

► **Meriofert** (Pharmasure Ltd)

**Menotrophin 75 unit** Meriofert 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £279.00 DT = £180.18

**Menotrophin 150 unit** Meriofert 150unit powder and solvent for solution for injection vials | 10 vial [PoM] £558.00 DT = £360.36

## Urofollitropin

02-Sep-2020

### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION

► Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 1150

### ● SIDE-EFFECTS

► **Common or very common** Breast tenderness · constipation · diarrhoea · gastrointestinal discomfort · headache · hot flush · increased risk of infection · muscle spasms · nausea · ovarian hyperstimulation syndrome · pain · pelvic pain · rash · vaginal discharge · vaginal haemorrhage · vomiting

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

### ● PRESCRIBING AND DISPENSING INFORMATION

Urofollitropin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH).

### ● PATIENT AND CARER ADVICE

**Conception and contraception** Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

► **Fostimon** (Pharmasure Ltd)

**Follicle stimulating hormone human (as Urofollitropin)**

**75 unit** Fostimon 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £279.00

**Follicle stimulating hormone human (as Urofollitropin)**

**150 unit** Fostimon 150unit powder and solvent for solution for injection vials | 10 vial [PoM] £558.00 DT = £558.00

## 7.4 Growth hormone disorders

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GROWTH HORMONE RECEPTOR ANTAGONISTS

## Pegvisomant

08-Apr-2021

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

### ● INDICATIONS AND DOSE

**Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)**

► BY SUBCUTANEOUS INJECTION

► **Adult:** Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (further investigations may be required before treatment initiation—consult product literature) · diabetes mellitus (adjustment of antidiabetic therapy may be necessary)

### ● SIDE-EFFECTS

► **Common or very common** Arthralgia · arthritis · asthenia · constipation · diarrhoea · dizziness · drowsiness · dyslipidaemia · dyspnoea · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperglycaemia · hypertension · hypoglycaemia · influenza like illness · lipohypertrophy · myalgia · nausea · numbness · oedema · skin reactions · sleep disorders · sweat changes · tremor · vomiting · weight increased

- ▶ **Uncommon** Apathy · confusion · dry mouth · eye strain · feeling abnormal · healing impaired · hunger · leucocytosis · leucopenia · libido increased · memory loss · Meniere's disease · oral disorders · panic attack · polyuria · proteinuria · renal impairment · taste altered · thrombocytopenia
- ▶ **Frequency not known** Anger · angioedema · hepatic function abnormal · laryngospasm

**SIDE-EFFECTS, FURTHER INFORMATION** **Injection-site reactions** Rotate injection sites to avoid lipohypertrophy.

**Abnormal hepatic function** Manufacturer advises interrupt treatment if liver function tests at least 5 times the upper limit of normal or transaminase levels at least 3 times the upper limit of normal and blood bilirubin increased—consult product literature. Discontinue if liver injury is confirmed.

- **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); temporary or permanent withdrawal may be needed—consult product literature.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises assess liver function tests before treatment initiation and monitor liver function tests during treatment—consult product literature.
  - ▶ Manufacturer advises monitor serum IGF-1 concentrations.

● **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Pegvisomant (Somavert<sup>®</sup>)** for the treatment of adult patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor type 1 (IGF-1) concentrations or was not tolerated (November 2017)  
SMC No. 158/05 Recommended

**All Wales Medicines Strategy Group (AWMSG) decisions**

- ▶ **Pegvisomant (Somavert<sup>®</sup>)** for the treatment of adult patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor-1 (IGF-1) concentrations or was not tolerated (November 2017) AWMSG No. 3545 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- ▶ **Somavert** (Pfizer Ltd)
  - ▶ **Pegvisomant 10 mg** Somavert 10mg powder and solvent for solution for injection vials | 30 vial [PoM] £1,500.00 (Hospital only)
  - ▶ **Pegvisomant 15 mg** Somavert 15mg powder and solvent for solution for injection vials | 30 vial [PoM] £2,250.00 (Hospital only)
  - ▶ **Pegvisomant 20 mg** Somavert 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £100.00 (Hospital only) | 30 vial [PoM] £3,000.00 (Hospital only)
  - ▶ **Pegvisomant 25 mg** Somavert 25mg powder and solvent for solution for injection vials | 30 vial [PoM] £3,750.00 (Hospital only)
  - ▶ **Pegvisomant 30 mg** Somavert 30mg powder and solvent for solution for injection vials | 30 vial [PoM] £4,500.00 (Hospital only)

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

### Somatropin

12-Apr-2021

#### (Recombinant Human Growth Hormone)

##### ● INDICATIONS AND DOSE

##### **Gonadal dysgenesis (Turner syndrome)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 1.4 mg/m<sup>2</sup> daily, alternatively 45–50 micrograms/kg daily

##### **Deficiency of growth hormone**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

##### **DOSE EQUIVALENCE AND CONVERSION**

- ▶ Dose formerly expressed in units; somatropin 1 mg = 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypoadrenalism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · resolved intracranial hypertension (monitor closely) · risk of hypothyroidism—manufacturers recommend periodic thyroid function tests · Silver-Russell syndrome
- **INTERACTIONS** → Appendix 1: somatropin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Carpal tunnel syndrome · fluid retention · headache · joint disorders · lipatrophy · myalgia · oedema · paraesthesia
  - ▶ **Uncommon** Gynaecomastia · idiopathic intracranial hypertension
  - ▶ **Rare or very rare** Hyperglycaemia · hyperinsulinism · hypothyroidism · osteonecrosis of femur · pancreatitis · slipped capital femoral epiphysis
  - ▶ **Frequency not known** Leukaemia · musculoskeletal stiffness

**SIDE-EFFECTS, FURTHER INFORMATION** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.
- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.
- **PRESCRIBING AND DISPENSING INFORMATION** Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **SAIZEN<sup>®</sup> SOLUTION FOR INJECTION** For use with *cool.click<sup>®</sup>* needle-free autoinjector device or *easypod<sup>®</sup>* autoinjector device (non-NHS but available free of charge from clinics).

**NORDITROPIN® PREPARATIONS** Cartridges are for use with appropriate *NordiPen®* device (non-NHS but available free of charge from clinics).

Multidose disposable prefilled pens for use with *NovoFine®* or *NovoTwist®* needles.

**OMNITROPE®** For use with *Omnitrope Pen 5®* and *Omnitrope Pen 10®* devices (non-NHS but available free of charge from clinics).

**NUTROPINAQ®** For use with *NutropinAq®* Pen device (non-NHS but available free of charge from clinics).

**ZOMACTON®** 4 mg vial for use with *Zomafet 2®* Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with *Zomafet Vision X®* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

**SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION** For use with *one.click®* autoinjector device or *cool.click®* needle-free autoinjector device or *easypod®* autoinjector device (non-NHS but available free of charge from clinics).

**GENOTROPIN® PREPARATIONS** Cartridges are for use with *Genotropin®* Pen device (non-NHS but available free of charge from clinics).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ **Somatropin for adults with growth hormone deficiency (August 2003)** NICE TA64 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Norditropin FlexPro** (Novo Nordisk Ltd)

**Somatropin (epr) 3.3 mg per 1 ml** Norditropin FlexPro 5mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £106.35 DT = £115.90 [CD4-2]

**Somatropin (epr) 6.7 mg per 1 ml** Norditropin FlexPro 10mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £212.70 DT = £231.80 [CD4-2]

**Somatropin (epr) 10 mg per 1 ml** Norditropin FlexPro 15mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £319.05 DT = £347.70 [CD4-2]

- ▶ **Norditropin NordiFlex** (Novo Nordisk Ltd)

**Somatropin (epr) 3.3 mg per 1 ml** Norditropin NordiFlex 5mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £115.90 DT = £115.90 [CD4-2]

**Somatropin (epr) 6.7 mg per 1 ml** Norditropin NordiFlex 10mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £231.80 DT = £231.80 [CD4-2]

**Somatropin (epr) 10 mg per 1 ml** Norditropin NordiFlex 15mg/1.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £347.70 DT = £347.70 [CD4-2]

- ▶ **Norditropin SimpleXx** (Novo Nordisk Ltd)

**Somatropin (epr) 3.3 mg per 1 ml** Norditropin SimpleXx 5mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £106.35 DT = £106.35 [CD4-2]

**Somatropin (epr) 6.7 mg per 1 ml** Norditropin SimpleXx 10mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £212.70 DT = £212.70 [CD4-2]

**Somatropin (epr) 10 mg per 1 ml** Norditropin SimpleXx 15mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £319.05 DT = £319.05 [CD4-2]

- ▶ **NutropinAq** (ipSEN Ltd)

**Somatropin (rbe) 5 mg per 1 ml** NutropinAq 10mg/2ml solution for injection cartridges | 1 cartridge [PoM] £203.00 DT = £203.00 [CD4-2] | 3 cartridge [PoM] £609.00 DT = £609.00 [CD4-2]

- ▶ **Omnitrope** (Sandoz Ltd)

**Somatropin (rbe) 3.333 mg per 1 ml** Omnitrope Pen 5 5mg/1.5ml solution for injection cartridges | 5 cartridge [PoM] £368.74 DT = £368.74 [CD4-2]

- ▶ **Omnitrope SurePal** (Sandoz Ltd)

**Somatropin (rbe) 3.333 mg per 1 ml** Omnitrope SurePal 5 5mg/1.5ml solution for injection cartridges | 5 cartridge [PoM] £368.74 DT = £368.74 [CD4-2]

**Somatropin (rbe) 6.667 mg per 1 ml** Omnitrope SurePal 10 10mg/1.5ml solution for injection cartridges | 5 cartridge [PoM] £737.49 DT = £737.49 [CD4-2]

**Somatropin (rbe) 10 mg per 1 ml** Omnitrope SurePal 15 15mg/1.5ml solution for injection cartridges | 5 cartridge [PoM] £1,106.22 DT = £1,106.22 [CD4-2]

- ▶ **Saizen** (Merck Serono Ltd)

**Somatropin (rnc) 5.825 mg per 1 ml** Saizen 6mg/1.03ml solution for injection cartridges | 1 cartridge [PoM] £139.08 DT = £139.08 [CD4-2]

**Somatropin (rnc) 8 mg per 1 ml** Saizen 12mg/1.5ml solution for injection cartridges | 1 cartridge [PoM] £278.16 DT = £278.16 [CD4-2] | Saizen 20mg/2.5ml solution for injection cartridges | 1 cartridge [PoM] £463.60 DT = £463.60 [CD4-2]

#### Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Genotropin** (Pfizer Ltd)

**Somatropin (rbe) 5.3 mg** Genotropin 5.3mg powder and solvent for solution for injection cartridges | 1 cartridge [PoM] £92.15 DT = £92.15 [CD4-2]

**Somatropin (rbe) 12 mg** Genotropin 12mg powder and solvent for solution for injection cartridges | 1 cartridge [PoM] £208.65 DT = £208.65 [CD4-2]

- ▶ **Genotropin GoQuick** (Pfizer Ltd)

**Somatropin (rbe) 5.3 mg** Genotropin GoQuick 5.3mg powder and solvent for solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £92.15 DT = £92.15 [CD4-2]

**Somatropin (rbe) 12 mg** Genotropin GoQuick 12mg powder and solvent for solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £208.65 DT = £208.65 [CD4-2]

- ▶ **Genotropin MiniQuick** (Pfizer Ltd)

**Somatropin (rbe) 200 microgram** Genotropin MiniQuick 200microgram powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £24.35 DT = £24.35 [CD4-2]

**Somatropin (rbe) 400 microgram** Genotropin MiniQuick 400microgram powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £48.68 DT = £48.68 [CD4-2]

**Somatropin (rbe) 600 microgram** Genotropin MiniQuick 600microgram powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £73.03 DT = £73.03 [CD4-2]

**Somatropin (rbe) 800 microgram** Genotropin MiniQuick 800microgram powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £97.37 DT = £97.37 [CD4-2]

**Somatropin (rbe) 1 mg** Genotropin MiniQuick 1mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £121.71 DT = £121.71 [CD4-2]

**Somatropin (rbe) 1.2 mg** Genotropin MiniQuick 1.2mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £146.06 DT = £146.06 [CD4-2]

**Somatropin (rbe) 1.4 mg** Genotropin MiniQuick 1.4mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £170.39 DT = £170.39 [CD4-2]

**Somatropin (rbe) 1.6 mg** Genotropin MiniQuick 1.6mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £194.74 DT = £194.74 [CD4-2]

**Somatropin (rbe) 1.8 mg** Genotropin MiniQuick 1.8mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £219.08 DT = £219.08 [CD4-2]

**Somatropin (rbe) 2 mg** Genotropin MiniQuick 2mg powder and solvent for solution for injection pre-filled disposable devices | 7 pre-filled disposable injection [PoM] £243.42 DT = £243.42 [CD4-2]

- ▶ **Humatrope** (Eli Lilly and Company Ltd)

**Somatropin (rbe) 6 mg** Humatrope 6mg powder and solvent for solution for injection cartridges | 1 cartridge [PoM] £108.00 DT = £108.00 [CD4-2]

**Somatropin (rbe) 12 mg** Humatrope 12mg powder and solvent for solution for injection cartridges | 1 cartridge [PoM] £216.00 DT = £208.65 [CD4-2]

**Somatropin (rbe) 24 mg** Humatrope 24mg powder and solvent for solution for injection cartridges | 1 cartridge [PoM] £432.00 DT = £432.00 [CD4-2]

- ▶ **Zomacton** (Ferring Pharmaceuticals Ltd)

**Somatropin (rbe) 4 mg** Zomacton 4mg powder and solvent for solution for injection vials | 1 vial [PoM] £68.28 DT = £68.28 [CD4-2]

## 8 Sex hormone responsive conditions

### Sex hormones

01-Feb-2022

#### Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol p. 815 (oestradiol), estrone (oestrone), and estril p. 898 (oestril)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol p. 819 (ethinyloestradiol) and mestranol). Tibolone p. 819 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

#### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred; for further information, see Osteoporosis p. 725. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 161 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The Medicines and Healthcare products Regulatory Agency (MHRA) advises that HRT should only be prescribed to relieve post-menopausal symptoms that are adversely affecting quality of life and treatment should be reviewed regularly to ensure the minimum effective dose is used for the shortest duration. For osteoporosis, consider alternative treatments. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should

not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

For the treatment of menopausal symptoms in women with breast cancer see Breast cancer p. 1017.

#### Risk of breast cancer

All types of *systemic* (oral or transdermal) HRT treatment increase the risk of breast cancer after 1 year of use. This risk is higher for combined oestrogen-progestogen HRT (particularly for continuous HRT preparations where both oestrogen and progestogen are taken throughout each month) than for oestrogen-only HRT, but is irrespective of the type of oestrogen or progestogen. Longer duration of HRT use (but not the age at which HRT is started) further increases risk.

Although the risk of breast cancer is lower after stopping HRT than it is during current use, the excess risk persists for more than 10 years after stopping compared with women who have never used HRT. Vaginal preparations containing low doses of oestrogen to treat local symptoms are not thought to be associated with an effect on breast cancer risk.

The MHRA advises discussing the updated information on the risk of breast cancer with women who use or are considering starting HRT, at their next routine appointment. The MHRA advises encouraging current and past HRT users to be vigilant for signs of breast cancer and to attend routine breast screening. If a decision is made to stop treatment, in the absence of contra-indications, the MHRA recommends this should be done gradually to minimise recurrence of menopausal symptoms. For more information, see estradiol p. 815, conjugated oestrogens (equine) p. 814 and the MHRA Drug Safety Update: [www.gov.uk/drug-safety-update/hormone-replacement-therapy-hrt-further-information-on-the-known-increased-risk-of-breast-cancer-with-hrt-and-its-persistence-after-stopping](http://www.gov.uk/drug-safety-update/hormone-replacement-therapy-hrt-further-information-on-the-known-increased-risk-of-breast-cancer-with-hrt-and-its-persistence-after-stopping).

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use especially oestrogen-progestogen combined treatment, but this is not thought to be the case with tibolone p. 819.

Tibolone p. 819 has also been associated with an increased risk of breast cancer during treatment, although the extent of risk and its persistence after stopping is currently inconclusive.

#### Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.

Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.

#### Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

#### Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who

have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.

Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.

#### Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.

**Table 1: Summary of HRT risks and benefits\* during current use and current use plus post-treatment from age of menopause up to age 69 years, per 1000 women with 5 years or 10 years use of HRT**

	Risks over 5 years use (with no use or 5 years current HRT use)		Total risks up to age 69 (after no use or after 5 years HRT use <sup>1</sup> )		Risks over 10 years (with no use or 10 years current HRT use)		Total risks up to age 69 (after no use or after 10 years HRT use <sup>1</sup> )	
	Cases per 1000 women with no HRT use	Extra cases per 1000 women using HRT	Cases per 1000 women with no HRT use	Extra cases per 1000 women using HRT	Cases per 1000 women with no HRT use	Extra cases per 1000 women using HRT	Cases per 1000 women with no HRT use	Extra cases per 1000 women using HRT

\*Menopausal symptom relief is not included in this table, but is a key benefit of HRT and will play a major part in the decision to prescribe HRT.

<sup>1</sup>Best estimates based on relative risks of HRT use from age 50 (see DSU table 2 for relative risks). For breast cancer this includes cases diagnosed during current HRT use and diagnosed after HRT use until age 69 years; for other risks, this assumes no residual effects after stopping HRT use.

<sup>5</sup>Latest evidence suggests that transdermal HRT products have a lower risk of VTE than oral preparations.

**Table 2: Detailed summary of relative and absolute risks and benefits during current use from age of menopause and up to age 69, per 1000 women with 5 years or 10 years use of HRT**

age 60–69	5	5.5	3 (2–5)	–2	

\* Background incidence from: Hospital Admissions in England (HES) for stroke and VTE; placebo arms of Women's Health Initiative (WHI) trial for coronary heart disease (CHD) and fracture; the International Agency Research on Cancer (IARC) for ovarian cancer and endometrial cancer; and from Office for National Statistics (ONS) for England for 2015, calculated for never-users in the Collaborative Group on Hormonal Factors in Breast Cancer meta-analysis for breast cancer.

† Best estimate and range based on relative risk and 95% confidence intervals (CI).

‡ Risk ratios and 95% CI from: meta-analysis of prospective observational studies for breast cancer (95% CI not available); meta-analyses of RCTs and observational studies for endometrial cancer, ovarian cancer and VTE; meta-analyses of randomised controlled trials (RCTs) for stroke; and from WHI trial for CHD and fracture risk.

§ Latest evidence suggests that transdermal HRT products have a lower risk of VTE than oral preparations.

¶ Menopausal symptom relief is not included in this table but is a key benefit of HRT and will play a major part in the decision to prescribe HRT.

NS=non-significant difference.

Reproduced with permission of the MHRA under the terms of the Open Government Licence (OGL) v3.0

**Risk of coronary heart disease**

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

**Choice**

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone p. 819 are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

**Considerations in the elderly**

The use of oestrogens in elderly patients is potentially inappropriate (STOPP criteria) if prescribed in patients with a history of breast cancer or venous thromboembolism (increased risk of recurrence). Oral oestrogens may be inappropriate if prescribed without concurrent progestogen in those with an intact uterus (risk of endometrial cancer).

For further information, see *STOPP/START criteria* in Prescribing in the elderly p. 29.

**Surgery**

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

**Reasons to stop HRT**

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;

- detection of a risk factor which contra-indicates treatment.

**Ethinylestradiol**

Ethinylestradiol p. 819 (ethinylloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

**Raloxifene**

Raloxifene hydrochloride p. 814 is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

**Progestogens and progesterone receptor modulators**

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 876) and testosterone analogues (norethisterone p. 823 and norgestrel). The newer progestogens (desogestrel p. 871, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 872 is the active isomer of norgestrel and has twice its potency. Progesterone p. 825 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorelin analogues are also licensed for endometriosis.

Although oral progestogens have been used widely for menorrhagia (see Heavy menstrual bleeding p. 813) they are relatively ineffective compared with tranexamic acid p. 118 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1238; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

**[EvG]** Vaginal micronised progesterone (*Utrogestan*<sup>®</sup>) [unlicensed] is used for the prevention of miscarriage and should be offered following vaginal bleeding in women with an intra-uterine pregnancy confirmed by a scan, if they have previously had a miscarriage. If a fetal heartbeat is confirmed, continue progesterone until 16 completed weeks of pregnancy. **[A]** In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 133 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

**Hormone replacement therapy**

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

**Oral contraception**

Desogestrel p. 871, gestodene, levonorgestrel p. 872, norethisterone p. 823, and norgestimate are used in

combined oral contraceptives and in progestogen-only contraceptives.

### Cancer

Progestogens also have a role in neoplastic disease.

### Progesterone receptor modulators

Ulipristal acetate p. 870 is a progesterone receptor modulator with a partial progesterone antagonist effect. Intermittent ulipristal acetate can be used to treat moderate to severe symptoms of uterine fibroids in premenopausal women where surgery and uterine artery embolisation are unsuitable, or have failed. Ulipristal acetate is also used as a hormonal emergency contraceptive.

## Endometriosis

19-Sep-2017

### Description of condition

Endometriosis is the growth of endometrial-like tissue outside the uterus. Endometriosis is a condition affecting women mainly of reproductive age and, although its exact cause is unknown, it is an oestrogen-dependent condition and is associated with menstruation. Endometriosis is typically associated with symptoms such as pelvic pain, painful periods and subfertility. Women with endometriosis report pain, which can be frequent, chronic and severe, as well as tiredness, more sick days, and a significant physical, sexual, psychological and social impact. Endometriosis is an important cause of subfertility and this can also have a significant effect on quality of life.

Women may also have endometriosis without symptoms, so it is difficult to know how common the disease is in the population. It is also unclear whether endometriosis is always progressive or can remain stable or improve with time.

### Aims of treatment

The aim of treatment is to reduce the severity of symptoms, improve the quality of life, and to improve fertility if this is affected.

### Drug treatment

Management options for endometriosis include drug treatment and surgery. Most drug treatments for endometriosis work by suppressing ovarian function and are contraceptive. Surgical treatment aims to remove or destroy endometriotic lesions. The choice of treatment depends on the woman's preferences and priorities in terms of pain management and fertility.

**[EvGr]** A short trial (such as 3 months) of paracetamol or an NSAID alone or in combination should be considered for first-line management of endometriosis-related pain. If pain relief is inadequate, consider other forms of pain management and referral for further assessment.

Hormonal treatment (with a combined oral contraceptive or a progestogen) should be offered to women with suspected, confirmed or recurrent endometriosis. The patient should be informed that hormonal treatment for endometriosis can reduce pain and has no permanent negative effect on subsequent fertility. If initial hormonal treatment for endometriosis is not effective, not tolerated or is contra-indicated, the woman should be referred to a gynaecologist or specialist endometriosis service for possible further treatment, which could include other hormonal treatments or surgery. **[A]** For use of drugs to treat neuropathic pain, see Neuropathic pain.

### Surgery

**[EvGr]** Women with suspected or confirmed endometriosis should be asked about their symptoms, preferences and priorities with respect to pain and fertility, to guide surgical

decision-making. For deep endometriosis involving the bowel, bladder or ureter, gonadotropin-releasing hormones given for 3 months before surgery should be considered. Excision rather than ablation should be considered to treat endometriomas, taking into account the woman's desire for fertility and her ovarian reserve. After laparoscopic excision or ablation of endometriosis, consider hormonal treatment (with, for example, a combined hormonal contraceptive), to prolong the benefits of surgery and manage symptoms.

A hysterectomy may be indicated if, for example, the woman has adenomyosis or heavy menstrual bleeding that has not responded to other treatments. **[A]**

### Surgical management if fertility is a priority

**[EvGr]** If fertility is a priority, the management of endometriosis-related subfertility should have multidisciplinary involvement with input from a fertility specialist. Women with endometriosis who are trying to conceive should not be offered hormonal treatment, because it does not improve spontaneous pregnancy rates. **[A]**

## Heavy menstrual bleeding

11-Jun-2021

### Description of condition

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, and/or for a duration of more than 7 days, which results in the need to change menstrual products every 1–2 hours. Heavy menstrual bleeding occurs regularly, every 24–35 days.

### Drug treatment

**[EvGr]** The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel-releasing intra-uterine system p. 872 is the first-line treatment option. Patients should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel-releasing intra-uterine system p. 872 is unsuitable, either tranexamic acid p. 118, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter, referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, a levonorgestrel-releasing intra-uterine system p. 872, a combined hormonal contraceptive, a cyclical oral

progesterone, ulipristal acetate p. 870, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given. Intermittent ulipristal acetate can be offered to treat moderate to severe symptoms of uterine fibroids in premenopausal women where surgery and uterine artery embolisation are unsuitable, or have failed.

The effectiveness of drug treatment for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. Treatment with a gonadotrophin-releasing hormone analogue before hysterectomy and myomectomy should be considered if uterine fibroids are causing an enlarged or distorted uterus.

### CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

#### Raloxifene hydrochloride

01-Jun-2021

##### ● INDICATIONS AND DOSE

##### Treatment and prevention of postmenopausal osteoporosis

- ▶ BY MOUTH
- ▶ Adult: 60 mg once daily

##### Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 60 mg once daily for 5 years

- **UNLICENSED USE** Not licensed for chemoprevention of breast cancer in the UK. Licensed for this indication in USA.
- **CONTRA-INDICATIONS** Cholestasis · endometrial cancer · history of venous thromboembolism · undiagnosed uterine bleeding
- **CAUTIONS** Avoid in Acute porphyrias p. 1150 · breast cancer (manufacturer advises avoid during treatment for breast cancer) · history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) · risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- **INTERACTIONS** → Appendix 1: raloxifene
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Influenza · leg cramps · peripheral oedema · vasodilation
  - ▶ **Uncommon** Embolism and thrombosis
  - ▶ **Rare or very rare** Breast abnormalities · gastrointestinal discomfort · gastrointestinal disorder · headaches · nausea · rash · thrombocytopenia · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of increased exposure).
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - ▶ Raloxifene for the primary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA160 Not recommended
  - ▶ Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA161 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

##### ▶ Raloxifene hydrochloride (Non-proprietary)

Raloxifene hydrochloride 60 mg Raloxifene 60mg tablets | 28 tablet £17.06 DT = £3.80

### OESTROGENS

#### Conjugated oestrogens (equine)

14-Dec-2020

##### ● INDICATIONS AND DOSE

##### PREMARIN<sup>®</sup> TABLETS

##### Menopausal symptoms

- ▶ BY MOUTH
- ▶ Adult: 0.3–1.25 mg daily continuously; with cyclical progesterone for 12–14 days of each cycle in women with a uterus

##### Postmenopausal osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 0.625–1.25 mg daily continuously; with cyclical progesterone for 12–14 days of each cycle in women with a uterus

##### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)**

Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progesterone HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia

- **CAUTIONS** Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules (closely monitor breast status—risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease (closely monitor breast status—risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease reported · migraine · migraine-like headaches · presence of antiphospholipid antibodies (increased risk of thrombotic events) · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of breast cancer · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

#### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of breast cancer HRT use is associated with an increased risk of breast cancer—see *Important safety information*.  
Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.  
In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.
- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.  
In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.
- ▶ *Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.
- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · arthralgia · breast abnormalities · depression · leg cramps · menstrual cycle irregularities · vaginal discharge · weight changes
- ▶ **Uncommon** Anxiety · cervical abnormalities · contact lens intolerance · dizziness · embolism and thrombosis · gallbladder disorder · gastrointestinal discomfort · headaches · hirsutism · libido disorder · mood altered · nausea · oedema · skin reactions · vulvovaginal candidiasis
- ▶ **Rare or very rare** Angioedema · asthma exacerbated · cerebrovascular insufficiency · chorea exacerbated · colitis ischaemic · epilepsy exacerbated · galactorrhoea · glucose

tolerance impaired · hypocalcaemia · jaundice cholestatic · myocardial infarction · neoplasms · pancreatitis · pelvic pain · vomiting

- ▶ **Frequency not known** Endometrial hyperplasia · erythema nodosum

**SIDE-EFFECTS, FURTHER INFORMATION** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **PATIENT AND CARER ADVICE**  
Information sheet The MHRA has provided a patient information sheet to aid healthcare professionals when counselling women on the risk of breast cancer with HRT use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## Estradiol

27-May-2021

#### ● INDICATIONS AND DOSE

##### BEDOL<sup>®</sup>

#### Menopausal symptoms | Osteoporosis prophylaxis

- ▶ **BY MOUTH**
- ▶ **Adult:** 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus continued →

**ELLESTE SOLO<sup>®</sup> MX****Menopausal symptoms**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX 40*, subsequently adjust according to response

**Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX 80*, subsequently adjust according to response

**ELLESTE-SOLO<sup>®</sup> 1-MG****Menopausal symptoms**

- ▶ BY MOUTH
- ▶ Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ELLESTE-SOLO<sup>®</sup> 2-MG****Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ESTRADERM MX<sup>®</sup>****Menopausal symptoms**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX25* for first 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX50*; subsequently adjust according to response

**ESTRADOT<sup>®</sup>****Menopausal symptoms**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *25 patch* for 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *50 patch*; subsequently adjust according to response

**EVOREL<sup>®</sup>****Menopausal symptoms | Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with *Evorel 50 patch*; subsequently adjust according to response; dose may be reduced to *Evorel 25 patch* after first month if necessary for menopausal symptoms only

**FEMSEVEN<sup>®</sup>****Menopausal symptoms | Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *FemSeven 50 patches* for the first few months, subsequently adjust according to response

**LENZETTO<sup>®</sup>****Menopausal symptoms**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Initially 1 spray daily, applied to the dry and healthy skin of the forearm, or alternatively the inner thigh, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose increase should be made only after at least 4 weeks of continuous treatment increased if necessary to 2 sprays daily (max. per dose 3 sprays daily)

**OESTROGEL<sup>®</sup>****Menopausal symptoms**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over a large area, to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus. If switching from cyclical HRT, start at end of regimen; otherwise start at any time

**Osteoporosis prophylaxis**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1.5 mg once daily continuously, to be applied over a large area, to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus. If switching from cyclical HRT, start at end of regimen; otherwise start at any time

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For *Oestrogel<sup>®</sup>*: 2 measures is equivalent to estradiol 1.5 mg.

**PROGYNOVA<sup>®</sup>****Menopausal symptoms**

- ▶ BY MOUTH
- ▶ Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**PROGYNOVA<sup>®</sup> TS****Menopausal symptoms | Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be

used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *Prodynova TS 50*, subsequently adjust according to response, women receiving *Prodynova TS 100* patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

**SANDRENA®****Menopausal symptoms**

## ▶ TO THE SKIN

- ▶ **Adult:** Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

**ZUMENON®****Menopausal symptoms**

## ▶ BY MOUTH

- ▶ **Adult:** Initially 1 mg daily, to be started on day 1 of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

## ▶ BY MOUTH

- ▶ **Adult:** 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE: HORMONE REPLACEMENT THERAPY (HRT): FURTHER INFORMATION ON THE KNOWN INCREASED RISK OF BREAST CANCER WITH HRT AND ITS PERSISTENCE AFTER STOPPING (SEPTEMBER 2019)**

Data from a meta-analysis of more than 100 000 women with breast cancer have confirmed that the risk of breast cancer is increased with the use of all forms of systemic HRT, except vaginal oestrogens, for longer than 1 year. Findings have shown that the risk increases further with longer duration of use, is higher for combined oestrogen-progestogen HRT than with oestrogen-only HRT, and persists for more than 10 years after stopping HRT. Healthcare professionals are advised to only prescribe HRT for the relief of postmenopausal symptoms that adversely affect quality of life, and to regularly review patients to ensure that it is used for the shortest time and at the lowest dose. Patients currently and previously on HRT should be informed of the risk and to be vigilant for signs of breast cancer; they should also be encouraged to attend breast screening appointments.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of

endometriosis may be exacerbated · uterine fibroids may increase in size

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus using *systemic* preparations, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- ▶ **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have *predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

*Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- ▶ **Risk of breast cancer with systemic use** HRT use is associated with an increased risk of breast cancer—see *Important safety information*. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Headaches · nausea · skin reactions
- ▶ **Uncommon** Hypertension

**SPECIFIC SIDE-EFFECTS**▶ **Common or very common**

- ▶ With oral use Asthenia · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · menstrual cycle irregularities · muscle complaints · pelvic pain · weight changes
- ▶ With transdermal use Abdominal pain · breast abnormalities · menstrual cycle irregularities · uterine disorders · vaginal discharge · weight changes
- ▶ **Uncommon**
- ▶ With oral use Anxiety · back pain · breast abnormalities · cervical abnormalities · cystitis-like symptom · depression · dizziness · embolism and thrombosis · erythema nodosum · gallbladder disorder · oedema · palpitations · peripheral vascular disease · tumour growth · visual impairment · vulvovaginal candidiasis
- ▶ With transdermal use Asthenia · breast neoplasm benign · depression · flatulence · increased risk of infection ·

leiomyoma · mood swings · venous thromboembolism · vertigo · vomiting

- ▶ **Rare or very rare**
- ▶ With oral use Angioedema · cerebrovascular insufficiency · chorea · contact lens intolerance · haemolytic anaemia · hepatic disorders · hirsutism · malaise · myocardial infarction · sexual dysfunction · steepening of corneal curvature · vaginal discharge · vomiting
- ▶ With transdermal use Epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · libido disorder
- ▶ **Frequency not known**
- ▶ With oral use Carbohydrate metabolism change · epilepsy exacerbated · hypertriglyceridaemia · increased risk of coronary artery disease · neoplasms · pancreatitis · systemic lupus erythematosus (SLE)

**SIDE-EFFECTS, FURTHER INFORMATION** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **MONITORING REQUIREMENTS**
  - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With transdermal use Manufacturer advises patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.
- **PATIENT AND CARER ADVICE**
  - ▶ With transdermal use Patient counselling is advised for estradiol patches and spray (administration).
  - ▶ With topical use Patient counselling is advised for estradiol gels (administration). Information sheet
  - ▶ With oral use or topical use or transdermal use The MHRA has provided a patient information sheet to aid healthcare professionals when counselling women on the risk of breast cancer with HRT use.

**LENZETTO** ▶ With transdermal use Apply to dry, healthy skin of the inner forearm or alternatively the inner thigh and allow to dry for 2 minutes before covering with clothing. Avoid skin contact with another person (particularly children) or pets and avoid washing the area for at least 1 hour after application. If a sunscreen is needed, apply at least 1 hour before Lenzetto®.

**SANDRENA** ▶ With topical use Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

**ESTROGEL** ▶ With topical use Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

**Ethinylestradiol**

22-May-2020

**(Ethinylloestradiol)**● **INDICATIONS AND DOSE**

**Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used**

▶ **BY MOUTH**

- ▶ **Adult (female):** 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

**Female hypogonadism**▶ **BY MOUTH**

- ▶ **Adult (female):** 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

**Menstrual disorders**▶ **BY MOUTH**

- ▶ **Adult (female):** 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

**Palliative treatment of prostate cancer**▶ **BY MOUTH**

- ▶ **Adult (male):** 0.15–1.5 mg daily.

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Acute porphyrias p. 1150 • history of breast cancer • history of venous thromboembolism • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • thrombophilic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- ▶ **Combined hormonal contraception** For more information on contra-indications for ethinylestradiol in *contraception* see combined hormonal contraceptive preparations containing ethinylestradiol.
- ▶ **Hormone replacement therapy** For more information on contra-indications for hormone replacement therapy see Sex hormones p. 808
- **CAUTIONS** Cardiovascular disease (risk of fluid retention) • diabetes (increased risk of heart disease) • history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of hypertriglyceridaemia (increased risk of pancreatitis) • hypophyseal tumours • increased risk of gall-bladder disease • migraine (migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk factors for venous thromboembolism • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Combined hormonal contraception** For more information on cautions for ethinylestradiol in *contraception* see combined hormonal contraceptive preparations containing ethinylestradiol.
- ▶ **Hormone replacement therapy** For more information on cautions for hormone replacement therapy see Sex hormones p. 808
- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **SIDE-EFFECTS** Breast abnormalities • cervical mucus increased • cholelithiasis • contact lens intolerance • depression • electrolyte imbalance • embolism and thrombosis • erythema nodosum • feminisation • fluid retention • headaches • hypertension • jaundice cholestatic • metrorrhagia • mood altered • myocardial infarction • nausea • neoplasms • skin reactions • stroke • uterine disorders • vomiting • weight change

**SIDE-EFFECTS, FURTHER INFORMATION**

**Cyclical HRT** (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tibolone**

09-Sep-2021

● **INDICATIONS AND DOSE**

**Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated**

▶ **BY MOUTH**

- ▶ **Adult:** 2.5 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · history of arterial thromboembolic disease (e.g. angina, myocardial infarction, stroke or TIA) · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · uninvestigated or undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Diabetes (increased risk of heart disease) · epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke

● **INTERACTIONS** → Appendix 1: tibolone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Breast abnormalities · cervical dysplasia · endometrial thickening · gastrointestinal discomfort · genital abnormalities · hair growth abnormal · increased risk of infection · pelvic pain · postmenopausal haemorrhage · vaginal discharge · vaginal haemorrhage · weight increased
- ▶ **Uncommon** Oedema · skin reactions
- ▶ **Frequency not known** Arthralgia · dementia · depression · dizziness · erythema nodosum · gallbladder disorder · headaches · increased risk of ischaemic stroke · myalgia · neoplasms · vision disorders

**SIDE-EFFECTS, FURTHER INFORMATION** **Vaginal bleeding**

Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

**Reasons to withdraw treatment** Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY** Avoid; toxicity in *animal* studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute disease.
- **RENAL IMPAIRMENT** EvGr Caution (risk of fluid retention).
- **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

## Estradiol with medroxyprogesterone

05-Oct-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 815, medroxyprogesterone acetate p. 876.

### ● INDICATIONS AND DOSE

#### INDIVINA® TABLETS

##### Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 3 years previously

###### ► BY MOUTH

- Adult: Initially 1/2.5 mg daily taken continuously, adjust according to response, to be started at end of scheduled bleed if changing from cyclical HRT

#### TRIDESTRA®

##### Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

###### ► BY MOUTH

- Adult: 1 tablet daily for 70 days, white tablet to be taken, then 1 tablet daily for 14 days, blue tablet to be taken, then 1 tablet daily for 7 days, yellow tablet to be taken, subsequent courses are repeated without interval

- **INTERACTIONS** → Appendix 1: estradiol · hormone replacement therapy · medroxyprogesterone

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Form unstacked

- **Tridestra** (Orion Pharma (UK) Ltd) Tridestra tablets | 91 tablet [PoM](#) £20.49

##### Tablet

- **Indivina** (Orion Pharma (UK) Ltd) Estradiol valerate 1 mg, Medroxyprogesterone acetate 2.5 mg Indivina 1mg/2.5mg tablets | 84 tablet [PoM](#) £20.58 DT = £20.58
- **Estradiol valerate 2 mg, Medroxyprogesterone acetate 5 mg** Indivina 2mg/5mg tablets | 84 tablet [PoM](#) £20.58 DT = £20.58
- **Estradiol valerate 1 mg, Medroxyprogesterone acetate 5 mg** Indivina 1mg/5mg tablets | 84 tablet [PoM](#) £20.58 DT = £20.58

## Estradiol with norethisterone 11-Dec-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 815, norethisterone p. 823.

### ● INDICATIONS AND DOSE

#### CLINORETTE<sup>®</sup>

##### Menopausal symptoms in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, white tablet to be taken, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, pink tablet to be taken, subsequent courses repeated without interval

#### ELLESTE-DUET<sup>®</sup> 1-MG

##### Menopausal symptoms

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, white tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, green tablet to be taken, subsequent courses are repeated without interval

#### ELLESTE-DUET<sup>®</sup> 2-MG

##### Menopausal symptoms | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, orange tablet to be taken, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, grey tablet to be taken, subsequent courses are repeated without interval

#### ELLESTE-DUET<sup>®</sup> CONTI

##### Menopausal symptoms in women whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

#### EVOREL<sup>®</sup> CONTI

##### Menopausal symptoms in women whose last menstrual period occurred over 18 months previously | Osteoporosis prophylaxis

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, to be started at end of scheduled bleed if changing from cyclical HRT

#### EVOREL<sup>®</sup> SEQUI

##### Menopausal symptoms | Osteoporosis prophylaxis

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly for 2 weeks, *Evorel*<sup>®</sup> 50 patch to be applied and started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), then apply 1 patch twice weekly for the following 2 weeks, *Evorel*<sup>®</sup> Conti patch to be applied, subsequent courses are repeated without interval.

#### KLIOFEM<sup>®</sup>

##### Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

#### KLIOVANCE<sup>®</sup>

##### Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

#### NOVOFEM<sup>®</sup>

##### Menopausal symptoms in women whose last menstrual period occurred over 6 months previously | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 16 days, red tablet to be taken, then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing previous regimen

#### TRISEQUENS<sup>®</sup>

##### Menopausal symptoms in women whose last menstrual period occurred over 6 months previously | Osteoporosis prophylaxis

- ▶ BY MOUTH
- ▶ Adult: 1 tablet daily for 12 days, blue tablet to be taken, followed by 1 tablet daily for 10 days, white tablet to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses are repeated without interval; start treatment with blue tablet at any time or if changing from cyclical HRT, start treatment the day after finishing previous regimen

- **INTERACTIONS** → Appendix 1: estradiol · hormone replacement therapy · norethisterone

#### ● PATIENT AND CARER ADVICE

**EVOREL<sup>®</sup> SEQUI** Patients and carers should be advised on the application of *Evorel*<sup>®</sup> Sequi patches.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Form unstated

- ▶ **Clinorette** (ReSource Medical UK Ltd)

- ▶ **Kliovance** (Novo Nordisk Ltd)  
**Norethisterone acetate 500 microgram, Estradiol 1 mg** Kliovance tablets | 84 tablet [PoM] £13.20 DT = £13.20

#### Transdermal patch

- ▶ **Evorel Conti** (Theramex HQ UK Ltd)  
**Estradiol 50 microgram per 24 hour, Norethisterone acetate 170 microgram per 24 hour** Evorel Conti patches | 8 patch [PoM] £13.00 | 24 patch [PoM] £37.22 DT = £37.22

## Estradiol with progesterone

02-Sep-2021

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 815, progesterone p. 825.

### ● INDICATIONS AND DOSE

#### BIJUVE®

#### Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously

##### ► BY MOUTH

- **Adult:** 1 capsule daily continuously, dose to be taken in the evening with food, if changing from continuous sequential or cyclical HRT, start treatment the day after finishing the 28-day cycle. Treatment may start immediately after surgical menopause or if changing from another continuous combined HRT

- **INTERACTIONS** → Appendix 1: estradiol · hormone replacement therapy

### ● SIDE-EFFECTS

- **Common or very common** Alopecia · breast abnormalities · dizziness · fatigue · gastrointestinal discomfort · haemorrhage · headaches · nausea · pain · pelvic pain · skin reactions · uterine disorders · vulvovaginal disorders · weight changes
- **Uncommon** Altered smell sensation · anaemia · anxiety · arthralgia · cervical abnormalities · chills · concentration impaired · constipation · depression · diarrhoea · drowsiness · dry mouth · flatulence · fluid retention · hirsutism · hot flush · hyperlipidaemia · hyperphagia · hypertension · hyperuricaemia · increased risk of infection · leiomyoma · libido increased · memory impairment · metrorrhagia · mood altered · muscle spasms · neoplasms · oral discomfort · pancreatitis acute · paraesthesia · postmenopausal haemorrhage · sleep disorders · taste altered · telangiectasia · thrombophlebitis · vertigo · visual impairment · vomiting

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **Bijuve** (Theramex HQ UK Ltd)

Estradiol 1 mg, Progesterone 100 mg Bijuve 1mg/100mg capsules | 28 capsule [PoM](#) £8.14 | 84 capsule [PoM](#) £24.42

## PROGESTOGENS

### Dienogest

17-Feb-2020

- **DRUG ACTION** Dienogest is a nortestosterone derivative that has a progestogenic effect in the uterus, reducing the production of estradiol and thereby suppressing endometriotic lesions.

### ● INDICATIONS AND DOSE

#### Endometriosis

##### ► BY MOUTH

- **Females of childbearing potential:** 2 mg once daily, can be started on any day of cycle, dose should be taken continuously at the same time each day

- **CONTRA-INDICATIONS** Arterial disease (past or present) · cardiovascular disease (past or present) · diabetes with vascular involvement · liver tumours (past or present) · sex hormone-dependent malignancies (confirmed or suspected) · undiagnosed vaginal bleeding · venous thromboembolism (active)

- **CAUTIONS** Diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of depression · history of ectopic pregnancy · history of gestational diabetes · patients at risk of osteoporosis · patients at risk of venous thromboembolism

### CAUTIONS, FURTHER INFORMATION

- **Immobilisation** Manufacturer advises to discontinue treatment during prolonged immobilisation. For elective surgery, treatment should be discontinued at least 4 weeks before surgery; treatment may be restarted 2 weeks after complete remobilisation.

- **INTERACTIONS** → Appendix 1: dienogest

### ● SIDE-EFFECTS

- **Common or very common** Alopecia · anxiety · asthenic conditions · breast abnormalities · depression · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hot flush · libido loss · mood altered · nausea · ovarian cyst · pain · skin reactions · sleep disorder · vomiting · vulvovaginal disorders · weight changes
- **Uncommon** Anaemia · appetite increased · autonomic dysfunction · broken nails · circulatory system disorder · concentration impaired · constipation · dandruff · diarrhoea · dry eye · dyspnoea · genital discharge · hair changes · hyperhidrosis · hypotension · increased risk of infection · limb discomfort · muscle spasms · oedema · palpitations · pelvic pain · photosensitivity reaction · tinnitus
- **Frequency not known** Glucose tolerance impaired · insulin resistance · menstrual cycle irregularities

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that, if contraception is required, females of childbearing potential should use non-hormonal contraception during treatment. The menstrual cycle usually returns to normal within 2 months after stopping treatment.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients with a history of chloasma gravidarum to avoid sunlight or UV radiation exposure during treatment. **Missed doses** Manufacturer advises if one or more tablets are missed, or if vomiting and/or diarrhoea occurs within 3–4 hours of taking a tablet, another tablet should be taken as soon as possible and the next dose taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Zalkya** (Stragen UK Ltd)

Dienogest 2 mg Zalkya 2mg tablets | 28 tablet [PoM](#) £20.68 DT = £20.68

## Norethisterone

08-Nov-2021

### ● INDICATIONS AND DOSE

#### Endometriosis

##### ► BY MOUTH

- **Adult:** 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

#### Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)

##### ► BY MOUTH

- **Adult:** 5 mg 3 times a day for 10 days

#### Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)

##### ► BY MOUTH

- **Adult:** 5 mg twice daily, to be taken from day 19 to day 26 of cycle continued →

**Dysmenorrhoea**

- ▶ BY MOUTH
- ▶ Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

**Premenstrual syndrome (but not recommended)**

- ▶ BY MOUTH
- ▶ Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

**Postponement of menstruation**

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Breast cancer**

- ▶ BY MOUTH
- ▶ Adult: 40 mg daily, increased if necessary to 60 mg daily

**Short-term contraception**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

**Contraception**

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

**● CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS** Acute porphyrias p. 1150 · current breast cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice (non-contraceptive indications) · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications)

**SPECIFIC CONTRA-INDICATIONS**

- ▶ With oral use History of thromboembolism (non-contraceptive indications) · undiagnosed vaginal bleeding (non-contraceptive indications)

**● CAUTIONS**

**GENERAL CAUTIONS** Cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · hypertension · liver tumours—seek specialist advice before use · migraine · multiple risk factors for cardiovascular disease—seek specialist advice before intramuscular use · positive antiphospholipid antibodies · rheumatoid arthritis · risk factors for venous thromboembolism · systemic lupus erythematosus

**SPECIFIC CAUTIONS**

- ▶ With intramuscular use Cervical cancer
- ▶ When used for contraception History of stroke (including transient ischaemic attack)—seek specialist advice before intramuscular use · ischaemic heart disease—seek specialist advice before intramuscular use · undiagnosed vaginal bleeding—seek specialist advice before intramuscular use
- ▶ With oral use for contraception Malabsorption syndromes

**CAUTIONS, FURTHER INFORMATION**

- ▶ Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an

earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **INTERACTIONS** → Appendix 1: norethisterone

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Menstrual cycle irregularities
- ▶ **Uncommon** Breast tenderness
- ▶ **Frequency not known** Hepatic cancer · thromboembolism

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea · skin reactions · weight increased
- ▶ **Uncommon**
- ▶ With intramuscular use Abdominal distension · depressed mood
- ▶ **Frequency not known**
- ▶ With oral use Appetite change · depression · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness · rash · weight change

**● PREGNANCY**

- ▶ With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.
- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution; avoid in severe or active disease.

- ▶ When used for breast cancer Manufacturer advises avoid.

**● RENAL IMPAIRMENT**

- ▶ With oral use [\[EvG\]](#) Use with caution. 

**● PATIENT AND CARER ADVICE**

- ▶ Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.
- ▶ Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.
- ▶ Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).
- ▶ After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.
- ▶ Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of

treatment but there is no evidence of permanent infertility.

#### Missed doses

**Missed oral contraceptive pill** The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Solution for injection

- ▶ **Noristerat** (Bayer Plc)

**Norethisterone enantate 200 mg per 1 ml** Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule **[PoM]** £4.05 DT = £4.05

#### Tablet

- ▶ **Norethisterone (Non-proprietary)**

**Norethisterone 5 mg** Norethisterone 5mg tablets | 30 tablet **[PoM]** £4.15 DT = £2.00

- ▶ **Noriday** (Pfizer Ltd)

**Norethisterone 350 microgram** Noriday 350microgram tablets | 84 tablet **[PoM]** £2.10 DT = £2.10

- ▶ **Primolut N** (Bayer Plc)

**Norethisterone 5 mg** Primolut N 5mg tablets | 30 tablet **[PoM]** £2.26 DT = £2.00

- ▶ **Utovalan** (Pfizer Ltd)

**Norethisterone 5 mg** Utovalan 5mg tablets | 30 tablet **[PoM]** £1.40 DT = £2.00 | 90 tablet **[PoM]** £4.21

Combinations available: **Estradiol with norethisterone**, p. 822

## Progesterone

09-Feb-2022

### • INDICATIONS AND DOSE

#### CRINONE<sup>®</sup> VAGINAL GEL

#### Supplementation of luteal phase in infertility (under expert supervision)

- ▶ BY VAGINA

- ▶ Adult: 1 applicatorful daily, start either after documented ovulation or on day 18–21 of cycle

#### Adjunct in in-vitro fertilisation [when mainly tubal, idiopathic, or endometriosis related infertility is associated with normal ovulatory cycles] (under expert supervision)

- ▶ BY VAGINA

- ▶ Adult: 1 applicatorful daily, dose to be inserted preferably in the morning, start from the day of embryo transfer and continue for a total of 30 days once pregnancy is confirmed

#### CYCLOGEST<sup>®</sup> PESSARIES

#### Premenstrual syndrome | Post-natal depression

- ▶ BY VAGINA, OR BY RECTUM

- ▶ Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

#### Supplementation of luteal phase during assisted reproductive technology (ART) treatment (under expert supervision)

- ▶ BY VAGINA

- ▶ Adult: 400 mg twice daily, start at oocyte retrieval, and continue for 38 days once pregnancy is confirmed

#### LUBION<sup>®</sup>

#### Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

#### LUTIGEST<sup>®</sup>

#### Supplementation of luteal phase during assisted reproductive technology (ART) treatment (under expert supervision)

- ▶ BY VAGINA

- ▶ Adult: 100 mg 3 times a day, start the day after oocyte retrieval, and continue for 30 days once pregnancy is confirmed

#### UTROGESTAN<sup>®</sup> CAPSULES

#### Progestogenic opposition of oestrogen HRT

- ▶ BY MOUTH

- ▶ Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

#### UTROGESTAN<sup>®</sup> VAGINAL CAPSULES

#### Supplementation of luteal phase during assisted reproductive technology (ART) cycles

- ▶ BY VAGINA

- ▶ Adult: 200 mg 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

#### Threatened miscarriage [with vaginal bleeding and previous miscarriage] (initiated by a specialist)

- ▶ BY VAGINA

- ▶ Adult: 400 mg twice daily from when intra-uterine pregnancy is confirmed until week 16 of pregnancy if fetal heartbeat confirmed, offer a repeat scan within 2 weeks if fetal heartbeat is not seen on an initial scan

### • UNLICENSED USE

**UTROGESTAN<sup>®</sup> VAGINAL CAPSULES** **[EvGr]** Progesterone is used in the prevention of threatened miscarriage, **[A]** but is not licensed for this indication.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · breast cancer · genital cancer · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · history of thromboembolism · missed miscarriage · thrombophlebitis · undiagnosed vaginal bleeding

- **CAUTIONS** Conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of depression · migraine · risk factors for thromboembolism

### • SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With oral use Headache · menstrual cycle irregularities
- ▶ With vaginal use Breast pain · drowsiness · gastrointestinal discomfort

- ▶ **Uncommon**

- ▶ With oral use Breast pain · constipation · diarrhoea · dizziness · drowsiness · jaundice cholestatic · skin reactions · vomiting

- ▶ **Rare or very rare**

- ▶ With oral use Depression · nausea

- ▶ **Frequency not known**
- ▶ With intramuscular use Alopecia · breast changes · cervical abnormalities · depression · drowsiness · fever · hirsutism · insomnia · jaundice cholestatic · menstrual cycle irregularities · nausea · oedema · protein catabolism · skin reactions · weight increased
- ▶ With rectal use Diarrhoea · flatulence
- ▶ With vaginal use Leakage of the pessary base · menstrual cycle irregularities · vulvovaginal pain
- **ALLERGY AND CROSS-SENSITIVITY** For *Utrogestan*<sup>®</sup> oral and vaginal capsules, manufacturer advises contra-indicated in patients with hypersensitivity to soy or peanut products—contains soya lecithin.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment. For *Utrogestan*<sup>®</sup> oral capsules, manufacturer advises avoid in acute or active liver disease. For *Crinone*<sup>®</sup> vaginal gel, manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Evgr Caution (risk of fluid retention; no information available). ◆
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With oral use Manufacturer advises capsules should be taken at bedtime on an empty stomach.
- **PATIENT AND CARER ADVICE**
- ▶ With oral use Patient counselling is advised for progesterone capsules (administration).
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **LUTIGEST**<sup>®</sup> For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
- ▶ Progesterone (*Lutigest*<sup>®</sup>) for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women (October 2016) SMC No. 1185/16 Recommended
- **LUBION**<sup>®</sup> For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
- ▶ Progesterone (*Lubion*<sup>®</sup>) is indicated in adults for luteal support as part of an Assisted Reproductive Technology (ART) treatment program in infertile women who are unable to use or tolerate vaginal preparations (July 2018) SMC No. SMC2017 Recommended
- **UTROGESTAN<sup>®</sup> VAGINAL CAPSULES** For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
- ▶ Micronised progesterone (*Utrogestan Vaginal*<sup>®</sup>) in women for supplementation of the luteal phase during Assisted Reproductive Technology (ART) cycles (May 2017) SMC No. 935/13 Recommended
- **LESS SUITABLE FOR PRESCRIBING**
- ▶ With vaginal use Progesterone pessaries are less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- **Pessary**
- ▶ **Cyclogest** (L.D. Collins & Co. Ltd)
- **Progesterone 200 mg** Cyclogest 200mg pessaries | 15 pessary PoM £8.95 DT = £8.95
- **Progesterone 400 mg** Cyclogest 400mg pessaries | 15 pessary PoM £12.96 DT = £12.96
- ▶ **Lutigest** (Ferring Pharmaceuticals Ltd)
- **Progesterone 100 mg** Lutigest 100mg vaginal tablets | 21 pessary PoM £19.50 DT = £19.50
- **Solution for injection**
- ▶ **Lubion** (Pharmasure Ltd)
- **Progesterone 22.48 mg per 1 ml** Lubion 25mg/1.112ml solution for injection vials | 7 vial PoM £56.00 DT = £56.00

**Vaginal gel**

- ▶ **Crinone** (Merck Serono Ltd)
- **Progesterone 80 mg per 1 gram** Crinone 8% progesterone vaginal gel | 15 unit dose PoM £30.83 DT = £30.83
- **Capsule**
- ▶ **Utrogestan** (Besins Healthcare (UK) Ltd)
- **Progesterone 100 mg** Utrogestan 100mg capsules | 30 capsule PoM £5.13 DT = £5.13
- **Progesterone 200 mg** Utrogestan 200mg vaginal capsules with applicators | 21 capsule PoM £21.00 DT = £21.00

Combinations available: *Estradiol with progesterone*, p. 823

## 8.1a Anti-oestrogens

## OVULATION STIMULANTS

**Clomifene citrate**

23-Nov-2020

**(Clomiphene citrate)**

- **DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

● **INDICATIONS AND DOSE****Female infertility due to ovulatory dysfunction**

- ▶ **BY MOUTH**
- ▶ Adult (female): 50 mg once daily for 5 days, to be started at any time if no recent uterine bleeding or on or around the fifth day of cycle if progesterogen-induced bleeding is planned or if spontaneous uterine bleeding occurs, then 100 mg once daily if required for 5 days, this second course to be given at least 30 days after the first course, only in the absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended (beyond a total of 6 cycles).

**IMPORTANT SAFETY INFORMATION**

Manufacturer advises clomifene should not normally be used for longer than 6 cycles (possible increased risk of ovarian cancer).

- **CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- **CAUTIONS** Ectopic pregnancy · incidence of multiple births increased · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- **SIDE-EFFECTS** Abdominal distension · alopecia · angioedema · anxiety · breast tenderness · cataract · cerebral thrombosis · depression · disorientation · dizziness · fatigue · headache · hot flush · hypertriglyceridaemia · insomnia · jaundice cholestatic · menstrual cycle irregularities · mood altered · nausea · neoplasms · nervous system disorders · optic neuritis · ovarian and fallopian tube disorders · palpitations · pancreatitis · paraesthesia · psychosis · seizure · skin reactions · speech disorder · stroke · syncope · tachycardia · uterine disorders · vertigo · vision disorders · visual impairment (discontinue and initiate ophthalmological examination) · vomiting
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Possible effects on fetal development.
- **BREAST FEEDING** May inhibit lactation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in liver disease or history of liver dysfunction.
- **PATIENT AND CARER ADVICE**  
**Conception and contraception** Patients planning to conceive should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Clomifene citrate (Non-proprietary)**

Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet [PoM]  
£12.95 DT = £10.15

▶ **Clomid (Sanofi)**

Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet [PoM]  
£10.15 DT = £10.15

## 8.2 Male sex hormone responsive conditions

### Androgens, anti-androgens and anabolic steroids

14-Aug-2020

**Androgens**

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*<sup>®</sup>, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

**Anti-androgens****Cyproterone acetate**

Cyproterone acetate p. 830 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy, and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

The MHRA/CHM have released important safety information on the use of cyproterone acetate and risk of meningioma. For further information, see *Important safety information* for cyproterone acetate.

**Dutasteride and finasteride**

Dutasteride p. 849 and finasteride p. 850 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 845 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

**Anabolic steroids**

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**ANDROGENS****Androgens**

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · risk factors for venous thromboembolism · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · thrombophilia—increased risk of thrombosis · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Elderly Prescription potentially inappropriate (STOPP criteria) in the absence of primary or secondary hypogonadism (risk of androgen toxicity; no proven benefit outside of the hypogonadism indication). See also Prescribing in the elderly p. 29.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Hot flush · hypertension · polycythaemia · prostate abnormalities · skin reactions · weight increased
  - ▶ **Uncommon** Alopecia · asthenia · behaviour abnormal · depression · dizziness · dyspnoea · dysuria · gynaecomastia · headache · hyperhidrosis · insomnia · nausea · sexual dysfunction
  - ▶ **Rare or very rare** Pulmonary oil microembolism
  - ▶ **Frequency not known** Anxiety · epiphyses premature fusion · fluid retention · jaundice · oedema · oligozoospermia · paraesthesia · precocious puberty · prostate cancer · seborrhoea · sleep apnoea · urinary tract obstruction
- SIDE-EFFECTS, FURTHER INFORMATION** Stop treatment or reduce dose if severe polycythaemia occurs.

- **PREGNANCY** Avoid—causes masculinisation of female fetus.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (increased risk of fluid retention and heart failure).

- **RENAL IMPAIRMENT** In general, manufacturers advise caution (increased risk of fluid retention and heart failure).

### ● MONITORING REQUIREMENTS

- ▶ Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
- ▶ Monitor prostate and PSA in men over 45 years.

### ● PATIENT AND CARER ADVICE

Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

F 827

12-Nov-2020

## Testosterone

### ● INDICATIONS AND DOSE

#### Low sexual desire in postmenopausal women (administered on expert advice)

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 50 mg every week, the contents of a 5-g sachet or 5-g tube (containing 50 mg/5 g of testosterone) to be divided for daily dosing and applied to non-hair areas, such as the abdomen or upper thighs, over the period of 1 week

#### TESTAVAN<sup>®</sup>

##### Hypogonadism due to androgen deficiency in men

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 23 mg once daily; increased in steps of 23 mg, adjusted according to response; maximum 69 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Testavan*<sup>®</sup>: one pump actuation delivers 1.15 g of gel containing 23 mg of testosterone.

#### TESTIM<sup>®</sup>

##### Hypogonadism due to testosterone deficiency in men

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Testim*<sup>®</sup>: one tube of 5 g contains 50 mg testosterone.

#### TESTOGEL<sup>®</sup> 16.2MG/G

##### Hypogonadism due to androgen deficiency in men

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 40.5 mg once daily; increased in steps of 20.25 mg, adjusted according to response; maximum 81 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Testogel*<sup>®</sup> 16.2 mg/g: one pump actuation delivers 1.25 g of gel containing 20.25 mg of testosterone.

#### TESTOGEL<sup>®</sup> 50MG/5G

##### Hypogonadism due to androgen deficiency in men

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Testogel*<sup>®</sup> 50 mg/5 g: one sachet of 5 g contains 50 mg of testosterone.

#### TOSTRAN<sup>®</sup>

##### Hypogonadism due to testosterone deficiency in men

##### ▶ BY TRANSFERMAL APPLICATION

- ▶ Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Tostran*<sup>®</sup>: 1 g of gel contains 20 mg testosterone.

- **UNLICENSED USE** <sup>EvGr</sup> Testosterone is used for the treatment of low sexual desire in postmenopausal women,  but is not licensed for this indication.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Hypertriglyceridaemia
- ▶ **Frequency not known** Anaemia · deep vein thrombosis · electrolyte imbalance · frontal balding (in women) · hair growth unwanted (in women) · hypertrichosis · malaise · muscle cramps · musculoskeletal pain · testicular disorder · vasodilation · voice lowered (in women)

**SIDE-EFFECTS, FURTHER INFORMATION** When used for low sexual desire in post-menopausal women The long-term effects of testosterone in this patient group are largely unknown, but side-effects can include growth of unwanted hair, frontal balding and deepening of the voice.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

**TESTOGEL<sup>®</sup> 50MG/5G** Manufacturer advises apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

**TOSTRAN<sup>®</sup>** Manufacturer advises apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

**TESTIM<sup>®</sup>** Manufacturer advises squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

**TESTOGEL<sup>®</sup> 16.2MG/G** Apply thin layer of gel on clean, dry, healthy skin over right and left upper arms and shoulders. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, and cover the site with clothing once gel dried; avoid shower or bath for at least 2 hours.

**TESTAVAN<sup>®</sup>** Manufacturer advises apply one pump actuation of gel evenly onto clean, dry, intact skin over upper arm and shoulder using the applicator, without getting any gel on the hands—repeat on opposite upper arm and shoulder if two pump actuations are required, and repeat again on initial upper arm and shoulder if three pump actuations are required. Allow to dry completely before dressing and cover application site with clothing. Wash hands with soap and water immediately if gel was touched during application; avoid shower or bath for at least 2 hours.

- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer testosterone gel.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Testosterone (*Testavan*<sup>®</sup>) as replacement therapy for adult male hypogonadism, when testosterone deficiency has been confirmed by clinical features and biochemical tests (April 2019) SMC No. SMC2152 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Butylated hydroxytoluene, propylene glycol

- ▶ **Testosterone (Non-proprietary)**

**Testosterone 40.5 mg** Testogel 40.5mg/2.5g gel sachets | 30 sachet [PoM] £31.11 [CD4-2]

- ▶ **Testavan** (Ferring Pharmaceuticals Ltd)

**Testosterone 20 mg per 1 gram** Testavan 20mg/g transdermal gel | 85.5 gram [PoM] £25.22 DT = £25.22 [CD4-2]

- ▶ **Testim** (Endo Ventures Ltd)

**Testosterone 50 mg** Testim 50mg/5g gel | 30 tube [PoM] £30.50 DT = £30.50 [CD4-2]

- ▶ **Testogel** (Besins Healthcare (UK) Ltd)

**Testosterone 50 mg** Testogel 50mg/5g gel sachets | 30 sachet [PoM] £31.11 DT = £31.11 [CD4-2]

**Testosterone 16.2 mg per 1 gram** Testogel 16.2mg/g gel | 88 gram [PoM] £31.11 DT = £31.11 [CD4-2]

- ▶ **Tostran** (Kyowa Kirin Ltd)

**Testosterone 20 mg per 1 gram** Tostran 2% gel | 60 gram [PoM] £28.63 DT = £28.63 [CD4-2]

## Testosterone decanoate, isocaproate, phenylpropionate and propionate

14-Jul-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate below.

- **INDICATIONS AND DOSE**

**Androgen deficiency**

- ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 mL every 3 weeks, adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Each 1 mL dose of *Sustanon*<sup>®</sup> 250 solution for injection contains 100 mg testosterone decanoate, 60 mg testosterone isocaproate, 60 mg testosterone phenylpropionate and 30 mg testosterone propionate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

- ▶ **Sustanon** (Aspen Pharma Trading Ltd)

**Testosterone propionate 30 mg per 1 ml, Testosterone isocaproate 60 mg per 1 ml, Testosterone phenylpropionate 60 mg per 1 ml, Testosterone decanoate 100 mg per 1 ml** Sustanon 250mg/1ml solution for injection ampoules | 1 ampoule [PoM] £2.45 [CD4-2]

## Testosterone enantate

13-May-2020

- **INDICATIONS AND DOSE**

**Hypogonadism**

- ▶ BY SLOW INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

**Breast cancer**

- ▶ BY SLOW INTRAMUSCULAR INJECTION

- ▶ Adult: 250 mg every 2–3 weeks

- **UNLICENSED USE** Not licensed for use in breast cancer.

- **SIDE-EFFECTS** Bone formation increased · circulatory system disorder · gastrointestinal disorder · gastrointestinal haemorrhage · hepatomegaly · hypercalcaemia · neoplasms · spermatogenesis abnormal

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Testosterone enantate (Non-proprietary)**

**Testosterone enantate 250 mg per 1 ml** Testosterone enantate 250mg/1ml solution for injection ampoules | 3 ampoule [PoM] £87.73 DT = £87.73 [CD4-2]

F 827

## Testosterone propionate

13-May-2020

- **INDICATIONS AND DOSE**

**Androgen deficiency**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 mg 2–3 times a week

**Delayed puberty in males**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 mg once weekly

**Breast cancer in women**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 100 mg 2–3 times a week

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: solution for injection

F 827

## Testosterone undecanoate

13-May-2020

- **INDICATIONS AND DOSE**

**Androgen deficiency**

- ▶ BY MOUTH

- ▶ Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**Hypogonadism**

- ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult (male): 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Uncommon** Diarrhoea · mood altered

**SPECIFIC SIDE-EFFECTS**

- ▶ **Uncommon**
- ▶ With intramuscular use Appetite increased · arthralgia · breast abnormalities · cardiovascular disorder · cough · dysphonia · hypercholesterolaemia · increased risk of infection · migraine · muscle complaints · musculoskeletal stiffness · night sweats · pain in extremity · snoring · testicular disorders · tremor · urinary disorders · urinary tract disorder
- ▶ **Frequency not known**
- ▶ With intramuscular use Hair growth increased · spermatogenesis reduced
- ▶ With oral use Azoospermia · fluid imbalance · gastrointestinal discomfort · hepatic function abnormal · lipid metabolism change · myalgia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ **Nebido** (Bayer Plc)

**Testosterone undecanoate 250 mg per 1 ml** Nebido 1000mg/4ml solution for injection vials | 1 vial [PoM] £87.11 DT = £87.11 [CD4-2]

## 8.2a Male sex hormone antagonist

### ANTI-ANDROGENS

#### Cyproterone acetate

01-Dec-2020

##### ● INDICATIONS AND DOSE

##### Hyper-sexuality in males | Sexual deviation in males

###### ► BY MOUTH

► Adult: 50 mg twice daily, to be taken after food

##### Prevention of tumour flare with initial gonadorelin analogue therapy

###### ► BY MOUTH

► Adult (male): 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

##### Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred

###### ► BY MOUTH

► Adult (male): 200–300 mg daily in 2–3 divided doses.

##### Hot flushes with gonadorelin analogue therapy or after orchidectomy

###### ► BY MOUTH

► Adult (male): Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

##### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE: CYPROTERONE ACETATE: NEW ADVICE TO MINIMISE RISK OF MENINGIOMA (JUNE 2020)

Cyproterone acetate has been associated with an overall rare, but cumulative dose-dependent, increased risk of meningioma (single and multiple), mainly at doses of 25 mg/day and higher. Healthcare professionals are advised to monitor patients for meningiomas, and to permanently discontinue treatment if diagnosed. Use of cyproterone acetate, including co-cyprindiol, for all indications is contra-indicated in those with meningioma or a history of meningioma. Treatment with high doses of cyproterone acetate for any indication, except prostate cancer, should be restricted to when alternative treatments or interventions are unavailable or considered inappropriate.

##### ● CONTRA-INDICATIONS

**GENERAL CONTRA-INDICATIONS** Dubin-Johnson syndrome · existing or history of thromboembolic disorders · malignant diseases (except for carcinoma of the prostate) · meningioma or history of meningioma · previous or existing liver tumours (not due to metastases from carcinoma of the prostate) · Rotor syndrome · wasting diseases (except for inoperable carcinoma of the prostate)

##### SPECIFIC CONTRA-INDICATIONS

- When used for hypersexuality Severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia
- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
- **INTERACTIONS** → Appendix 1: anti-androgens
- **SIDE-EFFECTS**
  - **Common or very common** Depressed mood · dyspnoea · fatigue · gynaecomastia · hepatic disorders · hot flush · hyperhidrosis · nipple pain · restlessness · weight change

##### ► Uncommon Skin reactions

- **Rare or very rare** Galactorrhoea · meningioma (increased risk with increasing cumulative dose) · neoplasms
- **Frequency not known** Adrenocortical suppression · anaemia · azoospermia · hair changes · hypotrichosis · osteoporosis · sebaceous gland underactivity (may clear acne) · thromboembolism

**SIDE-EFFECTS, FURTHER INFORMATION** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (unless used for prostate cancer).

##### ● MONITORING REQUIREMENTS

- Monitor blood counts initially and throughout treatment.
- Monitor adrenocortical function regularly.
- Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

##### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

##### Tablet

##### CAUTIONARY AND ADVISORY LABELS 21

##### ► Cyproterone acetate (Non-proprietary)

**Cyproterone acetate 50 mg** Cyproterone 50mg tablets | 56 tablet [PoM](#) £56.84 DT = £41.44

**Cyproterone acetate 100 mg** Cyproterone 100mg tablets | 84 tablet [PoM](#) £132.57 DT = £79.86

##### ► Androcur (Bayer Plc)

**Cyproterone acetate 50 mg** Androcur 50mg tablets | 60 tablet [PoM](#) £31.34

##### ► Cyprostat (Bayer Plc)

**Cyproterone acetate 50 mg** Cyprostat 50mg tablets | 160 tablet [PoM](#) £82.86

**Cyproterone acetate 100 mg** Cyprostat 100mg tablets | 80 tablet [PoM](#) £82.86

## 9 Thyroid disorders

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > THYROID STIMULATING HORMONES

#### Thyrotropin alfa

02-Dec-2020

#### (Recombinant human thyroid stimulating hormone; rhTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

### ● INDICATIONS AND DOSE

**Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) | To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients**

► BY INTRAMUSCULAR INJECTION

► Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

● **CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results

### ● SIDE-EFFECTS

- **Common or very common** Asthenia · dizziness · headache · nausea · vomiting
- **Uncommon** Chills · diarrhoea · feeling hot · fever · flushing · hypersensitivity · influenza · influenza like illness · pain · paraesthesia · pulmonary reaction · skin reactions · taste altered
- **Rare or very rare** Atrial fibrillation · hyperthyroidism
- **Frequency not known** Arthralgia · dyspnoea · goitre · hyperhidrosis · myalgia · neoplasm complications · palpitations · residual metastases enlarged · stroke · tremor

● **ALLERGY AND CROSS-SENSITIVITY** [EvGr](#) Contra-indicated if previous hypersensitivity to bovine or human thyrotrophin. [⚠](#)

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for injection**

► **Thyrogen** (Sanofi Genzyme)

Thyrotropin alfa 900 microgram Thyrogen 900microgram powder for solution for injection vials | 2 vial [PoM](#) £583.04

## 9.1 Hyperthyroidism

### Hyperthyroidism

09-Dec-2019

#### Description of condition

Hyperthyroidism results from the excessive production and secretion of thyroid hormones leading to thyrotoxicosis (an excess of circulating thyroid hormones). Signs and symptoms of hyperthyroidism include a goitre, hyperactivity, disturbed sleep, fatigue, palpitations, anxiety, heat intolerance, increased appetite with unintentional weight loss, and diarrhoea. Complications include Graves' orbitopathy, thyroid storm (thyrotoxic crisis), pregnancy complications, reduced bone mineral density, heart failure, and atrial fibrillation. Risk factors include smoking, a family history of thyroid disease, co-existent autoimmune conditions, and low iodine intake.

Primary hyperthyroidism refers to when the condition arises from the thyroid gland rather than due to a pituitary or hypothalamic disorder. It is mainly caused by Graves' disease (an autoimmune disorder mediated by antibodies that stimulate the thyroid-stimulating hormone (TSH) receptor). Other causes include toxic nodular goitre (autonomously functioning thyroid nodules that secrete excess thyroid hormone), or drug-induced thyrotoxicosis.

Primary hyperthyroidism is more common in females than males and can be classified as either overt or subclinical; both of which may or may not be symptomatic. Overt hyperthyroidism is characterised by TSH levels below the reference range and free thyroxine (FT4) and/or free tri-

iodothyronine (FT3) levels above the reference range. In subclinical hyperthyroidism, TSH is suppressed but FT4 and FT3 are within the reference range.

Thyrotoxicosis can also occur without hyperthyroidism; this is usually transient, and can occur due to excess intake of levothyroxine or over-the-counter supplements containing thyroid hormone, or thyroiditis.

#### Aims of treatment

Treatment aims to alleviate symptoms, align thyroid function tests within or close to the reference range, and to reduce the risk of long-term complications.

#### Non-drug treatment

[EvGr](#) Radioactive iodine or surgery (such as total thyroidectomy or hemithyroidectomy) may be considered by specialists in the management of Graves' disease or toxic nodular goitre. Whilst awaiting these treatments, antithyroid drugs should be offered to control hyperthyroidism, see *Graves' disease* and *Toxic nodular goitre* in *Primary hyperthyroidism*. [⚠](#)

#### Primary Hyperthyroidism

[EvGr](#) Patients with symptoms of thyroid storm should be treated as a medical emergency. Refer patients urgently to an endocrinologist if a pituitary or hypothalamic disorder is suspected, and refer or discuss with an endocrinologist all patients with new-onset hyperthyroidism (base urgency on clinical judgement). If malignancy is suspected, refer patients using a suspected cancer pathway.

Explain to patients, and their family or carers if appropriate, that:

- Some patients may feel well even when their thyroid function tests are outside the reference range;
- Even when they have no symptoms, treatment may be advised to reduce the risk of long-term complications;
- Symptoms may lag behind treatment changes for several weeks to months.

Consider antithyroid drugs alongside supportive treatment (for example, beta-blockers) for patients with hyperthyroidism awaiting specialist assessment and further treatment. Carbimazole p. 832 is the recommended choice of antithyroid drug, with propylthiouracil p. 833 considered for those in whom carbimazole is unsuitable. For further information, see *Graves' disease* and *Toxic nodular goitre*.

Before starting antithyroid drugs, check full blood count and liver function tests. [⚠](#)

The MHRA/CHM have released important safety information regarding the use of carbimazole p. 832 and the risk of acute pancreatitis. For further information, see *Important safety information* for carbimazole p. 832.

For guidance on follow up and monitoring of hyperthyroidism, see NICE guideline: **Thyroid disease** (see *Useful resources*).

#### Graves' disease

[EvGr](#) Under specialist care, radioactive iodine is recommended as first-line definitive treatment unless it is unsuitable or remission is likely to be achieved with antithyroid drugs. For patients in whom an antithyroid drug is likely to achieve remission (such as in mild and uncomplicated cases), a choice of either carbimazole p. 832 or radioactive iodine should be offered. Carbimazole p. 832 should be offered as first-line definitive treatment if radioactive iodine and surgery are unsuitable treatment options.

Offer carbimazole p. 832 as a 12–18 month course using either a block and replace regimen (combination of fixed high-dose carbimazole with levothyroxine sodium p. 835), or a titration regimen (dose based on thyroid function tests), and review the need for further treatment. If patients have persistent or relapsed hyperthyroidism despite antithyroid drug treatment, consider radioactive iodine or surgery.

Consider propylthiouracil for patients who experience side-effects to carbimazole below, are pregnant or are trying to conceive within the following 6 months, or have a history of pancreatitis.

If agranulocytosis develops during antithyroid treatment, stop and do not restart treatment. **A**

#### Toxic nodular goitre

**EvGr** Under specialist care, radioactive iodine is recommended as first-line definitive treatment for patients with hyperthyroidism secondary to multiple nodules; offer total thyroidectomy or life-long antithyroid drugs if radioactive iodine is unsuitable. For patients with hyperthyroidism secondary to a single nodule, offer radioactive iodine or surgery (hemithyroidectomy) as first-line definitive treatment; if these options are unsuitable, offer life-long antithyroid drugs. Consider treatment with a titration regimen of carbimazole below when offering life-long antithyroid drugs.

Consider propylthiouracil for patients who experience side-effects to carbimazole, are pregnant or are trying to conceive within the following 6 months, or have a history of pancreatitis.

If agranulocytosis develops during antithyroid treatment, stop and do not restart treatment. **A**

#### Subclinical hyperthyroidism

**EvGr** For patients who have 2 TSH readings lower than 0.1 mIU/litre at least 3 months apart and evidence of thyroid disease or symptoms of thyrotoxicosis, consider seeking specialist advice.

Consider measuring TSH every 6 months for patients with untreated subclinical hyperthyroidism. For further information on monitoring in subclinical hyperthyroidism, see NICE guideline: **Thyroid disease** (see *Useful resources*).

**A**

#### Thyrotoxicosis without hyperthyroidism

**EvGr** Transient thyrotoxicosis without hyperthyroidism usually only needs supportive treatment (for example, beta-blockers). **A**

#### Hyperthyroidism in pregnancy

**EvGr** Females with hyperthyroidism who are planning a pregnancy should be referred to an endocrinologist and advised to use effective contraception until specialist advice has been sought; advise patients to seek immediate medical advice if pregnancy is suspected or confirmed. All pregnant females should be referred urgently to a specialist. If there is uncertainty whether current antithyroid drug treatment should be continued or changed, or if the patient has adrenergic symptoms (such as tremor or tachycardia), seek urgent advice from an endocrinologist whilst awaiting specialist assessment. Pregnant females with severe signs and symptoms of hyperthyroidism (such as thyroid storm) should be admitted to hospital. Females who have recently received radioactive iodine should be advised to avoid becoming pregnant for at least 6 months after treatment. **A**

The MHRA/CHM have released important safety information regarding the use of carbimazole below, with strengthened advice on contraception due to an increased risk of congenital malformations. For further information, see *Conception and contraception*, *Pregnancy*, and *Important safety information* for carbimazole below.

## ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

### Carbimazole

02-Sep-2020

#### ● INDICATIONS AND DOSE

##### Hyperthyroidism

- ▶ BY MOUTH
- ▶ Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

##### Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- ▶ BY MOUTH
- ▶ Adult: 40–60 mg daily, therapy usually given for 18 months

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

#### IMPORTANT SAFETY INFORMATION

##### NEUTROPENIA AND AGRANULOCYTOSIS

Manufacturer advises of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

##### MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—dose maternal, fetal, and neonatal monitoring is recommended.

##### MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

- **CONTRA-INDICATIONS** Severe blood disorders
- **INTERACTIONS** → Appendix 1: carbimazole
- **SIDE-EFFECTS**
  - ▶ **Rare or very rare** Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
  - ▶ **Frequency not known** Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy ·

nausea · nerve disorders · neutropenia · pancreatitis acute (discontinue permanently) · salivary gland enlargement · skin reactions · taste loss

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that females of childbearing potential should use effective contraception during treatment.
- **PREGNANCY** The MHRA advises consider use only after a thorough benefit-risk assessment. See *Important Safety Information* for further information.
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild to moderate insufficiency—half-life may be prolonged; avoid in severe insufficiency.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

##### ▶ Carbimazole (Non-proprietary)

**Carbimazole 5 mg** Carbimazole 5mg tablets | 100 tablet [POM](#)  
£12.35 DT = £2.68

**Carbimazole 10 mg** Carbimazole 10mg tablets | 100 tablet [POM](#)  
£81.32 DT = £81.32

**Carbimazole 15 mg** Carbimazole 15mg tablets | 100 tablet [POM](#)  
£127.03 DT = £127.03

**Carbimazole 20 mg** Carbimazole 20mg tablets | 100 tablet [POM](#)  
£208.17 DT = £4.53

## ANTITHYROID DRUGS > THIOURACILS

### Propylthiouracil

18-Aug-2021

#### ● INDICATIONS AND DOSE

##### Hyperthyroidism

###### ▶ BY MOUTH

- ▶ **Adult:** Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **INTERACTIONS** → Appendix 1: propylthiouracil
- **SIDE-EFFECTS**
  - ▶ **Rare or very rare** Agranulocytosis · bone marrow disorders · glomerulonephritis acute · hearing impairment · leucopenia · thrombocytopenia · vomiting
  - ▶ **Frequency not known** Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoproteinaemia · interstitial pneumonitis · lupus-like syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis
- **SIDE-EFFECTS, FURTHER INFORMATION** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest

dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.  
**Monitoring** Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half life).  
**Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**  
**Dose adjustments** See p. 21.  
[EvgGr](#) Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>.  
Use half normal dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>. [M](#)
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ▶ Propylthiouracil (Non-proprietary)

**Propylthiouracil 25 mg** Propylthiouracil 25mg tablets | 28 tablet [POM](#) £27.65-£36.99 DT = £32.32

**Propylthiouracil 50 mg** Propylthiouracil 50mg tablets | 56 tablet [POM](#) £57.58 DT = £4.16 | 100 tablet [POM](#) £5.00-£102.82

**Propylthiouracil 100 mg** Propylthiouracil 100mg tablets | 56 tablet [POM](#) £34.65-£46.34 DT = £40.50

## VITAMINS AND TRACE ELEMENTS

### Iodide with iodine

(Lugol's Solution; Aqueous Iodine Oral Solution)

#### ● INDICATIONS AND DOSE

##### Thyrotoxicosis (pre-operative)

###### ▶ BY MOUTH USING ORAL SOLUTION

- ▶ **Adult:** 0.1–0.3 mL 3 times a day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses based on the use of an aqueous oral solution containing iodine 50 mg/mL and potassium iodide 100 mg/mL.

- **CAUTIONS** Not for long-term treatment
- **SIDE-EFFECTS** Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza like illness · insomnia (long term use) · rash · salivary gland pain
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Oral solution

CAUTIONARY AND ADVISORY LABELS 27

## 9.2 Hypothyroidism

### Hypothyroidism

09-Dec-2019

#### Description of condition

Hypothyroidism results from the underproduction and secretion of thyroid hormones. Signs and symptoms of hypothyroidism include fatigue, weight gain, constipation, menstrual irregularities, depression, dry skin, intolerance to the cold, and reduced body and scalp hair. Complications include dyslipidaemia, coronary heart disease, heart failure, impaired fertility, pregnancy complications, impaired concentration and/or memory, and rarely myxoedema coma (which is a life-threatening medical emergency).

Primary hypothyroidism refers to when the condition arises from the thyroid gland and may be caused by iodine deficiency, autoimmune disease (such as Hashimoto's thyroiditis), radiotherapy, surgery or drugs, rather than due to a pituitary or hypothalamic disorder (secondary hypothyroidism).

Primary hypothyroidism is more common in females than males and can be classified as either overt or subclinical; both of which may or may not be symptomatic. Overt hypothyroidism is characterised by thyroid stimulating hormone (TSH) levels above the reference range and free thyroxine (FT4) levels below the reference range. In subclinical hypothyroidism, TSH levels are above the reference range but FT4 and free tri-iodothyronine (FT3) levels are within the reference range. In pregnancy, it is defined as overt based on elevated TSH levels (using trimester-specific reference ranges) regardless of FT4 levels.

#### Aims of treatment

The aims of treatment are to alleviate symptoms, align thyroid function tests within or close to the reference range, and to reduce the risk of long-term complications.

#### Management of primary hypothyroidism

**EvGr** Explain to patients, and their family or carers if appropriate, that:

- Some patients may feel well even when their thyroid function tests are outside the reference range;
- Even when they have no symptoms, treatment may be advised to reduce the risk of long-term complications;
- Symptoms may lag behind treatment changes for several weeks to months. **A**

#### Overt hypothyroidism

**EvGr** Offer levothyroxine sodium p. 835 as first-line treatment and aim to maintain thyroid-stimulating hormone (TSH) levels within the reference range. If symptoms persist, even after achieving normal TSH levels, consider adjusting the dose to achieve optimal well-being whilst avoiding doses that cause TSH suppression or thyrotoxicosis.

For patients whose TSH level was very high before starting treatment or who have had a prolonged period of untreated disease, the TSH level can take up to 6 months to return to the reference range.

Consider measuring TSH levels every 3 months until a stable level has been achieved, then yearly thereafter. Monitoring free thyroxine (FT4) should also be considered in those who continue to be symptomatic.

Due to the uncertainty around the long-term adverse effects and the insufficient evidence of benefit over

levothyroxine monotherapy, the use of natural thyroid extract is not recommended. Liothyronine (either alone or in combination with levothyroxine) is not routinely recommended for the same reasons. NHS England's specialist pharmacy service have produced guidance on the prescribing of liothyronine, for further information see: [www.sps.nhs.uk/articles/updated-rmoc-guidance-prescribing-of-liothyronine/](http://www.sps.nhs.uk/articles/updated-rmoc-guidance-prescribing-of-liothyronine/). **A**

#### Subclinical hypothyroidism

**EvGr** When considering whether to start treatment for subclinical hypothyroidism, take into account features suggesting underlying thyroid disease.

For patients who have a TSH level of 10 mIU/L or higher on 2 separate occasions 3 months apart, consider levothyroxine sodium p. 835. If symptoms persist, even after achieving normal TSH levels, consider adjusting the dose to achieve optimal well-being whilst avoiding doses that cause TSH suppression or thyrotoxicosis.

For patients whose TSH level was very high before starting treatment or who have had a prolonged period of untreated disease, the TSH level can take up to 6 months to return to the reference range.

For patients in whom treatment is started, consider measuring TSH levels every 3 months until a stable level has been achieved, then yearly thereafter. Monitoring free thyroxine (FT4) should also be considered in those who continue to be symptomatic.

For symptomatic patients aged under 65 years with a TSH level above the reference range, but lower than 10 mIU/L on 2 separate occasions 3 months apart, consider a 6-month trial of levothyroxine sodium p. 835. If symptoms do not improve after starting levothyroxine, re-measure TSH and if the level remains elevated, adjust the dose. If symptoms persist when serum TSH is within the reference range, consider stopping levothyroxine and follow the recommendations on *Monitoring untreated subclinical hypothyroidism and monitoring after stopping treatment* in the NICE guideline: **Thyroid disease** (see *Useful resources*). **A**

#### Management of secondary hypothyroidism

**EvGr** If secondary hypothyroidism is suspected, refer the patient urgently to an endocrinologist to assess the underlying cause. **A**

#### Hypothyroidism in pregnancy

**EvGr** Refer all females with hypothyroidism who are planning a pregnancy or are pregnant, to an endocrinologist. For those planning a pregnancy and whose thyroid function tests (TFTs) are not within range, advise delaying conception until stabilised on levothyroxine sodium p. 835 treatment. If there is any uncertainty about treatment initiation or dosing, discuss this with an endocrinologist whilst awaiting review.

TFTs may produce misleading results in pregnancy and trimester-related reference ranges should be used. If pregnancy is confirmed, urgently measure TFTs; discuss the initiation, or changes to levothyroxine sodium p. 835 treatment and TFT monitoring with an endocrinologist whilst awaiting review, to reduce the risk of obstetric and neonatal complications. **A**

#### Useful Resources

Thyroid disease: assessment and management. National Institute for Health and Care Excellence. NICE guideline 145. November 2019, updated February 2020 [www.nice.org.uk/guidance/ng145](http://www.nice.org.uk/guidance/ng145)

## THYROID HORMONES

## Levothyroxine sodium

08-Jun-2021

## (Thyroxine sodium)

## ● INDICATIONS AND DOSE

## Primary hypothyroidism

## ▶ BY MOUTH

- Adult: Initially 1.6 micrograms/kg once daily, adjusted according to response, round dose to the nearest 25 micrograms, dose to be taken preferably 30–60 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Elderly: Initially 25–50 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably 30–60 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

## Primary hypothyroidism in patients with cardiac disease

## ▶ BY MOUTH

- Adult: Initially 25–50 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably 30–60 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

## Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

## ▶ BY MOUTH

- Adult: 50–150 micrograms daily therapy usually given for 18 months

- **UNLICENSED USE** [\[EvGr\]](#) Levothyroxine is used in the doses provided in the BNF for the treatment of primary hypothyroidism, [⚠](#) but these may differ from those licensed.

## IMPORTANT SAFETY INFORMATION

## MHRA/CHM ADVICE: LEVOTHYROXINE: NEW PRESCRIBING ADVICE FOR PATIENTS WHO EXPERIENCE SYMPTOMS ON SWITCHING BETWEEN DIFFERENT LEVOTHYROXINE PRODUCTS (MAY 2021)

A small proportion of patients treated with levothyroxine report symptoms, often consistent with thyroid dysfunction, when switching between different tablet formulations of levothyroxine. Healthcare professionals are advised that if a patient reports symptoms after changing to a different tablet of levothyroxine, a thyroid function test should be considered; if a patient is persistently symptomatic, whether they are biochemically euthyroid or have evidence of abnormal thyroid function, consistently prescribing a specific levothyroxine tablet known to be well tolerated by the patient should be considered. If symptoms or poor control of thyroid function persist despite adhering to a specific tablet, consider prescribing levothyroxine in an oral solution formulation.

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

## CAUTIONS, FURTHER INFORMATION

- ▶ Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

- **INTERACTIONS** → Appendix 1: thyroid hormones

- **SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · arthralgia · diarrhoea · dyspnoea · fever · flushing · headache · hyperhidrosis · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased

**SIDE-EFFECTS, FURTHER INFORMATION** Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes angular pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. **Dose adjustments** Levothyroxine requirement may increase during pregnancy. **Monitoring** Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

## ● MONITORING REQUIREMENTS

- ▶ When used for Primary hypothyroidism [\[EvGr\]](#) Consider measuring thyroid stimulating hormone (TSH) level every three months until stabilised (two similar measurements within the reference range, 3 months apart), then yearly thereafter. Consider measuring free thyroxine (FT4) if symptoms of hypothyroidism persist after starting levothyroxine. [⚠](#)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

## Tablet

## ▶ Levothyroxine sodium (Non-proprietary)

**Levothyroxine sodium anhydrous 50 microgram** Tirosint 50microgram capsules | 28 capsule [PoM] £ DT = £43.08

**Levothyroxine sodium anhydrous 100 microgram** Tirosint 100microgram capsules | 28 capsule [PoM] £

**Liothyronine sodium**

08-Jul-2019

**(L-Tri-iodothyronine sodium)****● INDICATIONS AND DOSE****Hypothyroidism****► BY MOUTH**

- Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

**Hypothyroid coma****► BY SLOW INTRAVENOUS INJECTION**

- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CONTRA-INDICATIONS** Thyrotoxicosis

- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

**CAUTIONS, FURTHER INFORMATION**

- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

- **INTERACTIONS** → Appendix 1: thyroid hormones

**● SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS** Angina pectoris · anxiety · arrhythmias · diarrhoea · fever · flushing · headache · hyperhidrosis · insomnia · muscle cramps · muscle weakness · palpitations · tremor · vomiting · weight decreased

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Menstruation irregular
- With oral use Heat intolerance

**SIDE-EFFECTS, FURTHER INFORMATION** **Initial dosage in patients with cardiovascular disorders** If metabolism increases too rapidly (causing diarrhoea, nervousness,

rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
- Dose adjustments** Liothyronine requirement may increase during pregnancy.
- Monitoring** Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet****► Liothyronine sodium (Non-proprietary)**

**Liothyronine sodium 5 microgram** Liothyronine 5microgram tablets | 28 tablet [PoM] £100.94 DT = £99.47

**Liothyronine sodium 10 microgram** Liothyronine 10microgram tablets | 28 tablet [PoM] £152.44 DT = £148.00

**Liothyronine sodium 20 microgram** Liothyronine 20microgram tablets | 28 tablet [PoM] £245.29 DT = £63.08

**Liothyronine sodium 25 microgram** Cytomel 25microgram tablets | 100 tablet [PoM] £

**Powder for solution for injection****► Liothyronine sodium (Non-proprietary)**

**Liothyronine sodium 20 microgram** Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,567.50 DT = £1,567.50

**Capsule****► Liothyronine sodium (Non-proprietary)**

**Liothyronine sodium 5 microgram** Liothyronine 5microgram capsules | 28 capsule [PoM] £55.00

**Liothyronine sodium 10 microgram** Liothyronine 10microgram capsules | 28 capsule [PoM] £65.00

**Liothyronine sodium 20 microgram** Liothyronine 20microgram capsules | 28 capsule [PoM] £55.00

## 1 Bladder and urinary disorders

### 1.1 Urinary frequency, enuresis, and incontinence

#### Urinary incontinence and pelvic organ prolapse in women

16-Jun-2019

##### Description of condition

Urinary incontinence is the involuntary leakage of urine and can range in severity and nature. It can impact the person, as well as their families and carers, and can be detrimental to an individual's physical, psychological, and social well-being. Urinary incontinence can be the result of functional abnormalities in the lower urinary tract, or due to other illnesses. It can be sub-classified into four main types: stress, urgency, mixed, and overflow incontinence.

Stress incontinence is the involuntary leakage on effort or exertion, or on sneezing or coughing, and is associated with the loss of pelvic floor support and/or damage to the urethral sphincter.

Urgency incontinence is involuntary leakage which is accompanied, or immediately preceded by a sudden compelling desire to pass urine that is difficult to delay. It is often part of a larger symptom complex known as overactive bladder syndrome. This syndrome is defined as urinary urgency, which may or may not be accompanied by urgency incontinence, but is usually associated with increased frequency and nocturia. The symptoms are thought to be caused by involuntary contractions of the detrusor muscle.

Mixed urinary incontinence is involuntary leakage associated with both urgency and stress, however, one type tends to be predominant.

Overflow incontinence is a complication of chronic urinary retention and occurs when a person cannot empty their bladder completely and it becomes over distended. This may

result in continuous, or frequent loss of small quantities of urine. For further information, see Urinary retention p. 844.

Other types include continuous urinary incontinence, where there is constant leakage of urine which may be due to the severity of the persons' condition or may be due to an underlying cause, such as a fistula. Incontinence may also be situational, for example during sexual intercourse or when a person is giggling.

The main risk factor for developing any type of incontinence is older age; this is due to the physiological changes that occur with natural aging. Some other risk factors for stress incontinence include pregnancy, vaginal delivery, obesity, constipation, family history, smoking, lack of supporting tissue (such as in prolapse or hysterectomy) and use of some drugs such as ACE inhibitors (can cause cough) and alpha-adrenergic blockers (relax the bladder outlet and urethra).

Some conditions can increase detrusor muscle overactivity and therefore worsen urgency incontinence. These include conditions that affect the lower urinary tract such as; Urinary-tract infections p. 641, urinary obstruction, or oestrogen deficiency, those affecting the nervous system such as; stroke, dementia, and Parkinson's disease, and systemic conditions such as; diabetes mellitus or hypercalcaemia. Side-effects of some drugs may also increase detrusor muscle overactivity or indirectly contribute to urgency incontinence; these include cholinesterase inhibitors, drugs that cause constipation, and those with anticholinergic effects. Diuretics, alcohol, and caffeine all increase urine production and can cause polyuria, frequency, urgency, and nocturia.

##### Aims of treatment

Manage urinary incontinence and the symptoms of overactive bladder syndrome.

##### Non-drug treatment

**EvGr** Women with urinary incontinence should modify their fluid intake, and if their BMI is 30 kg/m<sup>2</sup> or greater, be advised to lose weight. For those with an overactive bladder, a reduction in caffeine intake should be trialled.

Absorbent products, hand-held urinals and toileting aids should not be used to treat urinary incontinence, unless the person has severe cognitive or mobility impairment that may prevent further treatment. They may be used in some women as a coping strategy whilst awaiting treatment, as an adjunct to ongoing therapy, or as long-term management after all treatment options have been considered; their use should be reviewed at least annually. Intravaginal and intraurethral devices should only be used when required to prevent leakage at specific times, for example during exercise.

Surgical management may be an option for some women and will depend on a number of factors. Discussion around the details of the procedures and subsequent shared decision making should be carried out. [A](#)

#### Urgency incontinence

[E](#)[V](#)[G](#)[r](#) Women should be offered bladder training for at least 6 weeks as first-line treatment. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added. [A](#)

#### Stress incontinence

[E](#)[V](#)[G](#)[r](#) Women should trial supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day. [A](#)

#### Mixed incontinence

[E](#)[V](#)[G](#)[r](#) Women should trial both bladder training for at least 6 weeks and supervised pelvic floor muscle training for at least 3 months, which should include at least 8 contractions performed 3 times per day. If frequency is a problem and satisfactory benefit from bladder training is not achieved, drug treatment for an overactive bladder should be added. [A](#)

#### Drug treatment

[E](#)[V](#)[G](#)[r](#) When considering drug treatment in women with incontinence exclude any possible causes, including drugs or conditions that may exacerbate incontinence or overactive bladder.

A urine dipstick test should be performed in all women presenting with incontinence to test for active infection or haematuria, and analysed along with the patient's symptoms. For further information, see Urinary-tract infections p. 641. Women should be referred to a specialist if there is:

- persistent bladder or urethral pain;
- pelvic mass that is clinically benign;
- associated faecal incontinence;
- suspected neurological disease, or urogenital fistulae;
- history of previous incontinence surgery, pelvic cancer surgery or pelvic radiation therapy;
- recurrent or persistent UTI for those aged over 60; [A](#) see Urinary-tract infections p. 641
- [E](#)[V](#)[G](#)[r](#) palpable bladder after voiding, or symptoms of voiding difficulty.

Urgent referral should occur in women aged 45 years or older if there is unexplained visible haematuria without UTI, or visible haematuria persisting or recurring despite successful treatment of UTI. Urgent referral is also required in women aged 60 years or older with unexplained non-visible haematuria and either dysuria or raised white cell count. [A](#)

#### Urgency incontinence

[E](#)[V](#)[G](#)[r](#) An anticholinergic drug should be considered for women who have trialled bladder training, where frequency is a problem and symptoms persist. Consider the total anticholinergic load, coexisting conditions, such as cognitive impairment or poor bladder emptying, and the risk of side-effects when offering anticholinergic medicine. When prescribing an anticholinergic in those with dementia, see Dementia p. 325. Immediate release oxybutynin hydrochloride p. 841, immediate release tolterodine tartrate

p. 842, or darifenacin p. 840 can be used first-line.

Immediate release oxybutynin should not be used in frail, older women at risk of sudden deterioration in their physical or mental health. The lowest dose should be used and titrated upwards if necessary. *Transdermal* oxybutynin hydrochloride p. 841 may be used in those unable to tolerate oral treatment. Mirabegron p. 843 may be used if treatment with an anticholinergic is contra-indicated, ineffective, or not tolerated, for further information, see *National funding/access decisions* in mirabegron.

Treatment should be reviewed after 4 weeks, or sooner if required. If treatment is effective review the woman again at 12 weeks, then annually thereafter, or every 6 months if the woman is over 75 years of age. If treatment has not been effective or is not tolerated an alternative anticholinergic drug can be used, the current dose adjusted or, mirabegron trialled; review again after 4 weeks. Alternative anticholinergics include, an untried first-line drug, or one of the following; fesoterodine fumarate p. 840, propiverine hydrochloride p. 842, solifenacin succinate p. 842, trospium chloride p. 843, or an *extended release* formulation of either oxybutynin hydrochloride or tolterodine tartrate. Women who have tried taking medicine for overactive bladder, but treatment has failed, should be referred to secondary care, where treatment with botulinum toxin type A p. 440 or surgical methods may be considered.

Flavoxate hydrochloride p. 840, propantheline bromide p. 92, or imipramine hydrochloride p. 408 should not be used as treatment options.

In women who have troublesome nocturia, desmopressin p. 722 may also be used. *Intravaginal* oestrogen therapy can be used in those women who are post-menopausal and have vaginal atrophy. Treatment with an intravaginal oestrogen should be reviewed at least annually to re-assess the need for continued treatment and monitor for symptoms of endometrial hyperplasia or carcinoma. [A](#)

#### Stress incontinence

[E](#)[V](#)[G](#)[r](#) Duloxetine p. 399 is **not** recommended as first-line treatment for women with stress incontinence. It may be used second-line where conservative treatment including pelvic floor training has failed, and only if surgery is not appropriate or the woman prefers pharmacological treatment, but should not be offered routinely. [A](#)

#### Mixed incontinence

Women with mixed urinary incontinence should be treated according to the predominant type, refer to *Urgency incontinence* or *Stress incontinence* for drug treatment options.

#### Pelvic organ prolapse

Pelvic organ prolapse is the symptomatic descent of part of the wall of the vagina or uterus. Symptoms can include a vaginal bulge or sensation of something coming down, urinary, bowel and sexual symptoms, and pelvic and back pain. These can all affect a woman's quality of life.

[E](#)[V](#)[G](#)[r](#) Women who present to primary care with symptoms, or an incidental finding of vaginal prolapse should be examined to rule out pelvic mass or other pathology, and a full history taken. Treatment preferences should be discussed and referral made where necessary. Women in secondary care should be considered for referral to a clinician with expertise in prolapse if experiencing incidental symptoms, or on incidental finding of vaginal prolapse. A validated pelvic floor symptom questionnaire may aid assessment and decision making.

Women should be given advice on minimising heavy lifting, preventing or treating constipation, and if their BMI is 30 kg/m<sup>2</sup> or greater, encouraged to lose weight. A programme of supervised pelvic floor muscle training for at least 16 weeks may also be tried for some women.

A vaginal oestrogen may be used for women with prolapse and signs of vaginal atrophy, an oestrogen-releasing ring

may be more appropriate for those women who have cognitive or physical impairments.

A vaginal pessary may be used alone, or in conjunction with pelvic floor muscle training for those with symptomatic pelvic organ prolapse. Surgical management may be required in women whose symptoms have not improved with non-surgical methods, or who have declined non-surgical treatment. 

## Nocturnal enuresis in children

23-May-2017

### Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

### Treatment

#### Children under 5 years

 For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. 

#### Non Drug Treatment

 Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 722, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. 

#### Drug Treatment

 Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 841 or tolterodine tartrate p. 842 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 408 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually. 

### Useful Resources

Bedwetting in under 19s. National Institute for Health and Care Excellence. Clinical guideline CG111. October 2010. [www.nice.org.uk/guidance/cg111](http://www.nice.org.uk/guidance/cg111)

## ANTIMUSCARINICS

### Antimuscarinics (systemic)

● **CONTRA-INDICATIONS** Angle-closure glaucoma · gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention

● **CAUTIONS** Acute myocardial infarction (in adults) · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · prostatic hyperplasia · pyrexia · ulcerative colitis

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** Prescription potentially inappropriate (STOPP criteria):
  - to treat extrapyramidal side-effects of antipsychotic medications (risk of antimuscarinic toxicity)
  - with delirium or dementia (risk of exacerbation of cognitive impairment), narrow-angle glaucoma (risk of acute exacerbation of glaucoma), or chronic prostatism (risk of urinary retention)
  - if two or more antimuscarinic drugs prescribed concomitantly (risk of increased antimuscarinic toxicity) See also Prescribing in the elderly p. 29.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
- ▶ **Rare or very rare** Angioedema · confusion (more common in elderly)

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

## ANTIMUSCARINICS &gt; URINARY

F 839

## Darifenacin

13-May-2020

## ● INDICATIONS AND DOSE

## Urinary frequency | Urinary urgency | Incontinence

## ▶ BY MOUTH

- ▶ Adult: Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **INTERACTIONS** → Appendix 1: darifenacin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · dry eye · nasal dryness
  - ▶ **Uncommon** Asthenia · bladder pain · cough · diarrhoea · dyspnoea · erectile dysfunction · flatulence · hyperhidrosis · hypertension · increased risk of infection · injury · insomnia · oedema · oral ulceration · taste altered · thinking abnormal · urinary tract disorder
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).  
**Dose adjustments** Manufacturer advises maximum 7.5 mg daily in moderate impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 3, 25

Darifenacin (as Darifenacin hydrobromide) 7.5 mg Emselex 7.5mg modified-release tablets | 28 tablet [PoM] £25.48 DT = £25.48

Darifenacin (as Darifenacin hydrobromide) 15 mg Emselex 15mg modified-release tablets | 28 tablet [PoM] £25.48 DT = £25.48

F 839

## Fesoterodine fumarate

03-Aug-2021

## ● INDICATIONS AND DOSE

## Urinary frequency | Urinary urgency | Urge incontinence

## ▶ BY MOUTH

- ▶ Adult: 4 mg once daily, increased if necessary up to 8 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment.
- ▶ For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

- **INTERACTIONS** → Appendix 1: fesoterodine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · dry eye · gastrointestinal discomfort · insomnia · throat complaints
  - ▶ **Uncommon** Cough · fatigue · gastrointestinal disorders · nasal dryness · taste altered · urinary tract infection · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

**Dose adjustments** Manufacturer advises increase dose cautiously in mild impairment; maximum 4 mg daily in moderate impairment.

- **RENAL IMPAIRMENT** [EvGr] Use with caution. [M] **Dose adjustments** [EvGr] Increase dose cautiously if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. [M] See p. 21.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

## Oxybutynin hydrochloride

### ● INDICATIONS AND DOSE

#### Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response
- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
- ▶ Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

#### Urinary frequency | Urinary urgency | Urinary incontinence

- ▶ BY TRANSDERMAL APPLICATION USING PATCHES
- ▶ Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

#### Nocturnal enuresis associated with overactive bladder

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*<sup>®</sup> XL

- **CAUTIONS** Acute porphyrias p. 1150
- **INTERACTIONS** → Appendix 1: oxybutynin
- **SIDE-EFFECTS**

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ With oral use Dry eye
  - ▶ With transdermal use Gastrointestinal discomfort · increased risk of infection
- ▶ **Uncommon**
  - ▶ With oral use Abdominal discomfort · appetite decreased · dysphagia
  - ▶ With transdermal use Back pain · hot flush · injury
- ▶ **Frequency not known**
  - ▶ With oral use Anxiety · arrhythmia · cognitive disorder · depressive symptom · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection

- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With transdermal use Manufacturer advises apply patches to clean, dry, unbroken skin on abdomen, hip or buttock; remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- ▶ In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

### ● PATIENT AND CARER ADVICE

- ▶ With transdermal use Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms [www.medicinesforchildren.org.uk/medicines/oxybutynin-for-daytime-urinary-symptoms/](http://www.medicinesforchildren.org.uk/medicines/oxybutynin-for-daytime-urinary-symptoms/)

## Solifenacin succinate

### ● INDICATIONS AND DOSE

#### Urinary frequency | Urinary urgency | Urinary incontinence

- ▶ BY MOUTH
- ▶ Adult: 5 mg once daily, increased if necessary to 10 mg once daily

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises maximum 5 mg once daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment or severe renal impairment.

- **CAUTIONS** Susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: solifenacin

### ● SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort
- ▶ **Uncommon** Cystitis · dry eye · dry throat · fatigue · gastrointestinal disorders · nasal dryness · peripheral oedema · taste altered · urinary tract infection
- ▶ **Rare or very rare** Hallucination
- ▶ **Frequency not known** Anaphylactic reaction · appetite decreased · arrhythmias · delirium · dysphonia · glaucoma · hyperkalaemia · liver disorder · muscle weakness · QT interval prolongation · renal impairment
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased half-life); avoid in severe impairment (no information available). **Dose adjustments** Manufacturer advises maximum 5 mg once daily in moderate impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment. **Dose adjustments** See p. 21. Manufacturer advises maximum 5 mg once daily if creatinine clearance 30 mL/minute or less.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *oral suspension*, doses should be followed by a glass of water—ingestion with food or other drinks may lead to the release of solifenacin in the mouth, causing a bitter taste and numbness in the mouth.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Oral solution

##### Solifenacin succinate (Non-proprietary)

Solifenacin succinate 1 mg per 1 ml Solifenacin 5mg/5ml oral suspension sugar free sugar-free | 150 ml **[PoM]** £27.62-£40.95 DT = £33.96

#### Oral suspension

## Tolterodine tartrate

### ● INDICATIONS AND DOSE

#### Urinary frequency | Urinary urgency | Urinary incontinence

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: 2 mg twice daily, reduced if not tolerated to 1 mg twice daily
- ▶ BY MOUTH USING MODIFIED-RELEASE CAPSULES
  - ▶ Adult: 4 mg once daily

- **CAUTIONS** History of QT-interval prolongation
- **INTERACTIONS** → Appendix 1: tolterodine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · bronchitis · chest pain · diarrhoea · dry eye · fatigue · gastrointestinal disorders · paraesthesia · peripheral oedema · vertigo · weight increased
- ▶ **Uncommon** Arrhythmia · heart failure · memory loss · nervousness
- ▶ **Frequency not known** Hallucination
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).  
**Dose adjustments** For *immediate-release medicines*, manufacturer advises dose reduction to 1 mg twice daily.  
For *modified-release capsules*, manufacturer advises dose reduction to 2 mg once daily.
- **RENAL IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).  
**Dose adjustments** See p. 21.  
For *immediate-release medicines*, manufacturer advises dose reduction to 1 mg twice daily if eGFR less than or equal to 30 mL/minute/1.73 m<sup>2</sup>.  
For *modified-release capsules*, manufacturer advises dose reduction to 2 mg once daily if eGFR less than or equal to 30 mL/minute/1.73 m<sup>2</sup>.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

## 1.2 Urinary retention

### Urinary retention

31-May-2017

#### Description of condition

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

*Acute* urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

*Chronic* urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

#### Urinary retention due to benign prostatic hyperplasia

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

#### Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

#### Acute urinary retention

[EVGr](#) Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride p. 845, doxazosin p. 845, tamsulosin hydrochloride p. 847, prazosin p. 847, indoramin p. 846 or terazosin p. 849) should be given for at least two days to manage acute urinary retention [A](#).

#### Chronic urinary retention

[EVGr](#) In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing incontinence, infection, or renal dysfunction and a surgical solution is not feasible. [A](#) Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

[EVGr](#) In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. [A](#)

The parasympathomimetic bethanechol chloride p. 849 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

#### Urinary retention due to benign prostatic hyperplasia

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient's quality of life. [EVGr](#) Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha<sub>1</sub>-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5 $\alpha$ -reductase inhibitor (such as finasteride p. 850 or dutasteride p. 849) should be used. A combination of an alpha-adrenoceptor blocker and a 5 $\alpha$ -reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection. 

### Related drugs

Other drugs used for urinary retention: neostigmine p. 1218, pyridostigmine bromide p. 1218.

## ALPHA-ADRENOCEPTOR BLOCKERS

### Alfuzosin hydrochloride

27-Jul-2021

#### ● INDICATIONS AND DOSE

##### Benign prostatic hyperplasia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: 2.5 mg 3 times a day; maximum 10 mg per day
  - ▶ Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Adult: 10 mg once daily

##### Acute urinary retention associated with benign prostatic hyperplasia

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
  - ▶ Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history of micturition syncope · avoid if history of postural hypotension
- **CAUTIONS** Acute heart failure · cerebrovascular disease · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · discontinue if angina worsens · elderly · history of QT-interval prolongation · patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For alpha<sub>1</sub>-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
    - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
    - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure  $\geq$  20 mmHg (risk of syncope and falls).
- See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: alpha blockers

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · diarrhoea · dizziness · dry mouth · headache · malaise · nausea · postural hypotension · vertigo · vomiting
- ▶ **Uncommon** Abdominal pain · arrhythmias · chest pain · drowsiness · flushing · oedema · palpitations · rhinitis · skin reactions · syncope · visual impairment
- ▶ **Rare or very rare** Angina pectoris · angioedema
- ▶ **Frequency not known** Cerebral ischaemia · floppy iris syndrome · hepatic disorders · neutropenia · priapism · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to

lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- **HEPATIC IMPAIRMENT** For *immediate-release* preparations manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure (risk of increased half-life). For *modified-release* preparations manufacturer advises avoid in hepatic failure.
  - Dose adjustments** For *immediate-release* preparations manufacturer advises initial dose of 2.5 mg once daily, increased to 2.5 mg twice daily according to response in mild to moderate hepatic failure.
- **RENAL IMPAIRMENT**  Avoid use of *modified-release* preparations if creatinine clearance less than 30 mL/minute as limited experience.  See p. 21.
  - Dose adjustments**  For *immediate-release* preparations, initial dose 2.5 mg twice daily and adjust according to response. 
- **PATIENT AND CARER ADVICE** Patient should be counselled on the first dose effect.
  - Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

## Doxazosin

02-Sep-2020

#### ● INDICATIONS AND DOSE

##### Hypertension

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

##### Benign prostatic hyperplasia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - ▶ Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - ▶ Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily continued →

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.
- **CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hypertrophy) · history of postural hypotension · monotherapy in patients with overflow bladder or anuria
- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · heart failure · pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo
  - ▶ **Uncommon** Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased
  - ▶ **Rare or very rare** Alopecia · bronchospasm · flushing · gynaecomastia · hepatic disorders · leucopenia · malaise · muscle weakness · thrombocytopenia · vision blurred
  - ▶ **Frequency not known** Floppy iris syndrome
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).  
**Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

**Benign prostatic hyperplasia**▶ **BY MOUTH**

- ▶ **Adult:** 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- ▶ **Elderly:** 20 mg daily may be adequate, dose to be taken at night

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** Established heart failure · history of micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · control incipient heart failure before initiating indoramin · elderly · epilepsy (convulsions in *animal* studies) · history of depression · Parkinson's disease (extrapyramidal disorders reported)

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Elderly** For alpha<sub>1</sub>-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
    - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
    - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure ≥ 20 mmHg (risk of syncope and falls).
- See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: alpha blockers

**SIDE-EFFECTS**

- ▶ **Rare or very rare** Parkinson's disease exacerbated
- ▶ **Frequency not known** Depression · dizziness · drowsiness · dry mouth · ejaculation failure · fatigue · headache · nasal congestion · weight increased
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** [EvGr] Use with caution. ⚠
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

#### CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Indoramin (Non-proprietary)**

**Indoramin (as Indoramin hydrochloride) 20 mg** Indoramin 20mg tablets | 56 tablet [PoM] £10.65-£69.05 | 60 tablet [PoM] £74.08 DT = £73.98

- ▶ **Doralese Tiltab** (Chemidex Pharma Ltd)

**Indoramin (as Indoramin hydrochloride) 20 mg** Doralese Tiltab 20mg tablets | 60 tablet [PoM] £11.44 DT = £73.98

## Prazosin

05-May-2021

- **INDICATIONS AND DOSE**

### Hypertension

- ▶ BY MOUTH

- ▶ **Adult:** Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

### Congestive heart failure (rarely used)

- ▶ BY MOUTH

- ▶ **Adult:** 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

### Raynaud's syndrome (but efficacy not established)

- ▶ BY MOUTH

- ▶ **Adult:** Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

### Benign prostatic hyperplasia

- ▶ BY MOUTH

- ▶ **Adult:** Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hyperplasia) · history of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose hypotension

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For alpha<sub>1</sub>-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
  - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
  - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure  $\geq$  20 mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: alpha blockers

- **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · headache · nasal congestion · nausea · nervousness · oedema · palpitations · postural hypotension · sexual dysfunction · skin reactions · syncope · urinary disorders · vertigo · vision blurred · vomiting

- ▶ **Uncommon** Angina pectoris · arrhythmias · arthralgia · epistaxis · eye pain · eye redness · gastrointestinal discomfort · hyperhidrosis · paraesthesia · sleep disorders · tinnitus
- ▶ **Rare or very rare** Alopecia · fever · flushing · gynaecomastia · hallucination · hepatic function abnormal · pain · pancreatitis · vasculitis

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).  
**Dose adjustments** Manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.

- **RENAL IMPAIRMENT**

**Dose adjustments** Manufacturer advises initial dose reduction to 500 micrograms daily in moderate to severe impairment; increase with caution.

- **PATIENT AND CARER ADVICE**

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.  
**Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

### Tablet

- ▶ **Prazosin (Non-proprietary)**

**Prazosin (as Prazosin hydrochloride) 2 mg** Minipress 2mg tablets | 100 tablet [PoM]  $\Sigma$  DT = £164.01

**Prazosin (as Prazosin hydrochloride) 5 mg** Minipress 5mg tablets | 100 tablet [PoM]  $\Sigma$

- ▶ **Hypovase** (Pfizer Ltd)

**Prazosin (as Prazosin hydrochloride) 500 microgram** Hypovase 500microgram tablets | 60 tablet [PoM] £2.69 DT = £2.69

## Tamsulosin hydrochloride

28-Jul-2021

- **INDICATIONS AND DOSE**

### Benign prostatic hyperplasia

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** 400 micrograms once daily

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension

- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · elderly

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Elderly** For alpha<sub>1</sub>-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
    - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
    - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure  $\geq$  20 mmHg (risk of syncope and falls).
- See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: alpha blockers

- **SIDE-EFFECTS**

- ▶ **Common or very common** Dizziness · sexual dysfunction

- ▶ **Uncommon** Asthenia · constipation · diarrhoea · headache · nausea · palpitations · postural hypotension · rhinitis · skin reactions · vomiting
- ▶ **Rare or very rare** Angioedema · Stevens-Johnson syndrome · syncope
- ▶ **Frequency not known** Dry mouth · epistaxis · vision disorders
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** [EVGr](#) Use with caution if creatinine clearance less than 10 mL/minute. [⚠](#) See p. 21.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.
- **EXCEPTIONS TO LEGAL CATEGORY** Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

## Terazosin

26-Oct-2020

### ● INDICATIONS AND DOSE

#### Mild to moderate hypertension

##### ► BY MOUTH

- Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

#### Benign prostatic hyperplasia

##### ► BY MOUTH

- Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

- **CONTRA-INDICATIONS** History of micturition syncope (in benign prostatic hyperplasia) · history of postural hypotension (in benign prostatic hyperplasia)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose

#### CAUTIONS, FURTHER INFORMATION

- First dose First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.
- Elderly For alpha<sub>1</sub>-selective adrenoceptor blockers, prescription potentially inappropriate (STOPP criteria):
  - in those with symptomatic orthostatic hypotension or micturition syncope (risk of precipitating recurrent syncope)
  - in those with persistent postural hypotension i.e. recurrent drop in systolic blood pressure  $\geq 20$  mmHg (risk of syncope and falls).

See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: alpha blockers

- **SIDE-EFFECTS** Angioedema · anxiety · arrhythmias · arthritis · asthenia · chest pain · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · epistaxis · fever · flatulence · gastrointestinal discomfort · gout · headache · hyperhidrosis · increased risk of infection · insomnia · joint disorders · myalgia · nasal congestion · nausea · oedema · pain · palpitations · paraesthesia · postural hypotension · sexual dysfunction · skin reactions · syncope · thrombocytopenia · tinnitus · urinary disorders · vasodilation · vertigo · vision disorders · vomiting · weight increased

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for terazosin tablets (initial dose).

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

**Driving and skilled tasks** May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Form unstated

- **Hytrin** (Advanz Pharma)

Hytrin BPH tablets starter pack | 28 tablet [PoM] £10.97

Hytrin tablets starter pack | 28 tablet [PoM] £13.00

#### Tablet

- **Terazosin (Non-proprietary)**

Terazosin (as Terazosin hydrochloride) 2 mg Terazosin 2mg tablets | 28 tablet [PoM] £2.75 DT = £2.74

Terazosin (as Terazosin hydrochloride) 5 mg Terazosin 5mg tablets | 28 tablet [PoM] £5.39 DT = £5.39

Terazosin (as Terazosin hydrochloride) 10 mg Terazosin 10mg tablets | 28 tablet [PoM] £8.11 DT = £8.09

- **Hytrin** (Advanz Pharma)

Terazosin (as Terazosin hydrochloride) 1 mg Hytrin 1mg tablets | 7 tablet [PoM] [S]

Terazosin (as Terazosin hydrochloride) 2 mg Hytrin 2mg tablets | 28 tablet [PoM] £2.20 DT = £2.74

Terazosin (as Terazosin hydrochloride) 5 mg Hytrin 5mg tablets | 28 tablet [PoM] £4.13 DT = £5.39

Terazosin (as Terazosin hydrochloride) 10 mg Hytrin 10mg tablets | 28 tablet [PoM] £7.87 DT = £8.09

## CHOLINE ESTERS

### Bethanechol chloride

09-Dec-2020

### ● INDICATIONS AND DOSE

#### Urinary retention

##### ► BY MOUTH

- Adult: 10–25 mg 3–4 times a day, to be taken 30 minutes before food

- **CONTRA-INDICATIONS** Bradycardia · conditions where increased motility of the gastro-intestinal tract could be harmful · conditions where increased motility of the urinary tract could be harmful · epilepsy · heart block · hyperthyroidism · hypotension · intestinal obstruction · obstructive airways disease · parkinsonism · peptic ulcer · recent myocardial infarction · urinary obstruction

- **CAUTIONS** Autonomic neuropathy (use lower initial dose)

- **SIDE-EFFECTS** Abdominal pain · hyperhidrosis · nausea · vomiting

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid; gastrointestinal disturbances in infant reported.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 22

- **Myotonine** (Glenwood GmbH)

Bethanechol chloride 10 mg Myotonine 10mg tablets | 100 tablet [PoM] £18.51 DT = £18.51

Bethanechol chloride 25 mg Myotonine 25mg tablets | 100 tablet [PoM] £27.26 DT = £27.26

## 5 $\alpha$ -REDUCTASE INHIBITORS

### Dutasteride

02-Sep-2020

- **DRUG ACTION** A specific inhibitor of the enzyme 5 $\alpha$ -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

### ● INDICATIONS AND DOSE

#### Benign prostatic hyperplasia

##### ► BY MOUTH

- Adult: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **INTERACTIONS** → Appendix 1: dutasteride

### ● SIDE-EFFECTS

- Common or very common Breast disorder · sexual dysfunction

- Uncommon Alopecia · hypertrichosis

- Frequency not known Angioedema · depressed mood · hypersensitivity · localised oedema · skin reactions · testicular disorders

- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
  - **MONITORING REQUIREMENTS** Manufacturer advises that patients should be regularly evaluated for prostate cancer.
  - **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
  - **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.
  - **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
- Capsule**  
CAUTIONARY AND ADVISORY LABELS 25
- ▶ **Dutasteride (Non-proprietary)**

Dutasteride 500 microgram Zepron 500microgram capsules | 30 capsule [PoM] £3.21 DT = £2.18
- Combinations available: *Tamsulosin with dutasteride*, p. 848
- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
  - **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
  - **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
  - **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.
  - **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Finasteride is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, powder
- Tablet**  
CAUTIONARY AND ADVISORY LABELS 25
- ▶ **Finasteride (Non-proprietary)**  
Finasteride 1 mg Finasteride 1mg tablets | 28 tablet [PoM] £6.00-£28.63 | 84 tablet [PoM] £88.40  
Finasteride 5 mg Finasteride 5mg tablets | 28 tablet [PoM] £13.94 DT = £1.05
  - ▶ **Propecia** (Organon Pharma (UK) Ltd)  
Finasteride 1 mg Propecia 1mg tablets | 28 tablet [PoM] £33.68 | 84 tablet [PoM] £88.40
  - ▶ **Proscar** (Organon Pharma (UK) Ltd)  
Finasteride 5 mg Proscar 5mg tablets | 30 tablet [PoM] £14.94

## Finasteride

04-Sep-2020

- **DRUG ACTION** A specific inhibitor of the enzyme 5 $\alpha$ -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

### ● INDICATIONS AND DOSE

#### Benign prostatic hyperplasia

##### ▶ BY MOUTH

- ▶ Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

#### Androgenetic alopecia in men

##### ▶ BY MOUTH

- ▶ Adult: 1 mg daily, continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (*Propecia*®) for male pattern hair loss; depression is also associated with *Proscar*® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

- **CAUTIONS** Obstructive uropathy
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Sexual dysfunction
  - ▶ **Uncommon** Breast abnormalities · skin reactions
  - ▶ **Frequency not known** Angioedema · depression · infertility male · palpitations · testicular pain

## 1.3 Urolithiasis

### Renal and ureteric stones

03-Apr-2019

#### Description of condition

Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of stone forming substances in the urine.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, males aged between 40–60 years, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely

to pass than proximal ureteral stones), and the degree of obstruction.

### Aims of treatment

**EvGr** The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life.  $\blacklozenge$

### Non-drug treatment

**EvGr** Consider watchful waiting for asymptomatic renal stones if they are less than 5mm in diameter. If they are larger; the risk and benefit of this option should be discussed with the patient.

Options for surgical stone removal should be discussed by the specialist hospital team depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.

Consider stone analysis and measure serum calcium in patients with recurring renal or ureteric stones.

Along with maintaining a healthy lifestyle, advise patients to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1,200mg and salt intake of no more than 6g a day. For patients with recurrent calcium stones avoid excessive intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive dietary intake of urate rich products, such as liver, kidney, calf thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies).  $\blacklozenge$

### Pain Management

**EvGr** Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic.  $\blacklozenge$

### Medical Expulsive Therapy

**EvGr** Consider alpha-adrenoceptor blockers for patients with distal ureteric stones less than 10mm in diameter. Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for patients having shockwave lithotripsy for ureteric stones less than 10mm.  $\blacklozenge$

### Prevention of recurrence of stones

**EvGr** Alongside lifestyle advice, consider potassium citrate [unlicensed] in patients with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if patients also have hypercalciuria after restricting their sodium intake to no more than 6g a day.  $\blacklozenge$

## 1.4 Urological pain

### Urological pain

03-Apr-2019

#### Treatment

**Lidocaine hydrochloride gel** is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones p. 850.

#### Alkalinisation of urine

*Alkalinisation* of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of

*cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 1128 is used as a urinary alkalinising agent in some metabolic and renal disorders.

### ALKALISING DRUGS > URINARY

## Citric acid with potassium citrate

21-Dec-2021

#### ● INDICATIONS AND DOSE

##### Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

▶ BY MOUTH USING ORAL SOLUTION

▶ Adult: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease · elderly
- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia · nausea · vomiting
- **RENAL IMPAIRMENT** **EvGr** Consider avoiding (risk of hyperkalaemia).  $\blacklozenge$
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K<sup>+</sup>/10 mL.
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

CAUTIONARY AND ADVISORY LABELS 27

▶ **Citric acid with potassium citrate (Non-proprietary)**

Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL  $\square$  £1.38 DT = £1.46

#### Effervescent tablet

▶ **Effercitrate** (Cambridge Healthcare Supplies Ltd)

Citric acid 250 mg, Potassium citrate 1.5 gmm Effercitrate tablets sugar-free | 12 tablet  $\square$  £3.98 DT = £3.98

## Sodium citrate

18-Nov-2021

#### ● INDICATIONS AND DOSE

##### Bladder washouts

▶ Adult: (consult product literature)

##### Relief of discomfort in mild urinary-tract infections

▶ BY MOUTH

▶ Adult: (consult product literature)

##### Constipation (dose approved for use by community practitioner nurse prescribers)

▶ BY RECTUM

▶ Child 3–17 years: 5 mL for 1 dose

▶ Adult: 5 mL for 1 dose

#### MICOLETTE<sup>®</sup>

##### Constipation

▶ BY RECTUM

▶ Child 3–17 years: 5–10 mL for 1 dose

▶ Adult: 5–10 mL for 1 dose

#### MICRALAX<sup>®</sup>

##### Constipation

▶ BY RECTUM

▶ Child 3–17 years: 5 mL for 1 dose

continued →

- ▶ Adult: 5 mL for 1 dose

**RELAXIT<sup>®</sup>****Constipation**

- ▶ BY RECTUM
- ▶ Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
- ▶ Child 3-17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

**● CONTRA-INDICATIONS**

- ▶ With oral use Conditions where excess sodium or glucose should be avoided (e.g. cardiac disease, hypertension, patients on a sodium-restricted diet or diabetes)
- ▶ With rectal use Acute gastro-intestinal conditions

**● CAUTIONS**

- ▶ With oral use Elderly
- ▶ With rectal use Debilitated patients (in adults) · sodium and water retention in susceptible individuals

- **INTERACTIONS** → Appendix 1: sodium citrate

- **SIDE-EFFECTS** Polyuria

**● PREGNANCY**

- ▶ With oral use Use with caution.

**● RENAL IMPAIRMENT**

- ▶ With oral use [\[EvGr\]](#) Caution (contains sodium). [⚠](#)

- **PRESCRIBING AND DISPENSING INFORMATION** Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Granules**

- ▶ **Sodium citrate (Non-proprietary)**

**Sodium citrate 4 gram** Cystitis Relief 4g oral granules sachets | 6 sachet [\[GSL\]](#) £2.38 DT = £2.38

- ▶ Brands may include CanesOasis, Cystocalm

**Oral solution**

- ▶ **Sodium citrate (Non-proprietary)**

**Sodium citrate 88.23 mg per 1 ml** Sodium citrate 0.3M oral solution | 30 ml [\[PoM\]](#) £4.70 DT = £4.70

**Powder**

- ▶ **Sodium citrate (Non-proprietary)**

**Sodium citrate 4 gram** Numark cystitis treatment 4g oral powder sachets | 6 sachet [\[GSL\]](#) £1.65 DT = £1.65

**Form unstacked**

- ▶ **Sodium citrate (Non-proprietary)**

**Sodium citrate 1 mg per 1 mg** Sodium citrate powder | 500 gram [\[GSL\]](#) £7.85 DT = £7.85

**Irrigation solution**

- ▶ **Sodium citrate (Non-proprietary)**

**Sodium citrate 3% irrigation solution** 1litre bags | 1 bag [ⓧ](#)

**Enema**

- ▶ **Micolette Micro-enema** (Pinewood Healthcare)

**Sodium citrate 90 mg per 1 ml** Micolette Micro-enema 5ml | 12 enema [\[P\]](#) £4.50

- ▶ **Micralax Micro-enema** (RPH Pharmaceuticals AB)

**Sodium citrate 90 mg per 1 ml** Micralax Micro-enema 5ml | 12 enema [\[P\]](#) £5.55

- ▶ **Relaxit** (Supra Enterprises Ltd)

**Sodium citrate 90 mg per 1 ml** Relaxit Micro-enema 5ml | 12 enema £5.21

**HEPARINOIDS****Pentosan polysulfate sodium**

05-Oct-2021

**● INDICATIONS AND DOSE****Bladder pain syndrome**

- ▶ BY MOUTH

- ▶ Adult: 100 mg 3 times a day, review treatment after 6 months and discontinue if no response

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED SEPTEMBER 2019): **ELMIRON<sup>®</sup>** (PENTOSAN POLYSULFATE SODIUM): RARE RISK OF PIGMENTARY MACULOPATHY

Cases of pigmentary maculopathy have been reported rarely with pentosan polysulfate sodium, especially after long-term use at high doses. Healthcare professionals are advised that patients should have regular ophthalmic examinations during treatment, and to consider stopping treatment if pigmentary maculopathy develops. Patients should be advised to seek immediate medical attention if visual changes occur.

- **CONTRA-INDICATIONS** Active bleeding

- **CAUTIONS** Patients at increased risk of bleeding

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · asthenia · back pain · diarrhoea · dizziness · gastrointestinal discomfort · haemorrhage · headache · increased risk of infection · nausea · pelvic pain · peripheral oedema

- ▶ **Uncommon** Amblyopia · anaemia · appetite decreased · arthralgia · constipation · depression · dyspnoea · emotional lability · eye disorders · flatulence · hyperhidrosis · hyperkinesia · insomnia · leucopenia · melanocytic naevus size increased · myalgia · oral ulceration · paraesthesia · photosensitivity reaction · skin reactions · thrombocytopenia · tinnitus · vomiting · weight changes

- ▶ **Frequency not known** Coagulation disorder · hepatic function abnormal

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—evidence of hepatic involvement in elimination.

- **RENAL IMPAIRMENT** Manufacturer advises caution—evidence of renal involvement in elimination.

- **MONITORING REQUIREMENTS** Manufacturer advises careful monitoring in patients with history of heparin or pentosan polysulfate sodium induced thrombocytopenia.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ Pentosan polysulfate sodium for treating bladder pain syndrome (November 2019) NICE TA610 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Pentosan polysulfate sodium (*Elmiron<sup>®</sup>*) for the treatment of adults with bladder pain syndrome characterised by either glomerulations or Hunner's lesions with moderate to severe pain, urgency and frequency of micturition (November 2019) SMC No. SMC2194 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Pentosan polysulfate sodium (Non-proprietary)**

Pentosan polysulfate sodium 50 mg Fibrase 50mg capsules | 50 capsule [PoM]

- ▶ **Elmiron** (Sovereign Medical Ltd, Consilient Health Ltd)

Pentosan polysulfate sodium 100 mg Elmiron 100mg capsules | 90 capsule [PoM] £450.00-£699.40 DT = £450.00

## TERPENES

### Anethol with borneol, camphene, cineole, fenchone and pinene

- **INDICATIONS AND DOSE**

- **Urolithiasis for the expulsion of calculi**

- ▶ BY MOUTH

- ▶ Adult: 1–2 capsules 3–4 times a day, to be taken before food

- **LESS SUITABLE FOR PRESCRIBING** Preparation is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Rowatinox** (Meadow Laboratories Ltd)

Cineole 3 mg, Anethol 4 mg, Fenchone 4 mg, Borneol 10 mg, Camphene 15 mg, Pinene 31 mg Rowatinox capsules | 50 capsule [PoM] £7.35

## 2 Bladder instillations and urological surgery

### Bladder instillations and urological surgery

19-Jul-2020

#### Bladder infection

Chlorhexidine solution below given as bladder irrigation is licensed for the management of common infections of the bladder in patients with an indwelling urinary catheter. Chlorhexidine has broad spectrum activity against many Gram-positive and Gram-negative bacteria but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning on micturition (in which case they should be discontinued). Sterile sodium chloride solution 0.9% (physiological saline) p. 1131 is licensed for use as a routine mechanical irrigant to flush out debris, small blood clots, or tissue in catheters.

Continuous bladder irrigation with amphotericin B (Fungizone<sup>®</sup>) 50 micrograms/mL p. 647 is licensed to treat some fungal infections (e.g. candiduria).

#### Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 975 and mitomycin p. 994 are licensed for the management of superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur. Instillation of epirubicin hydrochloride p. 977 is also licensed for the treatment and prophylaxis of certain forms of superficial bladder cancer.

Instillation of BCG (Bacillus Calmette-Guérin p. 1032), a live attenuated strain derived from *Mycobacterium bovis*, is

licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

#### Urological surgery

Glycine irrigation solution 1.5% p. 854 is licensed for use in transurethral surgical procedures such as prostatic resection; sterile sodium chloride solution 0.9% (physiological saline) is used for irrigation in percutaneous renal surgery (e.g. nephrolithotomy, ureteroscopy).

**Other drugs used for Bladder instillations and urological surgery** Sodium citrate, p. 851

## ANTISEPTICS AND DISINFECTANTS

### Chlorhexidine

23-Feb-2022

- **INDICATIONS AND DOSE**

- **Bladder irrigation and catheter patency solutions**

- ▶ BY INTRAVESICAL INSTILLATION

- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: irrigation solution

#### Irrigation

- ▶ **Chlorhexidine (Non-proprietary)**

Chlorhexidine acetate 200 microgram per 1 ml Chlorhexidine acetate 0.02% catheter maintenance solution | 100 ml [P] DT = £2.70

- ▶ **Uro-Tainer (chlorhexidine)** (B.Braun Medical Ltd)

Chlorhexidine acetate 200 microgram per 1 ml Uro-Tainer chlorhexidine 1:5000 catheter maintenance solution | 100 ml [P] £2.70 DT = £2.70

#### Irrigation solution

- ▶ **Chlorhexidine (Non-proprietary)**

Chlorhexidine acetate 200 microgram per 1 ml Chlorhexidine acetate 0.02% irrigation solution 1litre bottles | 1 bottle [P]

Chlorhexidine acetate 500 microgram per 1 ml Chlorhexidine acetate 0.05% irrigation solution 1litre bottles | 1 bottle [P]

### Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine above, lidocaine hydrochloride p. 1466.

- **INDICATIONS AND DOSE**

- **Urethral sounding and catheterisation**

- ▶ BY URETHRAL APPLICATION

- ▶ Adult: 6–11 mL

- **Cystoscopy**

- ▶ BY URETHRAL APPLICATION

- ▶ Adult: 11 mL, then 6–11 mL if required

- **Surface anaesthesia (dose approved for use by community practitioner nurse prescribers) (on doctor's advice only)**

- ▶ BY URETHRAL APPLICATION

- ▶ Adult: 6–11 mL

- **INTERACTIONS** → Appendix 1: antiarrhythmics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Instillagel** (CliniMed Ltd)

Chlorhexidine gluconate 500 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Instillagel gel | 60 ml [P] £10.50 DT = £10.50 | 110 ml [P] £11.00 DT = £11.00

## IRRIGATING SOLUTIONS

## Glycine

23-Nov-2020

## ● INDICATIONS AND DOSE

**Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours**

▶ Adult: (consult product literature)

## ● CAUTIONS

▶ Urological surgery There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

● **SIDE-EFFECTS** Cardiovascular disorder • electrolyte depletion • fluid overload • pulmonary disorder • seizure • vision blurred

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Irrigation solution**▶ **Glycine (Non-proprietary)**

Glycine 1.5% irrigation solution 3litre Easyflow bags | 1 bag 

Glycine 1.5% irrigation solution 1litre Flowfusor bottles | 1 bottle 

Glycine 1.5% irrigation solution 1litre Easyflow bags | 1 bag 

Glycine 1.5% irrigation solution 2litre Flowfusor bottles | 1 bottle 

## Catheter maintenance solutions

**Sodium chloride 9 mg per 1 ml 50 ml** • NHS indicative price = £3.70 • Drug Tariff (Part IXa) 100 ml • NHS indicative price = £3.70 • Drug Tariff (Part IXa)

**UroFlush Saline 0.9% catheter maintenance solution** (TriOn Pharma Ltd)

**Sodium chloride 9 mg per 1 ml 50 ml** • NHS indicative price = £3.15 • Drug Tariff (Part IXa) 100 ml • NHS indicative price = £3.15 • Drug Tariff (Part IXa)

## 3 Contraception

## Contraceptives, hormonal

05-May-2022

## Overview

Hormonal contraception includes combined hormonal contraception (containing an oestrogen and a progestogen) and progestogen-only contraception.

FSRH have produced guidance to support healthcare professionals on the use of contraception and provision of contraceptive services during the COVID-19 pandemic, available at: [www.fsrh.org/fsrh-and-covid-19-resources-and-information-for-srh/](http://www.fsrh.org/fsrh-and-covid-19-resources-and-information-for-srh/).

 When prescribing contraception, information should be given on all available methods taking into consideration medical eligibility. This should include contraceptive effectiveness (including factors that alter efficacy), non-contraceptive benefits, health risks, and side-effects to allow an informed decision to be made on the most suitable choice. 

In adolescents, hormonal contraception is used after menarche. When prescribing contraception for females aged under 16 years, it is considered good practice for health professionals to follow the criteria commonly known as the Fraser Guidelines, available at: [www.fsrh.org/standards-and-guidance/documents/cec-ceu-guidance-young-people-mar-2010/](http://www.fsrh.org/standards-and-guidance/documents/cec-ceu-guidance-young-people-mar-2010/).

For information on contraceptive use in specific populations such as young people, overweight or obese individuals, individuals with eating disorders, and after pregnancy, see FSRH guidance available at: [www.fsrh.org/standards-and-guidance/fsrh-guidelines-and-statements/contraception-for-specific-populations/](http://www.fsrh.org/standards-and-guidance/fsrh-guidelines-and-statements/contraception-for-specific-populations/).

For the UK Medical Eligibility Criteria for Contraceptive Use, which includes information on risk categorisation for patients with pre-existing medical conditions, see FSRH guidance available at: [www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/](http://www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/).

For information on switching methods of contraception, see FSRH Clinical Effectiveness Unit (CEU) guidance: **Switching or Starting Methods of Contraception** (see *Useful resources*).

**Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (March 2019) guidance**

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include male and female sterilisation, and the long-acting reversible contraceptives (LARC)—copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP). Females using the IMP must not take any interacting drugs that could reduce contraceptive effectiveness; for further information see *Contraceptives, interactions* p. 859.

For further guidance, see the FSRH CEU statement ([www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/](http://www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/)), MHRA drug safety update ([www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed/](http://www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed/)), and the UK teratogenic information service ([www.uktis.org](http://www.uktis.org)).

**Combined hormonal contraceptives**

Combined hormonal contraceptives (CHC) are available as tablets (COC), transdermal patches (CTP), and vaginal rings (CVR). They are highly user-dependant methods where the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. Certain factors such as the person's weight, malabsorption (COC only), and drug interactions may contribute to contraceptive failure. Prescriptions of up to 12 months' supply for CHC initiation or continuation may be

appropriate to avoid unwanted discontinuation and increased risk of pregnancy.

[EvGr](#) It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age as safer alternatives exist. [A](#)

CHC use may be associated with some health benefits such as:

- Reduced risk of ovarian, endometrial and colorectal cancer;
- Predictable bleeding patterns;
- Reduced dysmenorrhoea and menorrhagia;
- Management of symptoms of polycystic ovary syndrome (PCOS), endometriosis and premenstrual syndrome;
- Improvement of acne;
- Reduced menopausal symptoms;
- Maintaining bone mineral density in peri-menopausal females under the age of 50 years.

However, the use of CHC is also associated with health risks.

For information on these risks, and further information on the benefits, see FSRH clinical guideline: **Combined**

**Hormonal Contraception** (see *Useful resources*).

For information on advice to give to patients on the management of incorrect CHC use, see FSRH clinical guidance: **Incorrect use of Combined Hormonal Contraception** (see *Useful resources*).

#### Preparation choice

Combined oral contraceptives (COCs) containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'multiphasic'.

Combined oral contraceptives usually contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of COCs range from 20–40 micrograms. [EvGr](#) A monophasic preparation containing 30 micrograms or less of ethinylestradiol in combination with levonorgestrel or norethisterone (to minimise cardiovascular risk), is generally used as the first line option. However, choice should be made taking into account the patients medical history, personal preference, previous contraceptive experience, and any age related considerations.

Due to potential reduced efficacy, non-oral CHC should be considered if there are concerns over absorption. In females who weigh 90 kg or more, consider non-topical options or use additional precautions with CTP. [A](#)

**Regimen choice**

[EvGr](#) Information should be given to females on both the traditional 21 day CHC regimen with a monthly withdrawal bleed during the 7 day hormone free interval (HFI), and 'tailored' CHC regimens [unlicensed use]. Tailored CHC regimens can only be used with monophasic CHC containing ethinylestradiol [unlicensed use]; they offer the choice of either a shortened, or less frequent, or no hormone free interval based on the person's preference.

The following tailored regimens may be used [unlicensed use]:

- Shortened HFI: 21 days of continuous use followed by a 4 day HFI;
- Extended use (tricycling): 9 weeks of continuous use followed by a 4 or 7 day HFI;
- Flexible extended use: continuous use for 21 days or more followed by a 4 day HFI when breakthrough bleeding occurs;
- Continuous use: continuous CHC use with no HFI. [A](#)

Withdrawal bleeds do not represent physiological menstruation and there is no difference in efficacy or safety of using the traditional 21 day regimen, which mimics the natural menstrual cycle, over using extended or continuous regimens. Use of the traditional regimen may be associated

with disadvantages such as heavy or painful withdrawal bleeds, headaches, mood changes, and increased risk of incorrect use with subsequent unplanned pregnancy. [EvGr](#) Withdrawal bleeds during traditional CHC use has been reported in females who are pregnant and should therefore not be relied on as reassurance of a person's pregnancy status. [A](#)

**Follow up**

[EvGr](#) A review of continued medical eligibility, satisfaction and adherence, drug interactions, and consideration of alternative contraception should be undertaken annually. Body mass index and blood pressure should also be checked annually. [A](#)

**Surgery**

[EvGr](#) CHC use should be discontinued at least 4 weeks prior to major elective surgery, any surgery to the legs or pelvis, or surgery that involves prolonged immobilisation of a lower limb. An alternative method of contraception should be used to prevent unintentional pregnancy, and CHC may be recommenced 2 weeks after full remobilisation. When discontinuation is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on CHC, thromboprophylaxis should be considered. [M](#)

**When to seek further advice**

[EvGr](#) All females should be advised to seek advice from a healthcare professional if they experience any troublesome side-effects, have a significant health event, start any new medication, would like to discontinue CHC, or to discuss alternative methods at any time. For further information, see FSRH guidance **Combined Hormonal Contraception** (see *Useful resources*). [A](#)

**Progestogen-only contraceptives**

Progestogen-only contraceptive options are available in oral, injectable, subdermal, and intra-uterine form. Some forms are highly user-dependent (e.g. oral tablet), whilst others rely on timely re-administration (e.g. depot injection); the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. The primary mechanism of action differs between contraceptive options, however progestogenic effects leading to contraceptive action include changes to the cervical mucus affecting sperm penetration, endometrial changes affecting implantation, and ovulation suppression (to varying degrees).

**Oral progestogen-only contraceptives**

Oral progestogen-only preparations contain either levonorgestrel p. 872, norethisterone p. 823, or desogestrel p. 871. [EvGr](#) Oral progestogens may suppress ovulation to varying extents, for example, up to 60% of cycles are anovulatory in females using a levonorgestrel pill, whereas ovulation is suppressed in up to 97% of cycles in females taking a desogestrel pill. As ovulation is suppressed more consistently with desogestrel, it may have benefits over levonorgestrel and norethisterone, such as improving symptoms of dysmenorrhoea. There is however, insufficient evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Prescriptions of up to 12 months' supply at initial and subsequent visits may be appropriate. Follow-up should be tailored on a case by case basis with the advice to return if any problems arise. [A](#)

For further information on progestogen-only pills, see FSRH guidance: **Progestogen-only Pills** (see *Useful resources*).

**Parenteral progestogen-only contraceptives**

Parenteral long-acting progestogens include the injections medroxyprogesterone acetate p. 876 and norethisterone enantate, and the implant etonogestrel p. 875. These are long-acting reversible contraceptive options that work primarily by suppressing ovulation along with other

progestogenic effects. [EvGr](#) As they often lead to amenorrhoea or reduced bleeding, they may benefit those with menstrual problems (such as heavy bleeding or dysmenorrhoea). [▲](#)

### Injections

The failure rate for injectable progestogen-only contraception during the first year is approximately only 0.2% with perfect use (used consistently and correctly), the failure rate with typical use (includes incorrect/inconsistent use) is approximately 6%. The typical failure rates are higher compared to other long-acting methods and may be due to the relative frequency of repeat injections.

[EvGr](#) Depot medroxyprogesterone acetate is administered every 13 weeks. Its use is associated with a small loss of bone mineral density, which largely recovers after discontinuation. However, due to the concerns and uncertainties around bone-loss the following is advised regarding its use:

- Females aged under 18 years may use depot medroxyprogesterone acetate after all options have been discussed and are considered unsuitable or unacceptable.
- In all females, although there is no definitive upper duration limit, use should be reviewed every 2 years and continuation benefits and risks discussed.
- Females aged 50 years and over should switch to another contraceptive method; if they do not wish to discontinue use, continuation may be considered following a discussion of the benefits and risks.
- In females with significant risk factors for osteoporosis, other methods of contraception should be considered.

Patients should be informed that there can be a delayed return of fertility of up to 1 year after discontinuation of depot medroxyprogesterone acetate. However, patients who discontinue use and do not wish to conceive, should be advised to start an alternative contraceptive method before or at the time of their next scheduled injection. [▲](#)

Norethisterone enantate is less commonly used in the UK.

[EvGr](#) It is used for short-term contraception (duration of 8 weeks) for females whose partners undergo a vasectomy until the vasectomy is effective, and after rubella immunisation. [▲](#)

For further information on progestogen-only injections including dosing interval of repeat injections and management of side-effects, see FSRH guidance: **Progestogen-only Injectable Contraception** (see *Useful resources*).

### Implant

[EvGr](#) The etonogestrel implant p. 875 is inserted subdermally and provides highly effective contraception for up to 3 years. The contraceptive failure rate for both perfect and typical use is approximately 0.05% in the first year of use. Routine follow-up during implant use, removal or replacement is not generally required, however patients should be advised to see their healthcare professional if the implant cannot be felt or problematic bleeding occurs. [▲](#)

For further information on progestogen-only implant, see FSRH guidance: **Progestogen-only Implant** (see *Useful resources*).

### Intra-uterine progestogen-only systems

Intra-uterine systems (IUS) containing levonorgestrel p. 872 are long-acting reversible contraceptive options that have a licensed duration of use that ranges from 3–10 years depending on the system used. A foreign-body effect may be a contributing factor to the contraceptive action, in addition to progestogenic effects. Ovulation is not suppressed in the majority of females (over 75%) who use an IUS. An IUS releasing 20mcg/24hour of levonorgestrel may also have health benefits such as improving pain associated with dysmenorrhoea, endometriosis or adenomyosis.

FSRH CEU have issued recommendations on the management of pain and anxiety associated with insertion of

intra-uterine contraception, available at: [www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/](http://www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/).

[EvGr](#) Patients should be advised to seek medical advice if they develop symptoms of pelvic infection, pain, abnormal bleeding, non-palpable threads or they can feel the stem of the IUS. [▲](#)

For further information on progestogen-only IUS, see FSRH guidance: **Intra-uterine Contraception** (see *Useful resources*).

### Surgery

In accordance with the UK Medical Eligibility Criteria for Contraceptive Use, progestogen-only pills, injections, implants, and intra-uterine systems are suitable for use as contraceptives in females undergoing surgery. For further information, see FSRH guidance: **UK Medical Eligibility Criteria for Contraceptive Use** (available at: [www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/](http://www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/)).

## Contraceptives, non-hormonal

05-Jan-2022

### Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (March 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended

pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include male and female sterilisation, and the long-acting reversible contraceptives (LARC)—copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP). Females using the IMP must not take any interacting drugs that could reduce contraceptive effectiveness; for further information, see Contraceptives, interactions p. 859.

For further guidance, see the FSRH Clinical Effectiveness Unit (CEU) statement ([www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/](http://www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/)), MHRA drug safety update ([www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed/](http://www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed/)), and the UK teratogen information service ([www.uktis.org](http://www.uktis.org)).

### Barrier methods

Barrier methods include condoms (male and female), diaphragms and cervical caps. Male condoms are less effective than some other contraception methods but are effective when used consistently and correctly, and provide significant protection against some sexually transmitted infections (STIs). Female condoms are also available; they are pre-lubricated with a non-spermicidal lubricant.

There is no evidence that condoms lubricated with spermicide provide additional protection against pregnancy or STIs. **EvGr** Diaphragms and caps must be used in conjunction with a **spermicide** and should not be removed until at least 6 hours after the last episode of intercourse. **A**

### Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone. They have two components: a spermicide and a vehicle for its delivery (e.g. vaginal gel). **EvGr** They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); **A** high frequency use of the spermicide nonoxinol '9' p. 877 has been associated with genital lesions, which may increase the risk of acquiring these infections.

### Contraceptive devices

#### Intra-uterine devices

**EvGr** The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; **A** however they may be unsuitable in women with certain conditions such as those with pelvic inflammatory disease or unexplained vaginal bleeding. The UK Medical Eligibility Criteria for Contraceptive Use (published by FSRH) provides guidance on safe use of contraceptive methods including restrictions for intra-uterine devices; full guidance is available at [www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/](http://www.fsrh.org/standards-and-guidance/uk-medical-eligibility-criteria-for-contraceptive-use-ukmec/).

**EvGr** Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause. **A**

The most effective intra-uterine devices have at least 380 mm<sup>2</sup> of copper and have banded copper on the transverse arms. Other smaller devices have been introduced to minimise side-effects.

FSRH CEU have issued recommendations on the management of pain and anxiety associated with insertion of intra-uterine contraception, available at: [www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/](http://www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/).

### Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms, contraceptive diaphragms and caps made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

## Emergency contraception

05-Jan-2022

### Overview

**EvGr** Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse (UPSI). It does not replace effective regular contraception.

Females of childbearing potential who do not wish to conceive should be offered emergency contraception after UPSI that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after UPSI from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to females whose regular contraception has been compromised or has been used incorrectly. **A**

### Emergency contraceptive methods

#### Copper intra-uterine devices

**EvGr** Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 868) is the most effective form of emergency contraception and should be offered (if appropriate) to all females who have had UPSI and do not wish to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after the first UPSI in a natural menstrual cycle, or up to 5 days after the earliest estimated date of ovulation (i.e. within the minimum period before implantation), whichever is later. For information on the use of copper intra-uterine devices as emergency contraception in women using hormonal contraception, see FSRH guideline: **Emergency Contraception** (see Useful resources).

Antibacterial cover may be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs. **A**

For further information on the use of copper intra-uterine devices as emergency contraception, see FSRH guideline:

**Emergency Contraception** (see Useful resources).

FSRH Clinical Effectiveness Unit have issued recommendations on the management of pain and anxiety associated with insertion of intra-uterine contraception, available at: [www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/](http://www.fsrh.org/news/fsrh-statement-pain-associated-with-insertion-of-intrauterine/).

#### Hormonal methods

**EvGr** Oral hormonal emergency contraceptives (includes levonorgestrel p. 872 and ulipristal acetate p. 870) should be offered as soon as possible if a copper intra-uterine device is not appropriate or is not acceptable to the patient and there has been UPSI within the last 5 days; either drug should be taken as soon as possible to increase efficacy. Oral emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of UPSI and may also be used between 72 and 96 hours after UPSI [unlicensed use], but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours

(5 days) of UPSI. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

There is the possibility that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel. If the patient's BMI is greater than 26 kg/m<sup>2</sup> or their body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] is given (see *Emergency contraception* under levonorgestrel). It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line oral emergency contraceptive for females who have had UPSI within the last 96–120 hours (even if they have also had additional instances of UPSI within the last 96 hours). It should also be considered first line for females who have had UPSI within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation.

Levonorgestrel may be considered for oral emergency contraception in females on a regular combined hormonal contraceptive who have missed contraception within the first week of restarting their contraceptive. See the FSRH guideline: **Emergency Contraception** (see Useful resources) for further information.

Ulipristal acetate and levonorgestrel can be used as oral emergency contraception more than once in the same cycle.

⚠ Note that the manufacturer of levonorgestrel advises that there may be an increased risk of side-effects (such as menstrual irregularities) with repeated administration of levonorgestrel as emergency contraception more than once in the same cycle.

For further information on the use of oral hormonal methods as emergency contraception, see the FSRH guideline: **Emergency Contraception** (see Useful resources).

#### *Hormonal emergency contraception interactions*

See Contraceptives, interactions below.

#### **Starting hormonal contraception after hormonal emergency contraception**

The copper intra-uterine device immediately provides effective ongoing contraception, whereas oral hormonal emergency contraception methods do **not**.

⚡ After taking levonorgestrel, females should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Females should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception; they must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. However, hormonal contraception can be started immediately in females who are on a regular combined hormonal contraceptive who have missed contraception within the first week of restarting after a scheduled hormone-free interval, and have taken ulipristal acetate as emergency contraception; they must use condoms reliably or abstain from intercourse for 7 days until contraception becomes effective. ⚡ For further information on delaying versus immediately restarting combined hormonal contraception after taking ulipristal acetate, see the FSRH Clinical Effectiveness Unit statement: **Response to recent publication** (available at: [www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-response-to-recent-publication-regarding/](http://www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-response-to-recent-publication-regarding/)).

#### **Useful Resources**

Emergency Contraception. The Faculty of Sexual and Reproductive Healthcare. FSRH guideline. March 2017, updated December 2020.  
[www.fsrh.org/standards-and-guidance/documents/ceu-clinical-guidance-emergency-contraception-march-2017](http://www.fsrh.org/standards-and-guidance/documents/ceu-clinical-guidance-emergency-contraception-march-2017)

## Contraceptives, interactions

05-May-2022

### Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 336, eslicarbazepine acetate, nevirapine p. 700, oxcarbazepine p. 349, phenytoin p. 351, phenobarbital p. 365, primidone p. 366, ritonavir p. 714, St John's wort, topiramate p. 361 and, above all, rifabutin p. 627 and rifampicin p. 634), and possibly also griseofulvin p. 655. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For further information on other drug interactions with hormonal contraceptives, see the *Interactions* section of the relevant drug monograph.

### Combined hormonal contraceptive interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 876 and norethisterone p. 823) or intra-uterine devices (levonorgestrel p. 872; see also Contraceptives, non-hormonal p. 857). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

#### **Short course (2 months or less) of an enzyme-inducing drug**

Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

#### **Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin**

Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily p. 819 [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period.

#### **Long-term course (over 2 months) of rifampicin or rifabutin**

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

#### **Antibacterials that do not induce liver enzymes**

Due to anecdotal reports of contraceptive failures, there had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 599, doxycycline p. 616) reduce the efficacy of *combined* oral contraceptives by

impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction. It is recommended by the Faculty of Sexual and Reproductive Healthcare (FSRH) that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur when using combined oral contraceptives. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

#### Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

#### Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 875 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

#### Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 870 could be reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). [EvGr](#) A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions under levonorgestrel*). [⚠](#) There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

[EvGr](#) Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended. Women on a regular combined oral contraceptive may be able to restart regular contraception immediately after administration of ulipristal acetate as emergency hormonal contraception. [⚠](#) For further information, see *Starting hormonal contraception after emergency hormonal contraception under Emergency contraceptive methods in Emergency contraception p. 858*.

When a progestogen (including levonorgestrel for emergency contraception) is given 7 days before, or 5 days after administration of ulipristal acetate p. 870 as emergency hormonal contraception, the contraceptive effect of ulipristal acetate may be reduced.

## 3.1 Contraception, combined

### OESTROGENS COMBINED WITH PROGESTOGENS

#### Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · atrial fibrillation · benign hepatocellular adenoma · Budd-Chiari syndrome · cardiomyopathy with impaired cardiac function · complicated congenital heart disease · complicated valvular heart disease · current breast cancer · hepatocellular carcinoma · hypertension (blood pressure systolic 160 mmHg or diastolic 100 mmHg or higher) · hypertensive retinopathy · ischaemic heart disease · known thrombogenic mutations (e.g. factor V Leiden, prothrombin mutation, protein S, protein C and antithrombin deficiencies) · less than 3 weeks postpartum in non-breastfeeding women with other risk factors for venous thromboembolism · less than 6 weeks postpartum in breastfeeding women · major surgery with prolonged immobilisation · migraine with aura · peripheral vascular disease with intermittent claudication · positive antiphospholipid antibodies · previous or current venous thrombosis · smoking in patients aged 35 years and over (15 or more cigarettes daily) · stroke · systemic lupus erythematosus with antiphospholipid antibodies · transient ischaemic attack
- **CAUTIONS**
  - GENERAL CAUTIONS** Carrier of breast cancer gene mutations e.g. BRCA1, BRCA2—seek specialist advice before use · cervical intraepithelial neoplasia or cancer · cholestasis during pregnancy · cholestasis with previous use of combined hormonal contraception—seek specialist advice before use · focal nodular hyperplasia · gallbladder disease—if medically treated or current, seek specialist advice before use · history of breast cancer—seek specialist advice before use · history of negative mood changes induced by hormonal contraceptive (a product containing an alternative progestogen may be tried) · inflammatory bowel disease · organ transplantation—when complicated, seek specialist advice before use · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · prolactinoma—seek specialist advice before use · risk factors for cardiovascular disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed mass or breast symptoms during combined hormonal contraception treatment—if symptoms exist prior to initiation, seek specialist advice before use · undiagnosed vaginal bleeding · viral hepatitis during

combined hormonal contraception treatment—if condition exists prior to initiation, seek specialist advice before use

#### SPECIFIC CAUTIONS

- With oral use Bariatric surgery with body mass index  $30 \text{ kg/m}^2$  to  $34 \text{ kg/m}^2$  (possible reduction in contraceptive efficacy)—if body mass index  $\geq 35 \text{ kg/m}^2$ , seek specialist advice before use · severe diarrhoea (possible reduction in contraceptive efficacy) · vomiting (possible reduction in contraceptive efficacy)

#### CAUTIONS, FURTHER INFORMATION

- Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is smaller than that associated with pregnancy and the postpartum period. In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen and oestrogen dose.
- Risk factors for venous thromboembolism Use with **caution** if any of following factors present and **avoid or seek specialist advice** if multiple risk factors present (for risk factors where treatment with combined hormonal contraceptives should be avoided, see *Contra-indications*)
  - Age 40 years and older—if 50 years and older, seek specialist advice before use;
  - 6 weeks to 6 months *postpartum* in breastfeeding women;
  - 3 to 6 weeks *postpartum* in non-breastfeeding women in the absence of additional risk factors for venous thromboembolism—if 3 to 6 weeks *postpartum* with risk factors, or if less than 3 weeks *postpartum* without risk factors, seek specialist advice before use;
  - Smoking if age under 35 years, or if 35 years and older and have stopped smoking at least 1 year ago—if 35 years and older smoking less than 15 cigarettes a day or stopped smoking less than 1 year ago, seek specialist advice before use;
  - Obesity with body mass index  $30 \text{ kg/m}^2$  to  $34 \text{ kg/m}^2$ —if body mass index  $\geq 35 \text{ kg/m}^2$ , seek specialist advice before use;
  - History of hypertension during pregnancy in currently normotensive women;
  - Family history of venous thromboembolism in a first-degree relative aged 45 years and older—if first-degree relative is under 45 years, seek specialist advice before use;
  - Major surgery without prolonged immobilisation;
  - Long-term immobility (e.g. wheelchair use, debilitating illness)—seek specialist advice before use;
  - Superficial venous thrombosis;
  - Uncomplicated valvular heart disease;
  - Uncomplicated congenital heart disease;
  - Cardiomyopathy with normal cardiac function;
  - Long QT syndrome;
  - Systemic lupus erythematosus with no antiphospholipid antibodies;
  - High altitudes: women travelling above 4500 m or 14500 feet for more than 1 week should consider alternative contraceptive methods (risk of thrombosis).

### Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel <sup>1</sup>	5-7
Norgestimate <sup>1</sup>	5-7
Norethisterone <sup>1</sup>	5-7
Etonogestrel <sup>1</sup>	6-12
Norelgestromin <sup>1</sup>	6-12
Gestodene <sup>1</sup>	9-12
Desogestrel <sup>1</sup>	9-12
Drospirenone <sup>1</sup>	9-12
Dienogest <sup>2</sup>	Not known—insufficient data
Nomegestrol <sup>2</sup>	Not known—insufficient data

<sup>1</sup> Combined with ethinylestradiol <sup>2</sup> Combined with estradiol

- Risk of cardiovascular disease Combined hormonal contraceptives also slightly increase the risk of cardiovascular disease such as myocardial infarction and ischaemic stroke; risk appears to be greater with higher oestrogen doses.
- Risk factors for cardiovascular disease Use with **caution** if any one of following factors present but **avoid or seek specialist advice** if multiple risk factors present (for risk factors where treatment with combined hormonal contraceptives should be avoided, see *Contra-indications*)
  - Age 40 years and older—if 50 years and older, seek specialist advice before use;
  - Smoking if age under 35 years, or if 35 years and older and have stopped smoking at least 1 year ago—if 35 years and older smoking less than 15 cigarettes a day, or stopped smoking less than 1 year ago, seek specialist advice before use;
  - Hypertension if adequately controlled or if blood pressure systolic 140–159 mmHg or diastolic 90–99 mmHg, seek specialist advice before use;
  - History of hypertension during pregnancy in currently normotensive women;
  - Dyslipidaemias;
  - Non-migrainous headache (mild or severe) during combined hormonal contraceptive use;
  - Migraine without aura prior to initiation of combined hormonal contraceptives—if migraine without aura occurs during combined hormonal contraceptive use or when history of migraine with aura is 5 or more years ago, seek specialist advice;
  - Idiopathic intracranial hypertension
  - Uncomplicated valvular heart disease;
  - Uncomplicated congenital heart disease;
  - Cardiomyopathy with normal cardiac function;
  - Long QT syndrome;
  - Diabetes mellitus—if vascular disease present, seek specialist advice before use;
  - Rheumatoid arthritis;
  - Systemic lupus erythematosus without antiphospholipid antibodies.

#### • SIDE-EFFECTS

- Common or very common Acne · fluid retention · headaches · metrorrhagia · nausea · weight increased
- Uncommon Alopecia · hypertension
- Rare or very rare Venous thromboembolism

#### SIDE-EFFECTS, FURTHER INFORMATION

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the

combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

**Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **● PREGNANCY** Not known to be harmful.
- **● BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **● HEPATIC IMPAIRMENT** In general, manufacturer advises caution; avoid in acute disease, severe chronic disease, or liver tumour.
- **● DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. FSRH advises if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; for estradiol-containing preparations, additional precautions (barrier methods) necessary for 7 days (9 days for *Qlaira*®) if started after day 1 of cycle. Changing to combined preparation containing different progestogen
  - ▶ With oral use FSRH advises if previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. Consult product literature for requirements of specific preparations. Changing from progestogen-only tablet
  - ▶ With oral use FSRH advises if previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). Secondary amenorrhoea (exclude pregnancy)
  - ▶ With oral use FSRH advises start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®). After childbirth (not breast-feeding)
  - ▶ With oral use FSRH advises start 3 weeks after childbirth except on specialist advice in the absence of additional risk factors for thromboembolism, or 6 weeks after childbirth in the presence of additional risk factors for thromboembolism (increased risk of thrombosis if started earlier); additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). After abortion, miscarriage, ectopic pregnancy or gestational trophoblastic disease
  - ▶ With oral use FSRH advises additional contraceptive precautions (barrier methods) required for 7 days if started after day 5 following treatment; for estradiol-containing preparations, additional contraceptive precautions (barrier methods) required for 7 days (9 days for *Qlaira*®) if started after day 1 following treatment.
- **● PATIENT AND CARER ADVICE**

**Travel** Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting

- ▶ With oral use Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.

**Missed doses**

- ▶ With oral use The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

## Dienogest with estradiol valerate

17-Feb-2021

### ● INDICATIONS AND DOSE

**Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations**

#### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding may occur during the 2-day interval of inactive tablets); subsequent courses repeated without interval

- **● INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **● SIDE-EFFECTS**
  - ▶ **Common or very common** Breast abnormalities · gastrointestinal discomfort · increased risk of infection · menstrual cycle irregularities
  - ▶ **Uncommon** Appetite increased · cervical abnormalities · crying · depression · diarrhoea · dizziness · fatigue · haemorrhage · hot flush · hyperhidrosis · mood altered · muscle spasms · neoplasms · oedema · ovarian and fallopian tube disorders · painful sexual intercourse · pelvic disorders · sexual dysfunction · skin reactions · sleep disorders · uterine cramps · vomiting · vulvovaginal disorders · weight decreased
  - ▶ **Rare or very rare** Aggression · anxiety · arterial thromboembolism · asthma · chest pain · cholecystitis chronic · concentration impaired · constipation · contact lens intolerance · dry eye · dry mouth · dyspnoea · eye swelling · fever · galactorrhoea · gastrooesophageal reflux disease · genital discharge · hair changes · hypertriglyceridaemia · hypotension · lymphadenopathy · malaise · myocardial infarction · pain · palpitations ·

paraesthesia · seborrhoea · sensation of pressure · urinary tract pain · vascular disorders · vertigo

#### ● DIRECTIONS FOR ADMINISTRATION

Changing to *Qlaira*® Start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand.

#### ● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

**Missed doses** A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

#### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

##### Form unstated

## Ethinylestradiol with etonogestrel

14-Mar-2021

### ● INDICATIONS AND DOSE

#### Menstrual symptoms

##### ► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

#### Contraception

##### ► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'tailored' regimens in which there is a shortened, less frequent, or no ring-free interval.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives · ethinylestradiol · etonogestrel

#### ● DIRECTIONS FOR ADMINISTRATION

Changing from combined hormonal contraception to vaginal ring Manufacturer advises insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method to vaginal ring From an implant or intra-uterine progestogen-only device, manufacturer advises insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

#### Mixed doses

##### Expulsion, delayed insertion or removal, or broken vaginal ring

If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Vaginal delivery system

- ▶ **NuvaRing** (Organon Pharma (UK) Ltd)  
**Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg** NuvaRing 0.12mg/0.015mg per day vaginal delivery system | 3 system [PoM](#) £29.70 DT = £29.70

#### Contraception with 21-day combined preparations

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after hormone-free interval, withdrawal bleeding occurs during the hormone-free interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day, see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no hormone-free interval.

#### Menstrual symptoms with 28-day combined preparations

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 active tablet once daily for 21 days, followed by 1 inactive tablet once daily for 7 days, withdrawal bleeding occurs during the 7-day interval of *inactive* tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day. Subsequent courses repeated without interval

#### Contraception with 28-day combined preparations

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 active tablet once daily for 21 days, followed by 1 inactive tablet once daily for 7 days, withdrawal bleeding occurs during the interval of *inactive* tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day. Subsequent courses repeated without interval, see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'tailored' regimens in which there is a shortened, less frequent, or no interval where *inactive* tablets are taken.

## Ethinylestradiol with norelgestromin

14-Mar-2021

### ● INDICATIONS AND DOSE

#### Menstrual symptoms

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

#### Contraception

##### ▶ BY TRANSDERMAL APPLICATION

- ▶ Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after a patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a patch-free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 854 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no patch-free interval.

- **CAUTIONS** Body-weight 90 kg and above (possible reduction in contraceptive efficacy)
- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives · ethinylestradiol
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · breast abnormalities · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · increased risk of infection · malaise · menstrual cycle irregularities · mood altered · muscle spasms · skin reactions · uterine cramps · vaginal haemorrhage · vomiting · vulvovaginal disorders
  - ▶ **Uncommon** Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
  - ▶ **Rare or very rare** Embolism and thrombosis · gallbladder disorders · genital discharge · neoplasms · stroke · swelling

- **Frequency not known** Anger · angioedema · cervical dysplasia · colitis · contact lens intolerance · erythema nodosum · hepatic disorders · hyperglycaemia · intracranial haemorrhage · myocardial infarction · pulmonary artery thrombosis · taste altered

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive

#### Changing from combined oral contraception

Manufacturer advises apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

#### Changing from progestogen-only method

Manufacturer advises

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**After childbirth (not breast-feeding)** Manufacturer advises start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

**After abortion or miscarriage** Manufacturer advises before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

**Travel** Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

#### Missed doses

**Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal

contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

**3.2 Contraception, devices****Other drugs used for Contraception, devices**

Levonorgestrel, p. 872

**CONTRACEPTIVE DEVICES****Intra-uterine contraceptive devices (copper)**

24-Nov-2020

● **INDICATIONS AND DOSE****Contraception**▶ **BY INTRA-UTERINE ADMINISTRATION**

- ▶ Females of childbearing potential: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen;

consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · genital malignancy · medical diathermy · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · unexplained uterine bleeding · Wilson's disease
- **CAUTIONS** Anaemia · anatomical abnormalities—seek specialist advice · anticoagulant therapy · cardiac disease—seek specialist advice · endometriosis · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)—seek specialist advice · menorrhagia (progestogen intra-uterine system might be preferable) · postpartum—seek specialist advice · risk of sexually transmitted infections · severe primary dysmenorrhoea · young age
- **CAUTIONS, FURTHER INFORMATION** The Faculty of Sexual and Reproductive Healthcare advises if removal is after day 3 of the menstrual cycle, intercourse should be avoided or another method of contraception used for at least 7 days before removal of device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed after day 3 of the menstrual cycle.
- Sexually transmitted infections and pelvic inflammatory disease The main excess risk of pelvic infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  - they are under 25 years old *or*
  - they are over 25 years old *and*
    - have a new partner *or*
    - have had more than one partner in the past year *or*
    - their regular partner has other partners.

The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) be performed in these women. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, consider appropriate prophylactic antibacterial cover. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Abdominal pain lower · anaemia · back pain · device complications · menstrual cycle irregularities · pelvic inflammatory disease · uterine injuries
- **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated if patient has a copper allergy. 
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.
- **PRESCRIBING AND DISPENSING INFORMATION**  
**TT380® SLIMLINE** For uterine length 6.5–9 cm; replacement every 10 years.

#### PROGESTERONE RECEPTOR MODULATORS

##### Ulipristal acetate

13-Apr-2021

- **DRUG ACTION** Ulipristal acetate is a synthetic, selective progesterone receptor modulator with a partial progesterone antagonist effect.

##### ● INDICATIONS AND DOSE

###### Emergency contraception

###### ► BY MOUTH

- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

###### Uterine fibroids (under expert supervision)

###### ► BY MOUTH

- Adult: 5 mg daily for up to 3 months, starting during the first week of menstruation, treatment course may be repeated if necessary; re-treatment should start no sooner than during the first week of the second menstruation following completion of the previous course; maximum 4 courses

##### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ULIPRISTAL ACETATE 5 MG (*ESMYA*®): FURTHER RESTRICTIONS DUE TO RISK OF SERIOUS LIVER INJURY (FEBRUARY 2021)

Rare but serious cases of liver injury and hepatic failure requiring liver transplantation have been reported worldwide in women treated with *Esmya*® for symptoms of uterine fibroids. Its licence was temporarily suspended in March 2020 to allow a further review of these risks. Although the temporary suspension has been lifted, further restrictions have been introduced.

Healthcare professionals are advised that *Esmya*® should only be used for intermittent treatment of moderate to severe uterine fibroid symptoms before menopause and when surgical procedures (including uterine fibroid embolisation) are not suitable or have failed. If considered to be appropriate therapy, the risks and benefits of *Esmya*® should be discussed with patients before prescribing so that they can make an informed decision about treatment options. Liver function should be monitored before, during, and after treatment courses (see *Monitoring requirements*); *Esmya*® should not be used in those with an underlying liver disorder. Patients should be advised to stop therapy and seek immediate medical advice if any signs of liver damage develop.

There are currently no concerns with the use of the emergency contraceptive *ellaOne*®—see *Indications and dose*.

##### ● CONTRA-INDICATIONS

**GENERAL CONTRA-INDICATIONS** Breast cancer · cervical cancer · ovarian cancer · severe asthma controlled by oral glucocorticoids · undiagnosed vaginal bleeding · uterine cancer

##### SPECIFIC CONTRA-INDICATIONS

- When used for uterine fibroids Vaginal bleeding not caused by uterine fibroids

- **INTERACTIONS** → Appendix 1: ulipristal

##### ● SIDE-EFFECTS

- **Common or very common** Asthenia · breast abnormalities · dizziness · endometrial thickening · gastrointestinal discomfort · headaches · hot flush · menstrual cycle irregularities · mood altered · myalgia · nausea · ovarian and fallopian tube disorders · pain · pelvic pain · skin reactions · vertigo · vomiting · weight increased
- **Uncommon** Alopecia · anxiety · appetite disorder · chills · concentration impaired · constipation · diarrhoea · drowsiness · dry mouth · fever · flatulence · genital abnormalities · hyperhidrosis · increased risk of infection · insomnia · libido disorder · malaise · oedema · urinary incontinence · vision disorders · vulvovaginal disorders
- **Rare or very rare** Abnormal sensation in eye · disorientation · dry throat · epistaxis · eye erythema · painful sexual intercourse · syncope · taste altered · thirst · tremor
- **Frequency not known** Angioedema · hepatic disorders

##### ● CONCEPTION AND CONTRACEPTION

- When used for Uterine fibroids [EvGr](#) Non-hormonal contraceptive methods should be used during treatment and for 12 days after stopping, if required. [⚠](#)

##### ● PREGNANCY

- When used for Emergency contraception [EvGr](#) Limited information available—if pregnancy occurs, report to the *ellaOne*® pregnancy registry. [⚠](#)
- When used for Uterine fibroids [EvGr](#) Avoid—limited information available. [⚠](#)

##### ● BREAST FEEDING

- When used for Emergency contraception [EvGr](#) Avoid for 1 week after administration—present in milk. [⚠](#)
- When used for Uterine fibroids [EvGr](#) Avoid—present in milk but no further information available. [⚠](#)

##### ● HEPATIC IMPAIRMENT

- When used for Emergency contraception [EvGr](#) Avoid in severe impairment—no information available. [⚠](#)
- When used for Uterine fibroids [EvGr](#) Avoid—risk of increased exposure. [⚠](#)

##### ● RENAL IMPAIRMENT

- When used for Uterine fibroids [EvGr](#) Avoid in severe impairment unless patient is closely monitored—no information available. [⚠](#)

##### ● MONITORING REQUIREMENTS

- When used for Uterine fibroids [EvGr](#) Perform liver function tests before treatment initiation—do not initiate if serum transaminases exceed 2 times the upper limit of normal. During the first 2 treatment courses, monitor liver function monthly; for further treatment courses, perform liver function tests once before each new treatment course and when clinically indicated. At the end of each treatment course, perform liver function tests after 2–4 weeks. Discontinue treatment if serum transaminases exceed 3 times the upper limit of normal and closely monitor patient. Periodically monitor the endometrium following repeated intermittent treatment. [⚠](#)

##### ● PATIENT AND CARER ADVICE

- When used for Emergency contraception When prescribing or supplying hormonal emergency contraception, women should be told:
  - if vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
  - that their next period may be early or late;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- that a barrier method of contraception needs to be used—see Emergency contraception p. 858 for further information;
- that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
- that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- ▶ When used for Uterine fibroids Prescribers should explain to patients the requirement for treatment-free intervals—see also *Important safety information*. Patient card
- ▶ When used for Uterine fibroids A patient card should be provided.
- Missed doses**
  - ▶ When used for Uterine fibroids If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks**
  - ▶ When used for Emergency contraception Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Ellaone** (HRA Pharma UK & Ireland Ltd)  
Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05 DT = £14.05
- ▶ **Esmya** (Gedeon Richter (UK) Ltd)  
Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [PoM] £114.13 DT = £114.13

## 3.4 Contraception, oral progestogen-only

**Other drugs used for Contraception, oral progestogen-only** Norethisterone, p. 823

### PROGESTOGENS

#### Desogestrel

18-Jan-2022

##### ● INDICATIONS AND DOSE

**Contraception**

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · current breast cancer
- **CAUTIONS** Cardiac dysfunction · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · liver tumours—seek specialist advice before use · malabsorption states · migraine with aura · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus · undiagnosed vaginal bleeding
- **INTERACTIONS** → Appendix 1: desogestrel

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Breast abnormalities · depressed mood · headache · libido decreased · menstrual cycle irregularities · mood altered · nausea · skin reactions · weight increased
- ▶ **Uncommon** Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
- ▶ **Rare or very rare** Erythema nodosum
- ▶ **Frequency not known** Angioedema · embolism and thrombosis · neoplasms

**SIDE-EFFECTS, FURTHER INFORMATION** The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- **ALLERGY AND CROSS-SENSITIVITY** [EVGr] *Feanolla*<sup>®</sup>, *Lovima*<sup>®</sup> and *Moonia*<sup>®</sup> tablets contra-indicated in patients with hypersensitivity or allergy to peanuts or soya. ⚠
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe or active disease.
- **PATIENT AND CARER ADVICE**

**Surgery** All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

**After childbirth** Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea,

additional precautions should be used during illness and for 2 days after recovery.

**Missed doses** The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

#### • NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Desogestrel (*Cerazette*<sup>®</sup>) for use as contraception (September 2003) SMC No. 36/03 Recommended with restrictions
- EXCEPTIONS TO LEGAL CATEGORY *Hana*<sup>®</sup> 75 microgram tablets and *Lovima*<sup>®</sup> 75 microgram tablets can be sold to the public for use as oral contraception in females of childbearing potential, following a clinical assessment.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ Desogestrel (Non-proprietary)

**Desogestrel 75 microgram** Desogestrel 75microgram tablets | 84 tablet [PoM] £22.92 DT = £1.86

##### ▶ Cerazette (Organon Pharma (UK) Ltd)

**Desogestrel 75 microgram** Cerazette 75microgram tablets | 84 tablet [PoM] £9.55 DT = £1.86

##### ▶ Cerelle (Consilient Health Ltd)

**Desogestrel 75 microgram** Cerelle 75microgram tablets | 84 tablet [PoM] £3.50 DT = £1.86

##### ▶ Desomono (MedRx Licences Ltd)

**Desogestrel 75 microgram** Desomono 75microgram tablets | 84 tablet [PoM] £6.50 DT = £1.86

##### ▶ Desorex (Somex Pharma)

**Desogestrel 75 microgram** Desorex 75microgram tablets | 84 tablet [PoM] £2.45 DT = £1.86

##### ▶ Zelleta (Morningside Healthcare Ltd)

**Desogestrel 75 microgram** Zelleta 75microgram tablets | 84 tablet [PoM] £2.98 DT = £1.86

administration delayed for 3 hours or more it should be regarded as a 'missed pill'

#### JAYDESS<sup>®</sup> 13.5MG INTRA-UTERINE DEVICE

##### Contraception

###### ▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 3 years

#### KYLEENA<sup>®</sup> 19.5MG INTRA-UTERINE DEVICE

##### Contraception

###### ▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

#### LEVOSERT<sup>®</sup> 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

##### Contraception | Menorrhagia

###### ▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 6 years when used for contraception and for 5 years when used for menorrhagia

#### MIRENA<sup>®</sup> 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

##### Contraception | Menorrhagia

###### ▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

##### Prevention of endometrial hyperplasia during oestrogen replacement therapy

###### ▶ BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

## Levonorgestrel

13-Apr-2021

### • INDICATIONS AND DOSE

#### Emergency contraception

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m<sup>2</sup>

#### Contraception

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ When used orally as an emergency contraceptive, the effectiveness of levonorgestrel could be reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.

**• UNLICENSED USE**

- ▶ With intra-uterine use The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
  - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
  - Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended;
  - Insertion immediately following termination of pregnancy below 24 weeks' gestation;
  - Postpartum insertions 4 weeks after delivery.
- ▶ With oral use The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
  - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m<sup>2</sup>;
  - Use for emergency contraception between 72–96 hours after coitus.
- ▶ With intra-uterine use or oral use in children Consult product literature for licensing status of individual preparations.

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

**• CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS** Current breast cancer (use with caution for emergency contraception)

**SPECIFIC CONTRA-INDICATIONS**

- ▶ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) · acute malignancies affecting the blood (use with caution in remission) · not suitable for emergency contraception · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually

transmitted infection (if not fully investigated and treated) · unexplained uterine bleeding · uterine or cervical malignancy

- ▶ With oral use Acute porphyrias p. 1150

**• CAUTIONS**

**GENERAL CAUTIONS** Cardiac disease—seek specialist advice for intra-uterine insertion · diabetes · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · migraine · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus

**SPECIFIC CAUTIONS**

- ▶ With intra-uterine use Anatomical abnormalities—seek specialist advice before use · cervical intraepithelial neoplasia · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)—seek specialist advice before use · postpartum—seek specialist advice before use · risk of sexually transmitted infections · young age
- ▶ With oral use Malabsorption states
- ▶ With oral use for contraception Undiagnosed vaginal bleeding

**CAUTIONS, FURTHER INFORMATION**

- ▶ With intra-uterine use The Faculty of Sexual and Reproductive Healthcare advises intercourse should be avoided or another method of contraception used for at least 7 days before removal of intra-uterine device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed.
- ▶ Sexually transmitted infections and pelvic inflammatory disease
- ▶ With intra-uterine use The main excess risk of pelvic infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  - they are under 25 years old *or*
  - they are over 25 years old *and*
    - have a new partner *or*
    - have had more than one partner in the past year *or*
    - their regular partner has other partners.

The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) be performed in these women. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE** Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel

**• SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Gastrointestinal discomfort · headaches · menstrual cycle irregularities · nausea · skin reactions

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intra-uterine use Back pain · breast abnormalities · depression · device expulsion · hirsutism · increased risk of infection · libido decreased · nervousness · ovarian cyst · pelvic disorders · uterine haemorrhage (on insertion) · vaginal haemorrhage (on insertion) · vulvovaginal disorders · weight increased
- ▶ With oral use Breast tenderness · diarrhoea · dizziness · fatigue · haemorrhage · vomiting
- ▶ **Uncommon**
- ▶ With intra-uterine use Alopecia · endometritis · oedema · uterine rupture
- ▶ **Rare or very rare**
- ▶ With oral use Face oedema · pelvic pain

► **Frequency not known**

- With oral use Cerebrovascular insufficiency · depressed mood · diabetes mellitus · embolism and thrombosis · neoplasms · sexual dysfunction · weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

**With intra-uterine use** There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patient's cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

● **PREGNANCY**

- With oral use Not known to be harmful.
- With intra-uterine use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

● **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

● **HEPATIC IMPAIRMENT**

- With intra-uterine use or oral use for Contraception Manufacturer advises avoid in liver tumour.
- With oral use for Contraception or Emergency contraception Manufacturer advises avoid in severe impairment.
- With intra-uterine use Manufacturer advises avoid in acute hepatic disease or in severe impairment (no information available)—consult product literature.

● **MONITORING REQUIREMENTS**

- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

● **DIRECTIONS FOR ADMINISTRATION**

- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

● **PRESCRIBING AND DISPENSING INFORMATION**

- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

● **PATIENT AND CARER ADVICE**

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or

very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

**Starting routine**

- With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones). After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:

- if vomiting occurs within 3 hours, a replacement dose should be taken;
- that their next period may be early or late;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- that a barrier method of contraception needs to be used—see Emergency contraception p. 858 for further information;
  - that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
  - that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
  - With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.
- Missed doses** When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

● **Scottish Medicines Consortium (SMC) decisions**

- Levonorgestrel (*Kyleena*)<sup>®</sup> for contraception for up to 5 years (February 2018) SMC No. 1299/18 Recommended

● **All Wales Medicines Strategy Group (AWMSG) decisions**

- Levonorgestrel (*Kyleena*)<sup>®</sup> for contraception for up to 5 years (September 2018) AWMSG No. 3582 Recommended

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle*<sup>®</sup> *One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Other drugs used for Contraception, parenteral progestogen-only** Norethisterone, p. 823

### PROGESTOGENS

#### Etonogestrel

11-Mar-2021

- **INDICATIONS AND DOSE**

**Contraception [no hormonal contraceptive use in previous month]**

- ▶ **BY SUBDERMAL IMPLANTATION**

- ▶ Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted during the first 5 days of cycle, no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

**Contraception [postpartum]**

- ▶ **BY SUBDERMAL IMPLANTATION**

- ▶ Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted within 20 days after delivery (or up to 6 months postpartum if fully breast-feeding and amenorrhoeic), no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

#### Contraception [following abortion or miscarriage]

- ▶ **BY SUBDERMAL IMPLANTATION**

- ▶ Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, when inserted within 5 days after abortion or miscarriage, no additional contraceptive precautions are needed, when inserted at any other time, additional precautions (e.g. barrier methods) advised for next 7 days

**Contraception [changing from other hormonal contraceptive]**

- ▶ **BY SUBDERMAL IMPLANTATION**

- ▶ Females of childbearing potential: 1 implant, which can be left in place for up to 3 years, consult product literature for advice on when to insert and additional contraceptive precautions

- **UNLICENSED USE** The FSRH advises that the etonogestrel implant is used as detailed below, although these situations are considered unlicensed:

- females outside the age range of 18–40 years;
- postpartum insertions within 20 days after delivery (or up to 6 months postpartum if fully breast-feeding and amenorrhoeic);
- insertion within 5 days after abortion or miscarriage in the second trimester.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): NEXPLANON® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: NEW INSERTION SITE TO REDUCE RARE RISK OF NEUROVASCULAR INJURY AND IMPLANT MIGRATION**

There have been reports of neurovascular injury and migration of Nexplanon® implants from the insertion site to the vasculature, including the pulmonary artery in rare cases. Correct subdermal insertion by an appropriately trained and accredited healthcare professional is recommended to reduce the risk of these events. Healthcare professionals are advised to review the updated guidance from the manufacturer and the statement from the Faculty of Sexual and Reproductive Healthcare (FSRH) on how to correctly insert the implant. Patients should be advised on how to locate the implant, informed to check this occasionally and report any concerns. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Implants inserted at a previous site that can be palpated should not pose a risk and should only be replaced if there are issues with its location or if a routine replacement is due.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · current breast cancer

- **CAUTIONS** Cardiac dysfunction · cervical cancer · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · history of stroke (including transient ischaemic attack) · history of venous thromboembolism · ischaemic heart disease · liver tumours—seek specialist advice before use · migraine · multiple risk factors for cardiovascular disease · positive antiphospholipid antibodies · rheumatoid arthritis · systemic lupus erythematosus · undiagnosed vaginal bleeding—seek specialist advice before use

- **INTERACTIONS** → Appendix 1: etonogestrel

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased ·

menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes

- ▶ **Uncommon** Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · myalgia · oedema · vomiting · vulvovaginal discomfort
- ▶ **Frequency not known** Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea

**SIDE-EFFECTS, FURTHER INFORMATION** The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Implant

- ▶ **Nexplanon** (Organon Pharma (UK) Ltd)  
Etonogestrel 68 mg Nexplanon 68mg implant | 1 device **POM**  
£83.43 DT = £83.43

## Medroxyprogesterone acetate

08-Nov-2021

### ● INDICATIONS AND DOSE

#### Dysfunctional uterine bleeding

- ▶ BY MOUTH
- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

#### Secondary amenorrhoea

- ▶ BY MOUTH
- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

#### Mild to moderate endometriosis

- ▶ BY MOUTH
- ▶ Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

#### Progestogen opposition of oestrogen HRT

- ▶ BY MOUTH
- ▶ Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

#### Endometrial cancer | Renal cell cancer

- ▶ BY MOUTH
- ▶ Adult: 200–600 mg daily

#### Breast cancer

- ▶ BY MOUTH
- ▶ Adult: 0.4–1.5 g daily

### Contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

#### Long-term contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

#### Contraception (when patient changing from other hormonal contraceptive)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: (consult product literature)

#### Hot flushes caused by long-term androgen suppression in men with prostate cancer

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period

- **UNLICENSED USE** **[EvGr]** Medroxyprogesterone acetate is used for the treatment of hot flushes caused by long-term androgen suppression in men, **⚠** but it is not licensed for this indication.
- **CONTRA-INDICATIONS**  
**GENERAL CONTRA-INDICATIONS** Acute porphyrias p. 1150 · current breast cancer (unless progestogens are being used in the management of this condition)  
**SPECIFIC CONTRA-INDICATIONS**  
▶ With oral use History of thromboembolism · undiagnosed vaginal bleeding
- **CAUTIONS**  
**GENERAL CAUTIONS** Cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of breast cancer—seek specialist advice before use · hypertension · liver tumours—seek specialist advice before use · migraine · positive antiphospholipid antibodies · rheumatoid arthritis · risk factors for thromboembolism · systemic lupus erythematosus  
**SPECIFIC CAUTIONS**  
▶ With intramuscular use or subcutaneous use Cervical cancer · history of stroke (including transient ischaemic attack)—seek specialist advice before use · history of venous thromboembolism · ischaemic heart disease—seek specialist advice before use · multiple risk factors for cardiovascular disease—seek specialist advice before use · undiagnosed vaginal bleeding—seek specialist advice before use  
▶ With oral use History of depression
- **INTERACTIONS** → Appendix 1: medroxyprogesterone

## ● SIDE-EFFECTS

### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · breast abnormalities · depression · dizziness · fluid retention · insomnia · menstrual cycle irregularities · nausea · sexual dysfunction · skin reactions · weight changes
- ▶ **Uncommon** Drowsiness · embolism and thrombosis · fever · galactorrhoea · hirsutism · muscle spasms · tachycardia

### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ With oral use Appetite increased · cervical abnormalities · constipation · fatigue · headache · hyperhidrosis · hypersensitivity · nervousness · oedema · tremor · vomiting
  - ▶ With parenteral use Anxiety · asthenia · gastrointestinal discomfort · headaches · mood altered · pain · vulvovaginal infection
- ▶ **Uncommon**
  - ▶ With oral use Congestive heart failure · corticoid-like effects · diabetes mellitus exacerbated · diarrhoea · dry mouth · euphoric mood · hypercalcaemia
  - ▶ With parenteral use Appetite abnormal · arthralgia · hot flush · hypertension · ovarian cyst · painful sexual intercourse · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders
- ▶ **Rare or very rare**
  - ▶ With oral use Cerebral infarction · jaundice · malaise · myocardial infarction
  - ▶ With parenteral use Breast cancer · lipodystrophy
- ▶ **Frequency not known**
  - ▶ With oral use Adrenergic-like effects · cataract diabetic · concentration impaired · confusion · glycosuria · palpitations · visual impairment (discontinue if papilloedema or retinal vascular lesions)
  - ▶ With parenteral use Hepatic disorders · osteoporosis · osteoporotic fractures · seizure

### SIDE-EFFECTS, FURTHER INFORMATION

**With oral use** In general, side effects may be more common with high doses such as those used in malignant disease.

**With parenteral use** Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

## ● CONCEPTION AND CONTRACEPTION

- ▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- ▶ With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

## ● PREGNANCY

- ▶ With oral use Avoid—genital malformations and cardiac defects reported.
- ▶ With intramuscular use or subcutaneous use Not known to be harmful.

- **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

- ▶ With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

## ● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises caution; avoid in acute or active disease.
- ▶ With intramuscular use or subcutaneous use Manufacturer advises caution; avoid in severe or active disease.

## ● RENAL IMPAIRMENT

- ▶ With oral use [EvGr](#) Use with caution. 

## ● PATIENT AND CARER ADVICE

- ▶ With intramuscular use or subcutaneous use Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

- ▶ **Climanor** (ReSource Medical UK Ltd)

**Medroxyprogesterone acetate 5 mg** Climanor 5mg tablets | 28 tablet [PoM](#) £3.27

- ▶ **Provera** (Pfizer Ltd)

**Medroxyprogesterone acetate 2.5 mg** Provera 2.5mg tablets | 30 tablet [PoM](#) £1.84 DT = £1.84

**Medroxyprogesterone acetate 5 mg** Provera 5mg tablets | 10 tablet [PoM](#) £1.23 DT = £1.23 | 100 tablet [PoM](#) £12.32

**Medroxyprogesterone acetate 10 mg** Provera 10mg tablets | 10 tablet [PoM](#) £2.47 | 90 tablet [PoM](#) £22.16 DT = £22.16 | 100 tablet [PoM](#) £24.73

**Medroxyprogesterone acetate 100 mg** Provera 100mg tablets | 60 tablet [PoM](#) £29.98 | 100 tablet [PoM](#) £49.94 DT = £49.94

**Medroxyprogesterone acetate 200 mg** Provera 200mg tablets | 30 tablet [PoM](#) £29.65 DT = £29.65

**Medroxyprogesterone acetate 400 mg** Provera 400mg tablets | 30 tablet [PoM](#) £58.67 DT = £58.67

### Suspension for injection

- ▶ **Depo-Provera** (Pfizer Ltd)

**Medroxyprogesterone acetate 150 mg per 1 ml** Depo-Provera 150mg/1ml suspension for injection vials | 1 vial [PoM](#) £6.01  
Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £6.01 DT = £6.01

- ▶ **Sayana Press** (Pfizer Ltd)

**Medroxyprogesterone acetate 160 mg per 1 ml** Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM](#) £6.90 DT = £6.90

## 3.6 Contraception, spermicidal

### SPERMICIDALS

#### Nonoxinol

#### ● INDICATIONS AND DOSE

**Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps**

- ▶ BY VAGINA

- ▶ Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness

**SIDE-EFFECTS, FURTHER INFORMATION** High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.

- **CONCEPTION AND CONTRACEPTION** No evidence of harm to diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

► **Gygel** (Marlbrough Pharmaceuticals Ltd)

Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 81 gram **[GSL]** £11.00 DT = £11.00

## 4 Erectile and ejaculatory conditions

### 4.1 Erectile dysfunction

#### Erectile dysfunction

06-Mar-2017

##### Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

##### Drug treatment

**[EvGr]** The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, Smoking cessation p. 531, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. **[A]** These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. **[EvGr]** Avanafil below, sildenafil p. 879 and vardenafil p. 882 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 880 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil (prostaglandin E<sub>1</sub>) p. 882 is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis. **[A]**

##### Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two

minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the *corpus cavernosum*; if necessary the procedure may be repeated on the opposite side;
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite *corpus cavernosum*; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse—see phenylephrine hydrochloride p. 885 [unlicensed indication], adrenaline/epinephrine p. 884 [unlicensed indication], and metaraminol p. 885 [unlicensed indication]. Extreme **caution** is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;
- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

##### Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: [www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff](http://www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff).

Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hsbusines.hscni.net/services/2034.htm](http://www.hsbusines.hscni.net/services/2034.htm).

Scottish Drug Tariff: [www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/).

##### Related drugs

Other drugs used for Erectile dysfunction: aviptadil with phentolamine mesilate p. 886.

## PHOSPHODIESTERASE TYPE-5 INHIBITORS

### Avanafil

10-Aug-2021

#### ● INDICATIONS AND DOSE

##### Erectile dysfunction

###### ► BY MOUTH

- **Adult:** Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

##### Erectile dysfunction in patients on alpha-blocker therapy

###### ► BY MOUTH

- **Adult:** Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure >170/100 mmHg · hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina

- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

**SIDE-EFFECTS**

- ▶ **Common or very common** Headaches · nasal complaints · vasodilation
- ▶ **Uncommon** Asthenia · dizziness · drowsiness · dyspnoea exertional · gastrointestinal discomfort · muscle complaints · nausea · pain · palpitations · respiratory disorders · vision blurred · vomiting
- ▶ **Rare or very rare** Akathisia · angina pectoris · chest pain · diarrhoea · dry mouth · emotional disorder · gastritis · genital pruritus · gout · haematuria · hypertension · increased risk of infection · influenza like illness · insomnia · penis disorder · peripheral oedema · rash · seasonal allergy · sexual dysfunction · tachycardia · urinary frequency increased · weight increased

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

**Dose adjustments** Manufacturer advises use lowest effective initial dose in mild to moderate impairment and adjust according to tolerance.

- **RENAL IMPAIRMENT** [EvGr](#) Avoid if creatinine clearance less than 30 mL/minute. [⚠](#) See p. 21.

- **PATIENT AND CARER ADVICE** Onset of effect may be delayed if taken with food.

**NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Avanafil (Spedra<sup>®</sup>)** for the treatment of erectile dysfunction (ED) in adult men (September 2015) SMC No. 980/14 Not recommended

**All Wales Medicines Strategy Group (AWMSG) decisions**

- ▶ **Avanafil (Spedra<sup>®</sup>)** for the treatment of erectile dysfunction in adult men (July 2015) AWMSG No. 1261 Recommended
- NHS restrictions** Spedra<sup>®</sup> is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff. The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Spedra** (A. Menarini Farmaceutica Internazionale SRL)

**Avanafil 50 mg** Spedra 50mg tablets | 4 tablet [PoM](#) £10.94 DT = £10.94 | 8 tablet [PoM](#) £19.70 DT = £19.70

**Avanafil 100 mg** Spedra 100mg tablets | 4 tablet [PoM](#) £14.08 DT = £14.08 | 8 tablet [PoM](#) £26.26 DT = £26.26

**Avanafil 200 mg** Spedra 200mg tablets | 4 tablet [PoM](#) £21.90 DT = £21.90 | 8 tablet [PoM](#) £39.40 DT = £39.40

**Sildenafil**

12-Aug-2021

**INDICATIONS AND DOSE****Pulmonary arterial hypertension (initiated under specialist supervision)****BY MOUTH**

- ▶ Adult: 20 mg 3 times a day

**BY INTRAVENOUS INJECTION**

- ▶ Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

**Erectile dysfunction****BY MOUTH**

- ▶ Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

**Digital ulcers [associated with systemic sclerosis]****BY MOUTH**

- ▶ Adult: 25 mg 3 times a day, increased to 50 mg 3 times a day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.
- ▶ With oral use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
- ▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

- **UNLICENSED USE** [EvGr](#) Sildenafil is used for the treatment of digital ulcer, [⚠](#) but is not licensed for this indication.

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS** Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

**SPECIFIC CONTRA-INDICATIONS**

- ▶ When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- ▶ When used for pulmonary arterial hypertension Sickle-cell anaemia

**CAUTIONS**

**GENERAL CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · autonomic dysfunction · bleeding disorders · cardiovascular disease · left ventricular

outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

#### SPECIFIC CAUTIONS

- ▶ When used for pulmonary arterial hypertension Hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · pulmonary veno-occlusive disease

#### CAUTIONS, FURTHER INFORMATION

- ▶ Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · cough · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nasal complaints · nausea · night sweats · pain · skin reactions · tremor · vasodilation · vision disorders
- ▶ **Uncommon** Arrhythmias · chest pain · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · fatigue · feeling hot · gynaecomastia · haemorrhage · hypertension · hypotension · myalgia · numbness · palpitations · sinus congestion · tinnitus · vertigo · vomiting
- ▶ **Rare or very rare** Acute coronary syndrome · arteriosclerotic retinopathy · cerebrovascular insufficiency · glaucoma · haematospermia · hearing impairment · irritability · optic neuropathy (discontinue if sudden visual impairment occurs) · oral hypoesthesia · priapism · retinal occlusion · scleral discolouration · seizure · severe cutaneous adverse reactions (SCARs) · sudden cardiac death · syncope · throat tightness

- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

#### Dose adjustments

- ▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 10 mg twice daily in mild to moderate impairment.
- ▶ With oral use for Pulmonary arterial hypertension Manufacturer advises if usual dose not tolerated, consider dose reduction to 20 mg twice daily in mild to moderate impairment.
- ▶ When used for Erectile dysfunction Manufacturer advises consider initial dose reduction to 25 mg in mild to moderate impairment; adjust according to response.

#### ● RENAL IMPAIRMENT

##### Dose adjustments

- ▶ When used for Erectile dysfunction [\[EvGr\]](#) Consider initial dose of 25 mg if creatinine clearance less than 30 mL/minute. [\[M\]](#) See p. 21.
- ▶ With oral use for Pulmonary arterial hypertension [\[EvGr\]](#) If usual dose not tolerated, consider dose reduction to 20 mg twice daily. [\[M\]](#)
- ▶ With intravenous use for Pulmonary arterial hypertension [\[EvGr\]](#) If usual dose not tolerated, consider dose reduction to 10 mg twice daily. [\[M\]](#)

#### ● TREATMENT CESSATION

- ▶ When used for Pulmonary arterial hypertension Consider gradual withdrawal.

#### ● PATIENT AND CARER ADVICE

- ▶ When used for Erectile dysfunction Onset of effect may be delayed if taken with food.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

##### Scottish Medicines Consortium (SMC) decisions

- ▶ Sildenafil tablets (*Revatio*<sup>®</sup>) for the treatment of pulmonary arterial hypertension (February 2010) SMC No. 596/10 Recommended with restrictions
  - ▶ Sildenafil injection (*Revatio*<sup>®</sup>) for the treatment of pulmonary arterial hypertension (PAH) in patients who are unable to take sildenafil orally (March 2011) SMC No. 688/11 Recommended with restrictions
- #### NHS restrictions
- ▶ With oral use *Viagra*<sup>®</sup> is not prescribable in NHS primary care for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ▶ Sildenafil (Non-proprietary)

## Tadalafil

28-May-2021

#### ● INDICATIONS AND DOSE

##### Pulmonary arterial hypertension (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 40 mg once daily

**Erectile dysfunction**

## ▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, continuous daily use not recommended; maximum 1 dose per day

**Erectile dysfunction; for patients who anticipate sexual activity at least twice a week**

## ▶ BY MOUTH

- ▶ **Adult:** 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response

**Benign prostatic hyperplasia**

## ▶ BY MOUTH

- ▶ **Adult:** 5 mg once daily

**● CONTRA-INDICATIONS**

- ▶ **GENERAL CONTRA-INDICATIONS** Acute myocardial infarction in past 90 days · history of non-arteritic anterior ischaemic optic neuropathy · hypotension (avoid if systolic blood pressure below 90 mmHg)

**SPECIFIC CONTRA-INDICATIONS**

- ▶ When used for benign prostatic hyperplasia or erectile dysfunction Mild to severe heart failure · patients in whom vasodilatation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina

**● CAUTIONS**

- ▶ When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease · congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · left ventricular dysfunction · life-threatening arrhythmias · pericardial constriction · predisposition to priapism · pulmonary veno-occlusive disease · uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Elderly** For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.

- ▶ **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

**● SIDE-EFFECTS**

- ▶ **Common or very common** Flushing · gastrointestinal discomfort · headaches · myalgia · nasal congestion · pain
- ▶ **Uncommon** Arrhythmias · chest pain · dizziness · dyspnoea · eye pain · fatigue · gastrooesophageal reflux disease · haemorrhage · hypertension · hypotension · nausea · oedema · palpitations · skin reactions · tinnitus · vision disorders · vomiting
- ▶ **Rare or very rare** Acute coronary syndrome · angioedema · cerebrovascular insufficiency · eye erythema · eye swelling · haematospermia · hyperhidrosis · memory loss · optic neuropathy (discontinue if sudden visual impairment occurs) · priapism · retinal occlusion · seizure · Stevens-Johnson syndrome · sudden cardiac death · sudden hearing loss (discontinue drug and seek medical advice) · syncope

- ▶ **PREGNANCY** Manufacturer advises avoid.

- ▶ **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.

**● HEPATIC IMPAIRMENT**

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- ▶ When used for Benign prostatic hyperplasia or Erectile dysfunction Manufacturer advises caution for regular once-daily dosing (no information available), and in severe impairment for intermittent use (limited information available).

**Dose adjustments**

- ▶ When used for Pulmonary arterial hypertension Manufacturer advises consider initial dose reduction to 20 mg once daily in mild to moderate impairment.
- ▶ When used for Erectile dysfunction Manufacturer advises dose of 10 mg for intermittent use (no information available for higher doses).

**● RENAL IMPAIRMENT**

- ▶ When used for Pulmonary arterial hypertension [EvGr](#) Avoid in severe impairment. [M](#)
- ▶ When used for Erectile dysfunction or Benign prostatic hyperplasia [EvGr](#) Avoid regular once-daily dosing in severe impairment. [M](#)

**Dose adjustments**

- ▶ When used for Pulmonary arterial hypertension [EvGr](#) Initial dose of 20 mg once daily in mild-to-moderate impairment; dose may be increased to 40 mg once daily if tolerated. [M](#)
- ▶ When used for Erectile dysfunction [EvGr](#) Maximum dose of 10 mg for intermittent use in severe impairment. [M](#)

**● NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Tadalafil (*Adcirca*®)** for the treatment of pulmonary arterial hypertension (PAH) classified as WHO functional class II and III, to improve exercise capacity (July 2012) SMC No. 710/11 Recommended with restrictions  
**NHS restrictions** *Cialis*® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

- ▶ **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Tadalafil (Non-proprietary)**

**Tadalafil 2.5 mg** Tadalafil 2.5mg tablets | 28 tablet [PoM](#) £52.24 DT = £29.00

**Tadalafil 5 mg** Tadalafil 5mg tablets | 28 tablet [PoM](#) £54.99 DT = £2.20

**Tadalafil 10 mg** Tadalafil 10mg tablets | 4 tablet [PoM](#) £28.88 DT = £0.98

**Tadalafil 20 mg** Tadalafil 20mg tablets | 4 tablet [PoM](#) £54.99 DT = £1.17 | 8 tablet [PoM](#) £2.34-£109.98 | 56 tablet [PoM](#) £127.40-£390.00

▶ **Adcirca** (Eli Lilly and Company Ltd)

**Tadalafil 20 mg** Adcirca 20mg tablets | 56 tablet [PoM](#) £491.22

▶ **Cialis** (Eli Lilly and Company Ltd)

**Tadalafil 2.5 mg** Cialis 2.5mg tablets | 28 tablet [PoM](#) £54.99 DT = £29.00

**Tadalafil 5 mg** Cialis 5mg tablets | 28 tablet [PoM](#) £54.99 DT = £2.20

**Tadalafil 10 mg** Cialis 10mg tablets | 4 tablet [PoM](#) £28.88 DT = £0.98

**Tadalafil 20 mg** Cialis 20mg tablets | 4 tablet [PoM](#) £28.88 DT = £1.17 | 8 tablet [PoM](#) £57.76

▶ **Talmanco** (Viatrix UK Healthcare Ltd)

**Tadalafil 20 mg** Talmanco 20mg tablets | 56 tablet [PoM](#) £417.54

## Vardenafil

12-Aug-2021

### • INDICATIONS AND DOSE

#### Erectile dysfunction

##### ► BY MOUTH USING TABLETS

► Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

##### ► BY MOUTH USING ORODISPERSIBLE TABLET

► Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

#### Erectile dysfunction (patients on alpha-blocker therapy)

##### ► BY MOUTH USING TABLETS

► Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

#### DOSE EQUIVALENCE AND CONVERSION

► *Levitra*<sup>®</sup> 10 mg orodispersible tablets and *Levitra*<sup>®</sup> 10 mg film coated tablets are **not** bioequivalent.

• **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina

• **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval

#### CAUTIONS, FURTHER INFORMATION

► Elderly For phosphodiesterase type-5 inhibitors, prescription potentially inappropriate (STOPP criteria) in severe heart failure characterised by hypotension i.e. systolic blood pressure less than 90 mmHg, or concurrent nitrate therapy for angina (risk of cardiovascular collapse). See also Prescribing in the elderly p. 29.

• **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

#### • SIDE-EFFECTS

► **Common or very common** Dizziness · flushing · gastrointestinal discomfort · headache · nasal congestion

► **Uncommon** Allergic oedema · angioedema · arrhythmias · back pain · diarrhoea · drowsiness · dry mouth · dyspnoea · eye discomfort · eye disorders · gastrointestinal disorders · malaise · muscle complaints · muscle tone increased · nausea · palpitations · sensation abnormal · sinus congestion · skin reactions · sleep disorder · tinnitus · vertigo · vision disorders · vomiting

► **Rare or very rare** Angina pectoris · anxiety · chest pain · conjunctivitis · haemorrhage · hypertension · hypotension · memory loss · myocardial infarction · photosensitivity reaction · priapism · seizure · syncope

► **Frequency not known** Haematospermia · optic neuropathy (discontinue if sudden visual impairment occurs) · QT interval prolongation · sudden hearing loss

• **HEPATIC IMPAIRMENT** For *film-coated tablets*, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

For *orodispersible tablets*, manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

**Dose adjustments** For *film-coated tablets*, manufacturer advises initial dose reduction to 5 mg in mild to moderate impairment, increase according to response; max. 10 mg in moderate impairment.

For *orodispersible tablets*, manufacturer advises initial dose reduction to 5 mg using *film-coated tablets* in mild impairment, increase according to response.

### • RENAL IMPAIRMENT

**Dose adjustments** [LevGr](#) Consider initial dose of 5 mg if creatinine clearance less than 30 mL/minute; *orodispersible tablets* not suitable for initial doses. [◆](#) See p. 21.

### • PRESCRIBING AND DISPENSING INFORMATION

Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

### • NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### Scottish Medicines Consortium (SMC) decisions

► Vardenafil orodispersible tablet (*Levitra*<sup>®</sup>) for the treatment of erectile dysfunction (October 2011) SMC No. 727/11 Recommended with restrictions

**NHS restrictions** *Levitra*<sup>®</sup> is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Orodispersible tablet

EXCIPIENTS: May contain Aspartame

##### ► Vardenafil (Non-proprietary)

Vardenafil (as Vardenafil hydrochloride trihydrate)

10 mg Vardenafil 10mg orodispersible tablets sugar free sugar-free | 4 tablet [PoM](#) £19.67 DT = £19.67

##### ► Levitra (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra 10mg orodispersible tablets sugar-free | 4 tablet [PoM](#) £19.67 DT = £19.67

#### Tablet

##### ► Vardenafil (Non-proprietary)

Vardenafil (as Vardenafil hydrochloride trihydrate)

5 mg Vardenafil 5mg tablets | 4 tablet [PoM](#) £8.32 DT = £5.68 | 8 tablet [PoM](#) £11.36-£12.70

Vardenafil (as Vardenafil hydrochloride trihydrate)

10 mg Vardenafil 10mg tablets | 4 tablet [PoM](#) £14.78 DT = £10.58 | 8 tablet [PoM](#) £21.42-£29.57

Vardenafil (as Vardenafil hydrochloride trihydrate)

20 mg Vardenafil 20mg tablets | 4 tablet [PoM](#) £24.30 DT = £1.81 | 8 tablet [PoM](#) £5.89-£48.60

##### ► Levitra (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg Levitra 5mg tablets | 4 tablet [PoM](#) £8.32 DT = £5.68

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra 10mg tablets | 4 tablet [PoM](#) £14.78 DT = £10.58 | 8 tablet [PoM](#) £29.57

Vardenafil (as Vardenafil hydrochloride trihydrate)

20 mg Levitra 20mg tablets | 4 tablet [PoM](#) £24.30 DT = £1.81 | 8 tablet [PoM](#) £48.60

## PROSTAGLANDINS AND ANALOGUES

### Alprostadil

20-Jul-2020

### • INDICATIONS AND DOSE

#### Erectile dysfunction (initiated under specialist supervision)

##### ► BY URETHRAL APPLICATION

► Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week

**Aid to diagnosis of erectile dysfunction**

- ▶ BY URETHRAL APPLICATION
- ▶ Adult: 500 micrograms for 1 dose

**Erectile dysfunction**

- ▶ TO THE SKIN
- ▶ Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**CAVERJECT®****Erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Erectile dysfunction associated with neurological dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Aid to diagnosis**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

**Aid to diagnosis where evidence of neurological dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

**CAVERJECT® DUAL CHAMBER****Erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Erectile dysfunction associated with neurological dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Aid to diagnosis**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

**Aid to diagnosis where evidence of neurological dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

**VRIDAL® DUO****Neurogenic erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 1.25 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Erectile dysfunction**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**● CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS** Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocythaemia, polycythaemia, sickle cell anaemia, multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature · urethral application contra-indicated in severe hypospadias · urethral application contra-indicated in urethral stricture · urethral application contra-indicated in urethritis

**SPECIFIC CONTRA-INDICATIONS**

- ▶ With topical use Balanitis · severe curvature · severe hypospadias · urethral stricture · urethritis
- **CAUTIONS** Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop) · priapism (patients should be instructed to report any erection lasting 4 hours or longer) · risk factors for cardiovascular disorders · risk factors for cerebrovascular disorders

- **INTERACTIONS** → Appendix 1: alprostadil

- **SIDE-EFFECTS**

- GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Balanoposthitis · hypotension · penile disorders · sexual dysfunction

- SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - With intracavernosal use Haemorrhage · muscle spasms · skin reactions
  - With topical use Genital abnormalities · rash · urinary tract pain
  - With urethral use Dizziness · haemorrhage · headache · muscle spasms · urethral burning
- ▶ **Uncommon**
  - With intracavernosal use Asthenia · dry mouth · extrasystole · hyperhidrosis · increased risk of infection · inflammation · mydriasis · nausea · oedema · pelvic pain · peripheral vascular disease · presyncope · scrotal disorders · sensation abnormal · spermatocoele · testicular disorders · urinary disorders · vascular disorders · vasodilation
  - With topical use Dizziness · hyperaesthesia · pain in extremity · scrotal pain · syncope · urinary tract disorders
  - With urethral use Hyperhidrosis · increased risk of infection · leg pain · nausea · pelvic pain · perineal pain · peripheral vascular disease · scrotal disorders · sensation abnormal · skin reactions · spermatocoele · syncope · testicular disorders · urinary disorders · vascular disorders · vasodilation
- ▶ **Frequency not known**
  - With intracavernosal use Myocardial ischaemia · stroke

- **CONCEPTION AND CONTRACEPTION**

- ▶ With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
- ▶ With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intracavernosal use Manufacturer advises the first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- ▶ With urethral use Manufacturer advises during initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

- **PATIENT AND CARER ADVICE** Patients should be instructed to report any erection lasting 4 hours or longer.

- ▶ With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** *Caverject*<sup>®</sup>, *Viridal*<sup>®</sup> Duo, *Vitaros*<sup>®</sup> and *MUSE*<sup>®</sup> are not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under *How to use BNF publications*.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- Stick**

- ▶ **Muse** (Viatris UK Healthcare Ltd)

**Alprostadil 500 microgram** Muse 500microgram urethral sticks | 1 applicator [PoM] £11.30 DT = £11.30 | 6 applicator [PoM] £67.79

**Alprostadil 1 mg** Muse 1000microgram urethral sticks | 1 applicator [PoM] £11.56 DT = £11.56 | 6 applicator [PoM] £65.67

- Cream**

- ▶ **Vitaros** (Ferring Pharmaceuticals Ltd)

**Alprostadil 3 mg per 1 gram** Vitaros 3mg/g cream | 4 applicator [PoM] £40.00 DT = £40.00

- Powder and solvent for solution for injection**

- ▶ **Caverject** (Pfizer Ltd)

**Alprostadil 10 microgram** Caverject 10microgram powder and solvent for solution for injection vials | 1 vial [PoM] £9.24 DT = £9.24  
Caverject Dual Chamber 10microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £14.70 DT = £14.70

**Alprostadil 20 microgram** Caverject Dual Chamber 20microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £19.00 DT = £19.00

Caverject 20microgram powder and solvent for solution for injection vials | 1 vial [PoM] £11.94 DT = £11.94

**Alprostadil 40 microgram** Caverject 40microgram powder and solvent for solution for injection vials | 1 vial [PoM] £21.58 DT = £21.58

- ▶ **Viridal** (Advanz Pharma)

**Alprostadil 10 microgram** Viridal Duo Starter Pack 10microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £20.13 DT = £20.13

Viridal Duo Continuation Pack 10microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £16.55 DT = £16.55

**Alprostadil 20 microgram** Viridal Duo Starter Pack 20microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £24.54 DT = £24.54

Viridal Duo Continuation Pack 20microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £21.39 DT = £21.39

**Alprostadil 40 microgram** Viridal Duo Starter Pack 40microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £29.83 DT = £29.83

Viridal Duo Continuation Pack 40microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £27.22 DT = £27.22

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Adrenaline/epinephrine

20-Jan-2022

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta<sub>1</sub> effects); it can cause peripheral vasodilation (a beta<sub>2</sub> effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**

**Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)**

- ▶ BY INTRACAVERNOSAL INJECTION

- ▶ **Adult:** 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution, **Important:** if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

- **UNLICENSED USE**

- ▶ When used for priapism The use of adrenaline is an unlicensed indication.

- **CAUTIONS** Arteriosclerosis · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION** Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

**● SIDE-EFFECTS**

- ▶ **Rare or very rare** Cardiomyopathy
- ▶ **Frequency not known** Angina pectoris · angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · CNS haemorrhage · confusion · dizziness · dry mouth · dyspnoea · headache · hepatic necrosis · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension (increased risk of cerebral haemorrhage) · hypokalaemia · injection site necrosis · insomnia · intestinal necrosis · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitations · peripheral coldness · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · renal necrosis · soft tissue necrosis · tremor · urinary disorders · vomiting

● **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

● **MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

EXCIPIENTS: May contain Sulfiters

▶ **Adrenaline/epinephrine (Non-proprietary)**

**Adrenaline 100 microgram per 1 ml** Adrenaline (base) 100micrograms/1ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule [PoM] £101.85-£139.02 DT = £101.85  
**Adrenaline (base) 1mg/10ml** (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £7.21 | 1 pre-filled disposable injection [PoM] £7.21-£18.00 (Hospital only) | 10 pre-filled disposable injection [PoM] £180.00 (Hospital only)

**Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 ml** Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule [PoM] £118.03 DT = £118.03  
**Adrenaline (base) 500micrograms/5ml** (1 in 10,000) dilute solution for injection ampoules | 10 ampoule [PoM] £108.50 DT = £108.50

**Adrenaline 1 mg per 1 ml** Adrenaline (base) 10mg/10ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £111.32-£151.95 DT = £111.32

Adrenaline (base) for anaphylaxis 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.47 DT = £11.15

Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.83-£12.47 DT = £11.15

**Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml** Adrenaline (base) 5mg/5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £124.84 DT = £124.84

Adrenaline (base) 500micrograms/0.5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £102.30-£139.33 DT = £120.82

Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £6.00-£10.50 DT = £10.34

**Metaraminol**

28-Apr-2020

**● INDICATIONS AND DOSE**

**Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)**

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 1 mg every 15 minutes

● **UNLICENSED USE** Use for priapism is an unlicensed indication.

● **CAUTIONS** Associated with fatal hypertensive crises · cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hypertension · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia

● **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

**● SIDE-EFFECTS**

- ▶ **Common or very common** Headache · hypertension
- ▶ **Rare or very rare** Skin exfoliation · soft tissue necrosis
- ▶ **Frequency not known** Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For *intracavernosal injection*, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**▶ **Metaraminol (Non-proprietary)**

**Metaraminol (as Metaraminol tartrate) 500 microgram per**

**1 ml** Metaraminol 2.5mg/5ml solution for injection ampoules | 10 ampoule [PoM] £37.40 (Hospital only)

Metaraminol 5mg/10ml solution for injection ampoules | 10 ampoule [PoM] £76.10 (Hospital only)

Metaraminol 2.5mg/5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £95.00 (Hospital only)

Metaraminol 5mg/10ml solution for injection vials | 10 vial [PoM] £55.00 (Hospital only)

**Metaraminol (as Metaraminol tartrate) 10 mg per**

**1 ml** Metaraminol 10mg/1ml solution for injection vials | 10 vial [PoM] £20.50 (Hospital only)

Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £21.50

**Phenylephrine hydrochloride****● INDICATIONS AND DOSE**

**Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)**

## ▶ BY INTRACAVERNOSAL INJECTION

- ▶ Adult: 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

● **UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.

● **CONTRA-INDICATIONS** Hypertension

● **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

● **SIDE-EFFECTS** Angle closure glaucoma · anxiety · appetite decreased · arrhythmias · asthenia · confusion · dyspnoea · headache · hypertension · hypoxia · insomnia · nausea · palpitations · peripheral ischaemia · psychosis · tremor · urinary retention · vomiting

● **DIRECTIONS FOR ADMINISTRATION** For *intracavernosal injection*, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**▶ **Phenylephrine hydrochloride (Non-proprietary)**

**Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml** Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 10 pre-filled disposable injection [PoM] £150.00 (Hospital only)

**Phenylephrine hydrochloride 100 microgram per**

**1 ml** Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule [PoM] £46.20 (Hospital only)

Phenylephrine 2mg/20ml solution for injection vials | 10 vial [PoM] £110.00 (Hospital only)

Phenylephrine hydrochloride 10 mg per 1 ml Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule [PoM] £99.00-£99.12 (Hospital only)

Phenylephrine 10mg/1ml concentrate for solution for injection ampoules | 10 ampoule [PoM] £99.12 (Hospital only)

## VASODILATORS > PERIPHERAL VASODILATORS

### Aviptadil with phentolamine mesilate

16-Oct-2020

- **DRUG ACTION** Phentolamine is a short-acting alpha-adrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

#### • INDICATIONS AND DOSE

##### Erectile dysfunction

- ▶ BY INTRACAVERNOSAL INJECTION
- ▶ Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y micrograms of aviptadil/phentolamine.

- **CONTRA-INDICATIONS** Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · not for use with other agents for erectile dysfunction · patients for whom sexual activity is inadvisable · penile implants · predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukaemia)
  - **CAUTIONS** Concomitant treatment with anticoagulants (potential increased risk of bleeding) · history of psychiatric disorder or addiction (potential for abuse) · severe cardiovascular disease · severe cerebrovascular disease
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Bruising · flushing
    - ▶ **Uncommon** Dizziness · haematoma · headache · palpitations · tachycardia
    - ▶ **Rare or very rare** Angina pectoris · myocardial infarction · penile fibrosis (following multiple injections) · penile nodules · sexual dysfunction
  - **MONITORING REQUIREMENTS** Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie's disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie's disease.
  - **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that the initial injections of *Invicorp*<sup>®</sup> must be administered by medically trained personnel; self-administration may only be undertaken after proper training.
  - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).
  - **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.
  - **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- Scottish Medicines Consortium (SMC) decisions**
- ▶ Aviptadil/phentolamine mesilate (*Invicorp*<sup>®</sup>) for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed

aetiology (December 2017) SMC No. 1284/17 Recommended with restrictions

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Aviptadil/phentolamine mesilate (*Invicorp*<sup>®</sup>) for the symptomatic treatment of erectile dysfunction in adult males due to neurogenic, vasculogenic, psychogenic, or mixed aetiology (July 2017) AWMSG No. 3435 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ *Invicorp* (Evolan Pharma AB)

Aviptadil 71.43 microgram per 1 ml, Phentolamine mesilate 5.71 mg per 1 ml *Invicorp* 25micrograms/2mg/0.35ml solution for injection ampoules | 5 ampoule [PoM] £47.50 DT = £47.50

## 4.2 Premature ejaculation

### Premature ejaculation

01-Aug-2017

#### Description of condition

Premature ejaculation is a common male sexual disorder characterised by brief ejaculatory latency, loss of control, and psychological distress.

#### Treatment

**EvGr** Non-drug treatment (including psychosexual counselling, education, and behavioural treatments) are recommended in patients for whom premature ejaculation causes few (if any) problems or in patients who prefer not to take drug treatment. These techniques can also be used in addition to a drug treatment.

For patients with life-long premature ejaculation, drug treatment is the recommended approach. **⚡** Dapoxetine p. 887, a short-acting selective serotonin re-uptake inhibitor, is licensed to be used when required for this condition (not continuous daily use).

**EvGr** Other selective serotonin re-uptake inhibitors (citalopram p. 396, fluoxetine p. 397, fluvoxamine maleate p. 398, escitalopram p. 397, paroxetine p. 398, sertraline p. 399 [unlicensed indications]) and the tricyclic antidepressant clomipramine [unlicensed indication] have been widely used as regular, daily treatment. Caution is suggested in prescribing selective serotonin re-uptake inhibitors for young adolescents with premature ejaculation, and to men who also have a depressive disorder, particularly when associated with suicidal ideation. Ejaculation delay may start a few days after the start of treatment, but it is more evident after 1 to 2 weeks, since receptor desensitisation requires time to occur.

If premature ejaculation is secondary to Erectile dysfunction p. 878, the erectile dysfunction should be treated first. **⚡**

Topical anaesthetic preparations for the management of premature ejaculation are available without prescription.

**Other drugs used for Premature ejaculation** Lidocaine with prilocaïne, p. 1468

## SELECTIVE SEROTONIN RE-UP TAKE INHIBITORS

### Dapoxetine

19-Jul-2021

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

#### INDICATIONS AND DOSE

**Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes**

##### BY MOUTH

- ▶ **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg.
  - ▶ Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.
- **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · postural hypotension · significant cardiac disease · uncontrolled epilepsy
  - **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma
  - **INTERACTIONS** → Appendix 1: SSRIs
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Anxiety · asthenia · concentration impaired · constipation · diarrhoea · dizziness · drowsiness · dry mouth · gastrointestinal discomfort · gastrointestinal disorders · headache · hypotension · mood altered · nausea · paraesthesia · sexual dysfunction · sinus congestion · sleep disorders · sweat changes · syncope · tinnitus · tremor · vasodilation · vision blurred · vomiting · yawning
    - ▶ **Uncommon** Akathisia · arrhythmias · behaviour abnormal · confusion · depression · eye pain · feeling abnormal · feeling hot · hypertension · level of consciousness decreased · mydriasis · pruritus · taste altered · thinking abnormal · vertigo
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if psychiatric disorder develops.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
  - **RENAL IMPAIRMENT** [EvGr](#) Use with caution if creatinine clearance 30–80 mL/minute; avoid if creatinine clearance less than 30 mL/minute (limited information available).
  - ◆ See p. 21.
  - **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.
  - **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

#### PATIENT AND CARER ADVICE

Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

## 5 Gynaecological conditions

### 5.1 Polycystic ovary syndrome

#### Polycystic ovary syndrome

20-Sep-2021

##### Description of condition

Polycystic ovary syndrome (PCOS) is one of the most common endocrine disorders affecting females of childbearing potential. Clinical features may include ovulation disorders, polycystic ovarian morphology, and hyperandrogenism (with the clinical manifestations of acne, hirsutism and oligomenorrhoea). Complications of PCOS include cardiovascular disease, obstructive sleep apnoea, psychological disorders (such as anxiety and depression), infertility, endometrial cancer, pregnancy complications (such as gestational diabetes and pre-eclampsia), and metabolic disorders (such as insulin resistance and type 2 diabetes).

##### Aims of treatment

Treatment aims to manage the clinical features of PCOS and prevent the development of complications.

##### Non-drug treatment

[EvGr](#) Lifestyle modifications are recommended first line in the management of PCOS; healthy eating, regular physical exercise and maintaining a healthy weight should be encouraged. For females who are overweight or obese, weight loss advice should be offered or referral to a dietician considered, as weight loss may achieve menstrual regularity and reduce insulin resistance, hyperandrogenism, and the risk of type 2 diabetes and cardiovascular disease. For further information on weight management, see Obesity p. 97. Cardiovascular disease risk factors should be assessed (noting that conventional cardiovascular risk calculators have not been validated in females with PCOS) and managed appropriately; specialist referral is required if dyslipidaemia requires treatment. ◆ For further information, see Cardiovascular disease risk assessment and prevention p. 206.

##### Drug treatment

[EvGr](#) Combined oral contraceptives [unlicensed] are commonly used in PCOS for the treatment of acne, hirsutism, and menstrual irregularity in females who are not planning a pregnancy. Alternative treatment options for menstrual irregularities include a cyclical progestogen [unlicensed] or a levonorgestrel intra-uterine system [unlicensed]. ◆ For the management of acne in females with PCOS, see Acne p. 1361.

[EvGr](#) Treatment with insulin-sensitising drugs, such as metformin, should only be initiated by a specialist. Metformin hydrochloride p. 761 can be considered for

females with PCOS who have impaired glucose tolerance or are already undergoing lifestyle modifications with no improvement in impaired glucose tolerance [unlicensed indication]. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is limited supporting evidence on the long-term benefits.

For the management of infertility, consider referral for fertility treatment.

In females with PCOS who are pregnant or are considering a pregnancy, consider referral for gestational diabetes screening, and whether any changes to drug treatment(s) are required.  $\blacktriangle$

## 6 Obstetrics

### Obstetrics

07-Jan-2022

#### Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion, or induce or augment labour, and to minimise blood loss from the placental site. They include oxytocin below, carbeteocin p. 891, ergometrine maleate p. 890, and the prostaglandins. All induce uterine contractions with varying degrees of force, frequency, and duration.

#### Induction of abortion

$\text{EvGr}$  Pre-treatment with mifepristone p. 892 can facilitate the process of medical abortion.  $\blacktriangle$  It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

$\text{EvGr}$  The prostaglandin misoprostol p. 893 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion following sequential use with mifepristone; it is also used for cervical priming before surgical abortion.

$\blacktriangle$  Gemeprost p. 893, a prostaglandin administered vaginally as pessaries, is licensed for the medical induction of abortion in the second trimester of pregnancy; it is also licensed to soften and dilate the cervix before surgical abortion in early pregnancy.

#### Induction of labour

$\text{EvGr}$  If a pharmacological method of induction is considered suitable, offer dinoprostone p. 889 or misoprostol for women with a Bishop score of 6 or less.

For women with a Bishop score of more than 6, oxytocin may be offered in conjunction with amniotomy.  $\blacktriangle$  Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

$\text{EvGr}$  Mifepristone [unlicensed] followed by either misoprostol [unlicensed] or dinoprostone [unlicensed] can be given for the induction of labour following intra-uterine fetal death in women with no uterine scarring.  $\blacktriangle$

#### Prevention and treatment of haemorrhage

$\text{EvGr}$  Active management of the third stage of labour reduces the risk of postpartum haemorrhage. Prophylactic oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered.  $\blacktriangle$  Ergometrine with oxytocin p. 890 given intramuscularly may be an option in the absence of hypertension or other contra-indications. Oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

$\text{EvGr}$  Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options include oxytocin, ergometrine maleate, or a combination of

ergometrine with oxytocin p. 890. Carboprost p. 891, and misoprostol [unlicensed] are alternative options.  $\blacktriangle$

#### Ectopic pregnancy

$\text{EvGr}$  Systemic methotrexate [unlicensed] is used for the management of ectopic pregnancy.  $\blacktriangle$

#### Myometrial relaxants

Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

$\text{EvGr}$  Women between 24 and 33 weeks of gestation who have intact membranes and are in suspected or diagnosed premature labour can be given nifedipine p. 178 [unlicensed indication] for tocolysis. An oxytocin receptor antagonist (such as atosiban p. 891) is an alternative if nifedipine is contra-indicated or unsuitable.

The beta<sub>2</sub> agonists salbutamol p. 273 and terbutaline sulfate p. 275 are no longer recommended for inhibiting uncomplicated premature labour.  $\blacktriangle$  Use of high-dose short acting beta<sub>2</sub> agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time.

## 6.1 Induction of labour

**Other drugs used for induction of labour** Misoprostol, p. 893

### OXYTOCIN AND ANALOGUES

#### Oxytocin

25-Mar-2021

##### • INDICATIONS AND DOSE

##### Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

##### ► BY INTRAVENOUS INFUSION

- Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop

induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

#### Caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units immediately after delivery

#### Prevention of postpartum haemorrhage after delivery of placenta

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 10 units, can be used instead of oxytocin with ergometrine (*Syntometrine*®).

#### Treatment of postpartum haemorrhage

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, repeated if necessary

#### Treatment of severe cases of postpartum haemorrhage (following intravenous injection)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

#### Incomplete, inevitable, or missed miscarriage

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

- **UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by intramuscular injection is an unlicensed use.

#### IMPORTANT SAFETY INFORMATION

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: manufacturer advises use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

- **CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable · any condition where vaginal delivery inadvisable · avoid intravenous injection during labour · avoid prolonged administration in oxytocin-resistant uterine inertia · avoid rapid intravenous injection (may transiently reduce blood pressure) · fetal distress (discontinue immediately if this occurs) · hypertonic uterine contractions (discontinue immediately if this occurs) · severe cardiovascular disease · severe pre-eclamptic toxemia

#### ● CAUTIONS

**GENERAL CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) · cardiovascular disease

#### SPECIFIC CAUTIONS

- ▶ When used for induction of labour for medical reasons or for stimulation of labour in hypotonic uterine inertia History of lower-uterine segment caesarean section · mild pregnancy-induced cardiac disease · mild pregnancy-induced hypertension · moderate pregnancy-induced cardiac disease · moderate pregnancy-induced hypertension · presence of borderline cephalopelvic disproportion (avoid if significant) · risk factors for disseminated intravascular coagulation · secondary uterine inertia · women over 35 years

- **INTERACTIONS** → Appendix 1: oxytocin

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · headache · nausea · vomiting

- ▶ **Rare or very rare** Dyspnoea · hypotension · rash
- ▶ **Frequency not known** Angioedema · disseminated intravascular coagulation · electrolyte imbalance · flushing · haemorrhage · myocardial ischaemia · pulmonary oedema · QT interval prolongation · uterine rupture · water intoxication

**SIDE-EFFECTS, FURTHER INFORMATION** Avoid rapid intravenous injection (may transiently reduce blood pressure).

Uterine hyperstimulation—usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture.

**Overdose** Placental abruption and amniotic fluid embolism reported on overdose.

#### ● MONITORING REQUIREMENTS

- ▶ Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- ▶ Monitor for disseminated intravascular coagulation after parturition.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Syntocinon*®), manufacturer advises give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for *induction or enhancement of labour*, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL. [\[EvGr\]](#) For *treatment of postpartum uterine haemorrhage* dilute 40 units in 500 mL infusion fluid. ⚠ If high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), manufacturer advises use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

#### Solution for injection

##### ▶ Oxytocin (Non-proprietary)

**Oxytocin 5 unit per 1 ml** Oxytocin 5units/1ml solution for injection ampoules | 5 ampoule [\[PoM\]](#) £4.00 (Hospital only) | 10 ampoule [\[PoM\]](#) £8.03

## PROSTAGLANDINS AND ANALOGUES

### Dinoprostone

24-Jun-2021

#### ● INDICATIONS AND DOSE

PROPESS®

#### Cardinal ripening and induction of labour at term

##### ▶ BY VAGINA

- ▶ Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cardinal ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cardinal ripening inadequate after 24 hours (dose not to be repeated)

continued →

**PROSTIN E2® VAGINAL GEL****Induction of labour**

## ▶ BY VAGINA

- ▶ Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

**Induction of labour (unfavourable primigravida)**

## ▶ BY VAGINA

- ▶ Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

**PROSTIN E2® VAGINAL TABLETS****Induction of labour**

## ▶ BY VAGINA

- ▶ Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ *Prostin E2 Vaginal tablets* and *Vaginal Gel* are not bioequivalent.

- **CONTRA-INDICATIONS** Active cardiac disease · active pulmonary disease · avoid extra-amniotic route in cervicitis or vaginitis · fetal distress · fetal malpresentation · grand multiparas · history of caesarean section · history of difficult or traumatic delivery · history of major uterine surgery · major cephalopelvic disproportion · multiple pregnancy · placenta praevia or unexplained vaginal bleeding during pregnancy · ruptured membranes · untreated pelvic infection
- **CAUTIONS** Effect of oxytocin enhanced · history of asthma · history of epilepsy · history of glaucoma and raised intra-ocular pressure · hypertension · risk factors for disseminated intravascular coagulation · uterine rupture · uterine scarring
- **SIDE-EFFECTS**
- **Uncommon** Amniotic cavity infection · febrile disorders · headache · hyperbilirubinaemia neonatal · hypotension · pruritus · uterine atony · vaginal burning
- ▶ **Frequency not known** Abdominal pain · diarrhoea · disseminated intravascular coagulation · genital oedema · nausea · uterine rupture · vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** [EvG] Avoid. ⚠
- **MONITORING REQUIREMENTS**
- ▶ Monitor for disseminated intravascular coagulation after parturition.
- ▶ Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- ▶ Care needed in monitoring uterine activity when used in sequence following oxytocin.
- **PRESCRIBING AND DISPENSING INFORMATION Important:** Do not confuse dose of *Prostin E2® vaginal gel* with that of *Prostin E2® vaginal tablets*—not bioequivalent.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### ERGOT ALKALOIDS

#### Ergometrine maleate

01-Jun-2021

● **INDICATIONS AND DOSE****Postpartum haemorrhage caused by uterine atony**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 250–500 micrograms

- **CONTRA-INDICATIONS** Eclampsia · first stage of labour · induction of labour · second stage of labour · sepsis · severe cardiac disease · severe hypertension · vascular disease
- **CAUTIONS** Acute porphyrias p. 1150 · cardiac disease · hypertension · multiple pregnancy
- **INTERACTIONS** → Appendix 1: ergometrine
- **SIDE-EFFECTS** Abdominal pain · arrhythmias · chest pain · coronary vasospasm · dizziness · dyspnoea · headache · hypertension · myocardial infarction · nausea · palpitations · pulmonary oedema · rash · tinnitus · vasoconstriction · vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**▶ **Ergometrine maleate (Non-proprietary)**

- ▶ **Ergometrine maleate 500 microgram per 1 ml** Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £15.00–£22.00

#### Ergometrine with oxytocin

22-Apr-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate above, oxytocin p. 888.

● **INDICATIONS AND DOSE****Active management of the third stage of labour |****Postpartum haemorrhage caused by uterine atony**

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 1 mL for one dose

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: No longer recommended

**Bleeding due to incomplete miscarriage or abortion**

## ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: Adjusted according to response to, the patient's condition and blood loss

- **INTERACTIONS** → Appendix 1: ergometrine · oxytocin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Syntometrine** (Alliance Pharmaceuticals Ltd)  
Ergometrine maleate 500 microgram per 1 ml, Oxytocin 5 unit per 1 ml Syntometrine 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £7.87

## OXYTOCIN AND ANALOGUES

### Carbetocin

24-May-2021

#### ● INDICATIONS AND DOSE

##### Prevention of uterine atony after caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- **CONTRA-INDICATIONS** Eclampsia · epilepsy · pre-eclampsia
- **CAUTIONS** Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Chest pain · chills · dizziness · dyspnoea · feeling hot · flushing · headache · hypotension · nausea · pain · pruritus · taste metallic · tremor · vomiting
- ▶ **Frequency not known** Hyperhidrosis · tachycardia
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic disease.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

##### Scottish Medicines Consortium (SMC) decisions

- ▶ Carbetocin (*Pabal*®) for the prevention of uterine atony following delivery of the infant by Caesarean section under epidural or spinal anaesthesia (January 2018) SMC No. 309/06 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Pabal** (Ferring Pharmaceuticals Ltd)  
Carbetocin 100 microgram per 1 ml Pabal 100micrograms/1ml solution for injection vials | 5 vial [PoM] £88.20 (Hospital only)

## PROSTAGLANDINS AND ANALOGUES

### Carboprost

08-Nov-2021

#### ● INDICATIONS AND DOSE

##### Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)

- **CONTRA-INDICATIONS** Cardiac disease · pulmonary disease · untreated pelvic infection

- **CAUTIONS** Excessive dosage may cause uterine rupture · history of anaemia · history of asthma · history of cardiovascular disease · history of diabetes · history of epilepsy · history of glaucoma · history of hypertension · history of hypotension · history of jaundice · history of pulmonary disease · history of raised intra-ocular pressure · uterine scars

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Chills · cough · diarrhoea · headache · nausea · uterine disorders · vasodilation · vomiting

- ▶ **Uncommon** Abdominal pain upper · asthma · back pain · breast tenderness · chest discomfort · dizziness · drowsiness · dry mouth · dyspnoea · eye pain · haemorrhage · hiccups · hyperhidrosis · hypertension · increased risk of infection · movement disorders · muscle complaints · paraesthesia · pelvic pain · respiratory disorders · septic shock · sleep disorder · syncope · tachycardia · taste altered · tinnitus · uterine injuries · vertigo · vision blurred
- ▶ **Frequency not known** Anxiety · asthenia · blepharospasm · choking sensation · palpitations · rash · thirst · throat complaints · thyrotoxic crisis

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in active hepatic disease.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Hemabate** (Pfizer Ltd)  
Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Hemabate 250micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £182.01 (Hospital only)

## 6.3 Premature labour

**Other drugs used for Premature labour** Nifedipine, p. 178 · Salbutamol, p. 273 · Terbutaline sulfate, p. 275

## OXYTOCIN RECEPTOR ANTAGONISTS

### Atosiban

24-May-2021

#### ● INDICATIONS AND DOSE

##### Uncomplicated premature labour between 24 and 33 weeks of gestation

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS** Abnormal fetal heart rate · abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · placenta praevia · premature rupture of membranes after 30 weeks' gestation · severe pre-eclampsia

- **CAUTIONS** Intra-uterine growth restriction

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · headache · hot flush · hyperglycaemia · hypotension · nausea · tachycardia · vomiting
- ▶ **Uncommon** Fever · insomnia · skin reactions
- ▶ **Rare or very rare** Uterine atony · Uterine haemorrhage
- ▶ **Frequency not known** Dyspnoea · pulmonary oedema

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Tractocile*® concentrate for intravenous infusion), manufacturer advises give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Atosiban (Non-proprietary)**

**Atosiban (as Atosiban acetate) 7.5 mg per 1 ml** Atosiban 6.75mg/0.9ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £18.41 (Hospital only)

- ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

**Atosiban (as Atosiban acetate) 7.5 mg per 1 ml** Tractocile 6.75mg/0.9ml solution for injection vials | 1 vial [PoM] £18.41 (Hospital only)

#### Solution for infusion

- ▶ **Atosiban (Non-proprietary)**

**Atosiban (as Atosiban acetate) 7.5 mg per 1 ml** Atosiban 37.5mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £50.18-£52.82 (Hospital only)

Atosiban 6.75mg/0.9ml solution for injection ampoules | 1 ampoule [PoM] £17.99 (Hospital only)

- ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

**Atosiban (as Atosiban acetate) 7.5 mg per 1 ml** Tractocile 37.5mg/5ml solution for infusion vials | 1 vial [PoM] £52.82 (Hospital only)

## 6.4 Termination of pregnancy

### PROGESTERONE RECEPTOR MODULATORS

#### Mifepristone

07-Feb-2022

- **DRUG ACTION** Mifepristone, an antiprogesterone steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

#### INDICATIONS AND DOSE

**Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)**

- ▶ **BY MOUTH**

▶ **Adult:** 200 mg for 1 dose, to be taken 36–48 hours before procedure

**Induction of labour in intra-uterine fetal death in women without uterine scarring (under close medical supervision)**

- ▶ **BY MOUTH**

▶ **Adult:** 200 mg for 1 dose, dose followed by dinoprostone *or* misoprostol, given in accordance with national protocols

**Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)**

- ▶ **BY MOUTH**

▶ **Adult:** 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina *or* misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

**Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)**

- ▶ **BY MOUTH**

▶ **Adult:** 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

#### Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- ▶ **BY MOUTH**

▶ **Adult:** 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg *or* misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **UNLICENSED USE** [EvGr] Mifepristone is used in the doses provided in the BNF for the induction of labour in intra-uterine fetal death in women without uterine scarring , but these may differ from those licensed.
- **CONTRA-INDICATIONS** Acute porphyrias p. 1150 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma
- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- **INTERACTIONS** → Appendix 1: mifepristone
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal cramps · diarrhoea · infection · nausea · pelvic inflammatory disease · uterine disorders · vaginal haemorrhage (sometimes severe) · vomiting
- ▶ **Uncommon** Hypotension
- ▶ **Rare or very rare** Angioedema · chills · dizziness · erythema nodosum · fever · headache · hot flush · malaise · skin reactions · toxic epidermal necrolysis · toxic shock syndrome · uterine rupture
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic failure (no information available).
- **RENAL IMPAIRMENT** [EvGr] Avoid in renal failure (no information available). 
- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Mifepristone (Non-proprietary)**

**Mifepristone 200 mg** Mifepristone 200mg tablets | 1 tablet [PoM] £10.14 | 30 tablet [PoM] £190.60 (Hospital only)

- ▶ **Mifegyne** (Nordic Pharma Ltd)

**Mifepristone 200 mg** Mifegyne 200mg tablets | 3 tablet [PoM] £52.66 (Hospital only)

## Mifepristone and misoprostol 02-Jun-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, misoprostol p. 893, mifepristone p. 892.

### ● INDICATIONS AND DOSE

**Medical termination of intra-uterine pregnancy of up to 63 days gestation (under close medical supervision)**

- ▶ BY MOUTH, OR BY VAGINA
- ▶ Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: mifepristone · misoprostol

### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · haemorrhage · nausea · uterine disorders · vomiting
- ▶ **Uncommon** Infection · skin reactions
- ▶ **Rare or very rare** Chills · dizziness · erythema nodosum · fever · headache · hot flush · hypotension · malaise · toxic epidermal necrolysis · uterine rupture
- ▶ **Frequency not known** Pelvic inflammatory disease · toxic shock syndrome
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Form unstated

- ▶ **Medabon Combipack** (Sun Pharmaceutical Industries Europe B.V.) Medabon Combipack tablets | 1 pack (PoM) £17.00 (Hospital only)

## PROSTAGLANDINS AND ANALOGUES

### Gemeprost 28-May-2021

#### ● INDICATIONS AND DOSE

**Cervical ripening prior to first trimester surgical abortion**

- ▶ BY VAGINA
- ▶ Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

#### Second trimester abortion

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

#### Second trimester intra-uterine death

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

**Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | Medical termination of intra-uterine pregnancy of 50-63 days gestation following mifepristone**

- ▶ BY VAGINA
- ▶ Adult: 1 mg

**Termination of pregnancy of 13-24 weeks gestation (in combination with a prostaglandin) following mifepristone**

- ▶ BY VAGINA
- ▶ Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring
- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis
- **SIDE-EFFECTS** Back pain · chest pain · chills · coronary vasospasm · diarrhoea · dizziness · dyspnoea · fever · flushing · headache · hypotension · muscle weakness · myocardial infarction · nausea · palpitations · uterine pain · uterine rupture · vaginal haemorrhage · vomiting
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
  - ▶ If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - ▶ When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Pessary

- ▶ **Cervagem** (Sanofi)  
**Gemeprost 1 mg** Cervagem 1mg pessaries | 5 pessary (PoM)  (Hospital only)

## Misoprostol 08-Dec-2021

● **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that acts as a potent uterine stimulant.

### ● INDICATIONS AND DOSE

**Termination of pregnancy following mifepristone (gestation up to 49 days)**

- ▶ BY MOUTH
- ▶ Adult: 400 micrograms for 1 dose, dose to be given 24-48 hours after mifepristone

**Termination of pregnancy following mifepristone (gestation 50 to 63 days)**

- ▶ INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 24-48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

**Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)**

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36-48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

**Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)**

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36-48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

### ANGUSTA®

**Induction of labour (specialist supervision in hospital)**

- ▶ BY MOUTH
- ▶ Adult: 25 micrograms every 2 hours, alternatively 50 micrograms every 4 hours, to be given in accordance with local protocols; maximum 200 micrograms per day

● **UNLICENSED USE** Misoprostol doses for termination of pregnancy may differ from those in product literature.

**● CONTRA-INDICATIONS**

**ANGUSTA**® Active labour · fetal malpresentation · placenta praevia · suspicion or evidence of fetal compromise · unexplained vaginal bleeding after 24 weeks gestation · uterine abnormality · uterine scar

**● CAUTIONS**

▶ When used for termination of pregnancy Cardiovascular disease · risk factors for cardiovascular disease

**ANGUSTA**® Before 37 weeks' gestation (limited information available) · chorioamnionitis · modified Bishop score greater than 6 (limited information available)

**● INTERACTIONS** → Appendix 1: misoprostol

**● SIDE-EFFECTS**

▶ **Common or very common** Chills · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting

▶ **Uncommon** Haemorrhage · menstrual cycle irregularities · postmenopausal haemorrhage · uterine cramps

▶ **Frequency not known** Uterine rupture

**● BREAST FEEDING** Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. [EVGr](#) Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose. [D](#)

**ANGUSTA**® [EVGr](#) Avoid for 4 hours after administration of the last dose. [M](#)

**● HEPATIC IMPAIRMENT**

**ANGUSTA**® [EVGr](#) Caution in impairment—risk of increased exposure. [M](#)

**Dose adjustments** [EVGr](#) Consider dose reduction and/or prolonged dosing interval in impairment. [M](#)

**● RENAL IMPAIRMENT**

**ANGUSTA**® [EVGr](#) Caution in impairment—risk of increased exposure; avoid if eGFR less than 15 ml/min/1.73 m<sup>2</sup>. [M](#) See p. 21.

**Dose adjustments** [EVGr](#) Consider dose reduction and/or prolonged dosing interval in impairment. [M](#)

**● PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**● MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Misoprostol (Non-proprietary)**

**Misoprostol 200 microgram** Misoprostol 200microgram vaginal tablets | 4 tablet [PoM](#) [S](#) (Hospital only)

▶ **Angusta** (Norgine Pharmaceuticals Ltd)

**Misoprostol 25 microgram** Angusta 25microgram tablets | 8 tablet [PoM](#) £83.14 (Hospital only)

▶ **Topogyne** (Nordic Pharma Ltd)

**Misoprostol 400 microgram** Topogyne 400microgram tablets | 1 tablet [PoM](#) £8.00 DT = £8.00

Combinations available: *Mifepristone and misoprostol*, p. 893

## 7 Vaginal and vulval conditions

### Vaginal and vulval conditions

06-Aug-2021

#### Vaginal and vulval changes

##### Topical oestrogen for vaginal atrophy

Topical oestrogens are available as estradiol pessaries and vaginal rings p. 897, and as estriol pessaries, cream and gel p. 898. [EVGr](#) They are used to treat the symptoms of vaginal

atrophy related to oestrogen deficiency in postmenopausal women. [A](#) Systemic effects of oestrogen are minimised by using the lowest effective dose to control symptoms; [EVGr](#) the dose may be increased on the advice of a healthcare professional with expertise in menopause if there is inadequate symptom control. Treatment is continued for as long as needed to relieve symptoms and reviewed initially at 3 months, then at least annually.

Vaginal oestrogens can also be considered in women with pelvic organ prolapse who have signs of vaginal atrophy. [A](#) For further information, see Urinary incontinence and pelvic organ prolapse in women p. 837.

##### Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff). [EVGr](#) Menopausal women with vaginal dryness can use vaginal moisturisers and lubricants alone or in addition to vaginal oestrogen. [A](#)

#### Vaginal and vulval infections

##### Vulvovaginal candidiasis

Vulvovaginal candidiasis (genital thrush) is symptomatic inflammation of the vagina and/or vulva caused by a superficial fungal infection; most cases are caused by *Candida albicans*.

[EVGr](#) Acute vulvovaginal candidiasis is treated with either an oral azole drug (such as fluconazole p. 649 or itraconazole p. 651), or with an intravaginal imidazole pessary or cream (e.g. clotrimazole p. 896, econazole nitrate p. 896, or miconazole p. 897) inserted high into the vagina. [A](#) [EVGr](#) Treatment may be supplemented with a topical antifungal cream for vulvitis and to treat other superficial sites of infection. [D](#) Local irritation may occur on application of intravaginal imidazole drug preparations and may be mistaken for treatment failure.

Intravaginal imidazole drugs are effective against candida in short courses of 1 to 14 days according to the preparation used. [EVGr](#) Treatment can be repeated if the initial course fails to control symptoms or if symptoms recur after 7 days. [M](#)

##### Vulvovaginal candidiasis in pregnancy

[EVGr](#) Symptomatic vulvovaginal candidiasis is common during pregnancy and can be treated with intravaginal application of an imidazole (such as clotrimazole). Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. [A](#) There is limited systemic absorption of imidazoles from the vagina. [EVGr](#) Treatment with an oral azole drug should be avoided during pregnancy. [A](#)

##### Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as recent (up to 3 months before) antibacterial therapy, poorly controlled diabetes mellitus, pregnancy, immunosuppression, HRT use, or possibly oral contraceptive use.

[EVGr](#) Treatment of recurrent vulvovaginal candidiasis involves initial treatment with oral fluconazole (induction regimen) to ensure clinical remission, followed immediately by a maintenance regimen for 6 months. When oral fluconazole treatment is unsuitable, an intravaginal imidazole can be given. [A](#)

##### Other infections

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis. Oral or intravaginal antibacterial drugs may be required for the treatment of bacterial vaginosis. For further information, see Genital system infections, antibacterial therapy p. 549.

[EVGr](#) Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 590.

The antiviral drugs aciclovir p. 687, famciclovir p. 689, and valaciclovir p. 690 can be used in the treatment of genital infection due to herpes simplex virus; they have a beneficial effect on virus shedding, and reducing the severity and duration of episodes.  For further information, see Herpesvirus infections p. 686.

For information on the human papillomavirus vaccine, see Human papillomavirus vaccine p. 1403.

## 7.1 Vaginal and vulval infections

### 7.1a Vaginal and vulval bacterial infections

#### ANTIBACTERIALS > LINCOSAMIDES

### Clindamycin

25-Oct-2021

#### ● INDICATIONS AND DOSE

##### DALACIN<sup>®</sup> 2% CREAM

#### Bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicatorful delivers a 5 g dose of clindamycin 2%.

- **INTERACTIONS** → Appendix 1: clindamycin

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions
- ▶ **Frequency not known** Constipation · diarrhoea (discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

**SIDE-EFFECTS, FURTHER INFORMATION** Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

#### ● CONCEPTION AND CONTRACEPTION

**DALACIN<sup>®</sup> 2% CREAM** Damages latex condoms and diaphragms.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Genital system infections, antibacterial therapy p. 549.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Dalacin** (Pfizer Ltd)  
Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram  £10.86 DT = £10.86

#### ANTISEPTICS AND DISINFECTANTS

### Dequalinium chloride

20-Aug-2020

- **DRUG ACTION** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

#### ● INDICATIONS AND DOSE

#### Bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult 18–55 years: 10 mg once daily for 6 days, inserted at night

- **CONTRA-INDICATIONS** Vaginal ulceration

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection · vulvovaginal disorders
- ▶ **Uncommon** Haemorrhage · headache · nausea
- ▶ **Frequency not known** Cystitis · fever
- **CONCEPTION AND CONTRACEPTION** Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available.

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

- For full details see funding body website
- Scottish Medicines Consortium (SMC) decisions**
- ▶ Dequalinium chloride (**Fluomizin<sup>®</sup>**) for treatment of bacterial vaginosis (November 2016) SMC No. 1194/16 Recommended with restrictions

#### All Wales Medicines Strategy Group (AWMSG) decisions

- ▶ Dequalinium chloride (**Fluomizin<sup>®</sup>**) for treatment of bacterial vaginosis after initial treatment is ineffective or not tolerated as an alternative option to clindamycin vaginal cream (November 2016) AWMSG No. 2775 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Fluomizin** (Kora Healthcare)  
Dequalinium chloride 10 mg Fluomizin 10mg vaginal tablets | 6 tablet  £6.95 DT = £6.95

#### CARBOXYLIC ACIDS

### Lactic acid

24-Nov-2020

#### ● INDICATIONS AND DOSE

##### BALANCE ACTIV RX<sup>®</sup> GEL

#### Prevention of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

##### RELACTAGEL<sup>®</sup> GEL

#### Prevention of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

#### Treatment of bacterial vaginosis

- ▶ BY VAGINA
- ▶ Adult: 5 mL daily for 7 nights, insert the contents of one tube

- **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in shellfish allergy. 

#### ● CONCEPTION AND CONTRACEPTION

- RELACTAGEL<sup>®</sup> GEL** Not recommended if trying to conceive.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Products without form

EXCIPIENTS: May contain Propylene glycol

- ▶ **Balance Activ** (BBI Healthcare Ltd)  
Balance Activ BV vaginal pH correction gel | 7 device £5.25

## 7.1b Vaginal and vulval fungal infections

**Other drugs used for Vaginal and vulval fungal infections**  
Fluconazole, p. 649 · Itraconazole, p. 651

### ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

#### Clotrimazole

10-Nov-2021

##### ● INDICATIONS AND DOSE

##### Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)

- ▶ BY VAGINA USING CREAM
- ▶ Adult: Apply 2–3 times a day, to be applied to anogenital area

##### Vaginal candidiasis (dose for 10% intravaginal cream)

- ▶ BY VAGINA USING VAGINAL CREAM
- ▶ Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

##### Vaginal candidiasis

- ▶ BY VAGINA USING PESSARIES
- ▶ Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

##### Recurrent vulvovaginal candidiasis

- ▶ BY VAGINA USING PESSARIES
- ▶ Adult: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS** Abdominal pain · discomfort · genital peeling · oedema · paraesthesia · pelvic pain · skin reactions · vaginal haemorrhage
- **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.
- **PREGNANCY**  
**Dose adjustments** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.
- **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include *Canesten*<sup>®</sup> Internal Cream.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Pessary

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Canesten (clotrimazole)** (Bayer Plc)

**Clotrimazole 100 mg** Canesten 100mg pessaries | 6 pessary [P] £3.85 DT = £3.85

**Clotrimazole 200 mg** Canesten 200mg pessaries | 3 pessary [P] £3.41 DT = £3.41

**Clotrimazole 500 mg** Canesten Vaginal 500mg pessaries | 1 pessary [PoM] £2.00 DT = £4.63

##### Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Clotrimazole (Non-proprietary)**

**Clotrimazole 10 mg per 1 gram** Clotrimazole 1% cream | 20 gram [P] £1.80 DT = £1.20 | 50 gram [P] £3.67 DT = £3.00

- ▶ **Canesten (clotrimazole)** (Bayer Plc)

**Clotrimazole 10 mg per 1 gram** Canesten 1% cream | 20 gram [P] £2.20 DT = £1.20 | 50 gram [P] £3.64 DT = £3.00  
Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT = £1.20

**Clotrimazole 20 mg per 1 gram** Canesten 2% thrush cream | 20 gram [P] £4.76 DT = £4.76

**Clotrimazole 100 mg per 1 gram** Canesten 10% VC cream | 5 gram [PoM] £4.50 DT = £6.23

### Econazole nitrate

08-May-2020

##### ● INDICATIONS AND DOSE

##### GYNO-PEVARYL<sup>®</sup> ONCE

##### Vaginal and vulval candidiasis

- ▶ BY VAGINA
- ▶ Adult: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

##### GYNO-PEVARYL<sup>®</sup> CREAM

##### Vaginal and vulval candidiasis

- ▶ INITIALLY BY VAGINA USING VAGINAL CREAM
- ▶ Adult: 1 applicatorful daily for at least 14 days, dose to be inserted vaginally at night and (to the skin) apply daily for at least 14 days, to be applied to vulva at night, course can be repeated once if necessary

##### GYNO-PEVARYL<sup>®</sup> PESSARY

##### Vaginal and vulval candidiasis

- ▶ BY VAGINA
- ▶ Adult: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Vaginal burning
- ▶ **Frequency not known** Angioedema
- **CONCEPTION AND CONTRACEPTION** Cream and pessaries damage latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Pessary

- ▶ **Gyno-Pevaryl** (Karo Pharma)

**Econazole nitrate 150 mg** Gyno-Pevaryl 150mg vaginal pessaries | 3 pessary [PoM] £4.17 DT = £4.17

##### Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

- ▶ **Gyno-Pevaryl** (Karo Pharma)

**Econazole nitrate 10 mg per 1 gram** Gyno-Pevaryl 1% cream | 30 gram [PoM] £3.78 DT = £3.78

### Ketoconazole

04-Feb-2020

##### ● INDICATIONS AND DOSE

##### Vaginal and vulva candidiasis

- ▶ BY VAGINA USING CREAM
- ▶ Adult: Apply 1–2 times a day, to be applied to the anogenital area

- **CONTRA-INDICATIONS** Acute porphyrias p. 1150
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Skin reactions
  - ▶ **Uncommon** Alopecia · angioedema
  - ▶ **Rare or very rare** Taste altered
- **CONCEPTION AND CONTRACEPTION** Effect on latex condoms and diaphragms not yet known.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- **Nizoral** (Janssen-Cilag Ltd)  
Ketoconazole 20 mg per 1 gram Nizoral 2% cream | 30 gram **[PoM]**  
£4.24 DT = £4.24

## Miconazole

09-Feb-2022

### ● INDICATIONS AND DOSE

#### Vaginal and vulval candidiasis

- ▶ BY VAGINA USING VAGINAL CREAM
- ▶ Adult: 1 applicatorful once daily for 7 days, to be inserted into the vagina before bedtime, course can be repeated once if necessary

#### Superficial sites of infection in vaginal and vulval candidiasis | Vulvitis

- ▶ BY VAGINA USING VAGINAL CREAM
- ▶ Adult: Apply twice daily, apply to the anogenital area

- **CAUTIONS** Avoid in Acute porphyrias p. 1150
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dysmenorrhoea · skin reactions · vulvovaginal disorders
- ▶ **Frequency not known** Abdominal pain · angioedema · dysuria · headache · nausea · pelvic cramps · urinary tract infection · vaginal haemorrhage
- **CONCEPTION AND CONTRACEPTION** *Gyno-Daktarin*® damages latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

- EXCIPIENTS: May contain Butylated hydroxyanisole
- ▶ **Gyno-Daktarin** (Janssen-Cilag Ltd)  
Miconazole nitrate 20 mg per 1 gram Gyno-Daktarin 2% vaginal cream | 78 gram **[PoM]** £4.33 DT = £4.33

## 7.2 Vaginal atrophy

### OESTROGENS

#### Estradiol

27-May-2021

### ● INDICATIONS AND DOSE

#### Vaginal atrophy in postmenopausal women | Prophylaxis of recurrent urinary-tract infection in postmenopausal women

- ▶ BY VAGINA USING PESSARIES
- ▶ Adult: 10 micrograms daily for 2 weeks, then reduced to 10 micrograms twice weekly

#### ESTRING®

#### Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)

- ▶ BY VAGINA
- ▶ Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

#### Prophylaxis of recurrent urinary-tract infection in postmenopausal women

- ▶ BY VAGINA
- ▶ Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months

- **UNLICENSED USE** **[EvGr]** Estradiol pessaries or vaginal tablets, and *Estring*® are used for the prophylaxis of

recurrent urinary-tract infection in postmenopausal women, **[C]** but are not licensed for this indication.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · review treatment at least annually to assess need for continued treatment · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · headaches · nausea · skin reactions · vaginal haemorrhage · vulvovaginal disorders
- ▶ **Uncommon** Hypertension · vulvovaginal fungal infection · weight increased
- ▶ **Rare or very rare** Diarrhoea · embolism and thrombosis · endometrial hyperplasia · fluid retention · genital pruritus · increased risk of ischaemic stroke · insomnia · neoplasm malignant · neoplasms · vaginismus

- **CONCEPTION AND CONTRACEPTION** For estradiol pessaries or vaginal tablets, no evidence of damage to latex condoms and diaphragms.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **MONITORING REQUIREMENTS**
  - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

**Pessary**

  - ▶ **Estradiol (Non-proprietary)**
    - ▶ **Estradiol 10 microgram** Estradiol 10microgram pessaries | 24 pessary [Pom] £16.72 DT = £16.72
    - ▶ **Vagifem** (Novo Nordisk Ltd)
      - ▶ **Estradiol 10 microgram** Vagifem 10microgram vaginal tablets | 24 pessary [Pom] £16.72 DT = £16.72
      - ▶ **Vagirux** (Gedeon Richter (UK) Ltd)
        - ▶ **Estradiol 10 microgram** Vagirux 10microgram vaginal tablets | 24 pessary [Pom] £11.34 DT = £16.72

**Vaginal delivery system**

CAUTIONARY AND ADVISORY LABELS 10

  - ▶ **Estring** (Pfizer Ltd)
    - ▶ **Estradiol (as Estradiol hemihydrate) 7.5 microgram per 24 hour** Estring 7.5micrograms/24hours vaginal delivery system | 1 device [Pom] £31.42 DT = £31.42

## Estriol

18-Jun-2021

### ● INDICATIONS AND DOSE

#### Vaginal atrophy in postmenopausal women

- ▶ INITIALLY BY VAGINA USING VAGINAL CREAM, OR BY VAGINA USING VAGINAL GEL
- ▶ Adult: Apply 1 applicatorful daily for 3–4 weeks, then (by vagina) reduced to 1 applicatorful twice weekly, to be applied at bedtime, treatment should be evaluated after 12 weeks

#### Vaginal atrophy in postmenopausal women

- ▶ INITIALLY BY VAGINA USING PESSARIES
- ▶ Adult: 1 pessary daily for 3 weeks, then (by vagina) 1 pessary twice weekly, to be inserted at bedtime

#### Prophylaxis of recurrent urinary-tract infection in postmenopausal women

- ▶ BY VAGINA USING VAGINAL CREAM
- ▶ Adult: Apply 1 applicatorful daily for 3–4 weeks, then reduced to 1 applicatorful twice weekly, to be applied at bedtime

#### OVESTIN®

#### Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)

- ▶ BY VAGINA
- ▶ Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ For *Ovestin*® cream, 1 applicatorful contains 500 micrograms estriol; for *Blissel*® gel, 1 applicatorful contains 50 micrograms estriol; for *Imvaggis*® pessary, 1 pessary contains 30 micrograms estriol.

- **UNLICENSED USE** [EvGr] Estriol vaginal cream is used for the prophylaxis of recurrent urinary-tract infection in postmenopausal women, (E) but is not licensed for this indication.

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · history of breast cancer · history of venous thromboembolism · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Acute porphyrias p. 1150 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · review treatment at least annually to assess need for continued treatment · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

#### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dysuria · genital abnormalities · skin reactions · vulvovaginal disorders
- ▶ **Uncommon** Anorectal discomfort · candida infection · headache · pelvic pain
- ▶ **Frequency not known** Breast abnormalities · cervical mucus increased · dementia · erythema nodosum · gallbladder disorder · increased risk of coronary artery disease · increased risk of ischaemic stroke · increased risk of venous thromboembolism · nausea · neoplasms · vaginal haemorrhage · vomiting
- **CONCEPTION AND CONTRACEPTION** *Imvaggis*® pessary may damage latex condoms (decreases tensile strength).

**OVESTIN**® Effect on latex condoms and diaphragms not yet known.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.
- **RENAL IMPAIRMENT** EvGr Use with caution. M
- **MONITORING REQUIREMENTS**
- ▶ Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
- ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Pessary

EXCIPIENTS: May contain Butylated hydroxytoluene

- ▶ **Imvaggis** (Besins Healthcare (UK) Ltd)

**Estriol 30 microgram** Imvaggis 0.03mg pessaries | 24 pessary PoM £13.38 DT = £13.38

#### Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Estriol (Non-proprietary)**

**Estriol 100 microgram per 1 gram** Estriol 0.01% cream | 80 gram PoM S

- ▶ **Ovestin** (Aspen Pharma Trading Ltd)

**Estriol 1 mg per 1 gram** Ovestin 1mg cream | 15 gram PoM £4.45 DT = £4.45

#### Vaginal gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Blissel** (Flynn Pharma Ltd)

**Estriol 50 microgram per 1 gram** Blissel 50micrograms/g vaginal gel with applicator | 30 gram PoM £18.90 DT = £18.90

## Prasterone

20-May-2019

- **DRUG ACTION** Prasterone is biochemically and biologically identical to endogenous dehydroepiandrosterone (DHEA), and is converted to oestrogens and androgens.

### ● INDICATIONS AND DOSE

**Vulvar and vaginal atrophy [in postmenopausal women with moderate to severe symptoms]**

- ▶ BY VAGINA USING PESSARIES

- ▶ Adult: 6.5 mg once daily, at bedtime. Treatment should be reassessed at least every 6 months

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · acute liver disease · Acute porphyrias p. 1150 · history of breast cancer · history of liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Assess need for continued treatment at least every 6 months · cholelithiasis · diabetes mellitus · factors predisposing to thromboembolism · history of endometrial hyperplasia · hypertriglyceridaemia · liver disorders (discontinue if jaundice or deterioration in liver function occurs during treatment) · migraine (or migraine-like headaches) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. Bleeding or spotting occurring during treatment should be investigated.

For oestrogen products for vaginal application, where systemic exposure to oestrogen remains within the normal postmenopausal range, it is not recommended to add a progestogen.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, major surgery or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- ▶ Other conditions The product literature advises caution in other conditions including hypertension, asthma, epilepsy, otosclerosis, and systemic lupus erythematosus. Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

### ● SIDE-EFFECTS

- ▶ **Common or very common** Cervical abnormalities · weight change
- ▶ **Uncommon** Breast neoplasm benign · uterine polyp
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid use with condoms, diaphragms or cervical caps made of latex—may damage rubber.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **PATIENT AND CARER ADVICE**  
**Missed doses** Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Pessary

- ▶ **Intrarosa** (Theramex HQ UK Ltd) ▼

**Prasterone 6.5 mg** Intrarosa 6.5mg pessaries | 28 pessary PoM £15.94 DT = £15.94 CD4-2

## SELECTIVE OESTROGEN RECEPTOR MODULATORS

### Ospemifene

31-Aug-2020

- **DRUG ACTION** Ospemifene is a selective oestrogen receptor modulator that has an oestrogen-like effect in the vagina, increasing the cellular maturation and mucification of the vaginal epithelium.

#### ● INDICATIONS AND DOSE

**Moderate to severe symptomatic vulvar and vaginal atrophy [in post-menopausal women who are not candidates for local vaginal oestrogen therapy]**

► BY MOUTH

► Adult: 60 mg once daily

- **CONTRA-INDICATIONS** Breast cancer (suspected or actively treated) · endometrial hyperplasia · history of venous thromboembolism · sex-hormone dependent malignancy (suspected or active) · unexplained vaginal bleeding
- **CAUTIONS** Risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- **INTERACTIONS** → Appendix 1: ospemifene
- **SIDE-EFFECTS**
  - **Common or very common** Genital discharge · hot flush · increased risk of infection · muscle spasms · skin reactions · vaginal discharge · vaginal haemorrhage
  - **Uncommon** Endometrial thickening · hypersensitivity · tongue swelling
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek immediate medical attention if they experience symptoms of thromboembolism (such as sudden chest pain, dyspnoea or swelling of a leg).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website
- **Scottish Medicines Consortium (SMC) decisions**
  - Ospemifene (*Senshio*®) for the treatment of moderate to severe symptomatic vulvar and vaginal atrophy in post-menopausal women who are not candidates for local vaginal oestrogen therapy (September 2019) SMC No. SMC2170 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## Immune system

### 1 Immune system disorders and transplantation

#### Immune response

29-Jun-2020

##### Inflammatory bowel disease

Azathioprine p. 902, ciclosporin p. 904, mercaptopurine p. 986, and methotrexate p. 987 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 1112 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

##### Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 911), calcineurin inhibitors (ciclosporin or tacrolimus p. 907), corticosteroids, or sirolimus p. 906. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

##### Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid *spread of infection*. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—**important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin p. 1390 or an antiviral [unlicensed] may be required for individuals exposed to varicella (chickenpox) or herpes zoster (shingles); for further information, see Immunoglobulins p. 1383. Wherever possible, immunisation or additional booster doses for individuals with immunosuppression should be carried out either before immunosuppression occurs or deferred until an

improvement in immunity has been seen. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

##### Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1213 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 968 is less commonly prescribed as an immunosuppressant.

##### Corticosteroids and other immunosuppressants

Prednisolone p. 747 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 910 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 913 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**Other drugs used for Immune system disorders and transplantation** Anakinra, p. 1193 · Chloroquine, p. 669 · Eculizumab, p. 1104 · Everolimus, p. 1058 · Hydroxychloroquine sulfate, p. 1190 · Rituximab, p. 955 · Tocilizumab, p. 1195

## IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

### Antithymocyte immunoglobulin (rabbit)

17-Jul-2020

#### ● INDICATIONS AND DOSE

##### Prophylaxis of organ rejection in heart allograft recipients

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

##### Prophylaxis of organ rejection in renal allograft recipients

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

##### Treatment of corticosteroid-resistant allograft rejection in renal transplantation

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

#### DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS** Infection

- **INTERACTIONS** → Appendix 1: immunoglobulins

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* (Thymoglobuline®), manufacturer advises give in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

#### NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in adults** (October 2017) NICE TA481 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- ▶ **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**

Antithymocyte immunoglobulin (rabbit) 20 mg per 1 mL Grafalon 100mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] [X] (Hospital only)

#### Powder and solvent for solution for infusion

- ▶ **Thymoglobulin** (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

## IMMUNOSUPPRESSANTS > ANTIMETABOLITES

### Azathioprine

18-Nov-2021

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

#### ● INDICATIONS AND DOSE

##### Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

###### ▶ BY MOUTH

- ▶ Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

##### Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

###### ▶ BY MOUTH

- ▶ Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

#### Autoimmune conditions

##### ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

#### Suppression of transplant rejection

##### ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Severe refractory eczema, normal or high TPMT activity**

▶ BY MOUTH

▶ Adult: 1–3 mg/kg daily

**Severe refractory eczema, intermediate TPMT activity**

▶ BY MOUTH

▶ Adult: 0.5–1.5 mg/kg daily

**Generalised myasthenia gravis**

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

● **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

**CONTRA-INDICATIONS**

▶ When used for severe refractory eczema Absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

● **CAUTIONS** Reduce dose in elderly · reduced thiopurine methyltransferase activity

● **INTERACTIONS** → Appendix 1: azathioprine

**SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

▶ **Common or very common** Bone marrow depression (dose-related) · increased risk of infection · leucopenia · pancreatitis · thrombocytopenia

▶ **Uncommon** Anaemia · hepatic disorders · hypersensitivity disorders

▶ **Rare or very rare** Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)

▶ **Frequency not known** Nodular regenerative hyperplasia · sinusoidal obstruction syndrome

**SPECIFIC SIDE-EFFECTS**

▶ With oral use Nausea

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may require drug withdrawal.

**Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

**Neutropenia and thrombocytopenia** Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

**Nausea** Nausea is common early in the course of treatment and usually resolves after a few weeks without an alteration in dose. Moderate nausea can be managed by using divided daily doses, taking doses after food, prescribing concurrent antiemetics or temporarily reducing the dose.

● **ALLERGY AND CROSS-SENSITIVITY** [EvGr] Contra-indicated in hypersensitivity to mercaptopurine. ⚠

● **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported

following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

● **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment.

**Dose adjustments** Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.

● **RENAL IMPAIRMENT** [EvGr] Caution (may result in slower elimination)—monitor complete blood count more frequently in those with severe impairment. ⚠

**Dose adjustments** [EvGr] Consider reducing starting dose (limited information available). ⚠

**PRE-TREATMENT SCREENING**

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Manufacturer advises consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Seek specialist advice for those with reduced or absent TPMT activity.

**MONITORING REQUIREMENTS**

▶ Monitor for toxicity throughout treatment.

▶ Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, manufacturer advises give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (Imuran®), manufacturer advises reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Expert sources advise give in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Manufacturer advises intravenous route should therefore be used **only** if oral route not feasible.

**PATIENT AND CARER ADVICE**

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

**▶ Azathioprine (Non-proprietary)**

**Azathioprine 25 mg** Azathioprine 25mg tablets | 28 tablet [PoM] £5.52 DT = £1.56 | 100 tablet [PoM] £5.54-£33.26

**Azathioprine 50 mg** Azathioprine 50mg tablets | 56 tablet [PoM] £5.50 DT = £1.80 | 100 tablet [PoM] £3.21-£16.55

**▶ Azapress (Ennogen Pharma Ltd)**

**Azathioprine 50 mg** Azapress 50mg tablets | 56 tablet [PoM] £2.83 DT = £1.80

- ▶ **Imuran** (Aspen Pharma Trading Ltd)  
**Azathioprine 25 mg** Imuran 25mg tablets | 100 tablet **[PoM]** £10.99  
**Azathioprine 50 mg** Imuran 50mg tablets | 100 tablet **[PoM]** £7.99

#### Powder for solution for injection

- ▶ **Imuran** (Aspen Pharma Trading Ltd)  
**Azathioprine 50 mg** Imuran 50mg powder for solution for injection vials | 1 vial **[PoM]** £15.38 DT = £15.38

## IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

### Ciclosporin

17-Sep-2021

#### (Cyclosporin)

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

#### ● INDICATIONS AND DOSE

##### Severe acute ulcerative colitis refractory to corticosteroid treatment

- ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**
- ▶ Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

##### Severe active rheumatoid arthritis (administered on expert advice)

- ▶ **BY MOUTH**
- ▶ Adult: Initially 1.5 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

##### Severe active rheumatoid arthritis [in combination with low-dose methotrexate, when methotrexate monotherapy has been ineffective] (administered on expert advice)

- ▶ **BY MOUTH**
- ▶ Adult: Initially 1.25 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks

##### Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ **BY MOUTH**
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

##### Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ **BY MOUTH**
- ▶ Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

##### Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- ▶ **BY MOUTH**
- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max.

duration of treatment usually 1 year unless other treatments cannot be used

#### Organ transplantation (used alone)

- ▶ **BY MOUTH**
- ▶ Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

#### Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

- ▶ **INITIALLY BY INTRAVENOUS INFUSION**
- ▶ Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

#### Nephrotic syndrome

- ▶ **BY MOUTH**
- ▶ Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment.

#### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Elderly—monitor renal function · hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- **INTERACTIONS** → Appendix 1: ciclosporin

## ● SIDE-EFFECTS

### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Eye inflammation
- SPECIFIC SIDE-EFFECTS**
- ▶ **Common or very common** Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia · hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
- ▶ **Uncommon** Anaemia · encephalopathy · oedema · thrombocytopenia · weight increased
- ▶ **Rare or very rare** Gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
- ▶ **Frequency not known** Pain in extremity · thrombotic microangiopathy

● **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).

**Dose adjustments** Manufacturer advises consider dose reduction in severe impairment to maintain blood-cyclosporin concentration in target range—monitor until concentration stable.

● **RENAL IMPAIRMENT** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid.

**Dose adjustments** See p. 21. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

### ● MONITORING REQUIREMENTS

- ▶ Monitor whole blood cyclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis. Monitor liver function. Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia). Monitor serum magnesium. Measure blood lipids before treatment and after the first month of treatment. In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month. Investigate lymphadenopathy that persists despite improvement in atopic dermatitis. Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients. Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives. In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals. In rheumatoid arthritis measure serum creatinine at least

twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased). Monitor hepatic function if concomitant NSAIDs given.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Manufacturer advises mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- ▶ With intravenous use For *intravenous infusion (Sandimmun®)*, manufacturer advises give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

### ● PRESCRIBING AND DISPENSING INFORMATION

**Brand name prescribing** Prescribing and dispensing of cyclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of cyclosporin, the patient should be monitored closely for changes in blood-cyclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun®* capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

● **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of cyclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Alcohol, polyoxyl castor oils

▶ **Sandimmun** (Novartis Pharmaceuticals UK Ltd)

**Cyclosporin 50 mg per 1 ml** Sandimmun 250mg/5ml concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £110.05

Sandimmun 50mg/1ml concentrate for solution for infusion ampoules

## Sirolimus

21-Jul-2020

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

### ● INDICATIONS AND DOSE

#### Prophylaxis of organ rejection in kidney allograft recipients

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- **INTERACTIONS** → Appendix 1: sirolimus

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders · sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia
- ▶ **Uncommon** Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
- ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).  
**Dose adjustments** Manufacturer advises maintenance dose reduction of approx. 50% in severe impairment—monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration.

### ● MONITORING REQUIREMENTS

- ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- ▶ Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic** assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- ▶ Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- ▶ When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.
- ▶ Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.

Patients should be advised to avoid excessive exposure to UV light.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481 Not recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

EXCIPIENTS: May contain Ethanol

##### ▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free | 60 ml [PoM] £162.41 DT = £162.41

#### Tablet

##### ▶ Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets |

30 tablet [PoM] £69.00 DT = £69.00

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet [PoM] £86.49 DT = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PoM] £172.98 DT = £172.98

## Tacrolimus

02-Dec-2020

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

#### ● INDICATIONS AND DOSE

##### ADOPT<sup>®</sup>

#### Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

#### Allograft rejection resistant to conventional immunosuppressive therapy

##### ▶ BY MOUTH

- ▶ Adult: Seek specialist advice

##### ADVAGRAF<sup>®</sup>

#### Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg once daily, to be taken in the morning

#### Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg once daily, to be taken in the morning

#### Allograft rejection resistant to conventional immunosuppressive therapy

##### ▶ BY MOUTH

- ▶ Adult: Seek specialist advice

##### ENVARUSUS<sup>®</sup> MODIFIED-RELEASE TABLETS

#### Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

#### Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

#### Rejection therapy

##### ▶ BY MOUTH

- ▶ Adult: Seek specialist advice

##### MODIGRAF<sup>®</sup>

#### Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

#### Rejection therapy

##### ▶ BY MOUTH

- ▶ Adult: Seek specialist advice

##### PROGRAF<sup>®</sup> CAPSULES

#### Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

#### Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

##### ▶ BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

continued →

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Allgraft rejection resistant to conventional immunosuppressive therapy**

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

**PROGRAF® INFUSION****Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Allgraft rejection resistant to conventional immunosuppressive therapy**

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: Seek specialist advice (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For *Prograf*®: intravenous and oral doses are **not** interchangeable due to differences in bioavailability. Follow correct dosing recommendations for the dosage form when switching formulations.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)**

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport*®, *Prograf*®, *Capexion*® and *Tacnt*® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf*® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf*® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: *Envarsus*® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1: tacrolimus
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder · renal impairment · renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tinnitus · tremor · urinary tract disorder · urine abnormal · vision disorders · vomiting · weight changes
  - ▶ **Uncommon** Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · hearing impairment · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations · pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy
  - ▶ **Rare or very rare** Fall · hirsutism · mobility decreased · muscle tone increased · muscle weakness · pancreatic pseudocyst · pericardial effusion · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · thirst · ulcer
  - ▶ **Frequency not known** Agranulocytosis · neoplasms · neoplasm malignant · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia
- SPECIFIC SIDE-EFFECTS**
- ▶ With intravenous use Anaphylactoid reaction (due to excipient)
- SIDE-EFFECTS, FURTHER INFORMATION** Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- **ALLERGY AND CROSS-SENSITIVITY** EvGr Contra-indicated if history of hypersensitivity to macrolides. M

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.  
**Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - ▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion (Prograf®)*; manufacturer advises give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.  
**Driving and skilled tasks** May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website

**NICE decisions**

- ▶ Immunosuppressive therapy for kidney transplant in adults [for immediate-release tacrolimus] (October 2017) NICE TA481 Recommended with restrictions
- ▶ Immunosuppressive therapy for kidney transplant in adults [for prolonged-release tacrolimus] (October 2017) NICE TA481 Not recommended

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Tacrolimus granules for suspension (*Modigraf®*) for prophylaxis of transplant rejection in adult and paediatric, kidney, liver or heart allograft recipients or for treatment of allograft rejection resistant to treatment with other immunosuppressive medicinal products in adult and paediatric patients (December 2010) SMC No. 657/10 Recommended with restrictions
- ▶ Tacrolimus (*Envarsus®*) for prophylaxis of transplant rejection in adult kidney or liver allograft recipients and treatment of allograft rejection resistant to treatment with other immunosuppressive medicinal products in adult patients (April 2015) SMC No. 1041/15 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES****Canakinumab**

17-May-2021

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**INDICATIONS AND DOSE**

**Gouty arthritis [in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or in those with contra-indications or intolerances to them, and in whom repeated courses of corticosteroids are inappropriate]**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 150 mg for 1 dose, in patients who respond, dose may be repeated after at least 12 weeks if symptoms recur, to be administered to the upper thigh, abdomen, upper arm or buttocks

**Cryopyrin-associated periodic syndromes (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 41 kg and above): 150 mg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

**Tumour necrosis factor receptor associated periodic syndrome (specialist use only) | Hyperimmunoglobulin D syndrome (specialist use only) | Familial Mediterranean fever (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight 41 kg and above): 150 mg every 4 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, a second continued →

dose may be considered if clinical response not achieved within 7 days—consult product literature

#### Still's disease (specialist use only)

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 4 mg/kg every 4 weeks (max. per dose 300 mg), to be administered to the upper thigh, abdomen, upper arm or buttocks

- **CONTRA-INDICATIONS** Active severe infection · leucopenia · neutropenia
- **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection
- CAUTIONS, FURTHER INFORMATION**
  - Vaccinations [Evgi](#) Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information. [M](#)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo
  - **Uncommon** Gastroesophageal reflux disease
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
  - Manufacturer advises monitor for signs and symptoms of infection (including tuberculosis) during and after treatment.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to seek medical advice if signs or symptoms suggestive of tuberculosis (including persistent cough, weight loss and subfebrile temperature) occur.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Ilaris** (Novartis Pharmaceuticals UK Ltd)

**Canakinumab 150 mg per 1 ml** Ilaris 150mg/1ml solution for injection vials | 1 vial [PoM](#) £9,927.80

## IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

### Basiliximab

23-Mar-2021

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

#### ● INDICATIONS AND DOSE

##### **Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)**

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, without second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Anaemia · capillary leak syndrome · constipation · cytokine release syndrome · diarrhoea · dyspnoea · electrolyte imbalance · headache · heart failure · hypercholesterolaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · myocardial infarction · nausea · pain · peripheral oedema · post procedural wound complication · pulmonary oedema · respiratory disorders · skin reactions · sneezing · tachycardia · weight increased
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Simulect*<sup>®</sup>), manufacturer advises give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- NICE decisions**
  - Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- **Simulect** (Novartis Pharmaceuticals UK Ltd)

**Basiliximab 10 mg** Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM](#) £758.69 (Hospital only)

**Basiliximab 20 mg** Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM](#) £842.38 (Hospital only)

## Belimumab

18-Jan-2022

## ● INDICATIONS AND DOSE

**Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy**

## ▶ BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

## IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BELIMUMAB (BENLYSTA®): INCREASED RISK OF SERIOUS PSYCHIATRIC EVENTS SEEN IN CLINICAL TRIALS (APRIL 2019)

Clinical trials show an increased risk of depression, suicidal ideation or behaviour, or self-injury in patients with systemic lupus erythematosus on belimumab. Healthcare professionals should assess patients for these risks before starting treatment, monitor for new or worsening signs of these risks during treatment, and advise patients to seek immediate medical attention if new or worsening symptoms occur.

- **CAUTIONS** Do not initiate until active infections controlled · history or development of malignancy · predisposition to infection

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Depression · diarrhoea · fever · hypersensitivity · increased risk of infection · infusion related reaction · leucopenia · migraine · nausea · pain in extremity
- ▶ **Uncommon** Angioedema · skin reactions · suicidal behaviours
- ▶ **Frequency not known** Progressive multifocal leukoencephalopathy (PML) · psychiatric disorder · self-injurious behaviour

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.

- **PREGNANCY** Avoid unless essential.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** EVGR Caution in severe impairment (limited information available). M

- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Benlysta®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Belimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ Belimumab for treating active autoantibody-positive systemic lupus erythematosus (December 2021) NICE TA752 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Belimumab (Benlysta®) as add-on therapy in adult patients with active, autoantibody-positive systemic lupus erythematosus (SLE) with a high degree of disease activity (e.g. positive anti-dsDNA and low complement) despite standard therapy (May 2017) SMC No. 775/12 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- ▶ **Benlysta** (GlaxoSmithKline UK Ltd) ▼

**Belimumab 120 mg** Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial PoM £121.50 (Hospital only)

**Belimumab 400 mg** Benlysta 400mg powder for concentrate for solution for infusion vials | 1 vial PoM £405.00 (Hospital only)

## IMMUNOSUPPRESSANTS &gt; PURINE SYNTHESIS INHIBITORS

## Mycophenolate mofetil

05-Oct-2021

● **INDICATIONS AND DOSE**

**Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)**

## ▶ BY MOUTH

- ▶ Adult: 1 g twice daily, to be started within 72 hours of transplantation

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

**Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

## ▶ BY MOUTH

- ▶ Adult: 1.5 g twice daily, to be started within 5 days of transplantation

**Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

## ▶ INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

## CEPTAVA®

**Renal transplantation (specialist use only)**

## ▶ BY MOUTH

- ▶ Adult: 720 mg twice daily, to be started within 72 hours of transplantation

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For *Ceptava*®: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

## MYFORTIC®

**Renal transplantation (specialist use only)**

## ▶ BY MOUTH

- ▶ Adult: 720 mg twice daily, to be started within 72 hours of transplantation

continued →

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ For *Myfortic*<sup>®</sup>: mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see *Conception and contraception* and *Patient and carer advice*.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

**CAUTIONS, FURTHER INFORMATION**

- ▶ Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1: mycophenolate

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Acidosis · alopecia · anaemia · appetite decreased · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · depression · diarrhoea · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · headache · hyperglycaemia · hypertension · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thinking abnormal · thrombocytopenia · tremor · vomiting · weight decreased
- ▶ **Uncommon** Agranulocytosis
- ▶ **Frequency not known** Endocarditis · hypogammaglobulinaemia · malignancy · meningitis · neutropenia · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intravenous use Hepatitis · muscle tone increased
- ▶ With oral use Anxiety · burping · confusion · dizziness · gout · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · neuromuscular dysfunction · taste altered · vasodilation

**SIDE-EFFECTS, FURTHER INFORMATION** Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

**● CONCEPTION AND CONTRACEPTION**

Pregnancy prevention The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment—2 pregnancy tests 8–10 days apart are

recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion (CellCept*<sup>®</sup>), manufacturer advises give intermittently in Glucose 5%; reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.
- **PATIENT AND CARER ADVICE**

Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ **Immunosuppressive therapy for kidney transplant in adults [mycophenolate mofetil, when used as part of an immunosuppressive regimen, as an initial option] (October 2017)** NICE TA481 Recommended

**1.1 Multiple sclerosis****Multiple sclerosis**

14-Sep-2020

**Description of condition**

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

*Relapsing-remitting* multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into *secondary-progressive* multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

*Primary-progressive* multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

*Progressive-relapsing* multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

#### Disease activity in relapsing-remitting multiple sclerosis

*Active* disease is defined as at least two clinically significant relapses occurring within the last 2 years. *Highly active* disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 915. *Rapidly-evolving severe* relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

#### Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

#### Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. [EUGr](#) A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. [A](#) The choice of drug also depends on the patient's disability status, individual tolerance, disease severity and disease activity (see *Disease activity in relapsing-remitting multiple sclerosis* above). [EUGr](#) Treatment should be initiated as early as possible, under the supervision of a specialist. [A](#)

**Note:** NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 917, fingolimod p. 920 and natalizumab p. 927 for the treatment of multiple sclerosis in England, see *Useful resources* below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also *National funding/access decisions*, under individual monographs for teriflunomide p. 929, dimethyl fumarate p. 918 and alemtuzumab p. 926.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. [EUGr](#) Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis. [A](#)

#### Relapsing-remitting multiple sclerosis

[EUGr](#) Disease-modifying drugs are the recommended treatment for patients presenting with *active* relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to

their established safety profile, and the long term clinical experience associated with their use. [A](#) Peginterferon beta-1a p. 917 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with *active* disease. [EUGr](#) They may be preferred due to their oral route of administration. [A](#) There is insufficient evidence for the use of either drug to treat *highly active* or *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

[EUGr](#) More active disease may be treated with natalizumab or alemtuzumab. The MHRA has released restrictions on the use of alemtuzumab due to reports of serious cardiovascular and immune-mediated reactions, see *Important safety information* in the alemtuzumab drug monograph. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with *highly active* disease. [A](#) The NHS England Clinical Commissioning Policy (see *Useful resources* below) advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

#### Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

#### Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

#### Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

#### Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. [EUGr](#) Smoking may increase the progression of disability in multiple sclerosis, and Smoking cessation p. 531 should be encouraged. [A](#)

#### Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. [EUGr](#) Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 746 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required. [A](#)

#### Fatigue and impaired mobility

[EUGr](#) Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and

should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 450 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B<sub>12</sub> injections are **not** recommended as a treatment for fatigue in patients with multiple sclerosis. **Fampridine** below is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. **EVGr** NICE do not consider it to be a cost-effective treatment and do not recommend its use. **A**

### Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. **EVGr** These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1219 or gabapentin p. 343 [unlicensed indication] (for important safety information, released by the MHRA/CHM, on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour, see Epilepsy p. 330). They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1221 or dantrolene sodium p. 1460 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. A 4-week trial of cannabis extract p. 1219 can be offered as adjunctive treatment for moderate to severe spasticity in multiple sclerosis if other pharmacological treatments are not effective. Treatment with cannabis extract should be initiated and supervised by a specialist. For funding/access information, see NICE clinical guideline: **Cannabis-based medicinal products** (see *Useful resources*). **A**

### Oscillopsia

**EVGr** Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia (for important safety information, released by the MHRA/CHM, on the use of antiepileptic drugs and the risk of suicidal thoughts and behaviour, see Epilepsy p. 330.); memantine hydrochloride p. 329 [unlicensed indication] is the second-line option. **A**

### Emotional lability

**EVGr** Amitriptyline hydrochloride p. 404 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis. **A**

## CHOLINERGIC RECEPTOR STIMULATING DRUGS

### Fampridine

19-Aug-2021

#### ● INDICATIONS AND DOSE

#### Improvement of walking disability in multiple sclerosis (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)
- **CAUTIONS** Atrioventricular conduction disorders · predisposition to seizures · sinoatrial conduction disorders · symptomatic cardiac rhythm disorders
- **INTERACTIONS** → Appendix 1: fampridine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · asthenia · balance impaired · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · laryngeal pain · nausea · pain · palpitations · paraesthesia · tremor · urinary tract infection · vomiting
  - ▶ **Uncommon** Seizure · skin reactions · tachycardia
- **PREGNANCY** Avoid—toxicity in *animal studies*.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** **EVGr** Caution in mild impairment; avoid if creatinine clearance less than 50 mL/minute, **A** see p. 21.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - For full details see funding body website
  - Scottish Medicines Consortium (SMC) decisions**
    - ▶ Fampridine (*Fampyra*®) for the improvement of walking in adult patients with multiple sclerosis (MS) with walking disability (EDSS [expanded disability status scale] 4 to 7) (April 2020) SMC No. SMC2253 Recommended
  - All Wales Medicines Strategy Group (AWMSG) decisions**
    - ▶ Fampridine (*Fampyra*®) for improvement of walking in adult patients with multiple sclerosis with walking disability (Expanded Disability Status Scale 4 to 7) (December 2019) AWMSG No. 3942 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

- ▶ *Fampyra* (Biogen Idec Ltd)

**Fampridine 10 mg** *Fampyra* 10mg modified-release tablets | 28 tablet **[PoM]** £181.00 (Hospital only) | 56 tablet **[PoM]** £362.00 (Hospital only)

## IMMUNOSTIMULANTS > INTERFERONS

### Interferon beta

26-Nov-2020

#### ● INDICATIONS AND DOSE

#### AVONEX® INJECTION

**For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

continued →

**BETAFERON® INJECTION**

**For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

**EXTAVIA®**

**For relapsing, remitting multiple sclerosis | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

**REBIF® CARTRIDGE**

**For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

**REBIF® PRE-FILLED PEN AND SYRINGE**

**For relapsing, remitting multiple sclerosis | For a single demyelinating event with an active inflammatory process (if at high risk of developing multiple sclerosis)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depressive illness

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Consult product literature for further information on contra-indications.

- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION** Consult product literature for further information on cautions.

- **INTERACTIONS** → Appendix 1: interferons

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · chills · confusion · depression · diarrhoea · fever · headaches · hypothyroidism · influenza like illness (decreasing over time) · insomnia · malaise · menstrual cycle irregularities · nausea · pain · skin reactions · vasodilation · vomiting · weight changes
- ▶ **Uncommon** Emotional lability · glomerulosclerosis · hepatic disorders · nephrotic syndrome · seizure · thrombocytopenia
- ▶ **Rare or very rare** Cardiomyopathy · dyspnoea · haemolytic uraemic syndrome · hyperthyroidism · thrombotic microangiopathy
- ▶ **Frequency not known** Anxiety · chest pain · dizziness · injection site necrosis · muscle weakness · palpitations · pulmonary arterial hypertension

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intramuscular use Muscle complaints · musculoskeletal stiffness · neuromuscular dysfunction · rhinorrhoea · sensation abnormal · sweat changes
- ▶ With subcutaneous use Anaemia · tachycardia
- ▶ **Uncommon**
- ▶ With subcutaneous use Suicide attempt

- ▶ **Rare or very rare**
- ▶ With subcutaneous use Bronchospasm · pancreatitis · thyroid disorder
- ▶ **Frequency not known**
- ▶ With intramuscular use Angioedema · arrhythmias · arthritis · congestive heart failure · hypersensitivity · neurological effects · pancytopenia · psychosis · suicide · syncope · systemic lupus erythematosus (SLE)
- ▶ With subcutaneous use Abdominal pain · abscess · capillary leak syndrome · conjunctivitis · constipation · cough aggravated · ear pain · erectile dysfunction · eye disorder · hyperhidrosis · hypertension · increased risk of infection · lupus-like syndrome · lymphadenopathy · muscle tone increased · myalgia · paraesthesia · peripheral oedema · urinary disorders · visual impairment
- **PREGNANCY** Manufacturer advises use if clinically needed—possible toxicity in *animal* studies, but limited human data do not suggest an increased risk.
- **BREAST FEEDING** Manufacturer advises suitable for use during breast feeding—amount in milk probably too small to be harmful (recommendation also supported by specialist sources).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in decompensated liver disease.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
- ▶ **Liver Function** Manufacturer advises monitor liver function at baseline, then 1 month, 3 months and 6 months after initiation of therapy. Consider dose reduction if alanine aminotransferase (ALT) exceeds 5 times the upper limit of normal (consult product literature).
- ▶ **Thrombotic Microangiopathy** Manufacturer advises patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- ▶ **Nephrotic Syndrome** Manufacturer advises patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.
- ▶ **Thyroid Function** Manufacturer advises baseline thyroid function tests and repeat if signs or symptoms of thyroid dysfunction occur.
- **PRESCRIBING AND DISPENSING INFORMATION** Interferon beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- NICE decisions**
- ▶ **Beta interferons [ Avonex®, Extavia®, Rebif® ] and glatiramer acetate for treating multiple sclerosis (June 2018)** NICE TA527 Recommended with restrictions
- ▶ **Beta interferons [ Betaferon® ] and glatiramer acetate for treating multiple sclerosis (June 2018)** NICE TA527 Not recommended
- NHS restrictions**
- NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of interferon beta p. 915 for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for

initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/004](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/004).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPENTS: May contain Benzyl alcohol

- ▶ **Avonex** (Biogen Idec Ltd)

**Interferon beta-1a 12 mega unit per 1 ml** Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £654.00 | 12 pre-filled disposable injection [PoM] £1,962.00  
Avonex 30micrograms/0.5ml (6million units) solution for injection pre-filled pens | 4 pre-filled disposable injection [PoM] £654.00 | 12 pre-filled disposable injection [PoM] £1,962.00

- ▶ **Rebif** (Merck Serono Ltd)

**Interferon beta-1a 12 mega unit per 1 ml** Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £613.52  
Rebif 22micrograms/0.5ml (6million units) solution for injection 1.5ml cartridges | 4 cartridge [PoM] £613.52  
Rebif 8.8micrograms/0.2ml (2.4million units) solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £613.52  
Rebif 22micrograms/0.5ml (6million units) solution for injection pre-filled pens | 12 pre-filled disposable injection [PoM] £613.52  
**Interferon beta-1a 24 mega unit per 1 ml** Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £813.21  
Rebif 44micrograms/0.5ml (12million units) solution for injection pre-filled pens | 12 pre-filled disposable injection [PoM] £813.21  
Rebif 44micrograms/0.5ml (12million units) solution for injection 1.5ml cartridges | 4 cartridge [PoM] £813.21

#### Powder and solvent for solution for injection

- ▶ **Betaferon** (Bayer Plc)

**Interferon beta-1b 300 microgram** Betaferon 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63 DT = £596.63 (Hospital only)

- ▶ **Extavia** (Novartis Pharmaceuticals UK Ltd)

**Interferon beta-1b 300 microgram** Extavia 300microgram powder and solvent for solution for injection vials | 15 vial [PoM] £596.63 DT = £596.63 (Hospital only)

## Peginterferon beta-1a

25-May-2021

- **DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated ('pegylated') derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

#### ● INDICATIONS AND DOSE

##### Treatment of relapsing, remitting multiple sclerosis

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depression · suicidal ideation
- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION** Consult product literature for further information about cautions.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · asthenia · chills · depression · fever · headache · hyperthermia · influenza like illness · myalgia · nausea · pain · skin reactions · vomiting
- ▶ **Uncommon** Seizure · thrombocytopenia
- ▶ **Rare or very rare** Glomeruloclerosis · haemolytic uraemic syndrome · injection site necrosis · nephrotic syndrome · thrombotic microangiopathy
- ▶ **Frequency not known** Pulmonary arterial hypertension
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

- **PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** [EvGr] Use with caution in severe renal impairment. ⚠
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
  - ▶ Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
  - ▶ Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- NICE decisions**
  - ▶ Peginterferon beta-1a for treating relapsing-remitting multiple sclerosis (February 2020) NICE TA624 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Plegridy** (Biogen Idec Ltd)

**Interferon beta-1a (as Peginterferon beta-1a) 126 microgram per 1 ml** Plegridy 63micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £654.00

**Interferon beta-1a (as Peginterferon beta-1a) 188 microgram per 1 ml** Plegridy 94micrograms/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £654.00

**Interferon beta-1a (as Peginterferon beta-1a) 250 microgram per 1 ml** Plegridy 125micrograms/0.5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £654.00 (Hospital only)

Plegridy 125micrograms/0.5ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £654.00 (Hospital only)

## IMMUNOSTIMULANTS > OTHER

### Glatiramer acetate

29-Jun-2021

- **DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

#### ● INDICATIONS AND DOSE

##### Multiple sclerosis [relapsing-remitting] (initiated under specialist supervision)

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 mg once daily, alternatively 40 mg 3 times a week, doses to be separated by an interval of at least 48 hours

- **CAUTIONS** Cardiac disorders

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · constipation · cough · depression · dyspepsia · dysphagia · dyspnoea (may occur within minutes of injection) · ear disorder · eye disorders · fever · gastrointestinal disorders · headaches · hyperhidrosis · hypersensitivity · increased risk of infection · joint disorders · local reaction · lymphadenopathy · nausea · neoplasms · neuromuscular dysfunction · oedema

• oral disorders • pain • palpitations • rhinitis seasonal • skin reactions • speech disorder • syncope • taste altered • tremor • urinary disorders • vasodilation • vision disorders • vomiting • weight increased

- ▶ **Uncommon** Abnormal dreams • abscess • alcohol intolerance • angioedema • apnoea • arthritis • breast engorgement • burping • cataract • choking sensation • cholelithiasis • cognitive disorder • confusion • cyst • dry eye • dysgraphia • dyslexia • erythema nodosum • goitre • gout • haemorrhage • hallucination • hangover • hepatic disorders • hostility • hyperlipidaemia • hyperthyroidism • hypothermia • immediate post-injection reaction • inflammation • injection site necrosis • leucocytosis • leucopenia • mood altered • movement disorders • mucous membrane disorder • muscle atrophy • nephrolithiasis • nerve disorders • paralysis • pelvic prolapse • personality disorder • post vaccination syndrome • prostatic disorder • respiratory disorders • seizure • sexual dysfunction • skin nodule • splenomegaly • stupor • suicide attempt • testicular disorder • thrombocytopenia • urinary tract disorder • urine abnormal • varicose veins • vulvovaginal disorder

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT**  Use with caution (no information available). 

● **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website

#### NICE decisions

- ▶ **Beta interferons and glatiramer acetate for treating multiple sclerosis (June 2018)** NICE TA527 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ **Glatiramer acetate 40 mg/mL (Copaxone<sup>®</sup>) for the treatment of relapsing forms of multiple sclerosis (MS) (December 2015)** SMC No. 1108/15 Recommended

#### NHS restrictions

**NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of glatiramer acetate for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Brabio** (Viatris UK Healthcare Ltd)

**Glatiramer acetate 20 mg per 1 ml** Brabio 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection  £462.56 DT = £513.95

**Glatiramer acetate 40 mg per 1 ml** Brabio 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection  £462.56 DT = £513.95

- ▶ **Copaxone** (Teva UK Ltd)

**Glatiramer acetate 20 mg per 1 ml** Copaxone 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection  £513.95 DT = £513.95

**Glatiramer acetate 40 mg per 1 ml** Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection  £513.95 DT = £513.95

## IMMUNOSUPPRESSANTS > IMMUNOMODULATING DRUGS

### Dimethyl fumarate

29-Mar-2022

- **DRUG ACTION** Dimethyl fumarate is converted into active monomethyl fumarate which is thought to work by activating the nuclear factor (erythroid-derived 2)-like 2 (Nrf2) pathway, resulting in immunomodulatory and anti-inflammatory effects.

#### ● INDICATIONS AND DOSE

##### SKILARENCE<sup>®</sup>

**Plaque psoriasis [moderate-to-severe] (under expert supervision)**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 30 mg once daily for 1 week, dose to be taken in the evening, then increased in steps of 30 mg every week for 3 weeks, then increased in steps of 120 mg every week for 5 weeks, for further information on the dose titration and administration schedule, advice on establishing a maintenance dose, and for dose adjustments due to side-effects, consult product literature; maximum 720 mg per day

##### TECFIDERA<sup>®</sup>

**Multiple sclerosis [relapsing-remitting] (initiated by a specialist)**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustments due to side effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: DIMETHYL FUMARATE (TECFIDERA<sup>®</sup>): UPDATED ADVICE ON THE RISK OF PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML) ASSOCIATED WITH MILD LYMPHOPENIA (JANUARY 2021)**

A European review of safety data identified 11 cases of PML with lymphopenia associated with Tecfidera<sup>®</sup> treatment, including 3 cases in patients with mild lymphopenia (lymphocyte count between  $0.8 \times 10^9$ /litre and the lower limit of normal); previously, PML had only been confirmed in the setting of moderate to severe lymphopenia.

Healthcare professionals are advised that Tecfidera<sup>®</sup> is contra-indicated in patients with suspected or confirmed PML and should not be initiated in those with severe lymphopenia (lymphocyte count below  $0.5 \times 10^9$ /litre); patients with low lymphocyte counts should be investigated for underlying causes before initiating treatment. During treatment, all patients should have a lymphocyte count at least every 3 months. Treatment should be re-evaluated in those with sustained moderate reductions of absolute lymphocyte counts (between  $0.5$  and  $0.8 \times 10^9$ /litre) for longer than 6 months. Tecfidera<sup>®</sup> should be stopped in those with severe lymphopenia persisting for more than 6 months, and permanently discontinued if a patient develops PML.

Patients should be advised to be vigilant for any new or worsening neurological or psychiatric symptoms, and to seek urgent medical attention if these occur. They should also inform their family or carer about the risks and when to seek medical attention, as they may notice symptoms of which the patient is unaware. Symptoms of PML can resemble those of a multiple sclerosis relapse.

#### ● CONTRA-INDICATIONS

**TECFIDERA<sup>®</sup>** See Important safety information.

**SKILARENCE<sup>®</sup>** Do not initiate if leucocyte count below  $3 \times 10^9$ /litre • do not initiate if lymphocyte count below  $1 \times 10^9$ /litre • do not initiate if pathological haematological

abnormalities identified · severe gastro-intestinal disorders

● **CAUTIONS** Reduced lymphocyte count

**TECFIDERA**® Serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) · severe active gastro-intestinal disease

**SKILARENCE**® Significant infection (consider avoiding initiation until infection resolved and suspending treatment if infection develops)

● **INTERACTIONS** → Appendix 1: dimethyl fumarate

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · asthenia · constipation · decreased leucocytes · diarrhoea · eosinophilia · feeling hot · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · leucocytosis · nausea · paraesthesia · skin reactions · urine abnormalities · vasodilation · vomiting
- ▶ **Uncommon** Dizziness · thrombocytopenia
- ▶ **Rare or very rare** Acute lymphocytic leukaemia · pancytopenia
- ▶ **Frequency not known** Angioedema · drug-induced liver injury · dyspnoea · hypotension · hypoxia · JC virus infection · progressive multifocal leukoencephalopathy (PML) · renal failure · rhinorrhoea

**SIDE-EFFECTS, FURTHER INFORMATION** Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

● **PREGNANCY**

**TECFIDERA**® Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies.

**SKILARENCE**® Manufacturer advises avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Specialist sources indicate present in milk but amount probably too small to be harmful. Monitor breastfed infants for flushing, vomiting, diarrhoea, adequate weight gain, and developmental milestones, especially younger, exclusively breastfed infants.

● **HEPATIC IMPAIRMENT**

**TECFIDERA**® Manufacturer advises caution in severe impairment (no information available).

**SKILARENCE**® Manufacturer advises avoid in severe impairment (no information available).

● **RENAL IMPAIRMENT**

**TECFIDERA**® Manufacturer advises caution in severe impairment—no information available.

**SKILARENCE**® Manufacturer advises avoid in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor full blood count before treatment initiation then every 3 months thereafter—consult product information for further information.
- ▶ Manufacturer advises monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
- ▶ Manufacturer advises monitor renal and hepatic function before treatment initiation and during treatment—consult product literature for further information.
- ▶ Manufacturer of **Tecfidera**® advises perform a baseline MRI as a reference and repeat as required during treatment.

● **PRESCRIBING AND DISPENSING INFORMATION**

**SKILARENCE**® The manufacturer of **Skilarence**® has provided a *Healthcare Professional Guideline*, which includes important safety information on the risk of serious infections.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. The MHRA recommends that patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**TECFIDERA**® For full details see funding body website

**NICE decisions**

- ▶ Dimethyl fumarate (**Tecfidera**®) for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Dimethyl fumarate (**Tecfidera**®) for the treatment of adult patients with relapsing remitting multiple sclerosis (April 2014) SMC No. 886/13 Recommended

**SKILARENCE**® For full details see funding body website

**NICE decisions**

- ▶ Dimethyl fumarate for treating moderate-to-severe plaque psoriasis (September 2017) NICE TA475 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Dimethyl fumarate (**Skilarence**®) for the treatment of moderate to severe plaque psoriasis in adults in need of systemic medicinal therapy (April 2018) SMC No. 1313/18 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Tecfidera** (Biogen Idec Ltd)

**Dimethyl fumarate 120 mg** Tecfidera 120mg gastro-resistant capsules | 14 capsule [PoM] £343.00

**Dimethyl fumarate 240 mg** Tecfidera 240mg gastro-resistant capsules | 56 capsule [PoM] £1,373.00

**Gastro-resistant tablet**

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Skilarence** (Almirall Ltd)

**Dimethyl fumarate 30 mg** Skilarence 30mg gastro-resistant tablets | 42 tablet [PoM] £89.04 DT = £89.04 | 210 tablet [PoM] £445.20

**Dimethyl fumarate 120 mg** Skilarence 120mg gastro-resistant tablets | 90 tablet [PoM] £190.80 DT = £190.80 | 180 tablet [PoM] £381.60 DT = £381.60

## Diroximel fumarate

10-Mar-2022

- **DRUG ACTION** Diroximel fumarate is converted into active monomethyl fumarate which is thought to work by activating the nuclear factor (erythroid-derived 2)-like 2 (Nrf2) pathway, resulting in immunomodulatory and anti-inflammatory effects.

● **INDICATIONS AND DOSE**

**Multiple sclerosis (initiated under specialist supervision)**

▶ **BY MOUTH**

- ▶ **Adult:** Initially 231 mg twice daily for 7 days, then maintenance 462 mg twice daily, for dose adjustments due to side effects—consult product literature

- **CONTRA-INDICATIONS** Progressive multifocal leukoencephalopathy (suspected or confirmed) · severe lymphopenia (lymphocyte count below  $0.5 \times 10^9$ /litre)—consult product literature

- **CAUTIONS** Reduced lymphocyte count—consult product literature · risk factors for progressive multifocal leukoencephalopathy · serious infection (do not initiate until infection resolved; consider suspending treatment if infection develops) · severe active gastrointestinal disease (no information available)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Progressive Multifocal Leukoencephalopathy **[EvGr]** There is an increased risk of opportunistic infection and progressive multifocal leukoencephalopathy (PML) caused by JC virus associated with dimethyl fumarate and other fumarates. Prolonged moderate to severe lymphopenia increases the risk of PML, although risk cannot be excluded in patients with mild lymphopenia. Other factors that may increase the risk include treatment duration, profound decreases in CD4+ and CD8+ T cell count, and previous immunosuppressant or immunomodulatory treatment. **[M]**

- **INTERACTIONS** → Appendix 1: diroximel fumarate

● **SIDE-EFFECTS**

- ▶ **Common or very common** Decreased leucocytes · diarrhoea · feeling hot · gastrointestinal discomfort · gastro-intestinal disorders · increased risk of infection · nausea · paraesthesia · skin reactions · urine abnormalities · vasodilation · vomiting
- ▶ **Uncommon** Thrombocytopenia
- ▶ **Frequency not known** Angioedema · drug-induced liver injury · dyspnoea · hypotension · hypoxia · progressive multifocal leukoencephalopathy (PML) · rhinorrhoea

- **PREGNANCY** **[EvGr]** Avoid unless potential benefit outweighs risk—toxicity in animal studies. **[M]**
- **BREAST FEEDING** Specialist sources indicate present in milk but amount probably too small to be harmful. Monitor breastfed infants for flushing, vomiting, diarrhoea, adequate weight gain, and developmental milestones, especially younger, exclusively breastfed infants.

- **HEPATIC IMPAIRMENT** **[EvGr]** Caution in severe impairment (no information available). **[M]**

- **RENAL IMPAIRMENT** **[EvGr]** Caution in moderate or severe impairment (no information available). **[M]**

● **MONITORING REQUIREMENTS**

- ▶ **[EvGr]** Monitor full blood count, including lymphocytes, before treatment initiation then every 3 months thereafter—consult product literature.
- ▶ Monitor patient closely for features of progressive multifocal leukoencephalopathy (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
- ▶ Monitor renal and hepatic function before treatment initiation and during treatment—consult product literature.
- ▶ Perform baseline MRI and repeat as required during treatment. **[M]**

- **PATIENT AND CARER ADVICE** Patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they should also be advised to report symptoms of infection to their doctor. Patients and their carers should be counselled on the risk of progressive multifocal leukoencephalopathy and advised to seek immediate medical attention if symptoms develop. **Missed doses** If a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Diroximel fumarate (Vumerity®)** for the treatment of adult patients with relapsing-remitting multiple sclerosis (RRMS) (February 2022) SMC No. SMC2444 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

CAUTIONARY AND ADVISORY LABELS 25

▶ **Diroximel fumarate (Non-proprietary)**

**Diroximel fumarate 231 mg** Vumerity 231mg gastro-resistant capsules | 120 capsule **[PoM]** £1,471.07 (Hospital only)

**Fingolimod**

07-Jan-2021

- **DRUG ACTION** Fingolimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

● **INDICATIONS AND DOSE****Multiple sclerosis (initiated by a specialist)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 500 micrograms once daily

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)**

Fingolimod is known to cause transient bradycardias and heart block after the first dose—see *Cautions, Contra-indications, and Monitoring* for further information.

**MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)**

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see *Contra-indications* for further information.

**MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)**

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

**MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)**

Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma. Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis
- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to 12 months
- advise patients to protect themselves against UV radiation exposure and seek urgent medical advice if they notice any skin lesions
- refer patients with suspicious lesions to a dermatologist

Fingolimod has also been associated with risk of fatal fungal infections and reports of progressive multifocal leukoencephalopathy (PML)—see *Monitoring and Side effects* for further information.

**MHRA/CHM ADVICE: FINGOLIMOD (GILENYA®): INCREASED RISK OF CONGENITAL MALFORMATIONS; NEW CONTRA-INDICATION DURING PREGNANCY AND IN WOMEN OF CHILDBEARING POTENTIAL NOT USING EFFECTIVE CONTRACEPTION (SEPTEMBER 2019)**

An increased risk of major congenital malformations, including cardiac, renal, and musculoskeletal defects, has been associated with the use of fingolimod in pregnancy. Females of childbearing potential must use effective contraception during, and for 2 months after stopping, treatment. Healthcare professionals are advised that fingolimod is contra-indicated in pregnancy and that female patients should be informed of the risk of congenital malformations and given a pregnancy-specific patient reminder card. Pregnancy should be excluded before starting treatment, and pregnancy testing repeated at suitable intervals during treatment. Fingolimod should be stopped 2 months before planning a pregnancy. If a female taking fingolimod becomes pregnant, treatment should be stopped immediately, and the patient referred to an obstetrician for close monitoring. Exposed pregnancies should be enrolled on the pregnancy registry.

**MHRA/CHM ADVICE: FINGOLIMOD (GILENYA®): UPDATED ADVICE ABOUT THE RISKS OF SERIOUS LIVER INJURY AND HERPES MENINGOENCEPHALITIS (JANUARY 2021)**

A European review of safety data identified 7 cases of clinically significant liver injury that developed between 10 days and 5 years of starting fingolimod, including 3 reports of acute hepatic failure requiring liver transplantation. The guidance for monitoring liver function and criteria for discontinuation have been strengthened to minimise the risks of liver injury.

Liver function tests including serum bilirubin should be performed before starting and during treatment at months 1, 3, 6, 9, and 12, then periodically thereafter until 2 months after discontinuation.

In the absence of clinical symptoms, if liver transaminases (AST or ALT) exceed:

- 3 times the upper limit of normal (ULN) but less than 5 times the ULN without increase in serum bilirubin, liver function tests should be monitored more frequently;
- 5 times the ULN or at least 3 times the ULN with any increase in serum bilirubin, fingolimod should be discontinued; treatment may be restarted when serum levels have returned to normal, after careful benefit-risk assessment of the underlying cause.

In the presence of clinical symptoms suggestive of hepatic dysfunction, liver function tests should be checked promptly and fingolimod discontinued if significant liver injury is confirmed; further treatment may be restarted after recovery, only if an alternative cause of hepatic dysfunction is established.

The review also considered reported cases of herpes zoster/herpes simplex infections with visceral or CNS dissemination (e.g. herpes meningoencephalitis), some of which were fatal. Healthcare professionals are reminded to continue to be vigilant for infections with fingolimod.

Patients should be advised to seek urgent medical attention if they develop any signs or symptoms of liver injury or brain infection (during fingolimod treatment and for 8 weeks after the last dose in the case of the latter).

- **CONTRA-INDICATIONS** Active malignancies · baseline QTc interval 500 milliseconds or greater · cerebrovascular disease (including transient ischaemic attack) in the previous 6 months · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure in the previous 6 months (New York Heart Association class III/IV) · increased risk for opportunistic

infections (including immunosuppression) · myocardial infarction in the previous 6 months · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · severe cardiac arrhythmias requiring treatment with class Ia or class III anti-arrhythmic drugs · unstable angina in the previous 6 months

- **CAUTIONS** Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease · elderly (limited information available) · history of myocardial infarction · history of symptomatic bradycardia or recurrent syncope · patients receiving anti-arrhythmic or heart-rate lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs, or appropriate monitoring if unable to switch) · pulmonary fibrosis · severe respiratory disease · severe sleep apnoea · significant QT prolongation (QTc greater than 470 milliseconds in women, or QTc greater than 450 milliseconds in men); if QTc 500 milliseconds or greater—see *Contra-indications* · susceptibility to QT-interval prolongation (including electrolyte disturbances) · uncontrolled hypertension

#### CAUTIONS, FURTHER INFORMATION

- ▶ Washout period A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.
- ▶ Bradycardia and cardiac rhythm disturbance Fingolimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Fingolimod is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.

- **INTERACTIONS** → Appendix 1: fingolimod

#### • SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · arthralgia · asthenia · atrioventricular block · back pain · bradycardia · cough · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · headaches · hypertension · increased risk of infection · myalgia · neoplasms · skin reactions · vision blurred · weight decreased
- ▶ **Uncommon** Macular oedema · nausea · seizures · thrombocytopenia
- ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
- ▶ **Frequency not known** Autoimmune haemolytic anaemia · haemophagocytic lymphohistiocytosis · hepatic disorders · peripheral oedema · progressive multifocal leukoencephalopathy (PML)

#### SIDE-EFFECTS, FURTHER INFORMATION Basal-cell

**carcinoma** Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.

#### • Progressive multifocal leukoencephalopathy (PML)

and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment and for 2 months after last treatment—see *Important safety information* for further information.
- **PREGNANCY** Manufacturer advises avoid—teratogenic.
- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.
  - **MONITORING REQUIREMENTS**
    - ▶ All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
      - ▶ **Pre-treatment**
        - an ECG and blood pressure measurement before starting
      - ▶ **During the first 6 hours of treatment**
        - continuous ECG monitoring for 6 hours
        - blood pressure and heart rate measurement every hour
      - ▶ **After 6 hours of treatment**
        - a further ECG and blood pressure measurement
    - ▶ If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
    - ▶ If post-dose bradyarrhythmia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.
    - ▶ If after 6 hours, the heart rate is less than 45 beats per minute, or the ECG shows new onset second degree or higher grade AV block, or a QTc interval of 500 milliseconds or greater, monitoring should be extended (at least overnight, until side-effect resolution).
    - ▶ The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
    - ▶ In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.
    - ▶ **Note**
      - ▶ First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:
        - 1 day or more during the first 2 weeks of treatment
        - more than 7 days during weeks 3 and 4 of treatment
        - more than 2 weeks after one month of treatment
      - ▶ If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned.
    - ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
    - ▶ Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated.
    - ▶ The MHRA advises to monitor liver function—see *Important Safety Information*.
    - ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced)—consult product literature.
    - ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
    - ▶ Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.
  - **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Gilenya*® has provided a *Prescriber's checklist*.
  - **PATIENT AND CARER ADVICE**
    - ▶ Patient reminder card Patients should be given a patient reminder card.
      - ▶ Female patients of childbearing potential should also be given a pregnancy-specific patient reminder card.
  - **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
    - ▶ **NICE decisions**
      - ▶ Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254 Recommended with restrictions
    - ▶ **Scottish Medicines Consortium (SMC) decisions**
      - ▶ Fingolimod (*Gilenya*®) as a single disease modifying therapy in highly active relapsing remitting multiple sclerosis [in patients with high disease activity despite treatment with a beta-interferon with an unchanged or increased relapse rate or ongoing severe relapses as compared to the previous year] (September 2012) SMC No. 763/12 Recommended with restrictions
      - ▶ Fingolimod (*Gilenya*®) as a single disease modifying therapy in highly active relapsing remitting multiple sclerosis [for patients with rapidly evolving severe relapsing remitting multiple sclerosis] (October 2014) SMC No. 992/14 Recommended with restrictions
      - ▶ Fingolimod (*Gilenya*®) as a single disease modifying therapy in highly active relapsing remitting multiple sclerosis for patients with high disease activity despite treatment with at least one disease modifying therapy (April 2015) SMC No. 1038/15 Recommended
    - ▶ **All Wales Medicines Strategy Group (AWMSG) decisions**
      - ▶ Fingolimod (*Gilenya*®) as a single disease modifying therapy in highly active relapsing remitting multiple sclerosis in adults with rapidly evolving severe relapsing remitting multiple sclerosis (January 2017) AWMSG No. 3135 Recommended
  - ▶ **NHS restrictions**
    - ▶ **NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of fingolimod for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - ▶ **Capsule**
    - ▶ **Fingolimod (Non-proprietary)**
      - ▶ **Fingolimod (as Fingolimod hydrochloride)**
        - 500 microgram Fingolimod 500microgram capsules | 28 capsule [PoM] £1,396.50 DT = £1,470.00 (Hospital only)

          - ▶ **Fingolimod (as Fingolimod hydrochloride)**
            - 500 microgram Gilenya 0.5mg capsules | 7 capsule [PoM] £367.50 | 28 capsule [PoM] £1,470.00 DT = £1,470.00

## Ozanimod

25-Jun-2021

● **DRUG ACTION** Ozanimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

### ● INDICATIONS AND DOSE

#### Multiple sclerosis (initiated by a specialist)

##### ► BY MOUTH

► **Adult:** Initially 0.23 mg once daily on days 1–4, then increased to 0.46 mg once daily on days 5–7, then increased to 0.92 mg once daily from day 8 onwards, the same dose escalation regimen is recommended when treatment is interrupted for 1 day or more during the first 14 days of treatment, for more than 7 consecutive days between days 15–28, or for more than 14 consecutive days after day 28. For interruptions of shorter duration, treatment may be continued with the next planned dose

● **CONTRA-INDICATIONS** Active malignancy · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure (New York Heart Association class III or IV) in the previous 6 months · immunodeficiency · myocardial infarction in the previous 6 months · phototherapy with UV-B radiation or PUVA-chemotherapy (increased risk of cutaneous neoplasm) · posterior reversible encephalopathy syndrome (suspected or confirmed) · progressive multifocal leukoencephalopathy · second-degree Mobitz type II atrioventricular (AV) block, third-degree AV block, or sick sinus syndrome, if the patient does not have a pacemaker · severe active infection · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina in the previous 6 months

● **CAUTIONS** Administration of vaccinations · cerebrovascular disease · chronic obstructive pulmonary disease · diabetes mellitus (increased risk of macular oedema) · elderly (limited information available) · heart failure · immunosuppression or other risk factors for infection · myocardial infarction · patients receiving QT-prolonging or heart rate-lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers · pulmonary fibrosis · recurrent syncope · retinal disease (increased risk of macular oedema) · risk of discontinuation effects, including disease rebound · second-degree Mobitz type I atrioventricular block · severe respiratory disease · severe untreated sleep apnoea · significant QT prolongation (QTc greater than 500 milliseconds) · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · uveitis (increased risk of macular oedema)

#### CAUTIONS, FURTHER INFORMATION

► Bradycardia and cardiac rhythm disturbance **[EvGr]** Ozanimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. It is not recommended in patients with a history of symptomatic bradycardia or recurrent syncope, uncontrolled hypertension, severe untreated sleep apnoea, or significant QT prolongation or other risk factors for QT prolongation unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation. **[M]**

► Vaccinations **[EvGr]** Vaccination may be less effective during and for up to 3 months after treatment. Live attenuated vaccines should be avoided during and for 3 months after treatment; if they are required they should be given at least 1 month prior to initiation. Immunisation against varicella zoster is recommended prior to treatment in those without documented immunity. **[M]**

● **INTERACTIONS** → Appendix 1: ozanimod

### ● SIDE-EFFECTS

► **Common or very common** Bradycardia · hypertension · increased risk of infection · lymphopenia · postural hypotension

● **CONCEPTION AND CONTRACEPTION** **[EvGr]** Exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 3 months after last dose. **[M]**

● **PREGNANCY** **[EvGr]** Avoid—toxicity in *animal* studies. **[M]**

● **BREAST FEEDING** **[EvGr]** Avoid—present in milk in *animal* studies. **[M]**

● **HEPATIC IMPAIRMENT** **[EvGr]** Avoid in severe impairment (no information available). **[M]**

### ● MONITORING REQUIREMENTS

► **[EvGr]** Patients with certain pre-existing cardiac conditions should be monitored for bradycardia for 6 hours after the first dose. An ECG should be obtained before dosing and after 6 hours **[M]**—consult product literature for further information.

► **[EvGr]** Monitor blood pressure regularly during treatment.

► Monitor hepatic transaminases and bilirubin before initiation of treatment and then at months 1, 3, 6, 9 and 12 and periodically thereafter (interrupt treatment if significant liver injury occurs: liver transaminases above 5 times the upper limit of normal).

► Monitor full blood count before initiation and periodically during treatment (interrupt treatment if lymphocyte count reduced) **[M]**—consult product literature.

► **[EvGr]** Eye examination recommended in patients with diabetes or history of uveitis or retinal disease before initiation and periodically during treatment (interrupt treatment if macular oedema occurs). **[M]**

● **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of Zeposia<sup>®</sup> has provided a *Prescriber's Checklist*.

● **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight without protection. Patients should be advised to promptly report symptoms of infection.

Patient reminder card Patients should be given a *Patient/Caregiver Guide*.

Female patients of childbearing potential should be given a *Pregnancy Reminder Card*.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

► Ozanimod for treating relapsing-remitting multiple sclerosis (June 2021) NICE TA706 Not recommended

#### Scottish Medicines Consortium (SMC) decisions

► Ozanimod (Zeposia<sup>®</sup>) for the treatment of adult patients with relapsing remitting multiple sclerosis (February 2021) SMC No. SMC2309 Recommended with restrictions

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

EXCIPIENTS: May contain Gelatin

► Zeposia (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Ozanimod (as Ozanimod hydrochloride) 230 microgram Zeposia 0.23mg capsules | 4 capsule **[PoM]** **[S]** (Hospital only)

## Ponesimod

01-Mar-2022

- **DRUG ACTION** Ponesimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

### ● INDICATIONS AND DOSE

#### Multiple sclerosis (initiated under specialist supervision)

##### ► BY MOUTH

- **Adult:** Initially 2 mg once daily on days 1–2, then increased to 3 mg once daily on days 3–4, then increased to 4 mg once daily on days 5–6, then increased in steps of 1 mg once daily from days 7–11, then increased to 10 mg once daily on days 12–14; maintenance 20 mg once daily from day 15 onwards, for re-initiation after treatment interruption—consult product literature
- **CONTRA-INDICATIONS** Active chronic infections · active malignancies · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure (New York Heart Association class III or IV) in the previous 6 months · immunodeficiency · macular oedema · myocardial infarction in the previous 6 months · phototherapy with UV-B radiation or PUVA-phototherapy (increased risk of cutaneous neoplasm) · second-degree Mobitz type II AV block, third-degree AV block, or sick sinus syndrome, unless pacemaker fitted · severe active infections · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina in the previous 6 months
- **CAUTIONS** Administration of vaccinations · cerebrovascular disease (including transient ischaemic attack or stroke more than 6 months ago) · chronic obstructive pulmonary disease · decompensated heart failure (more than 6 months ago) · diabetes mellitus (increased risk of macular oedema) · elderly (no information available) · history of cardiac arrest · history of second-degree Mobitz type II AV block, third-degree AV block, sick sinus syndrome, or sino-atrial heart block · history of significant liver disease · history of uveitis (increased risk of macular oedema) · immunosuppression or other risk factors for infection · patients receiving QT-prolonging or heart rate-lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers · pulmonary fibrosis · recurrent syncope · risk of discontinuation effects, including disease rebound · severe respiratory disease · significant QT prolongation (QTc greater than 500 milliseconds) or other risk factors for QT prolongation · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · unstable ischaemic heart disease

#### CAUTIONS, FURTHER INFORMATION

- Bradycardia and cardiac rhythm disturbance [EvGr](#) Ponesimod may cause transient bradycardia, AV conduction delays, and heart block after the first dose. It is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation. [M](#)
- Vaccinations [EvGr](#) Vaccination may be less effective during treatment. Live attenuated vaccines should be avoided during treatment; if they are required treatment should be stopped 1 week before and restarted 4 weeks after vaccination. Immunisation against varicella zoster is recommended prior to treatment in those without documented immunity. [M](#)
- **INTERACTIONS** → Appendix 1: ponesimod
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · chest discomfort · cough · depression · dizziness · drowsiness · dyspepsia ·

dyspnoea · fatigue · fever · hypercholesterolaemia · hypertension · increased risk of infection · insomnia · joint disorders · ligament sprain · lymphopenia · macular oedema · migraine · numbness · pain · peripheral oedema · vertigo

- **Uncommon** Bradycardia · dry mouth · hyperkalaemia
- **Frequency not known** Atrioventricular block · neoplasms · seizure
- **CONCEPTION AND CONTRACEPTION** [EvGr](#) Exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 1 week after last dose. [M](#)
- **PREGNANCY** [EvGr](#) Avoid—toxicity in *animal* studies. [M](#)
- **BREAST FEEDING** [EvGr](#) Avoid—present in milk in *animal* studies. [M](#)
- **HEPATIC IMPAIRMENT** [EvGr](#) Avoid in moderate to severe impairment (increased exposure). [M](#)
- **MONITORING REQUIREMENTS**
  - [EvGr](#) An ECG should be obtained before initiation of treatment. Patients with certain pre-existing cardiac conditions should be monitored for bradycardia for at least 4 hours after the first dose. [M](#)—consult product literature for further information.
  - [EvGr](#) Monitor blood pressure regularly during treatment.
  - Monitor full blood count before initiation and periodically during treatment. [M](#)—consult product literature for further information.
  - [EvGr](#) Monitor hepatic transaminases and bilirubin before initiation of treatment and then as clinically indicated (discontinue treatment if significant liver injury occurs).
  - Eye examination recommended in all patients before initiation of treatment and then as clinically indicated (interrupt treatment if macular oedema occurs); patients with diabetes or history of uveitis to have eye examination periodically during treatment. [M](#)
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Ponvory*<sup>®</sup> has provided a *Prescriber's Checklist*.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight without protection. Patients should be advised to promptly report symptoms of infection during and for up to 1 week after last dose. Patient reminder card. Patients should be given a *Patient/Caregiver Guide*.  
Female patients of childbearing potential should be given a *Pregnancy Reminder Card*.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
For full details see funding body website

## Siponimod

03-Dec-2020

- **DRUG ACTION** Siponimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

### ● INDICATIONS AND DOSE

#### Multiple sclerosis [secondary progressive, with active disease] (initiated by a specialist)

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 0.25 mg once daily on days 1 and 2, followed by 0.5 mg once daily on day 3, followed by 0.75 mg once daily on day 4, followed by 1.25 mg once daily on day 5, dose to be taken in the morning for the first 5 days; maintenance 2 mg once daily from day 6 onwards, in patients with a CYP2C9\*1\*3 or CYP2C9\*2\*3 genotype a reduced maintenance dose of 1 mg once daily is used from day 6 onwards. For dose adjustments based on lymphocyte count—consult product literature
- **CONTRA-INDICATIONS** Active malignancies · cryptococcal meningitis · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · heart failure in the previous 6 months (New York Heart Association class III or IV) · immunodeficiency syndrome · macular oedema · myocardial infarction in the previous 6 months · patients homozygous for CYP2C9\*3\*3 genotype (poor metabolisers) · phototherapy with UV-B radiation or PUVA · photochemotherapy (increased risk of cutaneous neoplasms) · progressive multifocal leukoencephalopathy · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · stroke (including transient ischaemic attack) in the previous 6 months · unstable angina pectoris in the previous 6 months
- **CAUTIONS** Administration of vaccinations (may be less effective during siponimod treatment—consult product literature for further information) · diabetes mellitus (increased risk of macular oedema) · elderly (limited information available) · exposure to sunlight (increased risk of cutaneous neoplasms) · first- or second-degree Mobitz type I atrioventricular block · heart failure (New York Heart Association class I and II) · myocardial infarction · patients receiving QT-prolonging or heart rate-lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs or appropriate monitoring) · recurrent syncope · retinal disease (increased risk of macular oedema) · risk of discontinuation effects, including disease rebound · severe sleep apnoea · significant QT prolongation (QTc greater than 500 milliseconds) · sinus bradycardia (heart rate below 55 beats per minute) · uncontrolled hypertension · uveitis (increased risk of macular oedema)
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Bradycardia and cardiac rhythm disturbance Siponimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Siponimod is not recommended in patients with a history of symptomatic bradycardia or recurrent syncope, uncontrolled hypertension, severe untreated sleep apnoea, or significant QT prolongation unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.
- **INTERACTIONS** → Appendix 1: siponimod
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmias · asthenia · atrioventricular block · diarrhoea · dizziness · headache · hypertension · increased risk of infection · lymphopenia · macular oedema · nausea · neoplasms · pain in extremity · peripheral oedema · seizure · tremor
  - ▶ **Frequency not known** Meningitis cryptococcal · vision disorders
  - **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises contra-indicated in patients with hypersensitivity to peanut or soya products.
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment; females of childbearing potential should use effective contraception during treatment and for 10 days after last dose.
  - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.
  - **PRE-TREATMENT SCREENING** Manufacturer advises CYP2C9 genotyping before treatment initiation—consult product literature. Manufacturer advises check varicella zoster virus status in patients with unconfirmed or incomplete vaccination history. A full course of vaccination against varicella zoster is required 1 month before initiating treatment in antibody-negative patients.
  - **MONITORING REQUIREMENTS**
    - ▶ Manufacturer advises regular monitoring of heart rate, particularly during treatment initiation, and of blood pressure.
    - ▶ Manufacturer advises patients with certain pre-existing cardiac conditions should be monitored for bradycardia for 6 hours after the first dose. An ECG should be obtained before dosing and after 6 hours—consult product literature for further information.
    - ▶ Manufacturer advises monitor full blood count before initiation and periodically during treatment (reduce dosage or interrupt treatment if lymphocyte count reduced)—consult product literature.
    - ▶ Manufacturer advises monitor hepatic transaminases and bilirubin before initiation of treatment and then as clinically indicated (interrupt treatment if significant liver injury occurs).
    - ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis or retinal disease).
  - **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Mayzent*® has provided a *Physician Education Pack*.
  - **PATIENT AND CARER ADVICE** Manufacturer advises patients to avoid exposure to sunlight without protection. Manufacturer advises patients should promptly report symptoms of infection.
    - Missed doses** Manufacturer advises if a dose is missed during treatment initiation (days 1–6), the initial titration regimen should be restarted. If a maintenance dose is missed (after day 6), the missed dose should not be taken, and the next dose should be taken at the normal time. If 4 or more consecutive doses are missed, the initial titration regimen should be used to restart treatment.
    - Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness during treatment initiation.
  - **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
  - NICE decisions**
    - ▶ Siponimod for treating secondary progressive multiple sclerosis (November 2020) NICE TA656 Recommended

**Scottish Medicines Consortium (SMC) decisions**

- ▶ Siponimod (*Mayzent*<sup>®</sup>) for the treatment of adult patients with secondary progressive multiple sclerosis (SPMS) with active disease evidenced by relapses or imaging features of inflammatory activity (October 2020) SMC No. SMC2265 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

EXCIPIENTS: May contain Lecithin

- ▶ **Mayzent** (Novartis Pharmaceuticals UK Ltd) ▼

**Siponimod (as Siponimod fumaric acid) 250 microgram** Mayzent 0.25mg tablets | 12 tablet [PoM] £293.52 | 120 tablet [PoM] £1,761.12

**Siponimod (as Siponimod fumaric acid) 2 mg** Mayzent 2mg tablets | 28 tablet [PoM] £1,643.72

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE****Anti-lymphocyte monoclonal antibodies**

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**IMPORTANT SAFETY INFORMATION**

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anaphylactic reaction · arthralgia · asthenia · conjunctivitis · constipation · cough · depression · diarrhoea · fever · headache · hypersensitivity (discontinue permanently) · increased risk of infection · infusion related reaction · leucopenia · myocardial infarction · neutropenia · night sweats · pain · thrombocytopenia · vomiting
- ▶ **Uncommon** Haemolytic anaemia · progressive multifocal leukoencephalopathy (PML)
- ▶ **Rare or very rare** Hepatitis B reactivation

**SIDE-EFFECTS, FURTHER INFORMATION** **Infusion-related side-effects**

In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

**Cytokine release syndrome** Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.
- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

**Alemtuzumab**

06-Oct-2020

● **INDICATIONS AND DOSE**

**Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): **LEMTRADA**<sup>®</sup> (ALEMTUZUMAB): UPDATED RESTRICTIONS AND STRENGTHENED MONITORING REQUIREMENTS FOLLOWING REVIEW OF SERIOUS CARDIOVASCULAR AND IMMUNE-MEDIATED REACTIONS

Following a review of alemtuzumab by the European Medicines Agency, a revised indication, additional contra-indications (see *Contra-indications*), and strengthened monitoring requirements before, during, and after treatment have been recommended. Healthcare professionals are advised that alemtuzumab should only be used for the treatment of patients with relapsing-remitting multiple sclerosis (RRMS) that is highly active despite a full and adequate course of treatment with at least one disease-modifying agent, or in patients with rapidly evolving severe RRMS.

Healthcare professionals should monitor patients before, during, and after treatment for cardiovascular reactions and non-immune thrombocytopenia (see *Monitoring requirements*). Patients should be informed of serious cardiovascular symptoms that can occur within a few days of treatment, signs of autoimmune disorders that can occur 48 months or more after treatment, and symptoms of hepatic injury; immediate medical attention should be sought by patients if they experience any of these symptoms.

- **CONTRA-INDICATIONS** Angina (past history) · autoimmune diseases (excluding multiple sclerosis) · cervicocephalic arterial dissection (past history) · clotting abnormalities (including patients on anticoagulant therapy) · human immunodeficiency virus · hypertension (uncontrolled) · myocardial infarction (past history) · severe active infection (until complete resolution) · stroke (past history)
- **CAUTIONS** Hepatitis B carriers · hepatitis C carriers · not recommended for inactive disease · not recommended for stable disease · patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course · pretreatment before administration is required (consult product literature)
- **CAUTIONS, FURTHER INFORMATION** For full details of cautions, consult product literature.
- ▶ Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, cytopenias, autoimmune hepatitis, and acquired haemophilia A. Manufacturer advises monitoring for autoimmune mediated conditions throughout the course of treatment (consult product literature).
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anxiety · asthma · cytokine release syndrome · endocrine ophthalmopathy · goitre · haemorrhage · hiccups · hyperhidrosis · hyperthyroidism · hypothyroidism ·

influenza like illness · leucocytosis · lymphadenopathy · lymphopenia · malaise · meningitis · menstrual cycle irregularities · multiple sclerosis exacerbated · muscle complaints · muscle weakness · neoplasms · nephropathy · oropharyngeal pain · peripheral oedema · sensation abnormal · skin reactions · stomatitis · thyroiditis · tremor · urine abnormalities · vertigo · vision disorders

- ▶ **Uncommon** Acquired haemophilia · appetite decreased · cervical dysplasia · dry mouth · dysphagia · ear pain · facial swelling · gallbladder disorders · gastrointestinal disorders · Goodpasture's syndrome · limb discomfort · musculoskeletal stiffness · nephrolithiasis · pancytopenia · pneumonitis · tension headache · throat irritation · weight changes
- ▶ **Rare or very rare** Haemophagocytic lymphohistiocytosis
- ▶ **Frequency not known** Artery dissection · cerebrovascular insufficiency · hepatitis autoimmune (including fatal cases) · liver injury · myocardial ischaemia · reactivation of infections · thyroid disorder autoimmune

● **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 4 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies*. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).

● **BREAST FEEDING** Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

● **PRE-TREATMENT SCREENING** Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

#### ● **MONITORING REQUIREMENTS**

- ▶ The MHRA advises to check liver, thyroid, and kidney function, urinalysis with microscopy, blood counts, and vital signs (including blood pressure, heart rate, and ECG) before infusions.
- ▶ The MHRA advises monitor blood pressure and heart rate continuously or at least once every hour during infusions—discontinue infusion if severe adverse reactions occur.
- ▶ The MHRA advises monitor patients for infusion-related reactions for at least 2 hours after infusions; patients should be informed of the risk of delayed infusion-related reactions and to seek immediate medical attention if these occur.
- ▶ The MHRA advises monitor platelet counts after treatment—consult product literature.
- ▶ For further information on monitoring, see *Important safety information*.
- ▶ HPV screening should be carried out annually in female patients.

● **PRESCRIBING AND DISPENSING INFORMATION** All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

● **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card and patient guide.

● **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

#### **NICE decisions**

- ▶ **Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014)** NICE TA312 Recommended

#### **Solution for infusion**

- ▶ **Lemtrada** (Sanofi Genzyme) ▼

**Alemtuzumab 10 mg per 1 ml** Lemtrada 12mg/1.2ml concentrate for solution for infusion vials | 1 vial [POM] £7,045.00 (Hospital only)

## Natalizumab

### ● **INDICATIONS AND DOSE**

**Highly active relapsing-remitting multiple sclerosis despite treatment with at least one disease-modifying drug, or those patients with rapidly-evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult 18–65 years: 300 mg every 4 weeks, consider discontinuing treatment if no response after 6 months

● **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

### ● **CAUTIONS**

- ▶ **Progressive Multifocal Leucoencephalopathy** Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment). Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Manufacturer advises treatment should be suspended until PML has been excluded. Manufacturer also advises if a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued. For information on cautions consult product literature.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS** Acute retinal necrosis · basophil count increased · eosinophilia · hyperbilirubinaemia · JC virus granule cell neuronopathy · liver injury · meningitis herpes · nucleated red cells

### **SIDE-EFFECTS, FURTHER INFORMATION** Progressive

**Multifocal Leucoencephalopathy (PML)** If suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

**Liver injury** Discontinue treatment if significant liver injury occurs.

**Infusion-related reactions** Infusion-related reactions including dizziness, nausea, urticaria, chills, vomiting and flushing have been reported either during infusion or within 1 hour after completion of infusion.

● **PREGNANCY** Avoid unless essential—*toxicity in animal studies*.

● **BREAST FEEDING** Present in milk in *animal studies*—avoid.

### ● **PRE-TREATMENT SCREENING**

Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

### ● **MONITORING REQUIREMENTS**

- ▶ Monitor liver function.

▶ **Progressive Multifocal Leucoencephalopathy** A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML.

All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.

- ▶ Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Tysabri*<sup>®</sup>), manufacturer advises give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation). Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML. Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop. Alert card A patient alert card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - ▶ Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007) NICE TA127 Recommended with restrictions
- **Scottish Medicines Consortium (SMC) decisions**
  - ▶ Natalizumab (*Tysabri*<sup>®</sup>) for use as single disease modifying therapy in highly active relapsing remitting multiple sclerosis (RRMS) (September 2007) SMC No. 329/06 Recommended with restrictions
- **NHS restrictions** NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of natalizumab for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

▶ *Tysabri* (Biogen Idec Ltd)Natalizumab 20 mg per 1 ml *Tysabri* 300mg/15ml concentrate for solution for infusion vials | 1 vial [P6M] £1,130.00 (Hospital only)

F 926

**Ocrelizumab**

11-Nov-2020

● **INDICATIONS AND DOSE****Multiple sclerosis (specialist use only)**

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 300 mg, then 300 mg after 2 weeks; maintenance 600 mg every 6 months, the first maintenance dose should be given 6 months after the first initial dose; a minimum interval of 5 months should be maintained between each maintenance dose, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature

- **CONTRA-INDICATIONS** Active infection · active malignancies · severely immunocompromised patients
- **CAUTIONS** Complete required vaccinations at least 6 weeks before treatment initiation · hepatitis B reactivation
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ Common or very common Catarrh
- ▶ Frequency not known Malignancy
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during treatment and for 12 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available; monitor infants for B-cell depletion.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor for signs and symptoms of progressive multifocal leucoencephalopathy (PML) (including any new onset or worsening of neurological symptoms)—if PML is suspected, interrupt treatment; discontinue treatment permanently if PML is confirmed.
  - ▶ Manufacturer advises monitor for infusion-related reactions during the infusion and observe patients for 1 hour after completion of the infusion—if severe pulmonary symptoms occur, permanently discontinue treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised that infusion-related reactions can occur within 24 hours of infusion.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - ▶ Ocrelizumab for treating relapsing-remitting multiple sclerosis (July 2018) NICE TA533 Recommended with restrictions
  - ▶ Ocrelizumab for treating primary progressive multiple sclerosis (June 2019) NICE TA585 Recommended with restrictions
- **Scottish Medicines Consortium (SMC) decisions**
  - ▶ Ocrelizumab (*Ocrevus*<sup>®</sup>) for the treatment of adult patients with relapsing forms of multiple sclerosis (RMS) with active disease defined by clinical or imaging features (December 2018) SMC No. SMC2121 Recommended with restrictions
  - ▶ Ocrelizumab (*Ocrevus*<sup>®</sup>) for treatment of adult patients with early primary progressive multiple sclerosis (PPMS) in terms of disease duration and level of disability, and with imaging features characteristic of inflammatory activity (January 2020) SMC No. SMC2223 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**▶ *Ocrevus* (Roche Products Ltd) ▼Ocrelizumab 30 mg per 1 ml *Ocrevus* 300mg/10ml concentrate for solution for infusion vials | 1 vial [P6M] £4,790.00 (Hospital only)**Ofatumumab**

20-May-2022

● **INDICATIONS AND DOSE****Multiple sclerosis (initiated by a specialist)**

▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 20 mg once weekly for 3 doses (weeks 0, 1 and 2), then maintenance 20 mg once a month, starting on week 4 (2 weeks after the third dose)

- **CONTRA-INDICATIONS** Active hepatitis B infection · active malignancies · severe active infection · severely immunocompromised patients
- **CAUTIONS** Active infection · hepatitis B carriers (seek expert advice before starting) · history of progressive multifocal leukoencephalopathy
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Immunisation [E<sub>VG</sub>r](#) Patients should receive all recommended vaccinations before starting treatment; live vaccines should be given at least 4 weeks before, and inactivated vaccines ideally at least 2 weeks before, starting ofatumumab. [M](#)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Cystitis · increased risk of infection · injection related reaction
  - ▶ **Frequency not known** Hepatitis B reactivation · JC virus infection · progressive multifocal leukoencephalopathy (PML)
- **CONCEPTION AND CONTRACEPTION** [E<sub>VG</sub>r](#) Females of childbearing potential should use effective contraception during treatment and for 6 months after the last dose. [M](#)
- **PREGNANCY** [E<sub>VG</sub>r](#) Avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. [M](#)
- **BREAST FEEDING** [E<sub>VG</sub>r](#) Avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed. If ofatumumab is used throughout the third trimester, breast-feeding can start immediately after birth. [M](#)
- **PRE-TREATMENT SCREENING** [E<sub>VG</sub>r](#) All patients should be screened for hepatitis B before treatment. [M](#)
- **MONITORING REQUIREMENTS** [E<sub>VG</sub>r](#) Monitor for signs or symptoms of progressive multifocal leukoencephalopathy (withhold treatment if suspected). [M](#)
- **DIRECTIONS FOR ADMINISTRATION** [E<sub>VG</sub>r](#) Usual sites for subcutaneous injection are the abdomen, thigh or upper outer arm. [M](#) After an initial dose administered under medical guidance, patients may self-administer *Kesimpta*<sup>®</sup> if they have been given the appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Ofatumumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light.
- **PATIENT AND CARER ADVICE**
  - Self-administration [E<sub>VG</sub>r](#) Patients and their carers should be given training in subcutaneous injection technique if appropriate. [M](#)
- **NATIONAL FUNDING/ACCESS DECISIONS**

## IMMUNOSUPPRESSANTS > PYRIMIDINE SYNTHESIS INHIBITORS

### Teriflunomide

20-Mar-2019

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.
- **INDICATIONS AND DOSE**
  - Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)**
    - ▶ **BY MOUTH**
    - ▶ **Adult:** 14 mg once daily
- **CONTRA-INDICATIONS** Anaemia · leucopenia · neutropenia · serious infection · severe hypoproteinaemia · severe immunodeficiency · significantly impaired bone-marrow function · thrombocytopenia
- **CAUTIONS** Adult over 65 years · anaemia · dyspnoea—assess for interstitial lung disease and consider suspending treatment · hypoproteinaemia (avoid if severe) · impaired bone-marrow function (avoid if severe) · latent tuberculosis · leucopenia · persistent cough—assess for interstitial lung disease and consider suspending treatment · severe infection—delay or suspend treatment until resolved · significant alcohol consumption · signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment · switching between other immunomodulating drugs · thrombocytopenia
- **INTERACTIONS** → Appendix 1: teriflunomide
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain upper · alopecia · anaemia · anxiety · arthralgia · cystitis · diarrhoea · headache · hypersensitivity · hypertension · increased risk of infection · menorrhagia · myalgia · nausea · nerve disorders · neutropenia · oral disorders · pain · palpitations · sensation abnormal · skin reactions · urinary frequency increased · vomiting · weight decreased
  - ▶ **Uncommon** Thrombocytopenia
  - ▶ **Frequency not known** Asthenia · hepatitis acute · interstitial lung disease · nail disorder · pancreatitis · sepsis
- **SIDE-EFFECTS, FURTHER INFORMATION** **Hepatic injury**
  - Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.
  - Important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).
- **CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in *animal studies*—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
  - ▶ Monitor blood pressure before treatment and periodically thereafter.
  - ▶ Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.
- **TREATMENT CESSATION** Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give *either* colestyramine p. 215 or charcoal, activated p. 1481. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - ▶ Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014) NICE TA303 Recommended with restrictions
  - ▶ **Scottish Medicines Consortium (SMC) decisions**
  - ▶ Teriflunomide (*Aubagio*®) for adults with relapsing-remitting multiple sclerosis (March 2014) SMC No. 940/14 Recommended with restrictions
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

<b>Tablet</b>
▶ <b>Teriflunomide (Non-proprietary)</b>
Teriflunomide 7 mg Aubagio 7mg tablets   28 tablet <b>[PoM]</b> £1,037.84 (Hospital only)
▶ <b>Aubagio</b> (Sanofi Genzyme)
Teriflunomide 14 mg Aubagio 14mg tablets   28 tablet <b>[PoM]</b> £1,037.84
- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Infusion-related reactions **[EvGr]** Infusion-related reactions can occur and amivantamab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; pre-medication with an antipyretic, antihistamine, and corticosteroid is recommended—consult product literature. **[M]**
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · asthenia · constipation · diarrhoea · dizziness · dry eye · electrolyte imbalance · eye discomfort · eye disorders · eye inflammation · facial swelling · gastrointestinal discomfort · hypoalbuminaemia · increased risk of infection · infusion related reaction · mucositis · myalgia · nail disorders · nausea · oedema · onycholysis · oral disorders · perineal rash · peripheral swelling · respiratory disorders · skin reactions · vertigo · vision disorders · vomiting
  - ▶ **Uncommon** Toxic epidermal necrolysis
  - ▶ **Frequency not known** Back pain · dyspnoea · fever · muscle weakness · pulmonary embolism
- **CONCEPTION AND CONTRACEPTION** **[EvGr]** Females of childbearing potential should use effective contraception during treatment and for at least 3 months after last treatment. **[M]** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** **[EvGr]** Avoid unless potential benefit outweighs risk—limited information available. **[M]** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** **[EvGr]** Avoid during treatment and for 3 months after last treatment—no information available. **[M]**
- **PRESCRIBING AND DISPENSING INFORMATION** Amivantamab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration. The manufacturer of *Rybrevant*® has provided a *Risk minimisation materials* document for healthcare professionals.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Patients should be advised to limit sun exposure during treatment and for 2 months after last treatment; protective clothing and use of sunscreen are advisable. Patients should be advised to discontinue contact lens use until worsening eye symptoms are evaluated. **Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and visual impairment.

## Malignant disease

### 1 Antibody responsive malignancy

#### ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

##### Amivantamab

17-Feb-2022

- **DRUG ACTION** Amivantamab is a human monoclonal antibody that targets and disrupts signalling in epidermal growth factor receptor (EGFR) and mesenchymal-epithelial transition factor (MET) receptor pathways, thereby preventing tumour cell progression and also causing immune-mediated tumour cell death.

##### ● INDICATIONS AND DOSE

**Non-small cell lung cancer [with activating epidermal growth factor receptor (EGFR) exon 20 insertion mutations] (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

EXCIPIENTS: May contain Edetic acid (edta), polysorbates

##### ▶ Amivantamab (non-proprietary) ▼

Amivantamab 50 mg per 1 ml Rybrevant 350mg/7ml concentrate for solution for infusion vials | 1 vial **[PoM]** £1,079.00 (Hospital only)

## Atezolizumab

24-Nov-2021

● **DRUG ACTION** Atezolizumab is a monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

### ● INDICATIONS AND DOSE

**Urothelial carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Small cell lung cancer (specialist use only) | Breast cancer (specialist use only) | Hepatocellular carcinoma (specialist use only)**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ATEZOLIZUMAB (*TECENTRIQ*®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARs) (JUNE 2021)

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as atezolizumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, atezolizumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Atezolizumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of atezolizumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

● **CAUTIONS** Abnormal thyroid function—consider appropriate treatment · history of severe cutaneous adverse reactions—see *Important safety information* for details · patients may need pre-medication to minimise the development of infusion-related reactions—consult product literature

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · appetite decreased · arthralgia · ascites · asthenia · chills · cough · cystitis · cytokine release syndrome · diarrhoea · dysphagia · dyspnoea · electrolyte imbalance · euthyroid sick syndrome · eye disorders · fever · gastrointestinal disorders · goitre · hepatic disorders · hyperglycaemia · hypersensitivity · hypotension · hypothyroidism · hypoxia · increased risk of infection · influenza like illness · infusion related reaction · myalgia · myxoedema · nasal congestion · nausea · oesophageal varices · oesophageal varices haemorrhage · oropharyngeal complaints · pain · radiation pneumonitis · respiratory disorders · skin reactions · skin ulcer · throat irritation · thrombocytopenia · thyroid disorder · thyroiditis · ulcerative colitis · vomiting

► **Uncommon** Adrenal hypofunction · connective tissue disorders · diabetes mellitus · diabetic ketoacidosis · hyperthyroidism · ketoacidosis · meningitis · muscle abscess · myopathy · nerve disorders · pancreatitis · photophobia · severe cutaneous adverse reactions (SCARs)

► **Rare or very rare** Hypophysitis · myocarditis · nephritis · neuromuscular dysfunction · temperature regulation disorder

**SIDE-EFFECTS, FURTHER INFORMATION** **Immune-related reactions** Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

**Infusion-related reactions** Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential, during treatment and for 5 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the brand name and batch number after each administration.  
All prescribers should be familiar with the *Physician Information and Management Guidelines* provided by the manufacturer.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after dilution.
- **PATIENT AND CARER ADVICE** An alert card should be provided.  
**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

### NICE decisions

- Atezolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (June 2018) NICE TA525 Recommended with restrictions
  - Atezolizumab for untreated PD-L1-positive advanced urothelial cancer when cisplatin is unsuitable (October 2021) NICE TA739 Recommended
  - Atezolizumab for treating locally advanced or metastatic non-small-cell lung cancer after chemotherapy (May 2018) NICE TA520 Recommended with restrictions
  - Atezolizumab in combination for treating metastatic non-squamous non-small-cell lung cancer (June 2019) NICE TA584 Recommended with restrictions
  - Atezolizumab monotherapy for untreated advanced non-small-cell lung cancer (June 2021) NICE TA705 Recommended
  - Atezolizumab with carboplatin and etoposide for untreated extensive-stage small-cell lung cancer (July 2020) NICE TA638 Recommended with restrictions
  - Atezolizumab with nab-paclitaxel for untreated PD-L1-positive, locally advanced or metastatic, triple-negative breast cancer (July 2020) NICE TA639 Recommended
  - Atezolizumab with bevacizumab for treating advanced or unresectable hepatocellular carcinoma (December 2020) NICE TA666 Recommended with restrictions
- Scottish Medicines Consortium (SMC) decisions**
- Atezolizumab (*Tecentriq*®) for the treatment of adult patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) after prior chemotherapy. Patients with EGFR activating mutations or ALK-positive tumour mutations should also have received targeted therapy before receiving *Tecentriq*® (July 2018) SMC No. 1336/18 Recommended with restrictions
  - Atezolizumab (*Tecentriq*®), in combination with bevacizumab, paclitaxel and carboplatin, is indicated for the first-line treatment of adult patients with metastatic non-squamous non-small cell lung cancer (NSCLC) (November 2019) SMC No. SMC2208 Not recommended

- ▶ **Atezolizumab (Tecentriq<sup>®</sup>)** as monotherapy for the first-line treatment of adult patients with metastatic non-small cell lung cancer (NSCLC) whose tumours have a PD-L1 expression on 50% or more tumour cells (TC) or 10% or more tumour-infiltrating immune cells (IC) and who do not have epidermal growth factor receptor (EGFR) mutant or anaplastic lymphoma kinase (ALK)-positive NSCLC (November 2021) SMC No. SMC2379 Recommended
- ▶ **Atezolizumab (Tecentriq<sup>®</sup>)** in combination with carboplatin and etoposide, is indicated for the first-line treatment of adult patients with extensive-stage small cell lung cancer (November 2020) SMC No. SMC2279 Recommended
- ▶ **Atezolizumab (Tecentriq<sup>®</sup>)** as monotherapy for the treatment of adult patients with locally advanced or metastatic urothelial carcinoma: after prior platinum-containing chemotherapy, or who are considered cisplatin ineligible (November 2018) SMC No. SMC2103 Not recommended
- ▶ **Atezolizumab (Tecentriq<sup>®</sup>)** in combination with nab-paclitaxel for the treatment of adult patients with unresectable locally advanced or metastatic triple-negative breast cancer whose tumours have PD-L1 expression at a level of 1% or more and who have not received prior chemotherapy for metastatic disease (November 2020) SMC No. SMC2267 Recommended
- ▶ **Atezolizumab (Tecentriq<sup>®</sup>)** in combination with bevacizumab for the treatment of adult patients with advanced or unresectable hepatocellular carcinoma who have not received prior systemic therapy (July 2021) SMC No. SMC2349 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

#### ▶ **Tecentriq (Roche Products Ltd)** ▼

 Tecentriq 1200mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £3,807.69 (Hospital only)

## Avelumab

10-Sep-2021

- **DRUG ACTION** Avelumab is a human monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

#### ● **INDICATIONS AND DOSE**

**Merkel cell carcinoma (specialist use only) | Renal cell carcinoma (specialist use only) | Urothelial carcinoma (specialist use only)**

#### ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 800 mg every 2 weeks, for information on dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature

#### **IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ<sup>®</sup>) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)**

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as avelumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, avelumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Avelumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of avelumab in patients with a history of severe or life-threatening

SCAR associated with other immunostimulant antineoplastic drugs.

- **CAUTIONS** Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)
  - **INTERACTIONS** → Appendix 1: monoclonal antibodies
  - **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · appetite decreased · arthralgia · asthenia · back pain · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · headache · hypertension · hyperthyroidism · hyponatraemia · hypothyroidism · influenza like illness · infusion related reaction · lymphopenia · myalgia · nausea · nerve disorders · peripheral oedema · respiratory disorders · skin reactions · thrombocytopenia · vomiting · weight decreased
  - ▶ **Uncommon** Adrenal hypofunction · arthritis · eosinophilia · flushing · gastrointestinal disorders · hepatic disorders · hyperglycaemia · hypersensitivity · hypotension · myositis · nephritis · neuromuscular dysfunction · renal failure · thyroiditis
  - ▶ **Rare or very rare** Cardiac inflammation · diabetes mellitus · hypopituitarism · pancreatitis · systemic inflammatory response syndrome · uveitis
  - ▶ **Frequency not known** Endocrine disorders
- SIDE-EFFECTS, FURTHER INFORMATION** **Infusion-related reactions** For treatment modifications in patients with grade 1 or 2 infusion-related reactions, consult product literature. Manufacturer advises permanently discontinue treatment in patients with grade 3 or 4 infusion-related reaction.

**Immune-related reactions** Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during treatment and for at least 1 month after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least 1 month after stopping treatment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion (Bavencio<sup>®</sup>)*, dilute requisite dose with Sodium Chloride 0.9%; give over 60 minutes via a separate line using a low-protein binding 0.2 micron filter.
- **PRESCRIBING AND DISPENSING INFORMATION** Avelumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card. A patient information brochure highlighting important safety information to minimise the risk of immune-related side-effects is also available.

**Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

● **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ **Avelumab** for treating metastatic Merkel cell carcinoma (updated April 2021) NICE TA517 Recommended with restrictions
  - ▶ **Avelumab** for untreated metastatic Merkel cell carcinoma (April 2021) NICE TA691 Recommended with restrictions
  - ▶ **Avelumab** with axitinib for untreated advanced renal cell carcinoma (September 2020) NICE TA645 Recommended
- Scottish Medicines Consortium (SMC) decisions**
- ▶ **Avelumab** (*Bavencio*®) as monotherapy for the treatment of adult patients with metastatic Merkel cell carcinoma (May 2018) SMC No. 1315/18 Recommended
  - ▶ **Avelumab** (*Bavencio*®) in combination with axitinib for the first-line treatment of adult patients with advanced renal cell carcinoma (October 2020) SMC No. SMC2248 Recommended
  - ▶ **Avelumab** (*Bavencio*®) as monotherapy for the first-line maintenance treatment of adult patients with locally advanced or metastatic urothelial carcinoma who are progression-free following platinum-based chemotherapy (August 2021) SMC No. SMC2359 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ▶ **Bavencio** (Merck Serono Ltd) ▼  
**Avelumab 20 mg per 1 ml** Bavencio 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £768.00

## Belantamab mafodotin

05-Jul-2021

- **DRUG ACTION** Belantamab mafodotin is an antibody-drug conjugate that contains belantamab linked to mcMMAF, a cytotoxic microtubule disrupting agent.

● **INDICATIONS AND DOSE**

**Multiple myeloma (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- Adult: 2.5 mg/kg every 3 weeks, for dose adjustments, interruption, and discontinuation due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** History of dry eyes

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · decreased leucocytes · diarrhoea · dry eye · eye discomfort · eye inflammation · fever · increased risk of infection · infusion related reaction · nausea · neutropenia · thrombocytopenia · vision disorders · vomiting
- ▶ **Frequency not known** Eye disorders · fatigue · lethargy

- **CONCEPTION AND CONTRACEPTION** [EvGr] Females of childbearing potential should use effective contraception during treatment and for 4 months after last treatment; male patients should use effective contraception during treatment and for 6 months after last treatment if their partner is of childbearing potential. (M) See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** [EvGr] Avoid unless potential benefit outweighs risk—embryotoxic in animal studies. (M) See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** [EvGr] Discontinue breast-feeding before starting treatment and for 3 months after last treatment. (M)

● **MONITORING REQUIREMENTS**

- ▶ [EvGr] Ophthalmic examination is advised at baseline, before the first 3 treatment cycles, and as clinically indicated during treatment—consult product literature.
- ▶ Obtain complete blood counts at baseline and monitor during treatment as clinically indicated—consult product literature. (M)

- **PRESCRIBING AND DISPENSING INFORMATION** Belantamab mafodotin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Patients should be advised to administer preservative-free artificial tears at least four times daily during treatment and to avoid wearing contact lenses until treatment is completed.
- Driving and skilled tasks** Patients and their carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of vision disorders.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

EXCIPIENTS: May contain Disodium edetate, polysorbates

- ▶ **Blenrep** (GlaxoSmithKline UK Ltd) ▼  
**Belantamab mafodotin 100 mg** Blenrep 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £5,707.83 (Hospital only)

## Bevacizumab

19-May-2021

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

● **INDICATIONS AND DOSE**

**Colorectal cancer (specialist use only) | Breast cancer (specialist use only) | Renal cell carcinoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Epithelial ovarian cancer (specialist use only) | Fallopian tube cancer (specialist use only) | Primary peritoneal cancer (specialist use only) | Carcinoma of the cervix (specialist use only) | Hepatocellular carcinoma (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)**

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenously bisphosphonates.

**MHRA/CHM ADVICE: SYSTEMICALLY ADMINISTERED VEGF PATHWAY INHIBITORS: RISK OF ANEURYSM AND ARTERY DISSECTION (JULY 2020)**

A European review of worldwide data concluded that systemically administered VEGF pathway inhibitors may lead to aneurysm and artery dissection in patients with

or without hypertension. Some fatal cases have been reported, mainly in relation to aortic aneurysm rupture and aortic dissection. The MHRA advises healthcare professionals to carefully consider the risk of aneurysm and artery dissection in patients with risk factors before initiating treatment with bevacizumab; any modifiable risk factors (such as smoking and hypertension) should be reduced as much as possible. Patients should be monitored and treated for hypertension as required.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) · risk factors for aneurysm or artery dissection · risk factors for arterial thromboembolism · uncontrolled hypertension · untreated CNS metastases
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Monitoring of blood pressure The MHRA advises to monitor blood pressure regularly—consult product literature if hypertension occurs during treatment.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abscess · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · cough · decreased leucocytes · dehydration · diarrhoea · drowsiness · dysarthria · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorders · fever · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · healing impaired · hypersensitivity · hypertension · hypoxia · increased risk of infection · infusion related reaction · mucositis · muscle weakness · myalgia · nausea · neutropenia · ovarian failure · pain · pelvic pain · peripheral neuropathy · proteinuria · rectovaginal fistula · sepsis · skin reactions · stomatitis · stroke · supraventricular tachycardia · syncope · taste altered · thrombocytopenia · vomiting · weight decreased
  - ▶ **Rare or very rare** Encephalopathy · necrotising fasciitis (discontinue and initiate treatment promptly)
  - ▶ **Frequency not known** Aneurysm · artery dissection · chest pain · chills · flushing · gallbladder perforation · hyperglycaemia · hypotension · nasal septum perforation · osteonecrosis of jaw · pulmonary hypertension · renal thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
  - ▶ Monitor for congestive heart failure.
  - ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
- ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - For full details see funding body website
- NICE decisions**
  - ▶ Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118 Not recommended
  - ▶ Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212 Not recommended
  - ▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242 Not recommended
  - ▶ Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178 Not recommended
  - ▶ Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214 Not recommended
  - ▶ Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263 Not recommended
  - ▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284 Not recommended
  - ▶ Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285 Not recommended
  - ▶ Atezolizumab with bevacizumab for treating advanced or unresectable hepatocellular carcinoma (December 2020) NICE TA666 Recommended with restrictions
  - ▶ Olaparib plus bevacizumab for maintenance treatment of advanced ovarian, fallopian tube or primary peritoneal cancer (April 2021) NICE TA693 Recommended with restrictions
- Scottish Medicines Consortium (SMC) decisions**
  - ▶ Bevacizumab (*Avastin*<sup>®</sup>) in combination with capecitabine for first-line treatment of metastatic breast cancer (May 2012) SMC No. 778/12 Not recommended
  - ▶ Bevacizumab (*Avastin*<sup>®</sup>) in combination with paclitaxel, topotecan, or pegylated liposomal doxorubicin for the treatment of platinum-resistant recurrent ovarian, fallopian tube, or primary peritoneal cancer (September 2015) SMC No. 1063/15 Recommended with restrictions
  - ▶ Bevacizumab (*Avastin*<sup>®</sup>) in combination with carboplatin and paclitaxel, for the front-line treatment of advanced (International Federation of Gynaecology and Obstetrics (FIGO) stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (November 2015) SMC No. 806/12 Recommended with restrictions
- All Wales Medicines Strategy Group (AWMSG) decisions**
  - ▶ Bevacizumab (*Avastin*<sup>®</sup>) in combination with paclitaxel and cisplatin, or, alternatively, paclitaxel and topotecan in patients who cannot receive platinum therapy, for the treatment of adult patients with persistent, recurrent, or metastatic carcinoma of the cervix (September 2017) AWMSG No. 2166 Not recommended
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
- Solution for infusion**

## Blinatumomab

17-May-2021

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

### ● INDICATIONS AND DOSE

#### Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

#### Philadelphia chromosome-negative acute lymphoblastic leukaemia in complete remission with minimal residual disease (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Adult (body-weight 45 kg and above): (consult product literature)

- **CAUTIONS** Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

### CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Manufacturer advises pre-medication with a corticosteroid and an anti-pyretic—consult product literature.
- ▶ Neurological events There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anaemia · arrhythmias · ataxia · chest discomfort · chills · cognitive disorder · confusion · constipation · cough · cranial nerve disorder · decreased leucocytes · diarrhoea · dizziness · drowsiness · dyspnoea · encephalopathy · facial swelling · fever · flushing · headache · hyperbilirubinaemia · hypersensitivity · hypertension · hypogammaglobulinaemia · hypoglobulinaemia · hypotension · immune disorder · increased risk of infection · infusion related reaction · insomnia · leucocytosis · memory loss · nausea · neutropenia · oedema · pain · respiratory disorders · seizure · sensation abnormal · sepsis · skin reactions · speech impairment · thrombocytopenia · tremor · tumour lysis syndrome · vomiting · weight increased
- ▶ **Uncommon** Capillary leak syndrome · haemophagocytic lymphohistiocytosis · lymphadenopathy · pancreatitis
- ▶ **Frequency not known** Consciousness impaired · psychiatric disorder · viral infection reactivation

**SIDE-EFFECTS, FURTHER INFORMATION** **Pancreatitis** Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

**Cytokine release syndrome, infusion-reactions and tumour lysis syndrome** Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** [EvGr] Caution in severe impairment (no information available). <M>
- **MONITORING REQUIREMENTS** Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
 For full details see funding body website
- **NICE decisions**
- ▶ **Blinatumomab for previously treated Philadelphia-chromosome-negative acute lymphoblastic leukaemia (June 2017)** NICE TA450 Recommended
- ▶ **Blinatumomab for treating acute lymphoblastic leukaemia in remission with minimal residual disease activity (July 2019)** NICE TA589 Recommended with restrictions
- **Scottish Medicines Consortium (SMC) decisions**
- ▶ **Blinatumomab (Blincyto®)** as monotherapy for the treatment of adults with Philadelphia chromosome-negative CD19 positive B-precursor acute lymphoblastic leukaemia in first or second complete remission with minimal residual disease greater than or equal to 0.1% (March 2020) SMC No. SMC2234 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates

#### ► **Blinicyto** (Amgen Ltd) ▼

**Blinatumomab 38.5 microgram** Blinicyto 38.5micrograms powder for concentrate and solution for solution for infusion vials | 1 vial [PoM] £2,017.00 (Hospital only)

## Brentuximab vedotin

03-Feb-2021

### • INDICATIONS AND DOSE

**CD30 positive Hodgkin lymphoma (specialist use only) | Systemic anaplastic large cell lymphoma (specialist use only) | CD30 positive cutaneous T-cell lymphoma (specialist use only)**

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CAUTIONS** Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anaemia · arthralgia · back pain · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · hyperglycaemia · increased risk of infection · infusion related reaction · myalgia · nausea · nerve disorders · neutropenia · skin reactions · thrombocytopenia · vomiting · weight decreased
  - **Uncommon** Anaphylactic reaction · cytomegalovirus infection reactivation · pancreatitis acute · sepsis · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome
  - **Frequency not known** Disease recurrence · gastrointestinal disorders · gastrointestinal haemorrhage · progressive multifocal leukoencephalopathy (PML) · respiratory disorders
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor for symptoms of progressive multifocal leukoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).
  - Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
  - Monitor for pulmonary toxicity—treat symptoms promptly.
  - Routinely monitor hepatic function.
  - Monitor for infusion-related (including anaphylactic) reactions.
  - Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - **Brentuximab vedotin for treating relapsed or refractory systemic anaplastic large cell lymphoma (October 2017)** NICE TA478 Recommended with restrictions
  - **Brentuximab vedotin in combination for untreated systemic anaplastic large cell lymphoma (August 2020)** NICE TA641 Recommended

- **Brentuximab vedotin for treating CD30-positive Hodgkin lymphoma (June 2018)** NICE TA524 Recommended with restrictions
- **Brentuximab vedotin for treating CD30-positive cutaneous T-cell lymphoma (April 2019)** NICE TA577 Recommended with restrictions

### Scottish Medicines Consortium (SMC) decisions

- **Brentuximab vedotin (Adcetris®) for the treatment of adult patients with CD30-positive cutaneous T-cell lymphoma (CTCL) after at least one prior systemic therapy (January 2020)** SMC No. SMC2229 Recommended with restrictions
- **Brentuximab vedotin (Adcetris®) in combination with cyclophosphamide, doxorubicin and prednisone for adult patients with previously untreated systemic anaplastic large cell lymphoma (SALCL) (January 2021)** SMC No. SMC2310 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

#### ► **Adcetris** (Takeda UK Ltd) ▼

**Brentuximab vedotin 50 mg** Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,500.00 (Hospital only)

## Cemiplimab

19-Jul-2021

- **DRUG ACTION** Cemiplimab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

### • INDICATIONS AND DOSE

#### Cutaneous squamous cell carcinoma (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 350 mg every 3 weeks, for dose interruption or discontinuation of treatment due to side-effects or infusion-related reactions—consult product literature

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)**

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as cemiplimab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, cemiplimab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Cemiplimab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of cemiplimab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- **CAUTIONS** For full details consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia · arthritis · asthenia · colitis · diarrhoea · hepatic disorders · hyperthyroidism · hypothyroidism · infusion related reaction · myalgia · pain · pneumonitis · skin reactions · stomatitis
  - **Uncommon** Adrenal insufficiency · cardiac inflammation · diabetic ketoacidosis · encephalitis · hypophysitis · immune thrombocytopenic purpura · keratitis · meningitis · muscle

weakness · myasthenia gravis · nephritis · nerve disorders · nervous system disorders · Sjögren's syndrome · thyroiditis · type 1 diabetes mellitus · vasculitis

- ▶ **Frequency not known** Encephalitis non-infective · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment and for at least 4 months after the last dose. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after stopping—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related side-effects—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, dilute to a concentration between 1 mg/mL and 20 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes through a low-protein binding in-line or add-on filter (pore size 0.2–5 micron).

- **PRESCRIBING AND DISPENSING INFORMATION** Cemiplimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

The manufacturer of *Libtayo*<sup>®</sup> has provided a *Risk minimisation materials* document for healthcare professionals.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature about storage after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Risk of immune-related side-effects. A patient alert card and patient guide should be provided.

- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

#### NICE decisions

- ▶ Cemiplimab for treating metastatic or locally advanced cutaneous squamous cell carcinoma (August 2019) NICE TA592 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Cemiplimab (*Libtayo*<sup>®</sup>) as monotherapy for the treatment of adult patients with metastatic or locally advanced cutaneous squamous cell carcinoma (CSCC) who are not candidates for curative surgery or curative radiation (February 2020) SMC No. SMC2216 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain L-proline, polysorbates, sucrose

- ▶ *Libtayo* (Sanofi) ▼

Cemiplimab 50 mg per 1 ml *Libtayo* 350mg/7ml concentrate for solution for infusion vials | 1 vial **[PoM]** £4,650.00 (Hospital only)

## Cetuximab

### ● INDICATIONS AND DOSE

**Metastatic colorectal cancer with a BRAF V600E mutation (in combination with encorafenib) Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult (initiated by a specialist): (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

**MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

### ● CONTRA-INDICATIONS

- ▶ When used for treatment of wild-type ras metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, in combination therapy with oxaliplatin-containing chemotherapy *RAS* mutated colorectal tumours (or if *RAS* tumour status unknown)

- **CAUTIONS** Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for keratitis · risk factors for ulcerative keratitis (including contact lens use) · severe dry eye

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · cytokine release syndrome · dehydration · diarrhoea · electrolyte imbalance · eye inflammation · fatigue · headache · hypersensitivity · infusion related reaction · mucositis · nausea · skin eruption · vomiting
- ▶ **Uncommon** Embolism and thrombosis · interstitial lung disease
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Meningitis aseptic · superinfection of skin lesions

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.

### ● PRE-TREATMENT SCREENING

- ▶ When used for Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated [\[EvGr\]](#) Evidence of non-mutated (wild-type) RAS status (at exons 2, 3, and 4 of *KRAS* and *NRAS*) is required before cetuximab is initiated, and should be determined by an experienced laboratory using a validated test method. [\[M\]](#)

### ● MONITORING REQUIREMENTS

- ▶ [\[EvGr\]](#) Monitor serum electrolyte levels prior to therapy and periodically during treatment.
- ▶ Monitor for signs and symptoms of infusion-related reactions—consult product literature. [\[M\]](#)

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises resuscitation facilities should be available.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145 Recommended
- ▶ Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (August 2017) NICE TA473 Recommended
- ▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242 Not recommended
- ▶ Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439 Recommended with restrictions
- ▶ Encorafenib plus cetuximab for previously treated BRAF V600E mutation-positive metastatic colorectal cancer (January 2021) NICE TA668 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- ▶ **Erbixux** (Merck Serono Ltd)  
Cetuximab 5 mg per 1 ml Erbixux 100mg/20ml solution for infusion vials | 1 vial [\[PoM\]](#) £178.10 (Hospital only)  
Erbixux 500mg/100ml solution for infusion vials | 1 vial [\[PoM\]](#) £890.50 (Hospital only)

## Daratumumab

04-May-2022

- **DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

### ● INDICATIONS AND DOSE

#### Multiple myeloma (specialist use only)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: DARATUMUMAB (DARZALEX®): RISK OF REACTIVATION OF HEPATITIS B VIRUS (AUGUST 2019)

An EU cumulative review of worldwide data has identified reports of hepatitis B virus (HBV) reactivation in patients treated with daratumumab, including several fatal cases. Healthcare professionals are advised to screen all patients for hepatitis B before starting treatment; patients with unknown serology already being treated with daratumumab should also be screened. Those with positive serology should be monitored for signs of HBV reactivation during, and for at least 6 months after, treatment; immediate medical attention should be sought if signs and symptoms of

HBV reactivation develop. Daratumumab should be stopped in patients with HBV reactivation and appropriate treatment initiated, based on expert advice. Experts should be consulted before resuming daratumumab in patients with adequately controlled viral reactivation.

- **CAUTIONS** History of obstructive pulmonary disorder (consider additional post-medication—consult product literature) · patients may need pre-medication to minimise adverse reactions · risk of herpes zoster reactivation (consider antiviral prophylaxis)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Infusion-related reactions Serious infusion-related reactions can occur following either intravenous or subcutaneous injection, and daratumumab should only be administered by appropriately trained staff where resuscitation facilities are available; manufacturer advises pre-medication with a corticosteroid, an antihistamine and an anti-pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Pruritus
- ▶ With parenteral use Anaemia · appetite decreased · arthralgia · asthenia · atrial fibrillation · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dyspnoea · fever · headache · hyperglycaemia · hypertension · hypocalcaemia · increased risk of infection · infusion related reaction · insomnia · muscle spasms · nausea · neutropenia · pain · pancreatitis · paraesthesia · peripheral neuropathy · peripheral oedema · pulmonary oedema · rash · sepsis · thrombocytopenia · vomiting
- ▶ **Uncommon**
- ▶ With parenteral use Hepatitis B reactivation

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises treatment should be immediately interrupted if an infusion-related reaction of any grade or severity occurs—consult product literature for specific management recommendations.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **EFFECT ON LABORATORY TESTS** Possible positive indirect Coombs test (may affect antibody screening).

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C; consult product literature for storage advice following dilution.

- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

#### NICE decisions

- ▶ Daratumumab with bortezomib and dexamethasone for previously treated multiple myeloma (April 2019) NICE TA573 Recommended with restrictions

- ▶ Daratumumab in combination for untreated multiple myeloma when a stem cell transplant is suitable (February 2022) NICE TA763 Recommended
  - ▶ Daratumumab monotherapy for treating relapsed and refractory multiple myeloma (April 2022) NICE TA783 Recommended with restrictions
- Scottish Medicines Consortium (SMC) decisions**
- ▶ Daratumumab (*Darzalex*<sup>®</sup>) as monotherapy, for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and have demonstrated disease progression on the last therapy (October 2017) SMC No. 1205/17 Recommended with restrictions
  - ▶ Daratumumab (*Darzalex*<sup>®</sup>) in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone, for the treatment of adult patients with multiple myeloma who have received at least one prior therapy (July 2019) SMC No. SMC2180 Recommended with restrictions
  - ▶ Daratumumab subcutaneous injection (*Darzalex*<sup>®</sup>) in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone, for the treatment of adult patients with multiple myeloma who have received at least one prior therapy (October 2020) SMC No. SMC2301 Recommended with restrictions
  - ▶ Daratumumab subcutaneous injection (*Darzalex*<sup>®</sup>) as monotherapy, for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and have demonstrated disease progression on the last therapy (October 2020) SMC No. SMC2304 Recommended with restrictions
  - ▶ Daratumumab (*Darzalex*<sup>®</sup>) in combination with bortezomib, thalidomide and dexamethasone for the treatment of adult patients with newly diagnosed multiple myeloma who are eligible for autologous stem cell transplant (January 2021) SMC No. SMC2302 Recommended
  - ▶ Daratumumab subcutaneous injection (*Darzalex*<sup>®</sup>) in combination with bortezomib, thalidomide and dexamethasone for the treatment of adult patients with newly diagnosed multiple myeloma who are eligible for autologous stem cell transplant (January 2021) SMC No. SMC2326 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Polysorbates, sorbitol

- ▶ *Darzalex* (Janssen-Cilag Ltd) ▼

Daratumumab 120 mg per 1 ml Darzalex 1800mg/15ml solution for injection vials | 1 vial [PoM] £4,320.00 (Hospital only)

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- ▶ *Darzalex* (Janssen-Cilag Ltd) ▼

Daratumumab 20 mg per 1 ml Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £360.00 (Hospital only)  
 Darzalex 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,440.00 (Hospital only)

## Dinutuximab beta

04-Nov-2020

- **DRUG ACTION** Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialoganglioside 2, which is overexpressed on neuroblastoma cells.

#### ● INDICATIONS AND DOSE

##### High-risk neuroblastoma (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute grade 3 or 4, or extensive chronic graft-versus-host disease
- **CAUTIONS** Avoid vaccinations during and for at least 10 weeks after treatment cessation (increased risk of immune stimulation and neurological toxicity) - ensure absence of systemic infection—any other infection should be controlled before treatment initiation - pre-medication must be administered to minimise the risk of infusion-related reactions and neuropathic pain

#### CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Severe infusion-related reactions can occur and dinutuximab beta should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with an antihistamine, and to monitor closely, particularly during the first and second treatment course; discontinue immediately if reaction occurs and treat as indicated—consult product literature.

Manufacturer advises pre-medication with non-opioid analgesics, gabapentin and opioids—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · ascites · capillary leak syndrome · chest pain · chills · constipation · cough · cytokine release syndrome · decreased leucocytes · device related infection · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haematuria · headache · heart failure · hyperhidrosis · hypersensitivity · hypertension · hypertriglyceridaemia · hypoalbuminaemia · hypotension · hypoxia · increased risk of infection · left ventricular dysfunction · muscle spasms · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · photosensitivity reaction · pulmonary oedema · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary retention · urine abnormalities · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Disseminated intravascular coagulation · eosinophilia · hepatocellular injury · hypovolaemic shock · intracranial pressure increased · peripheral vascular disease · posterior reversible encephalopathy syndrome (PRES)
- ▶ **Frequency not known** Erythropeonia

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function—consult product literature for values required for treatment initiation.
- ▶ Manufacturer advises monitor circulatory and respiratory function—risk of capillary leak syndrome.
- ▶ Manufacturer advises monitor liver function and electrolytes regularly.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients should not use or drive machines during treatment.

**NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ **Dinutuximab beta** for treating neuroblastoma (August 2018) NICE TA538 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Dinutuximab beta (Qarziba®)** for the treatment of high-risk neuroblastoma in patients aged 12 months and above, who have previously received induction chemotherapy and achieved at least a partial response, followed by myeloablative therapy and stem cell transplantation, as well as patients with history of relapsed or refractory neuroblastoma, with or without residual disease (November 2018) SMC No. SMC2105 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ▶ **Qarziba** (EUSA Pharma (UK) Ltd) ▼

Dinutuximab beta 4.5 mg per 1 ml Qarziba 20mg/4.5ml concentrate for solution for infusion vials | 1 vial [PoM] £7,610.00 (Hospital only)

**Dostarlimab**

01-Apr-2022

- **DRUG ACTION** Dostarlimab is a humanised monoclonal antibody which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

**INDICATIONS AND DOSE****Endometrial cancer (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 500 mg every 3 weeks for 4 doses on weeks 1, 4, 7, and 10, followed by 1 g every 6 weeks from week 13 onwards, for dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** History of severe or life-threatening cutaneous adverse reactions associated with other immunostimulant antineoplastic drugs · risk of transplant-related complications

**CAUTIONS, FURTHER INFORMATION**

- ▶ Transplant-related complications [EvGr] Patients who receive an allogeneic haematopoietic stem cell transplant before or after dostarlimab treatment may be at an increased risk of transplant-related complications, and should be closely monitored. There may also be an increased risk of rejection in solid organ transplant recipients. [M]

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- ▶ **Common or very common** Adrenal insufficiency · anaemia · arthralgia · autoimmune haemolytic anaemia · chills · diarrhoea · enterocolitis haemorrhagic · fever · gastrointestinal disorders · hyperthyroidism · hypertransaminaemia · hypothyroidism · infusion related reaction · myalgia · nausea · pancreatitis · respiratory disorders · skin reactions · vomiting
- ▶ **Uncommon** Diabetic ketoacidosis · eye inflammation · hepatic disorders · hypophysitis · nephritis · thyroiditis · type 1 diabetes mellitus
- ▶ **Frequency not known** Hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** **Immune-related reactions** Manufacturer advises most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature.

**Infusion-related reactions** Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** [EvGr] Females of childbearing potential should use effective contraception during treatment and for 4 months after last treatment. [M] See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** [EvGr] Avoid—limited information available. [M] See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** [EvGr] Avoid during treatment and for at least 4 months after last treatment—no information available. [M]
- **MONITORING REQUIREMENTS** [EvGr] Monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature. [M]
- **DIRECTIONS FOR ADMINISTRATION** [EvGr] For *intravenous infusion*, dilute to a concentration of 2–10 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes via an infusion pump. [M]
- **PRESCRIBING AND DISPENSING INFORMATION** Dostarlimab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under *Guidance on prescribing* p. 1; record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after dilution.
- **PATIENT AND CARER ADVICE** A patient card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website

**NICE decisions**

- ▶ **Dostarlimab** for previously treated advanced or recurrent endometrial cancer with high microsatellite instability or mismatch repair deficiency (March 2022) NICE TA779 Recommended

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Dostarlimab (Jemperli®)** as monotherapy for the treatment of adult patients with recurrent or advanced mismatch repair deficient or microsatellite instability-high endometrial cancer that has progressed on or following prior treatment with a platinum-containing regimen (March 2022) SMC No. SMC2404 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Polysorbates

- ▶ **Dostarlimab (non-proprietary)** ▼

Dostarlimab 50 mg per 1 ml Jemperli 500mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5,887.33 (Hospital only)

## Durvalumab

19-Jul-2021

● **DRUG ACTION** Durvalumab is a human monoclonal antibody that selectively binds to programmed cell death ligand-1 (PD-L1), blocking its interaction with the programmed death-1 (PD-1) receptor and with CD80, and thereby potentiating an immune response to tumour cells.

### ● INDICATIONS AND DOSE

#### Non-small cell lung cancer (initiated by a specialist)

##### ► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ<sup>®</sup>) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunotumourant antineoplastic drugs, such as durvalumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, durvalumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Durvalumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of durvalumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Cough · diarrhoea · dysphonia · dysuria · fever · flank pain · gastrointestinal discomfort · gastrointestinal disorders · hyperthyroidism · hypothyroidism · increased risk of infection · infusion related reaction · myalgia · night sweats · peripheral oedema · respiratory disorders · skin reactions · thyroiditis
  - **Uncommon** Adrenal insufficiency · glomerulonephritis · hepatic disorders · myopathy · nephritis · type 1 diabetes mellitus
  - **Rare or very rare** Diabetes insipidus · hypophysitis · hypopituitarism · myocarditis

**SIDE-EFFECTS, FURTHER INFORMATION** **Immune-related reactions** Manufacturer advises that most immune-related adverse reactions resolved with appropriate management, including initiation of immunosuppressive treatment and treatment modifications—consult product literature.

**Infusion-related reactions** Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, dilute to a concentration between 1 mg/mL and 15 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through a low-protein binding in-line filter (pore size 0.2 or 0.22 micron).
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
  - NICE decisions**
    - Durvalumab for treating locally advanced unresectable non-small-cell lung cancer after platinum-based chemoradiation (May 2019) NICE TA578 Recommended with restrictions
    - Scottish Medicines Consortium (SMC) decisions**
      - Durvalumab (Imfinzi<sup>®</sup>) for locally advanced, unresectable non-small cell lung cancer after platinum-based chemoradiation in adults (June 2019) SMC No. SMC2156 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates

##### ► Imfinzi (AstraZeneca UK Ltd) ▼

- Durvalumab 50 mg per 1 ml Imfinzi 120mg/2.4ml concentrate for solution for infusion vials | 1 vial [PoM] £592.00 (Hospital only)
- Imfinzi 500mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £2,466.00 (Hospital only)

## Elotuzumab

12-Apr-2019

- **DRUG ACTION** Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

### ● INDICATIONS AND DOSE

#### Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

##### ► BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature · secondary primary malignancies
  - CAUTIONS, FURTHER INFORMATION**
    - Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Chest pain · cough · decreased leucocytes · deep vein thrombosis · diarrhoea · fatigue · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · mood altered · night sweats · numbness · oropharyngeal pain · weight decreased
  - **Frequency not known** Second primary malignancy
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects reported when used in combination with lenalidomide and dexamethasone, bortezomib and dexamethasone, or pomalidomide and dexamethasone.

**Infusion-related reactions** Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

- ▶ **Empliviti** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Lotuzumab 300 mg** Empliviti 300mg powder for concentrate for solution for infusion vials | 1 vial [POM] £1,085.00 (Hospital only)

**Lotuzumab 400 mg** Empliviti 400mg powder for concentrate for solution for infusion vials | 1 vial [POM] £1,446.00 (Hospital only)

## Gemtuzumab ozogamicin

06-Nov-2020

- **DRUG ACTION** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

### ● INDICATIONS AND DOSE

#### CD33-positive acute myeloid leukaemia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) · haematopoietic stem cell transplantation (increased risk of hepatotoxicity) · pre-medication recommended to minimise adverse reactions

#### CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.
- **INTERACTIONS** → Appendix 1: gemtuzumab ozogamicin
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema · pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting
- ▶ **Frequency not known** Interstitial pneumonia

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions (including fatal cases) can occur during the first

24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.

### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.
- ▶ Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

### ● PRESCRIBING AND DISPENSING INFORMATION

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE**
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018) NICE TA545 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ Gemtuzumab ozogamicin (*Mylotarg*<sup>®</sup>) as combination therapy with daunorubicin and cytarabine for the treatment of patients age 15 years and above with previously untreated, *de novo* CD33-positive acute myeloid leukaemia, except acute promyelocytic leukaemia (October 2018) SMC No. SMC2089 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- ▶ **Mylotarg** (Pfizer Ltd) ▼

**Gemtuzumab ozogamicin 5 mg** Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £6,300.00 (Hospital only)

## Inotuzumab ozogamicin

09-Nov-2020

- **DRUG ACTION** Inotuzumab ozogamicin is a monoclonal antibody that binds to CD22-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

● **INDICATIONS AND DOSE**

**Monotherapy for relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (under expert supervision)**

- ▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Prior confirmed severe or ongoing sinusoidal obstruction syndrome

- **CAUTIONS** History of, or predisposition to QT-interval prolongation (e.g. electrolyte disturbances, concomitant use of drugs that prolong the QT interval) - patients may need pre-medication to minimise adverse reactions - patients undergoing haematopoietic stem cell transplantation (increased risk of hepatotoxicity)

**CAUTIONS, FURTHER INFORMATION**

- ▶ Pre-medication Manufacturer advises pre-medication with a corticosteroid, antipyretic and antihistamine prior to dosing in all patients and pre-medication to reduce uric acid levels and hydration in patients with a high tumour burden (increased risk of tumour lysis syndrome)—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · appetite decreased · ascites · bone marrow disorders · central nervous system haemorrhage · chills · constipation · decreased leucocytes · diarrhoea · fatigue · fever · gastrointestinal discomfort · haemorrhage · headache · hyperbilirubinaemia · hypersensitivity · hyperuricaemia · increased risk of infection · infusion related reaction · nausea · neutropenia · QT interval prolongation · sepsis · sinusoidal obstruction syndrome · stomatitis · thrombocytopenia · tumour lysis syndrome · vomiting
- ▶ **Frequency not known** Hepatotoxicity

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises interrupt treatment if an infusion related reaction occurs; depending on the severity, discontinuation of the infusion or administration of steroids and antihistamines should be considered (consult product literature); permanently discontinue treatment in severe or life-threatening infusion reactions.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 8 months after the last dose; male patients should use effective contraception during treatment and for at least 5 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least two months after the last dose—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution if bilirubin and transaminase levels are raised (limited information available); avoid in serious ongoing impairment.

**Dose adjustments** Manufacturer advises dose interruption or discontinuation according to bilirubin and transaminase levels.

- **PRE-TREATMENT SCREENING** Manufacturer advises baseline CD22 positivity of greater than 0% is required prior to initiating treatment.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection, bleeding and other effects of myelosuppression during treatment; dose reduction or interruption or discontinuation of treatment may be required—consult product literature.
- ▶ Manufacturer advises monitor for signs of infusion related-reactions during and for at least 1 hour after infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises ECG and electrolytes should be monitored prior to the start of treatment and periodically during treatment; monitor for increases in serum amylase and lipase.
- ▶ Manufacturer advises monitor for signs and symptoms of sinusoidal obstruction syndrome; liver tests should be monitored prior to and following each dose—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises resuscitation facilities should be available during administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Inotuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

**NICE decisions**

- ▶ **Inotuzumab ozogamicin for treating relapsed or refractory B-cell acute lymphoblastic leukaemia (September 2018)**  
NICE TA541 Recommended with restrictions

**Scottish Medicines Consortium (SMC) decisions**

- ▶ **Inotuzumab ozogamicin (*Besponsa*<sup>®</sup>) as monotherapy for the treatment of adults with relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (ALL). Adult patients with Philadelphia chromosome positive relapsed or refractory B cell precursor ALL should have failed treatment with at least 1 tyrosine kinase inhibitor (June 2018)**  
SMC No. 1328/18 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

## Ipilimumab

08-Apr-2022

- **DRUG ACTION** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

● **INDICATIONS AND DOSE****Melanoma (as monotherapy) (specialist use only)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

**Melanoma (in combination with nivolumab) (specialist use only) | Renal cell carcinoma (in combination with nivolumab) (specialist use only) | Non-small cell lung cancer (in combination with nivolumab and platinum-based chemotherapy) (specialist use only) | Malignant pleural mesothelioma (in combination with nivolumab) (specialist use only) | Colorectal cancer (in combination with nivolumab) (specialist use only)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: IPIILIMUMAB (YERVOY®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (JANUARY 2019)**

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in ipilimumab-treated patients reported to have corticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsies, and eliminating other viral, bacterial, and parasitic causes.

**MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)**

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as ipilimumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, ipilimumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Ipilimumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of ipilimumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- **CAUTIONS** For full details consult product literature.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cancer pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye discomfort · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache ·

- hepatic disorders · hypophysitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Adrenal hypofunction · alkalosis · allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hypersensitivity · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis aseptic · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis autoimmune · neutropenia · pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder · pulmonary oedema · renal failure · renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · stomatitis · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis
- ▶ **Rare or very rare** Myasthenia gravis · proteinuria · serous retinal detachment · thyroiditis
- ▶ **Frequency not known** Cytomegalovirus infection reactivation · haemophagocytic lymphohistiocytosis · solid organ transplant rejection

**SIDE-EFFECTS, FURTHER INFORMATION** A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if bilirubin greater than 3 times upper limit of normal range or if transaminases equal to or greater than 5 times upper limit of normal range (limited information available).
- **MONITORING REQUIREMENTS**
- ▶ **EvGr** Monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
- ▶ Monitor for electrolyte disturbances before and periodically during treatment.
- ▶ Monitor for signs and symptoms of gastrointestinal perforation, immune-related reactions, and cardiac and pulmonary reactions during treatment—consult product literature. Patients should be monitored for adverse reactions for at least 5 months after the last dose. 
- **DIRECTIONS FOR ADMINISTRATION** **EvGr** For intravenous infusion, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 90 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron). 
- **PRESCRIBING AND DISPENSING INFORMATION** Ipilimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; record the brand name and batch number after each administration.
 

Infusion-related side-effects have been reported. If mild or moderate reactions occur, premedication is recommended; treatment should be discontinued for severe reactions.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding

storage conditions outside refrigerator and after preparation of the infusion.

- **PATIENT AND CARER ADVICE** A patient information guide and alert card should be provided.

**Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

#### NICE decisions

- ▶ **Ipilimumab** for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268 Recommended with restrictions
- ▶ **Ipilimumab** for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319 Recommended with restrictions
- ▶ **Nivolumab in combination with ipilimumab** for treating advanced melanoma (July 2016) NICE TA400 Recommended with restrictions
- ▶ **Nivolumab with ipilimumab** for previously treated metastatic colorectal cancer with high microsatellite instability or mismatch repair deficiency (July 2021) NICE TA716 Recommended
- ▶ **Nivolumab with ipilimumab and chemotherapy** for untreated metastatic non-small-cell lung cancer (September 2021) NICE TA724 Not recommended
- ▶ **Nivolumab with ipilimumab** for untreated advanced renal cell carcinoma (March 2022) NICE TA780 Recommended
- ▶ **Scottish Medicines Consortium (SMC) decisions**
- ▶ **Ipilimumab (Yervoy<sup>®</sup>)** for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy (April 2013) SMC No. 779/12 Recommended
- ▶ **Ipilimumab (Yervoy<sup>®</sup>)** for the treatment of advanced (unresectable or metastatic) melanoma in adults (first-line use) (November 2014) SMC No. 997/14 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Ipilimumab 5 mg per 1 ml** Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £3,750.00 (Hospital only)  
**Yervoy 200mg/40ml concentrate** for solution for infusion vials | 1 vial [PoM] £15,000.00 (Hospital only)

## Isatuximab

10-Feb-2022

- **DRUG ACTION** Isatuximab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

#### INDICATIONS AND DOSE

##### Multiple myeloma (specialist use only)

##### ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10 mg/kg every week on days 1, 8, 15 and 22 of the first 28-day cycle, then 10 mg/kg every 2 weeks on days 1 and 15 of subsequent 28-day cycles until disease progression or unacceptable toxicity, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature

- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature · secondary primary malignancies

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Infusion-related reactions** Serious infusion-related reactions can occur and isatuximab should only be administered when appropriately trained staff and resuscitation

facilities are immediately available; manufacturer advises pre-medication with dexamethasone, an antihistamine, and an anti-pyretic—consult product literature.

Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated—consult product literature.

- ▶ **Secondary primary malignancies** Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with isatuximab and initiate treatment as indicated.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · atrial fibrillation · diarrhoea · dyspnoea · fatigue · increased risk of infection · infusion related reaction · nausea · neoplasms · neutropenia · vomiting · weight decreased
- ▶ **Uncommon** Anaphylactic reaction

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in female patients of childbearing potential during treatment and for 5 months after last treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breastfeeding only if clinically needed.

- **EFFECT ON LABORATORY TESTS** Manufacturer advises may cause false positive indirect Coombs test—consult product literature. Manufacturer advises may affect accuracy of both serum protein electrophoresis (SPE) and immunofixation (IFE) assays—consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of **Sarclisa<sup>®</sup>** has provided a *Prescriber Brochure*.

Isatuximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

#### NICE decisions

- ▶ **Isatuximab with pomalidomide and dexamethasone** for treating relapsed and refractory multiple myeloma (November 2020) NICE TA658 Recommended with restrictions

#### Scottish Medicines Consortium (SMC) decisions

- ▶ **Isatuximab (Sarclisa<sup>®</sup>)** in combination with pomalidomide and dexamethasone for the treatment of adult patients with relapsed and refractory multiple myeloma who have received at least two prior therapies, including lenalidomide and a proteasome inhibitor, and have demonstrated disease progression on the last therapy (April 2021) SMC No. SMC2303 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates, sucrose

- ▶ **Sarclisa** (Sanofi Genzyme) ▼  
**Isatuximab 20 mg per 1 ml** Sarclisa 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £2,534.69 (Hospital only)

Sarclisa 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £506.94 (Hospital only)

## Mogamulizumab

04-Jan-2022

- **DRUG ACTION** Mogamulizumab is a monoclonal antibody, which binds to the CCR4 receptor, thereby potentiating an immune response to cancer cells.

### ● INDICATIONS AND DOSE

#### **Mycosis fungoides (initiated by a specialist) | Sézary syndrome (initiated by a specialist)**

##### ► BY INTRAVENOUS INFUSION

- **Adult:** 1 mg/kg every week on days 1, 8, 15 and 22 of the first 28-day cycle, followed by 1 mg/kg every 2 weeks on days 1 and 15 of subsequent 28-day cycles, dose to be administered within 2 days of the scheduled day, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** Patients may need pre-medication to minimise infusion-related reactions · risk factors for cardiac disorders · risk of serious infection and/or viral reactivation such as hepatitis B · risk of transplant-related complications

### CAUTIONS, FURTHER INFORMATION

- **Pre-medication** Manufacturer advises pre-medication with an antihistamine and an anti-pyretic—consult product literature.
- **Hepatitis B infection** Manufacturer advises patients should be tested for hepatitis B infection before treatment initiation; expert advice on measures against hepatitis B reactivation should be sought for patients with positive hepatitis B serology.
- **Transplant-related complications** Manufacturer advises patients who receive an allogeneic haematopoietic stem cell transplant within 50 days of mogamulizumab treatment are at higher risk of complications, such as severe graft-versus-host disease, and should be closely monitored.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

- **Common or very common** Anaemia · constipation · diarrhoea · fatigue · fever · headache · hypothyroidism · increased risk of infection · infusion related reaction · leucopenia · nausea · neutropenia · peripheral oedema · sepsis · skin reactions · stomatitis · thrombocytopenia · vomiting
- **Uncommon** Hepatic disorders · tumour lysis syndrome
- **Frequency not known** Cardiomyopathy · myocardial infarction · polymyositis · severe cutaneous adverse reactions (SCARs) · viral infection reactivation

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in male and female patients of childbearing potential during treatment and for at least 6 months after last treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **PREGNANCY** Manufacturer advises avoid—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor electrolytes, hydration status and renal function, particularly in the first month of treatment—risk of tumour lysis syndrome.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion (Poteligeo®)*, dilute to a

concentration between 0.1 mg/mL to 3 mg/mL with Sodium Chloride 0.9%; give over at least 60 minutes through a low-protein binding 0.22 micron in-line filter. Resuscitation facilities should be available.

- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after preparation of the infusion.

### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

### NICE decisions

- **Mogamulizumab for previously treated mycosis fungoides and Sézary syndrome [in adults with mycosis fungoides] (December 2021)** NICE TA754 Recommended with restrictions
- **Mogamulizumab for previously treated mycosis fungoides and Sézary syndrome [in adults with Sézary syndrome] (December 2021)** NICE TA754 Recommended

### Scottish Medicines Consortium (SMC) decisions

- **Mogamulizumab (Poteligeo®) for the treatment of adult patients with mycosis fungoides or Sézary syndrome who have received at least one prior systemic therapy (June 2021)** SMC No. SMC2336 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

EXCIPIENTS: May contain Polysorbates

#### ► **Poteligeo** (Kyowa Kirin Ltd) ▼

**Mogamulizumab 4 mg per 1 ml** Poteligeo 20mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £1,329.00 (Hospital only)

## Nivolumab

01-Apr-2022

- **DRUG ACTION** Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

### ● INDICATIONS AND DOSE

**Melanoma (in combination with ipilimumab) (specialist use only) | Renal cell carcinoma (in combination with cabozantinib or ipilimumab) (specialist use only) | Non-small cell lung cancer (in combination with ipilimumab and platinum-based chemotherapy) (specialist use only) | Malignant pleural mesothelioma (in combination with ipilimumab) (specialist use only) | Colorectal cancer (in combination with ipilimumab) (specialist use only)**

#### ► BY INTRAVENOUS INFUSION

- **Adult:** (consult product literature)

**Melanoma (as monotherapy) (specialist use only) | Renal cell carcinoma (as monotherapy) (specialist use only)**

#### ► BY INTRAVENOUS INFUSION

- **Adult:** 240 mg every 2 weeks, for dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature, alternatively 480 mg every 4 weeks, for dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature

**Non-small cell lung cancer (as monotherapy) (specialist use only) | Urothelial carcinoma (as monotherapy) (specialist use only) | Squamous cell cancer of the head and neck (as monotherapy) (specialist use only) | Classical Hodgkin lymphoma (as monotherapy) (specialist use only) | Oesophageal squamous cell carcinoma (as monotherapy) (specialist use only)**

▶ BY INTRAVENOUS INFUSION

▶ Adult: 240 mg every 2 weeks, for dose delay or discontinuation due to side-effects and infusion-related reactions—consult product literature

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: NIVOLUMAB (OPDIVO®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)**

A European review of worldwide data concluded that nivolumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with nivolumab versus the risk of possible organ transplant rejection for each patient.

**MHRA/CHM ADVICE: NIVOLUMAB (OPDIVO®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (OCTOBER 2019)**

A European review of worldwide data identified cases suggestive of gastrointestinal CMV infection or reactivation in nivolumab-treated patients, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

**MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIQ®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARs) (JUNE 2021)**

Severe cutaneous adverse reactions (SCARs), including cases of Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN), have been reported in patients treated with immunostimulant antineoplastic drugs, such as nivolumab. Healthcare professionals are advised to monitor patients for suspected severe skin reactions and exclude other causes. Patients should be advised to seek urgent medical attention if severe skin reactions occur. If a SCAR is suspected, nivolumab therapy should be withheld and the patient referred to a specialist for diagnosis and treatment. Nivolumab should be permanently discontinued for any grade confirmed SJS or TEN, and for any grade 4 SCAR. Caution is recommended when considering the use of nivolumab in patients with a history of severe or life-threatening SCAR associated with other immunostimulant antineoplastic drugs.

- **CAUTIONS** Haematopoietic stem cell transplant in patients with classical Hodgkin lymphoma - rapidly progressing or aggressive disease (delayed onset of effect)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Haematopoietic stem cell transplant
- ▶ When used for classical Hodgkin lymphoma **[EvGr]** Nivolumab may increase the risk of severe and potentially fatal graft-versus-host disease when used in patients with classical Hodgkin lymphoma who have undergone allogeneic haematopoietic stem cell transplant, particularly if there is a history of graft-versus-host disease. **[M]**
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · fatigue · fever · gastrointestinal disorders · haemolytic anaemia · headache · hyperglycaemia · hypersensitivity · hypertension · hyperthyroidism · hypoglycaemia · hypothyroidism · increased risk of infection · inflammation · infusion related reaction · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · neutropenia · oedema · pain · respiratory disorders · skin reactions · stomatitis · thrombocytopenia · vomiting · weight decreased
- ▶ **Uncommon** Adrenal hypofunction · arrhythmias · arthritis · cardiac inflammation · chest pain · dehydration · diabetes mellitus · eosinophilia · eye inflammation · hepatic disorders · hypophysitis · hypopituitarism · metabolic acidosis · nephritis · pancreatitis · paresis · pericardial disorders · renal impairment · sarcoidosis · thyroiditis · vision blurred
- ▶ **Rare or very rare** Connective tissue disorders · demyelination · diabetic ketoacidosis · histiocytic necrotising lymphadenitis · myopathy · neuromuscular dysfunction · severe cutaneous adverse reactions (SCARs) · vasculitis
- ▶ **Frequency not known** Cytomegalovirus infection reactivation · haemophagocytic lymphohistiocytosis · hypoparathyroidism · meningitis aseptic · solid organ transplant rejection · tumour lysis syndrome

**SIDE-EFFECTS, FURTHER INFORMATION Immune-related reactions** Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

**Infusion-related reactions** Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of pre-medication according to local guidelines; discontinue treatment if severe infusion reactions occur.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (limited information available).
- **MONITORING REQUIREMENTS**
  - ▶ **[EvGr]** Monitor for signs and symptoms of immune-related reactions, and cardiac and pulmonary reactions during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.
  - ▶ Monitor for electrolyte disturbances before and periodically during treatment. **[M]**
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 60 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron).
- **PRESCRIBING AND DISPENSING INFORMATION** Nivolumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on

prescribing p. 1; record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card with each prescription.

**Driving and skilled tasks** Patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue.

- **NATIONAL FUNDING/ACCESS DECISIONS**

For full details see funding body website

#### NICE decisions

- ▶ Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE TA384 Recommended

- ▶ Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400 Recommended with restrictions

- ▶ Nivolumab for adjuvant treatment of completely resected melanoma with lymph node involvement or metastatic disease (March 2021) NICE TA684 Recommended

- ▶ Nivolumab for previously treated advanced renal cell carcinoma (updated November 2017) NICE TA417 Recommended

- ▶ Nivolumab with ipilimumab for untreated advanced renal cell carcinoma (March 2022) NICE TA780 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) in combination with ipilimumab and 2 cycles of platinum-based doublet chemotherapy for the first-line treatment of metastatic non-small cell lung cancer in adults whose tumours have no sensitising epidermal growth factor receptor mutations or anaplastic lymphoma kinase translocations (January 2022) SMC No. SMC2397 Not recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) for use as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults (August 2016) SMC No. 1120/16 Recommended with restrictions

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) in combination with ipilimumab for the treatment of advanced (unresectable or metastatic) melanoma in adults (November 2016) SMC No. 1187/16 Recommended with restrictions

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) as monotherapy for the adjuvant treatment of adults with melanoma with involvement of lymph nodes or metastatic disease who have undergone complete resection (December 2018) SMC No. SMC2112 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) as monotherapy for the treatment of advanced renal cell carcinoma after prior therapy in adults (June 2017) SMC No. 1188/16 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) in combination with ipilimumab for the first-line treatment of adult patients with intermediate/poor-risk advanced renal cell carcinoma (June 2019) SMC No. SMC2153 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) for the treatment of adult patients with relapsed or refractory classical Hodgkin lymphoma (CHL) after autologous stem cell transplant (ASCT) and treatment with brentuximab vedotin (July 2017) SMC No. 1240/17 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) as monotherapy, for the treatment of squamous cell cancer of the head and neck (SCCHN) in adults progressing on or after platinum-based therapy (September 2017) SMC No. 1261/17 Recommended with restrictions

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) as monotherapy for the treatment of locally advanced unresectable or metastatic urothelial carcinoma in adults after failure of prior platinum-containing therapy (January 2018) SMC No. 1285/18 Not recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) as monotherapy for the treatment of adult patients with unresectable advanced, recurrent or metastatic oesophageal squamous cell carcinoma after prior fluoropyrimidine and platinum-based combination chemotherapy (August 2021) SMC No. SMC2362 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) in combination with ipilimumab for the treatment of adults with mismatch repair deficient or microsatellite instability-high metastatic colorectal cancer who have been previously treated with fluoropyrimidine-based combination chemotherapy (December 2021) SMC No. SMC2394 Recommended

- ▶ Nivolumab (*Opdivo*<sup>®</sup>) in combination with ipilimumab for the first-line treatment of adult patients with unresectable malignant pleural mesothelioma (MPM) (February 2022) SMC No. SMC2385 Recommended

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

#### ▶ Nivolumab (Non-proprietary)

Nivolumab 10 mg per 1 ml *Opdivo* 120mg/12ml concentrate for solution for infusion vials | 1 vial [Pom] £1,317.00 (Hospital only)

#### ▶ *Opdivo* (Bristol-Myers Squibb Pharmaceuticals Ltd)

Nivolumab 10 mg per 1 ml *Opdivo* 40mg/4ml concentrate for solution for infusion vials | 1 vial [Pom] £439.00 (Hospital only)

*Opdivo* 100mg/10ml concentrate for solution for infusion vials | 1 vial [Pom] £1,097.00 (Hospital only)

*Opdivo* 240mg/24ml concentrate for solution for infusion vials | 1 vial [Pom] £2,633.00 (Hospital only)

11-Nov-2020

## Obinutuzumab

### ● INDICATIONS AND DOSE

**Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities | Treatment of previously untreated advanced follicular lymphoma | Treatment of follicular lymphoma in patients who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen**

► **BY INTRAVENOUS INFUSION**  
 ► Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** For obinutuzumab contra-indications, consult product literature.
- **CAUTIONS** For full details on the cautions of obinutuzumab, consult product literature.
- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Manufacturer advises patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Manufacturer also advises patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection (consult product literature).
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmias · chest pain · dyspepsia · eye erythema · gastrointestinal disorders · heart failure · hypertension · hyperuricaemia · lymph node pain · nasal complaints · skin reactions · squamous cell carcinoma · tumour lysis syndrome · urinary disorders · weight increased
  - **Frequency not known** Acute coronary syndrome · angina pectoris · chills · dizziness · dyspnoea · flushing · hypotension · nausea · viral infection reactivation
- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.
- **NATIONAL FUNDING/ACCESS DECISIONS** For full details see funding body website
- **NICE decisions**
  - **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343 Recommended with restrictions
  - **Obinutuzumab for untreated advanced follicular lymphoma (March 2018)** NICE TA513 Recommended with restrictions
  - **Obinutuzumab with bendamustine for treating follicular lymphoma after rituximab (May 2020)** NICE TA629 Recommended

### Scottish Medicines Consortium (SMC) decisions

- **Obinutuzumab (Gazyvaro<sup>®</sup>) in combination with bendamustine followed by obinutuzumab maintenance is indicated for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen (March 2017) SMC No. 1219/17 Recommended**
- **Obinutuzumab (Gazyvaro<sup>®</sup>) in combination with chemotherapy, followed by maintenance therapy in patients achieving a response, for the treatment of patients with previously untreated advanced follicular lymphoma (FL) (September 2018) SMC No. SMC2015 Not recommended**

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Gazyvaro** (Roche Products Ltd)  
**Obinutuzumab 25 mg per 1 ml** Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £3,312.00 (Hospital only)

## Panitumumab

21-Jul-2020

- **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

### ● INDICATIONS AND DOSE

**Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)**

- **BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: SEVERE SKIN REACTIONS

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

#### MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** Interstitial pulmonary disease · the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown
- **CAUTIONS** History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · asthenia · chest pain · chills · constipation · cough · dehydration · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · hair changes · headache · hyperglycaemia · hyperhidrosis · hypersensitivity (may be delayed) · hypertension · hypotension · increased risk of infection · insomnia · leucopenia · mucositis · nail disorders · nausea · oral disorders · pain · peripheral oedema · skin reactions · skin ulcer · tachycardia · vomiting · weight decreased
- ▶ **Uncommon** Angioedema · cyanosis · infusion related reaction · nasal dryness · onycholysis · respiratory disorders · severe cutaneous adverse reactions (SCARs)
- ▶ **Rare or very rare** Anaphylactic reaction

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.

- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 962.

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.

- **PRE-TREATMENT SCREENING** Evidence of non-mutated *RAS* status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

### ● MONITORING REQUIREMENTS

- ▶ Monitor for hypomagnesaemia.
- ▶ Monitor for hypocalcaemia.
- ▶ Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).

### ● NATIONAL FUNDING/ACCESS DECISIONS

For full details see funding body website

#### NICE decisions

- ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242 Not recommended
- ▶ **Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017)** NICE TA439 Recommended with restrictions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Vectibix** (Amgen Ltd)

**Panitumumab 20 mg per 1 ml** Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial **[PoM]** £1,517.16 (Hospital only)  
Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial **[PoM]** £379.29 (Hospital only)

## Pembrolizumab

01-Mar-2022

- **DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

### ● INDICATIONS AND DOSE

**Melanoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Urothelial carcinoma (specialist use only) | Classical Hodgkin lymphoma (specialist use only) | Head and neck squamous cell carcinoma (specialist use only) | Renal cell carcinoma (specialist use only) | Colorectal cancer (specialist use only) | Oesophageal carcinoma (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 200 mg every 3 weeks, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature, alternatively 400 mg every 6 weeks, for treatment interruption or discontinuation due to side-effects and infusion-related reactions—consult product literature

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: PEMBROLIZUMAB (KEYTRUDA®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)**

A European review of worldwide data concluded that pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

**MHRA/CHM ADVICE: ATEZOLIZUMAB (TECENTRIO®) AND OTHER IMMUNE-STIMULATORY ANTI-CANCER DRUGS: RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (SCARS) (JUNE 2021)**
