In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Antibacterials, switching from parenteral to oral treatment

EvGr The ongoing parenteral administration of an antibacterial should be reviewed within 48 hours of treatment initiation and a switch to oral treatment considered if appropriate. **⚠** In older children it may be possible to switch to an oral antibacterial; in neonates and infants this should be done more cautiously because of the relatively high incidence of bacteraemia and the possibility of variable oral absorption.

Antibacterials for prophylaxis

In most situations, only a short course of prophylactic antibacterial is needed. Longer-term antibacterial prophylaxis is appropriate in specific indications such as vesico-ureteric reflux.

Notifiable diseases

Registered medical practitioners must notify the Proper Officer at their local council or local health protection team of any patient(s) suspected of suffering from any of the diseases listed below; a notification form should be completed immediately. For further information on reporting notifiable diseases, see **Public Health England** guidance at: www.gov.uk/guidance/notifiable-diseases-and-causative-organisms-how-to-report.

Anthrax	Mumps
Botulism	Paratyphoid fever
Brucellosis	Plague
Cholera	Polioomyelitis, acute
Diarrhoea (infectious bloody)	Rabies
Diphtheria	Rubella
Encephalitis, acute	SARS
Food poisoning	Scarlet fever
Haemolytic uraemic syndrome	Smallpox
Haemorrhagic fever (viral)	Streptococcal disease (Group A, invasive)
Hepatitis, viral	Tetanus
Legionnaires' disease	Tuberculosis
Leprosy	Typhoid fever
Malaria	Typhus
Measles	Whooping cough
Meningitis	Yellow fever
Meningococcal septicaemia	

Note It is good practice for registered medical practitioners to also report other diseases that may present a significant risk to human health. These should be done under the category 'other significant disease'.

Sepsis, early management

EvGr Children identified as being at high risk of severe illness or death due to suspected sepsis should be given a broad-spectrum antibacterial at the maximum recommended dose without delay (ideally within one hour). Microbiological samples and blood cultures must be taken prior to administration of antibiotics; the prescription should be adjusted subsequently according to susceptibility results.

A thorough clinical examination should be carried out to identify sources of infection. If the cause of infection is identified, treat in line with local antibacterial guidance or susceptibility results.

Children aged up to 17 years with suspected community-acquired sepsis of any cause should be treated with ceftriaxone p. 343. If the child is already in hospital or is known to have previously been infected or colonised with ceftriaxone-resistant bacteria, an alternative antibiotic should be chosen following local guidelines. Children younger than 3 months should also receive an additional antibiotic that is active against *listeria* (such as ampicillin p. 368 or amoxicillin p. 366).

Neonates who are in hospital with suspected sepsis within 72 hours of birth, should be treated with intravenous benzylpenicillin sodium p. 364 and gentamicin p. 333. Community-acquired sepsis in neonates (who are more than 40 weeks corrected gestational age) should be treated with ceftriaxone, unless already receiving an intravenous calcium infusion. Neonates aged 40 weeks corrected gestational age or below, or receiving an intravenous calcium infusion, should receive cefotaxime p. 342, dosed according to age.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the child's lactate concentration, systolic blood pressure (in children over 12 years) and their risk of severe illness or death. Children at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Children with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury. **⚠**

Antibacterials, use for prophylaxis

16-Mar-2017

Rheumatic fever: prevention of recurrence

- Phenoxymethylpenicillin p. 365 by mouth or erythromycin p. 355 by mouth.

Invasive group A streptococcal infection: prevention of secondary cases

- Phenoxymethylpenicillin by mouth.

If child penicillin allergic, *either* erythromycin by mouth or azithromycin p. 352 by mouth [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Meningococcal meningitis: prevention of secondary cases

- Ciprofloxacin p. 377 by mouth [unlicensed indication] or rifampicin p. 396 by mouth or ceftriaxone p. 343 by intramuscular injection [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

***Haemophilus influenzae* type b disease: prevention of secondary cases**

- Rifampicin by mouth or (if rifampicin cannot be used) ceftriaxone by intramuscular injection, or by intravenous injection, or by intravenous infusion [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against *Haemophilus influenzae* type b disease.

Diphtheria in non-immune patients: prevention of secondary cases

- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 353) by mouth.

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment.

Pertussis, antibacterial prophylaxis

- Clarithromycin (or azithromycin or erythromycin) by mouth.

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Pneumococcal infection in asplenia or in patients with sickle-cell disease, antibacterial prophylaxis

- Phenoxymethylpenicillin by mouth.

If cover also needed for *H. influenzae* in child give amoxicillin p. 366 instead.

If penicillin-allergic, erythromycin by mouth.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

***Staphylococcus aureus* lung infection in cystic fibrosis, antibacterial prophylaxis**

- Primary prevention, flucloxacillin p. 373 by mouth. Secondary prevention, flucloxacillin by mouth.

Tuberculosis antibacterial prophylaxis in susceptible close contacts or those who have become tuberculin positive

- See *Close contacts* and *Treatment of latent tuberculosis* under Tuberculosis p. 392.

Animal and human bites, antibacterial prophylaxis

- Co-amoxiclav p. 370 alone (or clindamycin p. 351 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 826 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Gastro-intestinal procedures, antibacterial prophylaxis**Operations on stomach or oesophagus**

- Single dose of i/v gentamicin p. 333 or i/v cefuroxime p. 341 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 348 (or vancomycin p. 349) if high risk of methicillin-resistant *Staphylococcus aureus*.

Open biliary surgery

- Single dose of i/v cefuroxime + i/v metronidazole p. 358 or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum, and resections in inflammatory bowel disease, and appendectomy

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be

given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*.

Endoscopic retrograde cholangiopancreatography

- Single dose of i/v gentamicin p. 333 or oral or i/v ciprofloxacin p. 377.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 366 or i/v teicoplanin p. 348 (or vancomycin p. 349).

Percutaneous endoscopic gastrostomy or jejunostomy

- Single dose of i/v co-amoxiclav p. 370 or i/v cefuroxime p. 341.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus*.

Orthopaedic surgery, antibacterial prophylaxis

Closed fractures

- Single dose of i/v cefuroxime or i/v flucloxacillin p. 373 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of methicillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 358 (or i/v clindamycin p. 351 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of methicillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin and i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus*, use i/v

teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Obstetric surgery, antibacterial prophylaxis

Termination of pregnancy

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 381 postoperatively.

Infective endocarditis, antibacterial prophylaxis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008, updated 2016)

- Chlorhexidine mouthwash is **not** recommended for the prevention of infective endocarditis in at risk children undergoing dental procedures.

Antibacterial prophylaxis is **not routinely** recommended for the prevention of infective endocarditis in children undergoing the following procedures:

- ▶ dental;
- ▶ upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- ▶ genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- ▶ upper and lower gastro-intestinal tract.

While these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose children to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in children at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If children at risk of infective endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Children at risk of infective endocarditis should be:

- ▶ advised to maintain good oral hygiene;
- ▶ told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment, antibacterial prophylaxis

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not

require antibacterial prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibacterials when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibacterials to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibacterial prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, antibacterial therapy

Septicaemia (community-acquired)

- *Child 1 month–18 years*, aminoglycoside + amoxicillin p. 366 (or ampicillin p. 368) or cefotaxime p. 342 (or ceftriaxone p. 343) alone
- ▶ If pseudomonas or resistant micro-organisms suspected, use a broad-spectrum antipseudomonal beta-lactam antibacterial.
- ▶ If anaerobic infection suspected, add metronidazole p. 358.
- ▶ If Gram-positive infection suspected, add flucloxacillin p. 373 or vancomycin p. 349 (or teicoplanin p. 348).
- ▶ *Suggested duration of treatment* at least 5 days.

Septicaemia (hospital-acquired)

- *Child 1 month–18 years*, a broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 362, ticarcillin with clavulanic acid p. 363, imipenem with cilastatin p. 336, or meropenem p. 337)
- ▶ If pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis, add aminoglycoside.
- ▶ If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- ▶ If anaerobic infection suspected, add metronidazole to a broad-spectrum cephalosporin.
- ▶ *Suggested duration of treatment* at least 5 days.

Septicaemia related to vascular catheter

- Vancomycin (or teicoplanin)
- ▶ If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- ▶ Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 364 should be given before urgent transfer to hospital, so long as this does not delay the

transfer; cefotaxime may be an alternative in penicillin allergy; chloramphenicol p. 385 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins*, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 377, or rifampicin p. 396, or ceftriaxone may be used.

Septicaemia in neonates

- *Neonate less than 72 hours old*, benzylpenicillin sodium + gentamicin p. 333
- ▶ If Gram-negative septicaemia suspected, use benzylpenicillin sodium + gentamicin + cefotaxime; stop benzylpenicillin sodium if Gram-negative infection confirmed.
- ▶ *Suggested duration of treatment* usually 7 days.
- *Neonate more than 72 hours old*, flucloxacillin + gentamicin or amoxicillin (or ampicillin) + cefotaxime
- ▶ *Suggested duration of treatment* usually 7 days.

Cardiovascular system infections, antibacterial therapy

Endocarditis: initial 'blind' therapy

- Flucloxacillin p. 373 (or benzylpenicillin sodium p. 364 if symptoms less severe) + gentamicin p. 333
- *If cardiac prostheses present, or if penicillin-allergic, or if methicillin-resistant Staphylococcus aureus suspected*, vancomycin p. 349 + rifampicin p. 396 + gentamicin

Endocarditis caused by staphylococci

- Flucloxacillin
- ▶ Add rifampicin for at least 2 weeks in prosthetic valve endocarditis
- ▶ *Suggested duration of treatment* at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic or if methicillin-resistant Staphylococcus aureus*, vancomycin + rifampicin
- ▶ *Suggested duration of treatment* at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Endocarditis (native valve) caused by fully-sensitive streptococci e.g. viridans streptococci

- Benzylpenicillin sodium
- ▶ *Suggested duration of treatment* 4 weeks
- *Alternative if a large vegetation, intracardial abscess, or infected emboli are absent*, benzylpenicillin sodium + gentamicin
- ▶ *Suggested duration of treatment* 2 weeks
- *If penicillin-allergic*, vancomycin
- ▶ *Suggested duration of treatment* 4 weeks

Endocarditis (native valve) caused by less-sensitive streptococci

- Benzylpenicillin sodium + gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)
- *If aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin*, benzylpenicillin sodium
- ▶ *Suggested duration of treatment* 4 weeks
- *If penicillin-allergic or highly penicillin-resistant*, vancomycin (or teicoplanin p. 348) + gentamicin
- ▶ *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)

Endocarditis (prosthetic valve) caused by streptococci

- Benzylpenicillin sodium + gentamicin
- ▶ *Suggested duration of treatment* at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)
- *If penicillin-allergic or highly penicillin-resistant*, vancomycin (or teicoplanin) + gentamicin
- ▶ *Suggested duration of treatment* at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)

Endocarditis caused by enterococci (e.g. *Enterococcus faecalis*)

- Amoxicillin p. 366 (or ampicillin p. 368) + gentamicin
- ▶ If gentamicin-resistant, substitute gentamicin with streptomycin p. 334
- ▶ *Suggested duration of treatment* at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic or penicillin-resistant*, vancomycin (or teicoplanin) + gentamicin
- ▶ If gentamicin-resistant, substitute gentamicin with streptomycin
- ▶ *Suggested duration of treatment* at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingellaspecies* ('HACEK' micro-organisms)

- Amoxicillin (or ampicillin) + gentamicin
- ▶ *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- *If amoxicillin-resistant*, ceftriaxone p. 343 + gentamicin
- ▶ *Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, antibacterial therapy

Meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If *meningococcal disease* (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 364 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 342 may be an alternative in penicillin allergy; chloramphenicol p. 385 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 475, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

In hospital, if aetiology unknown:

- *Neonate and child 1–3 months*, cefotaxime (or ceftriaxone p. 343) + amoxicillin p. 366 (or ampicillin p. 368)
- ▶ Consider adding vancomycin p. 349 if prolonged or multiple use of other antibacterials in the last 3 months, or

if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci

- ▶ *Suggested duration of treatment* at least 14 days
- *Child 3 months–18 years* cefotaxime (or ceftriaxone)
- ▶ Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
- ▶ *Suggested duration of treatment* at least 10 days

Meningitis caused by group B streptococcus

- Benzylpenicillin sodium + gentamicin p. 333 or cefotaxime (or ceftriaxone) alone
- ▶ *Suggested duration of treatment* at least 14 days; stop gentamicin after 5 days

Meningitis caused by meningococci

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- ▶ *Suggested duration of treatment* 7 days.
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins*, chloramphenicol
- ▶ *Suggested duration of treatment* 7 days.

Meningitis caused by pneumococci

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
- ▶ If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- ▶ If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 396.
- ▶ *Suggested duration of antibacterial treatment* 14 days.

Meningitis caused by *Haemophilus influenzae*

- Cefotaxime (or ceftriaxone)
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ *Suggested duration of antibacterial treatment* 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins*, or *if micro-organism resistant to cefotaxime*, chloramphenicol
- ▶ Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- ▶ *Suggested duration of antibacterial treatment* 10 days.
- ▶ For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Meningitis caused by *Listeria*

- Amoxicillin (or ampicillin) + gentamicin
- ▶ *Suggested duration of treatment* 21 days.
- ▶ Consider stopping gentamicin after 7 days
- *If history of immediate hypersensitivity reaction to penicillin*, co-trimoxazole p. 378
- ▶ *Suggested duration of treatment* 21 days.

Diabetic foot infections, antibacterial therapy

13-Nov-2019

Diabetic foot infection

Diabetic foot infection is defined as any type of skin, soft tissue or bone infection below the ankle in children with diabetes. It includes cellulitis, paronychia, abscesses, myositis, tendonitis, necrotising fasciitis, osteomyelitis, and septic arthritis. It is defined clinically by the presence of at least 2 of the following: local swelling or induration, erythema, local tenderness or pain, local warmth, or purulent discharge.

For guidance on classification of infection severity, see NICE guideline: **Diabetic foot problems** (see *Useful resources*).

Treatment

[EvGr] Refer children immediately to acute services and inform the multidisciplinary foot care service if they have a limb-threatening or life-threatening diabetic foot problem, such as ulceration with fever or any signs of sepsis, ulceration with limb ischaemia, or gangrene.

Antibacterial treatment should be started as soon as possible if diabetic foot infection is suspected. Samples (such as soft tissue, bone sample, or deep swab) should be taken for microbiological testing before, or as close as possible to, the start of antibacterial treatment.

Offer an antibacterial taking into account the severity of infection, risk of complications, previous microbiological results, recent antibacterial use, and patient preferences. **[A]**

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

Reassessment

[EvGr] Reassess if symptoms worsen rapidly or significantly at any time, do not start to improve within 1–2 days of starting antibacterial treatment, or the patient becomes systemically very unwell or has severe pain out of proportion to the infection. Take into account other diagnoses (such as pressure sores, gout, or non-infected ulcers), signs and symptoms of a more serious illness (such as limb ischaemia, osteomyelitis, necrotising fasciitis, or sepsis), and previous antibacterial use.

Review the choice of antibacterial when microbiological results are available and change according to the results, using a narrower-spectrum antibacterial if appropriate. **[A]**

Choice of antibacterial therapy

[EvGr] Seek specialist advice if a diabetic foot infection is suspected or confirmed in children. **[A]**

Useful Resources

Diabetic foot problems: prevention and management. National Institute for Health and Care Excellence. NICE guideline 19. August 2015, updated October 2019. www.nice.org.uk/guidance/ng19

Choice of antibacterial therapy

No penicillin allergy

- Flucloxacillin p. 373

Penicillin allergy or intolerance

- Clarithromycin p. 353 (or azithromycin p. 352 or erythromycin p. 355)

If pseudomonas suspected

- Ciprofloxacin p. 377 (or an aminoglycoside)

For topical treatments, see *Otitis externa*, under Ear p. 741.

Otitis media

Acute otitis media is an inflammation in the middle ear associated with effusion and accompanied by an ear infection. Acute otitis media is commonly seen in children and is generally caused by viruses (respiratory syncytial virus and rhinovirus) or bacteria (*Haemophilus influenzae*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Moraxella catarrhalis*); both virus and bacteria often co-exist. For further information see *Acute otitis media* in Ear p. 741.

[EvGr] Antibacterial therapy should be offered to children with acute otitis media who are systemically very unwell, have signs and symptoms of a more serious illness, or those who are at high-risk of serious complications due to pre-existing comorbidities. Antibacterial therapy should also be considered if otorrhoea (discharge following perforation of the eardrum) is present, or in children under 2 years of age with bilateral otitis media. **[A]**

Choice of antibacterial therapy in children

No penicillin allergy

- *First line:* **[EvGr]** amoxicillin p. 366. **[A]**
- *Second line* (worsening symptoms despite 2 to 3 days of antibacterial treatment): **[EvGr]** co-amoxiclav p. 370. **[A]**

Penicillin allergy or intolerance

- *First line:* **[EvGr]** clarithromycin p. 353 or erythromycin p. 355 (preferred in pregnancy). **[A]**
- *Second line* (worsening symptoms despite 2 to 3 days of antibacterial treatment): **[EvGr]** Consult local microbiologist. **[A]**

Eye infections, antibacterial therapy

Purulent conjunctivitis

- Chloramphenicol p. 729 eye drops.

Congenital chlamydial conjunctivitis

- Erythromycin p. 355 (by mouth)
- ▶ *Suggested duration of treatment* 14 days

Congenital gonococcal conjunctivitis

- Cefotaxime p. 342 (or ceftriaxone p. 343)
- ▶ *Suggested duration of treatment* single dose.

Gastro-intestinal system infections, antibacterial therapy

Gastro-enteritis

Frequently self-limiting and may not be bacterial.

- Antibacterial not usually indicated.

Ear infections, antibacterial therapy

03-Sep-2018

Otitis externa

Otitis externa can be triggered by a bacterial infection caused by *Pseudomonas aeruginosa* or *Staphylococcus aureus*. Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

Campylobacter enteritis

Frequently self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin p. 353 (*or* azithromycin p. 352 *or* erythromycin p. 355)
- *Alternative*, ciprofloxacin p. 377
- ▶ Strains with decreased sensitivity to ciprofloxacin isolated frequently

Salmonella (non-typhoid)

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised children, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin *or* cefotaxime p. 342

Shigellosis

Antibacterial not indicated for mild cases.

- Azithromycin *or* ciprofloxacin
- *Alternatives if micro-organism sensitive*, amoxicillin p. 366 *or* trimethoprim p. 390

Typhoid fever

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime (*or* ceftriaxone p. 343)
- ▶ azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant micro-organisms
- *Alternative if micro-organism sensitive*, ciprofloxacin *or* chloramphenicol p. 385

Clostridioides difficile infection

Clostridioides difficile infection is caused by colonisation of the colon with *Clostridioides difficile* and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 368, amoxicillin, co-amoxiclav p. 370, second- and third-generation cephalosporins, clindamycin p. 351, and quinolones, but few antibacterials are free of this side-effect. Oral metronidazole p. 358 *or* oral vancomycin p. 349 are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

- *For first episode of mild to moderate infection*, oral metronidazole
- ▶ *Suggested duration of treatment* 10–14 days
- *For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in children intolerant of metronidazole*, oral vancomycin
- ▶ *Suggested duration of treatment* 10–14 days
- *For infection not responding to vancomycin, or for life-threatening infection, or in patients with ileus*, oral vancomycin + i/v metronidazole
- ▶ *Suggested duration of treatment* 10–14 days

Peritonitis

- A cephalosporin + metronidazole *or* amoxicillin + gentamicin p. 333 + metronidazole *or* piperacillin with tazobactam p. 362 alone

Peritonitis: peritoneal dialysis-associated

- Vancomycin (*or* teicoplanin p. 348) + ceftazidime p. 343 added to dialysis fluid *or* vancomycin added to dialysis fluid + ciprofloxacin by mouth
- ▶ *Suggested duration of treatment* 14 days *or* longer

Necrotising enterocolitis in neonates

- Benzylpenicillin sodium p. 364 + gentamicin + metronidazole *or* amoxicillin (*or* ampicillin) + gentamicin + metronidazole *or* amoxicillin (*or* ampicillin) + cefotaxime + metronidazole

Genital system infections, antibacterial therapy**Uncomplicated genital chlamydial infection, nongonococcal urethritis, and non-specific genital infection**

Contact tracing recommended.

- *Child under 12 years*, erythromycin p. 355
- ▶ *Suggested duration of treatment* 14 days
- *Child 12–17 years*, azithromycin p. 352 as a single dose *or* doxycycline p. 381 for 7 days
- *Alternatively*, erythromycin for 14 days

Gonorrhoea: uncomplicated

Contact tracing recommended. Consider chlamydia coinfection. Choice of antibacterial depends on locality where infection acquired.

- *Child under 12 years*, single-dose of ceftriaxone p. 343
- *Child 12–17 years*, single-dose of cefixime p. 342
- *Alternatively, if micro-organism sensitive*, single-dose of ciprofloxacin p. 377
- *Child 12–17 years with pharyngeal infection*, single-dose of ceftriaxone

Pelvic inflammatory disease

Contact tracing recommended.

- *Child 2–11 years*, erythromycin + metronidazole p. 358 + single-dose of i/m ceftriaxone
- ▶ *Suggested duration of treatment* 14 days (except i/m ceftriaxone)
- *Child 12–17 years*, doxycycline + metronidazole + single-dose of i/m ceftriaxone
- ▶ If severely ill, seek specialist advice.
- ▶ *Suggested duration of treatment* 14 days (except i/m ceftriaxone)

Syphilis

Contact tracing recommended.

- *Child under 12 years*, benzylpenicillin sodium p. 364 *or* procaine benzylpenicillin [unlicensed]
- ▶ *Suggested duration of treatment* 10 days

Early syphilis (infection of less than 2 years)

- *Child 12–17 years*, benzathine benzylpenicillin p. 363
- ▶ *Suggested duration of treatment* single-dose (repeat dose after 7 days for females in the third trimester of pregnancy)
- *Alternatively*, doxycycline *or* erythromycin
- ▶ *Suggested duration of treatment* 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)

- *Child 12–17 years*, benzathine benzylpenicillin.
- ▶ *Suggested duration of treatment* once weekly for 2 weeks
- *Alternatively*, doxycycline
- ▶ *Suggested duration of treatment* 28 days

Asymptomatic contacts of patients with infectious syphilis

- Child 12–17 years, doxycycline
- ▶ Suggested duration of treatment 14 days

Neonatal congenital syphilis

- Benzylpenicillin sodium
- ▶ Also consider treating neonates with suspected congenital syphilis whose mothers were treated inadequately for syphilis, or whose mothers were treated for syphilis in the 4 weeks before delivery, or whose mothers were treated with non-penicillin antibacterials for syphilis.
- ▶ Suggested duration of treatment 10 days.

Musculoskeletal system infections, antibacterial therapy

Osteomyelitis

For management of osteomyelitis below the ankle in individuals with diabetes mellitus, see Diabetic foot infections, antibacterial therapy p. 324.

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 373
- ▶ Consider adding fusidic acid p. 387 or rifampicin p. 396 for initial 2 weeks.
- ▶ Suggested duration of treatment 6 weeks for acute infection
- If penicillin-allergic, clindamycin p. 351
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ Suggested duration of treatment 6 weeks for acute infection
- If methicillin-resistant *Staphylococcus aureus* suspected, vancomycin p. 349 (or teicoplanin p. 348)
- ▶ Consider adding fusidic acid or rifampicin for initial 2 weeks.
- ▶ Suggested duration of treatment 6 weeks for acute infection

Septic arthritis

For management of septic arthritis below the ankle in individuals with diabetes mellitus, see Diabetic foot infections, antibacterial therapy p. 324.

Seek specialist advice if prostheses present.

- Flucloxacillin
- ▶ Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin
- ▶ Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If methicillin-resistant *Staphylococcus aureus* suspected, vancomycin (or teicoplanin)
- ▶ Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 342 (or ceftriaxone p. 343)
- ▶ Suggested duration of treatment 4–6 weeks (longer if infection complicated); treat gonococcal infection for 2 weeks).

Nose infections, antibacterial therapy

31-Oct-2017

Sinusitis (acute)

Acute sinusitis is generally triggered by a viral infection, although occasionally it may become complicated by a bacterial infection caused by *Streptococcus pneumoniae*,

Haemophilus influenzae, *Moraxella catharrhalis*, or *Staphylococcus aureus*. For further information see Sinusitis (acute) p. 750.

Treatment

EVG1 Antibacterial therapy should *only* be offered to children with acute sinusitis who are systemically very unwell, have signs and symptoms of a more serious illness, those who are at high-risk of complications due to pre-existing comorbidities, or whenever bacterial sinusitis is suspected.

▶ For further information see Sinusitis (acute) p. 750.

Choice of antibacterial therapy

No penicillin allergy

- First line:
 - ▶ **EVG1** Non-life threatening symptoms: phenoxymethylpenicillin p. 365.
 - ▶ Systemically very unwell, signs and symptoms of a more serious illness, or at high-risk of complications: co-amoxiclav p. 370. **⚠**
- Second line (worsening symptoms despite 2 or 3 days of antibiotic treatment):
 - ▶ **EVG1** Non-life threatening symptoms: co-amoxiclav.
 - ▶ Systemically very unwell, signs and symptoms of a more serious illness or at high-risk of complications: consult local microbiologist. **⚠**

Penicillin allergy or intolerance

- First line: **EVG1** clarithromycin p. 353, or doxycycline p. 381 (for children above 12 years old). **⚠**
- Second line (worsening symptoms despite 2 or 3 days of antibiotic treatment): **EVG1** Consult local microbiologist. **⚠**

Useful Resources

Sinusitis (acute): antimicrobial prescribing. National Institute for Health and Care Excellence. NICE guideline 79. October 2017.

www.nice.org.uk/guidance/ng79

Oral bacterial infections

Antibacterial drugs

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it

can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 358 may sometimes be helpful for the treatment of severe oral infections or oral infections.

Penicillins

Phenoxymethylpenicillin p. 365 is effective for dentoalveolar abscess.

Broad-spectrum penicillins

Amoxicillin p. 366 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Co-amoxiclav p. 370 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 339 and cefradine p. 339 have been used in the treatment of oral infections.

Tetracyclines

In children over 12 years of age, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 381 has a longer duration of action than tetracycline p. 384 or oxytetracycline p. 383 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin

Clindamycin p. 351 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin p. 355-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 360 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, antibacterial therapy

22-Oct-2019

Epiglottitis (*Haemophilus influenzae*)

- Cefotaxime p. 342 (or ceftriaxone p. 343)
- *If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 385*

Bronchiectasis (non-cystic fibrosis), acute exacerbation

Bronchiectasis is a persistent or progressive condition, caused by chronic inflammatory damage to the airways and is characterised by thick-walled, dilated bronchi. Signs and symptoms may range from intermittent expectoration and infection, to chronic cough, persistent daily production of sputum, bacterial colonisation, and recurrent infections. An acute exacerbation is defined as sustained deterioration of the child's signs and symptoms from their baseline and presents with worsening local symptoms, with or without increased wheeze, breathlessness or haemoptysis and may be accompanied by fever or pleurisy.

Treatment

EvGr Obtain a sputum sample and send for culture and susceptibility testing. Antibacterial therapy should be given to all children with an acute exacerbation. ⚠

For children receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

EvGr Refer children to hospital if they have signs or symptoms suggestive of a more serious illness such as cardiorespiratory failure or sepsis. ⚠

Reassessment

EvGr Reassess if symptoms worsen rapidly or significantly at any time and consider:

- Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
- Previous antibacterial use that may have led to resistance.

Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed. ⚠

Choice of antibacterial therapy

EvGr The recommended total duration of treatment is 7–14 days.

Treatment should be guided by the most recent sputum culture and susceptibility results when available.

Seek specialist advice for children whose symptoms are not improving with repeated courses, or who are resistant to, or cannot take oral antibacterials. ⚠

• Oral first line :

- ▶ **EvGr** Amoxicillin p. 366, clarithromycin p. 353, or doxycycline p. 381 (child over 12 years).
- ▶ Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or

atypical bacteria, or high risk of complications): co-amoxiclav p. 370, or ciprofloxacin p. 377 (on specialist advice). \blacktriangle

- **Intravenous first line** (severely unwell or unable to take oral treatment):
 - ▶ EvGr Co-amoxiclav, piperacillin with tazobactam p. 362, or ciprofloxacin (on specialist advice). \blacktriangle

Antibacterial prophylaxis

EvGr For children with repeated acute exacerbations, a trial of antibacterial prophylaxis may be given on specialist advice only. \blacktriangle

Cough, acute

Acute cough is usually self-limiting and often resolves within 3–4 weeks without antibacterials. It is most commonly caused by a viral upper respiratory tract infection, but can have other infective causes such as acute bronchitis or pneumonia, or non-infective causes such as interstitial lung disease or gastro-oesophageal reflux disease.

Treatment

EvGr Children and their parents, or carers should be advised that an acute cough is usually self-limiting and to manage symptoms using self-care treatments. These include honey (for children over the age of 1 year) and over-the-counter cough medicines containing expectorants or cough suppressants, however there is limited evidence to support the use of such products. For more information, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 198.

Children with an acute cough who are systemically very unwell should be offered immediate antibacterial treatment.

Do not routinely offer an antibacterial to treat an acute cough associated with an upper respiratory tract infection or acute bronchitis in children who are not systemically very unwell or at higher risk of complications.

Children with a pre-existing co-morbidity or young children who were born prematurely are considered to be at a higher risk of complications if they present with an acute cough. In these patients, the need for immediate antibacterial treatment should be considered based on the face-to-face clinical examination. \blacktriangle

For general advice to give to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

EvGr Seek specialist advice, or refer children with an acute cough to hospital if they have signs or symptoms of a more serious illness or condition. \blacktriangle

Reassessment

EvGr Reassess if symptoms worsen rapidly or significantly taking into account alternative diagnoses, signs or symptoms suggestive of a more serious condition, and previous antibacterial use which may have led to resistant bacteria. \blacktriangle

Choice of antibacterial therapy

EvGr The recommended duration of oral treatment is 5 days. \blacktriangle

- **First line:**
 - ▶ EvGr Amoxicillin. \blacktriangle
 - ▶ EvGr Alternative **first line** choices: clarithromycin, erythromycin p. 355, or doxycycline (child over 12 years). \blacktriangle
- Choice during pregnancy:
 - ▶ EvGr Amoxicillin or erythromycin. \blacktriangle

Pneumonia, community-acquired

Pneumonia is an acute infection of the lung parenchyma that presents with symptoms such as cough, chest pain, dyspnoea, and fever. It is classified as community-acquired if acquired outside of hospital.

Treatment

EvGr Offer an antibacterial taking into account the severity of signs or symptoms based on clinical judgement, risk of

complications, local antimicrobial resistance and surveillance data, recent antibacterial use, and recent microbiological test results.

Antibacterial treatment should be started as soon as possible and within 4 hours of establishing a diagnosis (within 1 hour if the child has suspected sepsis and meets any of the high risk criteria for this — see NICE guideline on sepsis at: www.nice.org.uk/guidance/ng51).

Consider referring children to hospital or seeking specialist paediatric advice on further investigation and management.

For children in hospital with community-acquired pneumonia, and severe signs or symptoms or a comorbidity, consider sending a sample for microbiological testing. \blacktriangle

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

Reassessment

EvGr Reassess if signs or symptoms do not improve or worsen rapidly or significantly, and consider other possible non-bacterial causes such as influenza.

If a sample has been sent for microbiological testing, review the choice of antibacterial and consider changing according to the results, using a narrower-spectrum antibacterial if appropriate.

Send a sample (such as a sputum sample) for testing if there is no improvement after antibacterial therapy and this has not already been done. \blacktriangle

Choice of antibacterial therapy

EvGr Treatment should be based on clinical judgement, suspected micro-organism, and if severe signs or symptoms guided by microbiological results when available.

Offer oral antibacterials to children who are able to take oral treatment and the severity of their condition does not require intravenous treatment.

Children under 1 month should be referred to a paediatric specialist. \blacktriangle

Non-severe

- **Oral first line** in children aged 1 month and over:
 - ▶ EvGr Amoxicillin p. 366.
 - ▶ Alternative in penicillin allergy or amoxicillin unsuitable (e.g. atypical pathogens suspected): clarithromycin p. 353, doxycycline p. 381 (child over 12 years), or erythromycin p. 355 (in pregnancy). \blacktriangle

Severe

- **Oral or Intravenous first line** in children aged 1 month and over:
 - ▶ EvGr Co-amoxiclav p. 370.
 - ▶ If atypical pathogens suspected: co-amoxiclav **with** clarithromycin **or** oral erythromycin (in pregnancy).
 - ▶ For alternative in penicillin allergy consult local microbiologist. \blacktriangle

Pneumonia, hospital-acquired

Pneumonia is an acute infection of the lung parenchyma that presents with symptoms such as cough, chest pain, dyspnoea, and fever. It is classified as hospital-acquired when it develops 48 hours or more after hospital admission.

Treatment

EvGr In children with signs or symptoms of pneumonia starting within 48 hours of hospital admission, follow the recommendations for children with community-acquired pneumonia. \blacktriangle

Offer an antibacterial taking into account:

- EvGr The severity of signs or symptoms;
- The number of days in hospital before onset of symptoms;
- The risk of complications;

- Local hospital and ward-based antimicrobial resistance data;
- Recent antibacterial use;
- Recent microbiological test results;
- Recent contact with health or social care settings;
- Risk of adverse effects such as *Clostridioides difficile* infection.

Antibacterial treatment should be started as soon as possible and within 4 hours of establishing a diagnosis (within 1 hour if the child has suspected sepsis and meets any of the high risk criteria for this — see NICE guideline on sepsis at: www.nice.org.uk/guidance/ng51).

A sample (for example, sputum sample, nasopharyngeal swab or tracheal aspirate) should be taken for microbiological testing. **⚠**

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers see Antibacterials, principles of therapy p. 318.

Reassessment

EVGr Reassess if symptoms do not improve or worsen rapidly or significantly.

When microbiological results are available, review the choice of antibacterial and change according to the results, using a narrower-spectrum antibacterial if appropriate.

Seek advice from a microbiologist if symptoms do not improve as expected with treatment, or multidrug-resistant bacteria are present. **⚠**

Choice of antibacterial therapy

EVGr For children with non-severe signs or symptoms and not at higher risk of resistance, treatment should be guided by microbiological results when available. For children with severe signs or symptoms or at higher risk of resistance, treatment should be based on specialist microbiological advice and local resistance data.

Higher risk of resistance includes signs or symptoms starting more than 5 days after hospital admission, relevant comorbidity, recent use of broad-spectrum antibacterials, colonisation with multidrug-resistant bacteria, and recent contact with a health or social care setting before the current admission.

In children with signs or symptoms of pneumonia starting within 3 to 5 days of hospital admission and not at higher risk of resistance, consider following the recommendations for community-acquired pneumonia for choice of antibacterial.

In children under 1 month obtain specialist microbiological advice and consider local resistance data. **⚠**

Non-severe signs or symptoms and not at higher risk of resistance

- **Oral first line** in children aged 1 month and over:
 - ▶ **EVGr** Co-amoxiclav.
 - ▶ Alternative in penicillin allergy or co-amoxiclav unsuitable: clarithromycin. Other options can be considered based on specialist microbiological advice and local resistance data. **⚠**

Severe signs or symptoms or at higher risk of resistance

- **Intravenous first line** in children aged 1 month and over:
 - ▶ **EVGr** Piperacillin with tazobactam p. 362, ceftazidime p. 343, or ceftriaxone p. 343.
 - ▶ If meticillin-resistant *Staphylococcus aureus* confirmed or suspected, add teicoplanin p. 348, or vancomycin p. 349, or linezolid p. 389 [unlicensed] (child over 3 months under specialist advice only if vancomycin cannot be used). **⚠**

Lung infection in cystic fibrosis (*Staphylococcus spp.*)

- Flucloxacillin p. 373
 - ▶ If child already taking flucloxacillin prophylaxis or if severe exacerbation, add fusidic acid p. 387 or rifampicin p. 396; use flucloxacillin at treatment dose

- If penicillin-allergic, clarithromycin (or azithromycin p. 352 or erythromycin) or clindamycin p. 351
 - ▶ Use clarithromycin only if micro-organism sensitive

Lung infection in cystic fibrosis (*Haemophilus influenzae*)

- Amoxicillin or a broad-spectrum cephalosporin
 - ▶ In severe exacerbation use a third-generation cephalosporin (e.g. cefotaxime p. 342)

Lung infection in cystic fibrosis (*Pseudomonas spp.*)

- Ciprofloxacin p. 377 + nebulised colistimethate sodium p. 375
 - ▶ For severe exacerbation, an antipseudomonal beta-lactam antibacterial + parenteral tobramycin p. 334

Skin infections, antibacterial therapy

22-Mar-2020

Impetigo

Impetigo is a contagious, superficial bacterial infection of the skin that affects all age groups, but it is more common in young children. Transmission occurs directly through close contact with an infected individual or indirectly via contaminated objects such as toys, clothing, or towels.

Impetigo can develop as a primary infection or as a secondary complication of pre-existing skin conditions such as eczema, scabies, or chickenpox. The two main clinical forms are non-bullous impetigo (most common form) and bullous impetigo. Non-bullous impetigo is characterised by thin-walled vesicles or pustules that rupture quickly, forming a golden-brown crust, while bullous impetigo is characterised by the presence of fluid-filled vesicles and blisters that rupture, leaving a thin, flat, yellow-brown crust.

Initial treatment

EVGr Patients, and if appropriate their family or carers, should be advised on good hygiene measures to reduce the spread of impetigo to other body areas and to other people.

In patients with **localised non-bullous impetigo** who are not systemically unwell or at high risk of complications, consider hydrogen peroxide 1% cream p. 814; if unsuitable (e.g. if impetigo is around the eyes), offer a topical antibacterial.

In patients with **widespread non-bullous impetigo** who are not systemically unwell or at high risk of complications, offer a topical or oral antibacterial. Take into account that both routes of administration are effective; any previous use of topical antibacterials that could have led to resistance; and the preferences of the patient and, their family or carers

(if appropriate), including the practicalities of administration (particularly to large areas).

In patients with **non-bullous impetigo** who are systemically unwell or at high risk of complications and in all patients with **bullous impetigo**, offer an oral antibacterial.

Combination treatment with a topical and oral antibacterial is not recommended. **A**

For other considerations such as advice to be given to patients, and if appropriate their family or carers, see Antibacterials, principles of therapy p. 318.

EvGr Refer patients to hospital if they have any signs or symptoms suggestive of a more serious condition or illness, or if they have widespread impetigo and are immunocompromised.

Consider referral to hospital or seeking specialist advice for patients who are systemically unwell, have a higher risk of complications, or if impetigo is difficult to treat (such as bullous impetigo (particularly in children aged under 1 year) or frequently recurrent impetigo). **A**

Reassessment and further treatment

EvGr Reassess if symptoms worsen rapidly or significantly at any time, or do not improve after completion of the treatment course. Take into consideration other possible diagnoses (such as herpes simplex infection), signs or symptoms suggesting a more serious illness or condition (such as cellulitis), and previous antibacterial use that might have led to resistance.

For patients whose impetigo is worsening or has not improved after treatment with hydrogen peroxide 1% cream, offer a topical antibacterial if the infection remains localised, or a topical or oral antibacterial if infection has become widespread.

Offer an oral antibacterial to patients whose impetigo is worsening or has not improved after completing a course of topical antibacterial.

For patients whose impetigo is worsening or has not improved after completing a course of topical or oral antibacterials, consider sending a skin swab for microbiological testing.

For patients with impetigo that recurs frequently, send a skin swab for microbiological testing and consider taking a nasal swab and starting treatment for decolonisation (using topical treatments and personal hygiene measures).

If a skin swab has been sent for microbiological testing, review the choice of antibacterial and change according to the results if symptoms are not improving, using a narrower-spectrum antibacterial if possible. **A**

Choice of antibacterial therapy

EvGr Treatment should be based on infection severity and number of lesions, suspected micro-organism, local antibacterial resistance data, and be guided by microbiological results if available. **A**

- **Topical first line** if hydrogen peroxide unsuitable or ineffective:
 - ▶ **EvGr** fusidic acid p. 387.
 - ▶ Alternative if fusidic acid resistance suspected or confirmed: mupirocin p. 776. **A**
- **Oral first line:**
 - ▶ **EvGr** Flucloxacillin p. 373.
 - ▶ Alternative if penicillin allergy or flucloxacillin unsuitable: clarithromycin p. 353 or erythromycin p. 355 (in pregnancy). **A**
- If methicillin-resistant *Staphylococcus aureus* (MRSA) infection suspected or confirmed: **EvGr** Consult local microbiologist. **A**

Cellulitis and erysipelas

Cellulitis and erysipelas are infections of the subcutaneous tissues, which usually result from contamination of a break in the skin. Both conditions are characterised by acute localised inflammation and oedema. Lesions are more

superficial in erysipelas and have a well-defined, raised margin.

For management of infection below the ankle in children with diabetes, see Diabetic foot infections, antibacterial therapy p. 324.

Treatment

EvGr Consider taking a swab for microbiological testing **only** if the skin is broken and there is risk of infection by an uncommon pathogen (for example, after a penetrating injury, exposure to water-born organisms, or an infection acquired outside the UK).

Drawing around the extent of the infection to monitor progress prior to initiating antibacterial treatment can also be considered, taking into account that redness may be less visible on darker skin tones.

Offer an antibacterial taking into account the severity of symptoms, site of infection, risk of uncommon pathogens, previous microbiological results from a swab, and the patient's methicillin-resistant *Staphylococcus aureus* (MRSA) status if known. **A**

For other considerations such as switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

EvGr Manage any underlying condition that may predispose to cellulitis or erysipelas, such as diabetes mellitus, venous insufficiency, eczema, and oedema.

Refer children to hospital if they have signs or symptoms suggestive of a more serious illness, such as orbital cellulitis, osteomyelitis, septic arthritis, necrotising fasciitis, or sepsis.

Consider referral to hospital or seeking specialist advice for patients who have lymphangitis, are severely unwell, are unable to take oral antibacterials, have infection near the eyes or nose, or that could be caused by an uncommon pathogen. **A**

Reassessment

EvGr Reassess if symptoms worsen rapidly or significantly at any time, do not improve within 2–3 days of starting an antibacterial, or the child becomes systemically very unwell, has severe pain out of proportion to the infection, or has redness or swelling spreading beyond the initial presentation (taking into account that some initial spreading may occur). Take into consideration other possible diagnoses (such as an inflammatory reaction to an insect bite or deep vein thrombosis), any underlying condition that may predispose to cellulitis or erysipelas, signs or symptoms suggesting a more serious illness, results from microbiological tests, and previous antibacterial use that might have led to resistance.

Consider taking a swab for testing if the skin is broken and this has not already been done.

If a swab has been sent for microbiological testing, review the choice of antibacterial and change according to the results if signs or symptoms are not improving, using a narrower-spectrum antibacterial if possible.

Consider referral to hospital or seeking specialist advice if the infection has spread and is not responding to oral antibacterials. **A**

Choice of antibacterial therapy

EvGr Treatment should be based on clinical assessment, infection severity, suspected micro-organism, and site of infection.

Offer oral antibacterials to children who are able to take oral treatment and the severity of their condition does not require intravenous treatment.

Consider referral to hospital or seeking specialist advice if bacteria are resistant to oral antibacterials, patients cannot take oral treatment, or have infection near the eyes or nose.

Antibacterial choice for children under 1 month should be based on specialist advice. **A**

First choice antibacterials in children aged 1 month and over

- **Oral or Intravenous first line :**
- ▶ **[EvGr]** Flucloxacillin p. 373.
- ▶ Alternative in penicillin allergy or if flucloxacillin unsuitable: co-amoxiclav p. 370 (**not** in penicillin allergy), clarithromycin p. 353, or oral erythromycin p. 355 (in pregnancy). **⚠**
- **Oral or Intravenous first line if infection near the eyes or nose :**
- ▶ **[EvGr]** Co-amoxiclav.
- ▶ Alternative in penicillin allergy or co-amoxiclav unsuitable: clarithromycin. If anaerobes suspected, **add** metronidazole p. 358. **⚠**

Alternative choice antibacterials for severe infection in children aged 1 month and over

- **Oral or Intravenous:**
- ▶ **[EvGr]** Co-amoxiclav, clindamycin p. 351, or intravenous cefuroxime p. 341.
- ▶ If methicillin-resistant *Staphylococcus aureus* confirmed or suspected, **add** intravenous vancomycin p. 349, intravenous teicoplanin p. 348, or linezolid p. 389 (specialist use only if vancomycin or teicoplanin cannot be used).
- ▶ Other antibacterials may be appropriate based on microbiological results and specialist advice. **⚠**

Staphylococcal scalded skin syndrome

- Flucloxacillin
- **Suggested duration of treatment** 7–10 days.
- **If penicillin-allergic**, clarithromycin (or azithromycin p. 352 or erythromycin)
- ▶ **Suggested duration of treatment** 7–10 days.

Animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 826 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries; assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

- Co-amoxiclav
- ▶ **If penicillin-allergic**, clindamycin

Surgical wound infection

- Flucloxacillin or co-amoxiclav

Paronychia or 'septic spots' in neonate

- Flucloxacillin
- ▶ If systemically unwell, add an aminoglycoside.

ANTIBACTERIALS > AMINOGLYCOSIDES**Aminoglycosides****Overview**

These include amikacin p. 332, gentamicin p. 333, neomycin sulfate p. 774, streptomycin p. 334, and tobramycin p. 334. All are bactericidal and active against some Gram-positive

and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 358 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Cystic fibrosis

A higher dose of parenteral aminoglycoside is often required in children with cystic fibrosis because renal clearance of the aminoglycoside is increased. Aminoglycosides have a role in the treatment of pseudomonas lung infections in cystic fibrosis. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and has largely superseded *multiple-daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children with endocarditis or burns of more than 20% of the total body surface area. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations

should be monitored in patients receiving parenteral aminoglycosides and **must** be determined in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Neonates

As aminoglycosides are eliminated principally via the kidney, neonatal treatment must reflect the changes in glomerular filtration that occur with increasing gestational and postnatal age. The *extended interval dose regimen* is used in neonates, and serum-aminoglycoside concentrations **must** be measured. In patients on single daily dose regimens it may become necessary to prolong the dose interval to more than 24 hours if the trough concentration is high.

Aminoglycosides (by injection)

● **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

● **CAUTIONS** Auditory disorder · care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) · conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) · if possible, dehydration should be corrected before starting an aminoglycoside · vestibular disorder · whenever possible, parenteral treatment should not exceed 7 days

● **SIDE-EFFECTS**

- ▶ **Common or very common** Tinnitus
- ▶ **Uncommon** Nausea · skin reactions · vomiting
- ▶ **Rare or very rare** Anaemia · azotaemia · bronchospasm · eosinophilia · fever · headache · hearing impairment · hypomagnesaemia · paraesthesia · renal impairment
- ▶ **Frequency not known** Confusion · lethargy · leucopenia · nephrotoxicity · thrombocytopenia · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Ototoxicity and nephrotoxicity are important side-effects to consider with aminoglycoside therapy. Nephrotoxicity occurs most commonly in patients with renal impairment

● **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

Monitoring If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

● **RENAL IMPAIRMENT** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

Dose adjustments If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well.

Monitoring Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

● **MONITORING REQUIREMENTS**

▶ Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.

Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and **must** be determined in obesity, if high doses are being given and in cystic fibrosis.

Serum aminoglycoside concentrations **must** be determined in neonates.

In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen.

Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.

- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

Amikacin

● **INDICATIONS AND DOSE**

Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 7.5 mg/kg every 12 hours, to be administered over 3–5 minutes
- ▶ Child 12–17 years: 7.5 mg/kg every 12 hours; increased to 7.5 mg/kg every 8 hours (max. per dose 500 mg every 8 hours) for up to 10 days, higher dose to be used in severe infection, to be administered over 3–5 minutes; maximum 15 g per course

Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: Initially 15 mg/kg once daily adjusted according to plasma-concentration monitoring, not to be used for endocarditis or meningitis, dose to be adjusted according to serum-amikacin concentration, intravenous injection to be administered over 3–5 minutes

Neonatal sepsis (extended interval dose regimen)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate: 15 mg/kg every 24 hours, intravenous injection to be administered over 3–5 minutes.

Neonatal sepsis (multiple daily dose regimen)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate: Loading dose 10 mg/kg, then 7.5 mg/kg every 12 hours, intravenous injection to be administered over 3–5 minutes.

Pseudomonas lung infection in cystic fibrosis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 10 mg/kg every 8 hours (max. per dose 500 mg every 8 hours), intravenous injection to be administered over 3–5 minutes

Acute pyelonephritis (once daily dose regimen) | Urinary tract infection (catheter-associated, once daily dose regimen)

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 3 months–15 years: Initially 15 mg/kg once daily, dose to be adjusted according to serum-amikacin concentration
- ▶ Child 16–17 years: Initially 15 mg/kg once daily (max. per dose 1.5 g once daily), dose to be adjusted

according to serum-amikacin concentration; maximum 15 g per course

DOSES AT EXTREMES OF BODY-WEIGHT

► To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

● UNLICENSED USE

► With intravenous use Dose for cystic fibrosis not licensed.

● **INTERACTIONS** → Appendix 1: aminoglycosides

● SIDE-EFFECTS

► **Uncommon** Superinfection

► **Rare or very rare** Albuminuria · arthralgia · balance impaired · hypotension · muscle twitching · tremor

► **Frequency not known** Apnoea · neuromuscular blockade · paralysis

● MONITORING REQUIREMENTS

► With intravenous use *Multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre. *Once daily dose regimen*: pre-dose ('trough') concentration should be less than 5 mg/litre.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use *For intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 30–60 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in the dosing advice provided.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

► **Amikacin (Non-proprietary)**

Amikacin (as Amikacin sulfate) 250 mg per 1 ml Amikacin 500mg/2ml solution for injection vials | 5 vial [PoM] £60.00 (Hospital only)

► **Amikin (Vianex S.A.)**

Amikacin (as Amikacin sulfate) 50 mg per 1 ml Amikin 100mg/2ml solution for injection vials | 5 vial [PoM] £10.33

F 332

19-Mar-2020

Gentamicin

● INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis

► BY INTRAVENOUS INFUSION

► **Child**: Initially 7 mg/kg, to be given in a once daily regimen (not suitable for endocarditis or meningitis), subsequent doses adjusted according to serum-gentamicin concentration

► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

► **Child 1 month–11 years**: 2.5 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

► **Child 12–17 years**: 2 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

Neonatal sepsis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► **Neonate up to 7 days**: 5 mg/kg every 36 hours, to be given in an extended interval dose regimen.

► **Neonate 7 days to 28 days**: 5 mg/kg every 24 hours, to be given in an extended interval dose regimen.

Pseudomonal lung infection in cystic fibrosis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► **Child**: 3 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

Bacterial meningitis and CNS infection (supplement to systemic therapy) (administered on expert advice)

► BY INTRATHECAL INJECTION, OR BY INTRAVENTRICULAR INJECTION

► **Neonate**: (consult local protocol).

► **Child**: Initially 1 mg daily, then increased if necessary to 5 mg daily, seek specialist advice

Acute pyelonephritis (once daily dose regimen) | Urinary tract infection (catheter-associated, once daily dose regimen)

► BY INTRAVENOUS INFUSION

► **Child 3 months–15 years**: Initially 7 mg/kg once daily, subsequent doses adjusted according to serum-gentamicin concentration

► **Child 16–17 years**: Initially 5–7 mg/kg once daily, subsequent doses adjusted according to serum-gentamicin concentration

DOSES AT EXTREMES OF BODY-WEIGHT

► With intramuscular use or intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

● **UNLICENSED USE** Gentamicin doses in BNF publications may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POTENTIAL FOR HISTAMINE-RELATED ADVERSE DRUG REACTIONS WITH SOME BATCHES (NOVEMBER 2017)

► With intramuscular use or intrathecal use or intravenous use Following reports that some batches of gentamicin sulphate active pharmaceutical ingredient (API) used to manufacture gentamicin may contain higher than expected levels of histamine, which is a residual from the manufacturing process, the MHRA advise to monitor patients for signs of histamine-related adverse reactions; particular caution is required in patients taking concomitant drugs known to cause histamine release, in children, and in patients with severe renal impairment.

● **INTERACTIONS** → Appendix 1: aminoglycosides

● **SIDE-EFFECTS** Antibiotic associated colitis · blood disorder · depression · encephalopathy · hallucination · hepatic reaction · neurotoxicity · peripheral neuropathy · seizure · stomatitis · vestibular damage

● MONITORING REQUIREMENTS

► With intravenous use in neonates Extended interval dose regimen in neonates: pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre if more than 3 doses administered); consider monitoring one hour ('peak') concentration in neonates with poor response to treatment, with oedema, with Gram-negative infection, or with birth-weight greater than 4.5 kg (consider increasing dose if 'peak' concentration less than 8 mg/litre in severe sepsis).

► With intravenous use Once daily dose regimen: pre-dose ('trough') concentration should be less than 1 mg/litre.

► With intramuscular use or intravenous use Multiple daily dose regimen: one hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre. Multiple daily dose regimen for endocarditis: one hour ('peak') serum concentration should be 3–5 mg/litre; pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin

concentration should be determined twice each week (more often in renal impairment). Multiple daily dose regimen for cystic fibrosis: one hour ('peak') serum concentration should be 8–12 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.

- ▶ With intrathecal use or intraventricular use Intrathecal/intraventricular injection: cerebrospinal fluid concentration should not exceed 10 mg/litre.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intrathecal use or intraventricular use For intrathecal or intraventricular injection, use preservative-free intrathecal preparations only.
- ▶ With intravenous use For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.
- ▶ When used by inhalation For nebulisation, dilute preservative-free preparation in 3 mL sodium chloride 0.9%. Administer after physiotherapy and bronchodilators.
- **PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in the dosing advice provided.
- ▶ With intrathecal use Only preservative-free intrathecal preparation should be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Gentamicin (Non-proprietary)**
- Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule [PoM] £36.28 DT = £36.28 (Hospital only)
- Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule [PoM] £11.25 DT = £11.25
- Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial [PoM] £11.25 DT = £11.25
- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.00 DT = £6.88 (Hospital only)
- Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 DT = £6.88 | 10 ampoule [PoM] £12.00
- ▶ **Cidomycin (Sanofi)**
- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin 80mg/2ml solution for injection vials | 5 vial [PoM] £6.88 DT = £6.88
- Cidomycin 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88 DT = £6.88

Infusion

- ▶ **Gentamicin (Non-proprietary)**
- Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags | 20 bag [PoM] £40.17-£44.19
- Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags | 20 bag [PoM] £122.58-£134.83
- Gentamicin 360mg/120ml infusion bags | 20 bag [PoM] £174.07-£191.48

Streptomycin

● INDICATIONS AND DOSE

Tuberculosis, resistant to other treatment, in combination with other drugs

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child: 15 mg/kg once daily (max. per dose 1 g)

Adjunct to doxycycline in brucellosis (administered on expert advice)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child: 5–10 mg/kg every 6 hours, total daily dose may alternatively be given in 2–3 divided doses

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

- **INTERACTIONS** → Appendix 1: aminoglycosides
- **SIDE-EFFECTS** Amblyopia · angioedema · Clostridioides difficile colitis · haemolytic anaemia · muscle weakness · ototoxicity · pancytopenia
- **RENAL IMPAIRMENT**
- Dose adjustments** Should preferably be avoided. If essential, use with great care and consider dose reduction.
- **MONITORING REQUIREMENTS**
- ▶ One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment).
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: powder for solution for injection

Tobramycin

16-Mar-2020

● INDICATIONS AND DOSE

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 6–17 years: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
- ▶ BY INHALATION OF POWDER
- ▶ Child 6–17 years: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

Pseudomonal lung infection in cystic fibrosis

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child: 8–10 mg/kg daily in 3 divided doses, to be given as a multiple daily dose regimen over 3–5 minutes
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 10 mg/kg once daily (max. per dose 660 mg), to be given over 30 minutes, subsequent doses adjusted according to serum-tobramycin concentration

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Pneumonia in hospital patients

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 2–2.5 mg/kg every 8 hours, to be given as a multiple daily dose regimen over 3–5 minutes
- ▶ Child 12–17 years: 1 mg/kg every 8 hours, to be given as a multiple daily dose regimen over 3–5 minutes; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, to be given in severe infections as a multiple daily dose regimen over 3–5 minutes, dose to be reduced back to 3 mg/kg as soon as clinically indicated
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 7 mg/kg, to be given as a once daily dose regimen, subsequent doses adjusted according to serum-tobramycin concentration

Neonatal sepsis

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 32 weeks corrected gestational age: 4–5 mg/kg every 36 hours, to be given as an extended interval dose regimen, intravenous injection to be given over 3–5 minutes.
- ▶ Neonate 32 weeks corrected gestational age and above: 4–5 mg/kg every 24 hours, to be given as an extended interval dose regimen, intravenous injection to be given over 3–5 minutes.

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 2 mg/kg every 12 hours, to be given as a multiple daily dose regimen.

► Neonate 7 days to 28 days: 2–2.5 mg/kg every 8 hours, to be given as a multiple daily dose regimen.

DOSES AT EXTREMES OF BODY-WEIGHT

► With intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

VANTOBRA[®] NEBULISER SOLUTION

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

► BY INHALATION OF NEBULISED SOLUTION

► Child 6–17 years: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

● CAUTIONS

► When used by inhalation Auditory disorder · conditions characterised by muscular weakness (may impair neuromuscular transmission) · history of prolonged previous or concomitant intravenous aminoglycosides (increased risk of ototoxicity) · renal impairment (limited information available) · severe haemoptysis (risk of further haemorrhage) · vestibular disorder

● **INTERACTIONS** → Appendix 1: aminoglycosides

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

► Rare or very rare Diarrhoea · dizziness

SPECIFIC SIDE-EFFECTS

► Common or very common

► When used by inhalation Dysphonia · malaise · respiratory disorder · sputum discolouration

► Uncommon

► When used by inhalation Cough

► Rare or very rare

► When used by inhalation Abdominal pain · aphonia · appetite decreased · asthenia · asthma · chest discomfort · drowsiness · ear disorder · ear pain · haemorrhage · hypoxia · increased risk of infection · lymphadenopathy · oral ulceration · pain · taste altered

► Frequency not known

► When used by inhalation Oropharyngeal pain

► With parenteral use Granulocytopenia · leucocytosis · nerve disorders · urine abnormalities

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises to monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops — discontinue treatment until serum concentration falls below 2 mg/litre.

● RENAL IMPAIRMENT

► When used by inhalation Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops — discontinue treatment until serum concentration falls below 2 mg/litre.

● MONITORING REQUIREMENTS

► With intravenous use *Extended interval dose regimen in neonates*: pre-dose ('trough') concentration should be less than 2 mg/litre.

► With intravenous use *Once daily dose regimen*: pre-dose ('trough') concentration should be less than 1 mg/litre. *Multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 10 mg/litre (8–12 mg/litre in cystic fibrosis); pre-dose ('trough') concentration should be less than 2 mg/litre.

► When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 20–60 minutes.

► When used by inhalation Other inhaled drugs should be administered before tobramycin.

● **PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in dosing advice provided.

● PATIENT AND CARER ADVICE

► When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

VANTOBRA[®] NEBULISER SOLUTION

Missed doses ► When used by inhalation Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► **Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)** NICE TA276
Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta276

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Tobramycin (Non-proprietary)**

ANTIBACTERIALS > CARBAPENEMS

Carbapenems

Overview

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** (imipenem with cilastatin below) and meropenem p. 337 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections caused by multiple-antibacterial resistant organisms (including septicæmia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections).

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp.*

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin** (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

Ertapenem

29-Apr-2020

● INDICATIONS AND DOSE

Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–12 years: 15 mg/kg every 12 hours; maximum 1 g per day
- ▶ Child 13–17 years: 1 g once daily

Diabetic foot infections of the skin and soft-tissue

▶ BY INTRAVENOUS INFUSION

- ▶ Child 13–17 years: 1 g once daily

● **CAUTIONS** CNS disorders—risk of seizures

● **INTERACTIONS** → Appendix 1: carbapenems

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · skin reactions
- ▶ **Uncommon** Faeces discoloured · headache · hot flush · hypertension · melaena
- ▶ **Frequency not known** Aggression · hallucination · psychiatric disorder

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● **RENAL IMPAIRMENT** Use with caution (risk of seizures); avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Invanz[®]), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Diabetic foot infections, antibacterial therapy p. 324, Gastro-intestinal system infections, antibacterial therapy p. 324, Respiratory system infections, antibacterial therapy p. 327.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Ertapenem (Non-proprietary)**

Ertapenem (as Ertapenem sodium) 1 gram Ertapenem 1g powder for concentrate for solution for infusion vials | 10 vial [PoM] [X] (Hospital only)

▶ **Invanz** (Merck Sharp & Dohme Ltd)

Ertapenem (as Ertapenem sodium) 1 gram Invanz 1g powder for solution for infusion vials | 1 vial [PoM] £31.65 DT = £31.65

Imipenem with cilastatin

29-Apr-2020

● **INDICATIONS AND DOSE**

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicæmia

▶ BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 20 mg/kg every 12 hours.

▶ Neonate 7 days to 20 days: 20 mg/kg every 8 hours.

▶ Neonate 21 days to 28 days: 20 mg/kg every 6 hours.

▶ Child 1–2 months: 20 mg/kg every 6 hours

▶ Child 3 months–17 years: 15 mg/kg every 6 hours (max. per dose 500 mg)

Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

▶ BY INTRAVENOUS INFUSION

▶ Child 3 months–17 years: 25 mg/kg every 6 hours (max. per dose 1 g)

Cystic fibrosis

▶ BY INTRAVENOUS INFUSION

▶ Child: 25 mg/kg every 6 hours (max. per dose 1 g)

DOSE EQUIVALENCE AND CONVERSION

▶ Dose expressed in terms of imipenem.

● **UNLICENSED USE** Not licensed for use in children under 1 year.

● **CAUTIONS** CNS disorders · epilepsy

● **INTERACTIONS** → Appendix 1: carbapenems

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · eosinophilia · nausea · skin reactions · thrombophlebitis · vomiting
- ▶ **Uncommon** Bone marrow disorders · confusion · dizziness · drowsiness · hallucination · hypotension · leucopenia · movement disorders · psychiatric disorder · seizure · thrombocytopenia · thrombocytosis
- ▶ **Rare or very rare** Agranulocytosis · anaphylactic reaction · angioedema · chest discomfort · colitis haemorrhagic · cyanosis · dyspnoea · encephalopathy · flushing · focal tremor · gastrointestinal discomfort · haemolytic anaemia · headache · hearing loss · hepatic disorders · hyperhidrosis ·

hyperventilation · increased risk of infection · myasthenia gravis aggravated · oral disorders · palpitations · paraesthesia · polyarthralgia · polyuria · pseudomembranous enterocolitis · renal impairment · severe cutaneous adverse reactions (SCARs) · spinal pain · tachycardia · taste altered · tinnitus · tongue discoloration · tooth discolouration · urine discoloration · vertigo

▶ **Frequency not known** Agitation

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Present in milk but unlikely to be absorbed.

● **RENAL IMPAIRMENT** Clinical data are insufficient to recommend dosing for children with impairment (serum creatinine greater than 2 mg/dl)—in *adults*, manufacturer advises reduce dose (consult product literature).

● **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Imipenem with cilastatin (Non-proprietary)**

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 10 vial [POM] £130.30

▶ **Primaxin I.V. (Merck Sharp & Dohme Ltd)**

Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Primaxin IV 500mg powder for solution for infusion vials | 1 vial [POM] £12.00

▶ Child 12–17 years: 2 g every 8 hours

Meningitis

▶ BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 40 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 40 mg/kg every 8 hours.

▶ Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours

▶ Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours

▶ Child 12–17 years: 2 g every 8 hours

● **UNLICENSED USE** Not licensed for use in children under 3 months.

● **INTERACTIONS** → Appendix 1: carbapenems

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · diarrhoea · headache · inflammation · nausea · pain · skin reactions · thrombocytosis · vomiting

▶ **Uncommon** Agranulocytosis · antibiotic associated colitis · eosinophilia · haemolytic anaemia · increased risk of infection · leucopenia · neutropenia · paraesthesia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · thrombophlebitis

▶ **Rare or very rare** Seizure

● **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).

● **RENAL IMPAIRMENT**

Dose adjustments Use normal dose every 12 hours if estimated glomerular filtration rate 26–50 mL/minute/1.73 m².

Use half normal dose every 12 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m².

Use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function—risk of hepatotoxicity.

● **EFFECT ON LABORATORY TESTS** Positive Coombs' test.

● **DIRECTIONS FOR ADMINISTRATION** *Intravenous injection* to be administered over 5 minutes.

Displacement value may be significant when reconstituting injection, consult local guidelines. For *intravenous infusion*, dilute reconstituted solution further to a concentration of 1–20 mg/mL in Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Meropenem

06-Aug-2018

● **INDICATIONS AND DOSE**

Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicaemia

▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

▶ Neonate up to 7 days: 20 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 20 mg/kg every 8 hours.

▶ Child 1 month–11 years (body-weight up to 50 kg): 10–20 mg/kg every 8 hours

▶ Child 1 month–11 years (body-weight 50 kg and above): 0.5–1 g every 8 hours

▶ Child 12–17 years: 0.5–1 g every 8 hours

Severe aerobic and anaerobic Gram-positive and Gram-negative infections

▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

▶ Neonate up to 7 days: 40 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 40 mg/kg every 8 hours.

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

▶ BY INTRAVENOUS INFUSION

▶ Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours

▶ Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours

ANTIBACTERIALS > CEPHALOSPORINS

Cephalosporins

Overview

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 342 and ceftriaxone p. 343 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 342, cefotaxime, ceftazidime p. 343, ceftriaxone, or cefuroxime p. 341 can be used with caution; cefaclor p. 340, cefadroxil below, cefalexin p. 339, and cefradine p. 339 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefradine, and cefadroxil and the 'second generation' cephalosporin, cefaclor have a similar antimicrobial spectrum. They are useful for urinary-tract infections, respiratory-tract infections, otitis media, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and should be avoided in neonates with unconjugated hyperbilirubinaemia, hypoalbuminaemia, acidosis or impaired bilirubin binding.

Cephalosporins

- **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · eosinophilia · headache · leucopenia · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting · vulvovaginal candidiasis
 - ▶ **Uncommon** Anaphylactic reaction · pseudomembranous enterocolitis
 - ▶ **Rare or very rare** Agranulocytosis · angioedema · nephritis tubulointerstitial (reversible) · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Haemolytic anaemia
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
 - ▶ Cross-sensitivity with other beta-lactam antibacterials. About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of **immediate hypersensitivity** to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs' test.

ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

Cefadroxil

● INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

▶ BY MOUTH

▶ Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily

▶ Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily

Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

▶ BY MOUTH

▶ Child 6–17 years (body-weight 40 kg and above): 1 g once daily

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- ▶ **Common or very common** Dyspepsia · glossitis
- ▶ **Uncommon** Fungal infection
- ▶ **Rare or very rare** Arthralgia · drug fever · fatigue · hepatic disorders · insomnia · nervousness · serum sickness-like reaction
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 9

▶ **Cefadroxil (Non-proprietary)**

Cefadroxil (as Cefadroxil monohydrate) 500 mg Cefadroxil 500mg capsules | 20 capsule **[PoM]** £22.38 DT = £6.45

Cefalexin

(Cephalexin)

● INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

► BY MOUTH

- Neonate up to 7 days: 25 mg/kg twice daily (max. per dose 125 mg).
- Neonate 7 days to 20 days: 25 mg/kg 3 times a day (max. per dose 125 mg).
- Neonate 21 days to 28 days: 25 mg/kg 4 times a day (max. per dose 125 mg).

- Child 1–11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- Child 1–4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- Child 5–11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- Child 12–17 years: 500 mg 2–3 times a day

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

► BY MOUTH

- Child 1 month–11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
- Child 12–17 years: 1–1.5 g 3–4 times a day

Prophylaxis of recurrent urinary-tract infection

► BY MOUTH

- Child 3 months–15 years: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- Child 16–17 years: 125 mg once daily, dose to be taken at night, alternatively 500 mg for 1 dose, following exposure to a trigger

Acute pyelonephritis | Urinary-tract infection (catheter-associated)

► BY MOUTH

- Child 3–11 months: 12.5 mg/kg twice daily for 7 to 10 days, alternatively 125 mg twice daily; increased if necessary to 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- Child 1–4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day for 7 to 10 days; increased if necessary to 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- Child 5–11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day for 7 to 10 days; increased if necessary to 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day), increased dose used in severe infections
- Child 12–17 years: 500 mg 2–3 times a day for 7 to 10 days; increased to 1–1.5 g 3–4 times a day, increased dose used in severe infections

Lower urinary-tract infection in pregnancy

► BY MOUTH

- Child 12–17 years: 500 mg twice daily for 7 days

Lower urinary-tract infection

► BY MOUTH

- Child 3–11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily for 3 days
- Child 1–4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day for 3 days
- Child 5–11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day for 3 days
- Child 12–15 years: 500 mg twice daily for 3 days

- **UNLICENSED USE** E V G R Cefalexin is used for prophylaxis of recurrent urinary-tract infection, A but is not licensed for this indication.
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Agitation · arthrititis · confusion · fatigue · fungal infection · gastrointestinal discomfort · genital pruritus · hallucination · hepatitis (transient) · hypersensitivity · jaundice cholestatic (transient) · joint disorders · vaginal discharge
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose in moderate impairment.

Cefaclor● **INDICATIONS AND DOSE****Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1–11 months: 20 mg/kg daily in 3 divided doses, alternatively 62.5 mg 3 times a day
- ▶ Child 1–4 years: 20 mg/kg daily in 3 divided doses, alternatively 125 mg 3 times a day
- ▶ Child 5–11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
- ▶ Child 12–17 years: 250 mg 3 times a day; maximum 4 g per day
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1–11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
- ▶ Child 1–4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
- ▶ Child 5–11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily
- ▶ Child 12–17 years: 500 mg 3 times a day; maximum 4 g per day

Pneumonia

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child 12–17 years: 750 mg every 12 hours, dose to be taken with food

Lower urinary-tract infections

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 375 mg every 12 hours, dose to be taken with food

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1–11 months: 125 mg every 8 hours
- ▶ Child 1–6 years: 250 mg 3 times a day
- ▶ Child 7–17 years: 500 mg 3 times a day

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Akathisia · anxiety · aplastic anaemia · arthralgia · arthritis · asthenia · colitis · confusion · drowsiness · dyspnoea · fever · fungal infection · genital pruritus · hallucination · hepatitis (transient) · hypersensitivity · insomnia · jaundice cholestatic (transient) · lymphadenopathy · lymphocytosis · muscle tone increased · oedema · paraesthesia · proteinuria · syncope · vasodilation
- **SIDE-EFFECTS, FURTHER INFORMATION** Cefaclor is associated with protracted skin reactions, especially in children.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
Dose adjustments No dose adjustment required.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cefuroxime

F 338
21-May-2020

● INDICATIONS AND DOSE

Susceptible infections due to Gram-positive and Gram-negative bacteria

- ▶ BY MOUTH
 - ▶ Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
 - ▶ Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
 - ▶ Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
 - ▶ Neonate up to 7 days: 25 mg/kg every 12 hours, increased if necessary to 50 mg/kg every 12 hours, increased dose used in severe infection.

- ▶ Neonate 7 days to 20 days: 25 mg/kg every 8 hours, increased if necessary to 50 mg/kg every 8 hours, increased dose used in severe infection.

- ▶ Neonate 21 days to 28 days: 25 mg/kg every 6 hours, increased if necessary to 50 mg/kg every 6 hours, increased dose used in severe infection.

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis

Cellulitis | Erysipelas

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
 - ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased if necessary up to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g)

Lyme disease

- ▶ BY MOUTH
 - ▶ Child 3 months-11 years: 15 mg/kg twice daily (max. per dose 500 mg) for 14–21 days (for 28 days in Lyme arthritis)
 - ▶ Child 12-17 years: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

Surgical prophylaxis

- ▶ INITIALLY BY INTRAVENOUS INJECTION
 - ▶ Child: 50 mg/kg (max. per dose 1.5 g), to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 30 mg/kg every 8 hours (max. per dose

750 mg) if required for up to 3 doses (for high-risk procedures)

Urinary-tract infection (lower)

- ▶ BY MOUTH
 - ▶ Child (body-weight up to 40 kg): 15 mg/kg twice daily (max. per dose 250 mg)
 - ▶ Child (body-weight 40 kg and above): 250 mg twice daily

Urinary tract infection (catheter-associated)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
 - ▶ Child 3 months-15 years: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection
 - ▶ Child 16-17 years: 0.75–1.5 g every 6–8 hours

Acute pyelonephritis

- ▶ BY MOUTH
 - ▶ Child (body-weight up to 40 kg): 15 mg/kg twice daily (max. per dose 250 mg)
 - ▶ Child (body-weight 40 kg and above): 250 mg twice daily
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
 - ▶ Child 3 months-15 years: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection
 - ▶ Child 16-17 years: 0.75–1.5 g every 6–8 hours

- **UNLICENSED USE**  Cefuroxime is used for the treatment of cellulitis,  but the dose increase is not licensed for this indication.

 Cefuroxime is used for the treatment of erysipelas,  but the dose increase is not licensed for this indication. Not licensed for treatment of Lyme disease in children under 12 years. Duration of treatment in Lyme disease is unlicensed.

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection
- ▶ **Frequency not known** Drug fever

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
 - ▶ With parenteral use Gastrointestinal disorder
 - ▶ **Frequency not known**
 - ▶ With oral use Hepatic disorders · Jarisch-Herxheimer reaction · serum sickness
 - ▶ With parenteral use Cutaneous vasculitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

● RENAL IMPAIRMENT

Dose adjustments Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intramuscular use or intravenous use Single doses over 750 mg should be administered by the intravenous route only.
- ▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Lyme disease p. 391, Skin infections, antibacterial therapy p. 329, Urinary-tract infections p. 400.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

Cefixime**● INDICATIONS AND DOSE****Acute infections due to sensitive Gram-positive and Gram-negative bacteria**

▶ BY MOUTH

- ▶ Child 6–11 months: 75 mg daily
- ▶ Child 1–4 years: 100 mg daily
- ▶ Child 5–9 years: 200 mg daily
- ▶ Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily

Uncomplicated gonorrhoea

▶ BY MOUTH

- ▶ Child 12–17 years: 400 mg for 1 dose

- **UNLICENSED USE** Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

- **INTERACTIONS** → Appendix 1: cephalosporins

- **SIDE-EFFECTS** Acute kidney injury · arthralgia · drug fever · dyspepsia · dyspnoea · face oedema · flatulence · genital pruritus · hyper eosinophilia · jaundice · serum sickness-like reaction · thrombocytosis

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

Cefixime 200 mg Suprax 200mg tablets | 7 tablet [PoM] £13.23 DT = £13.23

Cefotaxime

F 338

● INDICATIONS AND DOSE**Uncomplicated gonorrhoea**

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 12–17 years: 500 mg for 1 dose

Severe exacerbations of *Haemophilus influenzae* infection in cystic fibrosis

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child: 50 mg/kg every 6–8 hours; maximum 12 g per day

Congenital gonococcal conjunctivitis

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 100 mg/kg (max. per dose 1 g) for 1 dose.

Infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis | *Haemophilus epiglottitis*

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours.

- ▶ Neonate 7 days to 20 days: 25 mg/kg every 8 hours.

- ▶ Neonate 21 days to 28 days: 25 mg/kg every 6–8 hours.

- ▶ Child: 50 mg/kg every 8–12 hours

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Meningitis

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

- ▶ Neonate 21 days to 28 days: 50 mg/kg every 6–8 hours.

- ▶ Child: 50 mg/kg every 6 hours; maximum 12 g per day

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years: 50 mg/kg for 1 dose
- ▶ Child 12–17 years: 1 g for 1 dose

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- **Uncommon** Drug fever · Jarisch-Herxheimer reaction · renal impairment · seizure

- ▶ **Frequency not known** Arrhythmia (following rapid injection) · bronchospasm · encephalopathy · fungal infection · hepatic disorders

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

● RENAL IMPAIRMENT

Dose adjustments Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Displacement value may be significant, consult local guidelines. For intermittent *intravenous infusion* dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Ceftazidime

15-Jun-2018

● INDICATIONS AND DOSE

Pseudomonal lung infection in cystic fibrosis

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child: 50 mg/kg every 8 hours; maximum 9 g per day

Febrile neutropenia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 50 mg/kg every 8 hours; maximum 6 g per day

Meningitis

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 24 hours.

- ▶ Neonate 7 days to 20 days: 50 mg/kg every 12 hours.

- ▶ Neonate 21 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 8 hours; maximum 6 g per day

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 25 mg/kg every 24 hours.
- ▶ Neonate 7 days to 20 days: 25 mg/kg every 12 hours.
- ▶ Neonate 21 days to 28 days: 25 mg/kg every 8 hours.

- ▶ Child: 25 mg/kg every 8 hours; maximum 6 g per day

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 24 hours.
- ▶ Neonate 7 days to 20 days: 50 mg/kg every 12 hours.
- ▶ Neonate 21 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 8 hours; maximum 6 g per day

Chronic *Burkholderia cepacia* infection in cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child: 1 g twice daily

- **UNLICENSED USE** Nebulised route unlicensed.

- **INTERACTIONS** → Appendix 1: cephalosporins

● SIDE-EFFECTS

- ▶ **Common or very common** Thrombocytosis · thrombophlebitis
- ▶ **Uncommon** Antibiotic associated colitis · fungal infection
- ▶ **Rare or very rare** Acute kidney injury

- ▶ **Frequency not known** Coma · encephalopathy · jaundice · lymphocytosis · myoclonus · neurological effects · paraesthesia · seizure · taste altered · tremor

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● RENAL IMPAIRMENT

Dose adjustments Manufacturer advises reduce dose if creatinine clearance 50 mL/minute or less—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.

- ▶ With intravenous use Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute reconstituted solution further to a concentration of not more than 40 mg/mL in Glucose 5% or Glucose 10% or Sodium chloride 0.9%; give over 20–30 minutes.
- ▶ When used by inhalation For nebulisation, dissolve dose in 3 mL of water for injection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Ceftriaxone

22-May-2020

● INDICATIONS AND DOSE

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- ▶ Neonate 15 days to 28 days: 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

continued →

- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- ▶ Child 12–17 years: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- ▶ Child 12–17 years: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases
- ▶ Child 12–17 years: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

Complicated skin and soft tissue infections | Infections of bones and joints

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- ▶ Neonate 15 days to 28 days: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily
- ▶ Child 12–17 years: 2 g once daily
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily
- ▶ Child 12–17 years: 2 g once daily
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–100 mg/kg daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g once daily
- ▶ Child 12–17 years: 2 g once daily

Suspected bacterial infection in neutropenic patients

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 15 days: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- ▶ Neonate 15 days to 28 days: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day

- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases; doses of 50 mg/kg or more should be given by infusion
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–100 mg/kg daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Bacterial meningitis | Bacterial endocarditis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 15 days: 50 mg/kg once daily.
- ▶ Neonate 15 days to 28 days: 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases; doses of 50 mg/kg or more should be given by infusion
- ▶ Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg daily, 100 mg/kg daily dose should be used for bacterial endocarditis; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 2–4 g daily, doses at the higher end of the recommended range used in severe cases
- ▶ Child 12–17 years: 2–4 g daily, doses at the higher end of the recommended range used in severe cases

Surgical prophylaxis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 15 days: 20–50 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure.
- ▶ Neonate 15 days to 28 days: 50–80 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg (max. per dose 2 g) for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg (max. per dose 2 g) for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure
- ▶ Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

Uncomplicated gonorrhoea | Pelvic inflammatory disease

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 45 kg): 125 mg for 1 dose
- ▶ Child 9–11 years (body-weight 45 kg and above): 250 mg for 1 dose
- ▶ Child 12–17 years: 500 mg for 1 dose

Syphilis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 15 days: 50 mg/kg once daily for 10–14 days.
- ▶ Neonate 15 days to 28 days: 75–100 mg/kg once daily for 10–14 days.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
- ▶ Child 12–17 years: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
- ▶ Child 12–17 years: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 75–100 mg/kg daily for 10–14 days; maximum 4 g per day
- ▶ Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis
- ▶ Child 12–17 years: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

Disseminated Lyme borreliosis (early [Stage II] and late [Stage III]) (administered on expert advice)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate 15 days to 28 days: 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration.

Lyme disease [affecting central nervous system]

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 4 g) for 21 days
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days

- ▶ Child 12–17 years (administered on expert advice): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days
- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g twice daily for 21 days
- ▶ Child 12–17 years (administered on expert advice): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days

Lyme arthritis | Acrodermatitis chronica atrophicans

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 2 g) for 28 days
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g once daily for 28 days
- ▶ Child 12–17 years (administered on expert advice): 2 g once daily for 28 days

Lyme carditis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 2 g) for 21 days
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g once daily for 21 days
- ▶ Child 12–17 years (administered on expert advice): 2 g once daily for 21 days

Congenital gonococcal conjunctivitis

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate: 25–50 mg/kg (max. per dose 125 mg) for 1 dose, intravenous infusion to be administered over 60 minutes.

Prevention of secondary case of meningococcal meningitis

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: 125 mg for 1 dose
- ▶ Child 12–17 years: 250 mg for 1 dose

Prevention of secondary case of Haemophilus influenzae type b disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 50 mg/kg daily (max. per dose 1 g) for 2 days
- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 12–17 years: 1 g daily for 2 days

Acute otitis media

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years (body-weight up to 50 kg): 50 mg/kg (max. per dose 2 g) for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
- ▶ Child 9–11 years (body-weight 50 kg and above): 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed
- ▶ Child 12–17 years: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

- **UNLICENSED USE** EvGr Not licensed for prophylaxis of *Haemophilus influenzae* type b disease. ⚠ Not licensed for prophylaxis of meningococcal meningitis.

EvGr Not licensed for congenital gonococcal conjunctivitis. Not licensed for use in children under 12 years of age for uncomplicated gonorrhoea. Not licensed for use in children for pelvic inflammatory disease. ⚠

EvGr Ceftriaxone is used for Lyme disease affecting the central nervous system in children with body-weight 50 kg

and over and in children aged 12 years and over, \blacktriangle but the dose is not licensed for this indication.

- **CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fatal reactions) · full-term neonates with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy · premature neonates less than 41 weeks corrected gestational age

- **CAUTIONS**

GENERAL CAUTIONS History of hypercalcaemia · history of kidney stones · use with caution in neonates

SPECIFIC CAUTIONS

- ▶ With intravenous use Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium)
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anaemia · coagulation disorder · fungal infection
 - ▶ **Rare or very rare** Bronchospasm · glycosuria · haematuria · oedema
 - ▶ **Frequency not known** Antibiotic associated colitis · cholelithiasis · hypersensitivity · kernicterus (in neonates) · nephrolithiasis · oral disorders · pancreatitis · seizure · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.

- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. \langle EvGr \rangle Specialist sources indicate suitable for use in pregnancy. \blacktriangle
- **BREAST FEEDING** \langle EvGr \rangle Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. \blacktriangle
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
 - ▶ With intravenous use For *intravenous infusion* (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. Displacement value may be significant, consult local guidelines. For *intravenous injection*, give over 5 minutes.

- ▶ With intramuscular use For *intramuscular injection*, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration (see above).
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Cardiovascular system infections, antibacterial therapy p. 322, Central nervous system infections, antibacterial therapy p. 323, Ear infections, antibacterial therapy p. 324, Eye infections, antibacterial therapy p. 324, Gastro-intestinal system infections, antibacterial therapy p. 324, Genital system infections, antibacterial therapy p. 325, Lyme disease p. 391, Musculoskeletal system infections, antibacterial therapy p. 326, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329, Urinary-tract infections p. 400.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Ceftriaxone (Non-proprietary)**

Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial \langle PoM \rangle £2.30 DT = £2.40 (Hospital only)

Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial \langle PoM \rangle £3.62 DT = £3.58 (Hospital only) | 1 vial \langle PoM \rangle \langle S \rangle DT = £9.58 | 10 vial \langle PoM \rangle £95.80 | 10 vial \langle PoM \rangle £91.50 (Hospital only)

Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial \langle PoM \rangle £18.30 DT = £19.18 (Hospital only) | 1 vial \langle PoM \rangle \langle S \rangle DT = £19.18 | 10 vial \langle PoM \rangle £191.80

Ceftriaxone 2g powder for solution for infusion vials | 1 vial \langle PoM \rangle £19.18 DT = £19.18 | 10 vial \langle PoM \rangle £191.80

- ▶ **Rocephin** (Roche Products Ltd)

Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial \langle PoM \rangle £2.40 DT = £2.40

Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial \langle PoM \rangle £9.58 DT = £9.58

Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial \langle PoM \rangle £19.18 DT = £19.18

ANTIBACTERIALS > CEPHALOSPORINS, OTHER

F 338

Cefepime

12-Dec-2019

- **INDICATIONS AND DOSE**

Infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month: 30 mg/kg every 8–12 hours, experience in children aged less than 2 months is limited—consult product literature; intravenous route preferred in severe infections
- ▶ Child 2 months–17 years (body-weight up to 41 kg): 50 mg/kg every 12 hours (max. per dose 2 g), increased if necessary to 50 mg/kg every 8 hours (max. per dose 2 g), increased dose used for severe infections, experience of intramuscular use is limited; intravenous route preferred in severe infections

Mild to moderate urinary tract infections

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 41 kg and above): 0.5–1 g every 12 hours, experience of intramuscular use is limited

Mild to moderate infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child (body-weight 41 kg and above): 1 g every 12 hours, experience of intramuscular use is limited

Severe infections due to sensitive Gram-positive and Gram-negative bacteria

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child (body-weight 41 kg and above): 2 g every 12 hours, increased if necessary to 2 g every 8 hours, increased dose used for very severe infections

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia
- ▶ **Uncommon** Gastrointestinal disorders · increased risk of infection
- ▶ **Rare or very rare** Constipation · dyspnoea · genital pruritus · paraesthesia · seizure · taste altered · vasodilation
- ▶ **Frequency not known** Anaphylactic shock · aplastic anaemia · coma · confusion · consciousness impaired · encephalopathy · haemorrhage · hallucination · myoclonus · nephrotoxicity · renal failure
- **PREGNANCY** Manufacturer advises caution—no data available but not known to be harmful in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in very low quantities.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.

Dose adjustments Manufacturer advises reduce dose—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** After reconstitution the solution is yellow to yellow-brown. Displacement value may be significant when reconstituting injection, consult local guidelines. For *intravenous infusion*, manufacturer advises reconstitute with 50 mL Glucose 5% or 10% or Sodium Chloride 0.9%; give over 30 minutes. For *intravenous injection*, manufacturer advises reconstitute with 10 mL Glucose 5% or 10% or Sodium Chloride 0.9%. For *intramuscular injection*, manufacturer advises reconstitute with 3 mL Water for Injection.
- **NATIONAL FUNDING/ACCESS DECISIONS**

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 4129

The *All Wales Medicines Strategy Group* has advised (November 2019) that cefepime (*Renapime*[®]) is recommended as an option for restricted use within NHS Wales. It should be restricted to use in the treatment of resistant *Pseudomonas* infections where first-line agents are not effective or contra-indicated. It is not recommended for use within NHS Wales outside of this subpopulation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Renapime** (Renescience Pharma Ltd)
Cefepime (as Cefepime dihydrochloride monohydrate)
1 gram Renapime 1g powder for solution for injection vials | 10 vial [PoM] £70.00
- ▶ **Cefepime** (as Cefepime dihydrochloride monohydrate)
2 gram Renapime 2g powder for solution for injection vials | 10 vial [PoM] £110.00

Ceftaroline fosamil● **INDICATIONS AND DOSE****Community-acquired pneumonia**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 6 mg/kg every 8 hours for 5–7 days.
- ▶ Child up to 2 months: 6 mg/kg every 8 hours for 5–7 days
- ▶ Child 2–23 months: 8 mg/kg every 8 hours for 5–7 days
- ▶ Child 2–11 years: 12 mg/kg every 8 hours (max. per dose 400 mg) for 5–7 days
- ▶ Child 12–17 years (body-weight up to 33 kg): 12 mg/kg every 8 hours (max. per dose 400 mg) for 5–7 days
- ▶ Child 12–17 years (body-weight 33 kg and above): 600 mg every 12 hours for 5–7 days

Complicated skin infections | Complicated soft-tissue infections

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 6 mg/kg every 8 hours for 5–14 days.
- ▶ Child up to 2 months: 6 mg/kg every 8 hours for 5–14 days
- ▶ Child 2–23 months: 8 mg/kg every 8 hours for 5–14 days, for high dose regimen consult product literature
- ▶ Child 2–11 years: 12 mg/kg every 8 hours (max. per dose 400 mg) for 5–14 days, for high dose regimen consult product literature
- ▶ Child 12–17 years (body-weight up to 33 kg): 12 mg/kg every 8 hours (max. per dose 400 mg) for 5–14 days, for high dose regimen consult product literature
- ▶ Child 12–17 years (body-weight 33 kg and above): 600 mg every 12 hours for 5–14 days, for high dose regimen consult product literature

- **CAUTIONS** Seizure disorders
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
- ▶ **Uncommon** Anaemia · antibiotic associated colitis · hypersensitivity
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information; *animal* studies do not indicate toxicity.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 51 mL/minute—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute reconstituted solution to 50, 100, or 250 mL with infusion fluid; give over 5 to 60 minutes. Consult product literature for administration of high-dose regimen.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The *Scottish Medicines Consortium*, has advised (Dec 2012) that ceftaroline fosamil (*Zinforo*[®]) is accepted for restricted use within NHS Scotland when methicillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Zinforo** (Pfizer Ltd)
Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg Zinforo 600mg powder for concentrate for solution for infusion vials | 10 vial [PoM] £375.00 (Hospital only)

ANTIBACTERIALS > GLYCOPEPTIDE

Teicoplanin

18-May-2020

● **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

● INDICATIONS AND DOSE

Clostridioides difficile infection

▶ BY MOUTH

▶ Child 12–17 years: 100–200 mg twice daily for 7–14 days

Cellulitis | Erysipelas

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child 1 month: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion

▶ Child 2 months–11 years: Initially 10 mg/kg every 12 hours for 3 doses, then 6–10 mg/kg once daily

▶ Child 12–17 years: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

▶ Child 12–17 years: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) | Bone and joint infections

▶ INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child 12–17 years: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

Serious infections caused by Gram-positive bacteria (including endocarditis, complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections, bone and joint infections)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Neonate: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion.

▶ Child 1 month: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion

▶ Child 2 months–11 years: Initially 10 mg/kg every 12 hours for 3 doses, then 6–10 mg/kg once daily

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)

▶ BY INTRAPERITONEAL INFUSION

▶ Child 12–17 years: (consult local protocol)

PHARMACOKINETICS

▶ Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

● **UNLICENSED USE** Not licensed for surgical prophylaxis.

● **INTERACTIONS** → Appendix 1: teicoplanin

● **SIDE-EFFECTS**

▶ **Common or very common** Fever · pain · skin reactions

▶ **Uncommon** Bronchospasm · diarrhoea · dizziness · eosinophilia · headache · hearing impairment · hypersensitivity · leucopenia · nausea · ototoxicity · thrombocytopenia · vomiting

▶ **Rare or very rare** Abscess · red man syndrome

▶ **Frequency not known** Agranulocytosis · angioedema · chills · neutropenia · overgrowth of nonsusceptible organisms · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · thrombophlebitis

SIDE-EFFECTS, FURTHER INFORMATION Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

● **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** No information available.

● **RENAL IMPAIRMENT**

Dose adjustments Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if estimated glomerular filtration rate

30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Monitoring Monitor renal and auditory function during prolonged treatment in renal impairment.

● **MONITORING REQUIREMENTS**

▶ With intramuscular use or intravenous use Manufacturer advises monitor serum-teicoplanin trough concentration at steady state after completion of loading dose and during maintenance treatment—consult product literature.

▶ Blood counts and liver and kidney function tests required.

▶ Manufacturer advises monitoring for adverse reactions when doses of 12 mg/kg twice daily are administered.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5%; give over 30 minutes.

▶ With oral use Injection can be used to prepare solution for oral administration.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Cardiovascular system infections, antibacterial therapy p. 322, Gastro-intestinal system infections, antibacterial therapy p. 324, Musculoskeletal system infections, antibacterial therapy p. 326, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329, Urinary-tract infections p. 400.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial [P6M] £7.32 DT = £7.32

Vancomycin

18-May-2020

- DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

INDICATIONS AND DOSE

Clostridioides difficile infection

BY MOUTH

- Neonate: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients.

- Child 1 month–11 years: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients; maximum 2 g per day

Clostridioides difficile infection [first episode]

BY MOUTH

- Child 12–17 years: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection

Clostridioides difficile infection [multiple recurrences]

BY MOUTH

- Child 12–17 years: 125 mg every 6 hours for 10 days, followed by, either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

Cellulitis | Erysipelas

BY INTRAVENOUS INFUSION

- Child 1 month–11 years: 10–15 mg/kg every 6 hours adjusted according to plasma-concentration monitoring
- Child 12–17 years: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring

Complicated skin and soft tissue infections | Bone infections | Joint infections | Community-acquired pneumonia | Hospital-acquired pneumonia [including ventilator-associated pneumonia] | Infective endocarditis | Acute bacterial meningitis | Bacteraemia [occurring in association with or suspected to be associated with the licensed indications]

BY INTRAVENOUS INFUSION

- Neonate up to 29 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 24 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 29 weeks to 35 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 12 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 35 weeks corrected gestational age and above (administered on expert advice): 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Child 1 month–11 years: 10–15 mg/kg every 6 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, doses higher than 60 mg/kg/day cannot be generally recommended as the safety of increased dosing has not been fully assessed
- Child 12–17 years: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, in seriously ill patients, a loading dose of 25–30 mg/kg (usual max. 2 g) can be used to facilitate rapid attainment of the target trough serum-vancomycin concentration

Perioperative prophylaxis of bacterial endocarditis [in patients at high risk of developing bacterial endocarditis when undergoing major surgical procedures]

BY INTRAVENOUS INFUSION

- Neonate: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery.

- Child: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery

Surgical prophylaxis (when high risk of MRSA)

BY INTRAVENOUS INFUSION

- Child: (consult local protocol)

CNS infection e.g. ventriculitis (administered on expert advice)

BY INTRAVENTRICULAR ADMINISTRATION

- Neonate: 10 mg every 24 hours.

- Child: 10 mg every 24 hours, for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased, adjust dose according to CSF concentration after 3–4 days; aim for pre-dose ('trough') concentration less than 10 mg/litre. If CSF not draining free reduce dose frequency to once every 2–3 days

Peritonitis associated with peritoneal dialysis

BY INTRAPERITONEAL ADMINISTRATION

- Child: Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre

Eradication of methicillin-resistant *Staphylococcus aureus* from the respiratory tract in cystic fibrosis

BY INHALATION OF NEBULISED SOLUTION

- Child: 4 mg/kg twice daily (max. per dose 250 mg) for 5 days, alternatively 4 mg/kg 4 times a day (max. per dose 250 mg) for 5 days

PHARMACOKINETICS

- Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route. Not licensed for intraventricular use or inhalation. Not licensed for use by the *intrathecal* route for the treatment of meningitis.

CONTRA-INDICATIONS

- With intravenous use Previous hearing loss

● CAUTIONS

- ▶ With intravenous use Premature neonates (monitor serum-concentration carefully) · young infants (monitor serum-concentration carefully)
- ▶ With oral use Systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with *Clostridioides difficile*-induced pseudomembranous colitis (increased risk of adverse reactions)

● **INTERACTIONS** → Appendix 1: vancomycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Agranulocytosis · nausea · nephritis tubulointerstitial · neutropenia (more common after 1 week or cumulative dose of 25g) · renal failure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus (discontinue) · vasculitis · vertigo

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Back pain · bradycardia · cardiac arrest (on rapid intravenous injection) · cardiogenic shock (on rapid intravenous injection) · chest pain · dyspnoea · hearing loss · hypotension · muscle complaints · pseudomembranous enterocolitis · red man syndrome · wheezing

SIDE-EFFECTS, FURTHER INFORMATION Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

● **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

Monitoring Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

● **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.

● **RENAL IMPAIRMENT** Manufacturer advises serial monitoring of renal function.

- ▶ With intravenous use Manufacturer advises use with caution—increased risk of toxic effects with prolonged high blood concentration.

Dose adjustments

▶ With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridioides difficile*-induced pseudomembranous colitis, see *Monitoring*.

▶ With intravenous use Manufacturer advises initial dose must not be reduced—consult product literature.

● MONITORING REQUIREMENTS

▶ With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment—consult product literature). Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs. Manufacturer advises pre-dose ('trough') concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre—consult product literature.

Manufacturer advises periodic testing of auditory function. Manufacturer advises monitor blood counts, urinalysis, hepatic and renal function periodically in all patients; monitor leucocyte count regularly in patients receiving long-term vancomycin or if given concurrently with other drugs that may cause neutropenia or agranulocytosis.

- ▶ With oral use Manufacturer advises monitoring serum-vancomycin concentration in inflammatory intestinal disorders.

Manufacturer advises serial tests of auditory function may be helpful to minimise the risk of ototoxicity in patients with an underlying hearing loss, or who are receiving concomitant therapy with other ototoxic drugs.

- ▶ With intravenous use Aim for pre-dose ('trough') concentration less than 10 mg/litre.
- ▶ When used by inhalation Measure lung function before and after initial dose of vancomycin and monitor for bronchospasm.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.

Displacement value may be significant, consult product literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/mL; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not available (limited evidence); 10 mg/mL can be used if infused via a central venous line over at least 1 hour.

- ▶ With oral use Injection can be used to prepare solution for oral administration—consult product literature.
- ▶ When used by inhalation For *nebulisation* administer required dose in 4 mL of sodium chloride 0.9% (or water for injections). Administer inhaled bronchodilator before vancomycin.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Blood infections, antibacterial therapy p. 322, Cardiovascular system infections, antibacterial therapy p. 322, Central nervous system infections, antibacterial therapy p. 323, Gastro-intestinal system infections, antibacterial therapy p. 324, Musculoskeletal system infections, antibacterial therapy p. 326, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion

Powder for solution for infusion

▶ Vancomycin (Non-proprietary)

Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial [PoM] £7.25 DT = £5.49 | 10 vial [PoM] £62.50 DT = £62.50

Vancomycin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £5.49-£8.50 DT = £5.49 (Hospital only) | 10 vial [PoM] £62.50 DT = £62.50 (Hospital only) | 10 vial [PoM] £62.50-£72.50 DT = £62.50

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

18-May-2020

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

● INDICATIONS AND DOSE

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections

▶ BY MOUTH

▶ Neonate up to 14 days: 3–6 mg/kg 3 times a day.

▶ Neonate 14 days to 28 days: 3–6 mg/kg 4 times a day.

▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)

▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used for severe infections, total daily dose may alternatively be given in 3 divided doses, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Cellulitis | Erysipelas

▶ BY MOUTH

▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg) for 7 days then review

▶ BY INTRAVENOUS INFUSION

▶ Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used in life-threatening infection, total daily dose may alternatively be given in 3 divided doses

Staphylococcal lung infection in cystic fibrosis

▶ BY MOUTH

▶ Child: 5–7 mg/kg 4 times a day (max. per dose 600 mg)

Treatment of falciparum malaria (to be given with or following quinine)

▶ BY MOUTH

▶ Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days

- **UNLICENSED USE** Not licensed for treatment of falciparum malaria.
- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates (in neonates) · diarrhoeal states
- **CAUTIONS** Avoid in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: clindamycin

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

▶ With oral use Abdominal pain · antibiotic associated colitis · diarrhoea (discontinue)

▶ Uncommon

▶ With oral use Nausea · vomiting

▶ Frequency not known

▶ With oral use Agranulocytosis · angioedema · eosinophilia · gastrointestinal disorders · jaundice · leucopenia · neutropenia · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vulvovaginal infection

▶ With parenteral use Abdominal pain · agranulocytosis · antibiotic associated colitis · cardiac arrest · diarrhoea (discontinue) · eosinophilia · hypotension · jaundice · leucopenia · nausea · neutropenia · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · thrombophlebitis · vomiting · vulvovaginal infection

SIDE-EFFECTS, FURTHER INFORMATION

Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *C difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

- **PREGNANCY** Manufacturer advises not known to be harmful in the second and third trimesters; use with caution in the first trimester—limited data.

- **BREAST FEEDING** [EvoGr](#) Specialist sources indicate use with caution—present in milk. Monitor infant for effects on the gastrointestinal flora such as diarrhoea, candidiasis, or rarely, blood in the stool indicating possible antibiotic-associated colitis. 

- **MONITORING REQUIREMENTS** Monitor liver and renal function if treatment exceeds 10 days. Monitor liver and renal function in neonates and infants.

● DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use Avoid rapid intravenous administration. For *intravenous infusion*, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Gastro-intestinal system infections, antibacterial therapy p. 324, Malaria, treatment p. 426, MRSA p. 392, Musculoskeletal system infections, antibacterial therapy p. 326, Skin infections, antibacterial therapy p. 329.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue and contact a doctor immediately if severe, prolonged or bloody diarrhoea develops.

▶ With oral use Capsules should be swallowed with a glass of water.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

▶ With oral use Clindamycin capsules may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

ANTIBACTERIALS > MACROLIDES

Macrolides

18-Jun-2018

Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 355 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, typhoid [unlicensed indication], trachoma [unlicensed indication], and Lyme disease [unlicensed indication].

Clarithromycin p. 353 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

• CAUTIONS

- ▶ With intravenous use or oral use Electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

• SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · hearing impairment · insomnia · nausea · pancreatitis · paraesthesia · skin reactions · taste altered · vasodilation · vision disorders · vomiting
- ▶ **Uncommon** Angioedema · anxiety · arrhythmias · candida infection · chest pain · constipation · drowsiness · eosinophilia · hepatic disorders · leucopenia · neutropenia · palpitations · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · tinnitus · vertigo
- ▶ **Rare or very rare** Antibiotic associated colitis · myasthenia gravis · nephritis tubulointerstitial
- ▶ **Frequency not known** Hallucination · hypotension · seizure · smell altered · thrombocytopenia · tongue discoloration

↑ above

Azithromycin

03-Mar-2020

• INDICATIONS AND DOSE

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

▶ BY MOUTH

- ▶ Child 6 months–11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- ▶ Child 12–17 years: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

▶ BY MOUTH

- ▶ Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- ▶ Child 6 months–17 years (body-weight 15–25 kg): 200 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 26–35 kg): 300 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 36–45 kg): 400 mg once daily for 3 days
- ▶ Child 6 months–17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

Infection in cystic fibrosis

▶ BY MOUTH

- ▶ Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days, repeated after 1 week to complete course, treatment may be repeated as necessary

Chronic *Pseudomonas aeruginosa* infection in cystic fibrosis

▶ BY MOUTH

- ▶ Child 6–17 years (body-weight 25–40 kg): 250 mg 3 times a week
- ▶ Child 6–17 years (body-weight 41 kg and above): 500 mg 3 times a week

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

▶ BY MOUTH

- ▶ Child 12–17 years: 1 g for 1 dose

Lyme disease [erythema migrans and/or non-focal symptoms]

▶ BY MOUTH

- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 51 kg): 10 mg/kg daily for 17 days
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 51 kg and above): 500 mg daily for 17 days
- ▶ Child 12–17 years (administered on expert advice): 500 mg daily for 17 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

▶ BY MOUTH

- ▶ Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7 days

- **UNLICENSED USE** Azithromycin may be used as detailed below, although these situations are considered outside the scope of its licence:
 - prevention of group A streptococcal infection;
 - chronic *Pseudomonas aeruginosa* infection in cystic fibrosis;
 - **EvGr** Lyme disease ;
 - mild to moderate typhoid due to multiple-antibacterial resistant organisms.
- **INTERACTIONS** → Appendix 1: macrolides
- **SIDE-EFFECTS**
 - ▶ Common or very common Arthralgia
 - ▶ Uncommon Numbness · oedema · photosensitivity reaction
 - ▶ Frequency not known Acute kidney injury · aggression · akathisia · haemolytic anaemia · syncope
- **PREGNANCY** Manufacturers advise use only if adequate alternatives not available.
- **BREAST FEEDING** Present in milk; use only if no suitable alternatives.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in severe impairment (no information available).
- **RENAL IMPAIRMENT** Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** See Lyme disease p. 391 for place in therapy and further information on treatment. Flavours of oral liquid formulations may include cherry or banana.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension **Tablet**

Impetigo

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5–7 days
- ▶ Child 12–17 years: 250 mg twice daily for 5–7 days, increased if necessary to 500 mg twice daily, increased dose used in severe infections

Community-acquired pneumonia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days

continued →

- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours)
- ▶ Child 12–17 years: 500 mg every 12 hours

Hospital-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days then review
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days then review
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days then review
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days then review
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days then review
- ▶ Child 12–17 years: 500 mg twice daily for 5 days then review

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Neonate: 7.5 mg/kg twice daily.
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
- ▶ Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours) maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
- ▶ Child 12–17 years: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7–14 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7–14 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 7–14 days

Acute cough [if systemically very unwell or at higher risk of complications] | Acute sore throat

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days

- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 5 days

Acute otitis media

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Neonate: 7.5 mg/kg twice daily.
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5–7 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5–7 days
- ▶ Child 12–17 years: 250–500 mg twice daily for 5–7 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours) maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
- ▶ Child 12–17 years: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Prevention of pertussis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Neonate: 7.5 mg/kg twice daily for 7 days.
- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
- ▶ Child 12–17 years: 500 mg twice daily for 7 days

***Helicobacter pylori* eradication in combination with omeprazole, and amoxicillin or metronidazole**

- ▶ BY MOUTH

- ▶ Child 1–5 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- ▶ Child 6–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- ▶ Child 12–17 years: 500 mg twice daily

Acute sinusitis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- ▶ Child 12–17 years: 250 mg twice daily for 5 days, alternatively 500 mg twice daily for 5 days

- **UNLICENSED USE** EvGr Duration of treatment for acute sinusitis differs from product literature and adheres to national guidelines. A
- ▶ With oral use EvGr Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. A Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.
- ▶ With intravenous use Intravenous infusion not licensed for use in children under 12 years.

● **INTERACTIONS** → Appendix 1: macrolides

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Burping · dry mouth · muscle complaints · oral disorders · thrombocytosis · tremor
- ▶ **Frequency not known** Abnormal dreams · agranulocytosis · depersonalisation · depression · mania · myopathy · psychotic disorder · renal failure · tooth discolouration · urine discolouration

SPECIFIC SIDE-EFFECTS

▶ **Uncommon**

- ▶ With oral use Epistaxis
- ▶ With parenteral use Cardiac arrest · dyskinesia · haemorrhage · loss of consciousness · pulmonary embolism

● **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe failure if renal impairment also present.

● **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.

- ▶ With oral use Avoid *Klaricid XL*[®] or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Ear infections, antibacterial therapy p. 324, Nose infections, antibacterial therapy p. 326, Oropharyngeal infections, antibacterial therapy p. 761, Peptic ulceration p. 58, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.

● **INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- ▶ BY MOUTH

- ▶ Neonate: 12.5 mg/kg every 6 hours.

- ▶ Child 1-23 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections

- ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

- ▶ Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10–12.5 mg/kg every 6 hours.

- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Impetigo

- ▶ BY MOUTH

- ▶ Child 8-17 years: 250–500 mg 4 times a day for 5–7 days

Cellulitis | Erysipelas

- ▶ BY MOUTH

- ▶ Child 8-17 years: 250–500 mg 4 times a day for 5–7 days then review

Community-acquired pneumonia

- ▶ BY MOUTH

- ▶ Child 8-17 years: 250–500 mg 4 times a day for 5 days

continued →

Acute cough [if systemically very unwell or at higher risk of complications] | Acute sore throat

▶ BY MOUTH

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10–12.5 mg/kg every 6 hours.

- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Early syphilis

▶ BY MOUTH

- ▶ Child 12-17 years: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

▶ BY MOUTH

- ▶ Child 1-23 months: 12.5 mg/kg 4 times a day for 14 days
- ▶ Child 2-11 years: 250 mg twice daily for 14 days
- ▶ Child 12-17 years: 500 mg twice daily for 14 days

Pelvic inflammatory disease

▶ BY MOUTH

- ▶ Child 1-23 months: 12.5 mg/kg 4 times a day for 14 days
- ▶ Child 2-11 years: 250 mg twice daily for 14 days
- ▶ Child 12-17 years: 500 mg twice daily for 14 days

Prevention and treatment of pertussis

▶ BY MOUTH

- ▶ Neonate: 12.5 mg/kg every 6 hours.

- ▶ Child 1-23 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
- ▶ Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10–12.5 mg/kg every 6 hours.

- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

Prevention of secondary case of diphtheria in non-immune patient

▶ BY MOUTH

- ▶ Child 1-23 months: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

▶ BY MOUTH

- ▶ Child 1-23 months: 125 mg every 6 hours for 10 days
- ▶ Child 2-7 years: 250 mg every 6 hours for 10 days
- ▶ Child 8-17 years: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

▶ BY MOUTH

- ▶ Child 1-23 months: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
- ▶ Child 2-7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- ▶ Child 8-17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of recurrence of rheumatic fever

▶ BY MOUTH

- ▶ Child 1-23 months: 125 mg twice daily
- ▶ Child 2-17 years: 250 mg twice daily

Acne

▶ BY MOUTH

- ▶ Child 1-23 months: 250 mg once daily, alternatively 125 mg twice daily
- ▶ Child 12-17 years: 500 mg twice daily

Gastro-intestinal stasis

▶ BY MOUTH

- ▶ Neonate: 3 mg/kg 4 times a day.

- ▶ Child: 3 mg/kg 4 times a day

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 3 mg/kg 4 times a day.

- ▶ Child 1-11 months: 3 mg/kg 4 times a day

- **UNLICENSED USE** E_VGr Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. A

Erythromycin may be used for gastro-intestinal stasis, but it is not licensed for this indication.

- **CAUTIONS** Avoid in Acute porphyrias p. 652 · neonate under 2 weeks (risk of hypertrophic pyloric stenosis)
- **INTERACTIONS** → Appendix 1: macrolides

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Rare or very rare** Hearing loss (can occur after large doses)
- ▶ **SPECIFIC SIDE-EFFECTS**
- ▶ With oral use Cerebral impairment
- ▶ With parenteral use Atrioventricular block

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
 - **Dose adjustments** Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Ear infections, antibacterial therapy p. 324, Eye infections, antibacterial therapy p. 324, Gastro-intestinal system infections, antibacterial therapy p. 324, Genital system infections, antibacterial therapy p. 325, Oropharyngeal infections, antibacterial therapy p. 761, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.

ANTIBACTERIALS > MONOBACTAMS

Aztreonam

11-May-2020

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

- **INDICATIONS AND DOSE**

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Neonate up to 7 days: 30 mg/kg every 12 hours.

▶ Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.

▶ Child 1 month–11 years: 30 mg/kg every 6–8 hours

▶ Child 12–17 years: 1 g every 8 hours, alternatively 2 g every 12 hours

Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

▶ Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2 g 4 times a day)

▶ Child 12–17 years: 2 g every 6–8 hours

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

▶ BY INHALATION OF NEBULISED SOLUTION

▶ Child 6–17 years: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

- **UNLICENSED USE**

▶ With systemic use Injection not licensed for use in children under 7 days.

- **CAUTIONS**

▶ When used by inhalation Haemoptysis—risk of further haemorrhage

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Dyspnoea · respiratory disorders

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used by inhalation Cough · haemoptysis · joint disorders · laryngeal pain · nasal complaints · rash
- ▶ **Rare or very rare**
- ▶ With parenteral use Anaemia · asthenia · breast tenderness · chest pain · confusion · diplopia · dizziness · eosinophilia · haemorrhage · headache · hepatic disorders · hypotension · insomnia · leucocytosis · myalgia · nasal congestion · neutropenia · oral disorders · pancytopenia · paraesthesia · pseudomembranous enterocolitis · seizure · thrombocytopenia · thrombocytosis · tinnitus · vertigo · vulvovaginal candidiasis
- ▶ **Frequency not known**
- ▶ With parenteral use Abdominal pain · angioedema · diarrhoea · nausea · skin reactions · taste altered · toxic epidermal necrolysis · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

● PREGNANCY

- ▶ With systemic use No information available; manufacturer of injection advises avoid.
- ▶ When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Manufacturer advises caution in chronic impairment with cirrhosis.
Dose adjustments ▶ With systemic use Manufacturer advises dose reduction of 20–25% for long term treatment of patients with chronic impairment with cirrhosis, especially in alcoholic cirrhosis and concomitant renal impairment.

● RENAL IMPAIRMENT

- ▶ **Dose adjustments** ▶ With systemic use If estimated glomerular filtration rate 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If estimated glomerular filtration rate less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

● MONITORING REQUIREMENTS

- ▶ When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous injection*, give over 3–5 minutes. Displacement value of injection may be significant, consult local guidelines. For intermittent *intravenous infusion*, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
- ▶ When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 753/12

The *Scottish Medicines Consortium* has advised (January 2015) that aztreonam powder for nebuliser solution (*Cayston*[®]) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing

satisfactory therapeutic benefit (measured as $\geq 2\%$ decline in forced expiratory volume in 1 second). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for nebuliser solution

- ▶ **Cayston** (Gilead Sciences International Ltd)
Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial [PoM] £2,181.53 DT = £2,181.53

Powder for solution for injection

- ▶ **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial [PoM] £9.40 (Hospital only)
Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial [PoM] £18.82 (Hospital only)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

18-May-2020

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

● INDICATIONS AND DOSE

Anaerobic infections

▶ BY MOUTH

- ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)
- ▶ Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)

▶ BY RECTUM

- ▶ Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 26 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 24 hours, then 7.5 mg/kg daily usually treated for a total duration of 7 days (for 10–14 days in *Clostridioides difficile* infection).
- ▶ Neonate 26 weeks to 34 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 12 hours, then 7.5 mg/kg every 12 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridioides difficile* infection).
- ▶ Neonate 34 weeks corrected gestational age and above: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridioides difficile* infection).
- ▶ Child 1 month: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours

usually treated for a total duration of 7 days (for 10–14 days in *Clostridioides difficile* infection)

- ▶ Child 2 months–17 years: 7.5 mg/kg every 8 hours (max. per dose 500 mg) usually treated for 7 days (for 10–14 days in *Clostridioides difficile* infection)

Cellulitis | Erysipelas

▶ BY MOUTH

- ▶ Child 1 month: 7.5 mg/kg every 12 hours for 7 days then review
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) for 7 days then review
- ▶ Child 12–17 years: 400 mg every 8 hours for 7 days then review
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1 month: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours
- ▶ Child 2 months–17 years: 7.5 mg/kg every 8 hours (max. per dose 500 mg)

Helicobacter pylori eradication; in combination with clarithromycin and omeprazole

▶ BY MOUTH

- ▶ Child 1–5 years: 100 mg twice daily
- ▶ Child 6–11 years: 200 mg twice daily
- ▶ Child 12–17 years: 400 mg twice daily

Helicobacter pylori eradication; in combination with amoxicillin and omeprazole

▶ BY MOUTH

- ▶ Child 1–5 years: 100 mg 3 times a day
- ▶ Child 6–11 years: 200 mg 3 times a day
- ▶ Child 12–17 years: 400 mg 3 times a day

Fistulating Crohn's disease

▶ BY MOUTH

- ▶ Child: 7.5 mg/kg 3 times a day usually given for 1 month but should not be used for longer than 3 months because of concerns about peripheral neuropathy

Bacterial vaginosis

▶ BY VAGINA USING VAGINAL GEL

- ▶ Child: 1 applicatorful daily for 5 days, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 applicatorful of vaginal gel delivers a 5 g dose of metronidazole 0.75%.

Pelvic inflammatory disease

▶ BY MOUTH

- ▶ Child 12–17 years: 400 mg twice daily for 14 days

Acute ulcerative gingivitis

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days

Acute oral infections

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3–7 days

Surgical prophylaxis

▶ BY MOUTH

- ▶ Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered 2 hours before surgery
- ▶ Child 12–17 years: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY RECTUM

- ▶ Child 5–9 years: 500 mg, to be administered 2 hours before surgery, then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

- ▶ Child 10–17 years: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 10 mg/kg, to be administered up to 30 minutes before the procedure.

- ▶ Neonate 40 weeks corrected gestational age and above: 20–30 mg/kg, to be administered up to 30 minutes before the procedure.

- ▶ Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered up to 30 minutes before the procedure

- ▶ Child 12–17 years: 500 mg, to be administered up to 30 minutes before the procedure, then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)

▶ BY MOUTH

- ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis

▶ BY MOUTH

- ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
- ▶ Child 3–6 years: 100 mg twice daily for 7 days
- ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
- ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis

▶ BY MOUTH

- ▶ Child 1–2 years: 500 mg once daily for 3 days
- ▶ Child 3–6 years: 600–800 mg once daily for 3 days
- ▶ Child 7–9 years: 1 g once daily for 3 days
- ▶ Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus

▶ BY INTRAVENOUS INFUSION

- ▶ Child: (consult product literature)

- **UNLICENSED USE** EvGr Metronidazole is used for the treatment of cellulitis, A but is not licensed for this indication.

- EvGr Metronidazole is used for the treatment of erysipelas, A but is not licensed for this indication.

- ▶ With vaginal use Metronidazole vaginal gel not licensed for use in children under 18 years.

● CAUTIONS

- ▶ With vaginal use Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative - not recommended during menstruation - some systemic absorption may occur with vaginal gel

- **INTERACTIONS** → Appendix 1: metronidazole

● SIDE-EFFECTS

● Common or very common

- ▶ With systemic use Dry mouth · myalgia · nausea · oral disorders · taste altered · vomiting
- ▶ With vaginal use Pelvic discomfort · vulvovaginal candidiasis · vulvovaginal disorders

● Uncommon

- ▶ With systemic use Asthenia · headache · leucopenia (with long term or intensive therapy)
- ▶ With vaginal use Menstrual cycle irregularities · vaginal haemorrhage
- ▶ Rare or very rare
- ▶ With systemic use Agranulocytosis · angioedema · appetite decreased · ataxia · cerebellar syndrome · confusion · diarrhoea · dizziness · drowsiness · encephalopathy · epigastric pain · epileptiform seizure (with long term or intensive therapy) · flushing · hallucination · hepatic disorders · meningitis aseptic · mucositis · nerve disorders · neutropenia · pancreatitis · pancytopenia · peripheral neuropathy (with long term or intensive therapy) · psychotic disorder · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · urine dark · vision disorders

▶ Frequency not known

- ▶ With systemic use Depressed mood · gastrointestinal disorder · hearing impairment · tinnitus

● PREGNANCY

- ▶ With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

● BREAST FEEDING

- ▶ With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

● HEPATIC IMPAIRMENT

- ▶ With oral use or rectal use Manufacturer advises caution in hepatic encephalopathy (risk of decreased clearance).
- ▶ With intravenous use Manufacturer advises caution in severe impairment (risk of decreased clearance).

Dose adjustments ▶ With oral use or rectal use Manufacturer advises dose reduction to one-third of the daily dose in hepatic encephalopathy (dose may be given once daily).

▶ With intravenous use Manufacturer advises consider dose reduction in severe impairment.

● MONITORING REQUIREMENTS

- ▶ With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, give over 20–30 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Antiprotozoal drugs p. 418, Gastrointestinal system infections, antibacterial therapy p. 324, Genital system infections, antibacterial therapy p. 325, Oropharyngeal infections, antibacterial therapy p. 761, Peptic ulceration p. 58, Skin infections, antibacterial therapy p. 329.
- ▶ With systemic use Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Metronidazole for bacterial infections www.medicinesforchildren.org.uk/metronidazole-bacterial-infections

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

- ▶ With oral use Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25, 27

▶ Metronidazole (Non-proprietary)

Metronidazole 200 mg Metronidazole 200mg tablets | 21 tablet [PoM](#) £4.03 DT = £4.03

Metronidazole 400 mg Metronidazole 400mg tablets | 21 tablet [PoM](#) £5.75 DT = £3.75

Infusion

ELECTROLYTES: May contain Sodium

▶ Metronidazole (Non-proprietary)

Metronidazole 5 mg per 1 ml Metronidazole 500mg/100ml infusion 100ml bags | 20 bag [PoM](#) £67.05 DT = £67.05

Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

● INDICATIONS AND DOSE

Intestinal amoebiasis

▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ Child 12–17 years: 2 g once daily for 2–3 days

Amoebic involvement of liver

▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ Child 12–17 years: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

▶ BY MOUTH

- ▶ Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary

- **INTERACTIONS** → Appendix 1: tinidazole

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Frequency not known** Angioedema · ataxia · dizziness · fatigue · flushing · leucopenia · oral disorders · peripheral

neuropathy · seizure · sensation abnormal · taste altered · tongue discolouration · urine discolouration

- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

DT = £11.04

ANTIBACTERIALS > PENICILLINS

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 364 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, and leptospirosis. It is also used in combination with gentamicin p. 333 for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is **no longer the drug of first choice for pneumococcal meningitis**. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 358 is preferred. Benzylpenicillin sodium is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin p. 363 or **procaine benzylpenicillin** are used in the treatment of syphilis.

Phenoxymethylpenicillin p. 365 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin sodium because they produce penicillinases. Flucloxacillin p. 373, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Broad-spectrum penicillins

Ampicillin p. 368 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*.

Ampicillin is also active against *Listeria* spp. and enterococci. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

Amoxicillin p. 366 is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

Amoxicillin or ampicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections. They are also used in the treatment of endocarditis and listerial meningitis. Amoxicillin is also used for the treatment of Lyme disease.

Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in children with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Co-amoxiclav p. 370 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 369) is available to treat infections involving either streptococci or staphylococci.

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 362 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 363 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary-tract, skin and soft tissue, or intra-abdomen. They may be used for the empirical treatment of septicaemia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin) since they have a synergistic effect.

Piperacillin with tazobactam is used in cystic fibrosis for the treatment of *Ps. aeruginosa* colonisation when ciprofloxacin p. 377 and nebulised colistimethate sodium p. 375 have been ineffective; it can also be used in infective exacerbations, when it is combined with an aminoglycoside.

Mecillinams

Pivmecillinam hydrochloride p. 373 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

Penicillins

● **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

● **CAUTIONS** History of allergy

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · hypersensitivity · nausea · skin reactions · thrombocytopenia · vomiting
- ▶ **Uncommon** Antibiotic associated colitis · leucopenia
- ▶ **Rare or very rare** Agranulocytosis · angioedema · haemolytic anaemia · hepatic disorders · nephritis tubulointerstitial · seizure · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can cause antibiotic-associated colitis.

- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA-LACTAMASE INHIBITOR

Piperacillin with tazobactam

22-May-2020

● INDICATIONS AND DOSE

Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 90 mg/kg every 8 hours.
- ▶ Child 1 month–11 years: 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
- ▶ Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Complicated intra-abdominal infections

▶ BY INTRAVENOUS INFUSION

- ▶ Child 2–11 years: 112.5 mg/kg every 8 hours (max. per dose 4.5 g)
- ▶ Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Acute exacerbation of bronchiectasis

▶ BY INTRAVENOUS INFUSION

- ▶ Child 1 month–11 years: 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
- ▶ Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 90 mg/kg every 6 hours (max. per dose 4.5 g)

- **UNLICENSED USE** Not licensed for use in children under 12 years (except for children 2–12 years with neutropenia and complicated intra-abdominal infections).

EXGPI Piperacillin with tazobactam is used for the treatment of acute exacerbation of bronchiectasis,  but is not licensed for this indication.

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · candida infection · constipation · gastrointestinal discomfort · headache · insomnia
 - ▶ **Uncommon** Arthralgia · flushing · hypokalaemia · hypotension · myalgia · thrombophlebitis
 - ▶ **Rare or very rare** Epistaxis · stomatitis
 - ▶ **Frequency not known** Eosinophilia · neutropenia · pancytopenia · pneumonia eosinophilic · renal failure · thrombocytosis
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT**

Dose adjustments *Child under 12 years* 78.75 mg/kg (max. 4.5 g) every 8 hours if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

Child 12–18 years max. 4.5 g every 8 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; max. 4.5 g every 12 hours if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. For *intravenous infusion*, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.
For choice of antibacterial therapy, see Blood infections, antibacterial therapy p. 322, Gastro-intestinal system infections, antibacterial therapy p. 324, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329, Urinary-tract infections p. 400.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, powder for solution for infusion

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Piperacillin with tazobactam (Non-proprietary)**

Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 250mg powder for solution for infusion vials | 1 vial [PoM] £9.55 DT = £7.65 (Hospital only) | 10 vial [PoM] £86.40 (Hospital only)

Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Piperacillin 4g / Tazobactam 500mg powder for solution for infusion vials | 1 vial [PoM] £15.75-£19.97 (Hospital only) | 1 vial [PoM] £12.90 | 10 vial [PoM] £48.00-£76.50 | 10 vial [PoM] £99.00 (Hospital only)

▶ **Tazocin (Pfizer Ltd)**

Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Tazocin 2g/0.25g powder for solution for infusion vials | 1 vial [PoM] £7.65 DT = £7.65

Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Tazocin 4g/0.5g powder for solution for infusion vials | 1 vial [PoM] £15.17

F 362

Ticarcillin with clavulanic acid

22-May-2020

● **INDICATIONS AND DOSE****Infections due to *Pseudomonas* and *Proteus* spp.**

▶ BY INTRAVENOUS INFUSION

- ▶ Preterm neonate (body-weight up to 2 kg): 80 mg/kg every 12 hours.
- ▶ Preterm neonate (body-weight 2 kg and above): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
- ▶ Neonate: 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
- ▶ Child (body-weight up to 40 kg): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections
- ▶ Child (body-weight 40 kg and above): 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
- **INTERACTIONS** → Appendix 1: clavulanate · penicillins
- **SIDE-EFFECTS** Eosinophilia · haemorrhage · hypokalaemia · thrombophlebitis
- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Accumulation of electrolytes contained in preparation can occur in patients with renal failure.
Dose adjustments In neonates, reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
In children aged 1 month–17 years, use normal dose every 8 hours if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use half normal dose every 8 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be important, consult local guidelines. For intermittent infusion, dilute reconstituted solution further to a concentration of 16–32 mg/mL with glucose 5%; infuse over 30–40 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

▶ **Timentin (GlaxoSmithKline UK Ltd)**

Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial [PoM] £21.32

ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE

F 362

Benzathine benzylpenicillin

24-Apr-2020

(Benzathine penicillin G)● **INDICATIONS AND DOSE****Erysipelas | Yaws | Pinta**

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child (body-weight up to 30 kg): 0.6 million units as a single dose, mid-lateral thigh muscle is the preferred site of injection
- ▶ Child (body-weight 30 kg and above): 1.2 million units as a single dose, mid-lateral thigh muscle is the preferred site of injection

Syphilis [primary and secondary stage]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years: 50 000 units/kg (max. per dose 2.4 million units) as a single dose, mid-lateral thigh muscle is the preferred site of injection, if clinical symptoms recur or laboratory findings remain strongly positive—repeat treatment
- ▶ Child 12–17 years: 2.4 million units as a single dose, outer quadrant of the gluteus maximus or Hochstetter's ventrogluteal field is the preferred site of injection, if clinical symptoms recur or laboratory findings remain strongly positive—repeat treatment

Syphilis [late-stage (latent seropositive)]

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years: 50 000 units/kg once weekly (max. per dose 2.4 million units) for 3 weeks, mid-lateral thigh muscle is the preferred site of injection
- ▶ Child 12–17 years: 2.4 million units once weekly for 3 weeks, outer quadrant of the gluteus

continued →

maximus or Hochstetter's ventrogluteal field is the preferred site of injection

Congenital syphilis [without neurological involvement]

► BY DEEP INTRAMUSCULAR INJECTION

► Neonate: 50 000 units/kg as a single dose, mid-lateral thigh muscle is the preferred site of injection.

► Child 1–24 months: 50 000 units/kg as a single dose, mid-lateral thigh muscle is the preferred site of injection

Prophylaxis of rheumatic fever [without cardiac involvement] | Prophylaxis of poststreptococcal glomerulonephritis [without cardiac involvement] | Prophylaxis of erysipelas [without cardiac involvement]

► BY DEEP INTRAMUSCULAR INJECTION

► Child (body-weight up to 30 kg): 0.6 million units every 3–4 weeks for at least 5 years or up to 21 years of age (whichever is longer), mid-lateral thigh muscle is the preferred site of injection in children

► Child (body-weight 30 kg and above): 1.2 million units every 3–4 weeks for at least 5 years or up to 21 years of age (whichever is longer), mid-lateral thigh muscle is the preferred site of injection in children

Prophylaxis of rheumatic fever [transient cardiac involvement] | Prophylaxis of poststreptococcal glomerulonephritis [transient cardiac involvement] | Prophylaxis of erysipelas [transient cardiac involvement]

► BY DEEP INTRAMUSCULAR INJECTION

► Child (body-weight up to 30 kg): 0.6 million units every 3–4 weeks for at least 10 years or up to 21 years of age (whichever is longer), mid-lateral thigh muscle is the preferred site of injection in children

► Child (body-weight 30 kg and above): 1.2 million units every 3–4 weeks for at least 10 years or up to 21 years of age (whichever is longer), mid-lateral thigh muscle is the preferred site of injection in children

Prophylaxis of rheumatic fever [persistent cardiac involvement] | Prophylaxis of poststreptococcal glomerulonephritis [persistent cardiac involvement] | Prophylaxis of erysipelas [persistent cardiac involvement]

► BY DEEP INTRAMUSCULAR INJECTION

► Child (body-weight up to 30 kg): 0.6 million units every 3–4 weeks for at least 10 years or up to 40 years of age (whichever is longer); life-long prophylaxis may be necessary, mid-lateral thigh muscle is the preferred site of injection in children

► Child (body-weight 30 kg and above): 1.2 million units every 3–4 weeks for at least 10 years or up to 40 years of age (whichever is longer); life-long prophylaxis may be necessary, mid-lateral thigh muscle is the preferred site of injection in children

● **INTERACTIONS** → Appendix 1: penicillins

● **SIDE-EFFECTS**

- **Common or very common** Increased risk of infection
- **Uncommon** Oral disorders
- **Rare or very rare** Arthralgia · nephropathy
- **Frequency not known** Encephalopathy · Hoigne's syndrome · Jarisch-Herxheimer reaction · local reaction (in infants)

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients allergic to peanuts or soya (contains phospholipids from soya lecithin).

● **PREGNANCY** Manufacturer advises not known to be harmful.

● **BREAST FEEDING** Manufacturer advises present in milk in small amounts but not known to be harmful. Monitor infant for effects on the gastrointestinal flora; discontinue breast feeding if diarrhoea, candidiasis or rash in the infant occur.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment (possible risk of delayed metabolism and excretion in severe impairment).

● **RENAL IMPAIRMENT** Manufacturer advises caution in impairment (possible risk of delayed metabolism and excretion in severe impairment).

Dose adjustments Manufacturer advises reduce daily dose by 25% and give as a single dose if creatinine clearance 15–59 mL/minute; reduce daily dose by 50–80% and give in 2–3 divided doses if creatinine clearance less than 15 mL/minute (maximum 1–3 million units per day).

● **MONITORING REQUIREMENTS**

► Manufacturer advises observe the patient for hypersensitivity reactions for at least 30 minutes after the injection.

► Manufacturer advises monitor renal, hepatic and haematopoietic function periodically in patients on long-term treatment.

● **EFFECT ON LABORATORY TESTS** False-positive direct Coombs' test. False-positive urinary glucose. False-positive urobilinogen. False-positive urinary protein using precipitation techniques, the Folin-Ciocalteu-Lowry method, or the biuret method. False-positive urinary amino acids using the ninhydrin method. Increased levels of urinary 17-ketosteroids using the Zimmermann reaction.

● **DIRECTIONS FOR ADMINISTRATION** For *deep intramuscular injection*, manufacturer advises reconstitute with water for injection and inject slowly with low pressure. No more than 5 mL should be administered per injection site and do not administer into tissues with reduced perfusion. Avoid rubbing the injection site after the injection.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Lecithin, polysorbates

► **Benzathine benzylpenicillin (Non-proprietary)**

Benzathine benzylpenicillin 1.2 mega unit Benzathine benzylpenicillin 1.2million unit powder and solvent for suspension for injection vials | 1 vial [PoM] £9.50

Benzathine benzylpenicillin 2.4 mega unit Benzathine benzylpenicillin 2.4million unit powder and solvent for suspension for injection vials | 1 vial [PoM] £9.50

► **Extencillin (Imported (France))**

F 362

21-May-2020

Benzylpenicillin sodium

(Penicillin G)

● **INDICATIONS AND DOSE**

Mild to moderate susceptible infections | Throat infections | Otitis media | Pneumonia | Cellulitis

► BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.

► Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

► Child: 25 mg/kg every 6 hours; increased if necessary to 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours) in severe infection, intravenous route recommended in infants

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 25 mg/kg every 4 hours; increased if necessary to 50 mg/kg every 4 hours (max. per dose 2.4 g every 4 hours)

Meningitis | Meningococcal disease

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.
- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.
- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital

Neonatal sepsis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 50 mg/kg every 8 hours, intravenous route recommended in neonates.
- ▶ Neonate 7 days to 28 days: 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

IMPORTANT SAFETY INFORMATION

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fever · Jarisch-Herxheimer reaction
 - ▶ **Rare or very rare** Neurotoxicity · neutropenia
 - ▶ **Frequency not known** Coma
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause

neurotoxicity, including cerebral irritation, convulsions, or coma.

Dose adjustments Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours.

Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Blood infections, antibacterial therapy p. 322, Cardiovascular system infections, antibacterial therapy p. 322, Central nervous system infections, antibacterial therapy p. 323, Ear infections, antibacterial therapy p. 324, Oropharyngeal infections, antibacterial therapy p. 761, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- ▶ **Benzylpenicillin sodium (Non-proprietary)**
 - Benzylpenicillin sodium 600 mg** Benzylpenicillin 600mg powder for solution for injection vials | 2 vial [POM] £6.01-£6.02 DT = £6.02 | 25 vial [POM] £75.12-£75.25

Phenoxyethylpenicillin (Penicillin V)

18-May-2020

● INDICATIONS AND DOSE**Oral infections | Otitis media**

- ▶ BY MOUTH
- ▶ Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day

Acute sore throat

- ▶ BY MOUTH
- ▶ Child 1–11 months: 62.5 mg 4 times a day, alternatively 125 mg twice daily for 5–10 days
- ▶ Child 1–5 years: 125 mg 4 times a day, alternatively 250 mg twice daily for 5–10 days
- ▶ Child 6–11 years: 250 mg 4 times a day, alternatively 500 mg twice daily for 5–10 days
- ▶ Child 12–17 years: 500 mg 4 times a day, alternatively 1000 mg twice daily for 5–10 days

Prevention of recurrence of rheumatic fever

- ▶ BY MOUTH
- ▶ Child 1 month–5 years: 125 mg twice daily
- ▶ Child 6–17 years: 250 mg twice daily

continued →

Prevention of secondary case of invasive group A streptococcal infection

► BY MOUTH

► Neonate: 12.5 mg/kg every 6 hours (max. per dose 62.5 mg) for 10 days.

- Child 1-11 months: 62.5 mg every 6 hours for 10 days
- Child 1-5 years: 125 mg every 6 hours for 10 days
- Child 6-11 years: 250 mg every 6 hours for 10 days
- Child 12-17 years: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

► BY MOUTH

- Child 1-11 months: 62.5 mg twice daily
- Child 1-4 years: 125 mg twice daily
- Child 5-17 years: 250 mg twice daily

Acute sinusitis

► BY MOUTH

- Child 1-11 months: 62.5 mg 4 times a day for 5 days
- Child 1-5 years: 125 mg 4 times a day for 5 days

Amoxicillin

21-May-2020

(Amoxycillin)● **INDICATIONS AND DOSE****Susceptible infections (e.g. sinusitis, salmonellosis, oral infections)**

► BY MOUTH

► Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

- Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
- Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection.

► Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection.

► Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Community-acquired pneumonia

► BY MOUTH

- Child 1-11 months: 125 mg 3 times a day for 5 days; increased if necessary up to 30 mg/kg 3 times a day
- Child 1-4 years: 250 mg 3 times a day for 5 days; increased if necessary up to 30 mg/kg 3 times a day
- Child 5-11 years: 500 mg 3 times a day for 5 days; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g 3 times a day)
- Child 12-17 years: 500 mg 3 times a day for 5 days; increased if necessary up to 1 g 3 times a day

Acute exacerbation of bronchiectasis

► BY MOUTH

- Child 1-11 months: 125 mg 3 times a day for 7–14 days
- Child 1-4 years: 250 mg 3 times a day for 7–14 days
- Child 5-17 years: 500 mg 3 times a day for 7–14 days

Acute cough [if systemically very unwell or at higher risk of complications]

► BY MOUTH

- Child 1-11 months: 125 mg 3 times a day for 5 days
- Child 1-4 years: 250 mg 3 times a day for 5 days
- Child 5-17 years: 500 mg 3 times a day for 5 days

Acute otitis media

► BY MOUTH

- Child 1-11 months: 125 mg 3 times a day for 5–7 days
- Child 1-4 years: 250 mg 3 times a day for 5–7 days
- Child 5-17 years: 500 mg 3 times a day for 5–7 days

Cystic fibrosis (treatment of asymptomatic *Haemophilus influenzae* carriage or mild exacerbation)

▶ BY MOUTH

- ▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
- ▶ Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- ▶ Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
- ▶ Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection.

- ▶ Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection.

- ▶ Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

Lyme disease (under expert supervision)

▶ BY MOUTH

- ▶ Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg 3 times a day) usual duration 2–4 weeks.

Lyme disease [erythema migrans and/or non-focal symptoms] | Lyme disease [affecting cranial nerves or peripheral nervous system]

▶ BY MOUTH

- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 34 kg): 30 mg/kg 3 times a day for 21 days
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 34 kg and above): 1 g 3 times a day for 21 days
- ▶ Child 12–17 years (administered on expert advice): 1 g 3 times a day for 21 days

Lyme arthritis | Acrodermatitis chronica atrophicans

▶ BY MOUTH

- ▶ Child 1 month–11 years (administered on expert advice) (body-weight up to 34 kg): 30 mg/kg 3 times a day for 28 days
- ▶ Child 1 month–11 years (administered on expert advice) (body-weight 34 kg and above): 1 g 3 times a day for 28 days
- ▶ Child 12–17 years (administered on expert advice): 1 g 3 times a day for 28 days

Anthrax (treatment and post-exposure prophylaxis)

▶ BY MOUTH

- ▶ Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
- ▶ Child (body-weight 20 kg and above): 500 mg 3 times a day

Listerial meningitis (in combination with another antibiotic)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50–100 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50–100 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibiotic)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.

- ▶ Neonate 7 days to 28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for *Haemophilus influenzae*

▶ BY MOUTH

- ▶ Child 1 month–4 years: 125 mg twice daily
- ▶ Child 5–11 years: 250 mg twice daily
- ▶ Child 12–17 years: 500 mg twice daily

***Helicobacter pylori* eradication in combination with clarithromycin and omeprazole**

▶ BY MOUTH

- ▶ Child 1–5 years: 250 mg twice daily
- ▶ Child 6–11 years: 500 mg twice daily
- ▶ Child 12–17 years: 1 g twice daily

***Helicobacter pylori* eradication in combination with metronidazole and omeprazole**

▶ BY MOUTH

- ▶ Child 1–5 years: 125 mg 3 times a day
- ▶ Child 6–11 years: 250 mg 3 times a day
- ▶ Child 12–17 years: 500 mg 3 times a day

Prophylaxis of recurrent urinary-tract infection

▶ BY MOUTH

- ▶ Child 16–17 years: 250 mg once daily, dose to be taken at night, alternatively 500 mg for 1 dose, following exposure to a trigger

Prophylaxis of recurrent urinary-tract infection (initiated under specialist supervision)

▶ BY MOUTH

- ▶ Child 3–11 months: 62.5 mg once daily, dose to be taken at night
- ▶ Child 1–4 years: 125 mg once daily, dose to be taken at night
- ▶ Child 5–15 years: 250 mg once daily, dose to be taken at night

Lower urinary-tract infection in pregnancy

▶ BY MOUTH

- ▶ Child 12–17 years: 500 mg 3 times a day for 7 days

Lower urinary-tract infection

▶ BY MOUTH

- ▶ Child 3–11 months: 125 mg 3 times a day for 3 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days
- ▶ Child 5–15 years: 500 mg 3 times a day for 3 days

Asymptomatic bacteriuria in pregnancy

▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): 250–500 mg 3 times a day, alternatively 750–1000 mg twice daily

Urinary-tract infection (catheter-associated)

▶ BY MOUTH

- ▶ Child 3–11 months: 125 mg 3 times a day for 7 to 10 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 7 to 10 days
- ▶ Child 5–15 years: 500 mg 3 times a day for 7 to 10 days
- ▶ Child 16–17 years: 500 mg 3 times a day for 7 days

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature. EvGr Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. ⚠

EvGr Amoxicillin is used for the treatment of acute exacerbation of bronchiectasis, Δ but is not licensed for this indication.

EvGr Amoxicillin is used for prophylaxis of recurrent urinary-tract infection, Δ but is not licensed for this indication.

• CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

▶ With intravenous use Accumulation of sodium can occur with high parenteral doses

• **INTERACTIONS** → Appendix 1: penicillins

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ **Rare or very rare** Colitis haemorrhagic · crystalluria · dizziness · hyperkinesia · hypersensitivity vasculitis · mucocutaneous candidiasis · neutropenia

▶ **Frequency not known** Jarisch-Herxheimer reaction

SPECIFIC SIDE-EFFECTS

▶ **Rare or very rare**

▶ With oral use Black hairy tongue

• **PREGNANCY** Not known to be harmful.

• **BREAST FEEDING** Trace amount in milk, but appropriate to use.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution.

• **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).

▶ With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.

Dose adjustments Reduce dose in severe impairment; rashes more common.

• DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines.

Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

• **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Anthrax p. 391, Antibacterials, use for prophylaxis p. 319, Cardiovascular system infections, antibacterial therapy p. 322, Central nervous system infections, antibacterial therapy p. 323, Ear infections, antibacterial therapy p. 324, Gastro-intestinal system infections, antibacterial therapy p. 324, Lyme disease p. 391, Nose infections, antibacterial therapy p. 326, Oral bacterial infections p. 326, Peptic ulceration p. 58, Respiratory system infections, antibacterial therapy p. 327, Urinary-tract infections p. 400.

• **PATIENT AND CARER ADVICE** Patient counselling is advised for Amoxicillin (Amoxil[®]) paediatric suspension (use of pipette).

Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ Amoxicillin (Non-proprietary)

Amoxicillin (as Amoxicillin sodium) 250 mg Amoxicillin 250mg powder for solution for injection vials | 10 vial **[PoM]** £4.80 | 10 vial **[PoM]** £4.50 (Hospital only)

Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500mg powder for solution for injection vials | 10 vial **[PoM]** £9.60 DT = £5.48 | 10 vial **[PoM]** £12.00 DT = £5.48 (Hospital only)

Amoxicillin (as Amoxicillin sodium) 1 gram Amoxicillin 1g powder for solution for injection vials | 1 vial **[PoM]** £1.92 | 10 vial **[PoM]** £16.50 DT = £10.96 (Hospital only)

▶ Amoxil (GlaxoSmithKline UK Ltd)

Amoxicillin (as Amoxicillin sodium) 500 mg Amoxil 500mg powder for solution for injection vials | 10 vial **[PoM]** £5.48 DT = £5.48

Amoxicillin (as Amoxicillin sodium) 1 gram Amoxil 1g powder for solution for injection vials | 10 vial **[PoM]** £10.96 DT = £10.96

Oral suspension

Ampicillin

21-May-2020

• INDICATIONS AND DOSE

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

▶ BY MOUTH

▶ Neonate 7 days to 20 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

▶ Neonate 21 days to 28 days: 30 mg/kg 4 times a day (max. per dose 125 mg).

▶ Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

▶ Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

▶ Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.
- ▶ Neonate 7 days to 20 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.
- ▶ Neonate 21 days to 28 days: 30 mg/kg every 6 hours, increased if necessary to 60 mg/kg every 6 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.
- ▶ Child: 25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours), increased if necessary to 50 mg/kg every 6 hours (max. per dose 1 g every 6 hours), increased dose used in severe infection

Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibacterial)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Listerial meningitis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 100 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 100 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 100 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

● CAUTIONS

GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS** Colitis haemorrhagic
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT**
- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
- Dose adjustments** If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With oral use Administer at least 30 minutes before food.

- ▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

26-May-2020

Co-fluapicil

● INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
- ▶ Child 10–17 years: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

- ▶ BY MOUTH
- ▶ Child 10–17 years: 500/500 mg every 6 hours

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

- Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Manufacturer advises:
- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
 - flucloxacillin should be used with caution in patients with hepatic impairment;
 - careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

- **CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS** Arthralgia · bronchospasm · coma · dyspnoea · electrolyte imbalance · eosinophilia · erythema nodosum · gastrointestinal disorder · hallucination · Jarisch-Herxheimer reaction · myalgia · purpura non-thrombocytopenic · vasculitis
- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA- LACTAMASE INHIBITOR

F 362

21-May-2020

Co-amoxiclav● **INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites

▶ **BY MOUTH USING TABLETS**

▶ Child 12-17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection

▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

▶ Neonate: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months.

▶ Child 1-2 months: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months

▶ Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 125/31 suspension)

▶ **BY MOUTH USING ORAL SUSPENSION**

▶ Neonate: 0.25 mL/kilogram 3 times a day.

▶ Child 1-11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection

▶ Child 1-5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 250/62 suspension)

▶ **BY MOUTH USING ORAL SUSPENSION**

▶ Child 6-11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, and animal bites (doses for 400/57 suspension)

▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 2-23 months: 0.15 mL/kilogram twice daily, doubled in severe infection
- ▶ Child 2-6 years (body-weight 13-21 kg): 2.5 mL twice daily, doubled in severe infection
- ▶ Child 7-12 years (body-weight 22-40 kg): 5 mL twice daily, doubled in severe infection
- ▶ Child 12-17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Cellulitis | Erysipelas▶ **BY MOUTH USING TABLETS**

▶ Child 12-17 years: 250/125 mg every 8 hours, alternatively 500/125 mg every 8 hours for 5-7 days then review (review after 7 days in severe infection or if infection near the eyes or nose)

▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- ▶ Child 1-2 months: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months
- ▶ Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Cellulitis (doses for 125/31 suspension) | Erysipelas (doses for 125/31 suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5-7 days then review (review after 7 days in severe infection or if infection near the eyes or nose), dose doubled in severe infection
- ▶ Child 1-5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 5-7 days then review (review after 7 days in severe infection or if infection near the eyes or nose), dose doubled in severe infection

Cellulitis (doses for 250/62 suspension) | Erysipelas (doses for 250/62 suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 6-11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 5-7 days then review (review after 7 days in severe infection or if infection near the eyes or nose), dose doubled in severe infection

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial▶ **BY MOUTH USING TABLETS**

▶ Child 12-17 years: 250/125 mg every 8 hours for 5 days

Community-acquired pneumonia (doses for 125/31 suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Child 1-11 months: 0.5 mL/kilogram 3 times a day for 5 days
- ▶ Child 1-5 years: 0.5 mL/kilogram 3 times a day for 5 days, alternatively 10 mL 3 times a day for 5 days

Community-acquired pneumonia (doses for 250/62 suspension)▶ **BY MOUTH USING ORAL SUSPENSION**

▶ Child 6-11 years: 0.3 mL/kilogram 3 times a day for 5 days, alternatively 10 mL 3 times a day for 5 days

Community-acquired pneumonia▶ **BY MOUTH USING TABLETS**

- ▶ Child 12-17 years: 500/125 mg 3 times a day for 5 days
- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Child 1-2 months: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months
- ▶ Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Hospital-acquired pneumonia (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.5 mL/kilogram 3 times a day for 5 days then review
- ▶ Child 1–5 years: 0.5 mL/kilogram 3 times a day for 5 days then review, alternatively 10 mL 3 times a day for 5 days then review

Hospital-acquired pneumonia (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.3 mL/kilogram 3 times a day for 5 days then review, alternatively 10 mL 3 times a day for 5 days then review

Hospital-acquired pneumonia

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 500/125 mg 3 times a day for 5 days then review

Acute exacerbation of bronchiectasis (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day for 7–14 days
- ▶ Child 1–5 years: 5 mL 3 times a day for 7–14 days, alternatively 0.25 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 5 mL 3 times a day for 7–14 days, alternatively 0.15 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg 3 times a day for 7–14 days, alternatively 500/125 mg 3 times a day for 7–14 days
- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 1–2 months: 30 mg/kg every 12 hours, intravenous infusion is recommended in children less than 3 months
- ▶ Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Acute sinusitis (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day for 5 days
- ▶ Child 1–5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kilogram 3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kilogram 3 times a day for 5 days

Acute sinusitis

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days

Acute otitis media (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1–11 months: 0.25 mL/kilogram 3 times a day for 5–7 days
- ▶ Child 1–5 years: 5 mL 3 times a day for 5–7 days, alternatively 0.25 mL/kilogram 3 times a day for 5–7 days

Acute otitis media (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 5 mL 3 times a day for 5–7 days, alternatively 0.15 mL/kilogram 3 times a day for 5–7 days

Acute otitis media

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 250/125 mg 3 times a day for 5–7 days, alternatively 500/125 mg 3 times a day for 5–7 days

Acute pyelonephritis (doses for 125/31 suspension) | Urinary-tract infection (catheter-associated) (doses for 125/31 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 3–11 months: 0.25 mL/kilogram 3 times a day for 7 to 10 days, dose doubled in severe infection
- ▶ Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 7 to 10 days, dose doubled in severe infection

Acute pyelonephritis (doses for 250/62 suspension) | Urinary-tract infection (catheter-associated) (doses for 250/62 suspension)

- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 6–11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day for 7 to 10 days, dose doubled in severe infection

Acute pyelonephritis | Urinary-tract infection (catheter-associated)

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–15 years: 250/125 mg 3 times a day for 7–10 days, alternatively 500/125 mg 3 times a day for 7–10 days
- ▶ Child 16–17 years: 500/125 mg 3 times a day for 7–10 days
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 3 months–15 years: 30 mg/kg every 8 hours (max. per dose 1.2 g)
- ▶ Child 16–17 years: 1.2 g every 8 hours

DOSE EQUIVALENCE AND CONVERSION

- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **UNLICENSED USE** Co-amoxiclav may be used as detailed below, although these situations are considered unlicensed:
 - **E_vGr** treatment of acute exacerbation of bronchiectasis
 - treatment of hospital-acquired pneumonia
 - duration of treatment for acute sinusitis
 - duration of treatment for acute otitis media **A**
- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction
- **CAUTIONS**
 - GENERAL CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)
 - SPECIFIC CAUTIONS**
 - ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **INTERACTIONS** → Appendix 1: clavulanate · penicillins
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Increased risk of infection
 - ▶ **Uncommon** Dizziness · dyspepsia · headache
 - ▶ **Rare or very rare** Neutropenia

- ▶ **Frequency not known** Colitis haemorrhagic · crystalluria · hypersensitivity vasculitis · meningitis aseptic

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Akathisia · black hairy tongue · cholangitis · Kounis syndrome

SIDE-EFFECTS, FURTHER INFORMATION Hepatic events have been rarely reported in children.

Signs and symptoms usually occur during or shortly after treatment but in some cases may occur several weeks after discontinuation.

- **PREGNANCY** Manufacturer advises avoid unless essential—may be associated with an increased risk of necrotising enterocolitis in neonates.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Monitoring** Monitor liver function in liver disease.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments ▶ With oral use *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets*: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². *Co-amoxiclav 400/57 suspension*: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- ▶ With intravenous use *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For *intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For *intravenous injection*, administer over 3–4 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Ear infections, antibacterial therapy p. 324, Gastro-intestinal system infections, antibacterial therapy p. 324, Musculoskeletal system infections, antibacterial therapy p. 326, Nose infections, antibacterial therapy p. 326, Oropharyngeal infections, antibacterial therapy p. 761, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329, Urinary-tract infections p. 400.

Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Augmentin Intravenous 1.2g powder for solution for injection vials | 10 vial [PoM] £10.60

ANTIBACTERIALS > PENICILLINS,
MERCILLINAM-TYPE

F 362

Pivmecillinam hydrochloride

22-May-2020

● INDICATIONS AND DOSE
Acute uncomplicated cystitis
▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets

Chronic or recurrent bacteriuria
▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections
▶ BY MOUTH

- ▶ Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

- **UNLICENSED USE** Not licensed for use in children under 3 months.
- **CONTRA-INDICATIONS** Carnitine deficiency · gastro-intestinal obstruction · oesophageal strictures
- **CAUTIONS** Avoid in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Vulvovaginal fungal infection
 - ▶ **Uncommon** Dizziness · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headache · oral ulceration · vertigo
- **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive newborn screening results for isovaleric acidemia may occur in neonates born to mothers receiving pivmecillinam during late pregnancy.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Flucloxacillin

21-May-2020

● INDICATIONS AND DOSE
Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia
▶ BY MOUTH

- ▶ Neonate up to 7 days: 25 mg/kg twice daily.
- ▶ Neonate 7 days to 20 days: 25 mg/kg 3 times a day.
- ▶ Neonate 21 days to 28 days: 25 mg/kg 4 times a day.

- ▶ Child 1 month-1 year: 62.5–125 mg 4 times a day
- ▶ Child 2-9 years: 125–250 mg 4 times a day
- ▶ Child 10-17 years: 250–500 mg 4 times a day
- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 25 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 25 mg/kg every 6 hours.

- ▶ Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Impetigo
▶ BY MOUTH

- ▶ Neonate up to 7 days: 25 mg/kg twice daily.
- ▶ Neonate 7 days to 20 days: 25 mg/kg 3 times a day.
- ▶ Neonate 21 days to 28 days: 25 mg/kg 4 times a day.
- ▶ Child 1 month-1 year: 62.5–125 mg 4 times a day for 5–7 days
- ▶ Child 2-9 years: 125–250 mg 4 times a day for 5–7 days
- ▶ Child 10-17 years: 250–500 mg 4 times a day for 5–7 days
- ▶ **BY INTRAMUSCULAR INJECTION**
- ▶ Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)
- ▶ **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ Neonate up to 7 days: 25 mg/kg every 12 hours.

- ▶ Neonate 7 days to 20 days: 25 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 25 mg/kg every 6 hours.

- ▶ Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Severe infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia (severe infection) | Adjunct in impetigo (severe infection)
▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 50 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
- ▶ Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Cellulitis | Erysipelas

- ▶ BY MOUTH
- ▶ Child 1 month–1 year: 62.5–125 mg 4 times a day for 5–7 days then review
- ▶ Child 2–9 years: 125–250 mg 4 times a day for 5–7 days then review
- ▶ Child 10–17 years: 250–500 mg 4 times a day for 5–7 days then review
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 12.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Endocarditis (in combination with other antibacterial if necessary)

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Osteomyelitis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50–100 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Cerebral abscess | Staphylococcal meningitis

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 7 days: 50–100 mg/kg every 12 hours.
- ▶ Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
- ▶ Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
- ▶ Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Staphylococcal lung infection in cystic fibrosis

- ▶ BY MOUTH
- ▶ Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day
- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

- ▶ BY MOUTH
- ▶ Neonate: 125 mg twice daily.

- ▶ Child 1 month–3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

- ▶ BY MOUTH
- ▶ Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

- **UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Manufacturer advises:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- flucloxacillin should be used with caution in patients with hepatic impairment
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

CAUTIONS

- ▶ With intravenous use accumulation of electrolytes can occur with high doses · risk of kernicterus in jaundiced neonates when high doses given parenterally

- **INTERACTIONS** → Appendix 1: penicillins

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Rare or very rare** Arthralgia · fever · neutropenia

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Gastrointestinal disorder
- ▶ **Rare or very rare**
- ▶ With oral use Eosinophilia · myalgia
- ▶ **Frequency not known**
- ▶ With parenteral use Bronchospasm · coma · dyspnoea · electrolyte imbalance · erythema nodosum · hallucination · Jarisch-Herxheimer reaction · nephropathy · neurotoxicity · oral candidiasis · platelet dysfunction · purpura non-thrombocytopenic · vasculitis

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; including in those with risk factors for hepatic reactions.

RENAL IMPAIRMENT

- ▶ With intravenous use Accumulation of electrolytes can occur in patients with renal failure.

Dose adjustments Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute reconstituted solution in Glucose 5% or Sodium Chloride 0.9% and give intermittently over 30–60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Cardiovascular system infections, antibacterial therapy p. 322, Ear infections, antibacterial therapy p. 324, Musculoskeletal system infections, antibacterial therapy p. 326, Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.

ANTIBACTERIALS > POLYMYXINS

Colistimethate sodium

01-May-2020

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

● INDICATIONS AND DOSE

Serious infections due to selected aerobic Gram-negative bacteria in patients with limited treatment options

▶ BY INTRAVENOUS INFUSION

- ▶ Child (body-weight up to 41 kg): 75 000–150 000 units/kg daily in 3 divided doses, the data supporting the dose regimen are very limited—consult product literature for available information, including recommendation to use lean body-weight for dosing
- ▶ Child (body-weight 41 kg and above): 9 million units daily in 2–3 divided doses, the data supporting the dose regimen are very limited—consult product literature for available information, including recommendation to use lean body-weight for dosing

Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis

▶ BY INHALATION OF NEBULISED SOLUTION

- ▶ Child 1–23 months: 0.5–1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
 - ▶ Child 2–17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
- ###### ▶ BY INHALATION OF POWDER
- ▶ Child 6–17 years: 1.66 million units twice daily

- **CONTRA-INDICATIONS** Myasthenia gravis

● CAUTIONS

GENERAL CAUTIONS Children under 1 year of age (effects of immature renal and metabolic function on conversion to active colistin not known)

SPECIFIC CAUTIONS

- ▶ When used by inhalation Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS** → Appendix 1: colistimethate

● SIDE-EFFECTS

▶ Common or very common

- ▶ When used by inhalation Arthralgia · asthenia · asthma · balance impaired · chest discomfort · cough · dysphonia · dyspnoea · fever · haemorrhage · headache · lower respiratory tract infection · nausea · respiratory disorders · taste altered · throat complaints · tinnitus · vomiting

▶ Uncommon

- ▶ When used by inhalation Anxiety · appetite decreased · diarrhoea · drowsiness · ear congestion · flatulence · oral disorders · proteinuria · seizure · sputum purulent · thirst · weight change

▶ Rare or very rare

- ▶ With parenteral use Confusion · nephrotoxicity · presyncope · psychosis · speech slurred · visual impairment

▶ Frequency not known

- ▶ With parenteral use Apnoea · neurological effects · neurotoxicity · renal disorder · sensory disorder

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity and nephrotoxicity are dose-related.

● PREGNANCY

- ▶ When used by inhalation Clinical use suggests probably safe.
- ▶ With intravenous use Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

● HEPATIC IMPAIRMENT

- ▶ With intravenous use Manufacturer advises caution (no information available).

● RENAL IMPAIRMENT

- ▶ When used by inhalation Manufacturer advises caution.
- ▶ With intravenous use Consult product literature.

Monitoring

▶ With intravenous use In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor renal function.
- ▶ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

● DIRECTIONS FOR ADMINISTRATION

- ▶ When used by inhalation Manufacturer advises if other treatments are being administered, they should be taken in the order recommended by the physician. For *nebulisation*, consult product literature for information on reconstitution and dilution.
- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 40 000 units/mL with Sodium Chloride 0.9%; give over 30–60 minutes. Patients fitted with a totally implantable venous access device may tolerate an injection. For *slow intravenous injection* into a totally implantable venous access device, dilute to a concentration of 90 000 units/mL with Sodium Chloride 0.9% for child under 12 years (200 000 units/mL for child over 12 years); give over at least 5 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

● PATIENT AND CARER ADVICE

- ▶ When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Colistimethate sodium and tobramycin dry powders for inhalation for treating pseudomonas lung infection in cystic fibrosis (March 2013)** NICE TA276
Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta276

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ Colistimethate sodium (Non-proprietary)

Colistimethate sodium 1000000 unit Colistimethate 1million unit powder for solution for injection vials | 10 vial **[PoM]** £30.00 DT = £18.00 (Hospital only)

▶ Colomycin (Teva UK Ltd)

Colistimethate sodium 1000000 unit Colomycin 1million unit powder for solution for injection vials | 10 vial **[PoM]** £18.00 DT = £18.00

Colistimethate sodium 2000000 unit Colomycin 2million unit powder for solution for injection vials | 10 vial **[PoM]** £32.40 DT = £32.40

▶ Promixin (Profile Pharma Ltd)

Colistimethate sodium 1000000 unit Promixin 1million unit powder for solution for injection vials | 10 vial **[PoM]** £37.50 DT = £18.00 (Hospital only)

Inhalation powder

▶ Colobreathe (Teva UK Ltd)

Colistimethate sodium 1662500 unit Colobreathe 1,662,500unit inhalation powder capsules | 56 capsule **[PoM]** £968.80 DT = £968.80

Powder for nebuliser solution

▶ Promixin (Profile Pharma Ltd)

Colistimethate sodium 1000000 unit Promixin 1million unit powder for nebuliser solution unit dose vials | 30 unit dose **[PoM]** £204.00 DT = £204.00

ANTIBACTERIALS > QUINOLONES

Quinolones

31-Oct-2017

MHRA/CHM advice: Systemic and inhaled fluoroquinolones (November 2018, and March 2019)

The MHRA and CHM have released important safety information regarding the use of systemic and inhaled fluoroquinolones. For restrictions and precautions, see *Important safety information* for all quinolones (ciprofloxacin p. 377).

Overview

In the UK, only fluoroquinolones are available; the recommendations below therefore refer to the use of fluoroquinolones.

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including *Salmonella*, *Shigella*, *Campylobacter*, *Neisseria*, and *Pseudomonas*. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against *Chlamydia* and some mycobacteria. Most anaerobic organisms are not susceptible.

Many *Staphylococci* are resistant to quinolones and their use should be avoided in MRSA infections.

Ofloxacin p. 729 eye drops are used in ophthalmic infections.

There is much less experience of the other quinolones in children; expert advice should be sought.

Quinolones

IMPORTANT SAFETY INFORMATION

- ▶ With intravenous use or oral use or when used by inhalation The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

- ▶ With intravenous use or oral use Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:
 - quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
 - the risk of tendon damage is increased by the concomitant use of corticosteroids;
 - if tendonitis is suspected, the quinolone should be discontinued immediately.

MHRA/CHM ADVICE: SYSTEMIC AND INHALED FLUOROQUINOLONES: SMALL INCREASED RISK OF AORTIC ANEURYSM AND DISSECTION; ADVICE FOR PRESCRIBING IN HIGH-RISK PATIENTS (NOVEMBER 2018)

- ▶ With intravenous use or oral use

The MHRA advises that benefit-risk should be assessed and other therapeutic options considered before using fluoroquinolones in patients at risk of aortic aneurysm and dissection. Patients (particularly those at risk) and their carers should be informed about rare events of aortic aneurysm and dissection, and advised to seek immediate medical attention if sudden-onset severe abdominal, chest, or back pain develops.

MHRA/CHM ADVICE: FLUOROQUINOLONE ANTIBIOTICS: NEW RESTRICTIONS AND PRECAUTIONS FOR USE DUE TO VERY RARE REPORTS OF DISABLING AND POTENTIALLY LONG-LASTING OR IRREVERSIBLE SIDE EFFECTS (MARCH 2019)

- ▶ With intravenous use or oral use

Disabling, long-lasting or potentially irreversible adverse reactions affecting musculoskeletal and nervous systems have been reported very rarely with fluoroquinolone antibiotics. Healthcare professionals are advised to inform patients to stop treatment at the first signs of a serious adverse reaction, such as tendonitis or tendon rupture, muscle pain, muscle weakness, joint pain, joint swelling, peripheral neuropathy, and CNS effects, and to contact their doctor immediately. Fluoroquinolones should not be prescribed for non-severe or self-limiting infections, or non-bacterial conditions. Unless other commonly recommended antibiotics are inappropriate,

fluoroquinolones should not be prescribed for mild to moderate infections. Fluoroquinolones should be avoided in patients who have previously had serious adverse reactions. Use of fluoroquinolones with corticosteroids should also be avoided as it may exacerbate fluoroquinolone-induced tendinitis and tendon rupture. Fluoroquinolones should be prescribed with caution in patients with renal impairment or solid-organ transplants as they are at a higher risk of tendon injury.

● CONTRA-INDICATIONS

- ▶ With intravenous use or oral use or when used by inhalation History of tendon disorders related to quinolone use

● CAUTIONS

- ▶ With intravenous use or oral use or when used by inhalation Can prolong the QT interval · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight and UV radiation should be avoided during treatment and for 48 hours after stopping treatment · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation) · psychiatric disorders
- ▶ With intravenous use or oral use children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*)

CAUTIONS, FURTHER INFORMATION

- ▶ With intravenous use or oral use Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances use of ciprofloxacin may be justified in children.

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · eye discomfort · eye disorders · nausea · skin reactions · taste altered · vision disorders · vomiting
- ▶ **Uncommon** Anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chest pain · confusion · dizziness · dry eye · eosinophilia · eye inflammation · fever · flatulence · gastrointestinal discomfort · hallucination · headache · hearing impairment · hepatic disorders · hypotension · movement disorders · oedema · pain · renal impairment · rhinitis · seizure · sensation abnormal · sleep disorders · thrombocytopenia · thrombocytosis · tinnitus · vasodilation · vertigo
- ▶ **Rare or very rare** Agranulocytosis · anaemia · angioedema · antibiotic associated colitis · arthritis · asthma · depression · dyspnoea · gait abnormal · haemolytic anaemia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypoglycaemia · idiopathic intracranial hypertension · laryngeal oedema · leucopenia · muscle complaints · muscle weakness · myasthenia gravis aggravated · nephritis tubulointerstitial · neutropenia · pancreatitis · pancytopenia · photosensitivity reaction · psychotic disorder · severe cutaneous adverse reactions (SCARs) · suicidal tendencies · syncope · tendon disorders · tremor · vasculitis
- ▶ **Frequency not known** Corneal deposits (reversible after completion of treatment) · drowsiness · increased risk of aortic aneurysm · increased risk of aortic dissection · palpitations · peripheral neuropathy (sometimes irreversible) · polyneuropathy · QT interval prolongation · self-injurious behaviour

SIDE-EFFECTS, FURTHER INFORMATION The drug should be discontinued if neurological, psychiatric, tendon disorders or hypersensitivity reactions (including severe rash) occur. For more information regarding the safety of

fluoroquinolones, please see Important Safety Information.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.

● PREGNANCY

- ▶ With intravenous use or oral use or when used by inhalation Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.

● PATIENT AND CARER ADVICE

- ▶ With intravenous use or oral use The MHRA has produced an advice sheet on serious adverse reactions affecting musculoskeletal and nervous systems associated with fluoroquinolone use, which should be provided to patients and their carers.

Ciprofloxacin

P 376

17-Apr-2020

● INDICATIONS AND DOSE

Fistulating Crohn's disease

- ▶ BY MOUTH
- ▶ Child: 5 mg/kg twice daily

Severe respiratory-tract infections, gastro-intestinal infection

- ▶ BY MOUTH
- ▶ Neonate: 15 mg/kg twice daily.

- ▶ Child: 20 mg/kg twice daily (max. per dose 750 mg)
- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10 mg/kg every 12 hours, to be given over 60 minutes.

- ▶ Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Acute exacerbation of bronchiectasis (administered on expert advice)

- ▶ BY MOUTH
- ▶ Child 1-17 years: 20 mg/kg twice daily (max. per dose 750 mg) for 7–14 days
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1-17 years: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- ▶ BY MOUTH
- ▶ Child: 20 mg/kg twice daily (max. per dose 750 mg)
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Complicated urinary-tract infections

- ▶ BY MOUTH
- ▶ Neonate: 10 mg/kg twice daily.
- ▶ Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)
- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.

- ▶ Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection

Gonorrhoea

- ▶ BY MOUTH
- ▶ Child 12-17 years: 500 mg for 1 dose

Anthrax (treatment and post-exposure prophylaxis)

- ▶ BY MOUTH
- ▶ Child: 15 mg/kg twice daily (max. per dose 500 mg)

continued →

► BY INTRAVENOUS INFUSION

- Child: 10 mg/kg every 12 hours (max. per dose 400 mg)

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

- Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.

- Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose

- Child 5–11 years: 250 mg for 1 dose

- Child 12–17 years: 500 mg for 1 dose

Acute pyelonephritis | Urinary tract infection (catheter-associated)

► BY MOUTH

- Child 16–17 years: 500 mg twice daily for 7 days

► BY INTRAVENOUS INFUSION

- Child 16–17 years: 400 mg every 8–12 hours

- **UNLICENSED USE** Not licensed for use in children under 1 year of age. Licensed for use in children over 1 year for complicated urinary-tract infections, for pseudomonas lower respiratory-tract infections in cystic fibrosis, for prophylaxis and treatment of inhalational anthrax. Licensed for use in children over 1 year for other infections where the benefit is considered to outweigh the potential risks. Not licensed for use in children for gastro-intestinal anthrax. Not licensed for use in children for prophylaxis of meningococcal meningitis.

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- **INTERACTIONS** → Appendix 1: quinolones

● **SIDE-EFFECTS**

- **Common or very common** Arthropathy

- **Uncommon** Fungal superinfection

- **Rare or very rare** Bone marrow depression · crystalluria · erythema nodosum · haematuria · intracranial pressure increased · leucocytosis · migraine · muscle tone increased · olfactory nerve disorder · status epilepticus

- **Frequency not known** Mood altered

- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.

● **RENAL IMPAIRMENT**

- **Dose adjustments** Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Antibacterials, use for prophylaxis p. 319, Anthrax p. 391, Gastro-intestinal system infections, antibacterial therapy p. 324, Genital system infections, antibacterial therapy p. 325, Respiratory system infections, antibacterial therapy p. 327, Urinary-tract infections p. 400.

● **PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infection

- **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

ANTIBACTERIALS > SULFONAMIDES**Co-trimoxazole**

26-May-2020

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

● **INDICATIONS AND DOSE****Treatment of susceptible infections**

► BY MOUTH

- Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily

- Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily

- Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily

- Child 12–17 years: 960 mg twice daily

► BY INTRAVENOUS INFUSION

- Child 6 weeks–17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

► BY MOUTH

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION

- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Co-trimoxazole may be used as detailed below, although these situations are considered unlicensed:
 - Treatment of *Burkholderia cepacia* infections in cystic fibrosis;
 - Treatment of *Stenotrophomonas maltophilia* infections; Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 652
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia
- **INTERACTIONS** → Appendix 1: sulfonamides · trimethoprim
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions
 - **Uncommon** Vomiting
 - **Rare or very rare** Agranulocytosis · angioedema · aplastic anaemia · appetite decreased · arthralgia · ataxia · cough · depression · dizziness · dyspnoea · eosinophilia · fever · haemolysis · haemolytic anaemia · hallucination · hepatic disorders · hypoglycaemia · leucopenia · lung infiltration · megaloblastic anaemia · meningitis aseptic · metabolic acidosis · methaemoglobinaemia · myalgia · myocarditis allergic · nephritis tubulointerstitial · neutropenia · oral disorders · pancreatitis · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · renal tubular acidosis ·

seizure · serum sickness · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · uveitis · vasculitis · vertigo

SIDE-EFFECTS, FURTHER INFORMATION Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.

- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
 - Dose adjustments** Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².
 - Monitoring** Plasma concentration monitoring may be required in patients with moderate to severe renal impairment; seek expert advice.
- **MONITORING REQUIREMENTS**
 - Monitor blood counts on prolonged treatment.
 - Plasma concentration monitoring may be required with high doses; seek expert advice.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.
 - For choice of antibacterial therapy, see *Pneumocystis pneumonia* p. 413.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Alcohol, propylene glycol, sulfites

Sulfadiazine

(Sulphadiazine)

26-May-2020

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

● **INDICATIONS AND DOSE****Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid)**

▶ BY MOUTH

▶ Child 12–17 years: 1 g 3 times a day until delivery

Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid)

▶ BY MOUTH

▶ Neonate: 50 mg/kg twice daily for 12 months.

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Acute porphyrias p. 652
- **CAUTIONS** Asthma · avoid in blood disorders · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · neonates (risk of kernicterus) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: sulfonamides
- **SIDE-EFFECTS**
 - ▶ **Rare or very rare** Haemolytic anaemia
 - ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · appetite decreased · ataxia · back pain · blood disorders · cough · crystalluria · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · erythema nodosum · fatigue · fever · haematuria · hallucination · headache · hepatic disorders · hypoglycaemia · hypoproteinaemia · hypothyroidism · idiopathic intracranial hypertension · insomnia · kernicterus (in neonates) · leucopenia · meningitis aseptic · myocarditis · nausea · nephritis tubulointerstitial · nephrotoxicity · nerve disorders · neurological effects · neutropenia · oral disorders · pancreatitis · photosensitivity reaction · pseudomembranous enterocolitis · psychosis · renal impairment · renal tubular necrosis · respiratory disorders · seizure · serum sickness-like reaction · severe cutaneous adverse reactions (SCARs) · skin reactions · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · vasculitis · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment or jaundice.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 27

▶ **Sulfadiazine (Non-proprietary)**

£275.84 DT = £242.18

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS**Tetracyclines****Overview**

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 381 with either streptomycin p. 334 or rifampicin p. 396), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 355).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 383 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections.

Tetracyclines

- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Angioedema · diarrhoea · headache · Henoch-Schönlein purpura · hypersensitivity · nausea · pericarditis · photosensitivity reaction · skin reactions · systemic lupus erythematosus exacerbated · vomiting
 - ▶ **Rare or very rare** Appetite decreased · discolouration of thyroid gland · dysphagia · eosinophilia · fontanelle bulging (in infants) · gastrointestinal disorders · haemolytic anaemia · hepatic disorders · idiopathic

intracranial hypertension · increased risk of infection · neutropenia · oral disorders · pancreatitis · pseudomembranous enterocolitis · Stevens-Johnson syndrome · thrombocytopenia

- ▶ **Frequency not known** Dizziness · tooth discolouration
- SIDE-EFFECTS, FURTHER INFORMATION** Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment if raised intracranial pressure develops).
- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution.

Demeclocycline hydrochloride

● INDICATIONS AND DOSE

Susceptible infections (e.g. *chlamydia*, *rickettsia* and *mycoplasma*)

- ▶ BY MOUTH
- ▶ Child 12-17 years: 150 mg 4 times a day, alternatively 300 mg twice daily

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Agranulocytosis · aplastic anaemia · hearing impairment · nephritis · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Intracranial pressure increased · muscle weakness · nephrogenic diabetes insipidus · vision disorders
- **HEPATIC IMPAIRMENT**
- Dose adjustments** Manufacturer advises maximum 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Tablet

Doxycycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. *chlamydia*, *rickettsia* and *mycoplasma*)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 8-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 4.4 mg/kg daily in 1-2 divided doses for 1 day, then maintenance 2.2 mg/kg daily in 1-2 divided doses
- ▶ Child 8-11 years (administered on expert advice) (body-weight 45 kg and above): Initially 200 mg daily in 1-2 divided doses for 1 day, then maintenance 100 mg daily
- ▶ Child 12-17 years: Initially 200 mg daily in 1-2 divided doses for 1 day, then maintenance 100 mg daily

Severe infections (including refractory urinary-tract infections)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 8-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 4.4 mg/kg daily in 1-2 divided doses for 1 day, then maintenance 2.2-4.4 mg/kg daily in 1-2 divided doses
- ▶ Child 8-11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily
- ▶ Child 12-17 years: 200 mg daily

Acute sinusitis | Acute cough [if systemically very unwell or at higher risk of complications] | Community-acquired pneumonia

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total

Acute exacerbation of bronchiectasis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7-14 days in total

Acne

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg once daily

Early syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days

Late latent syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days

Lyme disease [erythema migrans and/or non-focal symptoms] | Lyme disease [affecting cranial nerves or peripheral nervous system] | Lyme carditis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 9-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 5 mg/kg in 2 divided doses on day 1, then 2.5 mg/kg daily in 1-2 divided doses for a total of 21 days, increased if necessary up to 5 mg/kg daily for 21 days, increased dose used in severe infections; maximum 200 mg per day
- ▶ Child 9-11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily in 1-2 divided doses for 21 days
- ▶ Child 12-17 years (administered on expert advice): 200 mg daily in 1-2 divided doses for 21 days

continued →

Lyme disease [affecting central nervous system]

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 9–11 years (administered on expert advice) (body-weight up to 45 kg): Initially 5 mg/kg in 2 divided doses on day 1, then 2.5 mg/kg daily in 1–2 divided doses for a total of 21 days, increased if necessary up to 5 mg/kg daily, increased dose used in severe infections
- ▶ Child 9–11 years (administered on expert advice) (body-weight 45 kg and above): 400 mg daily in 1–2 divided doses for 21 days
- ▶ Child 12–17 years (administered on expert advice): 400 mg daily in 1–2 divided doses for 21 days

Lyme arthritis | Acrodermatitis chronica atropicans

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 9–11 years (administered on expert advice) (body-weight up to 45 kg): Initially 5 mg/kg in 2 divided doses on day 1, then 2.5 mg/kg daily in 1–2 divided doses for a total of 28 days, increased if necessary up to 5 mg/kg daily for 28 days, increased dose used in severe infections; maximum 200 mg per day
- ▶ Child 9–11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily in 1–2 divided doses for 28 days
- ▶ Child 12–17 years (administered on expert advice): 200 mg daily in 1–2 divided doses for 28 days

Anthrax (treatment or post-exposure prophylaxis)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month–11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
- ▶ Child 12–17 years: 100 mg twice daily

Prophylaxis of malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 20 mg twice daily for 3 months

Rocky Mountain spotted fever

- ▶ BY MOUTH USING DISPERSIBLE TABLETS
- ▶ Child (administered on expert advice) (body-weight up to 45 kg): 2.2 mg/kg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5–7 days
- ▶ Child (administered on expert advice) (body-weight 45 kg and above): 100 mg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5–7 days

- **UNLICENSED USE** Doxycycline may be used as detailed below, although these situations are considered outside the scope of its licence:

- **[EvGr]** Duration of treatment for acute sinusitis;
- Lyme disease **A**;
- treatment or post-exposure prophylaxis of anthrax;
- malaria prophylaxis during pregnancy;
- recurrent aphthous ulceration.

- **CAUTIONS** Alcohol dependence · children 8–11 years—use only in acute or severe infections when there are no adequate alternatives (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia) · children under 8 years—use only in severe or life-threatening conditions (e.g. Rocky Mountain spotted fever) when there are no

adequate alternatives (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dyspnoea · hypotension · peripheral oedema · tachycardia
 - ▶ **Uncommon** Gastrointestinal discomfort
 - ▶ **Rare or very rare** Antibiotic associated colitis · anxiety · arthralgia · flushing · intracranial pressure increased with papilloedema · Jarisch-Herxheimer reaction · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · skin hyperpigmentation (long term use) · tinnitus · vision disorders
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Anthrax p. 391, Genital system infections, antibacterial therapy p. 325, Lyme disease p. 391, Malaria, prophylaxis p. 420, Malaria, treatment p. 426, Nose infections, antibacterial therapy p. 326, Oropharyngeal infections, antibacterial therapy p. 761, Respiratory system infections, antibacterial therapy p. 327, Urinary-tract infections p. 400.
- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary** Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Minocycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily

Acne

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg once daily, alternatively 50 mg twice daily
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg daily

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Systemic lupus erythematosus
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
 - ▶ Rare or very rare Acute kidney injury · hearing impairment · respiratory disorders · tinnitus
 - ▶ Frequency not known Alopecia · antibiotic associated colitis · arthralgia · ataxia · breast secretion · conjunctival discolouration · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyspepsia · hyperbilirubinaemia · hyperhidrosis · polyarteritis nodosa · sensation abnormal · tear discolouration · tongue discolouration · vertigo
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tetracycline Tablets may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

▶ **Tetracycline (Non-proprietary)**Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet  £6.75 DT = £4.15**Tigecycline**

06-Apr-2020

- **DRUG ACTION** Tigecycline is a glycycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against methicillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

● **INDICATIONS AND DOSE****Complicated skin and soft tissue infections (when other antibiotics are not suitable) | Complicated intra-abdominal infections (when other antibiotics are not suitable)**▶ **BY INTRAVENOUS INFUSION**

- ▶ Child 8–11 years (under expert supervision): 1.2 mg/kg every 12 hours (max. per dose 50 mg) for 5–14 days
- ▶ Child 12–17 years (under expert supervision): 50 mg every 12 hours for 5–14 days

- **CONTRA-INDICATIONS** Children under 8 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia) · Diabetic foot infections

- **CAUTIONS** Cholestasis

- **INTERACTIONS** → Appendix 1: tigecycline

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abscess · appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · headache · healing impaired · hyperbilirubinaemia · hypoglycaemia · hypoproteinaemia · increased risk of infection · nausea · sepsis · skin reactions · vomiting
- ▶ **Uncommon** Hepatic disorders · pancreatitis · thrombocytopenia · thrombophlebitis
- ▶ **Frequency not known** Acidosis · azotaemia · hyperphosphataemia · hypofibrinogenaemia · idiopathic intracranial hypertension · photosensitivity reaction · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · tooth discolouration

SIDE-EFFECTS, FURTHER INFORMATION Side-effects similar to those of the tetracyclines can potentially occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.

- **PREGNANCY** Tetracyclines should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

Dose adjustments Manufacturer advises dose reduction of 50% in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests, amylase, lipase, coagulation and haematology parameters before starting treatment, and regularly during treatment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tygacil[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes (preferably 60 minutes).

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Tigecycline (Non-proprietary)**

Tigecycline 50 mg Tigecycline 50mg powder for solution for infusion vials | 10 vial [PoM] £290.79 (Hospital only)

Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial [PoM] £323.10 (Hospital only)

ANTIBACTERIALS > OTHER

Chloramphenicol

13-May-2020

● **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

● **INDICATIONS AND DOSE**

Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ **Child:** 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicaemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

▶ BY INTRAVENOUS INJECTION

▶ **Neonate up to 14 days:** 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.

▶ **Neonate 14 days to 28 days:** 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

▶ **Child:** (consult product literature)

● **CONTRA-INDICATIONS** Acute porphyrias p. 652

● **CAUTIONS** Avoid repeated courses and prolonged treatment

● **INTERACTIONS** → Appendix 1: chloramphenicol

● **SIDE-EFFECTS**

▶ **Rare or very rare**

▶ With parenteral use Aplastic anaemia (reversible or irreversible, with reports of resulting leukaemia)

▶ **Frequency not known**

▶ With oral use Bone marrow disorders · circulatory collapse · diarrhoea · enterocolitis · nausea · optic neuritis · oral disorders · ototoxicity · vomiting

▶ With parenteral use Agranulocytosis · bone marrow disorders · depression · diarrhoea · dry mouth · fungal superinfection · headache · nausea · nerve disorders · thrombocytopenic purpura · urticaria · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

Grey syndrome Grey baby syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

● **PREGNANCY** Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

● **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of bone-marrow depression)—monitor plasma-chloramphenicol concentration.

Dose adjustments Manufacturer advises consider dose reduction.

Monitoring Monitor plasma-chloramphenicol concentration in hepatic impairment.

● **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

● **MONITORING REQUIREMENTS**

▶ Plasma concentration monitoring preferred in those under 4 years of age.

▶ Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre. Blood counts required before and periodically during treatment.

▶ In neonates Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Chloramphenicol (Non-proprietary)**

Chloramphenicol (as Chloramphenicol sodium succinate)

1 gram Chloramphenicol 1g powder for solution for injection vials | 1 vial [PoM] £88.00 DT = £88.00

Capsule

▶ **Chloramphenicol (Non-proprietary)**

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [PoM] £377.00 DT = £377.00

Daptomycin

21-Feb-2019

● **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

● **INDICATIONS AND DOSE**

Complicated skin and soft-tissue infections caused by Gram-positive bacteria

▶ BY INTRAVENOUS INFUSION

▶ **Child 12–23 months:** 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

▶ **Child 2–6 years:** 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

▶ **Child 7–11 years:** 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher

continued →

dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

- ▶ Child 12–17 years: 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteraemia—duration of treatment in accordance with risk of complications in individual patients

● **CAUTIONS** Obesity (limited information on safety and efficacy)

● **INTERACTIONS** → Appendix 1: daptomycin

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · anxiety · asthenia · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · hypertension · hypotension · increased risk of infection · insomnia · nausea · pain · skin reactions · vomiting
- ▶ **Uncommon** Appetite decreased · arrhythmias · arthralgia · electrolyte imbalance · eosinophilia · flushing · glossitis · hyperglycaemia · muscle weakness · myalgia · myopathy · paraesthesia · renal impairment · taste altered · thrombocytosis · tremor · vertigo
- ▶ **Rare or very rare** Jaundice
- ▶ **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · antibiotic associated colitis · chills · cough · infusion related reaction · peripheral neuropathy · respiratory disorders · syncope

SIDE-EFFECTS, FURTHER INFORMATION If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor plasma creatine phosphokinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.
- ▶ Manufacturer advises monitor renal function regularly during concomitant administration of potentially nephrotoxic drugs.

● **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1–6 years and over 30 minutes for children aged 7–17 years.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Daptomycin (Non-proprietary)**

Daptomycin 350 mg Daptomycin 350mg powder for solution for infusion vials | 1 vial [PoM] £60.00–£62.00 (Hospital only)

Daptomycin 500 mg Daptomycin 500mg powder for solution for infusion vials | 1 vial [PoM] £88.00–£88.57 (Hospital only)

▶ **Cubicin (Merck Sharp & Dohme Ltd)**

Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £62.00 (Hospital only)

Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £88.57 (Hospital only)

Fosfomycin

11-May-2020

● **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

● **INDICATIONS AND DOSE**

Acute uncomplicated lower urinary-tract infections (in females)

▶ BY MOUTH USING GRANULES

- ▶ Child 12–17 years (female): 3 g for 1 dose.

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

- ▶ Child 12–17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

- ▶ Child 12–17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Bacterial meningitis when first-line treatment ineffective or inappropriate

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- ▶ Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- ▶ Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- ▶ Child 12–17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

● CAUTIONS

- ▶ With intravenous use Cardiac insufficiency · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · headache · nausea · vomiting
- ▶ **Uncommon** Skin reactions
- ▶ **Frequency not known** Antibiotic associated colitis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With oral use Dizziness · vulvovaginal infection
- ▶ **Uncommon**
- ▶ With parenteral use Appetite decreased · dyspnoea · electrolyte imbalance · fatigue · oedema · taste altered · vertigo
- ▶ **Rare or very rare**
- ▶ With parenteral use Bone marrow disorders · eosinophilia · hepatic disorders · visual impairment
- ▶ **Frequency not known**
- ▶ With parenteral use Agranulocytosis · asthmatic attack · confusion · leucopenia · neutropenia · tachycardia · thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

● RENAL IMPAIRMENT

- ▶ With oral use Avoid oral treatment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- ▶ With intravenous use Age under 12 years (body-weight under 40 kg)—no information available. Age 12–18 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor electrolytes and fluid balance.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines.

Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.

- ▶ With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1033/15

The *Scottish Medicines Consortium* has advised (March 2015) that fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

SMC No. 1163/16

The *Scottish Medicines Consortium* has advised (September 2016) that fosfomycin trometamol (*Monuril*®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Fosfomycin (Non-proprietary)

Fosfomycin (as Fosfomycin sodium) 5 gram Infectofos 5g powder for solution for infusion vials | 10 vial [PoM] £

▶ Fomicyt (Kent Pharmaceuticals Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial [PoM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial [PoM] £300.00

Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

▶ Fosfomycin (Non-proprietary)

Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet [PoM] £75.45 DT = £4.86

▶ Monuril (Profile Pharma Ltd)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet [PoM] £4.86 DT = £4.86

Fusidic acid

30-Apr-2020

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal skin infection

▶ TO THE SKIN

- ▶ Child: Apply 3–4 times a day usually for 7 days

▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate

Non-bullous impetigo [in patients who are not systemically unwell or at high risk of complications]

▶ TO THE SKIN

- ▶ Child: Apply 3 times a day for 5–7 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

▶ BY MOUTH USING ORAL SUSPENSION

- ▶ Neonate: 15 mg/kg 3 times a day.

- ▶ Child 1–11 months: 15 mg/kg 3 times a day

- ▶ Child 1–4 years: 250 mg 3 times a day

continued →

- ▶ Child 5–11 years: 500 mg 3 times a day
- ▶ Child 12–17 years: 750 mg 3 times a day
- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

Staphylococcal infections due to susceptible organisms

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
- ▶ Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

DOSE EQUIVALENCE AND CONVERSION

- ▶ Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

● CAUTIONS

- ▶ With systemic use Impaired transport and metabolism of bilirubin
- ▶ With topical use Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

- ▶ Avoiding resistance
- ▶ With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

- **INTERACTIONS** → Appendix 1: fusidate

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**

- ▶ With intravenous use Dizziness · drowsiness · hepatic disorders · hyperbilirubinaemia · thrombophlebitis · vascular pain (reduced if given via central vein)
- ▶ With oral use Diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · nausea · vomiting
- ▶ **Uncommon**
- ▶ With intravenous use Appetite decreased · asthenia · headache · malaise
- ▶ With oral use Appetite decreased · asthenia · headache · malaise · rash pustular
- ▶ **Rare or very rare**
- ▶ With topical use Angioedema · conjunctivitis
- ▶ **Frequency not known**
- ▶ With intravenous use Agranulocytosis · anaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia
- ▶ With oral use Agranulocytosis · anaemia · hepatic disorders · hyperbilirubinaemia · leucopenia · neutropenia · pancytopenia · renal failure · rhabdomyolysis · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur with systemic use—these effects are usually reversible following withdrawal of therapy.

● PREGNANCY

- ▶ With systemic use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING

- ▶ With systemic use Present in milk—manufacturer advises caution.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Manufacturer advises caution.

● MONITORING REQUIREMENTS

- ▶ With systemic use Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract

obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Manufacturer advises *for intravenous infusion*, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).

- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Cardiovascular system infections, antibacterial therapy p. 322, Musculoskeletal system infections, antibacterial therapy p. 326, Skin infections, antibacterial therapy p. 329.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

May be prescribed as Sodium Fusidate ointment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Fucidin** (LEO Pharma)

- ▶ **Fusidic acid (Non-proprietary)**

Sodium fusidate 500 mg Sodium fusidate 500mg powder and solvent for solution for infusion vials | 1 vial [PoM](#) £20.50–£20.90 DT = £20.70

Linezolid

18-May-2020

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

● INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.

- Neonate 7 days to 28 days: 10 mg/kg every 8 hours.

- Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
- Child 12–17 years: 600 mg every 12 hours

Cellulitis (specialist use only) | Erysipelas (specialist use only)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
- Child 12–17 years: 600 mg every 12 hours

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

CHM ADVICE (OPTIC NEUROPATHY)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
 - have pre-existing myelosuppression;
 - are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
 - have severe renal impairment.
- If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · history of seizures ·

phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- **Close observation** Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.
- **INTERACTIONS** → Appendix 1: linezolid
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · localised pain · nausea · skin reactions · taste altered · vomiting
 - **Uncommon** Arrhythmia · chills · dry mouth · eosinophilia · fatigue · gastritis · hyperhidrosis · hyponatraemia · leucopenia · neutropenia · oral disorders · pancreatitis · polyuria · renal failure · seizure · sensation abnormal · thirst · thrombocytopenia · thrombophlebitis · tinnitus · tongue discolouration · transient ischaemic attack · vision disorders · vulvovaginal disorder
 - **Rare or very rare** Antibiotic associated colitis · bone marrow disorders · tooth discolouration
 - **Frequency not known** Alopecia · angioedema · lactic acidosis · nerve disorders · serotonin syndrome · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Respiratory system infections, antibacterial therapy p. 327, Skin infections, antibacterial therapy p. 329.
 - There is limited information on use in children and expert advice should be sought.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Trimethoprim

26-May-2020

● **INDICATIONS AND DOSE****Respiratory-tract infections**▶ **BY MOUTH**

▶ Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.

- ▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12–17 years: 200 mg twice daily

Prophylaxis of recurrent urinary-tract infection▶ **BY MOUTH**

▶ Neonate: 2 mg/kg once daily, dose to be taken at night.

- ▶ Child 4–5 weeks: 2 mg/kg once daily, dose to be taken at night
- ▶ Child 6 weeks–5 months: 2 mg/kg once daily, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12–15 years: 100 mg once daily, dose to be taken at night
- ▶ Child 16–17 years: 100 mg once daily, dose to be taken at night, alternatively 200 mg for 1 dose, following exposure to a trigger

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)▶ **BY MOUTH**

▶ Child: 5 mg/kg every 6–8 hours

Shigellosis / Invasive salmonella infection▶ **BY MOUTH**

▶ Child: (consult product literature)

Acute pyelonephritis▶ **BY MOUTH**

▶ Child 16–17 years: 200 mg twice daily for 14 days

Urinary-tract infection (catheter-associated)▶ **BY MOUTH**

- ▶ Child 3–5 months: 4 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, alternatively 25 mg twice daily for 7–10 days
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, alternatively 50 mg twice daily for 7–10 days
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, alternatively 100 mg twice daily for 7–10 days

- ▶ Child 12–15 years: 200 mg twice daily for 7–10 days
- ▶ Child 16–17 years: 200 mg twice daily for 7 days (14 days if upper urinary-tract symptoms are present)

Lower urinary-tract infection▶ **BY MOUTH**

▶ Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.

- ▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks–2 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 3–5 months: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 25 mg twice daily for 3 days
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 50 mg twice daily for 3 days
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg) for 3 days, alternatively 100 mg twice daily for 3 days
- ▶ Child 12–15 years: 200 mg twice daily for 3 days
- ▶ Child 16–17 years: 200 mg twice daily for 3 days (7 days in males)

- **UNLICENSED USE** [EvGr] Trimethoprim can be given as a single dose for the prophylaxis of recurrent urinary-tract infection following exposure to a trigger, Δ but this dosing regimen is not licensed. Not licensed for treatment of pneumocystis pneumonia.

Not licensed for use in children under 6 months for the prophylaxis of recurrent urinary-tract infection.

Not licensed for use in children under 6 weeks.

- **CONTRA-INDICATIONS** Blood dyscrasias
- **CAUTIONS** Acute porphyrias p. 652 · neonates (specialist supervision required) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1: trimethoprim
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · electrolyte imbalance · fungal overgrowth · headache · nausea · skin reactions · vomiting
 - ▶ **Rare or very rare** Agranulocytosis · angioedema · anxiety · appetite decreased · arthralgia · behaviour abnormal · bone marrow disorders · confusion · constipation · cough · depression · dizziness · dyspnoea · eosinophilia · erythema nodosum · fever · haemolysis · haemolytic anaemia · haemorrhage · hallucination · hepatic disorders · hypoglycaemia · lethargy · leucopenia · meningitis aseptic · movement disorders · myalgia · neutropenia · oral disorders · pancreatitis · paraesthesia · peripheral neuritis · photosensitivity reaction · pseudomembranous enterocolitis · renal impairment · seizure · severe cutaneous adverse reactions (SCARs) · sleep disorders · syncope · systemic lupus erythematosus (SLE) · thrombocytopenia · tinnitus · tremor · uveitis · vasculitis · vertigo · wheezing
 - ▶ **Frequency not known** Gastrointestinal disorder · megaloblastic anaemia · methaemoglobinaemia
- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.

- **RENAL IMPAIRMENT** Manufacturer advises caution in impairment.

Dose adjustments Manufacturer advises dose reduction to half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².

Manufacturer advises dose reduction to half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor blood counts with long-term use and in those with, or at risk of, folate deficiency.
- ▶ Manufacturer advises monitor serum electrolytes in patients at risk of developing hyperkalaemia, and consider monitoring in other patients, particularly with long-term use.
- ▶ Manufacturer advises consider monitoring renal function, particularly with long-term use.
- ▶ Manufacturer advises monitoring of plasma-trimethoprim concentration may be considered with long-term use and under specialist advice.

● **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Gastro-intestinal system infections, antibacterial therapy p. 324, Pneumocystis pneumonia p. 413, Respiratory system infections, antibacterial therapy p. 327, Urinary-tract infections p. 400.

● PATIENT AND CARER ADVICE

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Medicines for Children leaflet: Trimethoprim for bacterial infections
www.medicinesforchildren.org.uk/trimethoprim-bacterial-infections

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▶ Trimethoprim (Non-proprietary)

Trimethoprim 10 mg per 1 ml Trimethoprim 50mg/5ml oral suspension sugar free sugar-free | 100 ml [PoM] £6.82 DT = £4.89

▶ Monotrim (Chemidex Pharma Ltd)

Trimethoprim 10 mg per 1 ml Monotrim 50mg/5ml oral suspension sugar-free | 100 ml [PoM] £1.77 DT = £4.89

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Trimethoprim (Non-proprietary)

Trimethoprim 100 mg Trimogal 100mg tablets | 28 tablet [PoM] £0.89 DT = £0.88

Trimethoprim 100mg tablets | 28 tablet [PoM] £1.39 DT = £0.88

Trimethoprim 200 mg Trimogal 200mg tablets | 14 tablet [PoM] £0.91 DT = £0.91

Trimethoprim 200mg tablets | 14 tablet [PoM] £2.15 DT = £0.39 | 14 tablet [PoM] £5.00 DT = £0.91

Combinations available: **Co-trimoxazole**, p. 378

1.1 Anthrax

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 377 or, in patients over 12 years, doxycycline p. 381 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 366, benzylpenicillin sodium p. 364, chloramphenicol p. 385, clarithromycin p. 353, clindamycin p. 351, imipenem with cilastatin p. 336, rifampicin p. 396 [unlicensed indication], and vancomycin p. 349). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline

[unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

1.2 Lyme disease

Lyme disease

14-Nov-2018

Description of condition

Lyme disease, also known as Lyme borreliosis, is an infection caused by bacteria called *Borrelia burgdorferi*. It is transmitted to humans by the bite of an infected tick. Ticks are mainly found in grassy and wooded areas including urban gardens and parks. Most tick bites do not cause Lyme disease, and the prompt and correct removal of the tick reduces the risk of infection.

Lyme disease usually presents with a characteristic erythema migrans rash. This usually becomes visible 1–4 weeks after a tick bite, but can appear from 3 days to 3 months, and last for several weeks. It may be accompanied by non-focal (non-organ related) symptoms, such as fever, swollen glands, malaise, fatigue, neck pain or stiffness, joint or muscle pain, headache, cognitive impairment, or paraesthesia.

Other signs and symptoms of Lyme disease may also appear months or years after the initial infection and are typically characterised by focal symptoms (relating to at least 1 organ system). These include neurological (affecting cranial nerves, peripheral and central nervous systems), joint (Lyme arthritis), cardiac (Lyme carditis), or skin (acrodermatitis chronica atrophicans) manifestations.

Drug treatment

[EvGr] The diagnosis and management of Lyme disease in children should be discussed with a specialist unless the child presents with a single erythema migrans lesion and no other symptoms. Children diagnosed with Lyme disease should be given treatment with an antibacterial drug; the choice of drug should be based on presenting symptoms. ⚠

Child aged 9 years and over

[EvGr] In children presenting with *erythema migrans rash* with or without *non-focal symptoms* oral doxycycline p. 381 [unlicensed] is recommended as first-line treatment. If doxycycline p. 381 cannot be given, oral amoxicillin p. 366 should be used as an alternative. Oral azithromycin p. 352 [unlicensed] should be given if both doxycycline p. 381 and amoxicillin p. 366 are unsuitable.

In children presenting with focal symptoms of *cranial nerve or peripheral nervous system* involvement, oral doxycycline p. 381 [unlicensed] is recommended as first-line treatment. If doxycycline p. 381 cannot be given, oral amoxicillin p. 366 should be used as an alternative.

In children presenting with symptoms of *central nervous system* involvement, intravenous ceftriaxone p. 343 is recommended as first-line treatment. Oral doxycycline p. 381 [unlicensed] should be used as an alternative if ceftriaxone p. 343 cannot be given, or when switching to oral antibacterial treatment.

In children with symptoms of *Lyme arthritis* or *acrodermatitis chronica atrophicans*, oral doxycycline p. 381 [unlicensed] is recommended as first-line treatment. If doxycycline p. 381 cannot be given, oral amoxicillin p. 366 should be used as an alternative. Intravenous ceftriaxone p. 343 should be used if both doxycycline p. 381 and amoxicillin p. 366 are unsuitable.

In children with symptoms of *Lyme carditis* who are *haemodynamically stable*, oral doxycycline p. 381 [unlicensed] is recommended as first-line treatment. If doxycycline p. 381 cannot be given, intravenous ceftriaxone p. 343 should be used as an alternative.

In children with symptoms of *Lyme carditis* who are *haemodynamically unstable*, intravenous ceftriaxone p. 343 is recommended. If ceftriaxone p. 343 cannot be given, oral doxycycline p. 381 [unlicensed] should be used as an alternative. **A**

Child aged under 9 years

EvGr In children presenting with *erythema migrans rash* with or without *non-focal symptoms*, oral amoxicillin p. 366 is recommended as first-line treatment. If oral amoxicillin p. 366 cannot be given, oral azithromycin p. 352 [unlicensed] should be used as an alternative.

In children presenting with focal symptoms of *cranial nerve* or *peripheral nervous system* involvement, oral amoxicillin p. 366 is recommended.

In children presenting with symptoms of *central nervous system* involvement, intravenous ceftriaxone p. 343 is recommended.

In children with symptoms of *Lyme arthritis* or *acrodermatitis chronica atrophicans*, oral amoxicillin p. 366 is recommended as first-line treatment. If amoxicillin p. 366 cannot be given, intravenous ceftriaxone p. 343 should be used as an alternative.

In children with symptoms of *Lyme carditis* (both *haemodynamically stable* and *unstable*), intravenous ceftriaxone p. 343 is recommended. **A**

Ongoing symptom management

EvGr If symptoms continue to persist or worsen after antibacterial treatment, patients should be assessed for possible alternative causes, re-infection with Lyme disease, treatment failure or non-adherence to previous antibacterial treatment, or progression to organ damage caused by Lyme disease (such as nerve palsy).

A second course of antibacterial treatment should be given to patients presenting with signs and symptoms of re-infection. In patients presenting with ongoing symptoms due to possible treatment failure, treatment with an alternative antibacterial drug should be considered. A third course of antibacterial treatment is not recommended, and further management should be discussed with a national reference laboratory or suitable specialist depending on symptoms (for example, a rheumatologist or neurologist). **A**

Useful Resources

Lyme disease. National Institute for Health and Care Excellence. NICE guideline 95. April 2018.

www.nice.org.uk/guidance/ng95

'Be tick aware'-Toolkit for raising awareness of the potential risk posed by ticks and tick-borne disease in England. Public Health England. March 2018.

www.gov.uk/government/publications/tick-bite-risks-and-prevention-of-lyme-disease

1.3 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 373 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 396 or fusidic acid p. 387 should **not** be used alone because resistance may develop rapidly. Clindamycin p. 351 alone or a combination of rifampicin and fusidic acid can be used for *skin* and *soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin p. 349) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 389 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim p. 390 or nitrofurantoin p. 403 can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for septicæmia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 348 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 747.

1.4 Tuberculosis

Tuberculosis

24-Oct-2019

Overview

Tuberculosis is a curable infectious disease caused by bacteria of the *Mycobacterium tuberculosis* complex (*M. tuberculosis*, *M. africanum*, *M. bovis* or *M. microti*) and is spread by breathing in infected respiratory droplets from a person with infectious tuberculosis. The most common form of tuberculosis infection is in the lungs (**pulmonary**) but

infection can also spread and develop in other parts of the body (**extrapulmonary**).

The initial infection with tuberculosis clears in the majority of individuals. However, in some cases the bacteria may become dormant and remain in the body with no symptoms (**latent** tuberculosis) or progress to being symptomatic (**active** tuberculosis) over the following weeks or months. In individuals with latent tuberculosis only a small proportion will develop active tuberculosis.

Many cases of tuberculosis can be prevented by public health measures and when clinical disease does occur most individuals can be cured if treated properly with the correct dose, combination and duration of treatment. Drug-resistant strains of tuberculosis are much harder to treat and significantly increase an individual's risk of long-term complications or death.

Treatment phases, overview

The standard treatment of active tuberculosis is completed in two phases—an **initial phase** using four drugs and a **continuation phase** using two drugs, in fully sensitive cases. **EvGr** The management and investigation of tuberculosis in children should be undertaken by either a paediatrician with experience and training in tuberculosis or a general paediatrician with advice from a specialist clinician. This tuberculosis service should include specialised nurses and health visitors. **⚠**

Within the UK there are two regimens recommended for the treatment of tuberculosis: **unsupervised** or **supervised**; with the choice of either regimen dependent on a risk assessment to identify if a child needs enhanced case management.

EvGr In all phases of treatment for tuberculosis, fixed-dose combination tablets should be used, and a daily dosing schedule should be considered. **⚠**

Initial phase

EvGr As standard treatment for children with active tuberculosis, offer rifampicin p. 396, ethambutol hydrochloride p. 398, pyrazinamide p. 400 and isoniazid p. 399 (with pyridoxine hydrochloride p. 678) in the initial phase of treatment; modified according to drug susceptibility testing; and continued for 2 months.

Treatment should be started without waiting for culture results if clinical signs and symptoms are consistent with a tuberculosis diagnosis; consider completing the standard treatment even if subsequent culture results are negative. **⚠**

Continuation phase

EvGr After the initial phase, offer standard continuation treatment with rifampicin and isoniazid (with pyridoxine hydrochloride) for a further 4 months in children with active tuberculosis without central nervous system involvement. Longer treatment of 10 months should be offered to children with active tuberculosis of the central nervous system, with or without spinal involvement.

Treatment should be modified according to drug susceptibility testing. **⚠**

Unsupervised treatment

The unsupervised treatment regimen is for children who are likely to take antituberculosis drugs (or have treatment administered by a parent or carer) reliably and willingly without supervision by a healthcare worker.

Supervised treatment

For children or families requiring supervised treatment (directly observed therapy, DOT), this is offered as part of enhanced case management. **EvGr** A 3 times weekly dosing schedule can be considered in children with active tuberculosis if they require enhanced case management and daily directly observed therapy is not available. Antituberculosis treatment dosing regimens of fewer than 3 times a week are not recommended.

Directly observed therapy should be offered to children or to children whose carers:

- have a current risk or history of non-adherence;
- have previously been treated for tuberculosis;
- have a history of homelessness, drug or alcohol misuse;
- be in a young offender institution, or have been in the past 5 years;
- have a major psychiatric, memory or cognitive disorder;
- are in denial of the tuberculosis diagnosis;
- have multi-drug resistant tuberculosis;
- request directly observed therapy after discussion with the clinical team;
- are too ill to self-administer treatment.

Advice and support should be offered to those children and their carers to assist with treatment completion. **⚠**

Individuals with comorbidities or coexisting conditions, including the immunocompromised

EvGr Children with comorbidities or coexisting conditions (such as HIV, severe liver disease or diabetes) should be managed by a specialist multidisciplinary team with experience in managing tuberculosis and the comorbidity or coexisting condition.

In children who are HIV-positive with active tuberculosis, treatment with the standard regimen should not routinely exceed 6 months, unless the tuberculosis has central nervous system involvement, in which case treatment should not routinely extend beyond 12 months.

Care should be taken to avoid drug interactions when co-prescribing antiretroviral and antituberculosis drugs. **⚠** For further information on the **management of tuberculosis in HIV infection** consult the Children's HIV Association of UK and Ireland (www.chiva.org.uk/guidelines/).

Extrapulmonary tuberculosis

Central nervous system tuberculosis

EvGr Children with central nervous system tuberculosis should be offered standard treatment with **initial phase** drugs for 2 months (see *Initial phase* for specific drugs). After completion of the initial treatment phase, standard treatment with **continuation phase** drugs should then be offered (see *Continuation phase* for specific drugs); and continued for a further 10 months. Treatment for tuberculosis meningitis should be offered if clinical signs and other laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of *dexamethasone* or *prednisolone* should be offered at the same time as antituberculosis treatment, then slowly withdrawn over 4–8 weeks.

Referral for surgery should only be considered in children who have raised intracranial pressure; or have spinal TB with spinal instability or evidence of spinal cord compression. **⚠**

Pericardial tuberculosis

EvGr An initial high dose of oral *prednisolone* should be offered to children with active pericardial tuberculosis, at the same time as antituberculosis treatment, then slowly withdrawn over 2–3 weeks. **⚠**

Latent tuberculosis

Some children with latent tuberculosis are at increased risk of developing active tuberculosis (such as children who are HIV-positive, diabetic or receiving treatment with an anti-tumor necrosis factor alpha inhibitor). **EvGr** These children and their carers should be informed of the risks and symptoms of active tuberculosis. **⚠**

Close contacts

EvGr Children who are a close contact (prolonged, frequent or intense contact, for example household contacts) of a person with pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Children aged under 2 years should be assessed by a specialist. **⚠**

Recommended dosage for standard unsupervised 6-month treatment

Isoniazid	Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: ▶ body-weight up to 50 kg 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day ; ▶ body-weight 50 kg and above 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
Pyrazinamide	Child: ▶ body-weight up to 50 kg 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day ; ▶ body-weight 50 kg and above 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
Ethambutol hydrochloride	Child: 20 mg/kg once daily for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride p. 398 due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Pyrazinamide	Child: ▶ body-weight up to 50 kg 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase) ; ▶ body-weight 50 kg and above 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
Ethambutol hydrochloride	Child: 30 mg/kg 3 times a week for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Immunocompromised

[EvGr] Children who are anticipated to be, or who are currently immunocompromised should be referred to a specialist if latent tuberculosis is suspected (for example if they are from a high incidence country or have been in close contact with people with *suspected infectious* or *confirmed* pulmonary or laryngeal tuberculosis). **⚠**

Treatment of latent tuberculosis

[EvGr] Neonates who have been in close contact with a person with tuberculosis which has not yet been treated for at least two weeks, should start treatment with isoniazid p. 399 (with pyridoxine hydrochloride p. 678) followed by a Mantoux test after 6 weeks of treatment.

If the Mantoux test is positive (and active tuberculosis is not present) treatment should be continued for 6 months; if negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given. If the interferon-gamma release assay result is positive (and active tuberculosis is not present) treatment should be continued for 6 months.

Children aged 4 weeks to 2 years who have been in close contact with a person with tuberculosis which has not been treated for at least two weeks, should start treatment for latent tuberculosis and have a Mantoux test. Treatment is either isoniazid (with pyridoxine hydrochloride) alone for 6 months (preferred regimen if interactions with rifamycins are a concern) or rifampicin p. 396 and isoniazid (with pyridoxine hydrochloride) for 3 months (recommended when hepatotoxicity is a concern).

If the Mantoux test is positive (and active tuberculosis is not present), the treatment course should be completed. If the test is negative, treatment should be continued and the child should be re-assessed for active tuberculosis after 6 weeks. If the results are then negative (and confirmed by a negative interferon-gamma release assay), the treatment should be stopped and a BCG vaccination given (if the child has not already had one). If the result is positive (and active

tuberculosis is not present), the course of treatment should be continued.

Children aged over 2 years should be offered a Mantoux test, and if positive (and active tuberculosis is not present), then treat as above for children aged 4 weeks to 2 years. If the test is negative, then offer an interferon-gamma release assay after 6 weeks and repeat the Mantoux test. **⚠**

The choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. **[EvGr]** Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Children with severe liver disease should be treated under the care of a specialist team. Careful monitoring of liver function is necessary in children with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs. **⚠**

For advice on tuberculin testing and immunisation against tuberculosis, see Bacillus Calmette-Guérin vaccine p. 831.

Treatment failure

Major causes of treatment failure include incorrect prescribing by the clinician and inadequate compliance by the child or carer. **[EvGr]** All children diagnosed with tuberculosis should have an allocated case manager to help with the development of a health and social care plan, supervision of treatment, and support with the completion of treatment. Multidisciplinary tuberculosis teams should implement strategies (such as random urine tests, pill counts, home visits, health education counselling, and language appropriate reminder services) to help with adherence to, and successful completion of treatment. **⚠**

Treatment interruptions

A break in antituberculosis treatment of at least 2 weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions

is key to ensuring treatment success without relapse, drug resistance or further adverse events. **EVGr** If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly. **A**

Treatment interruptions due to drug-induced hepatotoxicity

EVGr Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once aspartate or alanine transaminase levels fall below twice the upper limit of normal, bilirubin levels have returned to the normal range, and hepatotoxic symptoms have resolved, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than 10 days. Start with ethambutol hydrochloride p. 398 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In children with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least 2 drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 334 (with or without a fluoroquinolone antibiotic, such as levofloxacin p. 728 or moxifloxacin p. 729), with ongoing monitoring by a liver specialist. **A**

Treatment interruptions due to cutaneous reactions

EVGr If a child with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least 2 drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist. **A**

Drug-resistant tuberculosis

EVGr Treatment of drug-resistant tuberculosis should be managed by a multidisciplinary team with experience in such cases, and where appropriate facilities for infection-control exist. **A** The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Single drug-resistant tuberculosis

EVGr For single drug-resistance in individuals with tuberculosis with central nervous system involvement, refer to a specialist with experience in managing drug-resistant tuberculosis. **A** For those without central nervous system involvement, the following treatment regimens are recommended:

Resistance to isoniazid:

- **EVGr** First 2 months (initial phase): rifampicin, pyrazinamide p. 400 and ethambutol hydrochloride;
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for 7 months (up to 10 months for extensive disease). **A**

Resistance to pyrazinamide:

- **EVGr** First 2 months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for 7 months. **A**

Resistance to ethambutol hydrochloride:

- **EVGr** First 2 months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride);
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for 4 months. **A**

Resistance to rifampicin:

- **EVGr** Offer treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive. **A**

Multi-drug resistant tuberculosis

EVGr In multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin, with or without any other resistance*), positive cases of rifampicin resistance require treatment with at least 6 antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. **A**

Other drugs used for Tuberculosis Rifabutin, below

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

09-May-2020

● INDICATIONS AND DOSE

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
- ▶ Child 12-17 years: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- ▶ BY MOUTH
- ▶ Child 1 month-11 years: 5 mg/kg once daily for up to 6 months after cultures negative
- ▶ Child 12-17 years: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- ▶ BY MOUTH
- ▶ Child 12-17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Acute porphyrias p. 652 · discolours soft contact lenses

- **INTERACTIONS** → Appendix 1: rifabutin

- **SIDE-EFFECTS** Agranulocytosis · anaemia · arthralgia · bronchospasm · chest pain · corneal deposits · decreased leucocytes · dyspnoea · eosinophilia · fever · haemolysis · hepatic disorders · influenza like illness · myalgia · nausea · neutropenia · pancytopenia · skin reactions · thrombocytopenia · urine discolouration · uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifampicin hypersensitivity.

● CONCEPTION AND CONTRACEPTION

Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored on prolonged therapy.

● **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

● PATIENT AND CARER ADVICE

Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14

▶ **Mycobutin** (Pfizer Ltd)

Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule PoM
 £90.38 DT = £90.38

Rifampicin

09-May-2020

● INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

▶ Neonate: 5–10 mg/kg twice daily.

- ▶ Child 1-11 months: 5–10 mg/kg twice daily
- ▶ Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

▶ BY MOUTH

- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

▶ BY MOUTH

- ▶ Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- ▶ Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

Congenital tuberculosis

▶ BY MOUTH

- ▶ Neonate: 15 mg/kg once daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

▶ BY MOUTH

- ▶ Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
- ▶ Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
- ▶ Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- ▶ Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

▶ BY MOUTH

- ▶ Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

▶ BY MOUTH

- ▶ Child 1-2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months-11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12-17 years: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

▶ BY MOUTH

- ▶ Neonate: 5 mg/kg every 12 hours for 2 days.

- ▶ Child 1-11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1-11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12-17 years: 600 mg every 12 hours for 2 days

Pruritus due to cholestasis

▶ BY MOUTH

- ▶ Child: 5–10 mg/kg once daily (max. per dose 600 mg)

● **UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.

● **CONTRA-INDICATIONS** Acute porphyrias p. 652 · jaundice

● **CAUTIONS** Discolours soft contact lenses

● **INTERACTIONS** → Appendix 1: rifampicin

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Nausea · thrombocytopenia · vomiting
- ▶ **Uncommon** Diarrhoea · leucopenia
- ▶ **Frequency not known** Abdominal discomfort · acute kidney injury · adrenal insufficiency · agranulocytosis · appetite decreased · disseminated intravascular coagulation · dyspnoea · eosinophilia · flushing · haemolytic anaemia · hepatitis · hypersensitivity · influenza · intracranial haemorrhage · menstrual disorder · muscle weakness · myopathy · oedema · pseudomembranous enterocolitis · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · sputum discolouration · sweat discolouration · tear discolouration · urine discolouration · vasculitis · wheezing

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Bone pain · gastrointestinal disorder · hyperbilirubinaemia · psychotic disorder
- ▶ With oral use Psychosis

SIDE-EFFECTS, FURTHER INFORMATION Side-effects that mainly occur with intermittent therapy include influenza-

like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure.

Discontinue if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important. Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.
- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function weekly for two weeks, then every two weeks for the next six weeks.
Dose adjustments Manufacturer advises maximum 8 mg/kg per day.
- **RENAL IMPAIRMENT** Use with caution if doses above 10 mg/kg daily.
- **MONITORING REQUIREMENTS**
 - ▶ *Renal function* should be checked before treatment.
 - ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
 - ▶ Blood counts should be monitored in patients on prolonged therapy.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use. Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
 - Flavours of syrup may include raspberry.
 - ▶ With oral use. In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.
- **PATIENT AND CARER ADVICE**
 - Soft contact lenses. Patients or their carers should be advised that rifampicin discolours soft contact lenses.
 - Hepatic disorders. Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
 - Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/rifampicin-meningococcal-prophylaxis

Rifampicin with isoniazid

10-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 396, isoniazid p. 399.

INDICATIONS AND DOSE

Treatment of tuberculosis (continuation phase)

▶ BY MOUTH

- ▶ Child: Although not licensed in children, consideration may be given to use of *Rifinah*® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).

DOSE EQUIVALENCE AND CONVERSION

- ▶ *Rifinah*® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
- ▶ Each *Rifinah*® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
- ▶ Each *Rifinah*® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1: isoniazid · rifampicin
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Isoniazid and rifampicin combination for latent tuberculosis www.medicinesforchildren.org.uk/isoniazid-and-rifampicin-combination-latent-tuberculosis

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

▶ **Rifinah** (Sanofi)

Isoniazid 100 mg, Rifampicin 150 mg Rifinah 150mg/100mg tablets | 84 tablet [PoM] £19.09 DT = £19.09

Isoniazid 150 mg, Rifampicin 300 mg Rifinah 300mg/150mg tablets | 56 tablet [PoM] £25.22 DT = £25.22

Rifampicin with isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 396, isoniazid p. 399, pyrazinamide p. 400.

● INDICATIONS AND DOSE

Initial treatment of tuberculosis (in combination with ethambutol)

- ▶ Child: Although not licensed in children, consideration may be given to use of *Rifater*® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).

DOSE EQUIVALENCE AND CONVERSION

- ▶ Tablet quantities refer to the number of *Rifater*® Tablets which should be taken. Each *Rifater*® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

- **UNLICENSED USE** Not licensed for use in children.

- **INTERACTIONS** → Appendix 1: isoniazid · pyrazinamide · rifampicin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 14, 22

- ▶ *Rifater* (Sanofi)

Isoniazid 50 mg, Rifampicin 120 mg, Pyrazinamide 300 mg | *Rifater* tablets | 100 tablet [PoM](#) £26.34

ANTIMYCOBACTERIALS > OTHER

Cycloserine

● INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

- ▶ BY MOUTH
- ▶ Child 2–11 years: Initially 5 mg/kg twice daily (max. per dose 250 mg), then increased if necessary up to 10 mg/kg twice daily (max. per dose 500 mg), dose to be increased according to blood concentration and response
- ▶ Child 12–17 years: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS

- ▶ Cycloserine penetrates the CNS.

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

- **INTERACTIONS** → Appendix 1: cycloserine

- **SIDE-EFFECTS** Behaviour abnormal · coma · confusion · congestive heart failure · drowsiness · dysarthria · headache · hyperirritability · megaloblastic anaemia · memory loss · neurological effects · paraesthesia · paresis · psychosis · rash · reflexes increased · seizures · suicidal ideation · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION CNS toxicity

Discontinue or reduce dose if symptoms of CNS toxicity occur.

Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develop.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.

- **RENAL IMPAIRMENT**

Dose adjustments Increase interval between doses if

creatinine clearance less than 50 mL/minute/1.73 m².

Monitoring Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**

- ▶ Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).

- ▶ Monitor haematological, renal, and hepatic function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

- ▶ *Cycloserine* (Non-proprietary)

Cycloserine 250 mg | Cycloserine 250mg capsules | 100 capsule [PoM](#) £442.89 DT = £442.89

Ethambutol hydrochloride

11-May-2020

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- ▶ BY MOUTH

- ▶ Child: 20 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs

(intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH

- ▶ Child: 30 mg/kg 3 times a week for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

- ▶ BY MOUTH

- ▶ Neonate: 20 mg/kg once daily for 2 months (initial phase).

- **CONTRA-INDICATIONS** Optic neuritis · poor vision

- **CAUTIONS** Young children

CAUTIONS, FURTHER INFORMATION

- ▶ Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **INTERACTIONS** → Appendix 1: ethambutol

- **SIDE-EFFECTS**

- ▶ **Common or very common** Hyperuricaemia · nerve disorders · visual impairment

- ▶ **Rare or very rare** Nephritis tubulointerstitial

- ▶ **Frequency not known** Alveolitis allergic · appetite decreased · asthenia · confusion · dizziness · eosinophilia · fever · flatulence · gastrointestinal discomfort · gout · hallucination · headache · jaundice · leucopenia · nausea · nephrotoxicity · neutropenia · photosensitive lichenoid eruption · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin reactions · taste metallic · thrombocytopenia · tremor · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Ocular toxicity

is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.
Dose adjustments If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.
Monitoring If creatinine clearance less than 30 mL/minute/1.73 m², monitor plasma-ethambutol concentration.
- **MONITORING REQUIREMENTS**
 - ▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
 - ▶ Renal function should be checked before treatment.
 - ▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.
 - ▶ In young children, routine ophthalmological monitoring recommended.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of ethambutol is required, the following strength is used: 400 mg/5 mL.
- **PATIENT AND CARER ADVICE**
Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.
Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis www.medicinesforchildren.org.uk/ethambutol-treatment-tuberculosis

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

▶ **Ethambutol hydrochloride (Non-proprietary)**

Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet [PoM] £17.00 DT = £11.51

Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet [PoM] £42.74 DT = £42.74

Isoniazid

08-May-2020

● **INDICATIONS AND DOSE****Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Congenital tuberculosis, in combination with other drugs

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- ▶ INITIALLY BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Neonate: 10 mg/kg daily for 6 months.
- ▶ Child 1 month-11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12-17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

- **CONTRA-INDICATIONS** Drug-induced liver disease
- **CAUTIONS** Acute porphyrias p. 652 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)
CAUTIONS, FURTHER INFORMATION
 - ▶ Peripheral neuropathy Pyridoxine hydrochloride p. 678 should be given prophylactically in all patients from the start of treatment. Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection.
- **INTERACTIONS** → Appendix 1: isoniazid
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Hepatic disorders
 - ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis · pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis
- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.
- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother.
Monitoring In breast-feeding, monitor infant for possible toxicity.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatotoxicity).
Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.
- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 678 recommended.
- **MONITORING REQUIREMENTS**
 - ▶ Renal function should be checked before treatment.
 - ▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.
Doses may need to be recalculated to allow for weight gain in younger children.
- **PATIENT AND CARER ADVICE**
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical

attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Pyrazinamide

12-May-2020

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

▶ BY MOUTH

- ▶ Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- ▶ Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

▶ BY MOUTH

- ▶ Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- ▶ Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

▶ BY MOUTH

- ▶ Neonate: 35 mg/kg once daily for 2 months (initial phase).

- **CAUTIONS** Diabetes
- **INTERACTIONS** → Appendix 1: pyrazinamide
- **SIDE-EFFECTS** Appetite decreased • arthralgia • dysuria • flushing • gout aggravated • hepatic disorders • malaise • nausea • peptic ulcer aggravated • photosensitivity reaction • sideroblastic anaemia • skin reactions • splenomegaly • vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment, acute hepatic disease and for up to 6 months after occurrence of hepatitis (risk of increased exposure).
- **RENAL IMPAIRMENT**
Dose adjustments If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.

● MONITORING REQUIREMENTS

- ▶ *Renal function* should be checked before treatment.
- ▶ *Hepatic function* should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

The RCPCH and NPPG recommend that, when a liquid special of pyrazinamide is required, the following strength is used: 500 mg/5 mL.

● PATIENT AND CARER ADVICE

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.
Medicines for Children leaflet: Pyrazinamide for treatment of tuberculosis www.medicinesforchildren.org.uk/pyrazinamide-treatment-tuberculosis

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

1.5 Urinary tract infections

Urinary-tract infections

12-Feb-2019

Description of condition

Urinary-tract infections (UTIs) are common infections that can affect any part of the urinary tract. They occur more frequently in females, and are usually independent of any risk factor. The risk of a UTI is greater in children aged under 1 year, in those with functional and structural abnormalities that may cause urinary retention, and in those who are sexually active. UTIs are predominantly caused by bacteria from the gastrointestinal tract entering the urinary tract with *Escherichia coli* being the most common cause.

Lower UTIs are associated with inflammation of the bladder (cystitis) and urethra (urethritis). In some children the infection can ascend the urinary tract and lead to an upper UTI. Upper UTIs affect the proximal part of the ureters (pyelitis) or the proximal part of the ureters and the kidneys (pyelonephritis). Acute pyelonephritis, especially in children with vesicoureteric reflux, may lead to renal scarring, hypertension or failure, and sepsis. The most common UTI symptoms in children younger than 3 months of age are fever, vomiting, lethargy, and irritability. Children older than 3 months of age usually present with fever, dysuria, or increased urinary frequency, that may be accompanied by vomiting, poor feeding, lethargy, irritability and abdominal pain or tenderness.

In pregnant females, asymptomatic bacteriuria is a risk factor for pyelonephritis and premature labour. UTIs in

pregnant females have been associated with developmental delay and cerebral palsy in the infant, as well as fetal death.

Insertion of a catheter into the urinary tract also increases the risk of developing a UTI, and the longer the catheter is in place for, further increases the risk of bacteriuria.

UTIs are considered recurrent after at least two episodes of acute pyelonephritis, three episodes of a lower UTI, or one episode of acute pyelonephritis in addition to one or more episodes of a lower UTI.

Aims of treatment

The aims of treatment are to relieve symptoms, treat the underlying infection, prevent systemic infection, and to reduce the risk of complications.

Non-drug treatment

EvGr Parents or carers of children with a UTI should be advised to ensure their child drinks plenty of fluids to avoid dehydration, and to use self-care strategies to reduce the risk of recurrent infections. These include wiping from front to back after defaecation, not delaying urination, and not wearing occlusive underwear.

Cranberry products may be used for the prevention of recurrent UTIs on the advice of a specialist, however the benefit of these products is uncertain. Children and their parents or carers should be advised to consider the sugar content of these products. **A**

Drug treatment

EvGr When prescribing antibacterial therapy the severity of symptoms, risk of developing complications, previous urine culture and susceptibility results, and previous antibacterial use should be taken into consideration.

With the exception of pregnant females, asymptomatic bacteriuria is not routinely treated with antibacterials. **A**
For other considerations such as for children receiving prophylactic antibacterial therapy, switching from *intravenous* to *oral* antibacterials, and for advice to give to children and their parents, or carers, see Antibacterials, principles of therapy p. 318.

EvGr Reassess children if symptoms worsen at any time, or do not start to improve within 48 hours of starting treatment.

Refer children to hospital if they have any symptoms or signs suggestive of a more serious illness or condition.

Review choice of antibacterial when microbiological results are available, and change treatment as appropriate if susceptibility results indicate bacterial resistance.

Advise parents or carers that paracetamol or ibuprofen can be used for pain relief as appropriate. In acute pyelonephritis, codeine may also be considered (child aged 12 years and over). **A**

Child under 3 months of age

EvGr Children under 3 months of age with a possible UTI should be referred to a paediatric specialist. **A**

Lower urinary-tract infection

Non-pregnant females aged 16 years and over

EvGr Consider a back-up antibacterial prescription for use if symptoms worsen or do not improve within 48 hours or an immediate antibacterial prescription. **A**

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Nitrofurantoin p. 403, or trimethoprim p. 390 (if low risk of resistance). **A**
- **Oral second line** (if no improvement after at least 48 hours or first line not suitable):
 - ▶ **EvGr** Nitrofurantoin (if not used first line), fosfomicin p. 386, or pivmecillinam hydrochloride p. 373. **A**

Males aged 16 years and over

EvGr An immediate antibacterial prescription should be given and a midstream urine sample obtained before

treatment is taken and sent for culture and susceptibility testing. **A**

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Nitrofurantoin, or trimethoprim. **A**
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
 - ▶ Consider pyelonephritis or prostatitis. See *pyelonephritis, acute*, or *prostatitis, acute* below for guidance.

Pregnant females aged 12 years and over

EvGr An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing. **A**

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Nitrofurantoin. **A**
- **Oral second line** (if no improvement after at least 48 hours, or first line not suitable):
 - ▶ **EvGr** Amoxicillin p. 366 (only if culture susceptible), or cefalexin p. 339. **A**
- **Alternative second line:**
 - ▶ **EvGr** Consult local microbiologist. **A**
- **Asymptomatic bacteriuria:**
 - ▶ **EvGr** Amoxicillin, cefalexin, or nitrofurantoin. **A**

Children aged 3 months to under 16 years of age

EvGr An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing. In children aged 3 months and over a dipstick urine test may be used. **A**

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Nitrofurantoin, or trimethoprim (if low risk of resistance). **A**
- **Oral second line** (if no improvement after at least 48 hours or first line not suitable):
 - ▶ **EvGr** Nitrofurantoin (if not used first line), or amoxicillin (if culture susceptible), or cefalexin. **A**

Pyelonephritis, acute

EvGr An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for children with pyelonephritis who are significantly dehydrated or are unable to take oral fluids and medicines, are pregnant, or have a higher risk of developing complications. **A**

Non-pregnant females and males aged 16 years and over

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Cefalexin, or ciprofloxacin p. 377. If sensitivity known: co-amoxiclav p. 370, or trimethoprim p. 390. **A**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **EvGr** Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin p. 332, ceftriaxone p. 343, cefuroxime p. 341, ciprofloxacin p. 377, or gentamicin p. 333. Co-amoxiclav p. 370 may be used if given in combination or sensitivity known. **A**

Intravenous second line:

- ▶ **EvGr** Consult local microbiologist. **A**

Pregnant females aged 12 years and over

Choice of antibacterial therapy

- **Oral first line:**
 - ▶ **EvGr** Cefalexin p. 339. **A**
- **Intravenous first line** (if severely unwell or unable to take oral treatment):
 - ▶ **EvGr** Cefuroxime. **A**
- **Second line** or combining antibacterials if concerned about susceptibility or sepsis:
 - ▶ **EvGr** Consult local microbiologist. **A**

Children aged 3 months to under 16 years**Choice of antibacterial therapy**

- **Oral first line:**
 - ▶ **[EvGr]** Cefalexin, or co-amoxiclav (if sensitivity known). **⚠**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **[EvGr]** Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin, ceftriaxone, cefuroxime, gentamicin, or co-amoxiclav (if given in combination or sensitivity known). **⚠**
- **Intravenous second line:**
 - ▶ **[EvGr]** Consult local microbiologist. **⚠**

Recurrent urinary-tract infection

[EvGr] For children with recurrent UTIs, refer or seek specialist advice for those at high risk of serious illness, males aged 16 years and over, pregnant females, children with suspected cancer, those presenting with recurrent upper UTI, and those with recurrent lower UTI with an unknown cause.

Consider a trial of antibacterial prophylaxis in non-pregnant females if behavioural and personal hygiene measures have not been effective or appropriate.

In non-pregnant females aged 16 years and over, single-dose antibacterial prophylaxis [unlicensed indication] should be considered for use when exposed to an identifiable trigger. Daily antibacterial prophylaxis should be considered in non-pregnant females aged 16 years and over who have had no improvement after single-dose antibacterial prophylaxis, or have no identifiable triggers.

With specialist advice, daily antibacterial prophylaxis should be considered in males, pregnant females, and children under 16 years of age if behavioural and personal hygiene measures alone are not effective or appropriate.

Advise parents or carers about the risk of resistance with long-term antibacterial use, seeking medical help if the child develops symptoms of an acute UTI, and to return for review within 6 months.

Review the success, and ongoing need of prophylaxis at least every 6 months. If antibacterial prophylaxis is stopped ensure the child has rapid access to treatment if they develop an acute UTI. **⚠**

Females and males**Choice of antibacterial therapy**

- **Oral first line:**
 - ▶ **[EvGr]** Trimethoprim, or nitrofurantoin p. 403.
- **Oral second line:**
 - ▶ **[EvGr]** Amoxicillin p. 366 [unlicensed indication], or cefalexin. **⚠**

Catheter-associated urinary-tract infection

[EvGr] For children with a catheter-associated urinary-tract infection, consider removing or changing the catheter as soon as possible if it has been in place for longer than 7 days, without delaying antibacterial treatment. An immediate antibacterial prescription should be given and a urine sample obtained before treatment is taken and sent for culture and susceptibility testing.

Consider referring or seeking specialist advice for children with a catheter-associated UTI who are significantly dehydrated or unable to take oral fluids and medicines, are pregnant, have a higher risk of developing complications, have recurrent catheter-associated UTIs, or have bacteria resistant to oral antibacterials. **⚠**

Non-pregnant females and males aged 16 years and over**Choice of antibacterial therapy**

- **Oral first line** (if **no** upper UTI symptoms):
 - ▶ **[EvGr]** Amoxicillin (only if culture susceptible), nitrofurantoin, or trimethoprim (if low risk of resistance). **⚠**
- **Oral second line** (if **no** upper UTI symptoms and first line not suitable):

- ▶ **[EvGr]** Pivmecillinam hydrochloride p. 373. **⚠**

- **Oral first line** (upper UTI symptoms):
 - ▶ **[EvGr]** Cefalexin, ciprofloxacin, co-amoxiclav (only if culture susceptible), or trimethoprim (only if culture susceptible). **⚠**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **[EvGr]** Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin, ceftriaxone, cefuroxime, ciprofloxacin, gentamicin, or co-amoxiclav (only in combination, unless culture results confirm susceptibility). **⚠**
- **Intravenous second line:**
 - ▶ **[EvGr]** Consult local microbiologist. **⚠**

Pregnant females aged 12 years and over**Choice of antibacterial therapy**

- **Oral first line:**
 - ▶ **[EvGr]** Cefalexin. **⚠**
- **Intravenous first line** (if severely unwell or unable to take oral treatment)
 - ▶ **[EvGr]** Cefuroxime. **⚠**
- **Second line or combining if concerned about susceptibility or sepsis:**
 - ▶ **[EvGr]** Consult local microbiologist. **⚠**

Children aged 3 months to under 16 years**Choice of antibacterial therapy**

- **Oral first line:**
 - ▶ **[EvGr]** Cefalexin or trimethoprim (if low risk of resistance), amoxicillin (if culture susceptible), or co-amoxiclav (if culture susceptible). **⚠**
- **Intravenous first line** (if severely unwell or unable to take oral treatment). **[EvGr]** Antibacterials may be combined if concerned about susceptibility or sepsis.
 - ▶ Amikacin, ceftriaxone, cefuroxime, gentamicin, or co-amoxiclav (only in combination, unless culture results confirm susceptibility). **⚠**
- **Intravenous second line:**
 - ▶ **[EvGr]** Consult local microbiologist. **⚠**

ANTIBACTERIALS > OTHER

Nitrofurantoin

11-May-2020

● INDICATIONS AND DOSE

Lower urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3 days
- ▶ Child 12–15 years: 50 mg 4 times a day for 3 days (7 days in pregnant women)
- ▶ Child 16–17 years: 50 mg 4 times a day for 3 days (7 days in males and pregnant women)
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–15 years: 100 mg twice daily for 3 days (7 days in pregnant women)
- ▶ Child 16–17 years: 100 mg twice daily for 3 days (7 days in males and pregnant women)

Urinary-tract infections (catheter-associated)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 16–17 years: 50 mg 4 times a day for 7 days, to be used if modified-release preparations are unavailable
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 16–17 years: 100 mg twice daily for 7 days

Severe chronic recurrent urinary-tract infections

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg 4 times a day for 3–7 days

Prophylaxis of recurrent urinary-tract infection

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12–15 years: 50–100 mg once daily, dose to be taken at night
- ▶ Child 16–17 years: 50–100 mg once daily, dose to be taken at night, alternatively 100 mg for 1 dose, following exposure to a trigger

Genito-urinary surgical prophylaxis

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after

- **UNLICENSED USE** [EvGr] Duration of treatment for lower urinary-tract infection differs from product literature and adheres to national guidelines. ⚠ See Urinary-tract infections p. 400 for further information. [EvGr] Nitrofurantoin can be given as a single dose for the prophylaxis of recurrent urinary tract infection following exposure to a trigger, ⚠ but this dosing regimen is not licensed. See Urinary-tract infections p. 400 for further information.
- **CONTRA-INDICATIONS** Acute porphyrias p. 652 · G6PD deficiency · infants less than 3 months old
- **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency
- **INTERACTIONS** → Appendix 1: nitrofurantoin
- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · arthralgia · asthenia · chest pain · chills · circulatory collapse · confusion · cough · cyanosis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · eosinophilia · euphoric mood · fever · granulocytopenia · haemolytic anaemia · headache · hepatic disorders · idiopathic intracranial hypertension · increased risk of infection · leucopenia · lupus-like syndrome · nausea · nerve disorders · nystagmus · pancreatitis · psychotic disorder · pulmonary hypersensitivity · pulmonary reaction (possible association with lupus erythematosus-like syndrome) · respiratory disorders · skin reactions · Stevens-Johnson syndrome ·

thrombocytopenia · urine discolouration · vertigo · vomiting

- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
 - **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution.
 - **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
 - **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
 - **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
 - **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-urinary-tract-infections
 - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
- Tablet**

2 Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local

treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 410 is the treatment of choice for aspergillosis; liposomal amphotericin p. 406 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 405 or itraconazole p. 409 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 407 can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, either amphotericin by intravenous infusion or an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 412 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is

difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 778 are used more frequently than griseofulvin p. 412 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans*[unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by *T. tonsurans* or *Microsporum* spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 405 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 555, econazole nitrate p. 555, ketoconazole p. 777, and tioconazole p. 777. They are used for the local treatment of

vaginal candidiasis and for dermatophyte infections. Miconazole p. 762 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin p. 406 and nystatin p. 763; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin below and micafungin below. They are only active against *Aspergillus* spp. and *Candida* spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 412 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 412 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 778 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

● INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

▶ BY INTRAVENOUS INFUSION

▶ Neonate: 25 mg/m² once daily.

- ▶ Child 1–2 months: 25 mg/m² once daily
- ▶ Child 3–11 months: 50 mg/m² once daily
- ▶ Child 1–17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises increase dose to 70 mg/m² daily (max. 70 mg daily) with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin).

● **INTERACTIONS** → Appendix 1: caspofungin

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · arthralgia · diarrhoea · dyspnoea · electrolyte imbalance · fever · flushing · headache · hyperhidrosis · hypotension · nausea · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · anxiety · appetite decreased · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · gastrointestinal discomfort · haematuria · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypoxia · induration · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocytopenia · thrombophlebitis · tremor · vision blurred
- ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** No information available for severe impairment.

Dose adjustments Usual initial dose, then use 70% of normal maintenance dose in moderate impairment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cancidas*®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding 500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Caspofungin (Non-proprietary)**

Caspofungin (as Caspofungin acetate) 50 mg Caspofungin 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £50.25–£327.67

Caspofungin (as Caspofungin acetate) 70 mg Caspofungin 70mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £52.91–£416.78

▶ **Cancidas** (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Cancidas 50mg powder for solution for infusion vials | 1 vial [PoM] £327.67

Caspofungin (as Caspofungin acetate) 70 mg Cancidas 70mg powder for solution for infusion vials | 1 vial [PoM] £416.78

Micafungin

● INDICATIONS AND DOSE

Invasive candidiasis

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.

continued →

- ▶ Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- ▶ Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

▶ BY INTRAVENOUS INFUSION

- ▶ Child 16–17 years (body-weight up to 40 kg): 3 mg/kg once daily
- ▶ Child 16–17 years (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.

- ▶ Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- ▶ Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

● **INTERACTIONS** → Appendix 1: micafungin

- **SIDE-EFFECTS** Anaemia · anxiety · appetite decreased · arrhythmias · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eosinophilia · flushing · gastrointestinal discomfort · haemolysis · haemolytic anaemia · headache · hepatic disorders · hepatic failure (potentially life-threatening) · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · insomnia · leucopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · renal impairment · severe cutaneous adverse reactions (SCARs) · shock · skin reactions · taste altered · thrombocytopenia · tremor · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic impairment; avoid in severe impairment (limited information available).

- **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

● **MONITORING REQUIREMENTS**

- ▶ Monitor renal function.
- ▶ Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion▶ **Mycamine** (Astellas Pharma Ltd)

- ▶ **Micafungin (as Micafungin sodium) 50 mg** Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM](#) | £196.08
- ▶ **Micafungin (as Micafungin sodium) 100 mg** Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM](#) | £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS**Amphotericin**

21-Nov-2019

(Amphotericin B)● **INDICATIONS AND DOSE****ABELCET[®]**

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

AMBISOME[®]

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE[®]**Systemic fungal infections**

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

● **UNLICENSED USE**

AMBISOME[®] *Ambisome[®]* not licensed for use in children under 1 month.

FUNGIZONE[®] Intravenous conventional formulation amphotericin (*Fungizone[®]*) is licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: PARENTAL AMPHOTERICIN B: REMINDER OF RISK OF POTENTIALLY FATAL ADVERSE REACTION IF FORMULATIONS CONFUSED (JULY 2018)**

The MHRA is aware of three fatal overdoses which were caused by medication error in which *Fungizone[®]* was administered (a non-lipid-based formulation of amphotericin B) instead of a lipid-based formulation. Healthcare professionals are advised:

- when prescribing and dispensing amphotericin products, both the complete generic name and the proprietary name should be used;
- the product name and dose should be verified before administration, especially if the dose prescribed exceeds the maximum recommended dose for *Fungizone*[®].

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- ▶ **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).
- **INTERACTIONS** → Appendix 1: amphotericin
- **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal (discontinue) · hyposthenuria · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting
- ▶ **Uncommon** Agranulocytosis · arrhythmias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
- ▶ **Rare or very rare** Arthralgia · cardiac arrest · coagulation disorder · deafness · encephalopathy · eosinophilia · haemorrhage · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · tinnitus · vertigo · vision disorders · weight decreased

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

DIRECTIONS FOR ADMINISTRATION

ABELCET[®] Amphotericin (lipid complex)

For *intravenous infusion*, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.

AMBISOME[®] Amphotericin (liposomal)

For *intravenous infusion*, reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a

final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.

FUNGIZONE[®] Amphotericin (as sodium deoxycholate complex)

For *intravenous infusion*, reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given *via* a central line); pH of glucose solution must be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

● PRESCRIBING AND DISPENSING INFORMATION

Amphotericin is available as *conventional, liposomal and lipid complex* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS

Fluconazole

10-Mar-2020

● INDICATIONS AND DOSE

Candidal balanitis

- ▶ BY MOUTH
- ▶ Child 16–17 years: 150 mg for 1 dose

Vaginal candidiasis

- ▶ BY MOUTH
- ▶ Child: 150 mg for 1 dose, for use in patients who are post-puberty

Vulvovaginal candidiasis (recurrent)

- ▶ BY MOUTH
- ▶ Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty

Mucosal candidiasis (except genital)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Neonate up to 14 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.
- ▶ Neonate 14 days to 28 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.

- ▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for continued →

7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

- ▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea capitis

▶ BY MOUTH

- ▶ Child 1–17 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

▶ BY MOUTH

- ▶ Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Neonate 14 days to 28 days: 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Prevention of fungal infections in immunocompromised patients

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.

- ▶ Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.

- ▶ Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 6 mg/kg daily (max. per dose 200 mg)

- **UNLICENSED USE** Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with AIDS.

- **CONTRA-INDICATIONS** Acute porphyrias p. 652

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon** Dizziness · flatulence · hepatic disorders · seizure · taste altered
- ▶ **Rare or very rare** Agranulocytosis · alopecia · dyslipidaemia · hypokalaemia · leucopenia · neutropenia · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · torsade de pointes

SPECIFIC SIDE-EFFECTS

▶ **Uncommon**

- ▶ With parenteral use Anaemia · appetite decreased · asthenia · constipation · drowsiness · dry mouth · fever · hyperhidrosis · insomnia · malaise · myalgia · paraesthesia · vertigo

▶ **Rare or very rare**

- ▶ With parenteral use Angioedema · face oedema · tremor

▶ **Frequency not known**

- ▶ With oral use Cardio-respiratory distress · oedema

SIDE-EFFECTS, FURTHER INFORMATION If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.

● **RENAL IMPAIRMENT**

Dose adjustments Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Fluconazole for yeast and fungal infections www.medicinesforchildren.org.uk/fluconazole-yeast-and-fungal-infections

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Fluconazole Capsules 50 mg may be prescribed.

Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

19-Feb-2020

● **INDICATIONS AND DOSE****Oropharyngeal candidiasis**▶ **BY MOUTH**

▶ Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day

▶ Child 12–17 years: 100 mg once daily for 15 days

Oropharyngeal candidiasis in patients with AIDS or neutropenia▶ **BY MOUTH**

▶ Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day

▶ Child 12–17 years: 200 mg once daily for 15 days

Systemic candidiasis where other antifungal drugs inappropriate or ineffective▶ **BY MOUTH**

▶ Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

▶ **BY INTRAVENOUS INFUSION**

▶ Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Pityriasis versicolor▶ **BY MOUTH**

▶ Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days

▶ Child 12–17 years: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum▶ **BY MOUTH**

▶ Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days

▶ Child 12–17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris▶ **BY MOUTH**

▶ Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days

▶ Child 12–17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Tinea capitis▶ **BY MOUTH**

▶ Child 1–17 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

Onychomycosis▶ **BY MOUTH**

▶ Child 1–11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

▶ Child 12–17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective▶ **BY INTRAVENOUS INFUSION**

▶ Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

▶ **BY MOUTH**

▶ Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

Histoplasmosis▶ **BY MOUTH**

▶ Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective▶ **BY MOUTH**

▶ Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

▶ **BY INTRAVENOUS INFUSION**

▶ Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate▶ **BY MOUTH**

▶ Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic▶ **BY MOUTH USING ORAL SOLUTION**

▶ Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

- **UNLICENSED USE** Not licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Acute porphyrias p. 652
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure

CAUTIONS, FURTHER INFORMATION

- ▶ Susceptibility to congestive heart failure There have been reports of heart failure associated with itraconazole. Those at risk may include patients receiving higher daily doses and longer courses, patients with cardiac disease, patients with chronic lung disease, and patients receiving treatment with calcium channel blockers. Manufacturer advises avoid in patients with ventricular dysfunction, such as history of congestive heart failure, unless the infection is serious.

- **INTERACTIONS** → Appendix 1: antifungals, azoles

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · constipation · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · heart failure · hepatic disorders · hyperbilirubinaemia · hypotension · nausea · oedema · pulmonary oedema · skin reactions · vision disorders · vomiting
- ▶ **Uncommon** Hearing loss · taste altered
- ▶ **Rare or very rare** Angioedema · hypersensitivity vasculitis · hypertriglyceridaemia · pancreatitis · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Peripheral neuropathy (discontinue)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With intravenous use Chest pain · confusion · cough · dizziness · drowsiness · electrolyte imbalance · fatigue · gastrointestinal disorder · granulocytopenia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypertension · myalgia · pain · renal impairment · tachycardia · tremor · urinary incontinence
- ▶ **Uncommon**
 - ▶ With intravenous use Dysphonia · numbness · thrombocytopenia
 - ▶ With oral use Flatulence · increased risk of infection · menstrual disorder
- ▶ **Rare or very rare**
 - ▶ With oral use Erectile dysfunction · leucopenia · sensation abnormal · serum sickness · tinnitus · urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported very rarely — discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.
- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).
- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises use only in serious or life-saving situations where potential benefit outweighs risk of hepatotoxicity.
- **RENAL IMPAIRMENT** Risk of congestive heart failure.
 - ▶ With oral use Bioavailability of oral formulations possibly reduced.
 - ▶ With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, or if history of hepatotoxicity with other drugs.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.
- ▶ With oral use For *oral liquid*, do not take with food; swirl around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.
 - ▶ With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

- ▶ **Sporanox** (Janssen-Cilag Ltd)

INDICATIONS AND DOSE

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

- ▶ BY MOUTH

- ▶ Child 2-11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- ▶ Child 12-14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required

- ▶ Child 12–14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- ▶ Child 15–17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- ▶ Child 15–17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- ▶ Child 12–14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- ▶ Child 12–14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months
- ▶ Child 15–17 years: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises increasing the maintenance dose with concurrent use of fosphenytoin, phenytoin, or rifabutin—no specific recommendations made for children.

● **CONTRA-INDICATIONS** Acute porphyrias p. 652

● **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

● **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Acute kidney injury · agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · hypoglycaemia · hypotension · increased risk of infection · insomnia · leucopenia · muscle tone increased · nausea · neutropenia · oedema · oral disorders · pain · pulmonary oedema · respiratory disorders · seizure · sensation abnormal · skin reactions · syncope · tetany · thrombocytopenia · tremor · vision disorders · vomiting
- ▶ **Uncommon** Adrenal insufficiency · arthritis · brain oedema · duodenitis · encephalopathy · eosinophilia · gallbladder disorders · hearing impairment · hypothyroidism · influenza like illness · lymphadenopathy · lymphangitis · movement disorders · nephritis · nerve disorders · pancreatitis · parkinsonism · phototoxicity · proteinuria · pseudomembranous enterocolitis · QT interval prolongation · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · taste altered · thrombophlebitis · tinnitus · vertigo
- ▶ **Rare or very rare** Angioedema · cardiac conduction disorders · disseminated intravascular coagulation · hyperthyroidism
- ▶ **Frequency not known** Cutaneous lupus erythematosus · periostitis (more common in transplant patients) ·

squamous cell carcinoma (more common in presence of phototoxicity)

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION **Hepatotoxicity** Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

Phototoxicity Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in severe impairment (no information available).

Dose adjustments Child 12–17 years Manufacturer advises use usual initial loading dose then halve maintenance doses in mild to moderate cirrhosis.

- **RENAL IMPAIRMENT**

Child 2–12 years No information available.

Child 12–17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

- **MONITORING REQUIREMENTS**

- ▶ Monitor renal function.

- ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE** Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Sulfobutylether beta cyclodextrin sodium
ELECTROLYTES: May contain Sodium

ANTIFUNGALS > OTHER

Flucytosine

20-Jan-2020

● INDICATIONS AND DOSE

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

▶ Neonate: 50 mg/kg every 12 hours.

▶ Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

▶ Neonate: 50 mg/kg every 12 hours.

▶ Child: 25 mg/kg every 6 hours for 2 weeks

- **UNLICENSED USE** Tablets not licensed.

- **CAUTIONS** Blood disorders

- **INTERACTIONS** → Appendix 1: flucytosine

- **SIDE-EFFECTS** Agranulocytosis · aplastic anaemia · blood disorder · cardiotoxicity · confusion · diarrhoea · hallucination · headache · hepatic disorders · leucopenia · nausea · rash · sedation · seizure · thrombocytopenia · toxic epidermal necrolysis · ventricular dysfunction · vertigo · vomiting

- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT**

Dose adjustments Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration.

Monitoring In renal impairment liver- and kidney-function tests and blood counts required weekly.

● MONITORING REQUIREMENTS

- ▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- ▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for infusion

ELECTROLYTES: May contain Sodium

Griseofulvin

16-Jan-2020

● INDICATIONS AND DOSE

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

▶ BY MOUTH

▶ Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), increased if necessary to 20 mg/kg daily (max. per dose 1 g), for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

▶ Child 12–17 years: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

▶ BY MOUTH

▶ Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses (max. per dose 1 g)

▶ Child 12–17 years: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Acute porphyrias p. 652 · systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1: griseofulvin

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · epigastric discomfort · headache · nausea · vomiting
- ▶ **Uncommon** Appetite decreased · confusion · coordination abnormal · dizziness · drowsiness · insomnia · irritability · peripheral neuropathy · photosensitivity reaction · skin reactions · taste altered · toxic epidermal necrolysis
- ▶ **Rare or very rare** Anaemia · hepatic disorders · leucopenia · neutropenia · systemic lupus erythematosus (SLE)

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in *animals*).

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of deterioration); avoid in severe impairment.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Griseofulvin for fungal infections www.medicinesforchildren.org.uk/griseofulvin-fungal-infections
Driving and skilled tasks May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

2.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease

Co-trimoxazole p. 378 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below or a combination of dapsone p. 414 with trimethoprim p. 390 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 351 and primaquine p. 430 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 414 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 478 is given by mouth for 5 days (alternatively, hydrocortisone p. 476 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy

and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

ANTIPROTOZOALS > OTHER

Atovaquone

27-May-2020

● **INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

▶ **BY MOUTH**

- ▶ Child 1-2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- ▶ Child 3 months-1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- ▶ Child 2-17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy) - other causes of pulmonary disease should be sought and treated

- **INTERACTIONS** → Appendix 1: antimalarials

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · angioedema · bronchospasm · diarrhoea · headache · hypersensitivity · hyponatraemia · insomnia · nausea · neutropenia · skin reactions · throat tightness · vomiting
- ▶ **Frequency not known** Stevens-Johnson syndrome

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in significant impairment and monitor closely—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

Monitoring Monitor more closely in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

▶ **Atovaquone (Non-proprietary)**

Atovaquone 150 mg per 1 ml Atovaquone 750mg/5ml oral suspension sugar free sugar-free | 250 ml [POM] £470.60

▶ **Wellvone (GlaxoSmithKline UK Ltd)**

Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [POM] £486.37 DT = £486.37

Dapsone

05-May-2020

● **INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

▶ **BY MOUTH**

- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
- ▶ Child 12–17 years: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

▶ **BY MOUTH**

- ▶ Child: 2 mg/kg once daily (max. per dose 100 mg)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 652 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1: dapsone
- **SIDE-EFFECTS** Agranulocytosis · appetite decreased · haemolysis · haemolytic anaemia · headache · hepatic disorders · hypoalbuminaemia · insomnia · lepra reaction · methaemoglobinaemia · motor loss · nausea · peripheral neuropathy · photosensitivity reaction · psychosis · severe cutaneous adverse reactions (SCARs) · skin reactions · tachycardia · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are dose-related. If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).
- **PREGNANCY** Folic acid p. 620 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Pentamidine isetionate

16-Mar-2020

● **INDICATIONS AND DOSE**

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child: 4 mg/kg once daily for at least 7–10 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

▶ **BY INHALATION OF NEBULISED SOLUTION**

- ▶ Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ Child 1–17 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

▶ **BY DEEP INTRAMUSCULAR INJECTION**

- ▶ Child 1–17 years: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

▶ **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- ▶ Child 1–17 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1: pentamidine
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
▶ **Common or very common** Dizziness · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · local reaction · nausea · rash · taste altered
▶ **Rare or very rare** QT interval prolongation
▶ **Frequency not known** Pancreatitis acute (can be severe and sometimes fatal)
SPECIFIC SIDE-EFFECTS
▶ **Common or very common**
▶ When used by inhalation Cough · dyspnoea · respiratory disorders
▶ With parenteral use Acute kidney injury · anaemia · azotaemia · electrolyte imbalance · flushing · haematuria · hyperglycaemia · induration · leucopenia · localised pain · myopathy · syncope · thrombocytopenia · vomiting
▶ **Rare or very rare**
▶ With parenteral use Arrhythmia (can be severe and sometimes fatal) · pancreatitis (can be severe and sometimes fatal)

- ▶ **Frequency not known**
- ▶ When used by inhalation Angioedema · appetite decreased · bradycardia · fatigue · renal failure
- ▶ With parenteral use Arrhythmias · perioral hypoaesthesia · sensation abnormal · Stevens–Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
- ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- ▶ Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

3 Helminth infection

Helminth infections

Specialist centres

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

Threadworms

Anthemintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the

perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 417 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 417 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 417 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 416 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also effective in children.

Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (thiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS**Albendazole****● INDICATIONS AND DOSE****Chronic *Strongyloides* infection**

▶ BY MOUTH

- ▶ Child 2–17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

▶ BY MOUTH

- ▶ Child 2–17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles

Hookworm infections

▶ BY MOUTH

- ▶ Child 2–17 years: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1: albendazole

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

4 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 358 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 360 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniocides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate p. 419, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 406 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*Ambisome*[®]). *Abelcet*[®], a lipid formulation of amphotericin, is also likely to be effective but less information is available.

Pentamidine isetonate p. 414 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 431 and sulfadiazine p. 380, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 351 or clarithromycin p. 353 or azithromycin p. 352. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid p. 600 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

4.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 406 · Pentamidine isetonate, p. 414

ANTIPROTOZOALS > OTHER

Sodium stibogluconate

● INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 mg/kg daily for at least 20 days

● UNLICENSED USE

- ▶ With intravenous use Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)

● CAUTIONS, FURTHER INFORMATION

- ▶ Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1: sodium stibogluconate

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · diarrhoea · headache · lethargy · malaise · myalgia · nausea · vomiting
- ▶ **Rare or very rare** Chest pain · chills · fever · flushing · haemorrhage · hyperhidrosis · jaundice · skin reactions · vertigo
- ▶ **Frequency not known** Arrhythmias · cough · pain · pancreatitis · pneumonia · QT interval prolongation · thrombosis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available; abnormalities in hepatic function may be expected in visceral leishmaniasis).

- **RENAL IMPAIRMENT** Avoid in significant impairment.

- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Pentostam** (GlaxoSmithKline UK Ltd)
Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial **PoM** £66.43

4.2 Malaria

Antimalarials

20-Nov-2019

Artemether with lumefantrine

Artemether with lumefantrine p. 427 is licensed for the treatment of acute uncomplicated falciparum malaria.

Artemimol with piperazine

Artemimol with piperazine phosphate p. 427 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperazine has a long half-life.

Atovaquone with proguanil

Atovaquone with proguanil hydrochloride p. 428 is licensed for the prophylaxis of falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 421) and for the treatment of acute, uncomplicated falciparum malaria.

Chloroquine

Chloroquine p. 429 is usually used with proguanil hydrochloride p. 431 for the prophylaxis of malaria in areas of the world where there is little chloroquine resistance (for details, see Recommended regimens for prophylaxis against malaria p. 421).

Guidelines for malaria prevention in travellers from the United Kingdom (2019) published by Public Health England state that patients already taking hydroxychloroquine sulfate p. 690 for another indication, and for whom chloroquine would be an appropriate antimalarial, can remain on hydroxychloroquine sulfate.

Chloroquine is **no longer recommended** for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 432, atovaquone with proguanil hydrochloride p. 428, or artemether with lumefantrine. It is still recommended for the treatment of non-falciparum malaria.

Doxycycline

Doxycycline p. 381 is used in adults and children over 12 years as an option for the prophylaxis of malaria in areas of chloroquine resistance. Doxycycline is also used as an alternative to mefloquine p. 430 or atovaquone with proguanil hydrochloride p. 428 (for details, see Recommended regimens for prophylaxis against malaria p. 421).

Mefloquine

Mefloquine is used for the prophylaxis of malaria in areas of chloroquine resistance. Mefloquine is also used as an alternative to doxycycline or atovaquone with proguanil hydrochloride p. 428, (for details, see Recommended regimens for prophylaxis against malaria p. 421).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Primaquine

Primaquine p. 430 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is usually used in combination with chloroquine or atovaquone for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 421).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however atovaquone with proguanil hydrochloride is licensed for the treatment of acute uncomplicated falciparum malaria. Atovaquone with proguanil hydrochloride is also used for the prophylaxis of falciparum malaria in areas of chloroquine resistance.

Atovaquone with proguanil hydrochloride is also used as an alternative to mefloquine or doxycycline. Atovaquone with proguanil hydrochloride is particularly suitable for short trips to chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 431 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine can be used in the treatment of *falciparum malaria* with (or following) quinine.

Quinine

Quinine is used for the treatment of *falciparum malaria*, if the infective species is *not known*, or if the infection is mixed (for details see Malaria, treatment p. 426).

Useful resources

Recommendations on prophylaxis against malaria reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the Public Health England (PHE) Guidelines for malaria prevention in travellers from the United Kingdom, 2019. The advice is aimed at residents of the UK who travel to endemic areas. www.gov.uk/government/publications/malaria-prevention-guidelines-for-travellers-from-the-uk

Malaria, prophylaxis

20-Nov-2019

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by the Advisory Committee on Malaria Prevention (ACMP), published in the Public Health England (PHE) Guidelines for malaria prevention in travellers from the United Kingdom, 2019. The advice is aimed at residents of the UK who travel to endemic areas.

For specialist centres offering advice on specific malaria-related problems, see Malaria, treatment p. 426. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For more information on choice of drug, see also Antimalarials p. 419. Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age.** If in doubt obtain advice from a specialist centre, see Malaria, treatment p. 426.

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases. Mosquito nets impregnated with a pyrethroid insecticide, such as permethrin p. 780, improves protection against insects and should be used if sleeping outdoors or in unscreened lodging; vaporised insecticides are also useful. Long sleeves and trousers worn after dusk also provide protection against bites.

Insect repellents give protection against bites also, but attention to the correct application of product is required. Diethyltoluamide (DEET) 20–50% (available in various preparations including sprays and modified-release polymer formulations) is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be

used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. If DEET is not tolerated or is unavailable, for alternative options see Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Length of prophylaxis

Prophylaxis should generally be started before travel into an endemic area; 1 week before travel for chloroquine p. 429 and proguanil hydrochloride p. 431; 2–3 weeks before travel for mefloquine p. 430; and 1–2 days before travel for atovaquone with proguanil hydrochloride p. 428 or doxycycline p. 381 (children aged 12 years and over). Prophylaxis should be continued for **4 weeks after leaving the area** (except for atovaquone with proguanil hydrochloride prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine and proguanil hydrochloride may be used. However, there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for use up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline (children aged 12 years and over) can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or atovaquone with proguanil hydrochloride may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice may be sought for long-term prophylaxis.

Return from malarial region

It is important to consider that any illness that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness after their return they should see a doctor early, and specifically mention their risk of exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline (children aged 12 years and over) or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see *interactions* information for doxycycline.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, pregnant individuals must be informed about the risks and benefits of effective prophylaxis. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined; in the case of proguanil hydrochloride, folic acid p. 620 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for the length of time that it is used during pregnancy. If travelling to high risk areas or there is resistance to other drugs,

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
-	No risk
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Low risk below 2000 m from May–November	1
	Very low risk below 2000 m from December–April	1
Algeria	No risk	1
Andaman and Nicobar Islands (India)	Low risk	1
Angola	High risk	4
Argentina	No risk	1
Armenia	No risk	1
Azerbaijan	Very low risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Very low risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	1
	No risk in Belize district (including Belize city and islands)	-
Benin	High risk	4
Bhutan	Low risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	1
	No risk in areas other than those above	-
Bolivia	Low risk in Amazon basin	1
	Low risk in rural areas below 2500 m (other than above)	1
	No risk above 2500 m	-
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half, including Okavango Delta area	1
	Very low risk in southern half	1
Brazil	Low risk in Amazon basin, including city of Manaus	1
	Very low risk in areas other than those above	1
	No risk in Iguaçu Falls	-
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	Low risk. Mefloquine resistance widespread in western provinces bordering Thailand	1
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap	1
	No risk in Phnom Penh	-
Cameroon	High risk	4
Cape Verde	Individuals travelling to Praia who are at increased risk of malaria (such as long-term travellers and those at risk of severe complications from malaria including pregnant women, infants and young children, the elderly, and asplenic individuals) should consider taking antimalarials, seek advice from a travel health advisor. Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
China	Low risk in Yunnan and Hainan provinces	1
	Very low risk in southern and some central provinces, including Anhui, Guizhou, Hena, Hubei, and Jiangsu below 1500 m	1
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-
Colombia	Low risk in rural areas below 1600 m	1
	Very low risk above 1600 m and in Cartagena	1
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Low risk in Limon province, but not city of Limon (Puerto Limon)	1
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Low risk	1
	No risk in cities of Santiago and Santo Domingo	-
East Timor (Timor-Leste)	Risk present	4
Ecuador	Low risk in areas below 1500 m including coastal provinces and Amazon basin	1
	No risk in Galapagos islands or city of Guayaquil	-
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country	1
	Very low risk in areas other than those above	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
	No risk in Asmara or in areas above 2200 m	-
Ethiopia	High risk below 2000 m	4
	No risk in Addis Ababa or in areas above 2000 m	-
French Guiana	Risk present (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	Low risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk from June–October in rural south east	1
	No risk from November–May in rural south east	-
Ghana	High risk	4
Guatemala	Low risk below 1500 m	1
	No risk in Guatemala City, Antigua, or Lake Atitlan and above 1500 m	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	Risk present in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	3
Honduras	Low risk below 1000 m and in Roatán and other Bay Islands	1
	No risk in San Pedro Sula or Tegucigalpa and areas above 1000 m	-
India	Risk present in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Low risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	Exceptional circumstances in low risk areas (dependent on individual risk assessment)	3
	No risk in Lakshadweep islands	-

	Low risk from July–October in areas below 1200 m	1
	Very low risk all year in Harare and Bulawayo	1

mefloquine may be considered during the second or third trimester of pregnancy. Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. Atovaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given if atovaquone with proguanil hydrochloride is used during pregnancy.

Breast-feeding

Some antimalarials should be avoided when breast feeding, see individual drugs for details.

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 103 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Other medical conditions

For additional information on malaria prophylaxis in patients with other medical conditions, see Public Health

England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Emergency standby treatment

Children and their parents or carers on prophylaxis visiting remote, malarious areas should carry standby emergency treatment if they are likely to be more than 24 hours away from medical care. Standby emergency treatment should also be considered in long-term travellers living in or visiting remote, malarious areas that may be far from appropriate medical attention; this does not replace the need to consider prophylaxis. Self-medication should be **avoided** if medical help is accessible.

In order to use standby treatment appropriately, children and their parents or carers should be provided with **written instructions** which include seeking urgent medical attention if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller due to concerns over drug resistance and to minimise drug toxicity.

Malaria prophylaxis, specific recommendations

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication

must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see *Recommended regimens for prophylaxis against malaria*, and Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (see *Useful resources*).

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Treatment

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 432, *Malarone*[®] (atovaquone with proguanil hydrochloride p. 428), or *Riamet*[®] (artemether with lumefantrine p. 427). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 429 which should not therefore be given for treatment. Quinine, *Malarone*[®] (atovaquone with proguanil hydrochloride), or

Riamet[®] (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 430 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 351 [unlicensed indication] or, in children over 12 doxycycline p. 381.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*[®], or *Riamet*[®] may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*[®] or *Riamet*[®] treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by *intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with or followed by either* doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous *artesunate* may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*[®], and *Riamet*[®] are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region.

Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*[®] [unlicensed indication], quinine, or *Riamet*[®] [unlicensed indication] can be used; as with chloroquine, primaquine p. 430 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a *radical cure* (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

Parenteral

If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS**Artemether with lumefantrine** 28-May-2018**● INDICATIONS AND DOSE**

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

▶ BY MOUTH

- ▶ Child (body-weight 5–14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)
- ▶ Child (body-weight 15–24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)
- ▶ Child (body-weight 25–34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)
- ▶ Child 12–17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in Acute porphyrias p. 652 · electrolyte disturbances
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · appetite decreased · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitations · QT interval prolongation · skin reactions · sleep disorders · vomiting
 - ▶ **Uncommon** Clonus · drowsiness
 - ▶ **Frequency not known** Angioedema
- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available)—monitor ECG and plasma potassium concentration.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

Monitoring In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

▶ BY MOUTH

- ▶ Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
 - ▶ Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
 - ▶ Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
 - ▶ Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
 - ▶ Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
 - **INTERACTIONS** → Appendix 1: antimalarials
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · conjunctivitis · cough · diarrhoea · eosinophilia · fever · increased risk of infection · leucocytosis · leucopenia · neutropenia · QT interval prolongation · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon** Arthralgia · cardiac conduction disorder · epistaxis · headache · hepatic disorders · hypochromia · lymphadenopathy · nausea · rhinorrhoea · seizure · splenomegaly · stomatitis · thrombocytosis
 - **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution in jaundice or in moderate to severe failure (no information available)—monitor ECG and plasma potassium concentration.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
 - **RENAL IMPAIRMENT** No information available in moderate to severe impairment.

Monitoring Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

● MONITORING REQUIREMENTS

- ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperquine concentration, in children who are vomiting or in females.

- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperquine phosphate with artemimol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Eurartesim** (Logixx Pharma Solutions Ltd)

Artemimol 40 mg, Piperquine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet [POM] £40.00

Atovaquone with proguanil hydrochloride

28-May-2019

● INDICATIONS AND DOSE

MALARONE[®] 250MG/100MG

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

▶ BY MOUTH

- ▶ Child (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Child (body-weight 11–20 kg): 1 tablet once daily for 3 days
- ▶ Child (body-weight 21–30 kg): 2 tablets once daily for 3 days
- ▶ Child (body-weight 31–40 kg): 3 tablets once daily for 3 days
- ▶ Child (body-weight 41 kg and above): 4 tablets once daily for 3 days

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each tablet of *Malarone*[®] contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.

MALARONE[®] PAEDIATRIC

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

▶ BY MOUTH

- ▶ Child (body-weight 5–7 kg): 0.5 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 8–9 kg): 0.75 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 10–19 kg): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 20–29 kg): 2 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
- ▶ Child (body-weight 30–39 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

- ▶ Child (body-weight 40 kg and above): Use *Malarone*[®] (standard) tablets.

Treatment of acute uncomplicated falciparum malaria

Treatment of non-falciparum malaria

▶ BY MOUTH

- ▶ Child (body-weight 5–8 kg): 2 tablets once daily for 3 days
- ▶ Child (body-weight 9–10 kg): 3 tablets once daily for 3 days
- ▶ Child (body-weight 11 kg and above): Use *Malarone*[®] (standard) tablets.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each tablet of *Malarone*[®] paediatric contains 62.5 mg atovaquone and 25 mg proguanil hydrochloride.

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria. Not licensed for prophylaxis of malaria in children under 11 kg.

Dosing for prophylaxis of malaria differs from product literature and adheres to Public Health England guidelines.

- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

- **INTERACTIONS** → Appendix 1: antimalarials

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · appetite decreased · cough · depression · diarrhoea · dizziness · fever · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Alopecia · anxiety · blood disorder · hyponatraemia · oral disorders · palpitations
- ▶ **Frequency not known** Hallucination · hepatic disorders · photosensitivity reaction · seizure · Stevens-Johnson syndrome · tachycardia · vasculitis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk. See also *Pregnancy* in Malaria, prophylaxis p. 420.

- **BREAST FEEDING** Use only if no suitable alternative available.

- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis and, if possible, for treatment if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- **MALARONE[®] PAEDIATRIC** Tablets may be crushed and mixed with food or milky drink just before administration.

- **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

Medicines for Children leaflet: Malarone for prevention of malaria www.medicinesforchildren.org.uk/malarone-prevention-malaria

● NATIONAL FUNDING/ACCESS DECISIONS

- **NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Malarone** (GlaxoSmithKline UK Ltd)

Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg Malarone Paediatric 62.5mg/25mg tablets | 12 tablet [POM] £6.26 DT = £6.26

Proguanil hydrochloride 100 mg, Atovaquone 250 mg Malarone 250mg/100mg tablets | 12 tablet [POM] £25.21 DT = £31.69

Chloroquine

11-May-2020

● INDICATIONS AND DOSE

Prophylaxis of malaria

- ▶ INITIALLY BY MOUTH USING SYRUP
- ▶ Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ INITIALLY BY MOUTH USING TABLETS
- ▶ Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

- ▶ BY MOUTH
- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

***P. vivax* or *P. ovale* infection during pregnancy while radical cure is postponed**

- ▶ BY MOUTH
- ▶ Child: 10 mg/kg once weekly (max. per dose 310 mg)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses expressed as chloroquine base.
- ▶ Each tablet contains 155 mg of chloroquine base (equivalent to 250 mg of chloroquine phosphate). Syrup contains 50 mg/5 mL of chloroquine base (equivalent to 80 mg/5 mL of chloroquine phosphate).

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.
- **CAUTIONS** Acute porphyrias p. 652 · diabetes (may lower blood glucose) · G6PD deficiency · long-term therapy (risk of retinopathy and cardiomyopathy) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (may lower seizure threshold)—avoid for prophylaxis of malaria if history of epilepsy · severe gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Cardiomyopathy · hallucination · hepatitis
- ▶ **Frequency not known** Abdominal pain · agranulocytosis · alopecia · anxiety · atrioventricular block · bone marrow disorders · confusion · corneal deposits · depression · diarrhoea · eye disorders · gastrointestinal disorder · headache · hearing impairment · hypoglycaemia · hypotension · insomnia · interstitial lung disease · movement disorders · myopathy · nausea · neuromyopathy · neutropenia · personality change · photosensitivity

reaction · psychotic disorder · QT interval prolongation · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tongue protrusion · vision disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution, particularly in cirrhosis.
- **RENAL IMPAIRMENT** Manufacturers advise caution. **Dose adjustments** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose.
- **MONITORING REQUIREMENTS** Expert sources advise ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- ▶ **NHS restrictions** Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** *Tablets* can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 5

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine above, proguanil hydrochloride p. 431.

● INDICATIONS AND DOSE

Prophylaxis of malaria

- ▶ BY MOUTH
- ▶ Child: (consult product literature)

- **INTERACTIONS** → Appendix 1: antimalarials
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Form unlicensed

- ▶ **Paludrine/Avoclor** (Alliance Pharmaceuticals Ltd)
Paludrine/Avoclor tablets anti-malarial travel pack | 112 tablet  £13.50

Mefloquine

05-Aug-2018

● **INDICATIONS AND DOSE****Treatment of malaria**

- ▶ BY MOUTH
- ▶ Child: (consult product literature)

Prophylaxis of malaria

- ▶ BY MOUTH
- ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature.
Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions · avoid for standby treatment if history of convulsions · history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury

CAUTIONS, FURTHER INFORMATION

- ▶ **Neuropsychiatric reactions** Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the *Guide for Healthcare Professionals* provided by the manufacturer.
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vision disorders · vomiting
 - ▶ **Frequency not known** Acute kidney injury · agranulocytosis · alopecia · aplastic anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · behaviour abnormal · cardiac conduction disorders · cataract · chest pain · chills · concentration impaired · confusion · cranial nerve paralysis · delusional disorder · depersonalisation ·

drowsiness · dyspnoea · encephalopathy · eye disorder · fever · flushing · gait abnormal · hallucination · hearing impairment · hepatic disorders · hyperacusia · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · memory loss · mood altered · movement disorders · muscle complaints · muscle weakness · nephritis · nerve disorders · oedema · palpitations · pancreatitis · paraesthesia · pneumonia · pneumonitis · psychosis · seizure · self-endangering behaviour · speech disorder · Stevens-Johnson syndrome · suicidal tendencies · syncope · thrombocytopenia · tinnitus · tremor · vertigo

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).
- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
- **BREAST FEEDING** Present in milk but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—elimination may be prolonged.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.
A patient alert card should be provided.
- **Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

- ▶ **Lariam** (Cheplapharm Arzneimittel GmbH)
Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet  £14.53 DT = £14.53

Primaquine● **INDICATIONS AND DOSE****Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection**

- ▶ BY MOUTH
- ▶ Child 6 months–17 years: 500 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection

▶ BY MOUTH

- ▶ Child 6 months–17 years: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild G6PD deficiency (administered on expert advice) | Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection in patients with mild G6PD deficiency (administered on expert advice)

▶ BY MOUTH

- ▶ Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

▶ BY MOUTH

- ▶ Child: This combination is associated with considerable toxicity (consult product literature)

- **UNLICENSED USE** Not licensed.
- **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Arrhythmia · dizziness · gastrointestinal discomfort · haemolytic anaemia (in G6PD deficiency) · leucopenia · methaemoglobinemia (in NADH methaemoglobin reductase deficiency) · nausea · QT interval prolongation · skin reactions · vomiting
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.
- **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.
- **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Quinine

04-Dec-2017

● **INDICATIONS AND DOSE****Non-falciparum malaria**▶ **BY INTRAVENOUS INFUSION**

- ▶ **Child:** 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient's condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

Falciparum malaria▶ **BY MOUTH**

- ▶ **Child:** 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Neonate:** Loading dose 20 mg/kg, infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.

- ▶ **Child:** Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin, reduce maintenance dose to 5–7 mg/kg if

parenteral treatment is required for more than 48 hours

Falciparum malaria (in intensive care unit)▶ **BY INTRAVENOUS INFUSION**

- ▶ **Neonate:** Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours until patient can swallow oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours.
- ▶ **Child:** Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

DOSE EQUIVALENCE AND CONVERSION

- ▶ When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- ▶ Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.

IMPORTANT SAFETY INFORMATION**MHRA/CHM ADVICE: REMINDER OF DOSE-DEPENDENT QT-PROLONGING EFFECTS (NOVEMBER 2017)**

Quinine has been associated with dose-dependent QT-interval-prolonging effects and should be used with caution in patients with risk factors for QT prolongation or in those with atrioventricular block—see Cautions for further information.

- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · electrolyte disturbance · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Abdominal pain · agitation · agranulocytosis · angioedema · asthma · atrioventricular conduction changes · bronchospasm · cardiotoxicity · cerebral impairment · coagulation disorders · coma · confusion · death · diarrhoea · dyspnoea · fever · flushing · gastrointestinal disorder · haemoglobinuria · haemolysis · haemolytic uraemic syndrome · headache · hearing impairment · hypersensitivity · loss of consciousness · muscle weakness · myasthenia gravis aggravated · nausea · ocular toxicity · oedema · pancytopenia · photosensitivity reaction · QT interval prolongation · renal impairment · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting

Overdose Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 891.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
 - ▶ With oral use Manufacturer advises caution (risk of prolonged half-life).
 - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
 - ▶ With oral use Manufacturer advises dose reduction or increased dose interval.
- **RENAL IMPAIRMENT**
 - Dose adjustments** ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet

▶ Quinine (Non-proprietary)

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet [PoM] £4.65 DT = £2.25

Quinine bisulfate 300 mg Quinine bisulfate 300mg tablets | 28 tablet [PoM] £5.50 DT = £4.55

Quinine sulfate 300 mg Quinine sulfate 300mg tablets | 28 tablet [PoM] £9.09 DT = £5.33

4.3 Toxoplasmosis

Other drugs used for Toxoplasmosis Pyrimethamine, p. 431

ANTIBACTERIALS > MACROLIDES

Spiramycin

20-Apr-2020

● INDICATIONS AND DOSE

Toxoplasmosis in pregnancy

▶ BY MOUTH

▶ Child 12–17 years: 1.5 g twice daily until delivery

Chemoprophylaxis of congenital toxoplasmosis

▶ BY MOUTH

▶ Neonate: 50 mg/kg twice daily.

DOSE EQUIVALENCE AND CONVERSION

▶ 3000 units ≡ 1 mg spiramycin.

- **UNLICENSED USE** Not licensed.
- **CAUTIONS** Arrhythmias · cardiac disease · G6PD deficiency · predisposition to QT interval prolongation

● SIDE-EFFECTS

- ▶ **Rare or very rare** Vasculitis
- ▶ **Frequency not known** Angioedema · diarrhoea · haemolysis · nausea · paraesthesia · pseudomembranous enterocolitis · skin reactions · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Sensitivity to other macrolides.
- **BREAST FEEDING** Present in breast milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Rovamycine (Imported (France))

Spiramycin 1.5 mega unit Rovamycine 1.5million unit tablets | 16 tablet [PoM] [X]

Spiramycin 3 mega unit Rovamycine 3million unit tablets | 10 tablet [PoM] [X]

5 Viral infection

5.1 Coronavirus

COVID-19

06-May-2020

Description of condition

COVID-19 is the syndrome caused by a novel coronavirus, SARS-CoV-2, which was originally detected late 2019 in Wuhan, Hubei Province, China. Primary transmission between people is through respiratory droplets generated by coughing and sneezing, and through contact with contaminated surfaces.

COVID-19 is predominantly a respiratory illness with early non-specific symptoms that can last 2–10 days before more specific signs or symptoms develop. The most common symptoms are fever, cough, and shortness of breath. Other symptoms, such as anxiety, delirium, agitation, fatigue, muscle aches, headache, and a loss of sense of smell may also be present. The illness varies in severity from no symptoms present in some individuals to severe pneumonia in others. Children with co-morbidities (such as cystic fibrosis, asthma, cardiovascular disease, and diabetes), frailty, impaired immunity, or a reduced ability to cough and clear secretions are more likely to develop severe pneumonia. Children with severe symptoms of COVID-19 may deteriorate rapidly.

Management

Medical practitioners must notify the Proper Officer at their local council or local health protection team of all suspected cases of COVID-19. For further information, see *Notifiable diseases in Antibacterials*, principles of therapy p. 318.

NICE have developed rapid guidelines to maximise patient safety, optimise treatment management, protect staff from infection, and make the best use of NHS resources. These guidelines provide recommendations around the provision of care during the pandemic (such as systemic anticancer treatments) and managing symptoms (including at the end of life). They also include recommendations for patients with conditions that increase the risk of developing COVID-19 (such as in immunocompromised patients, those with severe asthma; cystic fibrosis; rheumatological autoimmune, inflammatory and metabolic bone disorders; or conditions treated with drugs that affect the immune response). NICE are also developing rapid evidence summaries focusing on whether certain medications (such as non-steroidal anti-inflammatory drugs) may increase the severity/length of the COVID-19 illness, and advice on the safety and efficacy of COVID-19 treatments. For further information, see NICE

rapid guidelines and evidence summaries: **Coronavirus (COVID-19)** (see *Useful resources*).

NHS England and NHS Improvement have produced guidance for clinicians and NHS managers working in primary and secondary care, and community-based health, social care, mental health trusts and ambulance services. For further information, see NHS England: **Coronavirus guidance for clinicians and NHS managers** (see *Useful resources*).

PHE have also produced guidance for health professionals, the public, and non-clinical settings; on infection prevention and control; and sampling and diagnostics. For further information, see the PHE collection: **Coronavirus (COVID-19): guidance** (see *Useful resources*).

The MHRA has issued COVID-19 guidance for industry, in addition to information about medications and COVID-19, and guidance on medical devices (such as COVID-19 tests and testing kits). For further information, see the MHRA collection: **MHRA guidance on coronavirus (COVID-19)** (see *Useful resources*).

The UKTIS has produced an information page summarising the fetal and neonatal risks of exposure to COVID-19 treatments that have either been identified as possible options or listed as investigational medicinal products. For further information, see UKTIS: **Medications used to treat COVID-19 in pregnancy** (see *Useful resources*).

The Joint Committee on Vaccination and Immunisation have issued a statement on immunisation prioritisation during the COVID-19 pandemic (available at: www.gov.uk/government/publications/jcvi-statement-on-immunisation-prioritisation/statement-from-jcvi-on-immunisation-prioritisation).

Additional country-specific guidance is available for Northern Ireland, Scotland, and Wales (see *Useful resources*).

5.2 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Interferon alfa p. 602, **peginterferon alfa-2a**, lamivudine p. 455, adefovir dipivoxil, entecavir, and tenofovir disoproxil p. 456 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 453 or lamivudine, may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

Chronic hepatitis C

Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin p. 435 with either interferon alfa or **peginterferon alfa-2b** is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 438 and ribavirin is preferred.

Other drugs used for chronic hepatitis B Interferon alfa, p. 602 • Lamivudine, p. 455 • Tenofovir disoproxil, p. 456

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

451

Tenofovir alafenamide

26-Feb-2018

● INDICATIONS AND DOSE

Chronic hepatitis B (initiated by a specialist)

► BY MOUTH

- Child 12–17 years (body-weight 35 kg and above): 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS** Decompensated liver disease • HIV co-infection
- **INTERACTIONS** → Appendix 1: tenofovir alafenamide

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal distension · arthralgia · flatulence
- ▶ **Frequency not known** Hepatitis aggravated (during or following treatment) · nephrotoxicity
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (no information available).
- **PRE-TREATMENT SCREENING** Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.

● PATIENT AND CARER ADVICE

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ribavirin

27-Aug-2019

(Tribavirin)

● INDICATIONS AND DOSE

Bronchiolitis

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1-23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

REBETOL[®] CAPSULES

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- ▶ BY MOUTH
- ▶ Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- ▶ Child 3-17 years (body-weight 47-49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
- ▶ Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily

- ▶ Child 3-17 years (body-weight 65-80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- ▶ Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
- ▶ Child 3-17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL[®] ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- ▶ BY MOUTH
- ▶ Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- ▶ Child 3-17 years (body-weight 47-49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
- ▶ Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily
- ▶ Child 3-17 years (body-weight 65-80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- ▶ Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
- ▶ Child 3-17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

● UNLICENSED USE

- ▶ When used by inhalation Inhalation licensed for use in children (age range not specified by manufacturer).
- ▶ With intravenous use Intravenous preparation not licensed.

● CONTRA-INDICATIONS

- ▶ With systemic use Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · severe, uncontrolled cardiac disease in children with chronic hepatitis C

● CAUTIONS

- ▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · patients with a transplant—risk of rejection · risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

- **INTERACTIONS** → Appendix 1: ribavirin

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · arthritis · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · lymphadenopathy · malaise · memory loss · mood altered · muscle complaints · muscle weakness · nasal congestion · nausea · neutropenia · oral disorders · pain · palpitations · peripheral oedema · photosensitivity reaction · respiratory disorders · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · sweat changes · syncope · taste altered · thirst · throat pain · thrombocytopenia · tinnitus · tremor ·

vasodilation · vertigo · vision disorders · vomiting · weight decreased

- ▶ **Uncommon** Dehydration · diabetes mellitus · hallucination · hearing loss · hepatic disorders · hypertension · nerve disorders · sarcoidosis · suicidal tendencies · thyroiditis
- ▶ **Rare or very rare** Angina pectoris · angioedema · bone marrow disorders · cardiac inflammation · cerebral ischaemia · cholangitis · coma · congestive heart failure · facial paralysis · hepatic failure (discontinue) · hypersensitivity · intracranial haemorrhage · myocardial infarction · myopathy · pancreatitis · psychotic disorder · pulmonary embolism · retinopathy · seizure · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · vasculitis
- ▶ **Frequency not known** Haemolytic anaemia · homicidal ideation · nephrotic syndrome · pure red cell aplasia · renal failure · solid organ transplant rejection · tongue discolouration · ulcerative colitis

SIDE-EFFECTS, FURTHER INFORMATION Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

● PREGNANCY

- ▶ Avoid; teratogenicity in *animal* studies.
- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.

● BREAST FEEDING

- ▶ Avoid—no information available.

● RENAL IMPAIRMENT

- ▶ Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.

Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- ▶ With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
- ▶ With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ Flavours of oral liquid formulations may include bubble-gum.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300
Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
www.nice.org.uk/guidance/ta300

● LESS SUITABLE FOR PRESCRIBING

- ▶ Ribavirin inhalation is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Virazole (Mylan)

Ribavirin 100 mg per 1 ml Virazole 1.2g/12ml solution for injection vials | 5 vial [PoM](#) | £3,600.00

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

▶ Rebetol (Merck Sharp & Dohme Ltd)

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Ledipasvir with sofosbuvir

11-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 437.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

● INDICATIONS AND DOSE

Chronic hepatitis C infection (initiated by a specialist)

▶ BY MOUTH

- ▶ Child 12–17 years: 90/400 mg once daily, for duration of treatment consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- ▶ Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg ledipasvir/sofosbuvir.

- **CAUTIONS** Retreatment following treatment failure—efficacy not established

- **INTERACTIONS** → Appendix 1: ledipasvir · sofosbuvir

● SIDE-EFFECTS

- ▶ **Common or very common** Fatigue · headache · rash
- ▶ **Frequency not known** Angioedema · arrhythmia

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● PATIENT AND CARER ADVICE

- ▶ Vomiting If vomiting occurs within 5 hours of administration, an additional dose should be taken.
- ▶ **Missed doses** If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1343/18

The *Scottish Medicines Consortium* has advised (June 2018) that ledipasvir with sofosbuvir (*Harvoni*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 and 4 only in patients aged 12 years up to 18 years.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

● **CAUTIONS**

CAUTIONS, FURTHER INFORMATION Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

- **INTERACTIONS** → Appendix 1: sofosbuvir

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · fever · gastrointestinal discomfort · gastroesophageal reflux disease · headaches · influenza like illness · insomnia

· irritability · memory loss · muscle complaints · nasopharyngitis · nausea · neutropenia · pain · skin reactions · vision blurred · vomiting · weight decreased

- ▶ **Frequency not known** Arrhythmia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● **PATIENT AND CARER ADVICE**

Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)**
NICE TA330

Sofosbuvir (*Sovaldi*®) in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
- of genotype 3 with cirrhosis (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment
- of genotype 4, 5, or 6 with cirrhosis.

Sofosbuvir (*Sovaldi*®) in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 2 who are intolerant to *or* ineligible for interferon (treatment naive patients)
- of genotype 2 that has not adequately responded to interferon-based treatment
- of genotype 3 with cirrhosis who are intolerant to *or* ineligible for interferon (treatment naive patients)
- of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

- ▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)**
NICE TA330

Sofosbuvir (*Sovaldi*®) in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

Scottish Medicines Consortium (SMC) decisions

SMC No. 964/14

The *Scottish Medicines Consortium* has advised (June 2014) that sofosbuvir (*Sovaldi*®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 5MC2214

The *Scottish Medicines Consortium* has advised (November 2019) that glecaprevir with pibrentasvir (*Maviret*®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in patients aged 12 years up to 18 years. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3917

The *All Wales Medicines Strategy Group* has advised (October 2019) that glecaprevir/pibrentasvir (*Maviret*®) is recommended as an option for use within NHS Wales for the treatment of chronic hepatitis C virus (HCV) infection in adolescents aged 12 years or older. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Maviret** (AbbVie Ltd) ▼
Pibrentasvir 40 mg, Glecaprevir 100 mg Maviret 100mg/40mg tablets | 84 tablet [PoM] £12,993.66

IMMUNOSTIMULANTS > INTERFERONS**Peginterferon alfa**

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

● **INDICATIONS AND DOSE****PEGASYS®****Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation**

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ Child 5–17 years: (consult product literature)

- **CONTRA-INDICATIONS** Severe psychiatric illness
- CONTRA-INDICATIONS, FURTHER INFORMATION** For contra-indications consult product literature.
- **CAUTIONS**
CAUTIONS, FURTHER INFORMATION For cautions consult product literature.
- **INTERACTIONS** → Appendix 1: interferons
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · behaviour abnormal · chills · concentration impaired · cough · depression · diabetes mellitus · diarrhoea · dizziness · drowsiness · dyspnoea · ear pain · eye discomfort · face oedema · feeling cold · fever · flushing · gastrointestinal discomfort · growth retardation · haemorrhage · headaches · hypotension · hypothyroidism · increased risk of infection

· influenza like illness · laryngeal pain · leucopenia · lymphadenopathy · malaise · mood altered · muscle complaints · nausea · neutropenia · oral disorders · pain · palpitations · skin reactions · sleep disorders · syncope · tachycardia · taste altered · thrombocytopenia · urinary disorders · urinary tract disorder · vertigo · vision disorders · vomiting

► **Uncommon** Akathisia · chest discomfort · dysmenorrhoea · hallucination · hypersensitivity · keratitis · muscle contractions involuntary · nasal complaints · pallor · photosensitivity reaction · proteinuria · retinal exudate · sensation abnormal · tremor · vaginal discharge · wheezing
SIDE-EFFECTS, FURTHER INFORMATION Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of peginterferon alfa should be considered.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

● **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

● **BREAST FEEDING** Manufacturers advise avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment and decompensated cirrhosis.

● **RENAL IMPAIRMENT** For further information on peginterferon alfa use in renal impairment consult product literature.

Dose adjustments Reduce dose in moderate to severe impairment.

Monitoring Close monitoring required in renal impairment.

● **MONITORING REQUIREMENTS**

- Monitoring of lipid concentration is recommended.
- Monitoring of hepatic function is recommended.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

► Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300

Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.

Interferon alfa-2a (as Peginterferon alfa-2a) 270 microgram per 1 ml Pegasys 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PcM] £107.76 DT = £107.76

Interferon alfa-2a (as Peginterferon alfa-2a) 360 microgram per 1 ml Pegasys 180micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PcM] £497.60

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parenteral treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 440 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital

5.4 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

herpes; there is limited information available on use in children.

Valaciclovir p. 442 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

Cytomegalovirus infection

Ganciclovir p. 443 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 457; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 444 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and *animal* studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

10-Mar-2020

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex, suppression

▶ BY MOUTH

- ▶ Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

▶ BY MOUTH

- ▶ Child 1–23 months: 100–200 mg 4 times a day
- ▶ Child 2–17 years: 200–400 mg 4 times a day

Herpes simplex, treatment

▶ BY MOUTH

- ▶ Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).

- ▶ Child 1–2 months: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- ▶ Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- ▶ Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Herpes simplex, treatment, in immunocompromised or if absorption impaired

▶ BY MOUTH

- ▶ Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment, in immunocompromised or in simplex encephalitis

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- ▶ Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

▶ BY MOUTH

- ▶ Child 1–23 months: 200 mg 4 times a day for 5 days
- ▶ Child 2–5 years: 400 mg 4 times a day for 5 days
- ▶ Child 6–11 years: 800 mg 4 times a day for 5 days
- ▶ Child 12–17 years: 800 mg 5 times a day for 7 days

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10–20 mg/kg every 8 hours for at least 7 days.

- ▶ Child 1–2 months: 10–20 mg/kg every 8 hours for at least 7 days
- ▶ Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- ▶ Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days
- ▶ Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

▶ BY MOUTH

- ▶ Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- ▶ Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
- Child 1–2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 3 months–11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- Child 12–17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

► BY MOUTH

- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Varicella zoster (chickenpox), prophylaxis after delivery

► BY INTRAVENOUS INFUSION

- Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

DOSES AT EXTREMES OF BODY-WEIGHT

- With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

● UNLICENSED USE

- With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).
- With intravenous use Intravenous infusion not licensed for herpes zoster in children under 18 years.
- With oral use Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- **CAUTIONS** Maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

● SIDE-EFFECTS► **Common or very common**

- With intravenous use Nausea · photosensitivity reaction · skin reactions · vomiting
- With oral use Abdominal pain · diarrhoea · dizziness · fatigue · fever · headache · nausea · photosensitivity reaction · skin reactions · vomiting

► **Uncommon**

- With intravenous use Anaemia · leucopenia · thrombocytopenia

► **Rare or very rare**

- With intravenous use Abdominal pain · agitation · angioedema · ataxia · coma · confusion · diarrhoea · dizziness · drowsiness · dysarthria · dyspnoea · encephalopathy · fatigue · fever · hallucination · headache · hepatic disorders · inflammation localised · psychosis · renal impairment · renal pain · seizure · tremor

- With oral use Agitation · anaemia · angioedema · ataxia · coma · confusion · drowsiness · dysarthria · dyspnoea · encephalopathy · hallucination · hepatic disorders · leucopenia · psychosis · renal impairment · renal pain · seizure · thrombocytopenia · tremor

► **Frequency not known**

- With intravenous use Crystalluria
- With oral use Alopecia · crystalluria

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

Dose adjustments ► With intravenous use Use *normal intravenous dose* every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

► With oral use For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion*, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Aciclovir (oral) for viral infections
- With oral use www.medicinesforchildren.org.uk/aciclovir-oral-viral-infections-0

● PROFESSION SPECIFIC INFORMATION**Dental practitioners' formulary**

Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Valaciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment in immunocompromised patients

► BY MOUTH

► Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode

► BY MOUTH

► Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

► BY MOUTH

► Child 12–17 years: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

► BY MOUTH

► Child 12–17 years: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

► BY MOUTH

► Child 12–17 years: 1 g twice daily for 5–10 days

Herpes labialis treatment

► BY MOUTH

► Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

► BY MOUTH

► Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

► BY MOUTH

► Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

► BY MOUTH

► Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **UNLICENSED USE** Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.
- **CAUTIONS** Maintain adequate hydration (especially with high doses)
- **INTERACTIONS** → Appendix 1: valganciclovir
- **SIDE-EFFECTS**
 - Common or very common Diarrhoea · dizziness · headache · nausea · photosensitivity reaction · skin reactions · vomiting
 - Uncommon Abdominal discomfort · agitation · confusion · dyspnoea · haematuria · hallucination · leucopenia · level of consciousness decreased · renal pain · thrombocytopenia · tremor
 - Rare or very rare Angioedema · ataxia · coma · delirium · dysarthria · encephalopathy · nephrolithiasis · psychosis · renal impairment · seizure
 - Frequency not known Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION Neurological reactions more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with doses of 4 g or more per day (no information available).
- **RENAL IMPAIRMENT** Maintain adequate hydration.
Dose adjustments For *herpes zoster*, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).
For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).
For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

31-May-2018

● **INDICATIONS AND DOSE**

Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Child 12–17 years: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: (consult product literature).

- ▶ Child 1 month–16 years: (consult product literature)
- ▶ Child 17 years: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 6 mg/kg every 12 hours for 6 weeks.

- **UNLICENSED USE** Not licensed for use in children under 12 years for the treatment of cytomegalovirus disease in immunocompromised patients. Not licensed for congenital cytomegalovirus infection of the CNS.
- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy
- **INTERACTIONS** → Appendix 1: ganciclovir
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · chills · confusion · constipation · cough ·

depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · fever · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

- ▶ **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment

- ▶ **Rare or very rare** Agranulocytosis · hallucination

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.

● **HANDLING AND STORAGE**

Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Ganciclovir (Non-proprietary)**

Ganciclovir (as Ganciclovir sodium) 500 mg Ganciclovir 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £115.00 (Hospital only) | 5 vial [PoM] £125.95

▶ **Cymevene (Cheplapharm Arzneimittel GmbH)**

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £148.83

Valganciclovir

31-May-2018

• INDICATIONS AND DOSE

Prevention of cytomegalovirus disease [following solid organ transplantation from a cytomegalovirus positive donor]

► BY MOUTH

► Neonate: (consult product literature).

► Child: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

► Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

• **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

• **CAUTIONS** History of cytopenia · potential carcinogen (including long-term carcinogenicity) · potential teratogen (including long-term teratogenicity) · radiotherapy

• **INTERACTIONS** → Appendix 1: valganciclovir

• SIDE-EFFECTS

► **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · chest pain · confusion · constipation · cough · depression · diarrhoea · dizziness · dysphagia · dyspnoea · ear pain · eye disorders · eye inflammation · eye pain · flatulence · gastrointestinal discomfort · headache · hepatic function abnormal · increased risk of infection · insomnia · leucopenia · malaise · muscle complaints · nausea · neutropenia · night sweats · pain · peripheral neuropathy · renal impairment · seizure · sensation abnormal · sepsis · skin reactions · taste altered · thinking abnormal · thrombocytopenia · vomiting · weight decreased

► **Uncommon** Alopecia · arrhythmia · deafness · haematuria · hallucination · hypotension · infertility male · oral ulceration · pancreatitis · psychotic disorder · tremor · visual impairment

• **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 30 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. *Ganciclovir* may cause temporary or permanent inhibition of spermatogenesis—impaired fertility observed in *animal* studies.

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with *ganciclovir* in *animal* studies.

• **BREAST FEEDING** Manufacturer advises avoid—*ganciclovir* present in milk in *animal* studies.

• **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

• PRESCRIBING AND DISPENSING INFORMATION

Valganciclovir is a pro-drug of ganciclovir.

Flavours of oral liquid formulations may include tutti-frutti.

• **HANDLING AND STORAGE** Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days. Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin

or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

► **Valcyte** (Roche Products Ltd)

► **Valcyte** (Roche Products Ltd)

Valganciclovir (as Valganciclovir hydrochloride) 450 mg Valcyte 450mg tablets | 60 tablet [PoM] £1,081.46 DT = £1,027.40

ANTIVIRALS > OTHER

Foscarnet sodium

26-May-2020

• INDICATIONS AND DOSE

Cytomegalovirus disease

► BY INTRAVENOUS INFUSION

► Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily, increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

► BY INTRAVENOUS INFUSION

► Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

• **UNLICENSED USE** Not licensed for use in children.

• **CAUTIONS** Conditions where excess sodium should be avoided · ensure adequate hydration

• **INTERACTIONS** → Appendix 1: foscarnet

• SIDE-EFFECTS

► **Common or very common** Aggression · anaemia · anxiety · appetite decreased · arrhythmias · asthenia · chest pain · chills · confusion · constipation · coordination abnormal · dehydration · depression · diarrhoea · dizziness · electrolyte imbalance · fever · gastrointestinal discomfort · genital discomfort (due to high concentrations excreted in urine) · genital ulceration (due to high concentrations excreted in urine) · haemorrhage · headache · hepatic function abnormal · hypertension · hypotension · leucopenia · malaise · muscle contractions involuntary · myalgia · nausea (reduce infusion rate) · neutropenia · numbness · oedema · palpitations · pancreatitis · paraesthesia (reduce infusion rate) · peripheral neuropathy · proteinuria · renal impairment · seizure · sepsis · skin reactions · thrombocytopenia · thrombophlebitis · tremor · urinary disorders · vomiting

► **Uncommon** Acidosis · angioedema · glomerulonephritis · nephropathy · pancytopenia

► **Frequency not known** Anaphylactoid reaction · diabetes insipidus · muscle weakness · myopathy · oesophageal ulcer · QT interval prolongation · renal pain · renal tubular acidosis · severe cutaneous adverse reactions (SCARs)

• **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.

• **PREGNANCY** Manufacturer advises avoid.

• **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● RENAL IMPAIRMENT

Dose adjustments Reduce dose; consult product literature.

● MONITORING REQUIREMENTS

- ▶ Monitor electrolytes, particularly calcium and magnesium.
- ▶ Monitor serum creatinine every second day during induction and every week during maintenance.

● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/mL with Glucose 5% or Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour (give doses greater than 60 mg/kg over 2 hours).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Foscavet** (Clinigen Healthcare Ltd)

Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle **PoM** £119.85 (Hospital only)

5.5 HIV infection

HIV infection

19-Apr-2020

Overview

The human immunodeficiency virus (HIV) is a retrovirus that causes immunodeficiency by infecting and destroying cells of the immune system, particularly the CD4 cells. The prognosis of HIV has greatly improved due to more effective and better tolerated antiretroviral therapy (ART). The greatest risk to excess mortality and morbidity is delayed HIV diagnosis and treatment.

Drug treatment should only be prescribed by specialists within a paediatric HIV clinical network.

Further information on the management of children with HIV can be obtained from the Children's HIV Association (CHIVA) www.chiva.org.uk. For further information on antiretroviral use and toxicity in children see Paediatric European Network for Treatment of AIDS (PENTA) guidelines for treatment of paediatric HIV-1 infection available at penta-id.org/ and the British HIV Association guidelines available at www.bhiva.org/guidelines.

Aims of treatment

Treatment aims to achieve an undetectable viral load, to preserve immune function, and to reduce the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Treatment with a combination of ART aims to improve the physical and psychological well-being of infected children and optimise general health for a full and productive adult life.

Initiation of treatment

EvGr Antiretroviral therapy (ART) should be started in all children diagnosed with HIV irrespective of age, CD4 count and viral load. Infants born to women living with HIV require urgent diagnosis and treatment. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Additionally, potential transmitted resistance and resistance resulting from maternal or infant antiretroviral exposure during failed vertical transmission treatment should also be considered.

⚠ Commitment to treatment and strict adherence over many years are required.

EvGr In children, treatment of HIV infection is initiated with a combination of two nucleoside reverse transcriptase

inhibitors (NRTI) as a backbone regimen plus one of the following as a third drug: an integrase inhibitor (INI), a non-nucleoside reverse transcriptase inhibitor (NNRTI), or a boosted protease inhibitor (PI).

Abacavir p. 451 with lamivudine p. 455 is the NRTI backbone combination of choice for initial therapy however, abacavir should not be given to children who are positive for the HLA-B*5701 allele. Alternative NRTI backbone regimens and third drug options, depending on the age of the child, can be found at penta-id.org/.

The metabolism of many antiretroviral drugs varies in young children, it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases. ⚠

Switching therapy

EvGr Deterioration of the condition (including clinical, virological, and CD4 cell count changes) may require a change in therapy. The choice of an alternative regimen should be guided by factors such as the response to previous treatment, tolerability, drug-drug interactions, and the possibility of drug resistance. ⚠ For further information see Paediatric European Network for Treatment of AIDS (PENTA) HIV first and second line antiretroviral treatment guidelines available at www.chiva.org.uk.

HIV infection and pregnancy

EvGr Management of HIV infection in pregnancy should focus on the well-being of the women living with HIV, by ensuring that their ART regimen maximally suppresses viral replication as early as possible (if possible before conception) in order to minimise vertical transmission of HIV. Information on the teratogenic potential of most antiretroviral drugs is limited, however, all pregnant women living with HIV who conceive whilst on effective ART should continue this treatment throughout their pregnancy. All other women should start ART during their pregnancy. The recommended regimen is a NRTI backbone of either tenofovir disoproxil p. 456 or abacavir, with either emtricitabine p. 453 or lamivudine; the third drug should be efavirenz p. 448 or ritonavir-boosted p. 461 atazanavir p. 458. All treatment options require careful assessment by a specialist. ⚠ For further information, including alternative ART options, see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

EvGr Pregnancies in women with HIV and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com. ⚠

HIV infection and breast-feeding

EvGr Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided. ⚠ For further information see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

HIV infection, post-exposure prophylaxis

EvGr Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. ⚠ For further information see recommendations produced by the Children's HIV Association available at www.chiva.org.uk.

Drug treatment

Drugs that are licensed for the treatment of HIV/AIDS in children are listed below according to drug class.

Nucleoside reverse transcriptase inhibitors (NRTI or 'nucleoside analogue'): abacavir (ABC); emtricitabine (FTC), lamivudine (3TC); stavudine p. 456 (d4T), tenofovir alafenamide p. 434 fumarate (TAF), tenofovir disoproxil fumarate (TDF), and zidovudine p. 457 (AZT).

Non-nucleoside reverse transcriptase inhibitors (NNRTI): efavirenz (EFV), etravirine p. 449 (ETR), nevirapine p. 449 (NVP), and rilpivirine p. 450 (RPV).

Protease inhibitors (PI): atazanavir (ATZ), darunavir p. 459 (DRV), fosamprenavir p. 460 (FOS-APV), lopinavir (LPV), ritonavir (RTV), and tipranavir p. 462 (TPV).

CCR5 antagonist: maraviroc p. 462 (MVC).

Integrase inhibitors (INI): dolutegravir below (DTG), elvitegravir (EVG), and raltegravir p. 447 (RAL).

Fusion inhibitor: enfuvirtide below (T-20).

Pharmacokinetic enhancers: cobicistat (c), and low-dose ritonavir (r). They boost the concentrations of other antiretrovirals metabolised by CYP3A4, but have no antiretroviral activity themselves.

HIV infection in neonates

[EvGr] In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible (within 4 hours) after birth and starting no later than 72 hours after birth. Zidovudine monotherapy can be given where there is a very low or low risk of HIV transmission. Risk is determined by the mother's viral load at the time of delivery and whether the mother has been on combination ART for more than 10 weeks. Combination ART should be given to neonates at high risk of infection or whose mothers are found to be HIV positive after delivery. The preferred treatment regimen is zidovudine and lamivudine as the NRTI backbone and nevirapine as the third drug. Prophylaxis is given for 2–4 weeks depending on the risk of infection. **⚠** For further information see British HIV Association guidelines for the management of HIV in pregnancy and postpartum available at www.bhiva.org/guidelines.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

14-Jul-2018

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
- ▶ Child 16–17 years: 90 mg twice daily

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · appetite decreased · asthenia · concentration impaired · conjunctivitis · diabetes mellitus · gastroesophageal reflux disease · haematuria · hypertriglyceridaemia · increased risk of infection · influenza like illness · irritability · lymphadenopathy · myalgia · nasal congestion · nephrolithiasis · nightmare · numbness · pancreatitis · peripheral neuropathy · skin papilloma · skin reactions · tremor · vertigo · weight decreased
- ▶ **Frequency not known** Diarrhoea · hypersensitivity · immune reconstitution inflammatory syndrome · nausea · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION **Hypersensitivity** Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or

symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); increased risk of hepatic side effects in patients with chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial **[Pom]** £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

11-Jul-2018

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

● INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 40 kg and above): 50 mg once daily

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DOLUTEGRAVIR (TIVICAY®, TRIUMEQ®, JULUCA®): SIGNAL OF INCREASED RISK OF NEURAL TUBE DEFECTS; DO NOT PRESCRIBE TO WOMEN SEEKING TO BECOME PREGNANT; EXCLUDE PREGNANCY BEFORE INITIATION AND ADVISE USE OF EFFECTIVE CONTRACEPTION (JUNE 2018)

New safety recommendations have been issued while an EU review evaluates cases of neural tube defects in babies born to mothers who became pregnant while taking dolutegravir. The MHRA advises:

- dolutegravir should not be prescribed to women who are trying to become pregnant;
- pregnancy should be excluded in women of childbearing potential with pregnancy testing before starting dolutegravir;
- women of childbearing potential should be advised to use effective contraception throughout treatment with dolutegravir;

- if pregnancy is confirmed in the first trimester while a woman is taking dolutegravir, switch to an alternative treatment unless there is no suitable alternative;
- women taking dolutegravir for HIV should be advised not to stop taking their medicine without first consulting their doctor.

● **INTERACTIONS** → Appendix 1: dolutegravir

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anxiety · depression · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- ▶ **Uncommon** Arthralgia · hepatic disorders · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal tendencies

SIDE-EFFECTS, FURTHER INFORMATION **Hypersensitivity** Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● **PREGNANCY** Manufacturer advises avoid, see *Important Safety Information*.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir tablets.
Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (May 2014) that dolutegravir (*Tivicay*[®]) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected adolescents above 12 years. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (July 2017) that dolutegravir (*Tivicay*[®]) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected children aged 6 to 12 years of age. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that dolutegravir (*Tivicay*[®]) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected patients above 6 years of age. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Tivicay** (ViiV Healthcare UK Ltd)

Dolutegravir (as Dolutegravir sodium) 10 mg Tivicay 10mg tablets
| 30 tablet [POM] £99.75 DT = £99.75

Dolutegravir (as Dolutegravir sodium) 25 mg Tivicay 25mg tablets
| 30 tablet [POM] £249.38 DT = £249.38

Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets
| 30 tablet [POM] £498.75 DT = £498.75

Combinations available: *Abacavir with dolutegravir and lamivudine*, p. 452 · *Lamivudine with dolutegravir*, p. 456

Raltegravir

08-Feb-2019

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**

HIV-1 infection (initiated by a specialist)

▶ **BY MOUTH USING TABLETS**

- ▶ Child (body-weight 25 kg and above): 400 mg twice daily
- ▶ Child (body-weight 40 kg and above): 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

▶ **BY MOUTH USING CHEWABLE TABLETS**

- ▶ Child (body-weight 11–13 kg): 75 mg twice daily
- ▶ Child (body-weight 14–19 kg): 100 mg twice daily
- ▶ Child (body-weight 20–27 kg): 150 mg twice daily
- ▶ Child (body-weight 28–39 kg): 200 mg twice daily
- ▶ Child (body-weight 40 kg and above): 300 mg twice daily

▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Neonate up to 7 days (body-weight 2–2 kg): 4 mg once daily.

- ▶ Neonate up to 7 days (body-weight 3–3 kg): 5 mg once daily.

- ▶ Neonate up to 7 days (body-weight 4–4 kg): 7 mg once daily.

- ▶ Neonate 7 days to 28 days (body-weight 2–2 kg): 8 mg twice daily.

- ▶ Neonate 7 days to 28 days (body-weight 3–3 kg): 10 mg twice daily.

- ▶ Neonate 7 days to 28 days (body-weight 4–4 kg): 15 mg twice daily.

- ▶ Child (body-weight 3–3 kg): 25 mg twice daily
- ▶ Child (body-weight 4–5 kg): 30 mg twice daily
- ▶ Child (body-weight 6–7 kg): 40 mg twice daily
- ▶ Child (body-weight 8–10 kg): 60 mg twice daily
- ▶ Child (body-weight 11–13 kg): 80 mg twice daily
- ▶ Child (body-weight 14–19 kg): 100 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Raltegravir granules for oral suspension and chewable tablets are **not** bioequivalent or interchangeable with the 400 mg and 600 mg *standard* tablets.

- **CONTRA-INDICATIONS** Pre-term neonates—no information available

- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

- **INTERACTIONS** → Appendix 1: raltegravir

● **SIDE-EFFECTS**

- ▶ **Common or very common** Athaxia · appetite abnormal · asthenia · behaviour abnormal · depression · diarrhoea · dizziness · fever · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · skin reactions · sleep disorders · vertigo · vomiting
- ▶ **Uncommon** Alopecia · anaemia · anxiety · arrhythmias · arthralgia · arthritis · body fat disorder · burping · cachexia · chest discomfort · chills · cognitive disorder · concentration impaired · confusion · constipation · diabetes mellitus · drowsiness · dry mouth · dyslipidaemia · dysphonia · erectile dysfunction · feeling jittery · glossitis ·

gynaecomastia · haemorrhage · hepatic disorders · hot flush · hyperglycaemia · hypersensitivity · hypertension · immune reconstitution inflammatory syndrome · increased risk of infection · lipodystrophy · lymph node abscess · lymphatic abnormalities · malaise · memory loss · menopausal symptoms · mood altered · myalgia · myopathy · nasal congestion · nephritis · nephrolithiasis · nerve disorders · neutropenia · nocturia · odynophagia · oedema · osteopenia · pain · palpitations · pancreatitis acute · polydipsia · psychiatric disorder · renal cyst · renal impairment · sensation abnormal · severe cutaneous adverse reactions (SCARs) · skin papilloma · submandibular mass · suicidal tendencies · sweat changes · taste altered · tendinitis · thrombocytopenia · tinnitus · tremor · visual impairment · weight increased

► **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available), and in patients with chronic hepatitis B or C (consider interrupting or discontinuing treatment if impairment worsens; increased risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *chewable tablets*, the 100 mg strength can be divided into equal 50 mg doses.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 902/13

The *Scottish Medicines Consortium* has advised (September 2013) that raltegravir (*Isetress*®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adolescents and children aged 2 to 17 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir should be prescribed under the supervision of specialists in paediatric HIV.

SMC No. 1102/15

The *Scottish Medicines Consortium* has advised (November 2015) that raltegravir granules for oral suspension (*Isetress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults, adolescents, children, toddlers and infants from the age of 4 weeks when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir granules should be prescribed under the supervision of specialists in paediatric HIV.

SMC No. 1113/15

The *Scottish Medicines Consortium* has advised (November 2015) that raltegravir chewable tablets (*Isetress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in children from the age of 4 weeks to <2 years when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance; raltegravir chewable tablets should be prescribed under the supervision of specialists in paediatric HIV.

SMC No. 1280/17

The *Scottish Medicines Consortium* has advised (November 2017) that raltegravir 600 mg film-coated

tablets (*Isetress*®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults and paediatric patients weighing at least 40 kg when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

EXCIPIENTS: May contain Sorbitol

- **Isetress** (Merck Sharp & Dohme Ltd)

Raltegravir 100 mg Isetress 100mg granules sachets | 60 sachet [PoM] £213.02 DT = £213.02

Raltegravir 25 mg Isetress 25mg chewable tablets | 60 tablet [PoM] £29.46 DT = £29.46

Raltegravir 100 mg Isetress 100mg chewable tablets | 60 tablet [PoM] £117.85 DT = £117.85

ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Efavirenz

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- BY MOUTH USING CAPSULES
 - Child 3 months–17 years (body-weight 3.5–4 kg): 100 mg once daily
 - Child 3 months–17 years (body-weight 5–7.4 kg): 150 mg once daily
 - Child 3 months–17 years (body-weight 7.5–14 kg): 200 mg once daily
 - Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily
 - Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily
 - Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily
 - Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily
 - Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily
- BY MOUTH USING TABLETS
 - Child (body-weight 40 kg and above): 600 mg once daily

- **CAUTIONS** Acute porphyrias p. 652 · history of psychiatric disorders · history of seizures
- **INTERACTIONS** → Appendix 1: efavirenz
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anxiety · concentration impaired · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · fatigue · headache · movement disorders · nausea · skin reactions · sleep disorders · vomiting
 - **Uncommon** Behaviour abnormal · confusion · flushing · gynaecomastia · hallucination · hepatic disorders · memory loss · mood altered · pancreatitis · psychosis · seizure · Stevens-Johnson syndrome · suicidal tendencies · thinking abnormal · tinnitus · tremor · vertigo · vision blurred
 - **Rare or very rare** Delusions · photosensitivity reaction

- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

Abnormal hepatic function Manufacturer advises interrupt or discontinue treatment if transaminases more than 5 times the upper limit of normal.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Manufacturer advises avoid in severe impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** For patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food—consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.
- **PATIENT AND CARER ADVICE**
Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **INTERACTIONS** → Appendix 1: etravirine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Diabetes mellitus · diarrhoea · headache · hyperglycaemia · myocardial infarction · nausea · skin reactions · vomiting
- ▶ **Uncommon** Angioedema · bronchospasm · dry mouth · dyslipidaemia · gynaecomastia · haematemesis · hepatic disorders · hyperhidrosis · hypersensitivity · hypersomnia · numbness · pancreatitis · sluggishness · vision blurred
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Haemorrhagic stroke · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Hypersensitivity reactions**

Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).

- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **INDICATIONS AND DOSE**

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

- ▶ **BY MOUTH**

- ▶ Child 6–17 years (body-weight 16–19 kg): 100 mg twice daily
- ▶ Child 6–17 years (body-weight 20–24 kg): 125 mg twice daily
- ▶ Child 6–17 years (body-weight 25–29 kg): 150 mg twice daily
- ▶ Child 6–17 years (body-weight 30 kg and above): 200 mg twice daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 652

Nevirapine

- **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs (initial dose)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

continued →

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
- ▶ Child 3–17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
 - ▶ Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
 - ▶ Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
 - ▶ Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
 - ▶ Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily

- **UNLICENSED USE** 'Immediate-release' tablets not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²; 'immediate-release' tablets and suspension not licensed for once daily dose after the initial dose titration.

- **CONTRA-INDICATIONS** Acute porphyrias p. 652 · post-exposure prophylaxis

- **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

- **INTERACTIONS** → Appendix 1: nevirapine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · angioedema · diarrhoea · fatigue · fever · headache · hepatic disorders · hypersensitivity · hypertransaminasaemia · nausea · skin reactions · vomiting
- ▶ **Uncommon** Anaemia · arthralgia · myalgia · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Eosinophilia · osteonecrosis · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Hepatic effects

Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **HEPATIC IMPAIRMENT** For *modified-release* preparations, manufacturer advises avoid (no information available). For

immediate-release preparations, manufacturer advises caution in moderate impairment and chronic hepatitis (increased risk of hepatic side effects; consider interrupting or discontinuing treatment if hepatic function worsens); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
- ▶ Rash Monitor closely for skin reactions during first 18 weeks.

● **PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension▶ **Viramune** (Boehringer Ingelheim Ltd)

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

▶ BY MOUTH

- ▶ Child 12–17 years: 25 mg once daily

- **CAUTIONS** Acute porphyrias p. 652

- **INTERACTIONS** → Appendix 1: rilpivirine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · depression · dizziness · drowsiness · dry mouth · fatigue · gastrointestinal discomfort · headache · nausea · rash · sleep disorders · vomiting
- ▶ **Uncommon** Immune reconstitution inflammatory syndrome

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer rilpivirine tablets.

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 2936

The *All Wales Medicines Strategy Group* has advised (October 2016) that rilpivirine (*Edurant*®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in antiretroviral treatment-naïve patients from 12 years old to < 18 years old with a viral load \leq 100,000 HIV-1 RNA copies/ml.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 21, 25

▶ **Edurant** (Janssen-Cilag Ltd)

Rilpivirine (as Rilpivirine hydrochloride) 25 mg Edurant 25mg tablets | 30 tablet [PoM] £200.27

Combinations available: *Emtricitabine with rilpivirine and tenofovir alafenamide*, p. 453

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia (may require transfusion) · asthenia · diarrhoea · dizziness · headache · insomnia · nausea · neutropenia · skin reactions · vomiting
- ▶ **Uncommon** Angioedema · lactic acidosis · pancreatitis
- ▶ **Frequency not known** Immune reconstitution inflammatory syndrome · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

● PREGNANCY

Monitoring Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

● **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

- ▶ Child 3 months–11 years (body-weight 30 kg and above): 300 mg twice daily, alternatively 600 mg once daily
- ▶ Child 12–17 years: 300 mg twice daily, alternatively 600 mg once daily

● **INTERACTIONS** → Appendix 1: abacavir

● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · fever · lethargy
 - ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Hypersensitivity · weight increased
- SIDE-EFFECTS, FURTHER INFORMATION** Life-threatening hypersensitivity reactions have been reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis. Laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction).

● **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; consider avoiding in moderate to severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

● **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

● **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

● **PATIENT AND CARER ADVICE** Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

Patients should be provided with an alert card and advised to keep it with them at all times.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

22-May-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 453, elvitegravir, cobicistat, tenofovir alafenamide p. 434.

● INDICATIONS AND DOSE

HIV-1 infection (specialist use only)

► BY MOUTH

- Child 6–11 years (body-weight 25 kg and above): 1 tablet once daily
- Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)

Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in *Genvoya*[®] and *Stribild*[®]) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · elvitegravir · tenofovir alafenamide
- **SIDE-EFFECTS**
 - **Common or very common** Abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
 - **Uncommon** Anaemia · angioedema · depression
 - **Frequency not known** Nephrotoxicity · osteonecrosis · weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available. Manufacturer advises caution in children under 12 years with renal impairment—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) decisions**

- SMC No. 1142/16

- The *Scottish Medicines Consortium* has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoia*®) is accepted for use within NHS Scotland for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **All Wales Medicines Strategy Group (AWMSG) decisions**

- AWMSG No. 2248

- The *All Wales Medicines Strategy Group* has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (*Genvoia*®) is recommended as an option for use within NHS Wales for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Combinations available: *Darunavir with cobicistat, emtricitabine and tenofovir alafenamide*, p. 460

Emtricitabine with rilpivirine and tenofovir alafenamide

05-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 450, tenofovir alafenamide p. 434.

- **INDICATIONS AND DOSE**

- **HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)**

- ▶ BY MOUTH
 - ▶ Child 12–17 years (body-weight 35 kg and above): 1 tablet once daily

- **INTERACTIONS** → Appendix 1: rilpivirine · tenofovir alafenamide

- **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · depression · diarrhoea · dizziness · drowsiness · dry mouth · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
 - ▶ **Uncommon** Anaemia · angioedema · arthralgia · immune reconstitution inflammatory syndrome
 - ▶ **Frequency not known** Conjunctivitis · drug reaction with eosinophilia and systemic symptoms (DRESS) · eosinophilia · fever · osteonecrosis · QT interval prolongation · weight increased

SIDE-EFFECTS, FURTHER INFORMATION Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

● PATIENT AND CARER ADVICE

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*[®]) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (*Odefsey*[®]) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

- ▶ Child 3 months-11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose

- 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- ▶ Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

ZEFFIX®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

▶ BY MOUTH

- ▶ Child 2-11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
- ▶ Child 12-17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

● **UNLICENSED USE****EPIVIR® ORAL SOLUTION** Not licensed for use in children under 3 months.**EPIVIR® TABLETS** Not licensed for use in children under 3 months.**ZEFFIX®** Not licensed for use in children.

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** → Appendix 1: lamivudine

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · arthralgia · cough · fever · gastrointestinal discomfort · hepatic disorders · malaise · muscle complaints · myopathy · nasal disorder
- ▶ **Uncommon** Thrombocytopenia
- ▶ **Rare or very rare** Paraesthesia · peripheral neuropathy · pure red cell aplasia
- ▶ **Frequency not known** Respiratory tract infection · throat complaints

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

● **RENAL IMPAIRMENT****Dose adjustments** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Lamivudine with dolutegravir

30-Sep-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, lamivudine p. 455, dolutegravir p. 446.

● INDICATIONS AND DOSE

HIV-1 infection

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 40 kg and above): 300/50 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg lamivudine/dolutegravir.

- **INTERACTIONS** → Appendix 1: dolutegravir · lamivudine
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 50 mL/minute.
- **PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2205

The *Scottish Medicines Consortium* has advised (September 2019) that lamivudine with dolutegravir (*Dovato*®) is accepted for use within NHS Scotland for the treatment of HIV-1 infection in adults and adolescents aged 12 years or older, weighing at least 40 kg, with no known or suspected resistance to the integrase inhibitor class, or lamivudine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3659

The *All Wales Medicines Strategy Group* has advised (February 2020) that lamivudine with dolutegravir (*Dovato*®) is recommended as an option for use within NHS Wales for the treatment of HIV-1 infection in adults and adolescents above 12 years of age weighing at least 40 kg, with no known or suspected resistance to the integrase inhibitor class, or lamivudine. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Dovato** (ViiV Healthcare UK Ltd) ▼

Stavudine

01-Sep-2016

(d4T)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

- ▶ BY MOUTH
- ▶ Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food

- ▶ Child (body-weight 30–59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
- ▶ Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

- **UNLICENSED USE** Capsules not licensed for use in children under 3 months.

- **CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: stavudine

● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · depression · drowsiness · dyspepsia · hyperlactataemia · lipotrophy · nerve disorders · paraesthesia · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · thinking abnormal
- ▶ **Uncommon** Anxiety · appetite decreased · arthralgia · emotional lability · gynaecomastia · hepatic disorders · myalgia
- ▶ **Rare or very rare** Diabetes mellitus · hyperglycaemia · muscle weakness · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy.
Dose adjustments Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipotrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

- **MEDICINAL FORMS** No licensed medicines listed.

Tenofovir disoproxil

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when first-line nucleoside reverse transcriptase inhibitors cannot be used because of resistance or contra-indications

- ▶ BY MOUTH
- ▶ Child 2–17 years: 6.5 mg/kg once daily (max. per dose 245 mg)
- ▶ Child 6–17 years (body-weight 17–21 kg): 123 mg once daily
- ▶ Child 6–17 years (body-weight 22–27 kg): 163 mg once daily
- ▶ Child 6–17 years (body-weight 28–34 kg): 204 mg once daily

- ▶ Child 6–17 years (body-weight 35 kg and above): 245 mg once daily

Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histology of active liver inflammation or fibrosis)

▶ BY MOUTH

- ▶ Child 12–17 years (body-weight 35 kg and above): 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · flatulence
 - ▶ **Uncommon** Proximal renal tubulopathy
 - ▶ **Rare or very rare** Acute tubular necrosis · hepatic disorders · nephritis · nephrogenic diabetes insipidus · renal impairment
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in decompensated hepatic disease (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
 - ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **DIRECTIONS FOR ADMINISTRATION** *Granules:* mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules. **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Zidovudine

(Azidothymidine; AZT)

● **INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

▶ BY MOUTH

- ▶ Child: 180 mg/m² twice daily (max. per dose 300 mg)
- ▶ Child (body-weight 8–13 kg): 100 mg twice daily
- ▶ Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
- ▶ Child (body-weight 21–27 kg): 200 mg twice daily
- ▶ Child (body-weight 28–29 kg): 200–250 mg twice daily
- ▶ Child (body-weight 30 kg and above): 250–300 mg twice daily

HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)

▶ BY MOUTH

- ▶ Child (body-weight 4–8 kg): 12 mg/kg twice daily
- ▶ Child (body-weight 9–29 kg): 9 mg/kg twice daily

Prevention of maternal-fetal HIV transmission

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth
- ▶ Child 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature) · neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)
- **CAUTIONS** Lactic acidosis · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Leucopenia · malaise · myalgia
- ▶ **Uncommon** Bone marrow disorders · dyspnoea · fever · flatulence · generalised pain · myopathy · thrombocytopenia
- ▶ **Rare or very rare** Alertness decreased · anxiety · appetite decreased · cardiomyopathy · chest pain · chills · cough · depression · drowsiness · dyspepsia · gynaecomastia · hepatic disorders · hyperhidrosis · influenza like illness · nail discolouration · oral discolouration · paraesthesia · pure red cell aplasia · seizure · taste altered · urinary frequency increased
- ▶ **Frequency not known** Lipoatrophy

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Weight increased

SIDE-EFFECTS, FURTHER INFORMATION **Anaemia and myelosuppression** If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).

Dose adjustments Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

- **RENAL IMPAIRMENT**

Dose adjustments Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Zidovudine for treatment of HIV infection www.medicinesforchildren.org.uk/zidovudine-treatment-hiv-infection

Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 457, lamivudine p. 455.

INDICATIONS AND DOSE**HIV infection in combination with other antiretroviral drugs**

- ▶ **BY MOUTH**
- ▶ Child (body-weight 14–20 kg): 0.5 tablet twice daily
- ▶ Child (body-weight 21–29 kg): 0.5 tablet daily, to be given in the morning and 1 tablet daily, to be given in the evening
- ▶ Child (body-weight 30 kg and above): 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: lamivudine · zidovudine

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**

COMBIVIR® TABLETS Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Zidovudine with lamivudine (Non-proprietary)**

Lamivudine 150 mg, Zidovudine 300 mg Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet **[PoM]** £240.10–£255.10 DT = £300.12

- ▶ **Combivir** (ViiV Healthcare UK Ltd)

Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet **[PoM]** £300.12 DT = £300.12

ANTIVIRALS > PROTEASE INHIBITORS, HIV

Protease inhibitors

- **CONTRA-INDICATIONS** Acute porphyrias p. 652

- **CAUTIONS** Haemophilia (increased risk of bleeding)

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · angioedema · anxiety · appetite abnormal · arthralgia · asthenia · diabetes mellitus · diarrhoea · dizziness · dry mouth · dyslipidaemia · dyspnoea · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hepatic disorders · hypersensitivity · hypertension · malaise · muscle complaints · nausea · neutropenia · oral ulceration · pancreatitis · peripheral neuropathy · seizure · skin reactions · sleep disorders · taste altered · vomiting
- ▶ **Uncommon** Drowsiness · immune reconstitution inflammatory syndrome · osteonecrosis · Stevens-Johnson syndrome · weight increased

- **HEPATIC IMPAIRMENT** In general, manufacturers advise use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

F above

Atazanavir

06-May-2020

INDICATIONS AND DOSE**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- ▶ **BY MOUTH**

- ▶ Child 6–17 years (body-weight 15–19 kg): 150 mg once daily
- ▶ Child 6–17 years (body-weight 20–39 kg): 200 mg once daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 300 mg once daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

- **SIDE-EFFECTS**

- ▶ **Uncommon** Chest pain · chronic kidney disease · depression · disorientation · drug reaction with eosinophilia and systemic symptoms (DRESS) · gallbladder disorders · gynaecomastia · haematuria · memory loss · myopathy · nephritis tubulointerstitial · nephrolithiasis · proteinuria · syncope · torsade de pointes · urinary frequency increased

- ▶ **Rare or very rare** Gait abnormal · oedema · palpitations · QT interval prolongation · renal pain · vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.
Monitoring In pregnancy, monitor viral load and plasma atazanavir concentration during third trimester.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Darunavir

31-Jul-2018

● **INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir**▶ **BY MOUTH**

- ▶ Child 3–17 years (body-weight 15–29 kg): 375 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 450 mg twice daily
- ▶ Child 3–17 years (body-weight 40 kg and above): 600 mg twice daily
- ▶ Child 12–17 years: 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir▶ **BY MOUTH**

- ▶ Child 12–17 years (body-weight 40 kg and above): 800 mg once daily

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● **SIDE-EFFECTS**

- ▶ **Uncommon** Angina pectoris · arrhythmias · burping · chest pain · concentration impaired · confusion · constipation · cough · depression · dry eye · eye erythema · feeling hot · flushing · gout · gynaecomastia · haemorrhage · herpes simplex · hyperglycaemia · hypothyroidism · leucopenia · memory loss · mood altered · muscle weakness · myocardial infarction · nail discolouration · nephrolithiasis · oral disorders · osteoporosis · pain · peripheral oedema · polydipsia · QT interval prolongation · renal impairment · sensation abnormal · sexual dysfunction · sweat changes · throat irritation · thrombocytopenia · urinary disorders · urine abnormalities · vertigo
- ▶ **Rare or very rare** Arthritis · chills · feeling abnormal · joint stiffness · musculoskeletal stiffness · palpitations · rhinorrhoea · severe cutaneous adverse reactions (SCARs) · syncope · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION Mild to moderate rash occurs commonly, usually within the first 4 weeks of

therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Darunavir with cobicistat, emtricitabine and tenofovir alafenamide

25-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, darunavir p. 459, cobicistat, emtricitabine p. 453, tenofovir alafenamide p. 434.

● INDICATIONS AND DOSE

HIV infection (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DARUNAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNAL-TO-CHILD TRANSMISSION OF HIV-1 (JULY 2018) Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in *Rezolsta*® and *Symtuza*®) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see *Pregnancy*.

- **INTERACTIONS** → Appendix 1: cobicistat · HIV-protease inhibitors · tenofovir alafenamide
- **PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1290/18

The *Scottish Medicines Consortium* has advised (January 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2418

The *All Wales Medicines Strategy Group* has advised (March 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (*Symtuza*®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ *Symtuza* (Janssen-Cilag Ltd) ▼
Tenofovir alafenamide (as Tenofovir alafenamide fumarate) 10 mg, Cobicistat 150 mg, Emtricitabine 200 mg, Darunavir (as Darunavir ethanolate) 800 mg *Symtuza* 800mg/150mg/200mg/10mg tablets | 30 tablet [PoM](#) £672.97

Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ BY MOUTH
- ▶ Child 6–17 years (body-weight 25–39 kg): 18 mg/kg twice daily (max. per dose 700 mg)
- ▶ Child 6–17 years (body-weight 40 kg and above): 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

● SIDE-EFFECTS

- ▶ **Common or very common** Oral paraesthesia

SIDE-EFFECTS, FURTHER INFORMATION Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves and may respond to antihistamines.

- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
Dose adjustments In adults, manufacturer advises dose reduction—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** In children, oral suspension should be taken with food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

EXCIPIENTS: May contain Propylene glycol

- ▶ *Telzir* (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml *Telzir* 50mg/ml oral suspension | 225 ml [PoM](#) £69.06

Lopinavir with ritonavir

06-May-2020

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ BY MOUTH USING TABLETS
- ▶ Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily
- ▶ Child 2–17 years (body-weight up to 40 kg and body surface area 0.8–1.1 m²): 300/75 mg twice daily
- ▶ Child 2–17 years (body-weight 40 kg and above and body surface area 1.2 m² and above): 400/100 mg twice daily
- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Child 14 days–5 months: 3.75 mL/m² twice daily
- ▶ Child 6 months–17 years: 2.9 mL/m² twice daily (max. per dose 5 mL)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease · structural heart disease
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Increased risk of infection · leucopenia · lymphadenopathy · menstrual cycle irregularities · migraine · muscle weakness · myopathy · night sweats · pain · sexual dysfunction
 - ▶ **Uncommon** Atherosclerosis · atrioventricular block · cholangitis · constipation · deep vein thrombosis · haemorrhage · hyperbilirubinaemia · hypogonadism · myocardial infarction · nephritis · stomatitis · stroke · tinnitus · tremor · tricuspid valve incompetence · vasculitis · vertigo · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
- **PREGNANCY** For *tablets*, manufacturer advises only use if potential benefit outweighs risk—toxicity in *animal* studies (recommendation also supported by specialist sources). Avoid *oral solution* due to high alcohol and propylene glycol content.
- **HEPATIC IMPAIRMENT** For *oral solution*, manufacturer advises avoid due to propylene glycol content (risk of toxicity). For *tablets*, manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Avoid *oral solution* due to high propylene glycol content.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor liver function before and during treatment.
 - ▶ For *oral solution*, manufacturer advises monitor for signs of alcohol and propylene glycol toxicity (particularly in infants).
- **PRESCRIBING AND DISPENSING INFORMATION** For *oral solution*, manufacturer advises high alcohol (42% v/v) and propylene glycol content—consider total amounts from all medicines that are to be given to infants in order to avoid toxicity; caution in patients for which consumption may be harmful.
- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1302/18

The *Scottish Medicines Consortium* has advised (February 2018) that lopinavir with ritonavir oral solution (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected children aged from 14 days up to 2 years. SMC No. 326/06

The *Scottish Medicines Consortium* has advised (November 2006) that lopinavir with ritonavir tablet (*Kaletra*®) is accepted for use within NHS Scotland in combination with other antiretrovirals for the treatment of HIV-1 infected adults and children above the age of 2 years.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3557

The *All Wales Medicines Strategy Group* has advised (March 2018) that lopinavir with ritonavir oral solution (*Kaletra*®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus (HIV-1) infected children aged from 14 days to less than 2 years old.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

▶ BY MOUTH

- ▶ Child 2–17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2–3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor

Low-dose ritonavir to increase the effect of atazanavir

▶ BY MOUTH

- ▶ Child 6–17 years (body-weight 15–19 kg): 80–100 mg once daily
- ▶ Child 6–17 years (body-weight 20 kg and above): 100 mg once daily

Low-dose ritonavir to increase the effect of darunavir

▶ BY MOUTH

- ▶ Child 3–17 years (body-weight 15–29 kg): 50 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 60 mg twice daily
- ▶ Child 3–17 years (body-weight 40 kg and above): 100 mg twice daily
- ▶ Child 12–17 years (body-weight 40 kg and above): 100 mg once daily for use in patients taking darunavir once daily

Low-dose ritonavir to increase the effect of fosamprenavir

▶ BY MOUTH

- ▶ Child 6–17 years (body-weight 25–32 kg): 3 mg/kg twice daily
- ▶ Child 6–17 years (body-weight 33 kg and above): 100 mg twice daily

Low-dose ritonavir to increase the effect of tipranavir

▶ BY MOUTH

- ▶ Child 2–11 years: 150 mg/m² twice daily (max. per dose 200 mg)
- ▶ Child 12–17 years: 200 mg twice daily

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Back pain · concentration impaired · confusion · cough · dehydration · feeling hot · flushing · gastrointestinal haemorrhage · gout · hypotension · menorrhagia · myopathy · oedema · oral paraesthesia · oropharyngeal pain · paraesthesia · peripheral coldness · pharyngitis · renal impairment · syncope · thrombocytopenia · urinary frequency increased · vision blurred
 - ▶ **Uncommon** Myocardial infarction

- ▶ **Rare or very rare** Hyperglycaemia · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated — discontinue if pancreatitis diagnosed.

- **PREGNANCY**

Dose adjustments Only use low-dose booster to increase the effect of other protease inhibitors.

- **HEPATIC IMPAIRMENT** When used as a *low-dose booster*, manufacturer advises caution in severe impairment; avoid in decompensated liver disease. When used in *high-doses*, manufacturer advises avoid in severe impairment.

Dose adjustments Manufacturer advises consult product literature of co-administered protease inhibitor.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

£ 458

Tipranavir

06-May-2020

- **INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

- ▶ **BY MOUTH USING CAPSULES**

▶ Child 12–17 years: 500 mg twice daily

- ▶ **BY MOUTH USING ORAL SOLUTION**

▶ Child 2–11 years: 375 mg/m² twice daily (max. per dose 500 mg)

- **DOSE EQUIVALENCE AND CONVERSION**

▶ The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Abnormal liver function tests and/or signs or symptoms of liver injury (consider delaying treatment if serum transaminases are greater than 5 times the upper limit of normal—consult product literature) · patients at risk of increased bleeding from trauma, surgery or other pathological conditions

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

- **SIDE-EFFECTS**

- ▶ **Uncommon** Hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia
- ▶ **Rare or very rare** Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- ▶ **Frequency not known** Bleeding tendency

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every 2 weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor liver function before treatment, then every 2 weeks for 1 month, then every 4 weeks until 24 weeks, then every 8 to 12 weeks thereafter.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.

- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > OTHER

Maraviroc

20-May-2020

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

- **INDICATIONS AND DOSE**

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

- ▶ **BY MOUTH**

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Cardiovascular disease

- **INTERACTIONS** → Appendix 1: maraviroc

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
- ▶ **Uncommon** Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
- ▶ **Rare or very rare** Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Fever · hypersensitivity · immune reconstitution inflammatory syndrome · organ dysfunction · osteonecrosis

- **SIDE-EFFECTS, FURTHER INFORMATION** **Osteonecrosis**

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Hepatotoxicity Manufacturer advises consider discontinuation if signs or symptoms of acute hepatitis, or increased liver transaminases with systemic symptoms of hypersensitivity occur.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment and in patients with chronic hepatitis (increased risk of hepatic side-effects; limited information available).

- **RENAL IMPAIRMENT** If estimated glomerular filtration rate less than 80 mL/minute/1.73 m², consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Influenza

Management

Oseltamivir below and zanamivir p. 464 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser [unlicensed] or intravenously.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

ANTIVIRALS > NEURAMINIDASE INHIBITORS

Oseltamivir

10-Mar-2020

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● INDICATIONS AND DOSE

Prevention of influenza

► BY MOUTH

► Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.

► Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis

► Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

► Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

► Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

► Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

► Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

► BY MOUTH

► Neonate: 3 mg/kg twice daily for 5 days.

► Child 1-11 months: 3 mg/kg twice daily for 5 days

► Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days

► Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days

► Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days

► Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days

► Child 13-17 years: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.

- **INTERACTIONS** → Appendix 1: oseltamivir

● SIDE-EFFECTS

- **Common or very common** Dizziness · gastrointestinal discomfort · herpes simplex · nausea · sleep disorders · vertigo · vomiting
- **Uncommon** Arrhythmia · seizure · skin reactions
- **Rare or very rare** Angioedema · anxiety · behaviour abnormal · confusion · delirium · delusions · gastrointestinal haemorrhage · hallucination · hepatic disorders · self-injurious behaviour · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · visual impairment

- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

- **RENAL IMPAIRMENT** Avoid for *treatment and prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

● **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-influenza-flu

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** NICE TA158

Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged 65 years or older *or* those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta158

▶ **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009)** NICE TA168

Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta168

NHS restrictions Tamiflu[®] is not prescribable in NHS primary care except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SL5'.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain Sorbitol

▶ **Tamiflu** (Roche Products Ltd)

Oseltamivir (as Oseltamivir phosphate) 6 mg per 1 ml Tamiflu 6mg/ml oral suspension sugar-free | 65 ml [PoM] £10.27 DT = £10.27

Capsule

Oseltamivir (as Oseltamivir phosphate) 75 mg Tamiflu 75mg capsules | 10 capsule [PoM] £15.41 DT = £15.41

Zanamivir

20-May-2020

● **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● **INDICATIONS AND DOSE**

Post-exposure prophylaxis of influenza

▶ BY INHALATION OF POWDER

▶ Child 5–17 years: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

▶ BY INHALATION OF POWDER

▶ Child 5–17 years: 10 mg once daily for up to 28 days

Treatment of influenza

► BY INHALATION OF POWDER

- Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

Treatment of influenza [complicated and potentially life-threatening, resistant to other anti-influenza medicinal products and/or other treatments, including inhaled zanamivir]

► BY INTRAVENOUS INFUSION

- Child 6 months–5 years: 14 mg/kg twice daily for 5 to 10 days
- Child 6–17 years: 12 mg/kg twice daily (max. per dose 600 mg) for 5 to 10 days

● UNLICENSED USE

- When used by inhalation Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

● CAUTIONS

- When used by inhalation Asthma · chronic pulmonary disease · uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

- Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- **Common or very common** Skin reactions
- **Uncommon** Oropharyngeal oedema · severe cutaneous adverse reactions (SCARs)
- **Rare or very rare** Face oedema
- **Frequency not known** Behaviour abnormal · delirium · hallucination · level of consciousness decreased · seizure

SPECIFIC SIDE-EFFECTS

- **Common or very common**
- With intravenous use Diarrhoea · hepatocellular injury
- **Uncommon**
- When used by inhalation Bronchospasm · dehydration · dyspnoea · presyncope · throat tightness
- **Frequency not known**
- When used by inhalation Psychiatric disorder

SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (e.g. during a pandemic)—limited information available; *animal* studies do not indicate toxicity.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk (e.g. during a pandemic)—limited information available; present in low levels in milk in *animal* studies.

● RENAL IMPAIRMENT

- **Dose adjustments** ► With intravenous use Manufacturer advises reduce dose if creatinine clearance less than 80 mL/minute—consult product literature for details.

● DIRECTIONS FOR ADMINISTRATION

- When used by inhalation Other inhaled drugs should be administered before zanamivir.
- With intravenous use Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 200 micrograms/mL with Sodium Chloride 0.9%; give over 30 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

- When used by inhalation Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● NATIONAL FUNDING/ACCESS DECISIONS**NICE decisions**

- **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158**
Zanamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2204

- ▶ With intravenous use The *Scottish Medicines Consortium* has advised (December 2019) that zanamivir (*Dectova*®) is accepted for use within NHS Scotland for the treatment of complicated and potentially life-threatening influenza A or B virus infection in adult and paediatric patients aged 6 months and older when: the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient. Zanamivir (*Dectova*®) should be used in accordance with official guidance.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 4130

- ▶ With intravenous use The *All Wales Medicines Strategy Group* has advised (October 2019) that zanamivir (*Dectova*®) is recommended as an option for use within NHS Wales for the treatment of complicated and potentially life-threatening influenza A or B virus infection in adults and children (aged 6 months and older), when: the patient's influenza virus is known or suspected to be resistant to anti-influenza medicinal products other than zanamivir, and/or other anti-viral medicinal products for treatment of influenza, including inhaled zanamivir, are not suitable for the individual patient. Zanamivir (*Dectova*®) should be used in accordance with official guidance.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

• INDICATIONS AND DOSE

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.

- ▶ Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- **CAUTIONS** Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

• SIDE-EFFECTS

- ▶ **Common or very common** Apnoea
- ▶ **Uncommon** Seizure · thrombocytopenia · urticaria
- ▶ **Frequency not known** Hypersensitivity

5.7 Respiratory syncytial virus

Respiratory syncytial virus

Management

Ribavirin p. 435 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Synagis** (AbbVie Ltd)

Palivizumab 100 mg per 1 ml Synagis 100mg/1ml solution for injection vials | 1 vial **[PoM]** £563.64

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin p. 72) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as its analogue desmopressin below. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *nephrogenic and partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response.

Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlorothiazide, p. 117 • Chlortalidone, p. 150

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

- **INDICATIONS AND DOSE**

Diabetes insipidus, treatment

► BY MOUTH

- Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
- Child 1–23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION

▶ Neonate: Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily in 1–2 divided doses.

- ▶ Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- ▶ BY INTRAMUSCULAR INJECTION

▶ Neonate: Initially 100 nanograms once daily, adjusted according to response.

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: Initially 400 nanograms once daily, adjusted according to response
- ▶ Child 12–17 years: Initially 1–4 micrograms once daily, adjusted according to response

Primary nocturnal enuresis

- ▶ BY MOUTH
- ▶ Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Neonate: Not recommended, use trial of treatment.
- ▶ Child 1–23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Neonate: Not recommended, use trial of treatment.
- ▶ Child 1–23 months: 400 nanograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- ▶ Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 2–17 years: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: Initially 100–500 nanograms for 1 dose

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: 1–5 micrograms for 1 dose

- **UNLICENSED USE** Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of *DDAVP* intravenous injection is not licensed.
- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hyponatraemia · polydipsia in alcohol dependence · psychogenic polydipsia · syndrome of inappropriate ADH secretion · von Willebrand's Disease Type IIB (may result in pseudothrombocytopenia)
- **CAUTIONS**

GENERAL CAUTIONS Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

 - ▶ With intranasal use Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects
- **INTERACTIONS** → Appendix 1: desmopressin
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ Common or very common Hyponatraemia (on administration without restricting fluid intake) · nausea
 - ▶ Frequency not known Abdominal pain · aggression · allergic dermatitis · emotional disorder · fluid retention · headache · hyponatraemic seizure · vomiting · weight increased

SPECIFIC SIDE-EFFECTS

 - ▶ With intranasal use Epistaxis · nasal congestion · rhinitis

- ▶ With intravenous use Vasodilation

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)—increases risk of hyponatraemia.

- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** *DDAVP*[®] and *Desmotabs*[®] tablets may be crushed.
DDAVP[®] intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
DDAVP[®] injection may be administered orally.
Desmopressin oral lyophilisates are for sublingual administration.
- ▶ With intravenous use Higher doses of *DDAVP*[®] by *intravenous infusion*, used in mild to moderate haemophilia and von Willebrand's disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion. For *intravenous infusion* (*Octim*[®]), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*[®] intranasal solution.

- **PATIENT AND CARER ADVICE**

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: [desmopressin-bedwetting-0](http://desmopressin-bedwetting-0.www.medicinesforchildren.org.uk/desmopressin-bedwetting-0)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

- ▶ **Desmopressin (Non-proprietary)**
Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet [PoM] £76.62 DT = £63.09
Desmopressin acetate 200 microgram Desmopressin 200microgram tablets | 30 tablet [PoM] £28.50 DT = £23.52
- ▶ **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 100 microgram DDAVP 0.1mg tablets | 90 tablet [PoM] £44.12 DT = £63.09

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

13-Nov-2019

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 476 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone p. 476 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone p. 475 at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone p. 474 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 21). However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 143. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

EvGr In the management of asthma, corticosteroids are preferably used by inhalation. Systemic therapy along with bronchodilators is required for the treatment of acute asthma and in some very severe cases of chronic asthma. **A**

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 478) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole p. 417, cyclophosphamide p. 579, chlorambucil p. 579, and ciclosporin p. 559. *Congenital nephrotic syndrome* may be resistant to corticosteroids and immunosuppressants; indometacin p. 710 and an ACE inhibitor such as captopril p. 118 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression,

rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects

MHRA/CHM advice: Corticosteroids: rare risk of central serous chorioretinopathy with local as well as systemic administration (August 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

Overdose or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 511. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 478, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

For information on the cessation of oral corticosteroid treatment, see *Treatment cessation*, for systemic corticosteroids (e.g. prednisolone p. 478).

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children being treated for asthma, administration of medium or high dose inhaled corticosteroids may be associated with systemic side effects

such as growth failure, reduced bone mineral density and adrenal suppression, but this risk is likely to be outweighed by their ability to reduce the need for multiple courses of oral corticosteroids for acute asthma attacks.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 476 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 476; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 636.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 524 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 476 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡	Betamethasone 150 micrograms
	≡	Deflazacort 1.2 mg
	≡	Dexamethasone 150 micrograms
	≡	Hydrocortisone 4 mg
	≡	Methylprednisolone 800 micrograms
	≡	Triamcinolone 800 micrograms

The relatively high mineralocorticoid activity of hydrocortisone p. 476, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 478 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 474 and dexamethasone p. 475 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclomethasone dipropionate p. 167 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 474 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

- ▶ With intra-articular use or intradermal use or intralesional use For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.
- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsys · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · long-term use · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ With intra-articular use or intradermal use or intralesional use For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anxiety · behaviour abnormal · cataract subcapsular · cognitive impairment · Cushing's syndrome · electrolyte imbalance · fatigue · fluid retention · gastrointestinal discomfort · growth retardation · headache · healing impaired · hirsutism · hypertension · increased risk of infection · menstrual cycle irregularities · mood altered · nausea · osteoporosis · peptic ulcer · psychotic disorder · skin reactions · sleep disorders · weight increased
- ▶ **Uncommon** Adrenal suppression · alkalosis hypokalaemic · appetite increased · bone fractures · diabetic control impaired · eye disorders · glaucoma · haemorrhage · heart failure · hyperhidrosis · hypotension · leucocytosis · myopathy · osteonecrosis · pancreatitis · papilloedema · seizure · thromboembolism · tuberculosis reactivation · vertigo · vision blurred
- ▶ **Rare or very rare** Malaise · tendon rupture
- ▶ **Frequency not known** Chorioretinopathy · intracranial pressure increased with papilloedema (usually after withdrawal) · telangiectasia

SIDE-EFFECTS, FURTHER INFORMATION Adrenal

suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk

of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. **Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (risk of increased exposure).
- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
- **TREATMENT CESSATION** The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week *or* 2 mg/kg daily for 1 week *or* 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

• PATIENT AND CARER ADVICE

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

Betamethasone

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

• INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1–11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
- Child 1–5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
- Child 6–11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
- Child 12–17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Hiccups · myocardial rupture (following recent myocardial infarction) · oedema · Stevens-Johnson syndrome
- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule (Pom) £30.46 DT = £30.26

Deflazacort

- **DRUG ACTION** Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

• INDICATIONS AND DOSE

Inflammatory and allergic disorders

► BY MOUTH

- Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

Nephrotic syndrome

► BY MOUTH

- Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS**
- **Uncommon** Oedema
- **HEPATIC IMPAIRMENT**
- Dose adjustments** Manufacturer advises adjust to the minimum effective dose.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 10

- ▶ **Calcort** (Sanofi)

Deflazacort 6 mg Calcort 6mg tablets | 60 tablet [PoM] £15.82 DT = £15.82

Dexamethasone

F 472

10-Mar-2020

- **DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

● **INDICATIONS AND DOSE****Physiological replacement**

- ▶ BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION

- ▶ Child: 250–500 micrograms/m² every 12 hours, adjusted according to response

Suppression of inflammatory and allergic disorders

- ▶ BY MOUTH

- ▶ Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
- ▶ Child 12–17 years: Initially 0.4–20 mg daily

Mild croup

- ▶ BY MOUTH

- ▶ Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- ▶ INITIALLY BY MOUTH

- ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

Life-threatening cerebral oedema

- ▶ BY INTRAVENOUS INJECTION

- ▶ Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
- ▶ Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

● **UNLICENSED USE**

- ▶ With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

- **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

- ▶ With oral use Hiccups · hyperglycaemia · myocardial rupture (following recent myocardial infarction) · protein catabolism
- ▶ With parenteral use Perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)

- **PREGNANCY** Dexamethasone readily crosses the placenta.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use For administration by *mouth* tablets may be dispersed in water or injection solution given by mouth.
- ▶ With intravenous use For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

● **PATIENT AND CARER ADVICE**

- ▶ Medicines for Children leaflet: Dexamethasone for croup www.medicinesforchildren.org.uk/dexamethasone-croup-0

F 472

Fludrocortisone acetate

10-Mar-2020

- **DRUG ACTION** Fludrocortisone has very high mineralocorticoid activity and insignificant glucocorticoid activity.

● INDICATIONS AND DOSE

Mineralocorticoid replacement in adrenocortical insufficiency

► BY MOUTH

► Neonate: Initially 50 micrograms once daily, adjusted according to response; usual dose 50–200 micrograms once daily, higher doses may be required, dose adjustment may be required if salt supplements are administered.

► Child: Initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response, dose adjustment may be required if salt supplements are administered

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Conjunctivitis · idiopathic intracranial hypertension · muscle weakness · thrombophlebitis
- **HEPATIC IMPAIRMENT**
Monitoring Monitor patient closely in hepatic impairment.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Fludrocortisone for hormone replacement www.medicinesforchildren.org.uk/fludrocortisone-hormone-replacement

F 472

Hydrocortisone

17-Dec-2019

- **DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

● INDICATIONS AND DOSE

Acute adrenocortical insufficiency (Addisonian crisis)

► INITIALLY BY SLOW INTRAVENOUS INJECTION

► Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose
- Child 12–17 years: 100 mg every 6–8 hours

Congenital adrenal hyperplasia

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.

► Child: 9–15 mg/m² in 3 divided doses, adjusted according to response

Adrenal hypoplasia | Addison's disease, chronic maintenance or replacement therapy

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

► Child: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed

Inflammatory bowel disease—induction of remission

► BY INTRAVENOUS INJECTION

► Child 2–17 years: 2.5 mg/kg every 6 hours (max. per dose 100 mg)

► BY CONTINUOUS INTRAVENOUS INFUSION

► Child 2–17 years: 10 mg/kg daily; maximum 400 mg per day

Ulcerative colitis | Proctitis | Proctosigmoiditis

► BY RECTUM USING RECTAL FOAM

► Child 2–17 years: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response

► Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response

► Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response

► Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Hypertension resistant to inotropic treatment and volume replacement (limited evidence)

► BY INTRAVENOUS INJECTION

► Neonate: Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.

► Child: 1 mg/kg every 6 hours (max. per dose 100 mg)

Severe acute asthma | Life-threatening acute asthma

► BY INTRAVENOUS INJECTION

► Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

► Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

► Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until

conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

- ▶ Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

● UNLICENSED USE

- ▶ With oral use Use of injection by mouth is unlicensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYDROCORTISONE MUCO-ADHESIVE BUCCAL TABLETS: SHOULD NOT BE USED OFF-LABEL FOR ADRENAL INSUFFICIENCY IN CHILDREN DUE TO SERIOUS RISKS (DECEMBER 2018)

The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children.

Healthcare professionals are advised that:

- hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
- substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
- only hydrocortisone products licensed for adrenal replacement therapy should be used.

● CONTRA-INDICATIONS

- ▶ With rectal use Abdominal or local infection · abscess · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use Systemic absorption may occur

- INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ With oral use Dyslipidaemia · myocardial rupture (following recent myocardial infarction) · oedema
- ▶ With parenteral use Hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction)

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- ▶ With oral use For administration *by mouth*, injection solution may be swallowed [unlicensed use] but consider phosphate content. For *Alkindi*[®], manufacturer advises capsule should be opened and granules either administered directly into the mouth and then followed immediately with a drink, or sprinkled onto a spoonful of soft food (such as yoghurt) and given immediately. Granules should not be chewed or added to liquid before administration due to the bitter taste, and they should not be given via a nasogastric tube.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of hydrocortisone is required, the following strength is used: 5 mg/5 mL.

● PATIENT AND CARER ADVICE

- ▶ With systemic use Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2088

- ▶ With oral use The *Scottish Medicines Consortium* (October 2018) has advised that hydrocortisone (*Alkindi*[®]) is accepted for restricted use within NHS Scotland for the first-line treatment of patients with adrenal insufficiency

aged from birth to less than six years of age for whom hydrocortisone must otherwise be individually prepared by manipulation such as by compounding (or crushing) or by production of special solutions in order to produce age-appropriate doses, or hydrocortisone given as off-label buccal tablets. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● LESS SUITABLE FOR PRESCRIBING

- ▶ With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, liquid

F 472

Methylprednisolone

11-Oct-2019

- **DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

● INDICATIONS AND DOSE

Inflammatory and allergic disorders

- ▶ BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 0.5–1.7 mg/kg daily in 2–4 divided doses, divide doses depending on condition and response

Treatment of graft rejection reactions

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 10–20 mg/kg once daily for 3 days, alternatively 400–600 mg/m² once daily (max. per dose 1 g) for 3 days

Severe erythema multiforme | Lupus nephritis | Systemic onset juvenile idiopathic arthritis

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 10–30 mg/kg once daily or on alternate days (max. per dose 1 g) for up to 3 doses

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child: Seek specialist advice, to be injected into the gluteal muscle

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: METHYLPREDNISOLONE INJECTABLE MEDICINE CONTAINING LACTOSE (*SOLU-MEDRONE*® 40 MG): DO NOT USE IN PATIENTS WITH COWS' MILK ALLERGY (OCTOBER 2017)

- ▶ With intramuscular use or intravenous use
An EU-wide review has concluded that *Solu-Medrone*® 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows' milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows' milk proteins. If a patient's symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

● CAUTIONS

- ▶ With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse
- ▶ With systemic use Systemic sclerosis (increased incidence of scleroderma renal crisis)

● INTERACTIONS → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ Common or very common
- ▶ With oral use Depressed mood
- ▶ Frequency not known
- ▶ With oral use Confusion · delusions · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · Kaposi's sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction) · oedema · schizophrenia · suicidal ideation · withdrawal syndrome
- ▶ With parenteral use Confusion · delusions · depressed mood · diarrhoea · dizziness · dyslipidaemia · hallucination · hiccups · Kaposi's sarcoma · lipomatosis · oedema · schizophrenia · suicidal thoughts · vomiting · withdrawal syndrome

- **MONITORING REQUIREMENTS** Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Prednisolone

29-Nov-2019

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

● INDICATIONS AND DOSE

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

- ▶ BY MOUTH
- ▶ Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- ▶ Child 12–17 years: 40–50 mg daily for at least 5 days

Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

- ▶ BY MOUTH
- ▶ Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

Autoimmune hepatitis

- ▶ BY MOUTH
- ▶ Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

Corticosteroid replacement therapy

- ▶ BY MOUTH
- ▶ Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

Infantile spasms

- ▶ BY MOUTH
- ▶ Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

Infantile spasms (dose reduction in patient taking 40 mg daily)

- ▶ BY MOUTH
- ▶ Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, then stop

Infantile spasms (dose reduction in patient taking 60 mg daily)

- ▶ BY MOUTH
- ▶ Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

Idiopathic thrombocytopenic purpura

- ▶ BY MOUTH
- ▶ Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

Nephrotic syndrome

- ▶ BY MOUTH
- ▶ Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

Nephrotic syndrome (prevention of relapse)

- ▶ BY MOUTH
- ▶ Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Ulcerative colitis | Crohn's disease

- ▶ BY MOUTH
- ▶ Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

- ▶ BY MOUTH
- ▶ Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

Proctitis

- ▶ BY RECTUM USING RECTAL FOAM
- ▶ Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

- ▶ BY RECTUM USING SUPPOSITORIES
- ▶ Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

- ▶ BY RECTUM USING RECTAL FOAM
- ▶ Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

- ▶ BY RECTUM USING SUPPOSITORIES
- ▶ Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

● UNLICENSED USE

- ▶ With rectal use Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

- ▶ With systemic use
Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS

- ▶ With rectal use Abdominal or local infection · bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use Systemic absorption may occur with rectal preparations
- ▶ With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity) · systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)

- **INTERACTIONS** → Appendix 1: corticosteroids

● SIDE-EFFECTS

- ▶ With oral use Diarrhoea · dizziness · dyslipidaemia · lipomatosis · protein catabolism · scleroderma renal crisis

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

Monitoring ▶ With systemic use Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

Monitoring ▶ With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● MONITORING REQUIREMENTS

- ▶ With systemic use Manufacturer advises monitor blood pressure and renal function (s-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically. Metyrapone p. 481 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing's syndrome.

ENZYME INHIBITORS

Ketoconazole

04-Feb-2020

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

• INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

- ▶ **BY MOUTH**

▶ Child 12-17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

- **CONTRA-INDICATIONS** Acquired QTc prolongation · Acute porphyrias p. 652 · avoid concomitant use of hepatotoxic drugs · congenital QTc prolongation
- **CAUTIONS** Pre-treatment liver enzymes should not exceed 2 times the normal upper limit · risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vomiting
 - ▶ **Uncommon** Allergic conditions · alopecia · angioedema · asthenia · dizziness · drowsiness · headache · thrombocytopenia
 - ▶ **Rare or very rare** Fever · hepatic disorders · taste altered
 - ▶ **Frequency not known** Alcohol intolerance · appetite abnormal · arthralgia · azoospermia · dry mouth · epistaxis · flatulence · fontanelle bulging · gynaecomastia · hot flush · insomnia · intracranial pressure increased · malaise · menstrual disorder · myalgia · nervousness · papilloedema · paraesthesia · peripheral oedema · photophobia · photosensitivity reaction · tongue discoloration
- **SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use. Manufacturer advises reduce dose if hepatic enzymes increased to less than 3 times the upper limit of normal—

consult product literature; discontinue permanently if hepatic enzymes at least 3 times the upper limit of normal.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
 - ▶ Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
 - ▶ Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected.
- **PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.
Driving and skilled tasks Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- ▶ **Ketoconazole (non-proprietary)** ▼
Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet [PoM] £480.00 DT = £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

● INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

▶ BY MOUTH

- ▶ Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours

Management of Cushing's syndrome (specialist supervision in hospital)

▶ BY MOUTH

- ▶ Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to

cortisol production, or high, in which case corticosteroid replacement therapy is also needed

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 652 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** → Appendix 1: metyrapone
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · headache · hypotension · nausea · sedation · vomiting
 - ▶ **Rare or very rare** Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
 - ▶ **Frequency not known** Alopecia · bone marrow failure · hypertension
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of delayed response).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Metopirone** (HRA Pharma UK Ltd)

Metopirone 250 mg Metopirone 250mg capsules | 100 capsule [PoM] £363.66 DT = £363.66

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 482 and Type 2 diabetes mellitus p. 485 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral or antipsychotic drugs may also cause secondary diabetes. In children, conditions such as cystic fibrosis can lead to diabetes; monogenic diabetes (previously known as maturity onset diabetes in the young) can also occur due to a single gene defect.

Driving

Information on the requirements for driving vehicles by young people receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Alcohol

Adolescents and their carers should be made aware that alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; (note: specialist sources

recommend that **adult** patients with diabetes should drink alcohol only in moderation, and when accompanied by food).

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is **not** recommended or necessary for routine diagnostic use of diabetes when severe symptoms of hyperglycaemia are present. In children who have less severe symptoms and blood-glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It may be useful for diagnosis of monogenic diabetes or cystic fibrosis related diabetes, and is used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of *Polycal*[®] or as *Rapilose*[®] OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in *mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values	
IFCC-HbA1c (mmol/mol)	DCCT-HbA1c (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
69	8.5
75	9.0

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes below and Type 2 diabetes p. 485 in children, and for diagnosis of Type 2 diabetes p. 485 in adults. [EVR](#) HbA1c should not be used to diagnose diabetes in children. [A](#)

HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications, and children and their carers should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 485). [EVR](#) HbA1c should usually be measured in children with type 1 and type 2 diabetes every 3 months; and more frequently in children with type 1 diabetes if blood-glucose is poorly controlled. [A](#)

HbA1c monitoring is invalid in children with disturbed erythrocyte turnover or in children with a lack of, or abnormal haemoglobin (for example, any anaemia, a recent blood transfusion, or an altered red cell lifespan). In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Advanced Pharmacy Services

Patients with diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 25.

Type 1 diabetes

05-Jun-2017

Description of condition

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, premature cardiovascular disease, and peripheral artery disease.

Typical features in children presenting with type 1 diabetes are hyperglycaemia, polyuria, polydipsia, weight loss, and excessive tiredness.

Aims of treatment

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications. Disability from complications can often be prevented by early detection and active management of the disease (Diabetic complications p. 486).

[EVR](#) The target for glycaemic control should be individualised for each child, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, and history of hypoglycaemia. Tighter control of blood-glucose is now recommended for children with type 1 diabetes and treatment should attempt to reach near normal HbA1c and blood-glucose concentration. A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in children to minimise the risk of long-term complications. The optimal plasma glucose targets for children are:

- fasting blood-glucose concentration of 4–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre after meals;
- a blood-glucose concentration of at least 5 mmol/litre in young people when driving. [A](#)

Overview

[EVR](#) Type 1 diabetes requires insulin replacement, supported when necessary by active management of other associated cardiovascular risk factors such as hypertension. Tight glycaemic control may be achieved by intensive insulin management (multiple daily injections or insulin pump therapy) from diagnosis, accompanied by carbohydrate counting.

The effectiveness of metformin in combination with insulin is not yet known in children, and so should not be used; other oral antidiabetic drugs should not be used in

combination with insulin as their use may increase the risk of hypoglycaemia.

Dietary control is important in both type 1 and type 2 diabetes and children (with their families) should be encouraged to develop good knowledge of nutrition and how it affects their diabetes and insulin requirements. Healthy eating, regular exercise, and control of body-weight can reduce cardiovascular risk and help improve glycaemic control.

Children with type 1 diabetes over the age of 6 months should receive immunisation against influenza and pneumococcal infection (in children treated with antidiabetic drugs)—see Influenza vaccine p. 835 and Pneumococcal vaccine p. 838. \blacktriangle

Insulin therapy in type 1 diabetes

EvGr All children with type 1 diabetes require insulin therapy (see also **Insulin p. 484**). Treatment should be initiated and managed by clinicians with relevant expertise; there are three basic types of insulin regimen, although each regimen should be individualised.

Children should also be offered carbohydrate-counting training as part of a structured education programme. \blacktriangle

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

EvGr Children should be offered multiple daily injection basal-bolus regimens initiated at diagnosis, considering personal and family circumstances, and personal preferences. Children and their carers should be encouraged to adjust the insulin dose as appropriate after each blood-glucose measurement, and to inject rapid-acting insulin analogues before eating (rather than after eating); this reduces blood-glucose concentrations after meals and helps to optimise blood-glucose control.

If a multiple daily injection basal-bolus insulin regimen is unsuitable, or the child does not have optimal blood-glucose control, it may be necessary to offer an alternative insulin regimen (either continuous subcutaneous insulin infusion once-, twice- or three-times daily mixed injections) as well as additional support (such as increased contact with their specialist diabetes team).

Continuous subcutaneous insulin infusion (or insulin pump) therapy may be considered under the care of a specialist team. It should only be offered to children over 12 years who suffer disabling hypoglycaemia, or who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Children under 12 years may be offered insulin pump therapy if a multiple daily injection regimen is impractical or inappropriate, but they should undergo a trial of a multiple dose injection regimen between the ages of 12 and 18 years.

If the chosen regimen is a twice daily injection regimen, the insulin dose should be adjusted according to the general

trend in pre-meal, bedtime and occasional night-time blood-glucose concentration. \blacktriangle

Insulin requirements

EvGr The dosage of insulin must be determined individually for each child and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Prescribers and patients should be aware that initiation of insulin may be followed by a **temporary** partial remission phase or 'honeymoon period' when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control with an HbA1c concentration of less than 48 mmol/mol (6.5%). \blacktriangle

EvGr Insulin doses should be reviewed after puberty (around 1 year after menarche or after the growth spurt in boys) as insulin resistance falls after puberty, and maintenance of pubertal doses may increase the risk for excessive weight gain. \blacktriangle

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet and exercise), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison's disease or gastroparesis. **EvGr** A review of the child's injection sites should be offered at each clinic visit. \blacktriangle

Infection, stress, accidental or surgical trauma, and puberty may all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, and in certain endocrine disorders, such as anterior pituitary or adrenocortical insufficiency and hypothyroidism.

EvGr Rapid-acting insulin analogues should be supplied for use during intercurrent illness and episodes of hyperglycaemia. \blacktriangle

Risks of hypoglycaemia with insulin

EvGr Hypoglycaemia is an inevitable adverse effect of insulin treatment, and children and their carers should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 501). \blacktriangle

Impaired awareness of hypoglycaemia can occur, when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. **EvGr** Awareness of hypoglycaemia should be discussed and assessed with the child and their carer approximately every 3 months. \blacktriangle

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for adolescents who are drivers, cyclists, or in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see *Driving*, under Diabetes p. 481).

EvGr To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous glucose monitoring should be considered.

\blacktriangle **EvGr** Children and their carers should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. If recurrent severe episodes of hypoglycaemia continue despite

appropriate interventions, the child should be referred to a specialist centre. \blacktriangleleft

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

EVGr Children and their carers should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers. \blacktriangleleft

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Insulin

05-Jun-2017

Overview

For recommended insulin regimens see Type 1 diabetes p. 482 and Type 2 diabetes p. 485.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is

ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

EVGr Lipo hypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered.

Lipo hypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipo hypertrophy before administration. \blacktriangleleft

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin above (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 492, insulin glulisine p. 493 and insulin lispro p. 493).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 486 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

EVGr For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of *post-meal* injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia. \blacktriangleleft

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 494) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 482 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 494, biphasic insulin aspart p. 495 and biphasic insulin lispro p. 495).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

Long-acting insulin

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin, insulin zinc suspension, insulin detemir p. 496, insulin glargine p. 496, insulin degludec p. 495) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

Type 2 diabetes

05-Jun-2017

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

Type 2 diabetes in children is associated with increased body-weight, increased risk of renal complications, hypertension, and dyslipidaemia; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual child.

Overview

EvGr Lifestyle modifications (including weight loss, smoking cessation and regular exercise) can help to reduce both hyperglycaemia and cardiovascular risk and should be encouraged where appropriate. Children and their carers should also receive advice from a paediatric dietitian to help optimise body-weight and blood-glucose control.

Lifestyle modifications alone are often unsuccessful at achieving glycaemic control in children, therefore antidiabetic drugs should be offered and initiated alongside lifestyle interventions such as diet and exercise, from the time of diagnosis.

Children with type 2 diabetes should receive immunisation against influenza (over the age of 6 months) and pneumococcal infection—see Influenza vaccine p. 835 and Pneumococcal vaccine p. 838. **▲**

Antidiabetic drugs

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. For recommended treatment regimens and the place in therapy of each drug, see *Treatment of type 2 diabetes*.

EvGr Treatment with antidiabetic drugs should be initiated under specialist supervision **only**. **◀**

Metformin hydrochloride p. 488 is the only oral antidiabetic drug licensed for use in children. It has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. Metformin hydrochloride does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia.

EvGr The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side-effects. **▲**

There is little experience of the use of other non-insulin antidiabetic drugs in children, with most evidence extrapolated from adult studies.

Several **sulfonylureas** (such as gliclazide p. 490, glibenclamide p. 489 and tolbutamide p. 490) are available but experience in children is limited; they are not the recommended choice of treatment in children; therefore treatment should be initiated by a specialist. The sulfonylureas may cause hypoglycaemia which may be more common in children than in adults. Hypoglycaemia is more likely with long-acting sulfonylureas such as glibenclamide, which has been associated with severe, prolonged and sometimes fatal cases—for this reason sulfonylureas are usually avoided in children.

Treatment of type 2 diabetes

EvGr A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is ideal to minimise the risk of long-term complications, however an individualised lowest achievable target should be agreed with each child and their carers taking into account factors such as daily activities, individual life goals, complications, and comorbidities. HbA1c concentrations should be monitored every 3 months.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for children where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

Standard-release metformin hydrochloride is the first-line choice for initial treatment in children and should be offered from diagnosis, alongside nutrition and lifestyle advice.

If the combination of lifestyle changes and metformin hydrochloride fails to reduce HbA1c to the agreed target within 3 to 4 months of therapy, addition of a long-acting insulin or once-daily human isophane insulin p. 494 should be considered (see also, Insulin p. 484). **▲**

EvGr Initiation of insulin should be under specialist care. **◀**

EvGr Metformin hydrochloride should be continued alongside insulin, to improve insulin sensitivity. The combination of metformin hydrochloride and once-daily insulin is usually an effective treatment for maintaining glycaemic control in the majority of children for extended periods of time.

If the combination of basal insulin and metformin does not achieve the HbA1c target (and postprandial hyperglycaemia

persists) addition of prandial rapid- or short-acting insulin should be initiated and titrated until the target HbA1c is met. **⚠** Weight gain may occur and can be particularly problematic in children with type 2 diabetes when insulin therapy is initiated, unless there is careful attention and adherence to dietary measures. **EvGr** The importance of diet and exercise should be emphasised. **⚠**

Advanced Pharmacy Services

Children with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 25.

Diabetes p. 481
Type 1 diabetes p. 482
Type 2 diabetes p. 485
Diabetic foot infections, antibacterial therapy p. 324. For guidance on other diabetic foot problems, see NICE guideline **Diabetic foot problems**: <https://www.nice.org.uk/guidance/ng19>.

Diabetes and cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease later in life. **EvGr** Other risk factors for cardiovascular disease that should also be addressed are: smoking, hypertension, obesity and dyslipidaemia. **⚠** The use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid-regulating drugs can be beneficial in children with diabetes and a high cardiovascular disease risk. ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy. For guidance on stopping smoking, see Smoking cessation p. 313.

Diabetic nephropathy

EvGr In diabetic children with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Microalbuminuria can occur transiently during puberty. Provided there are no contra-indications, all diabetic children with nephropathy causing proteinuria or with established microalbuminuria should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. ACE inhibitors or angiotensin-II receptor antagonists should also be given as monotherapy, or combined therapy, in children with chronic kidney disease and proteinuria, to reduce the rate of progression of chronic kidney disease. **⚠**

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

See also treatment of hypertension in diabetes in Hypertension p. 104.

Diabetic neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Visual impairment

EvGr Optimal diabetic control (HbA1c ideally around 7% or 53 mmol/mol) and blood pressure control (<130/80 mmHg)

should be maintained to prevent onset and progression of diabetic eye disease. **⚠**

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in *shock*, give 10 mL/kg **sodium chloride 0.9%** as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45%** and **glucose 5%** after 12 hours if response is adequate and plasma-sodium concentration is stable.
- Include **potassium chloride** in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre *and* blood pH is greater than 7.3 *and* a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 492, or insulin glulisine p. 493, or insulin lispro p. 493.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

Diabetes, surgery and medical illness

05-Jun-2017

Management of diabetes during surgery

EvGr Children with diabetes should undergo surgery in centres with facilities and expertise for the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of

these children. All surgery requiring general anaesthesia in children with type 1 and type 2 diabetes requires hospital admission. **A**

Note: The following recommendations provide general guidance for the management of diabetes during surgery. **Local protocols and guidelines should be referred to where they exist.**

Use of insulin during surgery

Elective surgery—minor procedures

EvGr *Minor procedures* (procedures of less than 2 hours requiring either general anaesthesia or heavy sedation) in children who have type 1 or type 2 diabetes should not have a major impact on glycaemic control, and a slight modification of the usual regimen may be all that is necessary—adjustments should be made following local protocol; taking into consideration the type of insulin or antidiabetic drugs the child usually takes, whether fasting is required, the time of day of the operation, and requirement for intravenous fluids and glucose. All children who are usually prescribed insulin require intravenous insulin during surgery, to avoid ketoacidosis. **A**

Elective surgery—major procedures

EvGr *Major procedures* (procedures requiring general anaesthesia for more than 2 hours) in children who have type 1 or type 2 diabetes, should ideally be performed when diabetes is under optimal control. If glycaemic control is poor, the procedure should be delayed if possible; otherwise it is advisable to admit the child well in advance of surgery for stabilisation of glycaemic control.

Blood-glucose concentration should be maintained within the usual target range of 5–10 mmol/litre throughout the peri-operative period for all surgical procedures.

Children usually prescribed insulin for type 1 or type 2 diabetes require an intravenous insulin infusion p. 491 during surgery (even if fasting) to avoid ketoacidosis. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the evening before surgery, the usual insulin regimen should be given as normal; the usual bedtime snack should be given and hourly capillary blood-glucose monitoring should be initiated to detect hypoglycaemia or hyperglycaemia before the procedure. Ketones should also be checked if blood-glucose is above 14 mmol/litre, and an appropriate dose of short-acting insulin should be administered to restore blood-glucose to the target range;
- on the morning of surgery the usual insulin dose should be omitted;
- at least 2 hours before the procedure, a maintenance fluid infusion of sodium chloride 0.45% and glucose 5% (sodium chloride with glucose p. 638) intravenous infusion should be started. A switch to sodium chloride 0.9% infusion p. 636 may be required if sodium concentration falls and there is risk of hyponatraemia. After surgery, potassium chloride p. 651 should be added to the intravenous fluid, according to the child's body weight and fluid requirements. Electrolytes must be measured frequently throughout, and adjustments to the infusion made as necessary;
- soluble human insulin 1 unit/mL in sodium chloride 0.9% intravenous infusion should be started with the maintenance fluids at an infusion rate appropriate to the blood-glucose concentration, to maintain a concentration between 5 and 10 mmol/litre, adjusted according to hourly blood-glucose monitoring;
- if the blood-glucose concentration falls below 6 mmol/litre the insulin infusion should **not** be stopped as this will cause rebound hyperglycaemia; instead the rate should be reduced; however, if blood-glucose concentration drops below 4 mmol/litre the insulin infusion can be stopped temporarily for 10–15 minutes.

After surgery, continue the glucose infusion, and the intravenous insulin infusion or additional short-acting insulin as necessary, until the child can eat and drink normally and their usual treatment regimen can resume. A short-acting insulin can also be given if required to reduce hyperglycaemia. **A**

Emergency surgery

EvGr Children with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose, blood or urinary ketone concentration, and serum electrolytes checked before surgery. If ketones are high, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 486 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for *major elective surgery* (above). **A**

Use of antidiabetic drugs during surgery

EvGr If elective *minor surgical procedures* only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

Children who usually take **sulfonylureas** should have their medication stopped on the day of surgery. **A**

EvGr **Sulfonylureas** are associated with hypoglycaemia in the fasted state and therefore should not be recommenced until the child is eating and drinking normally. **E**

EvGr Children undergoing *minor procedures* require hourly blood-glucose monitoring and, if blood-glucose concentration rises above 10 mmol/litre, should be treated with subcutaneous rapid-acting insulin no more frequently than every 3 hours.

Children undergoing a *major surgical procedure* expected to last at least 2 hours should be managed on an intravenous insulin infusion following the recommendations for *Elective surgery* (above). **A**

EvGr Insulin is almost always required in medical and surgical emergencies. **E**

EvGr **Metformin hydrochloride p. 488** is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. In children undergoing *major surgery* lasting more than 2 hours, metformin hydrochloride should be discontinued 24 hours before the procedure. Children having *minor surgery* lasting less than 2 hours may stop their metformin on the day of surgery. Metformin hydrochloride should not be restarted until at least 48 hours after surgery or after the child is eating again, and only once normal renal function has been established. **A**

The manufacturer advises that metformin should also be omitted if contrast medium is administered during surgery to reduce the risk of contrast-induced nephropathy. It should be stopped prior to, or at the time of the test, and not to be restarted until 48 hours afterwards, and only once normal renal function has been established.

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Diabetes, pregnancy and breast-feeding

01-Aug-2017

Description of condition

Diabetes in pregnancy is associated with increased risks to the young woman (such as pre-eclampsia and rapidly

worsening retinopathy), and to the developing fetus, compared with pregnancy in non-diabetic young women. Effective blood-glucose control before conception and throughout pregnancy reduces (but does not eliminate) the risk of adverse outcomes such as miscarriage, congenital malformation, stillbirth, and neonatal death.

Management of pre-existing diabetes

EvGr Young women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c concentration below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Young women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for young women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 620. **⚠**

Overview

Oral antidiabetic drugs

EvGr All oral antidiabetic drugs, except metformin hydrochloride below, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Young women with diabetes may be treated with metformin hydrochloride below [unlicensed in pregnancy] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride below can be continued immediately after birth and during breast-feeding for those with pre-existing Type 2 diabetes p. 485. All other antidiabetic drugs should be avoided while breast-feeding. **⚠**

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 492 and insulin lispro p. 493) can be associated with fewer episodes of hypoglycaemia, a reduction in postprandial glucose excursions, and an improvement in overall glycaemic control compared with regular human insulin.

EvGr Iophane insulin p. 494 is the first-choice for long-acting insulin during pregnancy, however in young women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 496 or insulin glargine p. 496), it may be appropriate to continue their use throughout pregnancy.

Continuous subcutaneous insulin infusion p. 491 (insulin pump therapy) may be appropriate for young women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 491 without significant disabling hypoglycaemia.

All young women treated with insulin p. 491 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant young women with Type 1 diabetes p. 482 should also be prescribed glucagon p. 502 for use if needed.

Young women with pre-existing diabetes treated with insulin p. 491 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose. **⚠**

Medication for diabetic complications

EvGr Angiotensin-converting enzyme inhibitors and angiotensin-II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed. Statins should not be prescribed

during pregnancy and should be discontinued before a planned pregnancy. **⚠**

Gestational diabetes

EvGr Young women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride below may be prescribed [unlicensed use]. Insulin p. 491 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Young women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin p. 491 immediately with or without metformin hydrochloride below, in addition to a change in diet and exercise.

Young women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications, such as macrosomia or hydramnios, should be considered for immediate insulin treatment p. 491, with or without metformin hydrochloride below.

Young women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth. **⚠**

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

26-Jul-2018

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

• INDICATIONS AND DOSE

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 10 years.
- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)
- **CAUTIONS** Risk factors for lactic acidosis
CAUTIONS, FURTHER INFORMATION
- Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

- **INTERACTIONS** → Appendix 1: metformin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · appetite decreased · diarrhoea (usually transient) · gastrointestinal disorder · nausea · taste altered · vomiting
 - ▶ **Rare or very rare** Hepatitis · lactic acidosis (discontinue) · skin reactions · vitamin B12 absorption decreased
- **SIDE-EFFECTS, FURTHER INFORMATION** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.
- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.
- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.
- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
Dose adjustments Manufacturer advises consider dose reduction in moderate impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.
Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Metformin hydrochloride (Non-proprietary)**
 - Metformin hydrochloride 500 mg Metformin 500mg tablets | 28 tablet [PoM] £2.88 DT = £1.36 | 84 tablet [PoM] £2.30-£4.13 | 500 tablet [PoM] £18.75-£24.29
 - Metformin hydrochloride 850 mg Metformin 850mg tablets | 56 tablet [PoM] £2.56 DT = £1.34 | 300 tablet [PoM] £7.18-£8.86
- ▶ **Glucophage** (Merck Serono Ltd)
 - Metformin hydrochloride 500 mg Glucophage 500mg tablets | 84 tablet [PoM] £2.88
 - Metformin hydrochloride 850 mg Glucophage 850mg tablets | 56 tablet [PoM] £3.20 DT = £1.34

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Metformin hydrochloride (Non-proprietary)**
 - Metformin hydrochloride 100 mg per 1 ml Metformin 500mg/5ml oral solution sugar free sugar-free | 100 ml [PoM] £4.50-£5.74 sugar-free | 150 ml [PoM] £6.00 DT = £6.75
 - Metformin hydrochloride 170 mg per 1 ml Metformin 850mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] £19.95 DT = £19.95

BLOOD GLUCOSE LOWERING DRUGS
SULFONYLUREAS**Sulfonylureas**

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain · G6PD deficiency
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · hypoglycaemia · nausea · vomiting
 - ▶ **Uncommon** Hepatic disorders
 - ▶ **Rare or very rare** Agranulocytosis · erythrocytopenia · granulocytopenia · haemolytic anaemia · leucopenia · pancytopenia · thrombocytopenia
 - ▶ **Frequency not known** Allergic dermatitis (usually in the first 6–8 weeks of therapy) · constipation · photosensitivity reaction · skin reactions · visual impairment
- **HEPATIC IMPAIRMENT** In general, manufacturers advise avoid in severe impairment (increased risk of hypoglycaemia).
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

▮ above

16-Dec-2019

Glibenclamide**INDICATIONS AND DOSE****Type 2 diabetes mellitus**

- ▶ **BY MOUTH USING TABLETS**
 - ▶ Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Maturity-onset diabetes of the young (specialist use only)

- ▶ **BY MOUTH USING TABLETS**
 - ▶ Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Neonatal diabetes mellitus (initiated by a specialist)

- ▶ **BY MOUTH USING ORAL SUSPENSION**
 - ▶ Neonate: Initially 0.2 mg/kg daily in 2 divided doses, before feeding, increase dose according to product literature; usual maintenance 0.2–0.5 mg/kg daily in 2–4 divided doses, oral suspension is available in 2 different strengths and contains sodium benzoate—see *Prescribing and dispensing information* for information regarding the maximum volume per day.
 - ▶ Child: Initially 0.2 mg/kg daily in 2 divided doses, before feeding, increase dose according to product literature; usual maintenance 0.2–0.5 mg/kg daily in 2–4 divided doses, oral suspension is available in 2 different strengths and contains sodium benzoate—see *Prescribing and dispensing information* for information regarding the maximum volume per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
Not licensed for use in type 2 diabetes mellitus or maturity-onset diabetes of the young.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dyspepsia · neutropenia · tooth discolouration
 - ▶ **Frequency not known** Bone marrow depression · hypereosinophilia · vision disorders

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises care when prescribing and dispensing glibenclamide oral suspension as 2 different strengths are available. The prescriber must state the strength of the oral suspension to be used. Glibenclamide oral suspension contains sodium benzoate, and the maximum volume that can be given is 1 mL/kg per day, regardless of the strength of the suspension. If the calculated daily dose exceeds this maximum volume using the lower-strength suspension, the higher-strength suspension must be used to administer the dose—consult product literature.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

ELECTROLYTES: May contain Sodium

► **Amglidia** (Amring Pharmaceutical Ltd)

Glibenclamide 600 microgram per 1 ml Amglidia 0.6mg/ml oral suspension with 5ml oral syringe sugar-free | 30 ml [PoM] £2,100.00
 Amglidia 0.6mg/ml oral suspension with 1ml oral syringe sugar-free | 30 ml [PoM] £2,100.00

Glibenclamide 6 mg per 1 ml Amglidia 6mg/ml oral suspension with 5ml oral syringe sugar-free | 30 ml [PoM] £21,000.00
 Amglidia 6mg/ml oral suspension with 1ml oral syringe sugar-free | 30 ml [PoM] £21,000.00

Gliclazide

10-Mar-2020

● **INDICATIONS AND DOSE**

Type 2 diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

Maturity-onset diabetes of the young (specialist use only)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Anaemia · angioedema · dyspepsia · gastrointestinal disorder · hypersensitivity vasculitis · hyponatraemia · severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Gliclazide for type 2 diabetes mellitus and maturity-onset diabetes of the young

www.medicinesforchildren.org.uk/gliclazide-type-2-diabetes-mellitus-and-maturity-onset-diabetes-young

£ 489

Tolbutamide

● **INDICATIONS AND DOSE**

Type 2 diabetes mellitus

► BY MOUTH

► Child 12–17 years (specialist use only): 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS**
- **Rare or very rare** Aplastic anaemia · blood disorder
- **Frequency not known** Alcohol intolerance · appetite abnormal · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · headache · hypersensitivity (usually in the first 6–8 weeks of therapy) · paraesthesia · tinnitus · weight increased
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► **Tolbutamide (Non-proprietary)**

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM] £34.88 DT = £20.66 | 112 tablet [PoM] £82.64

INSULINS

Insulins

IMPORTANT SAFETY INFORMATION

NHS NEVER EVENT: OVERDOSE OF INSULIN DUE TO ABBREVIATIONS OR INCORRECT DEVICE (JANUARY 2018)
 The words 'unit' or 'international units' should **not** be abbreviated.

Specific insulin administration devices should always be used to measure insulin i.e. Insulin syringes and pens.

Insulin should **not** be withdrawn from an insulin pen or pen refill and then administered using a syringe and needle.

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Oedema
- ▶ **Uncommon** Lipodystrophy

Overdose Overdose causes hypoglycaemia.

● **PREGNANCY**

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● **BREAST FEEDING**

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

● **HEPATIC IMPAIRMENT** Insulin requirements may be decreased.

● **RENAL IMPAIRMENT** The compensatory response to hypoglycaemia is impaired in renal impairment.

Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.

● **MONITORING REQUIREMENTS**

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- ▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.
- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● **PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.

Units The word 'unit' should **not** be abbreviated.

● **PATIENT AND CARER ADVICE**

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton

Oldham

OL9 9QH

Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS > RAPID-ACTING

F 490

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

● **INDICATIONS AND DOSE**

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

Hyperglycaemia during illness

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

- ▶ Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia | Neonatal diabetes

- ▶ BY INTRAVENOUS INFUSION
- ▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis | Diabetes during surgery

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

● **INTERACTIONS** → Appendix 1: insulins

● **SIDE-EFFECTS**

- ▶ **Uncommon** Skin reactions
- ▶ **Rare or very rare** Refraction disorder

● **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated,

able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For *intravenous infusion in neonatal intensive care*, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) of human insulin; pH 6.6–8.0.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151** Continuous subcutaneous insulin infusion is recommended as an option in adults and children 12 years and over with type 1 diabetes:
 - who suffer repeated and unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
 Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/guidance/TA151

Isophane insulin

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)— intermediate acting)

● **INDICATIONS AND DOSE**

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● **PREGNANCY** Recommended where longer-acting insulins are needed.

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68 DT = £15.68
 Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT = £19.08
- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £21.70 DT = £21.70
- ▶ **Hypurin Porcine Isophane** (Wockhard UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £51.64 DT = £51.64
 Hypurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £34.43 DT = £34.43
- ▶ **Insulatard** (Novo Nordisk Ltd)

- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £20.40 DT = £21.70
- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT = £19.08
- ▶ **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
 Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT = £19.08
- ▶ **Insuman Basal SoloStar** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £19.80 DT = £21.70

INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

Biphasic insulin aspart (Intermediate-acting insulin)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- ▶ **Uncommon** Skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.89 DT = £29.89
- ▶ **NovoMix 30 Penfill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml

suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT = £28.79

Biphasic insulin lispro (Intermediate-acting insulin)

03-Feb-2020

F 490

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1: insulins

- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humalog Mix25** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61 DT = £16.61
 Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98
- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT = £29.46
- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £30.98 DT = £30.98

INSULINS > LONG-ACTING

Insulin degludec

08-Feb-2019

F 490

(Combination human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- ▶ **Rare or very rare** Urticaria

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*[®]) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

● NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3158

The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is **not** recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Tresiba FlexTouch** (Novo Nordisk Ltd)

Insulin degludec 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £46.60 DT = £46.60

Insulin degludec 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pens | 3 pre-filled disposable injection [PoM] £55.92 DT = £55.92

- ▶ **Tresiba Penfill** (Novo Nordisk Ltd)

Insulin degludec 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60 DT = £46.60

F 490

Insulin detemir

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 2–17 years: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- ▶ **Uncommon** Refraction disorder

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 494 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Levemir FlexPen** (Novo Nordisk Ltd)

Insulin detemir 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £42.00 DT = £42.00

- ▶ **Levemir InnoLet** (Novo Nordisk Ltd)

Insulin detemir 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £44.85 DT = £42.00

- ▶ **Levemir Penfill** (Novo Nordisk Ltd)

Insulin detemir 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT = £42.00

F 490

Insulin glargine

(Recombinant human insulin analogue—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 2–17 years: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

● SIDE-EFFECTS

- ▶ **Rare or very rare** Myalgia - sodium retention - taste altered

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Abasaglar** (Eli Lilly and Company Ltd)

Insulin glargine 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT = £37.77

- ▶ **Abasaglar KwikPen** (Eli Lilly and Company Ltd)

Insulin glargine 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £35.28 DT = £37.77

- ▶ **Lantus** (Sanofi)

Insulin glargine 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.77 DT = £37.77

Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pens | 5 pre-filled disposable injection [PoM] £37.77 DT = £37.77

Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM]

£27.92 DT = £27.92

- ▶ **Semglee** (Mylan) ▼

Insulin glargine 100 unit per 1 ml Semglee 100units/ml solution for injection 3ml pre-filled pens | 5 pre-filled disposable injection [PoM] £29.99 DT = £37.77

- ▶ **Toujeo** (Sanofi)

Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pens | 3 pre-filled disposable injection [PoM] £32.14 DT = £32.14

- ▶ **Toujeo DoubleStar** (Sanofi)

Insulin glargine 300 unit per 1 ml Toujeo 300units/ml solution for injection 3ml pre-filled DoubleStar pens | 3 pre-filled disposable injection [PoM] £64.27 DT = £64.27

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood ketones should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring
Glucose, p. 638

50 strip • NHS indicative price = £3.31 • Drug Tariff (Part IXr)

3.2 Hypoglycaemia

Hypoglycaemia

09-Apr-2020

Description of condition

Hypoglycaemia results from an imbalance between glucose supply, glucose utilisation, and existing insulin concentration. Clinical hypoglycaemia is defined as a blood-glucose concentration low enough to cause symptoms or signs of impaired brain function. In clinical practice, a glucose value of ≤ 3.9 mmol/litre is used as the threshold value to initiate treatment for hypoglycaemia in children with diabetes.

Symptoms of hypoglycaemia in the young include shakiness, pounding heart, sweatiness, headache, drowsiness, and difficulty concentrating. In young children, behavioural changes such as irritability, agitation, quietness, and tantrums, may be prominent.

Short-term complications of severe hypoglycaemia include transient neurological symptoms such as paresis, convulsions, encephalopathy, loss of consciousness, and rarely, subsequent neurological damage and mild intellectual impairment.

Diabetes mellitus, idiopathic ketotic hypoglycaemia, adrenal insufficiency, hyperinsulinism, fatty acid oxidation disorders, and glycogen storage disease (amongst others), may cause acute hypoglycaemia in children. Common clinical precipitants for hypoglycaemia in children with diabetes may include insufficient food consumption (i.e. missed meals, nocturnal hypoglycaemia), excessive insulin dosing, exercise, alcohol ingestion (in adolescents), and sulfonylureas [unlicensed].

Treatment of acute hypoglycaemia

For a quick reference resource with doses for the treatment of hypoglycaemia, see *Hypoglycaemia* in Medical emergencies in the community, inside back pages.

Prompt treatment of hypoglycaemia in children is essential whatever the cause. Hypoglycaemia caused by a sulfonylurea (although rarely used in children) or a long acting insulin, may persist for up to 24–36 hours following the last dose, especially if there is concurrent renal impairment (rare in children). **EvGr** Close monitoring is required and hospital care should be considered. 

Severe hypoglycaemia**Intravenous management**

Hypoglycaemia which causes unconsciousness or seizures is an emergency. [EVGr] If the child is in hospital and rapid intravenous access is possible, severe hypoglycaemia should be treated with glucose 10% intravenous infusion p. 638. [A] [EVGr] A bolus dose using glucose 10% can be given before the glucose infusion to rapidly increase the plasma-glucose concentration, in order to allow glucose to cross the blood brain barrier and alleviate neuroglycopenia. [E]

Pain and phlebitis may occur during administration, particularly if infused too quickly. Glucose 50% intravenous infusion is not recommended as it is hypertonic, thus increases the risk of extravasation injury, and is viscous, making administration difficult.

Oral and intramuscular management

[EVGr] Severe hypoglycaemia outside of hospital or when rapid intravenous access is not available, may be treated with concentrated oral glucose solution, as long as the child is **conscious and able to swallow**. [A] Proprietary products of fast-acting carbohydrate, as glucose 40% gel (e.g. *Glucogel*®, *Dextrogl*®, or *Rapilose gel*®, see glucose) are available for the patient to keep at hand in case of severe hypoglycaemia.

[EVGr] If the child is **unconscious or unable to swallow**, intramuscular glucagon below should be given and blood-glucose concentration monitored. [A] Glucagon increases blood glucose by mobilising glycogen stored in the liver. The manufacturer advises that it is ineffective in patients whose liver glycogen is depleted, therefore should not be used in anyone who has fasted for a prolonged period, has adrenal insufficiency, chronic hypoglycaemia, or alcohol-induced hypoglycaemia. [EVGr] Glucagon may also be less effective in children taking a sulfonylurea; in these cases, intravenous glucose will be required. [E]

[EVGr] As symptoms improve or normoglycaemia is restored, and the child is sufficiently awake, an oral long-acting carbohydrate snack (e.g. two biscuits, one banana) or a meal should be given to maintain normal blood-glucose concentration. The blood-glucose concentration should be checked repeatedly in children and young people who have persistently reduced consciousness after a severe hypoglycaemic episode, to determine whether further glucose is needed. [A]

Advice for parents or carers

[EVGr] Parents or carers of insulin-treated children should be trained and equipped to give intramuscular glucagon for emergency use in severe hypoglycaemic attacks.

Parents or carers should be advised to seek medical assistance if glucagon is not effective within 10 minutes as intravenous glucose is required. [A]

Non-severe hypoglycaemia

[EVGr] In children who **are able to swallow**, non-severe hypoglycaemia is treated with 10–20 g of fast-acting carbohydrate by mouth, preferably in liquid form, which may be taken more easily. Oral glucose solutions should not be used if consciousness is reduced as this could be dangerous (risk of choking). 10–20 g is available from approximately 2–4 teaspoonfuls of sugar added to a cup of water, or 3–6 glucose tablets.

Chocolates and biscuits should be avoided if possible, because they have a lower sugar content and their high fat content may delay stomach emptying.

Administration of fast-acting carbohydrates may need to be in frequent small amounts, because hypoglycaemia can cause vomiting. [A] Blood-glucose concentrations should rise within 5–15 minutes; [EVGr] if hypoglycaemia persists after 15 minutes, repeat the fast-acting glucose. As symptoms improve or normoglycaemia is restored, a long-acting carbohydrate snack (e.g. two biscuits, one banana) or a meal, can be given to prevent blood-glucose concentration from falling again. [A]

Neonatal hypoglycaemia in term babies

Infants at risk of impaired metabolic adaptation and hypoglycaemia include infants of mothers with diabetes (including gestational diabetes), those whose mothers have taken beta-blockers, and those with intra-uterine growth restriction. [EVGr] Severe or persistent hypoglycaemia may be a presenting feature of an underlying inborn error of metabolism and requires urgent medical review.

Asymptomatic neonatal hypoglycaemia may be treated by increasing breast-feeding frequency, supplementing with a breast milk substitute (i.e. formula), or intravenous glucose therapy. Buccal glucose gel may be used in conjunction with a feeding plan. When feeding interventions are offered, blood-glucose concentrations should be re-checked in 1 hour to ensure there has been a response. If feeding interventions are not effective, glucose 10% intravenous infusion should be given, and blood-glucose re-tested within 15 minutes. **Symptomatic** hypoglycaemic neonates should be treated immediately with a glucose intravenous infusion. If there is a delay in obtaining intravenous access, consider either buccal glucose gel or intramuscular glucagon. If blood glucose is <1 mmol/litre, buccal glucose gel should only be used as an interim measure while arranging treatment with intravenous glucose infusion. Neonates requiring 12 mg/kg/minute or more of glucose to maintain normoglycaemia, should be investigated for congenital hyperinsulinism. [E]

GLYCOGENOLYTIC HORMONES**Glucagon**

23-Apr-2020

• INDICATIONS AND DOSE**Diabetic hypoglycaemia**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Neonate: 20 micrograms/kg.

- Child 1 month–8 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 9–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given

Endogenous hyperinsulinism

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.

- Child 1 month–1 year: 1 mg for 1 dose
- BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.

- Child 1 month–1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary

Diagnosis of growth hormone secretion (specialist use only)

► BY INTRAMUSCULAR INJECTION

- Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

► INITIALLY BY INTRAVENOUS INJECTION

- Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

DOSE EQUIVALENCE AND CONVERSION

► 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

Unlicensed for growth hormone test and hyperinsulinism.

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma · when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge)
- **INTERACTIONS** → Appendix 1: glucagon
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Nausea
 - ▶ **Uncommon** Vomiting
 - ▶ **Rare or very rare** Abdominal pain · hypertension · hypotension · tachycardia
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/glucagon-hypoglycaemia
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)
Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial **[PoM]** £11.52 DT = £11.52

Other drugs used for Chronic hypoglycaemia
Chlorothiazide, p. 117

GLYCOGENOLYTIC HORMONES

Diazoxide

● INDICATIONS AND DOSE

Resistant hypertension

▶ BY MOUTH

- ▶ **Neonate:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day

Chronic intractable hypoglycaemia

▶ BY MOUTH

- ▶ **Neonate:** Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial

- **UNLICENSED USE** Not licensed for resistant hypertension.

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **SIDE-EFFECTS** Abdominal pain · albuminuria · appetite decreased (long term use) · arrhythmia · azotaemia · cardiomegaly · cataract · constipation · diabetic hyperosmolar coma · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal symptoms · face abnormal · fever · fluid retention · galactorrhoea · haemorrhage · headache · heart failure · hirsutism · hyperglycaemia · hyperuricaemia (long term use) · hypogammaglobulinaemia · hypotension · ileus · ketoacidosis · leucopenia · libido decreased · musculoskeletal pain · nausea · nephritic syndrome · oculogyric crisis · pancreatitis · parkinsonism · pulmonary hypertension · skin reactions · sodium retention · taste altered · thrombocytopenia · tinnitus · vision disorders · voice alteration (long term use) · vomiting
- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT**

- ▶ **Dose adjustments** Dose reduction may be required.

● **MONITORING REQUIREMENTS**

- ▶ Monitor blood pressure.
- ▶ Monitor white cell and platelet count during prolonged use.
- ▶ Regularly assess growth, bone, and psychological development during prolonged use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- ▶ **Eudemine** (RPH Pharmaceuticals AB)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet **[PoM]** £72.55 DT = £72.55

Capsule

- ▶ **Proglycem** (Imported (Germany))

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule **[PoM]** 

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · appetite decreased · asthenia · cholecystitis · cholelithiasis (following long term use) · cholestasis · constipation · diabetes mellitus · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · glucose tolerance impaired (following long term use) · headache · hyperglycaemia (long term use) · hypoglycaemia · myalgia · nausea · pruritus · sinus bradycardia · vomiting

- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

F 503

04-Oct-2018

Octreotide

● INDICATIONS AND DOSE

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

► BY SUBCUTANEOUS INJECTION

► Neonate: Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.

► Child: Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required

Bleeding from oesophageal or gastric varices

► BY CONTINUOUS INTRAVENOUS INFUSION

► Child: 1 microgram/kg/hour, higher doses may be required initially, when no active bleeding reduce dose over 24 hours; Usual maximum 50 micrograms/hour

● **UNLICENSED USE** Not licensed in children.

● **INTERACTIONS** → Appendix 1: octreotide

● SIDE-EFFECTS

► **Common or very common** Arrhythmias · biliary sludge · dyspnoea · hyperbilirubinaemia · hypothyroidism · skin reactions · thyroid disorder

► **Uncommon** Dehydration

► **Frequency not known** Hepatic disorders · pancreatitis acute (after administration) · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION Administering non-pediatric injections of octreotide between meals and at bedtime may reduce gastrointestinal side-effects.

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half-life in cirrhosis).

Dose adjustments In adults, manufacturer advises consider dose reduction—consult product literature.

● MONITORING REQUIREMENTS

► Monitor thyroid function on long-term therapy.

► Monitor liver function.

● **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection* or *intravenous infusion*, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85–£18.88 DT = £18.88

Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £2.97–£18.60 DT = £14.87

Octreotide 50micrograms/1ml solution for injection vials | 5 vial [PoM] £22.00

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £32.65 DT = £27.97

Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £30.33–£32.90 DT = £30.33

Octreotide 100micrograms/1ml solution for injection vials | 5 vial [PoM] £32.65 DT = £32.65

Octreotide (as Octreotide acetate) 200 microgram per

1 ml Octreotide 1mg/5ml solution for injection vials | 1 vial [PoM] £65.00 DT = £65.00

Octreotide (as Octreotide acetate) 500 microgram per

1 ml Octreotide 500micrograms/1ml solution for injection vials | 5 vial [PoM] £158.25 DT = £158.25

Octreotide 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £27.09–£169.35 DT = £135.47

Octreotide 500micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £154.22–£169.00 DT = £154.22

► Sandostatin (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Sandostatin 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.87 DT = £14.87

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Sandostatin 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £27.97 DT = £27.97

Octreotide (as Octreotide acetate) 500 microgram per

1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £135.47 DT = £135.47

Powder and solvent for suspension for injection

► Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 10 mg Olatuton 10mg powder and solvent for prolonged-release suspension for injection vials | 1 vial [PoM] £494.74 DT = £549.71

Octreotide (as Octreotide acetate) 20 mg Olatuton 20mg powder and solvent for prolonged-release suspension for injection vials | 1 vial [PoM] £719.40 DT = £799.33

Octreotide (as Octreotide acetate) 30 mg Olatuton 30mg powder and solvent for prolonged-release suspension for injection vials | 1 vial [PoM] £898.57 DT = £998.41

► Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial [PoM] £549.71 DT = £549.71

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33 DT = £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41 DT = £998.41

4 Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) p. 508 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 506 is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children has not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice **only**.

Other drugs used for Disorders of bone metabolism
Calcitriol, p. 681

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients with cancer and patients with poor dental status should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous

bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · arthralgia · asthenia · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting
- ▶ **Uncommon** Anaphylactic reaction · angioedema · bronchospasm · oesophageal stenosis (discontinue) · osteonecrosis
- ▶ **Rare or very rare** Atypical femur fracture · Stevens-Johnson syndrome

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

Alendronic acid

(Alendronate)

20-Mar-2020

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)
Hypercalcaemia (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract ·

symptomatic oesophageal disease · ulcers · upper gastrointestinal disorders

- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastrointestinal disorders · joint swelling · vertigo
 - ▶ **Uncommon** Haemorrhage
 - ▶ **Rare or very rare** Femoral stress fracture · oropharyngeal ulceration · photosensitivity reaction · severe cutaneous adverse reactions (SCARs)
- SIDE-EFFECTS, FURTHER INFORMATION** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution

- ▶ **Alendronic acid (Non-proprietary)**
Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £28.58 DT = £28.58

Effervescent tablet

- ▶ **Binosto** (Internis Pharmaceuticals Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT = £22.80

Tablet

- ▶ **Alendronic acid (Non-proprietary)**
Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £7.00 DT = £2.61
Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.92
- ▶ **Fosamax Once Weekly** (Merck Sharp & Dohme Ltd)
Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT = £0.92

Pamidronate disodium

F 505
23-Mar-2020

(Formerly called
aminohydroxypropylidenediphosphonate
disodium (APD))

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Atypical femoral fractures · cardiac disease · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · chills · decreased leucocytes · drowsiness · flushing · hypertension · insomnia · paraesthesia · tetany · thrombocytopenia
 - ▶ **Uncommon** Agitation · dyspnoea · hypotension · muscle cramps · seizure
 - ▶ **Rare or very rare** Confusion · glomerulonephritis · haematuria · heart failure · nephritis tubulointerstitial · nephrotic syndrome · oedema · pulmonary oedema · reactivation of infections · renal disorder exacerbated · renal tubular disorder · respiratory disorders · visual hallucinations · xanthopsia
 - ▶ **Frequency not known** Atrial fibrillation
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (no information available).
- **RENAL IMPAIRMENT**
Monitoring Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).
- **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous infusion (Pamidronate disodium, Hospira, Medac, Wockhardt)*, give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Pamidronate disodium (Medac, Hospira, Wockhardt)* dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.
- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
Solution for infusion
 - ▶ **Pamidronate disodium (Non-proprietary)**
Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 (Hospital only)
Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial [PoM] £55.00–£59.66 (Hospital only)
Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only)
Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)
Pamidronate disodium 9 mg per 1 ml Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial [PoM] £170.45 (Hospital only)

Pamidronate disodium 15 mg per 1 ml Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule [PoM] £119.32
Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule [PoM] £119.32
Pamidronate disodium 90mg/6ml solution for infusion ampoules | 1 ampoule [PoM] £170.46
Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoule [PoM] £119.32

F 505

Risedronate sodium

23-Mar-2020

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

► BY MOUTH

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia) · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
 - **Uncommon** Gastrointestinal disorders
 - **Rare or very rare** Glossitis
 - **Frequency not known** Amblyopia · apnoea · chest pain · corneal lesion · dry eye · hypersensitivity · hypersensitivity vasculitis · increased risk of infection · leg cramps · liver disorder · muscle weakness · neoplasms · nocturia · tinnitus · toxic epidermal necrolysis · weight decreased
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Correct hypocalcaemia before starting.
 - Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.
 Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.
 Medicines for Children leaflet: Risedronate for brittle bones www.medicinesforchildren.org.uk/risedronate-brittle-bones

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Risedronate sodium (Non-proprietary)**

Sodium clodronate

24-Mar-2020

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta or other causes) (specialist use only) | Hypercalcaemia (specialist use only)

► BY MOUTH

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute severe gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS** Proteinuria · respiratory disorder
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
Dose adjustments Reduce dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m².
 Use half normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)

21-Jan-2020

(Salcatonin)

● INDICATIONS AND DOSE

Hypercalcaemia (limited experience in children) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
 - ▶ Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
- ▶ BY INTRAVENOUS INFUSION
 - ▶ Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours

Osteoporosis (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
 - ▶ Child: Refer for specialist advice, experience very limited

- **UNLICENSED USE** Not licensed in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** History of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonins
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · arthralgia · diarrhoea · dizziness · fatigue · flushing · headache · musculoskeletal pain · nausea · secondary malignancy (long term use) · taste altered · vomiting
 - ▶ **Uncommon** Hypersensitivity · hypertension · influenza like illness · oedema · polyuria · skin reactions · visual impairment
 - ▶ **Rare or very rare** Bronchospasm · throat swelling · tongue swelling
 - ▶ **Frequency not known** Hypocalcaemia · tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid; inhibits lactation in animals.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor bone growth.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For intravenous infusion, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Calcitonin (salmon) (Non-proprietary)

Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon) 50units/1ml solution for injection ampoules | 5 ampoule [PoM] £167.50 DT = £167.50

Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100units/1ml solution for injection ampoules | 5 ampoule [PoM] £220.00 DT = £220.00

Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 400units/2ml solution for injection vials | 1 vial [PoM] £352.00 DT = £352.00

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Denosumab

27-Apr-2020

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

● INDICATIONS AND DOSE

XGEVA®

Giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in skeletally mature adolescents

- ▶ BY SUBCUTANEOUS INJECTION
 - ▶ Child: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least calcium 500 mg and Vitamin D 400 units daily should also be taken unless hypercalcaemia is present, to be administered into the thigh, abdomen or upper arm

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW; MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
 - A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
 - Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor

and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

MHRA/CHM ADVICE: DENOSUMAB: REPORTS OF OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (JUNE 2017)

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatoma. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

MHRA/CHM ADVICE: DENOSUMAB (XGEVA[®]) FOR GIANT CELL TUMOUR OF BONE: RISK OF CLINICALLY SIGNIFICANT HYPERCALCAEMIA FOLLOWING DISCONTINUATION (JUNE 2018)

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 9 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation, consider periodic assessment of serum calcium, re-evaluate the patient's calcium and vitamin D supplementation requirements, and advise patients to report symptoms of hypercalcaemia.

Denosumab is not recommended in patients with growing skeletons.

- **CONTRA-INDICATIONS** Hypocalcaemia
XGEVA[®] Unhealed lesions from dental or oral surgery
- **CAUTIONS** Risk factors for osteonecrosis of the external auditory canal - risk factors for osteonecrosis of the jaw—consider temporary interruption of denosumab if occurs during treatment
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · cataract · constipation · hypocalcaemia (including fatal cases) · increased risk of infection · pain · sciatica · second primary malignancy · skin reactions
 - ▶ **Uncommon** Cellulitis (seek prompt medical attention) · hypercalcaemia (on discontinuation)
 - ▶ **Rare or very rare** Atypical femur fracture · hypersensitivity · osteonecrosis
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies; risk of toxicity increases with each trimester.
- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.

• **PATIENT AND CARER ADVICE**

Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist. Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

Patient reminder card A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sorbitol

▶ **Xgeva** (Amgen Ltd)

Denosumab 70 mg per 1 mL Xgeva 120mg/1.7mL solution for injection vials | 1 vial **[PoM]** £309.86 DT = £309.86

5 Gonadotrophin responsive conditions

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• **INDICATIONS AND DOSE**

ZOLADEX LA[®]

Gonadotrophin-dependent precocious puberty

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

ZOLADEX[®]

Gonadotrophin-dependent precocious puberty

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Depression · patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Asthma · body hair change · breast abnormalities · depression · headache · hypersensitivity · mood altered · ovarian cyst · paraesthesia · skin reactions ·

vaginal haemorrhage · visual impairment · weight change · withdrawal bleed

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Zoladex** (AstraZeneca UK Ltd)
Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £70.00 DT = £70.00

Leuprorelin acetate

26-May-2020

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

PROSTAP 3 DCS[®]

Gonadotrophin-dependent precocious puberty (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child (body-weight up to 19 kg): 5.625 mg every 3 months, dose may be increased if necessary. Discontinue when bone maturation consistent with age of 12 years in girls or 13 years in boys
- ▶ Child (body-weight 20 kg and above): 11.25 mg every 3 months, dose may be increased if necessary. Discontinue when bone maturation consistent with age of 12 years in girls or 13 years in boys

PROSTAP SR DCS[®]

Gonadotrophin-dependent precocious puberty (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child (body-weight up to 19 kg): 1.88 mg every month, dose may be increased if necessary. Discontinue when bone maturation consistent with age of 12 years in girls or 13 years in boys
- ▶ Child (body-weight 20 kg and above): 3.75 mg every month, dose may be increased if necessary. Discontinue when bone maturation consistent with age of 12 years in girls or 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · emotional lability · gastrointestinal discomfort · haemorrhage · headache · metrorrhagia · nausea · vaginal discharge · vomiting

- ▶ **Frequency not known** Interstitial lung disease · seizure
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Prostap 3 DCS** (Takeda UK Ltd)
Leuprorelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT = £225.72
- ▶ **Prostap SR DCS** (Takeda UK Ltd)
Leuprorelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT = £75.24

Triptorelin

26-Nov-2019

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

DECAPEPTYL[®] SR 11.25MG

Gonadotrophin-dependent precocious puberty (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

DECAPEPTYL[®] SR 22.5MG

Gonadotrophin-dependent precocious puberty (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 22.5 mg every 6 months, discontinue when bone maturation consistent with age of 12–13 years in girls or 13–14 years in boys

GONAPEPTYL DEPOT[®]

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Depression · mood altered
 - ▶ **Uncommon** Anaphylactic reaction · haemorrhage · nausea · vaginal discharge · vomiting

- ▶ **Frequency not known** Alopecia · angioedema · epiphysiolysis · gastrointestinal discomfort · headache · hot flush · malaise · myalgia · nervousness · pain · skin reactions · vision disorders · weight increased
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
DECAPEPTYL® SR 22.5MG Each vial includes an average to allow accurate administration of a 22.5 mg dose.
DECAPEPTYL® SR 11.25MG Each vial includes an average to allow accurate administration of an 11.25 mg dose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

▶ **Decapeptyl SR** (Ipsen Ltd)

Triptorelin 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00 DT = £207.00

oligospermia. There is no justification for their use in primary gonadal failure.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 513, produced using recombinant DNA technology.

Mecasermin p. 515, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 512 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 502, arginine p. 662, and clonidine hydrochloride p. 108 [all unlicensed uses]. The tests should be carried out in specialist centres.

6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot*®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 512, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

● INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 0.3 microgram/m² for 1 dose

Infantile spasm

- ▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- ▶ Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

- **UNLICENSED USE** Not licensed for low-dose test for adrenocortical insufficiency. Not licensed for treatment of infantile spasms.

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's

syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure

- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of anaphylaxis. Should only be administered under medical supervision. Consult product literature.
- ▶ Hypertension. Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- ▶ Diabetes mellitus. Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distension · abscess · adrenocortical unresponsiveness · angioedema · appetite increased · bone fractures · congestive heart failure · Cushing's syndrome · diabetes mellitus exacerbated · dizziness · dyspnoea · electrolyte imbalance · exophthalmos · fluid retention · flushing · gastrointestinal disorders · glaucoma · growth retardation · haemorrhage · headache · healing impaired · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity (may be more severe in patients susceptible to allergies, especially asthma) · hypertension · idiopathic intracranial hypertension exacerbated · increased risk of infection · leucocytosis · malaise · menstruation irregular · muscle weakness · myopathy · nausea · osteonecrosis · osteoporosis · pancreatitis · papilloedema · pituitary unresponsiveness · posterior subcapsular cataract · protein catabolism · psychiatric disorder · seizure · skin reactions · tendon rupture · thromboembolism · vasculitis necrotising · ventricular hypertrophy · vertigo · vomiting · weight increased
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** For *depot injection*, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.

Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **DIRECTIONS FOR ADMINISTRATION** For *intramuscular or intravenous injection*, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synacthen** (Atrahs Pharma UK Ltd)
Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00 DT = £38.00

Suspension for injection

- EXCIPIENTS: May contain Benzyl alcohol
- ▶ **Synacthen Depot** (Atrahs Pharma UK Ltd)
Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28 DT = £346.28

6.2 Assessment of pituitary function

DIAGNOSTIC AGENTS

Cortico-relin

(Corticotrophin-releasing hormone; CRH)

● INDICATIONS AND DOSE

Test of anterior pituitary function

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Angioedema · cardiac arrest · chest tightness · dyspnoea · flushing · hypersensitivity · hypotension · loss of consciousness · tachycardia · urticaria · wheezing
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** No licensed medicines listed.

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPHIN-RELEASING HORMONES

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

● INDICATIONS AND DOSE

Assessment of anterior pituitary function | Assessment of delayed puberty

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Pain · skin reactions · swelling
 - ▶ **Rare or very rare** Abdominal discomfort · bronchospasm · dizziness · eye erythema · flushing · headache · nausea · tachycardia
 - ▶ **Frequency not known** Menorrhagia · sepsis · thrombophlebitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Gonadorelin (Non-proprietary)**
Gonadorelin (as Gonadorelin hydrochloride)
100 microgram Gonadorelin 100microgram powder for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

6.3 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

25-Jul-2018

(Recombinant Human Growth Hormone)

● INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily

Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 4–17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily

Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day

Chronic renal insufficiency (renal function decreased to less than 50%)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months

SHOX deficiency

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 45–50 micrograms/kg daily

DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.
- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypoadrenalism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not

recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1: somatropin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · lipotrophy
 - ▶ **Uncommon** Arthralgia · carpal tunnel syndrome · fluid retention · gynaecomastia · idiopathic intracranial hypertension · musculoskeletal stiffness · myalgia · oedema · paraesthesia
 - ▶ **Rare or very rare** Hyperglycaemia · hyperinsulinism · hypothyroidism · osteonecrosis of femur · pancreatitis · slipped capital femoral epiphysis
 - ▶ **Frequency not known** Leukaemia

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.
- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipotrophy.
GENOTROPIN[®], **NORDITROPIN[®]**, **NUTROPINAQ[®]**, **OMNITROPE[®]**, **SAIZEN[®]**, **ZOMACTON[®]** For use by subcutaneous injection.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

► Somatropin for the treatment of growth failure in children (May 2010) NICE TA188

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/guidance/ta188

6.3a Insulin-like growth factor-I deficiency

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOMEDINS

Mecasermin

12-Feb-2020

(Recombinant human insulin-like growth factor-I; rhIGF-I)

- **DRUG ACTION** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone.

● INDICATIONS AND DOSE

Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 2-17 years: Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MECASERMIN (INCRELEX[®]): RISK OF BENIGN AND MALIGNANT NEOPLASIA (JANUARY 2020)

Cases of benign and malignant tumours have been observed in children and adolescents treated with mecasermin; the risk of neoplasia is higher when used outside the licensed indication or dose. If a physician determines that there is a clinical need for such use, the patient and their carers should be consulted and fully informed of the potential benefits and risks, and the final decision made jointly. Physicians should be vigilant for the development of potential malignancies in such patients.

Healthcare professionals are advised that mecasermin is contra-indicated in children and adolescents with active or suspected neoplasia and in any condition or medical history that increases the risk of benign or malignant neoplasia. If benign or malignant neoplasm develops during treatment, mecasermin should be permanently discontinued.

- **CONTRA-INDICATIONS** Evidence of tumour activity (discontinue treatment)
- **CAUTIONS** Correct hypothyroidism before initiating treatment · diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · papilloedema
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adenoidal hypertrophy · arthralgia · dizziness · ear discomfort · gastrointestinal discomfort · gynaecomastia · hair texture abnormal · headache · hearing impairment · hyperglycaemia · hypoglycaemia · melanocytic naevus · myalgia · otitis media · pain in extremity · papilloedema · scoliosis · seizures · skin hypertrophy · sleep apnoea · snoring · tachycardia · thymus enlargement · tonsillar hypertrophy · tremor · vomiting
 - ▶ **Uncommon** Cardiac hypertrophy · cardiac valve disorders · depression · idiopathic intracranial hypertension · lipohypertrophy · nervousness · weight increased

- ▶ **Frequency not known** Alopecia · benign neoplasm (discontinue permanently) · neoplasm malignant (discontinue permanently)

SIDE-EFFECTS, FURTHER INFORMATION Funduscopy for papilloedema recommended regularly during treatment and if severe or recurrent headache, visual problems, nausea and vomiting occur – if papilloedema confirmed consider benign intracranial hypertension.

- **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
 - ▶ Monitor for disorders of the epiphysis of the hip (monitor for limping).
 - ▶ Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).
- **DIRECTIONS FOR ADMINISTRATION** Dose should be administered just before or after food.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mecasermin injection. **Missed doses** Patients or carers should be advised not to increase dose if a dose is missed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

7 Sex hormone responsive conditions

Sex hormones

Hormone replacement therapy

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotropic hypogonadism, hypergonadotrophic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol p. 516 in increasing doses,

guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion.

Topical oestrogen creams are used in the treatment of labial adhesions.

Progestogens

There are two main groups of progestogen, *progesterone and its analogues* (dydrogesterone and medroxyprogesterone acetate p. 553) and *testosterone analogues* (norethisterone p. 517 and norgestrel). The newer progestogens (desogestrel p. 547, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 549 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

Heavy menstrual bleeding

04-Jan-2019

Description of condition

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, or for a duration of more than 7 days, which results in the need to change menstrual products every 1–2 hours. Heavy menstrual bleeding occurs regularly, every 24–35 days.

Drug treatment

EvGr The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel-releasing intra-uterine system p. 549 is the first-line treatment option. Patients should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel-releasing intra-uterine system p. 549 is unsuitable, either tranexamic acid p. 87, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter, referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, a levonorgestrel-releasing intra-uterine system p. 549, a combined hormonal contraceptive, a cyclical oral progestogen, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given. **⚠**

The effectiveness of drug treatment for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. **EvGr** Treatment with a gonadotrophin-releasing hormone analogue before hysterectomy and myomectomy should be considered if uterine fibroids are causing an enlarged or distorted uterus. **⚠**

OESTROGENS

Ethinylestradiol

22-May-2020

(Ethinylestradiol)

● INDICATIONS AND DOSE

Induction of sexual maturation in girls

► BY MOUTH

- Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle.

Maintenance of sexual maturation in girls

► BY MOUTH

- Child (female): 20 micrograms daily, to be given with cyclical progestogen for 7 days of each 28-day cycle.

Prevention of tall stature in girls

► BY MOUTH

- Child 12–11 years (female): 20–50 micrograms daily.

- **UNLICENSED USE** Unlicensed for use in children.
- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Acute porphyrias p. 652 · cardiovascular disease (risk of fluid retention) · family history of thromboembolism · history of breast cancer · history of venous thromboembolism · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia
- **CAUTIONS** Diabetes (increased risk of heart disease) · history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of hypertriglyceridaemia (increased risk of pancreatitis) · hypophyseal tumours ·

increased risk of gall-bladder disease · migraine (migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS** Breast abnormalities · cervical mucus increased · cholelithiasis · contact lens intolerance · depression · electrolyte imbalance · embolism and thrombosis · erythema nodosum · feminisation · fluid retention · headaches · hypertension · jaundice cholestatic · metrorrhagia · mood altered · myocardial infarction · nausea · neoplasms · skin reactions · stroke · uterine disorders · vomiting · weight change
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in acute or active disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

▶ Ethinylestradiol (Non-proprietary)

Ethinylestradiol 2 microgram Ethinylestradiol 2microgram tablets | 100 tablet [POM] £200.00

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [POM] £200.00 DT = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet [POM] £200.00 DT = £200.00

Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet [POM] £200.00 DT = £200.00

PROGESTOGENS

Dienogest

17-Feb-2020

- **DRUG ACTION** Dienogest is a nortestosterone derivative that has a progestogenic effect in the uterus, reducing the production of estradiol and thereby suppressing endometrial lesions.

● INDICATIONS AND DOSE

Endometriosis

▶ BY MOUTH

- ▶ Females of childbearing potential: 2 mg once daily, can be started on any day of cycle, dose should be taken continuously at the same time each day

- **CONTRA-INDICATIONS** Arterial disease (past or present) · cardiovascular disease (past or present) · diabetes with vascular involvement · liver tumours (past or present) · sex hormone-dependent malignancies (confirmed or suspected) · undiagnosed vaginal bleeding · venous thromboembolism (active)

- **CAUTIONS** Diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · history of depression · history of ectopic pregnancy · history of gestational diabetes · patients at risk of osteoporosis · patients at risk of venous thromboembolism

CAUTIONS, FURTHER INFORMATION

- ▶ Immobilisation Manufacturer advises to discontinue treatment during prolonged immobilisation. For elective surgery, treatment should be discontinued at least 4 weeks before surgery; treatment may be restarted 2 weeks after complete remobilisation.

- **INTERACTIONS** → Appendix 1: dienogest
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anxiety · asthenic conditions · breast abnormalities · depression · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · hot flush · libido loss · mood altered · nausea · ovarian cyst · pain · skin reactions · sleep disorder · vomiting · vulvovaginal disorders · weight changes
 - ▶ **Uncommon** Anaemia · appetite increased · autonomic dysfunction · broken nails · circulatory system disorder · concentration impaired · constipation · dandruff · diarrhoea · dry eye · dyspnoea · genital discharge · hair changes · hyperhidrosis · hypotension · increased risk of infection · limb discomfort · muscle spasms · oedema · palpitations · pelvic pain · photosensitivity reaction · tinnitus
 - ▶ **Frequency not known** Glucose tolerance impaired · insulin resistance · menstrual cycle irregularities
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that, if contraception is required, females of childbearing potential should use non-hormonal contraception during treatment. The menstrual cycle usually returns to normal within 2 months after stopping treatment.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE** Manufacturer advises patients with a history of chloasma gravidarum to avoid sunlight or UV radiation exposure during treatment. **Missed doses** Manufacturer advises if one or more tablets are missed, or if vomiting and/or diarrhoea occurs within 3–4 hours of taking a tablet, another tablet should be taken as soon as possible and the next dose taken at the normal time.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Zalkya (Stragen UK Ltd)

Dienogest 2 mg Zalkya 2mg tablets | 28 tablet [POM] £20.68

Norethisterone

● INDICATIONS AND DOSE

Postponement of menstruation

▶ BY MOUTH

- ▶ Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–18 months oestrogen therapy)

▶ BY MOUTH

- ▶ Child: 5 mg once daily for the last 7 days of 28-day cycle

Short-term contraception

▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

▶ BY MOUTH

- ▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

● UNLICENSED USE

- ▶ When used for induction and maintenance of sexual maturation in females or Postponement of menstruation Not licensed for use in children.
- ▶ When used for Contraception Consult product literature for the licensing status of individual preparations.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- ▶ With oral use Acute porphyrias p. 652 · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

GENERAL CAUTIONS Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- ▶ When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- ▶ With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- ▶ Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- ▶ Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **INTERACTIONS** → Appendix 1: norethisterone

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Menstrual cycle irregularities
- ▶ **Uncommon** Breast tenderness
- ▶ **Frequency not known** Hepatic cancer · thromboembolism

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intramuscular use Dizziness · haemorrhage · headache · hypersensitivity · nausea · skin reactions · weight increased

▶ Uncommon

- ▶ With intramuscular use Abdominal distension · depressed mood
- ▶ **Frequency not known**
- ▶ With oral use Appetite change · depression · fatigue · gastrointestinal disorder · headaches · hypertension · libido disorder · nervousness · rash · weight change
- **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution; avoid in severe or active disease.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Solution for injection

7.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon*[®], which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone below.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of microphallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

Anti-androgens and precocious puberty

The gonadorelin stimulation test is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 521 and cyproterone acetate p. 520 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis),

hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spirolactone p. 133 is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some *aplastic anaemias*.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxandrolone

• INDICATIONS AND DOSE

Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature

- ▶ BY MOUTH
- ▶ Child 10–17 years (male): 1.25–2.5 mg daily for 3–6 months.

Stimulation of late pre-pubertal growth in girls with Turner's syndrome

- ▶ BY MOUTH
- ▶ Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- **CONTRA-INDICATIONS** History of primary liver tumours · hypercalcaemia · nephrosis
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Androgenetic alopecia · androgenic effects · anxiety · asthenia · bone formation increased · depression · electrolyte imbalance · epiphyses premature fusion (in pre-pubertal males) · gastrointestinal haemorrhage · gynaecomastia · headache · hirsutism · hypertension · jaundice cholestatic · nausea · oedema · paraesthesia · polycythaemia · precocious puberty (in pre-pubertal males) · seborrhoea · sexual dysfunction · skin reactions · spermatogenesis reduced · virilism · weight increased
 - ▶ **Rare or very rare** Hepatic neoplasm
 - ▶ **Frequency not known** Sleep apnoea
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Use with caution—potential for fluid retention.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- ▶ **Oxandrin** (Imported (Australia))
Oxandrolone 2.5 mg Oxandrin 2.5mg tablets | 100 tablet [PoM]  [CD4-2]

ANDROGENS**Androgens**

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
 - **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · risk factors for venous thromboembolism · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · thrombophilia—increased risk of thrombosis · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Hot flush · hypertension · polycythaemia · prostate abnormalities · skin reactions · weight increased
 - ▶ **Uncommon** Alopecia · asthenia · behaviour abnormal · depression · dizziness · dyspnoea · dysuria · gynaecomastia · headache · hyperhidrosis · insomnia · nausea · sexual dysfunction
 - ▶ **Rare or very rare** Pulmonary oil microembolism
 - ▶ **Frequency not known** Anxiety · epiphyses premature fusion · fluid retention · jaundice · oedema · oligozoospermia · paraesthesia · precocious puberty · prostate cancer · seborrhoea · sleep apnoea · urinary tract obstruction
- SIDE-EFFECTS, FURTHER INFORMATION** Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
 - **BREAST FEEDING** Avoid.
 - **HEPATIC IMPAIRMENT** In general, manufacturers advise caution (increased risk of fluid retention and heart failure).
 - **RENAL IMPAIRMENT** Caution—potential for fluid retention.
 - **MONITORING REQUIREMENTS** Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.

 above**Testosterone enantate**

13-May-2020

● **INDICATIONS AND DOSE****Induction and maintenance of sexual maturation in males (specialist use only)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 25–50 mg/m² every month, increase dose every 6–12 months according to response

- **UNLICENSED USE** Not licensed for use in children.
- **SIDE-EFFECTS** Bone formation increased · circulatory system disorder · gastrointestinal disorder · gastrointestinal haemorrhage · hepatomegaly · hypercalcaemia · neoplasms · spermatogenesis abnormal

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection▶ **Testosterone enantate (Non-proprietary)**

- ▶ **Testosterone enantate 250 mg per 1 ml** Testosterone enantate 250mg/1ml solution for injection ampoules | 3 ampoule [PoM] £83.74–£87.73 DT = £85.74 [CD4-2]

 above**Testosterone propionate**

13-May-2020

● **INDICATIONS AND DOSE****Delayed puberty in males**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 50 mg once weekly

Treatment of microphallus (specialist use only)

- ▶ TO THE SKIN USING CREAM
- ▶ Child: Apply 3 times a day for 3 weeks

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: solution for injection, cream

 above**Testosterone undecanoate**

13-May-2020

● **INDICATIONS AND DOSE****Induction and maintenance of sexual maturation in males (specialist use only)**

- ▶ BY MOUTH
- ▶ Child 12–17 years: 40 mg once daily on alternate days, adjusted according to response to 120 mg daily

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Uncommon** Diarrhoea · mood altered

SPECIFIC SIDE-EFFECTS

- ▶ **Frequency not known** Azoospermia · fluid imbalance · gastrointestinal discomfort · hepatic function abnormal · lipid metabolism change · myalgia · penis enlarged

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule**CAUTIONARY AND ADVISORY LABELS 21, 25**

- ▶ **Restandol** (Merck Sharp & Dohme Ltd)
Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule [PoM] £8.55 [CD4-2] | 60 capsule [PoM] £17.10 DT = £17.10 [CD4-2]

7.2a Male sex hormone antagonist**ANTI-ANDROGENS****Cyproterone acetate**

18-Oct-2019

● **INDICATIONS AND DOSE****Gonadotrophin-independent precocious puberty (specialist use only)**

- ▶ BY MOUTH
- ▶ Child: Initially 25 mg twice daily, adjusted according to response

- **UNLICENSED USE** Unlicensed for use in children.
- **CONTRA-INDICATIONS** Dubin–Johnson syndrome · existing or history of thromboembolic disorders · malignant diseases · meningioma or history of meningioma · previous or existing liver tumours · Rotor syndrome · severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia · wasting diseases · youths under

18 years (may arrest bone maturation and testicular development)

- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Depressed mood · dyspnoea · fatigue · gynaecomastia · hepatic disorders · hot flush · hyperhidrosis · nipple pain · restlessness · weight change
 - ▶ **Uncommon** Skin reactions
 - ▶ **Rare or very rare** Galactorrhoea · neoplasms
 - ▶ **Frequency not known** Adrenocortical suppression · anaemia · azoospermia · hair changes · hypotrichosis · osteoporosis · sebaceous gland underactivity (may clear acne) · thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood counts initially and throughout treatment.
 - ▶ Monitor adrenocortical function regularly.
 - ▶ Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole p. 522 is the most commonly used drug. Propylthiouracil p. 523 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 524 replacement (*blocking-replacement regimen*); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 111 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol p. 112 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 476 as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Carbimazole is associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy). See also *Important safety information* in the carbimazole below drug monograph.

Antithyroid drugs in neonates

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 113

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

22-Nov-2019

● INDICATIONS AND DOSE

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

▶ BY MOUTH

- ▶ Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

Hyperthyroidism (including Graves' disease)

▶ BY MOUTH

- ▶ Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
- ▶ Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
- ▶ Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Manufacturer advises of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

- **CONTRA-INDICATIONS** Severe blood disorders
- **INTERACTIONS** → Appendix 1: carbimazole
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- ▶ **Frequency not known** Agranulocytosis · alopecia · angioedema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy · nausea · nerve disorders · neutropenia · pancreatitis acute (discontinue permanently) · salivary gland enlargement · skin reactions · taste loss
- **CONCEPTION AND CONTRACEPTION** The MHRA advises that females of childbearing potential should use effective contraception during treatment.
- **PREGNANCY** The MHRA advises consider use only after a thorough benefit-risk assessment. See *Important Safety Information* and Antithyroid drugs p. 521 for further information.
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild to moderate insufficiency—half-life may be prolonged; avoid in severe insufficiency.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops. Medicines for Children leaflet: Carbimazole for hyperthyroidism www.medicinesforchildren.org.uk/carbimazole-hyperthyroidism

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet▶ **Carbimazole (Non-proprietary)**

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet [PoM]
£84.80 DT = £6.16

Carbimazole 10 mg Carbimazole 10mg tablets | 100 tablet [PoM]
£104.08 DT = £81.32

Carbimazole 15 mg Carbimazole 15mg tablets | 100 tablet [PoM]
£156.13 DT = £127.03

Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet [PoM]
£208.17 DT = £30.95

ANTITHYROID DRUGS > THIOURACILS**Propylthiouracil**● **INDICATIONS AND DOSE****Hyperthyroidism (including Graves' disease)**▶ **BY MOUTH**

- ▶ **Neonate:** Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- ▶ **Child 1–11 months:** Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- ▶ **Child 1–4 years:** Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- ▶ **Child 5–11 years:** Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- ▶ **Child 12–17 years:** Initially 100 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

DOSE EQUIVALENCE AND CONVERSION

- ▶ When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **UNLICENSED USE** Not licensed for use in children under 6 years of age.
- **INTERACTIONS** → Appendix 1: propylthiouracil
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Agranulocytosis · bone marrow disorders · glomerulonephritis acute · hearing impairment · leucopenia · thrombocytopenia · vomiting
- ▶ **Frequency not known** Alopecia · arthralgia · arthritis · encephalopathy · fever · gastrointestinal disorder · haemorrhage · headache · hepatic disorders · hypoprothrombinaemia · interstitial pneumonitis · lupus-like syndrome · lymphadenopathy · myopathy · nausea · nephritis · skin reactions · taste altered · vasculitis
- SIDE-EFFECTS, FURTHER INFORMATION** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable.

Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. **Monitoring** Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased half life). **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** **Dose adjustments** Use 75% of normal dose if estimated glomerular filtration rate 10–50 mL/minute/1.73 m². Use 50% of normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
- Tablet**
 - ▶ **Propylthiouracil (Non-proprietary)**
 - Propylthiouracil 50 mg** Propylthiouracil 50mg tablets | 56 tablet [PoM] £57.58 DT = £9.67 | 100 tablet [PoM] £117.27-£115.98

VITAMINS AND TRACE ELEMENTS**Iodide with iodine****(Lugol's Solution; Aqueous Iodine Oral Solution)**● **INDICATIONS AND DOSE****Thyrotoxicosis (pre-operative)**▶ **BY MOUTH USING ORAL SOLUTION**

- ▶ **Neonate:** 0.1–0.3 mL 3 times a day.

- ▶ **Child:** 0.1–0.3 mL 3 times a day

Neonatal thyrotoxicosis▶ **BY MOUTH USING ORAL SOLUTION**

- ▶ **Neonate:** 0.05–0.1 mL 3 times a day.

Thyrotoxic crisis▶ **BY MOUTH USING ORAL SOLUTION**

- ▶ **Child 1 month–1 year:** 0.2–0.3 mL 3 times a day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Doses based on the use of an aqueous oral solution containing iodine 50 mg/mL and potassium iodide 100 mg/mL.

- **CAUTIONS** Children · not for long-term treatment
- **SIDE-EFFECTS** Conjunctivitis · depression (long term use) · erectile dysfunction (long term use) · excessive tearing · headache · hypersensitivity · increased risk of infection · influenza like illness · insomnia (long term use) · rash · salivary gland pain
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: oral solution

8.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 525 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 476, and treatment of infection; assisted ventilation is often required.

Advanced Pharmacy Services

Children with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Medicines optimisation p. 25.

THYROID HORMONES

Levothyroxine sodium

10-Mar-2020

(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

► BY MOUTH

- Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.
- Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

- Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time
- Child 12–17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

► BY MOUTH

- Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · long-standing hypothyroidism · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)
- **INTERACTIONS** → Appendix 1: thyroid hormones
- **SIDE-EFFECTS** Alopecia · angina pectoris · anxiety · arrhythmias · arthralgia · diarrhoea · dyspnoea · epiphyses premature fusion · fever · flushing · headache · heat intolerance · hyperhidrosis · idiopathic intracranial hypertension · insomnia · malaise · menstruation irregular · muscle spasms · muscle weakness · oedema · palpitations · skin reactions · thyrotoxic crisis · tremor · vomiting · weight decreased
- **PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Dose adjustments Levothyroxine requirement may increase during pregnancy.
Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION** Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Levothyroxine for hypothyroidism www.medicinesforchildren.org.uk/levothyroxine-hypothyroidism

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

► Levothyroxine sodium (Non-proprietary)

Levothyroxine sodium anhydrous 12.5 microgram Levothyroxine sodium 12.5microgram tablets | 28 tablet [PoM] £12.49 DT = £8.19

Levothyroxine sodium anhydrous 25 microgram Levothyroxine sodium 25microgram tablets | 28 tablet [PoM] £3.05 DT = £1.50 | 500 tablet [PoM] £41.61-£54.46

Levothyroxine sodium 25microgram tablets lactose free | 100 tablet [PoM] 

Levothyroxine sodium anhydrous 50 microgram Levothyroxine sodium 50microgram tablets lactose free | 100 tablet [PoM] 
Levothyroxine sodium 50microgram tablets | 28 tablet [PoM]  £1.50
DT = £1.19 | 1000 tablet [PoM] £42.50–£55.71

Levothyroxine sodium anhydrous 75 microgram Levothyroxine sodium 75microgram tablets | 28 tablet [PoM]  £3.07
Levothyroxine sodium anhydrous 100 microgram Levothyroxine sodium 100microgram tablets lactose free | 100 tablet [PoM] 
Levothyroxine sodium 100microgram tablets | 28 tablet [PoM]  £1.77
DT = £1.19 | 1000 tablet [PoM] £42.50–£56.07

▶ **Eltroxin** (Advanz Pharma)

Levothyroxine sodium anhydrous 25 microgram Eltroxin 25microgram tablets | 28 tablet [PoM] £2.54 DT = £1.50

Levothyroxine sodium anhydrous 50 microgram Eltroxin 50microgram tablets | 28 tablet [PoM] £1.77 DT = £1.19

Levothyroxine sodium anhydrous 100 microgram Eltroxin 100microgram tablets | 28 tablet [PoM] £1.78 DT = £1.19

Oral solution

▶ **Levothyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 5 microgram per

1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £118.63 DT = £94.99

Levothyroxine sodium anhydrous 10 microgram per

1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £107.93 DT = £96.57

Levothyroxine sodium anhydrous 20 microgram per

1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £165.00 DT = £164.99

Levothyroxine sodium anhydrous 25 microgram per

1 ml Levothyroxine sodium 125micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £185.00 DT = £185.00

Liothyronine sodium

08-Jul-2019

(L-Tri-iodothyronine sodium)

● **INDICATIONS AND DOSE**

Hypothyroidism

▶ **BY MOUTH**

- ▶ Child 12–17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

Hypothyroid coma

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ Child 12–17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

Hypothyroidism (replacement for oral levothyroxine)

▶ **BY SLOW INTRAVENOUS INJECTION**

- ▶ Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

- ▶ 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- ▶ Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

● **CONTRA-INDICATIONS** Thyrotoxicosis

- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) · severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

● **INTERACTIONS** → Appendix 1: thyroid hormones

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

▶ **Frequency not known**

- Alopecia · angina pectoris · anxiety · arrhythmias · diarrhoea · fever · flushing · headache · heat intolerance · hyperhidrosis · insomnia · muscle cramps · muscle weakness · palpitations · tremor · vomiting · weight decreased

SPECIFIC SIDE-EFFECTS

▶ **Rare or very rare**

- ▶ With intravenous use Idiopathic intracranial hypertension
- ▶ **Frequency not known**
- ▶ With intravenous use Epiphyses premature fusion · menstruation irregular

- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Dose adjustments Liothyronine requirement may increase during pregnancy.

Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

● **PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 5 microgram Liothyronine 5microgram tablets | 28 tablet [PoM] £98.00 DT = £98.00

Liothyronine sodium 10 microgram Liothyronine 10microgram tablets | 28 tablet [PoM] £148.00 DT = £148.00

Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [PoM] £245.29 DT = £154.83

▶ **Cytomel** (Imported (United States))

Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [PoM] 

Powder for solution for injection

▶ **Liothyronine sodium (Non-proprietary)**

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,567.50 DT = £1,567.50

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 527 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 528 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

See also Nocturnal enuresis in children below.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach

7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

EVGr For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. **⚠**

Non Drug Treatment

EVGr Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 468, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. **⚠**

Drug Treatment

EVGr Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 527 or tolterodine tartrate p. 528 [unlicensed indication]).

Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 256 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually. ⚠

ANTIMUSCARINICS

Antimuscarinics (systemic) ⚠

- **CONTRA-INDICATIONS** Angle-closure glaucoma · gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · pyrexia · ulcerative colitis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Confusion · constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
 - ▶ **Rare or very rare** Angioedema
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

Oxybutynin hydrochloride

24-Jul-2018

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 2–4 years: 1.25–2.5 mg 2–3 times a day
 - ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
 - ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ **BY INTRAVESICAL INSTILLATION**
 - ▶ Child 2–17 years: 5 mg 2–3 times a day

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

Nocturnal enuresis associated with overactive bladder

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*[®] XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: oxybutynin
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · dry eye
 - ▶ **Uncommon** Abdominal discomfort · appetite decreased · dysphagia
 - ▶ **Frequency not known** Anxiety · arrhythmia · cognitive disorder · depressive symptom · drug dependence · gastrointestinal disorders · glaucoma · hallucination · heat stroke · hypohidrosis · mydriasis · nightmare · paranoia · photosensitivity reaction · seizure · urinary tract infection
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.
 - ▶ Intravesical instillation may be available from 'special-order' manufacturers or specialist importing companies.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-daytime-urinary-symptoms

1.2 Urinary retention

Urinary retention

31-May-2017

Description of condition

Urinary retention is the inability to voluntarily urinate. Causes in children can include severe voiding dysfunction, urethral blockage, drug treatment (such as opioids and antimuscarinic drugs), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, and neurogenic causes.

Acute urinary retention is a medical emergency characterised by the abrupt (over a period of hours) development of the inability to pass urine, associated with increasing pain and the presence of a distended bladder, which can be palpated on examination.

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by difficulties with initiating and maintaining urinary stream, urinary overflow, no sensation for needing to void and a post-void residual.

Treatment

[EvGr] Treatment of urinary retention depends on the underlying condition. Catheterisation is used as an effective initial management strategy, which should be followed by diagnostic evaluation and appropriate treatment of the underlying cause. Clean intermittent catheterisation on a long-term basis is effective for children with idiopathic or neurogenic bladder dysfunction.

The selective alpha-adrenoceptor blockers, doxazosin below and tamsulosin hydrochloride p. 530, have been shown to be of use in primary bladder neck dysfunction and dysfunctional voiding; they reduce urethral sphincteric pressure, thereby improving bladder emptying in children. Treatment should be under specialist advice only. ⚠

ALPHA-ADRENOCEPTOR BLOCKERS

Doxazosin

09-Feb-2020

● INDICATIONS AND DOSE**Hypertension**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 6–11 years: Initially 500 micrograms once daily, then increased to 2–4 mg once daily, dose should be increased at intervals of 1 week

- ▶ Child 12–17 years: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required

Dysfunctional voiding (initiated under specialist supervision)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 4–11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
- ▶ Child 12–17 years: Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day

DOSE EQUIVALENCE AND CONVERSION

- ▶ Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** History of postural hypotension
- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · heart failure · pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arrhythmias · asthenia · chest pain · cough · cystitis · dizziness · drowsiness · dry mouth · dyspnoea · gastrointestinal discomfort · headache · hypotension · increased risk of infection · influenza like illness · muscle complaints · nausea · oedema · pain · palpitations · skin reactions · urinary disorders · vertigo
 - ▶ **Uncommon** Angina pectoris · anxiety · appetite abnormal · arthralgia · constipation · depression · diarrhoea · gastrointestinal disorders · gout · haemorrhage · insomnia · myocardial infarction · sensation abnormal · sexual dysfunction · stroke · syncope · tinnitus · tremor · vomiting · weight increased
 - ▶ **Rare or very rare** Alopecia · bronchospasm · flushing · gynaecomastia · hepatic disorders · leucopenia · malaise · muscle weakness · thrombocytopenia · vision blurred
 - ▶ **Frequency not known** Floppy iris syndrome
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Accumulates in milk in *animal studies*—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).
Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

1.3 Urolithiasis**Renal and ureteric stones**

03-Apr-2019

Description of condition

Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of stone forming substances in the urine.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary

frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely to pass than proximal ureteral stones), and the degree of obstruction.

Aims of treatment

EvGr The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life. \blacktriangle

Non-drug treatment

EvGr Consider watchful waiting for asymptomatic renal stones if they are less than 5mm in diameter. If they are larger than this then the specialist will discuss the risk and benefit of this option with the patient or parents.

Options for surgical stone removal should be discussed by the specialist team in hospital depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.

For patients with recurrent calcium stones avoid excessive intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive dietary intake of urate rich products, such as liver, kidney, calf thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies). \blacktriangle

Child aged under 16 years

EvGr Consider referring children and young patients with renal or ureteric stones to a paediatric nephrologist or urologist with expertise in this area for assessment and metabolic investigations.

Advise children to drink or carers to give their children 1–2 litres of water a day (depending on age) with the addition of fresh lemon juice and to avoid carbonated drinks. Advise children or carers to maintain a normal daily calcium intake of 350–1000mg and daily salt intake of 2–6g (depending on age). \blacktriangle

Child aged 16 years and over

EvGr Consider stone analysis and measure serum calcium for children with recurring renal or ureteric stones.

Along with maintaining a healthy lifestyle, advise children to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1,200mg and salt intake of no more than 6g a day. \blacktriangle

Pain Management

EvGr Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic. \blacktriangle

Medical Expulsive Therapy

EvGr Consider alpha-adrenoceptor blockers for children with distal ureteric stones less than 10mm in diameter. \blacktriangle

Child aged 16 years and over

EvGr Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for children having shockwave lithotripsy for ureteric stones less than 10mm. \blacktriangle

Prevention of recurrence of stones

Child aged under 16 years

EvGr Alongside lifestyle advice, consider potassium citrate [unlicensed] in children with recurrent stones composed of at least 50% calcium oxalate, and those with hypercalciuria and hypocitraturia. \blacktriangle

Child aged 16 years and over

EvGr Alongside lifestyle advice, consider potassium citrate [unlicensed] in children with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if children also have hypercalciuria after restricting their sodium intake to no more than 6g a day. \blacktriangle

1.4 Urological pain

Urological pain

03-Apr-2019

Treatment

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones p. 530.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

12-May-2020

● INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections |

Alkalinisation of urine

▶ BY MOUTH USING ORAL SOLUTION

▶ Child 1-5 years: 5 mL 3 times a day, diluted well with water

▶ Child 6-17 years: 10 mL 3 times a day, diluted well with water

● **CAUTIONS** Cardiac disease

● **INTERACTIONS** → Appendix 1: potassium citrate

● **SIDE-EFFECTS** Hyperkalaemia · nausea · vomiting

● **RENAL IMPAIRMENT** Avoid in severe impairment.

Monitoring Close monitoring required in renal impairment—high risk of hyperkalaemia.

● **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.

● **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

- ▶ **Citric acid with potassium citrate (Non-proprietary)**

Citric acid monohydrate 50 mg per 1 ml, Potassium citrate

300 mg per 1 ml Potassium citrate mixture | 200 ml (GSJ) £1.38 DT = £1.38 | 200 ml (P) £1.38 DT = £1.38

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 756 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride **solution 0.9%** (physiological saline) p. 636 is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Catheter maintenance solutions

• CATHETER MAINTENANCE SOLUTIONS

OptiFlo G citric acid 3.23% catheter maintenance solution

(Bard Ltd)
50 ml • NHS indicative price = £3.70 • Drug Tariff (Part IXa)100 ml • NHS indicative price = £3.70 • Drug Tariff (Part IXa)

Sodium chloride 9 mg per 1 ml 50 ml • NHS indicative price = £3.49 • Drug Tariff (Part IXa)100 ml • NHS indicative price = £3.49 • Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

Hormonal contraception includes combined hormonal contraception (containing an oestrogen and a progestogen) and progestogen-only contraception.

[EvG] When prescribing contraception, information should be given on all available methods taking into consideration medical eligibility. This should include contraceptive effectiveness (including factors that alter efficacy), non-contraceptive benefits, health risks, and side effects to allow an informed decision to be made on the most suitable choice. **[A]**

In adolescents, hormonal contraception is used after menarche. When prescribing contraception for females under 16 years of age, it is considered good practice for health professionals to follow the criteria in the Department of Health Guidance (July 2004), commonly known as the Fraser Guidelines available at tinyurl.com/vy3H2gt.

The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare (FSRH); it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (May 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include the long-acting reversible contraceptives (LARC) copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP), and male and female sterilisation. For more information see the FSRH CEU statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed/), and the UK teratogenic information service (www.uktis.org).

Combined hormonal contraceptives

Combined hormonal contraceptives (CHC) are available as tablets (COC), transdermal patches (CTP), and vaginal rings (CVR). They are highly user-dependant methods where the failure rate if used perfectly (i.e. correctly and consistently) is less than 1%. Certain factors such as the person's weight, malabsorption (COC only), and drug interactions may contribute to contraceptive failure. Prescriptions of up to

12 months' supply for CHC initiation or continuation may be appropriate to avoid unwanted discontinuation and increased risk of pregnancy.

[EvGr] It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age as safer alternatives exist. **⚠**

CHC use may be associated with some health benefits such as:

- Reduced risk of ovarian, endometrial and colorectal cancer;
- Predictable bleeding patterns
- Reduced dysmenorrhoea and menorrhagia;
- Management of symptoms of polycystic ovary syndrome (PCOS), endometriosis and premenstrual syndrome;
- Improvement of acne;
- Reduced menopausal symptoms;
- Maintaining bone mineral density in peri-menopausal females under the age of 50 years.

The use of CHC is, however also associated with health risks. For information on these risks, and further information on the benefits, see FSRH clinical guideline: **Combined Hormonal Contraception** (see *Useful resources*).

For information on advice to give to patients on switching between CHC and other contraception, and the management of incorrect CHC use, see FSRH clinical guidance: **Combined Hormonal Contraception and Incorrect use of Combined Hormonal Contraception** (see *Useful resources*).

Preparation choice

Combined oral contraceptives (COCs) containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'multiphasic'.

Combined oral contraceptives usually contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of COCs range from 20–40 micrograms. **[EvGr]** A monophasic preparation containing 30 micrograms or less of ethinylestradiol in combination with levonorgestrel or norethisterone (to minimise cardiovascular risk), is generally used as the first line option. However, choice should be made taking into account the patients medical history, personal preference, previous contraceptive experience, and any age related considerations.

Due to potential reduced efficacy, non-oral CHC should be considered if there are concerns over absorption. In females who weigh 90 kg or more, consider non-topical options or use additional precautions with CTP. **⚠**

Combined Oral Contraceptives Monophasic 21-day preparations

Regimen choice

EvGr Information should be given to females on both the traditional 21 day CHC regimen with a monthly withdrawal bleed during the 7 day hormone free interval (HFI), and 'tailored' CHC regimens [unlicensed use]. Tailored CHC regimens can only be used with monophasic CHC containing ethinylestradiol [unlicensed use]; they offer the choice of either a shortened, or less frequent, or no hormone free interval based on the person's preference.

The following tailored regimens may be used [unlicensed use]:

- Shortened HFI: 21 days of continuous use followed by a 4 day HFI;
- Extended use (tricycling): 9 weeks of continuous use followed by a 4 or 7 day HFI;
- Flexible extended use: continuous use for 21 days or more followed by a 4 day HFI when breakthrough bleeding occurs;
- Continuous use: continuous CHC use with no HFI. **⚠**

Withdrawal bleeds do not represent physiological menstruation and there is no difference in efficacy or safety of using the traditional 21 day regimen, which mimics the natural menstrual cycle, over using extended or continuous regimens. Use of the traditional regimen may be associated

with disadvantages such as heavy or painful withdrawal bleeds, headaches, mood changes, and increased risk of incorrect use with subsequent unplanned pregnancy. **EvGr** Withdrawal bleeds during traditional CHC use have been reported in women who are pregnant and should therefore not be relied on as reassurance of a person's pregnancy status. **⚠**

Follow up

EvGr A review of continued medical eligibility, satisfaction and adherence, drug interactions, and consideration of alternative contraception should be undertaken annually. Body mass index and blood pressure should also be checked annually. **⚠**

Surgery

The manufacturers of CHC recommend that CHC use should be discontinued at least 4 weeks prior to major elective surgery, any surgery to the legs or pelvis, or surgery that involves prolonged immobilisation of a lower limb. An alternative method of contraception should be used to prevent unintentional pregnancy, and CHC may be recommenced 2 weeks after full remobilisation. When discontinuation is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on CHC, thromboprophylaxis should be considered.

When to seek further advice

EvGr All females should be advised to seek advice from a healthcare professional if they experience any troublesome side effects, have a significant health event, start any new medication, would like to discontinue CHC, or to discuss alternative methods at any time. For further information, see FSRH guidance **Combined Hormonal Contraception** (refer to *Useful resources* below). **⚠**

Progesterone-only contraceptives**Oral progesterone-only contraceptives**

Oral progesterone-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progesterone-only contraceptives with each other or with combined hormonal contraceptives. Progesterone-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progesterone-only contraceptives

Medroxyprogesterone acetate p. 553 (*Depo-Provera*®, *SAYANA PRESS*®) is a long-acting progesterone given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 549 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Contraceptives, non-hormonal

Contraception in patients taking medication with teratogenic potential: FSRH (February 2018) and MHRA (May 2019) guidance

Females of childbearing potential should be advised to use highly effective contraception if they or their male partners are taking known teratogenic drugs or drugs with potential teratogenic effects. Highly effective contraception should be used both during treatment and for the recommended duration after discontinuation to avoid unintended pregnancy. Pregnancy testing should be performed before treatment initiation to exclude pregnancy and repeat testing may be required.

Methods of contraception considered to be 'highly effective' include the long-acting reversible contraceptives (LARC) copper intra-uterine device (Cu-IUD), levonorgestrel intra-uterine system (LNG-IUS) and progestogen-only implant (IMP), and male and female sterilisation. For more information see the FSRH CEU statement (www.fsrh.org/standards-and-guidance/documents/fsrh-ceu-statement-contraception-for-women-using-known/), MHRA drug safety update (www.gov.uk/drug-safety-update/medicines-with-teratogenic-potential-what-is-effective-contraception-and-how-often-is-pregnancy-testing-needed), and the UK teratogenic information service (www.uktis.org).

Barrier methods

Barrier methods include condoms, diaphragms and cervical caps. Male condoms are less effective than some other contraception methods but are effective when used consistently and correctly, and provide significant protection against some sexually transmitted infections (STIs). A female condom (*Femidom*®) is also available; it is pre-lubricated with a non-spermicidal lubricant.

There is no evidence that condoms lubricated with spermicide provide additional protection against pregnancy or STIs. Diaphragms and caps must be used in conjunction with a **spermicide** and should not be removed until at least 6 hours after the last episode of intercourse.

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 553 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for young women irrespective of parity; however, it is less

appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*[®]) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*[®]), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Emergency contraception

31-Aug-2017

Overview

[EvGr] Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless the criteria for lactational amenorrhoea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly. **[A]**

Emergency contraceptive methods

Copper intra-uterine devices

[EvGr] Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 545) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs. **[A]**

Hormonal methods

[EvGr] Hormonal emergency contraceptives (includes levonorgestrel p. 549 and ulipristal acetate p. 547) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse (unlicensed use), but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception.

It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel; if BMI is greater than 26 kg/m² or body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel (unlicensed indication) (see *Emergency contraception* under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation. **[A]**

Hormonal emergency contraception interactions

See Contraceptives, interactions below.

Starting hormonal contraception after emergency hormonal contraception

Emergency hormonal contraception methods do **not** provide ongoing contraception. **[EvGr]** After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective. **[A]**

The copper intra-uterine device immediately provides effective ongoing contraception.

Contraceptives, interactions

06-Jun-2017

Overview

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 209, eslicarbazepine acetate, nevirapine p. 449, oxcarbazepine p. 218, phenytoin p. 220, phenobarbital p. 232, primidone p. 233, ritonavir p. 461, St John's Wort, topiramate p. 227 and, above all, rifabutin p. 395 and rifampicin p. 396), and possibly also griseofulvin p. 412. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For further information on other drug interactions with hormonal contraceptives, see the *Interactions* section of the relevant drug monograph.

Combined hormonal contraceptives interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 553 and norethisterone p. 517) or intra-uterine devices (levonorgestrel p. 549; see also Contraceptives, non-hormonal p. 535). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

Short course (2 months or less) of an enzyme-inducing drug

Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period.

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

It is recommended that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman.

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 368, doxycycline p. 381) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 552 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 547 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). **EvGr** A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. **⚠**

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

EvGr Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. **⚠** Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

EvGr Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate. **⚠**

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

● **CONTRA-INDICATIONS** Acute porphyrias p. 652 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

● **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

▶ Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of *arterial* thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

▶ Risk factors for venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*; body mass index $\geq 30 \text{ kg/m}^2$ (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);

- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *smoking*.

Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel ¹	5-7
Norgestimate ¹	5-7
Norethisterone ¹	5-7
Etonogestrel ¹	6-12
Norelgestromin ¹	6-12
Gestodene ¹	9-12
Desogestrel ¹	9-12
Drospirenone ¹	9-12
Dienogest ²	Not known—insufficient data
Nomegestrol ²	Not known—insufficient data

¹ Combined with ethinylestradiol ² Combined with estradiol

▶ Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
 - *diabetes mellitus* (avoid if diabetes complications present);
 - *hypertension*; blood pressure above *systolic* 140 mmHg or *diastolic* 90 mmHg (avoid if blood pressure above *systolic* 160 mmHg or *diastolic* 95 mmHg); (in adolescents, avoid if blood pressure very high);
 - *smoking* (avoid if smoking 40 or more cigarettes daily);
 - *obesity* (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- ▶ Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

● SIDE-EFFECTS

- ▶ **Common or very common** Acne · fluid retention · headaches · metrorrhagia · nausea · weight increased
- ▶ **Uncommon** Alopecia · hypertension
- ▶ **Rare or very rare** Venous thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION Breast cancer

There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** In general, manufacturer advises caution; avoid in acute disease, severe chronic disease, or liver tumour.

● DIRECTIONS FOR ADMINISTRATION

▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. **Secondary amenorrhoea (exclude pregnancy)** Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). **After abortion or miscarriage** Start same day.

● PATIENT AND CARER ADVICE

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery. **Diarrhoea and vomiting** Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe

diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.

Missed doses The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

F 538

Dienogest with estradiol valerate**● INDICATIONS AND DOSE**

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

▶ BY MOUTH

▶ Females of childbearing potential: 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding may occur during the 2-day interval of inactive tablets); subsequent courses repeated without interval

- **UNLICENSED USE** Consult product literature for the licensing status.
- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Breast abnormalities · gastrointestinal discomfort · increased risk of infection · menstrual cycle irregularities
 - ▶ **Uncommon** Appetite increased · cervical abnormalities · crying · depression · diarrhoea · dizziness · fatigue · haemorrhage · hot flush · hyperhidrosis · mood altered · muscle spasms · neoplasms · oedema · ovarian and fallopian tube disorders · painful sexual intercourse · pelvic disorders · sexual dysfunction · skin reactions · sleep disorders · uterine cramps · vomiting · vulvovaginal disorders · weight decreased
 - ▶ **Rare or very rare** Aggression · anxiety · arterial thromboembolism · asthma · chest pain · cholecystitis chronic · concentration impaired · constipation · contact lens intolerance · dry eye · dry mouth · dyspnoea · eye swelling · fever · galactorrhoea · gastroesophageal reflux disease · genital discharge · hair changes · hypertriglyceridaemia · hypotension · lymphadenopathy · malaise · myocardial infarction · pain · palpitations · paraesthesia · seborrhoea · sensation of pressure · urinary tract pain · vascular disorders · vertigo
- **DIRECTIONS FOR ADMINISTRATION** Changing to *Qlaira*® Start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*[®], refer to product literature.

Missed doses A missed pill for a patient taking *Qlaira*[®] is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*[®], refer to product literature.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

● PREGNANCY Toxicity in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** *Zoely*[®] (every day (ED) combined (monophasic) preparation), 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, starting on day 1 of cycle with first active tablet; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken). Changing to *Zoely*[®] Start the first active *Zoely*[®] tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand.

● PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Zoely*[®], refer to product literature.

Missed doses A missed pill for a patient taking *Zoely*[®] is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Zoely*[®], refer to product literature.

► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

Contraception

► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 532 for recommendations from the FSRH on 'tailored' regimens in which there is a shortened, less frequent, or no ring-free interval.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● **DIRECTIONS FOR ADMINISTRATION**

Changing method of contraception to vaginal ring

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

Missed doses **Expulsion, delayed insertion or removal, or broken vaginal ring** If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle *or* allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Menstrual symptoms

► BY TRANSDERMAL APPLICATION

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

Contraception

► BY TRANSDERMAL APPLICATION

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after a patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a patch-free interval (during which withdrawal bleeding occurs), see Contraceptives, hormonal p. 532 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no patch-free interval.

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · breast abnormalities · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · increased risk of infection · malaise · menstrual cycle irregularities · mood altered · muscle spasms · skin reactions · uterine cramps · vaginal haemorrhage · vomiting · vulvovaginal disorders
 - **Uncommon** Appetite increased · dyslipidaemia · insomnia · lactation disorders · oedema · photosensitivity reaction · sexual dysfunction
 - **Rare or very rare** Embolism and thrombosis · gallbladder disorders · genital discharge · neoplasms · stroke · swelling
 - **Frequency not known** Anir · angioedema · cervical dysplasia · colitis · contact lens intolerance · erythema nodosum · hepatic disorders · hyperglycaemia · intracranial haemorrhage · myocardial infarction · pulmonary artery thrombosis · taste altered

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive
Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch.

Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed doses Delayed application or detached patch If a patch is partially detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 48/03

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

Menstrual symptoms with 21-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

Contraception with 21-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after hormone-free interval, withdrawal bleeding occurs during the hormone-free interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day, see Contraceptives, hormonal p. 532 for recommendations from the FSRH on 'traditional' and 'tailored' regimens in which there is a shortened, less frequent, or no hormone-free interval.

- **UNLICENSED USE** Consult product literature for the licensing status.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

● SIDE-EFFECTS

- **Common or very common** Anxiety · asthenic conditions · breast abnormalities · chest pain · constipation · depression · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · genital discharge · hypersensitivity · increased risk of infection · insomnia · menstrual cycle irregularities · mood altered · muscle complaints · oedema · pain · skin reactions · vomiting
- **Uncommon** Appetite abnormal · cervical dysplasia · dry eye · dyspnoea · embolism and thrombosis · hirsutism · hot flush · libido disorder · ovarian cyst · palpitations · paraesthesia · syncope · visual impairment · vulvovaginal disorders · weight changes
- **Rare or very rare** Hepatic disorders · pancreatitis · photosensitivity reaction · sweat changes · tachycardia · vertigo
- **Frequency not known** Angioedema · contact lens intolerance · dyslipidaemia · erythema nodosum · neoplasms · seizure · suppressed lactation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

22-Apr-2020

● INDICATIONS AND DOSE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial

perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · genital malignancy · medical diathermy · pelvic inflammatory disease · post-abortion sepsis · postpartum sepsis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · unexplained uterine bleeding · Wilson's disease
- **CAUTIONS** Anaemia · anatomical abnormalities—seek specialist advice · anticoagulant therapy · cardiac disease—seek specialist advice · endometriosis · epilepsy (risk of seizure at time of insertion) · immunosuppression (risk of infection)—seek specialist advice · menorrhagia (progestogen intra-uterine system might be preferable) · postpartum—seek specialist advice · risk of sexually transmitted infections · severe primary dysmenorrhoea · young age
- CAUTIONS, FURTHER INFORMATION** The Faculty of Sexual and Reproductive Healthcare advises if removal is after day 3 of the menstrual cycle, intercourse should be avoided or another method of contraception used for at least 7 days before removal of device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed after day 3 of the menstrual cycle.
- ▶ Sexually transmitted infections and pelvic inflammatory disease The main excess risk of pelvic infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.
 The Faculty of Sexual and Reproductive Healthcare advises pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) be performed in these women. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, consider appropriate prophylactic antibacterial cover. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Device complications · epilepsy (on insertion) · haemorrhage (on insertion) · hypersensitivity · menstrual cycle irregularities · pain (on insertion—alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection exacerbated · presyncope (on insertion) · uterine injuries

SIDE-EFFECTS, FURTHER INFORMATION Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for

its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

- **PRESCRIBING AND DISPENSING INFORMATION**
 - TT380® SLIMLINE** For uterine length 6.5–9 cm; replacement every 10 years.
 - LOAD® 375** For uterine length over 7 cm; replacement every 5 years.
 - NOVAPLUS T 380® AG** 'Mini' size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years.
 - MULTILOAD® CU375** For uterine length 6–9 cm; replacement every 5 years.
 - GYNEFIX®** Suitable for all uterine sizes; replacement every 5 years.
 - IUB BALLERINE MIDI®** For uterine length over 6 cm; replacement every 5 years.
 - UT380 STANDARD®** For uterine length 6.5–9 cm; replacement every 5 years.
 - UT380 SHORT®** For uterine length 5–7 cm; replacement every 5 years.
 - MULTI-SAFE® 375** For uterine length 6–9 cm; replacement every 5 years.
 - ANCORA® 375 CU** For uterine length over 6.5 cm; replacement every 5 years.
 - T-SAFE® 380A QL** For uterine length 6.5–9 cm; replacement every 10 years.
 - NEO-SAFE® T380** For uterine length 6.5–9 cm; replacement every 5 years.
 - MINI TT380® SLIMLINE** For minimum uterine length 5 cm; replacement every 5 years.

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

26-May-2020

● **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

● INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

► Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ESMYA® (ULIPRISTAL ACETATE): SUSPENSION OF THE LICENCE DUE TO RISK OF SERIOUS LIVER INJURY (MARCH 2020)

Rare but serious cases of liver injury, including hepatic failure requiring liver transplantation, have been reported worldwide in women treated with *Esmya*® for symptoms of uterine fibroids. The licence of *Esmya*® has been suspended while a safety review is carried out, following a further case of liver injury requiring transplantation despite liver function monitoring. Healthcare professionals are advised not to start *Esmya*® in new patients and to stop treatment in current patients; alternative treatment options for uterine fibroids should be considered. Liver function tests should be performed 2–4 weeks after stopping treatment, and patients advised to be vigilant for the signs and symptoms of liver injury and to seek immediate medical advice if these occur, even if 1–2 months after stopping treatment. There are currently no concerns with the use of the emergency contraceptive *ellaOne*®—see *Indications and Dose*.

- **CAUTIONS** Uncontrolled severe asthma
- **INTERACTIONS** → Appendix 1: ulipristal
- **SIDE-EFFECTS**
- **Common or very common** Back pain • breast tenderness • dizziness • fatigue • gastrointestinal discomfort • headaches • menstrual cycle irregularities • mood altered • myalgia • nausea • pelvic pain • vomiting

- **Uncommon** Anxiety • appetite disorder • chills • concentration impaired • diarrhoea • drowsiness • dry mouth • fever • flatulence • hot flush • increased risk of infection • insomnia • libido disorder • malaise • skin reactions • vision disorders • vulvovaginal disorders
 - **Rare or very rare** Abnormal sensation in eye • disorientation • dry throat • eye erythema • genital pruritus • ovarian cyst ruptured • painful sexual intercourse • syncope • taste altered • thirst • tremor • vertigo
 - **PREGNANCY** Limited information available—if pregnancy occurs, manufacturer advises report to the *ellaOne*® pregnancy registry.
 - **BREAST FEEDING** Manufacturer advises avoid for 1 week after administration—present in milk.
 - **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
 - **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Esmya*® has provided a *Physician's Guide to Prescribing Esmya*®.
 - **PATIENT AND CARER ADVICE** When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
 - if vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.
- The Faculty of Sexual and Reproductive Healthcare also advises women should be told:
- that a barrier method of contraception needs to be used—see Emergency contraception p. 536 for further information;
 - that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
 - that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Ellaone** (HRA Pharma UK Ltd)
Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05
 DT = £14.05
- **Esmya** (Gedeon Richter (UK) Ltd)
Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [PoM]
 £114.13 DT = £114.13

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 517

PROGESTOGENS

Desogestrel

19-Jul-2018

● INDICATIONS AND DOSE

Contraception

► BY MOUTH

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if continued →

administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **CONTRA-INDICATIONS** Acute porphyrias p. 652 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- **INTERACTIONS** → Appendix 1: desogestrel
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Breast abnormalities · depressed mood · headache · libido decreased · menstrual cycle irregularities · mood altered · nausea · skin reactions · weight increased
 - ▶ **Uncommon** Alopecia · contact lens intolerance · fatigue · ovarian cyst · vomiting · vulvovaginal infection
 - ▶ **Rare or very rare** Erythema nodosum
 - ▶ **Frequency not known** Angioedema · embolism and thrombosis · neoplasms

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe or active disease.
- **PATIENT AND CARER ADVICE**

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive

protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 36/03

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*[®] should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Levonorgestrel

03-Mar-2020

● INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m²

Contraception

► BY MOUTH

- Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a "missed pill"

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.
- There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.
- With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 3 years

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next

7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks' gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

● UNLICENSED USE

- With intra-uterine use The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
 - Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended;
 - Insertion immediately following termination of pregnancy below 24 weeks' gestation;
 - Postpartum insertions 4 weeks after delivery.
- With oral use The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
 - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m²;
 - Use for emergency contraception between 72–96 hours after coitus.
- With intra-uterine use or oral use Consult product literature for licensing status of individual preparations.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is

inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

● CONTRA-INDICATIONS

- ▶ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute malignancies affecting the blood (use with caution in remission) · acute vaginitis · distorted uterine cavity · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · increased risk factors for pelvic infections · infected abortion during the previous three months · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · unexplained uterine bleeding · unresolved cervical intraepithelial neoplasia · uterine or cervical malignancy
- ▶ With oral use Acute porphyrias p. 652
- ▶ With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

GENERAL CAUTIONS Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)

SPECIFIC CAUTIONS

- ▶ With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · acute venous thromboembolism (consider removal) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · jaundice (consider removal) · marked increase of blood pressure (consider removal) · migraine (consider removal) · nulliparity · severe arterial disease (consider removal) · severe cervical stenosis · severe headache (consider removal) · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- ▶ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- ▶ With oral use for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

- ▶ With intra-uterine use The Faculty of Sexual and Reproductive Healthcare advises intercourse should be avoided or another method of contraception used for at least 7 days before removal of intra-uterine device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed.
- ▶ Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
 - they are under 25 years old *or*
 - they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- INTERACTIONS → Appendix 1: levonorgestrel

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort · headaches · menstrual cycle irregularities · nausea · skin reactions

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intra-uterine use Back pain · breast abnormalities · depression · device expulsion · hirsutism · increased risk of infection · libido decreased · nervousness · ovarian cyst · pelvic disorders · uterine haemorrhage (on insertion) · vaginal haemorrhage (on insertion) · vulvovaginal disorders · weight increased
- ▶ With oral use Breast tenderness · diarrhoea · dizziness · fatigue · haemorrhage · vomiting
- ▶ **Uncommon**
- ▶ With intra-uterine use Alopecia · endometritis · oedema · uterine rupture
- ▶ **Rare or very rare**
- ▶ With oral use Face oedema · pelvic pain
- ▶ **Frequency not known**
- ▶ With oral use Cerebrovascular insufficiency · depressed mood · diabetes mellitus · embolism and thrombosis · neoplasms · sexual dysfunction · weight changes

SIDE-EFFECTS, FURTHER INFORMATION **Breast cancer**

There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

With intra-uterine use There is no evidence of an association between the levonorgestrel intra-uterine

system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patient's cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

● PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With intra-uterine use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

● **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

● HEPATIC IMPAIRMENT

- ▶ With intra-uterine use or oral use for Contraception Manufacturer advises avoid in liver tumour.
- ▶ With oral use for Contraception or Emergency contraception Manufacturer advises avoid in severe impairment.
- ▶ With intra-uterine use Manufacturer advises avoid in acute hepatic disease or in severe impairment (no information available)—consult product literature.

● MONITORING REQUIREMENTS

- ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

● PATIENT AND CARER ADVICE

- ▶ Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine

- ▶ With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- ▶ With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
 - if vomiting occurs within 3 hours, a replacement dose should be taken;
 - that their next period may be early or late;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:

- that a barrier method of contraception needs to be used—see Emergency contraception p. 536 for further information;
- that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman's usual dysmenorrhoea;
- that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.

- ▶ With intra-uterine use Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.
- Missed doses** When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1299/18

The *Scottish Medicines Consortium* has advised (February 2018) that levonorgestrel (*Kyleena*®) is accepted for use within NHS Scotland as a contraceptive device for up to 5 years.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3582

The *All Wales Medicines Strategy Group* has advised (September 2018) that levonorgestrel (*Kyleena*®) is recommended as an option for use within NHS Wales for contraception for up to five years.

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle*® *One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

3.5 Contraception, parenteral progestogen-only

Other drugs used for Contraception, parenteral progestogen-only Norethisterone, p. 517

PROGESTOGENS

Etonogestrel

10-Mar-2020

• INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon*[®] not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED FEBRUARY 2020): *NEXPLANON*[®] (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: NEW INSERTION SITE TO REDUCE RARE RISK OF NEUROVASCULAR INJURY AND IMPLANT MIGRATION

There have been reports of neurovascular injury and migration of *Nexplanon*[®] implants from the insertion site to the vasculature, including the pulmonary artery in rare cases. Correct subdermal insertion by an appropriately trained and accredited healthcare professional is recommended to reduce the risk of these events. Healthcare professionals are advised to review the updated guidance from the manufacturer and the statement from the Faculty of Sexual and Reproductive Healthcare (FSRH) on how to correctly insert the implant. Patients should be advised on how to locate the implant, informed to check this occasionally and report any concerns. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Implants inserted at a previous site that can be palpated should not pose a risk and should only be replaced if there are issues with its location or if a routine replacement is due.

- **CONTRA-INDICATIONS** Acute porphyrias p. 652 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **INTERACTIONS** → Appendix 1: etonogestrel
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · alopecia · anxiety · appetite increased · breast abnormalities · depressed mood · dizziness · emotional lability · fatigue · flatulence · headaches · hot flush · increased risk of infection · influenza like illness · libido decreased · menstrual cycle irregularities · nausea · ovarian cyst · pain · skin reactions · weight changes
- ▶ **Uncommon** Arthralgia · constipation · diarrhoea · drowsiness · dysuria · fever · galactorrhoea · genital abnormalities · hypertrichosis · insomnia · gynaecology oedema · vomiting · vulvovaginal discomfort
- ▶ **Frequency not known** Abscess · angioedema · embolism and thrombosis · haemorrhage · insulin resistance · neoplasms · paraesthesia · seborrhoea

SIDE-EFFECTS, FURTHER INFORMATION The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Nexplanon** (Merck Sharp & Dohme Ltd)
Etonogestrel 68 mg Nexplanon 68mg implant | 1 device **[PoM]**
£83.43 DT = £83.43

Medroxyprogesterone acetate

24-May-2017

● INDICATIONS AND DOSE

Contraception

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
- ▶ Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
- ▶ Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraceptive)

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ Females of childbearing potential: (consult product literature)

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS Acute porphyrias p. 652 · severe arterial disease · undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

● CAUTIONS

GENERAL CAUTIONS Possible risk of breast cancer

SPECIFIC CAUTIONS History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus

- **INTERACTIONS** → Appendix 1: medroxyprogesterone

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · asthenia · breast abnormalities · depression · dizziness · gastrointestinal discomfort · headaches · insomnia · menstrual cycle irregularities · mood altered · nausea · pain · sexual dysfunction · skin reactions · vulvovaginal infection · weight changes
 - ▶ **Uncommon** Alopecia · appetite abnormal · arthralgia · drowsiness · fever · fluid retention · galactorrhoea · hirsutism · hot flush · hypertension · muscle spasms · ovarian cyst · painful sexual intercourse · tachycardia · uterine haemorrhage · varicose veins · vertigo · vulvovaginal disorders
 - ▶ **Rare or very rare** Breast cancer · lipodystrophy
 - ▶ **Frequency not known** Embolism and thrombosis · hepatic disorders · osteoporosis · osteoporotic fractures · seizure
- SIDE-EFFECTS, FURTHER INFORMATION** Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

● CONCEPTION AND CONTRACEPTION

- ▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- ▶ With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation. The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe or active disease.

- **PATIENT AND CARER ADVICE** Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Depo-Provera** (Pfizer Ltd)
Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £6.01 DT = £6.01
- ▶ **Sayana Press** (Pfizer Ltd)
Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection **[PoM]** £6.90 DT = £6.90

3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

● INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

- ▶ **BY VAGINA**
- ▶ Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital erosion · increased risk of HIV infection · pain · paraesthesia · skin reactions · vaginal redness
- SIDE-EFFECTS, FURTHER INFORMATION** High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.
- **CONCEPTION AND CONTRACEPTION** No evidence of harm to diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

► **Gygel** (Marlborough Pharmaceuticals Ltd)

Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 81 gram (GSL) £11.00 DT = £11.00

4 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*[®]) are used in the treatment of labial adhesions; treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 555, econazole nitrate p. 555, fenticonazole nitrate p. 556, and miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented

with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 407 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 358 or tinidazole p. 360.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream below and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 440 and valaciclovir p. 442 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

4.1 Vaginal and vulval infections

4.1a Vaginal and vulval bacterial infections

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

18-May-2020

● INDICATIONS AND DOSE

DALACIN[®] 2% CREAM

Bacterial vaginosis

► BY VAGINA

► Child: 1 applicatorful daily for 3–7 nights, dose to be administered at night

DOSE EQUIVALENCE AND CONVERSION

► 1 applicatorful delivers a 5 g dose of clindamycin 2%.

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **INTERACTIONS** → Appendix 1: clindamycin
- **SIDE-EFFECTS**
- **Common or very common** Skin reactions

- ▶ **Frequency not known** Constipation · diarrhoea (discontinue) · dizziness · gastrointestinal discomfort · headache · increased risk of infection · nausea · vertigo · vomiting · vulvovaginal irritation

SIDE-EFFECTS, FURTHER INFORMATION Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

- **CONCEPTION AND CONTRACEPTION** Damages latex condoms and diaphragms.
- **PRESCRIBING AND DISPENSING INFORMATION** For choice of antibacterial therapy, see Genital system infections, antibacterial therapy p. 325.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue and contact a doctor immediately if severe, prolonged or bloody diarrhoea develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Dalacin** (Pfizer Ltd)
Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram [PoM] £10.86 DT = £10.86

CARBOXYLIC ACIDS

Lactic acid

● INDICATIONS AND DOSE

BALANCE ACTIV RX[®] GEL

Prevention of bacterial vaginosis

▶ BY VAGINA

- ▶ Child: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in shellfish allergy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Vaginal Gel

EXCIPIENTS: May contain Propylene glycol

Other drugs used for Vaginal and vulval fungal infections
Fluconazole, p. 407

ANTIFUNGALS > IMIDAZOLE

Clotrimazole

10-Mar-2020

● INDICATIONS AND DOSE

Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)

▶ BY VAGINA USING CREAM

- ▶ Child: Apply 2–3 times a day, to be applied to anogenital area

Vaginal candidiasis (dose for 10% intravaginal cream)

▶ BY VAGINA USING VAGINAL CREAM

- ▶ Child: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

Vaginal candidiasis

▶ BY VAGINA USING PESSARIES

- ▶ Child: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

Recurrent vulvovaginal candidiasis

▶ BY VAGINA USING PESSARIES

- ▶ Child: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **UNLICENSED USE** Consult product literature for individual preparations.

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **INTERACTIONS** → Appendix 1: antifungals, azoles

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Oedema · paraesthesia · skin reactions

SPECIFIC SIDE-EFFECTS Abdominal pain · discomfort · genital peeling · pelvic pain · vaginal haemorrhage

- **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.

● PREGNANCY

Dose adjustments Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Clotrimazole for fungal infections www.medicinesforchildren.org.uk/clotrimazole-fungal-infections

● INDICATIONS AND DOSE

GYNO-PEVARYL[®] ONCE

Vaginal and vulval candidiasis

▶ BY VAGINA

- ▶ Child: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary continued →

GYNO-PEVARYL® PESSARY

Vaginal and vulval candidiasis

▶ BY VAGINA

- ▶ Child: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

● **SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Vaginal burning
- ▶ **Frequency not known** Angioedema

- **CONCEPTION AND CONTRACEPTION** Cream and pessaries damage latex condoms and diaphragms.

- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Pessary▶ **Gyno-Pevaryl** (Janssen-Cilag Ltd)

Econazole nitrate 150 mg Gyno-Pevaryl Once 150mg vaginal pessary | 1 pessary [PoM] £3.69 DT = £3.69

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 558, mercaptopurine p. 587, or once weekly methotrexate p. 588 are used to induce remission in unresponsive or chronically active Crohn's disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 620 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin (cyclosporin) p. 559 is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 566), calcineurin inhibitors (ciclosporin or tacrolimus p. 562), corticosteroids, or sirolimus p. 561. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced

stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period—**important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 601 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 579 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone p. 478 and dexamethasone p. 475 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

Other drugs used for immune system disorders and transplantation Anakinra, p. 691 · Chloroquine, p. 429 · Everolimus, p. 605 · Hydroxychloroquine sulfate, p. 690 · Rituximab, p. 574

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

28-Nov-2017

● INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

▶ BY INTRAVENOUS INFUSION

- ▶ Child 1–17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

▶ BY INTRAVENOUS INFUSION

- ▶ Child 1–17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS** Infection

- **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS**

- ▶ **Common or very common** Chills · diarrhoea · dysphagia · dyspnoea · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasm malignant · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting

- ▶ **Uncommon** Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or

Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482** Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Grafalon** (Imported (Germany))

Antithymocyte immunoglobulin (rabbit) 20 mg per 1 ml Grafalon 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] 

Powder and solvent for solution for infusion

- ▶ **Thymoglobulin** (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES

Azathioprine

13-Jun-2018

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

● **INDICATIONS AND DOSE**

Severe ulcerative colitis | Severe Crohn's disease

▶ BY MOUTH

- ▶ Child 2–17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily

Systemic lupus erythematosus | Vasculitis | Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate

▶ BY MOUTH

- ▶ Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

Suppression of transplant rejection

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **CAUTIONS** Reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1: azathioprine

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Bone marrow depression (dose-related) · increased risk of infection · leucopenia · pancreatitis · thrombocytopenia
- ▶ **Uncommon** Anaemia · hepatic disorders · hypersensitivity

- ▶ **Rare or very rare** Agranulocytosis · alopecia · bone marrow disorders · diarrhoea · gastrointestinal disorders · neoplasms · photosensitivity reaction · pneumonitis · severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Nodular regenerative hyperplasia · sinusoidal obstruction syndrome

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Nausea

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may require drug withdrawal.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

Neutropenia and thrombocytopenia Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.
- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.
- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment.
Dose adjustments Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose.
- **PRE-TREATMENT SCREENING**
Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for toxicity throughout treatment.
 - ▶ Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
 - ▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Consult local treatment protocol for details. For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute. For *intravenous infusion*, reconstitute 50 mg with 5–15 mL

Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of azathioprine is required, the following strength is used: 50 mg/5 mL.
- **PATIENT AND CARER ADVICE**
Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cyclosporin)

26-Nov-2019

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.
- **INDICATIONS AND DOSE**
Refractory ulcerative colitis
 - ▶ **BY MOUTH**
 - ▶ Child 2-17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response
 - ▶ **BY INTRAVENOUS INFUSION**
 - ▶ Child 3-17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response

continued →

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

▶ BY MOUTH

- ▶ Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

▶ BY MOUTH

- ▶ Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

▶ BY MOUTH

- ▶ Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation | Prevention and treatment of graft-versus-host disease

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: (consult local protocol)

Nephrotic syndrome

▶ BY MOUTH

- ▶ Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- **UNLICENSED USE** Not licensed for use in children under 3 months. Not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis. Not licensed for use in ulcerative colitis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)
- **CAUTIONS** Hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Malignancy In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Eye inflammation
 - SPECIFIC SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · diarrhoea · electrolyte imbalance · fatigue · fever · flushing · gastrointestinal discomfort · gingival hyperplasia · hair changes · headaches · hepatic disorders · hyperglycaemia · hyperlipidaemia · hypertension · hyperuricaemia · leucopenia · muscle complaints · nausea · paraesthesia · peptic ulcer · renal impairment (renal structural changes on long-term administration) · seizure · skin reactions · tremor · vomiting
 - ▶ **Uncommon** Anaemia · encephalopathy · oedema · thrombocytopenia · weight increased
 - ▶ **Rare or very rare** Gynaecomastia · haemolytic anaemia · idiopathic intracranial hypertension · menstrual disorder · multifocal motor neuropathy · muscle weakness · myopathy · pancreatitis
 - ▶ **Frequency not known** Pain in extremity · thrombotic microangiopathy
- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).
 - Dose adjustments** Manufacturer advises consider dose reduction in severe impairment to maintain blood-ciclosporin concentration in target range—monitor until concentration stable.
- **RENAL IMPAIRMENT**
 - Dose adjustments** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if the estimated glomerular filtration rate decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the estimated glomerular filtration rate decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
 - ▶ In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.

- ▶ With intravenous use For intermittent *intravenous infusion*, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

● PRESCRIBING AND DISPENSING INFORMATION

Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun*[®] capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA. Medicines for Children leaflet: Ciclosporin for nephrotic syndrome www.medicinesforchildren.org.uk/ciclosporin-nephrotic-syndrome-0

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Sirolimus

16-Nov-2017

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

▶ The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- **INTERACTIONS** → Appendix 1: sirolimus
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · arthralgia · ascites · constipation · diabetes mellitus · diarrhoea · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · fever · haemolytic uraemic syndrome · haemorrhage · headache · healing impaired · hyperglycaemia · hypertension · increased risk of infection · leucopenia · lymphatic vessel disorders · menstrual cycle irregularities · nausea · neoplasms · neutropenia · oedema · osteonecrosis · ovarian cyst · pain · pancreatitis · pericardial effusion · proteinuria · respiratory disorders · sepsis · skin reactions · stomatitis · tachycardia · thrombocytopenia
 - ▶ **Uncommon** Antibiotic associated colitis · focal segmental glomerulosclerosis · hepatic failure · nephrotic syndrome · pancytopenia · post transplant lymphoproliferative disorder
 - ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
Dose adjustments In adults, manufacturer advises maintenance dose reduction in severe impairment—consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
 - ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - ▶ Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
Sirolimus is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Ethanol

▶ **Rapamune** (Pfizer Ltd)

Sirolimus 1 mg per 1 mL Rapamune 1mg/ml oral solution sugar-free | 60 mL [PoM] £162.41 DT = £162.41

● UNLICENSED USE

ADVAGRAF® *Advagraf*® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

▶ With oral use

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport*®, *Prograf*®, *Capexon*® and *Tacni*® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf*® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf*® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: *Envarsus*® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · ascites · asthenic conditions · bile duct disorders · confusion · consciousness impaired · constipation · coronary artery disease · cough · depression · diabetes mellitus · diarrhoea · dizziness · dysgraphia · dyslipidaemia · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye disorder · febrile disorders · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal inflammatory disorders · haemorrhage · hallucination · headache · hepatic disorders · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypotension · increased risk of infection · ischaemia · joint disorders · leucocytosis · leucopenia · metabolic acidosis · mood altered · muscle spasms · nasal complaints · nausea · nephropathy · nervous system disorder · oedema · oral disorders · pain · peripheral neuropathy · peripheral vascular disease · primary transplant dysfunction · psychiatric disorder · renal impairment · renal tubular necrosis · respiratory disorders · seizure · sensation abnormal · skin reactions · sleep disorders · temperature sensation altered · thrombocytopenia · tinnitus · tremor · urinary tract disorder · urine abnormal · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Asthma · cardiac arrest · cardiomyopathy · cataract · central nervous system haemorrhage · chest discomfort · coagulation disorders · coma · dysmenorrhoea · encephalopathy · feeling abnormal · haemolytic anaemia · hearing impairment · heart failure · hypoglycaemia · hypoproteinaemia · influenza like illness · memory loss · multi organ failure · neutropenia · palpitations · pancreatitis · pancytopenia · paralysis · paresis · photosensitivity reaction · psychotic disorder · shock · speech disorder · stroke · ventricular hypertrophy
- ▶ **Rare or very rare** Fall · hirsutism · mobility decreased · muscle tone increased · muscle weakness · pancreatic pseudocyst · pericardial effusion · QT interval prolongation · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · thirst · ulcer
- ▶ **Frequency not known** Agranulocytosis · neoplasm malignant · neoplasms · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Anaphylactoid reaction (due to excipient) · hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
Dose adjustments Manufacturer advises consider dose reduction in severe impairment.
- **MONITORING REQUIREMENTS** After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.
- **DIRECTIONS FOR ADMINISTRATION**
▶ With intravenous use For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.
- **PRESCRIBING AND DISPENSING INFORMATION** The RCPCH and NPPG recommend that, when a liquid special of tacrolimus is required, the following strength is used: 5mg/5mL.
- **PROGRAF**® *INFUSION* Intravenous route should only be used if oral route is inappropriate.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.
Medicines for Children leaflet: Tacrolimus for prevention of transplant rejection www.medicinesforchildren.org.uk/tacrolimus-prevention-transplant-rejection
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
▶ Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482
Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial

option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (*Modigraf*[®]) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

▶ **Immunosuppressive therapy for kidney transplant in children and young people (October 2017) NICE TA482**

Prolonged-release tacrolimus is not recommended as an initial treatment to prevent organ rejection in patients having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA482

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2010) that tacrolimus granules for suspension (*Modigraf*[®]) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

20-Jun-2019

● **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● **INDICATIONS AND DOSE**

Cryopyrin-associated periodic syndromes (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

▶ Child 2-3 years (body-weight 7.5-14 kg): 4 mg/kg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

▶ Child 4-17 years (body-weight 7.5-14 kg): 4 mg/kg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

▶ Child 4-17 years (body-weight 15-40 kg): 2 mg/kg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

▶ Child 4-17 years (body-weight 41 kg and above): 150 mg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature

Tumour necrosis factor receptor associated periodic syndrome (specialist use only) | Hyperimmunoglobulin D syndrome (specialist use only) | Familial Mediterranean fever (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

▶ Child 2-17 years (body-weight 7.5-40 kg): 2 mg/kg every 4 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, a second dose may be considered if clinical response not achieved within 7 days—consult product literature

▶ Child 2-17 years (body-weight 41 kg and above): 150 mg every 4 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, a second dose may be considered if clinical response not achieved within 7 days—consult product literature

Still's disease (specialist use only)

▶ BY SUBCUTANEOUS INJECTION

▶ Child 2-17 years (body-weight 7.5 kg and above): 4 mg/kg every 4 weeks (max. per dose 300 mg), to be administered to the upper thigh, abdomen, upper arm or buttocks

● **CONTRA-INDICATIONS** Active severe infection · leucopenia · neutropenia

● **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection

CAUTIONS, FURTHER INFORMATION

▶ **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo

▶ **Uncommon** Gastrooesophageal reflux disease

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
 - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
 - **BREAST FEEDING** Consider if benefit outweighs risk—no known if present in human milk.
 - **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
 - **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
 - **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
 - ▶ Manufacturer advises monitor for signs and symptoms of infection (including tuberculosis) during and after treatment.
 - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).
 - **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to seek medical advice if signs or symptoms suggestive of tuberculosis (including persistent cough, weight loss and subfebrile temperature) occur.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Ilaris** (Novartis Pharmaceuticals UK Ltd)
Canakinumab 150 mg per 1 ml Ilaris 150mg/1ml solution for injection vials | 1 vial [PoM] £9,927.80

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

16-Nov-2017

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

● INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
- ▶ Child 1–17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Capillary leak syndrome · constipation · cytokine release syndrome · dyspnoea · fever · heart failure · hypersensitivity · hypertension · hypertrichosis · hypotension · increased risk of infection · myocardial

infarction · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sneezing · tachycardia

- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in children and young people (October 2017)** NICE TA482
 Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Simulect** (Novartis Pharmaceuticals UK Ltd)

● INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

- ▶ BY MOUTH
- ▶ Child: 600 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus) (under expert supervision)

- ▶ BY MOUTH
- ▶ Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus) (under expert supervision)

- ▶ BY MOUTH
- ▶ Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal

transplantation. Not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- ▶ Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

- **INTERACTIONS** → Appendix 1: mycophenolate

• SIDE-EFFECTS

- ▶ **Common or very common** Acidosis · alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · bone marrow disorders · burping · chills · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dyslipidaemia · dyspnoea · electrolyte imbalance · fever · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal haemorrhage · gout · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · insomnia · leucocytosis · leucopenia · malaise · nausea · neoplasms · neuromuscular dysfunction · oedema · oral disorders · pain · pancreatitis · paraesthesia · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · taste altered · thinking abnormal · thrombocytopenia · tremor · vasodilation · vomiting · weight decreased
- ▶ **Uncommon** Agranulocytosis
- ▶ **Frequency not known** Endocarditis · hypogammaglobulinaemia · malignancy · meningitis · neutropenia · polyomavirus-associated nephropathy · progressive multifocal leukoencephalopathy (PML) · pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

• CONCEPTION AND CONTRACEPTION

Pregnancy prevention The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment—2 pregnancy tests 8–10 days apart are recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **PRESCRIBING AND DISPENSING INFORMATION** Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m².
- **PATIENT AND CARER ADVICE**
Pregnancy prevention advice The MHRA advises that prescribers should ensure that female patients understand the need to comply with the pregnancy prevention advice, and they should be informed to seek immediate medical attention if there is a possibility of pregnancy; male patients planning to conceive children should be informed of the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy.
Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.
Medicines for Children leaflet: Mycophenolate mofetil for nephrotic syndrome www.medicinesforchildren.org.uk/mycophenolate-mofetil-nephrotic-syndrome

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Immunosuppressive therapy for kidney transplant in children and young people (October 2017)** NICE TA482
Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in patients having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA482

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

▶ Mycophenolate mofetil (Non-proprietary)

Mycophenolate mofetil 500 mg Mycophenolate mofetil 500mg tablets | 50 tablet [PoM](#) £10.44 DT = £6.16

▶ **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 500 mg CellCept 500mg tablets | 50 tablet [PoM](#) £82.26 DT = £6.16

▶ **Myfenas** (Teva UK Ltd)

Mycophenolate mofetil 500 mg Myfenas 500mg tablets | 50 tablet [PoM](#) £78.15 DT = £6.16

Oral suspension

EXCIPIENTS: May contain Aspartame

▶ **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 200 mg per 1 ml CellCept 1g/5ml oral suspension sugar-free | 175 ml [PoM](#) £115.16 DT = £115.16

Capsule

▶ Mycophenolate mofetil (Non-proprietary)

Mycophenolate mofetil 250 mg Mycophenolate mofetil 250mg capsules | 100 capsule [PoM](#) £33.40 DT = £27.12

- ▶ **CellCept** (Roche Products Ltd)
Mycophenolate mofetil 250 mg CellCept 250mg capsules | 100 capsule [PoM] £82.26 DT = £27.12
- ▶ **Myfenax** (Teva UK Ltd)
Mycophenolate mofetil 250 mg Myfenax 250mg capsules | 100 capsule [PoM] £78.15 DT = £27.12

1.1 Multiple sclerosis

IMMUNOSUPPRESSANTS > IMMUNOMODULATING DRUGS

Fingolimod

23-Mar-2020

- **DRUG ACTION** Fingolimod is a sphingosine-1-phosphate receptor modulator, which prevents movement of lymphocytes out of lymph nodes, thereby limiting inflammation in the central nervous system.

● INDICATIONS AND DOSE

Multiple sclerosis (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Child 10–17 years (body-weight up to 40 kg): 250 micrograms once daily
- ▶ Child 10–17 years (body-weight 40 kg and above): 500 micrograms once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose—see *Cautions*, *Contra-indications*, and *Monitoring* for further information.

MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see *Contra-indications* for further information.

MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)

Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma.

Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis
- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to 12 months
- advise patients to protect themselves against UV radiation exposure and seek urgent medical advice if they notice any skin lesions

- refer patients with suspicious lesions to a dermatologist

Fingolimod has also been associated with risk of fatal fungal infections and reports of progressive multifocal leukoencephalopathy (PML)—see *Monitoring* and *Side effects* for further information.

MHRA/CHM ADVICE: FINGOLIMOD (GILENYA®): INCREASED RISK OF CONGENITAL MALFORMATIONS; NEW CONTRA-INDICATION DURING PREGNANCY AND IN WOMEN OF CHILDBEARING POTENTIAL NOT USING EFFECTIVE CONTRACEPTION (SEPTEMBER 2019)

An increased risk of major congenital malformations, including cardiac, renal, and musculoskeletal defects, has been associated with the use of fingolimod in pregnancy. Females of childbearing potential must use effective contraception during, and for 2 months after stopping, treatment. Healthcare professionals are advised that fingolimod is contra-indicated in pregnancy and that female patients should be informed of the risk of congenital malformations and given a pregnancy-specific patient reminder card. Pregnancy should be excluded before starting treatment, and pregnancy testing repeated at suitable intervals during treatment. Fingolimod should be stopped 2 months before planning a pregnancy. If a female taking fingolimod becomes pregnant, treatment should be stopped immediately, and the patient referred to an obstetrician for close monitoring. Exposed pregnancies should be enrolled on the pregnancy registry.

- **CONTRA-INDICATIONS** Heart failure in the previous 6 months (New York Heart Association class III/IV) · active malignancies · baseline QTc interval 500 milliseconds or greater · cerebrovascular disease (including transient ischaemic attack) in the previous 6 months · decompensated heart failure (requiring inpatient treatment) in the previous 6 months · increased risk for opportunistic infections (including immunosuppression) · myocardial infarction in the previous 6 months · second-degree Mobitz type II atrioventricular block or third-degree AV block, or sick-sinus syndrome, if the patient does not have a pacemaker · severe active infection · severe cardiac arrhythmias requiring treatment with class Ia or class III anti-arrhythmic drugs · unstable angina in the previous 6 months
- **CAUTIONS** Body-weight less than 40 kg (limited information available) · check varicella zoster virus status—consult product literature for further information · children should be brought up-to-date with current immunisation schedule before starting treatment · children under 12 years (limited information available) · chronic obstructive pulmonary disease · history of myocardial infarction · history of symptomatic bradycardia or recurrent syncope · patients receiving anti-arrhythmic or heart-rate lowering drugs, including beta-blockers and heart rate-lowering calcium-channel blockers (seek advice from cardiologist regarding switching to alternative drugs, or appropriate monitoring if unable to switch) · pulmonary fibrosis · severe respiratory disease · severe sleep apnoea · significant QT prolongation (QTc greater than 460 milliseconds in females, or QTc greater than 450 milliseconds in males); if QTc 500 milliseconds or greater—see *Contra-indications* · susceptibility to QT-interval prolongation (including electrolyte disturbances) · Tanner stage I (limited information available) · uncontrolled hypertension
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Washout period A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.

- ▶ Bradycardia and cardiac rhythm disturbance. Fingolimod may cause transient bradycardia, atrioventricular conduction delays and heart block after the first dose. Fingolimod is not recommended in patients with the cardiovascular risks listed above unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist (including monitoring advice) is sought before initiation.

● **INTERACTIONS** → Appendix 1: fingolimod

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · arthralgia · asthenia · atrioventricular block · back pain · bradycardia · cough · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · headaches · hypertension · increased risk of infection · myalgia · neoplasms · skin reactions · vision blurred · weight decreased
- ▶ **Uncommon** Macular oedema · nausea · seizures · thrombocytopenia
- ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
- ▶ **Frequency not known** Anxiety · autoimmune haemolytic anaemia · haemophagocytic lymphohistiocytosis · peripheral oedema · progressive multifocal leukoencephalopathy (PML)

SIDE-EFFECTS, FURTHER INFORMATION **Basal-cell carcinoma** Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.

Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises females of childbearing potential should use effective contraception during treatment and for 2 months after last treatment—see *Important safety information* for further information.

● **PREGNANCY** Manufacturer advises avoid—teratogenic.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ **All patients** receiving fingolimod should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
- ▶ **Pre-treatment**
 - an ECG and blood pressure measurement before starting
- ▶ **During the first 6 hours of treatment**
 - continuous ECG monitoring for 6 hours
 - blood pressure and heart rate measurement every hour
- ▶ **After 6 hours of treatment**
 - a further ECG and blood pressure measurement
- ▶ If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
- ▶ If post-dose bradyarrhythmia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.
- ▶ If after 6 hours, the heart rate is less than 55 beats per minute in children aged 12 years and above, or less than 60 beats per minute in children under 12 years, or the ECG shows new onset second degree or higher grade AV block,

or a QTc interval of 500 milliseconds or greater, monitoring should be extended (at least overnight, until side-effect resolution).

- ▶ The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
- ▶ In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.

▶ **Note**

- ▶ First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:
 - 1 day or more during the first 2 weeks of treatment
 - more than 7 days during weeks 3 and 4 of treatment
 - more than 2 weeks after one month of treatment
- ▶ If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned.
- ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- ▶ Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated.
- ▶ Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced)—consult product literature.
- ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepato-splenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
- ▶ Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.

● **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Gilenya*® has provided a *Prescriber's checklist*.

● **PATIENT AND CARER ADVICE**

Patient reminder card Patients should be given a patient reminder card.

Female patients of childbearing potential should also be given a pregnancy-specific patient reminder card.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2012) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

SMC No. SMC2154

The *Scottish Medicines Consortium* has advised (June 2019) that fingolimod (*Gilenya*®) is accepted for use within NHS Scotland as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis for patients aged 10 years to less than 18 years with:

- highly active disease despite a full and adequate course of treatment with at least one disease-modifying therapy, or

- rapidly-evolving severe relapsing-remitting multiple sclerosis defined by two or more disabling relapses in one year, and with one or more gadolinium-enhancing lesions on brain MRI or a significant increase in T2 lesion load as compared to a previous MRI.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (January 2017) that fingolimod (*Gilenya*®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly-evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

AWMSG No. 2777

The *All Wales Medicines Strategy Group* has advised (June 2019) that fingolimod (*Gilenya*®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis for patients aged 10 to 17 years with:

- highly active disease despite a full and adequate course of treatment with at least one disease modifying therapy, or
- rapidly-evolving severe relapsing-remitting multiple sclerosis defined by two or more disabling relapses in one year, and with one or more gadolinium-enhancing lesions on brain MRI or a significant increase in T2 lesion load as compared to a previous recent MRI.

This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

NHS restrictions

NHS England Clinical Commissioning Policy NHS England (May 2014) has provided guidance on the use of fingolimod for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Blinatumomab

26-Feb-2020

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

• INDICATIONS AND DOSE

Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia (initiated by a specialist)

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child 1-17 years: (consult product literature)

- **CAUTIONS** Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

CAUTIONS, FURTHER INFORMATION

- ▶ **Pre-medication** Manufacturer advises pre-medication with a corticosteroid and an anti-pyretic—consult product literature.
- ▶ **Neurological events** There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anaemia · aphasia · appetite decreased · arthralgia · chest pain · chills · cognitive disorder · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · encephalopathy · facial swelling · fatigue · fever · flushing · headache · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · immune disorder · increased risk of infection · infusion related reaction · insomnia · leucocytosis · memory loss · nausea · neutropenia · oedema · pain · paraesthesia · rash · respiratory disorders · seizure · sepsis · tachycardia · thrombocytopenia · tremor · tumour lysis syndrome · vomiting · weight increased
- ▶ **Uncommon** Capillary leak syndrome · cranial nerve disorder · pancreatitis
- ▶ **Frequency not known** Device related infection · hypoxia · multi organ failure

SIDE-EFFECTS, FURTHER INFORMATION **Pancreatitis** Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).

Cytokine release syndrome, infusion-reactions and tumour lysis syndrome Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 575.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2148

The *Scottish Medicines Consortium* has advised (April 2019) that blinatumomab (*Blinicyto*®) is accepted for use within NHS Scotland as monotherapy for the treatment of paediatric patients aged 1 year or older with Philadelphia chromosome-negative CD19 positive B-cell precursor acute lymphoblastic leukaemia which is refractory or in relapse after receiving at least two prior therapies or in relapse after receiving prior allogeneic hematopoietic stem cell transplantation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3769

The *All Wales Medicines Strategy Group* has advised (April 2019) that blinatumomab (*Blinicyto*®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of paediatric patients aged 1 year or older with Philadelphia chromosome-negative CD19 positive B-cell precursor acute lymphoblastic leukaemia which is refractory or in relapse after receiving at least two prior therapies or in relapse after receiving prior allogeneic haematopoietic stem cell transplantation. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

Dinutuximab beta

10-Sep-2018

- **DRUG ACTION** Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialoganglioside 2, which is overexpressed on neuroblastoma cells.

- **INDICATIONS AND DOSE**

High-risk neuroblastoma (specialist use only)

► BY INTRAVENOUS INFUSION

► Child 1-17 years: (consult product literature)

- **CONTRA-INDICATIONS** Acute grade 3 or 4, or extensive chronic graft-versus-host disease
- **CAUTIONS** Avoid vaccinations during and for at least 10 weeks after treatment cessation (increased risk of immune stimulation and neurological toxicity) - ensure absence of systemic infection—any other infection should be controlled before treatment initiation - pre-medication must be administered to minimise the risk of infusion-related reactions and neuropathic pain

CAUTIONS, FURTHER INFORMATION

- Pre-medication Severe infusion-related reactions can occur and dinutuximab beta should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with an antihistamine, and to monitor closely, particularly during the first and second treatment course; discontinue immediately if reaction occurs and treat as indicated—consult product literature.

Manufacturer advises pre-medication with non-opioid analgesics, gabapentin and opioids—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal distension · anaemia · anxiety · appetite decreased · ascites · capillary leak syndrome · chills · cough · cytokine release syndrome · decreased leucocytes · device related infection · dizziness · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · fever · fluid imbalance · gastrointestinal disorders · haematuria · headache · heart failure · hyperhidrosis · hypersensitivity · hypertension · hypertriglyceridaemia · hypoalbuminaemia · hypotension · hypoxia · increased risk of infection · left ventricular dysfunction · muscle spasms · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · photosensitivity reaction · pulmonary oedema · renal impairment · respiratory disorders · seizure · sepsis · skin reactions · tachycardia · thrombocytopenia · tremor · urinary retention · urine abnormalities · vision disorders · vomiting · weight changes
 - **Uncommon** Disseminated intravascular coagulation · eosinophilia · hepatocellular injury · hypovolaemic shock · intracranial pressure increased · peripheral vascular disease · posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **PREGNANCY** Manufacturer advises avoid—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function—consult product literature for values required for treatment initiation.
 - ▶ Manufacturer advises monitor circulatory and respiratory function—risk of capillary leak syndrome.
 - ▶ Manufacturer advises monitor liver function and electrolytes regularly.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.
- **PATIENT AND CARER ADVICE**
 - ▶ **Driving and skilled tasks** Manufacturer advises patients should not use or drive machines during treatment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Dinutuximab beta for treating neuroblastoma (August 2018)**
NICE TA538
Dinutuximab beta (*Qarziba*®) is recommended as an option for treating high-risk neuroblastoma in people aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, only if:
 - they have not already had anti-GD2 immunotherapy, and
 - the manufacturer provides dinutuximab beta according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta538

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2105
The *Scottish Medicines Consortium* has advised (November 2018) that dinutuximab beta (*Qarziba*®) is accepted for use within NHS Scotland for the treatment of high-risk neuroblastoma in patients aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplantation, as well as patients with a history of relapsed or refractory neuroblastoma, with or without residual disease.

In patients with a history of relapsed or refractory disease and in patients who have not achieved a complete response after first line therapy, dinutuximab beta should be combined with interleukin-2.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Qarziba** (EUSA Pharma Ltd) ▼
Dinutuximab beta 4.5 mg per 1 ml Qarziba 20mg/4.5ml concentrate for solution for infusion vials | 1 vial [PoM] £7,610.00 (Hospital only)

Gemtuzumab ozogamicin

17-Oct-2018

- **DRUG ACTION** Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

INDICATIONS AND DOSE**CD33-positive acute myeloid leukaemia (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 15–17 years: (consult product literature)

- **CAUTIONS** Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) · haematopoietic stem cell transplantation (increased risk of hepatotoxicity) · pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

- ▶ Pre-medication Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.

SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema · pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting
- ▶ **Frequency not known** Interstitial pneumonia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions (including fatal cases) can occur during the first 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection,

bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.

- ▶ Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- ▶ Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- ▶ **Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018)** NICE TA545
Gemtuzumab ozogamicin (*Mylotarg*[®]), with daunorubicin and cytarabine, is recommended as an option for untreated *de novo* CD33-positive acute myeloid leukaemia (AML), except acute promyelocytic leukaemia, in people 15 years and over, only if:

- they start induction therapy when either the cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (that is, because the test was unsuccessful) or when their cytogenetic test results are not yet available, **and**
- they start consolidation therapy when their cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (because the test was unsuccessful), **and**
- the manufacturer provides gemtuzumab ozogamicin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta545

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2089

The *Scottish Medicines Consortium* has advised (October 2018) that gemtuzumab ozogamicin (*Mylotarg*[®]) is accepted for restricted use within NHS Scotland as combination therapy with daunorubicin and cytarabine for the treatment of previously untreated, *de novo* CD33-positive acute myeloid leukaemia in patients aged 15 years and above with a favourable, intermediate or unknown cytogenetic profile.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Mylotarg** (Pfizer Ltd) ▼

Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £6,300.00 (Hospital only)

Ipilimumab

13-Feb-2019

- **DRUG ACTION** Ipilimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

● INDICATIONS AND DOSE

Melanoma (as monotherapy) (specialist use only)

▶ BY INTRAVENOUS INFUSION

- ▶ Child 12–17 years: 3 mg/kg every 3 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: IPILIMUMAB (YERVOY[®]): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (JANUARY 2019)

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in ipilimumab-treated patients reported to have corticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

- **CAUTIONS** For full details consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cancer pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · eye discomfort · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hypophysitis · hypopituitarism · hypotension · hypothyroidism · influenza like illness · lethargy · lymphopenia · mucositis · muscle complaints · nausea · nerve disorders · night sweats · oedema · pain · skin reactions · vasodilation · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Adrenal hypofunction · alkalosis · allergic rhinitis · amenorrhoea · arrhythmias · arthritis · brain oedema · depression · dysarthria · eosinophilia · eye inflammation · glomerulonephritis · haemolytic anaemia · hair colour changes · hypersensitivity · hyperthyroidism · hypogonadism · increased risk of infection · infusion related reaction · libido decreased · meningitis · movement disorders · multi organ failure · muscle weakness · myopathy · nephritis autoimmune · neutropenia · pancreatitis · paraneoplastic syndrome · peripheral ischaemia · polymyalgia rheumatica · psychiatric disorder · pulmonary oedema · renal failure · renal tubular acidosis · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · syncope · systemic inflammatory response syndrome · thrombocytopenia · tremor · tumour lysis syndrome · vascular disorders · vasculitis
- ▶ **Rare or very rare** Myasthenia gravis · proteinuria · thyroiditis
- ▶ **Frequency not known** Cytomegalovirus infection reactivation

SIDE-EFFECTS, FURTHER INFORMATION A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if bilirubin greater than 3 times upper limit of normal range or if transaminases equal to or greater than 5 times upper limit of normal range (limited information available).
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises monitor liver function tests and thyroid function prior to initiation of treatment and before each dose.
 - ▶ Manufacturer advises monitor for signs or symptoms of immune-related side-effects and gastrointestinal perforation—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion*, give undiluted or dilute to a concentration of 1–4 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 90 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C) and protect from light—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2094

The *Scottish Medicines Consortium* has advised (October 2018) that ipilimumab (Yervoy[®]) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adolescents 12 years of age and older. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3604

The *All Wales Medicines Strategy Group* has advised (November 2018) that ipilimumab (Yervoy[®]) is recommended as an option for use within NHS Wales as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adolescents 12 to 17 years of age. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [POM] £3,750.00 (Hospital only)
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [POM] £15,000.00 (Hospital only)

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · anaphylactic reaction · arthralgia · asthenia · conjunctivitis · constipation · cough · depression · diarrhoea · fever · headache · hypersensitivity (discontinue permanently) · increased risk of infection · infusion related reaction · leucopenia · myocardial infarction · neutropenia · night sweats · pain · thrombocytopenia · vomiting
- ▶ **Uncommon** Haemolytic anaemia · progressive multifocal leukoencephalopathy (PML)
- ▶ **Rare or very rare** Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

above

Rituximab

26-Apr-2019

- **INDICATIONS AND DOSE**

Post-transplantation lymphoproliferative disease (under expert supervision) | Non-Hodgkin's lymphoma (under expert supervision) | Hodgkin's lymphoma (under expert supervision) | Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Child:** Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

CAUTIONS, FURTHER INFORMATION For full details on cautions, consult product literature or local treatment protocol.

- ▶ **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Angioedema · anxiety · appetite decreased · arrhythmias · bone marrow disorders · bursitis · cancer pain · cardiac disorder · chest pain · chills · dizziness · dysphagia · dyspnoea · ear pain · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · hepatitis B · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hypertension · hypotension · insomnia · lacrimation disorder · malaise · migraine · multi organ failure · muscle complaints · muscle tone increased · nausea · nerve disorders · oedema · oral disorders · osteoarthritis · respiratory disorders · sensation abnormal · sepsis · skin reactions · throat irritation · tinnitus · vasodilation · weight decreased
- ▶ **Uncommon** Asthma · coagulation disorder · heart failure · hypoxia · ischaemic heart disease · lymphadenopathy · taste altered
- ▶ **Rare or very rare** Cytokine release syndrome · facial paralysis · renal failure · Stevens-Johnson syndrome (discontinue) · toxic epidermal necrolysis (discontinue) · tumour lysis syndrome · vasculitis · vision disorders
- ▶ **Frequency not known** Epistaxis · hearing loss · hypogammaglobulinaemia · infective thrombosis · influenza like illness · irritability · muscle weakness · nasal congestion · posterior reversible encephalopathy syndrome (PRES) · psychiatric disorder · seizure · skin papilloma · tremor

SIDE-EFFECTS, FURTHER INFORMATION Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Cytotoxic drug handling guidelines

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from the Department of Health and Social Care website (www.gov.uk/government/organisations/department-of-health-and-social-care).

Safe systems for cytotoxic medicines

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is coordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Cytotoxic drugs: effect on pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on sperm). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

Management of cytotoxic drug side-effects

Gastro-intestinal effects

Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis

Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 407, is effective.

Nausea and vomiting

Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment— fluorouracil, etoposide p. 593, low doses of methotrexate p. 588, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment— carboplatin p. 592, doxorubicin hydrochloride p. 583, intermediate and low doses of cyclophosphamide p. 579, mitoxantrone p. 585, and high doses of methotrexate.

Highly emetogenic treatment— cisplatin p. 592, dacarbazine p. 580, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a 5HT₃-receptor antagonist may be of benefit.

For patients at high risk of *emesis* or when other treatment is inadequate, a 5HT₃-receptor antagonist is often highly effective. The addition of dexamethasone p. 475 and other anti-emetics may also be required.

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 278. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT₃-receptor antagonists may have a role in preventing uncontrolled symptoms. Aprepitant p. 279 given in combination with a 5HT₃-receptor antagonist (with or without dexamethasone) is licensed for prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy.

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 238 can be helpful for its amnesiac, sedative, and anxiolytic effects.

For information on the treatment of nausea and vomiting, see Nausea and labyrinth disorders p. 275.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 594 and bleomycin p. 591 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 581. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin p. 827 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 825 should be given.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Long-term and delayed toxicity

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride or nephrotoxicity with cisplatin and ifosfamide p. 580). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute myeloblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment of cytotoxic drug side-effects

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol p. 601 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 587 or azathioprine p. 558 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 601 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression

Folinic acid p. 600 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of levofolinic acid p. 600, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid p. 600 is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 588 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 579 and ifosfamide p. 580; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 599 reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine.

Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity.

Daunorubicin p. 583, doxorubicin hydrochloride p. 583, and epirubicin hydrochloride p. 584 are anthracycline

antibiotics. Mitoxantrone p. 585 (mitozantrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 594 and vincristine sulfate p. 594 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 585, fludarabine phosphate p. 586, mercaptopurine p. 587, methotrexate, and tioguanine p. 590 are commonly used in paediatric chemotherapy.

Other antineoplastic drugs

Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Busulfan

12-Jun-2018

(Busulphan)

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic progenitor cell transplantation

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Avoid in Acute porphyrias p. 652 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · diarrhoea · hepatic disorders · nausea · respiratory disorders · sinusoidal obstruction syndrome · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon** Seizure
 - ▶ **Rare or very rare** Cataract · eye disorders
 - SPECIFIC SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intravenous use Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · ascites · asthenia · asthma · cardiomegaly · chest pain · chills · confusion · constipation ·

- cough · depression · dizziness · dyspnoea · dysuria · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hiccups · hyperglycaemia · hypersensitivity · hypertension · hypoalbuminaemia · hypotension · increased risk of infection · insomnia · mucositis · myalgia · nervous system disorder · neutropenia · oedema · pain · pancytopenia · pericardial effusion · pericarditis · reactivation of infections · renal disorder · renal impairment · stomatitis · vasodilation · weight increased
- ▶ With oral use Amenorrhoea (may be reversible) · azoospermia · bone marrow disorders · cardiac tamponade · delayed puberty · hyperbilirubinaemia · infertility male · leucopenia · leukaemia · menopausal symptoms · oral disorders · ovarian and fallopian tube disorders · testicular atrophy
- ▶ **Uncommon**
- ▶ With intravenous use Capillary leak syndrome · delirium · encephalopathy · hallucination · hypoxia · intracranial haemorrhage
- ▶ **Rare or very rare**
- ▶ With oral use Dry mouth · erythema nodosum · gynaecomastia · myasthenia gravis · radiation injury · Sjögren's syndrome
- ▶ **Frequency not known**
- ▶ With intravenous use Hypogonadism · ovarian failure · premature menopause · sepsis

SIDE-EFFECTS, FURTHER INFORMATION Lung toxicity
Discontinue if lung toxicity develops.

Secondary malignancy Use of busulfan is associated with an increased incidence of secondary malignancy.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic in *animals*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available)—monitor hepatic function, especially following transplant (consult product literature).
- **MONITORING REQUIREMENTS**
 - ▶ Monitor cardiac and liver function.
 - ▶ Monitor full blood count regularly throughout treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

▶ Busulfan (Non-proprietary)

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet (POM) £69.02 DT = £69.02

Solution for infusion

▶ Busulfan (Non-proprietary)

Busulfan 6 mg per 1 ml Busulfan 60mg/10ml concentrate for solution for infusion vials | 8 vial (POM) £1,529.50–£2,157.52 (Hospital only)

▶ Busilvex (Pierre Fabre Ltd)

Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule (POM) £1,610.00 (Hospital only)

Chlorambucil

10-Mar-2020

● INDICATIONS AND DOSE

Hodgkin's disease | Non-Hodgkin's lymphoma

► BY MOUTH

► Child: (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)

► BY MOUTH

► Child 3 months–17 years: 200 micrograms/kg daily for 8 weeks

- **UNLICENSED USE** Not licensed for use in nephrotic syndrome.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
 - **INTERACTIONS** → Appendix 1: alkylating agents
 - **SIDE-EFFECTS**
 - **Common or very common** Anaemia · bone marrow disorders · diarrhoea · gastrointestinal disorder · leucopenia · nausea · neoplasms · neutropenia · oral ulceration · seizures · thrombocytopenia · vomiting
 - **Uncommon** Skin reactions
 - **Rare or very rare** Cystitis · fever · hepatic disorders · movement disorders · muscle twitching · peripheral neuropathy · respiratory disorders · severe cutaneous adverse reactions (SCARs) · tremor
 - **Frequency not known** Amenorrhoea · azoospermia
- SIDE-EFFECTS, FURTHER INFORMATION** **Secondary malignancy** Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

Skin reactions Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor for signs and symptoms of toxicity.
Dose adjustments Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Chlorambucil (Non-proprietary)**

Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet PM
£42.87 DT = £42.87

Cyclophosphamide

10-Mar-2020

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

Steroid-sensitive nephrotic syndrome

► BY MOUTH

► Child 3 months–17 years: 2–3 mg/kg daily for 8 weeks

► BY INTRAVENOUS INFUSION

► Child 3 months–17 years: 500 mg/m² once a month for 6 months

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Avoid in Acute porphyrias p. 652 · diabetes mellitus · haemorrhagic cystitis · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- **Common or very common** Agranulocytosis · alopecia · anaemia · asthenia · bone marrow disorders · cystitis · decreased leucocytes · fever · haemolytic uraemic syndrome · haemorrhage · hepatic disorders · immunosuppression · increased risk of infection · mucosal abnormalities · neutropenia · progressive multifocal leukoencephalopathy (PML) · reactivation of infections · sperm abnormalities · thrombocytopenia
- **Uncommon** Appetite decreased · embolism and thrombosis · flushing · hypersensitivity · ovarian and fallopian tube disorders · sepsis
- **Rare or very rare** Bladder disorders · chest pain · confusion · constipation · diarrhoea · disseminated intravascular coagulation · dizziness · eye inflammation · fluid imbalance · headache · hyponatraemia · menstrual cycle irregularities · nail discolouration · nausea · neoplasms · oral disorders · pancreatitis acute · renal failure · secondary neoplasm · seizure · severe cutaneous adverse reactions (SCARs) · SIADH · skin reactions · visual impairment · vomiting
- **Frequency not known** Abdominal pain · altered smell sensation · arrhythmias · arthralgia · ascites · cardiac inflammation · cardiogenic shock · cardiomyopathy · cough · deafness · dyspnoea · encephalopathy · excessive tearing · facial swelling · gastrointestinal disorders · heart failure · hyperhidrosis · hypoxia · infertility · influenza like illness · multi organ failure · muscle complaints · myelopathy · myocardial infarction · nasal complaints · nephropathy · nerve disorders · neuralgia · neurotoxicity · oedema · oropharyngeal pain · palpitations · pericardial effusion · peripheral ischaemia · pulmonary hypertension · pulmonary oedema · QT interval prolongation · radiation injuries · renal tubular disorder · renal tubular necrosis · respiratory disorders · rhabdomyolysis · scleroderma · sensation abnormal · sinusoidal obstruction syndrome · taste altered · testicular atrophy · tinnitus · tremor · tumour lysis syndrome · vasculitis

SPECIFIC SIDE-EFFECTS

- With intravenous use Infusion site necrosis · injection site necrosis

SIDE-EFFECTS, FURTHER INFORMATION Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication that may be prevented by increasing fluid intake for 24–48 hours after intravenous injection. Mesna can also help prevent cystitis.

Secondary malignancy As with all cytotoxic therapy, treatment with cyclophosphamide is associated with an increased incidence of secondary malignancies.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of decreased cyclophosphamide activation and increased risk of veno-occlusive liver disease).

Dose adjustments Manufacturer advises consider dose adjustment in severe impairment—consult product literature.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose—consult local treatment protocol for details.

● **DIRECTIONS FOR ADMINISTRATION** Consult local treatment protocol for details.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Cyclophosphamide for nephrotic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ **Cyclophosphamide (Non-proprietary)**

Cyclophosphamide (as Cyclophosphamide monohydrate)

50 mg Cyclophosphamide 50mg tablets | 100 tablet [PoM](#) £139.00
DT = £139.00

▶ **Cytoxan** (Imported (United States))

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet [PoM](#) [S](#)

Powder for solution for injection

▶ **Cyclophosphamide (Non-proprietary)**

Cyclophosphamide (as Cyclophosphamide monohydrate)

500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial [PoM](#) £9.20 (Hospital only) | 1 vial [PoM](#) £9.66

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [PoM](#) £10.66 (Hospital only) | 1 vial [PoM](#) £17.91

Cyclophosphamide (as Cyclophosphamide monohydrate)

2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [PoM](#) £31.64 (Hospital only)

Dacarbazine

● **INDICATIONS AND DOSE**

Hodgkin's disease | Paediatric solid tumours

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

● **CAUTIONS** Caution in handling—irritant to tissues

● **INTERACTIONS** → Appendix 1: alkylating agents

● **SIDE-EFFECTS**

▶ **Common or very common** Anaemia · appetite decreased · leucopenia · nausea · thrombocytopenia · vomiting

▶ **Uncommon** Alopecia · infection · influenza like illness · photosensitivity reaction · skin reactions

▶ **Rare or very rare** Agranulocytosis · confusion · diarrhoea · flushing · headache · hepatic disorders · lethargy · pancytopenia · paraesthesia · renal impairment · seizure · visual impairment

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

● **RENAL IMPAIRMENT** Avoid in severe impairment.

Dose adjustments Dose reduction may be required in combined renal and hepatic impairment.

● **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Dacarbazine (Non-proprietary)**

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PoM](#) £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM](#) £70.00

Powder for solution for injection

▶ **Dacarbazine (Non-proprietary)**

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM](#) £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM](#) £160.00

Ifosfamide

24-Jul-2019

● **INDICATIONS AND DOSE**

Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour | Germ cell tumour | Osteogenic sarcoma

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

● **CONTRA-INDICATIONS** Acute infection · cystitis · urinary-tract obstruction · urothelial damage

● **CAUTIONS** Avoid in Acute porphyrias p. 652

● **INTERACTIONS** → Appendix 1: alkylating agents

● **SIDE-EFFECTS**

▶ **Common or very common** Alopecia · appetite decreased · bone marrow disorders · haemorrhage · hepatic disorders · infection · leucopenia · nausea · reactivation of infection · renal impairment · thrombocytopenia · vomiting

▶ **Uncommon** Cardiotoxicity · diarrhoea · hypotension · oral disorders

▶ **Rare or very rare** Skin reactions

▶ **Frequency not known** Abdominal pain · agranulocytosis · amenorrhoea · anaemia · angina pectoris · angioedema · arrhythmias · arthralgia · asterixis · behaviour abnormal · blood disorders · bone disorders · cancer progression · capillary leak syndrome · cardiac arrest · cardiomyopathy · chills · conjunctivitis · constipation · cough · deafness · delirium · delusions · disseminated intravascular

coagulation · dysarthria · dyspnoea · electrolyte imbalance · embolism and thrombosis · encephalopathy · eye irritation · fatigue · fever · flushing · gait abnormal · gastrointestinal disorders · growth retardation · haemolytic anaemia · heart failure · hyperglycaemia · hyperhidrosis · hyperphosphaturia · hypertension · hypoxia · immunosuppression · infertility · malaise · mania · memory loss · metabolic acidosis · movement disorders · mucosal ulceration · multi organ failure · muscle complaints · myocardial infarction · nail disorder · neoplasms · nephritis tubulointerstitial · nephrogenic diabetes insipidus · neurotoxicity · oedema · ovarian and fallopian tube disorders · pain · pancreatitis · panic attack · peripheral neuropathy · polydipsia · premature menopause · psychiatric disorders · pulmonary hypertension · pulmonary oedema · radiation recall reaction · respiratory disorders · rhabdomyolysis · secondary malignancy · sensation abnormal · sepsis · severe cutaneous adverse reactions (SCARs) · SIADH · sinusoidal obstruction syndrome · sperm abnormalities · status epilepticus · tinnitus · tumour lysis syndrome · urinary disorders · vasculitis · vertigo · visual impairment

SIDE-EFFECTS, FURTHER INFORMATION **Urothelial toxicity** Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Use of ifosfamide is associated with an increased incidence of acute leukaemia.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Ifosfamide (Non-proprietary)**

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [PoM](#) £115.79–£119.27

Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [PoM](#) £228.09–£234.94

Melphalan

● **INDICATIONS AND DOSE**

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in embryonal tumours.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Consider use of prophylactic anti-infective agents · for high-dose intravenous administration establish adequate hydration · haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · bone marrow depression (delayed) · diarrhoea · feeling hot · myalgia · myopathy · nausea · paraesthesia · stomatitis · thrombocytopenia · vomiting
 - ▶ **Rare or very rare** Haemolytic anaemia · hepatic disorders · peripheral vascular disease · respiratory disorders · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION **Secondary malignancy** Use of melphalan is associated with an increased incidence of acute leukaemias.

Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT**
Dose adjustments Reduce dose initially (consult product literature).
- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Melphalan (Non-proprietary)**

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [PoM](#) £137.37 (Hospital only) | 1 vial [PoM](#) £137.37

Temozolomide

25-Jul-2018

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

● **INDICATIONS AND DOSE**

Treatment of recurrent or progressive malignant glioma

- ▶ BY MOUTH
- ▶ Child 3-17 years: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1: alkylating agents

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · asthenia · chills · concentration impaired · confusion · constipation · cough · decreased leucocytes · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · emotional lability · fever · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hemiparesis · hyperglycaemia · hypersensitivity · increased risk of infection · insomnia · level of consciousness decreased · malaise · memory loss · movement disorders · muscle weakness · nausea · neutropenia · oedema · pain · peripheral neuropathy · radiation injury · seizures · sensation abnormal · skin reactions · speech impairment · stomatitis · taste altered · thrombocytopenia · tremor · urinary disorders · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Altered smell sensation · anaemia · behaviour disorder · bone marrow disorders · cognitive impairment · condition aggravated · Cushing's syndrome · depression · diabetes insipidus · ear pain · erectile dysfunction · eye pain · gait abnormal · hallucination · hepatic disorders · hyperacusis · hyperbilirubinaemia · hypertension · hypokalaemia · intracranial haemorrhage · myalgia · myopathy · nasal congestion · nervous system disorder · palpitations · photosensitivity reaction · reactivation of infections · thirst · tinnitus · tongue discolouration · vasodilation
- ▶ **Rare or very rare** Neoplasms · respiratory disorders · secondary malignancy · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
 - ▶ Monitor for myelodysplastic syndrome.
 - ▶ Monitor for secondary malignancies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

▶ Temozolomide (Non-proprietary)

- **Temozolomide 5 mg** Temozolomide 5mg capsules | 5 capsule [PoM](#) £16.00 | 5 capsule [PoM](#) £10.06 (Hospital only)
- **Temozolomide 20 mg** Temozolomide 20mg capsules | 5 capsule [PoM](#) £65.00 | 5 capsule [PoM](#) £40.23 (Hospital only)
- **Temozolomide 100 mg** Temozolomide 100mg capsules | 5 capsule [PoM](#) £325.00 | 5 capsule [PoM](#) £201.18 (Hospital only)
- **Temozolomide 140 mg** Temozolomide 140mg capsules | 5 capsule [PoM](#) £465.00 | 5 capsule [PoM](#) £296.47 (Hospital only)
- **Temozolomide 180 mg** Temozolomide 180mg capsules | 5 capsule [PoM](#) £586.00 | 5 capsule [PoM](#) £381.18 (Hospital only)
- **Temozolomide 250 mg** Temozolomide 250mg capsules | 5 capsule [PoM](#) £814.00 | 5 capsule [PoM](#) £529.42 (Hospital only)
- ▶ **Temodal** (Merck Sharp & Dohme Ltd)
● **Temozolomide 5 mg** Temodal 5mg capsules | 5 capsule [PoM](#) £10.59 (Hospital only)

- **Temozolomide 20 mg** Temodal 20mg capsules | 5 capsule [PoM](#) £42.35 (Hospital only)
- **Temozolomide 100 mg** Temodal 100mg capsules | 5 capsule [PoM](#) £211.77 (Hospital only)
- **Temozolomide 140 mg** Temodal 140mg capsules | 5 capsule [PoM](#) £296.48 (Hospital only)
- **Temozolomide 180 mg** Temodal 180mg capsules | 5 capsule [PoM](#) £381.19 (Hospital only)
- **Temozolomide 250 mg** Temodal 250mg capsules | 5 capsule [PoM](#) £529.43 (Hospital only)

Thiotepa

07-Feb-2019

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CAUTIONS** Avoid in Acute porphyrias p. 652
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · ataxia · bladder disorder · cardiac arrest · cardiovascular insufficiency · diarrhoea · encephalopathy · fever · gastrointestinal discomfort · graft versus host disease · growth retardation · haemorrhage · headache · hearing impairment · heart failure · hepatic failure · hyperglycaemia · hypertension · hypogonadism · hypopituitarism · hypothyroidism · hypoxia · increased risk of infection · intracranial haemorrhage · memory loss · mucositis · multi organ failure · nausea · neutropenia · pain · pancytopenia · paresis · psychiatric disorder · pulmonary oedema · renal failure · respiratory disorders · secondary malignancy · seizure · sepsis · sinusoidal obstruction syndrome · skin reactions · stomatitis · thrombocytopenia · vomiting
 - ▶ **Frequency not known** Pulmonary arterial hypertension · severe cutaneous adverse reactions (SCARs)
- **SIDE-EFFECTS, FURTHER INFORMATION** Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**

● Scottish Medicines Consortium (SMC) decisions SMC No. 790/12

The *Scottish Medicines Consortium* has advised (June 2012) that thiotepa (*Tepadina*[®]) is **not recommended** for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Tepadina** (Adienne Pharma & Biotech)
● **Thiotepa 15 mg** Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) [S](#)
- **Thiotepa 100 mg** Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) [S](#)

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

21-Nov-2019

● INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** *DaunoXome*[®] is not licensed for use in children.
- **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS** Abdominal pain · alopecia · amenorrhoea · anaemia · arrhythmias · ascites · atrioventricular block · azoospermia · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnoea · extravasation necrosis · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · stomatitis · thrombocytopenia · thrombophlebitis · urine red · venous sclerosis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** For solution for infusion manufacturer advises caution. For powder for solution for infusion manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS**
 - ▶ Cardiac monitoring essential.
 - ▶ Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.
- **PRESCRIBING AND DISPENSING INFORMATION** Daunorubicin is available as *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ *DaunoXome* (Galen Ltd)
Daunorubicin (as Daunorubicin hydrochloride citrate liposomal pegylated) 2 mg per 1 ml *DaunoXome* 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £250.00

Powder for solution for infusion

- ▶ *Dauronubicin* (Non-proprietary)
Daunorubicin (as Daunorubicin hydrochloride)
20 mg *Dauronubicin* 20mg powder for solution for infusion vials | 10 vial [PoM] £715.00 (Hospital only)

Doxorubicin hydrochloride

21-Nov-2019

● INDICATIONS AND DOSE

Some paediatric malignancies | Ewing's sarcoma | Osteogenic sarcoma | Wilms' tumour | Neuroblastoma | Retinoblastoma | Some liver tumours | Acute lymphoblastic leukaemia | Hodgkin's lymphoma | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute inflammatory heart disease · increased haemorrhagic tendency · marked persisting myelosuppression induced by previous treatment · marked persisting stomatitis induced by previous treatment · previous myocardial infarction · previous treatment with maximum cumulative doses of doxorubicin · previous treatment with maximum cumulative doses of other anthracycline · severe arrhythmia · severe myocardial insufficiency
- **CAUTIONS** Caution in handling—irritant to tissues · consult product literature
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · bone marrow depression · breast pain · cachexia · cardiovascular disorder · chest discomfort · chills · constipation · cough · decreased leucocytes · dehydration · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysphagia · dyspnoea · dysuria · electrolyte imbalance · epistaxis · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · headache · hyperhidrosis · hypersensitivity · hypertension · hyperthermia · hypotension · increased risk of infection · influenza like illness · infusion related reaction · insomnia · malaise · mucosal abnormalities · muscle complaints · muscle tone increased · muscle weakness · nail disorder · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · scrotal erythema · sensation abnormal · sepsis · skin reactions · skin ulcer · syncope · taste altered · thrombocytopenia · vasodilation · vision blurred · vomiting · weight decreased
 - ▶ **Uncommon** Confusion · embolism and thrombosis
 - ▶ **Rare or very rare** Secondary oral neoplasms · severe cutaneous adverse reactions (SCARs)
 - ▶ **Frequency not known** Asthma · congestive heart failure · secondary malignancy · throat tightness

SIDE-EFFECTS, FURTHER INFORMATION Extravasation can cause tissue necrosis.

Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** For solution for injection or infusion, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments Manufacturer advises dose reduction according to bilirubin concentration.
- **RENAL IMPAIRMENT** Consult product literature in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection▶ **Doxorubicin hydrochloride (Non-proprietary)**

- Doxorubicin hydrochloride 2 mg per 1 ml** Doxorubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £18.54 (Hospital only)
Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 50mg/25ml solution for infusion vials | 1 vial [PoM] £103.00 (Hospital only)
Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 10mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £11.55–£19.57 (Hospital only)
Doxorubicin 10mg/5ml solution for infusion vials | 1 vial [PoM] £20.60 (Hospital only)
Doxorubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £92.70 (Hospital only)
Doxorubicin 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £54.00–£97.85 (Hospital only)

Solution for infusion▶ **Doxorubicin hydrochloride (Non-proprietary)**

- Doxorubicin hydrochloride 2 mg per 1 ml** Doxorubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £ (Hospital only)
Doxorubicin 100mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £ (Hospital only)
Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial [PoM] £412.00 (Hospital only)
Doxorubicin 200mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £234.66–£391.40 (Hospital only)

▶ **Caelyx (Janssen-Cilag Ltd)**

- Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml** Caelyx pegylated liposomal 50mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £712.49
Caelyx pegylated liposomal 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £360.23

Epirubicin hydrochloride

18-Nov-2019

● **INDICATIONS AND DOSE**

Recurrent acute lymphoblastic leukaemia | Rhabdomyosarcoma | Other soft-tissue tumours of childhood

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · amenorrhoea · anaemia · appetite decreased · arrhythmias · cardiac conduction disorders · chills · congestive heart failure ·

dehydration · diarrhoea · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · increased risk of infection · leucopenia · malaise · mucositis · nail discolouration · nausea · neutropenia · oral disorders · skin reactions · thrombocytopenia · urine discolouration · vasodilation · vomiting

- ▶ **Uncommon** Asthenia · embolism and thrombosis · sepsis
- ▶ **Rare or very rare** Hyperuricaemia
- ▶ **Frequency not known** Bone marrow depression · cardiomyopathy · cardiotoxicity · photosensitivity reaction · radiation injuries · shock

SIDE-EFFECTS, FURTHER INFORMATION **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

Cumulative doses of other anthracycline Epirubicin is considered less toxic than other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
Dose adjustments In adults, manufacturer advises dose reduction according to bilirubin level.
- **RENAL IMPAIRMENT**
Dose adjustments Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
- ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection▶ **Epirubicin hydrochloride (Non-proprietary)**

- Epirubicin hydrochloride 2 mg per 1 ml** Epirubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £20.18 (Hospital only) | 1 vial [PoM] £17.38
Epirubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £100.88 (Hospital only) | 1 vial [PoM] £86.89

▶ **Pharmorubicin (Pfizer Ltd)**

- Epirubicin hydrochloride 2 mg per 1 ml** Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £106.19 (Hospital only)
Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £21.24 (Hospital only)

Solution for infusion▶ **Epirubicin hydrochloride (Non-proprietary)**

- Epirubicin hydrochloride 2 mg per 1 ml** Epirubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £366.85 (Hospital only) | 1 vial [PoM] £306.20–£347.55
Epirubicin 100mg/50ml solution for infusion vials | 1 vial [PoM] £201.76 (Hospital only)
- ▶ **Pharmorubicin (Pfizer Ltd)**
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [PoM] £386.16 (Hospital only)

Mitoxantrone

18-Nov-2019

(Mitozantrone)

● INDICATIONS AND DOSE

Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia

► BY INTRAVENOUS INFUSION

• Child: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children.

● **INTERACTIONS** → Appendix 1: anthracyclines

● **SIDE-EFFECTS** Abdominal pain · acute leukaemia · alopecia · amenorrhoea · anxiety · appetite decreased · arrhythmia · asthenia · bone marrow depression · confusion · constipation · diarrhoea · drowsiness · dyspnoea · fever · gastrointestinal haemorrhage · heart failure · mucositis · nail discolouration · nail dystrophy · nausea · neurological effects · paraesthesia · scleral discolouration · skin discolouration · stomatitis · thrombocytopenia · urine blue · vomiting

SIDE-EFFECTS, FURTHER INFORMATION All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available).

Dose adjustments Manufacturer advises consider dose reduction.

● MONITORING REQUIREMENTS

► Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► Mitoxantrone (Non-proprietary)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £51.43–£121.85 (Hospital only) | 1 vial [PoM] £51.43

► Onkotrone (Baxter Healthcare Ltd)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] £103.57
Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] £129.48

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Clofarabine

02-Jul-2018

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

► BY INTRAVENOUS INFUSION

• Child 1-17 years: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children under 1 year.

● **CAUTIONS** Cardiac disease

● **INTERACTIONS** → Appendix 1: clofarabine

● SIDE-EFFECTS

► **Common or very common** Alopecia · anxiety · appetite decreased · arthralgia · capillary leak syndrome · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · feeling abnormal · feeling hot · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing impairment · hepatic disorders · hyperbilirubinaemia · hyperhidrosis · hypersensitivity · hypotension · increased risk of infection · irritability · mucositis · multi organ failure · myalgia · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · pericardial effusion · peripheral neuropathy · psychiatric disorder · renal impairment · respiratory disorders · sepsis · sinusoidal obstruction syndrome · skin reactions · systemic inflammatory response syndrome · tachycardia · tremor · tumour lysis syndrome · vomiting · weight decreased

► **Frequency not known** Antibiotic associated colitis · gastrointestinal disorders · hyponatraemia · pancreatitis · severe cutaneous adverse reactions (SCARs)

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► Clofarabine (Non-proprietary)

Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

► Evoltra (Sanofi) ▼

Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

Cytarabine

02-Dec-2019

● **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

► BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION

► Child: (consult local protocol)

Meningeal leukaemia | Meningeal neoplasms

► BY INTRATHECAL INJECTION

► Child: (consult local protocol)

● **UNLICENSED USE** *Depocyte*® intrathecal injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

● **INTERACTIONS** → Appendix 1: cytarabine

● SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite decreased · consciousness impaired · diarrhoea · dysarthria · dysphagia · eye disorders · eye inflammation · eye stinging · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhagic conjunctivitis (consider

prophylactic corticosteroid eye drops) · hyperuricaemia · leucopenia · nausea · oral disorders · renal impairment · skin reactions · thrombocytopenia · urinary retention · vasculitis · vision disorders · vomiting

- ▶ **Uncommon** Arthralgia · dyspnoea · headache · increased risk of infection · myalgia · nerve disorders · pain · paralysis · pericarditis · sepsis · skin ulcer · throat pain
- ▶ **Rare or very rare** Arrhythmias
- ▶ **Frequency not known** Acute respiratory distress syndrome (ARDS) · amenorrhoea · ataxia · azoospermia · bone marrow disorders · cardiomyopathy · cerebellar dysfunction · chest pain · coma · confusion · cytarabine syndrome · dizziness · drowsiness · haemorrhage · hepatic disorders · hyperbilirubinaemia · neurotoxicity · neurotoxicity rash · neutropenia · pancreatitis · personality change · pulmonary oedema · reticulocytopenia · rhabdomyolysis · seizure · tremor
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of CNS toxicity).
Dose adjustments Manufacturer advises dose reduction—consult product literature.
- **RENAL IMPAIRMENT** Consult local treatment protocols.
- **MONITORING REQUIREMENTS**
 - ▶ Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Cytarabine is available as *conventional* and *liposomal* formulations. These different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.
Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Cytarabine (Non-proprietary)**
 - Cytarabine 20 mg per 1 ml** Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50
 - Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM] £30.00 (Hospital only)
 - Cytarabine 500mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £19.50 (Hospital only)
 - Cytarabine 100 mg per 1 ml** Cytarabine 1g/10ml solution for injection Cytosafe vials | 1 vial [PoM] £39.00 (Hospital only)
 - Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £37.05-£52.27 (Hospital only) | 1 vial [PoM] £39.00
 - Cytarabine 500mg/5ml solution for injection vials | 5 vial [PoM] £89.78-£100.00 (Hospital only)
 - Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM] £26.93 (Hospital only)
 - Cytarabine 2g/20ml solution for injection Cytosafe vials | 1 vial [PoM] £77.50 (Hospital only)
 - Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £73.63-£103.87 (Hospital only) | 1 vial [PoM] £77.50

Fludarabine phosphate

● INDICATIONS AND DOSE

Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation

- ▶ **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CONTRA-INDICATIONS** Haemolytic anaemia
- **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer
- CAUTIONS, FURTHER INFORMATION**
 - ▶ Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.
- **INTERACTIONS** → Appendix 1: fludarabine
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · appetite decreased · asthenia · bone marrow depression (may be cumulative) · chills · cough · diarrhoea · fever · increased risk of infection · malaise · mucositis · nausea · neoplasms · nerve disorders · neutropenia · oedema · stomatitis · thrombocytopenia · vision disorders · vomiting
 - ▶ **Uncommon** Autoimmune disorder · confusion · dyspnoea · haemorrhage · respiratory disorders · tumour lysis syndrome
 - ▶ **Rare or very rare** Agitation · arrhythmia · coma · heart failure · seizure · severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
 - ▶ With oral use Progressive multifocal leukoencephalopathy (PML) · skin reactions · viral infection reactivation
 - ▶ With parenteral use Rash
- ▶ **Uncommon**
 - ▶ With oral use Acquired haemophilia · crystalluria · electrolyte imbalance · haemolytic anaemia · hyperuricaemia · metabolic acidosis · renal failure
- ▶ **Frequency not known**
 - ▶ With parenteral use Encephalopathy · intracranial haemorrhage
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (embryotoxic and teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute/1.73 m².
Dose adjustments Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of haemolysis.
 - ▶ Monitor for neurological toxicity.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Fludarabine phosphate (Non-proprietary)**
Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £155.00-£156.00 (Hospital only)

Tablet

- ▶ **Fludara** (Sanofi)
Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Powder for solution for injection

- ▶ **Fludarabine phosphate (Non-proprietary)**
Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only)
- ▶ **Fludara** (Sanofi)
Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Mercaptopurine

02-Dec-2019

(6-Mercaptopurine)

● INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

- ▶ BY MOUTH
- ▶ Child 2-17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

Acute lymphoblastic leukaemia | Lymphoblastic lymphomas

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

DOSE EQUIVALENCE AND CONVERSION

- ▶ Mercaptopurine tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

Not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs;

those with reduced TPMT activity may be treated under specialist supervision.

- **INTERACTIONS** → Appendix 1: mercaptopurine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · appetite decreased · bone marrow depression · diarrhoea · hepatic disorders · hepatotoxicity (more common at high doses) · leucopenia · nausea · oral disorders · pancreatitis · thrombocytopenia · vomiting
- ▶ **Uncommon** Arthralgia · fever · increased risk of infection · neutropenia · rash
- ▶ **Rare or very rare** Alopecia · face oedema · intestinal ulcer · neoplasms · oligozoospermia
- ▶ **Frequency not known** Hypoglycaemia · photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
- **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT**
- **Dose adjustments** Manufacturer advises consider reducing dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- **MONITORING REQUIREMENTS**
- ▶ Monitor liver function—discontinue if jaundice develops.
- ▶ When used for Severe ulcerative colitis or Severe Crohn's disease Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Oral suspension

EXCIPIENTS: May contain Aspartame

- ▶ **Xaluprine** (Nova Laboratories Ltd)
Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml [PoM] £170.00 DT = £170.00

Tablet

- ▶ **Mercaptopurine (Non-proprietary)**
Mercaptopurine 10 mg Mercaptopurine 10mg tablets | 100 tablet [PoM] [X]
- ▶ **Mercaptopurine 50 mg** Mercaptopurine 50mg tablets | 25 tablet [PoM] £49.15 DT = £49.15
Hanixol 50mg tablets | 25 tablet [PoM] £34.39 DT = £49.15

Methotrexate

25-Jul-2019

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

● INDICATIONS AND DOSE

Severe Crohn's disease

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn's disease

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis | Juvenile dermatomyositis | Vasculitis | Uveitis | Systemic lupus erythematosus | Localised scleroderma | Sarcoidosis

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

- ▶ BY INTRATHECAL INJECTION
- ▶ Child: (consult local protocol)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

- ▶ BY MOUTH
- ▶ Child 2–17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose

- **UNLICENSED USE** *Metoteject*[®] is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions.

IMPORTANT SAFETY INFORMATION

NHS NEVER EVENT: OVERDOSE OF METHOTREXATE FOR NON-CANCER TREATMENT (JANUARY 2018)

Patients given methotrexate, by any route, for non-cancer treatment should not be given more than their intended weekly dose.

WEEKLY DOSING

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;

- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection · ascites · immunodeficiency syndromes · significant pleural effusion
- **CAUTIONS** Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

- ▶ **Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- ▶ **Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- ▶ **Liver toxicity** Persistent 2–fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare.
- ▶ **Pulmonary toxicity** Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.

- **INTERACTIONS** → Appendix 1: methotrexate

● SIDE-EFFECTS

▶ Common or very common

- ▶ With intrathecal use Necrotising demyelinating leukoencephalopathy · neurotoxicity
- ▶ With oral use Anaemia · appetite decreased · diarrhoea · drowsiness · fatigue · gastrointestinal discomfort · headache · increased risk of infection · leucopenia · nausea · oral disorders · respiratory disorders · skin reactions · throat ulcer · thrombocytopenia · vomiting
- ▶ With parenteral use Anaemia · appetite decreased · chest pain · cough · diarrhoea · drowsiness · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · leucopenia · malaise · nausea · oral disorders · respiratory disorders · skin reactions · throat complaints · thrombocytopenia · vomiting

▶ Uncommon

- ▶ With oral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · chills · confusion · cystitis · depression · diabetes mellitus · dysuria · fever · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · myalgia · neoplasms · nephropathy · osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders
- ▶ With parenteral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipotrophy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders

► **Rare or very rare**

- With oral use Azotaemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discolouration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment
- With parenteral use Apnoea · asthma-like conditions · azotaemia · conjunctivitis · embolism and thrombosis · eosinophilia · gynaecomastia · hypotension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningism · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discolouration · necrosis · neutropenia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · sperm abnormalities · stress fracture · taste altered · telangiectasia · vision disorders
- **Frequency not known**
- With oral use Encephalopathy
- With parenteral use Aphasia · chills · cognitive disorder · defective oogenesis · dizziness · hemiparesis · leukoencephalopathy · metabolic change · mucositis · nephropathy · pancreatitis · pulmonary oedema · skin ulcer · sudden death · tinnitus

SIDE-EFFECTS, FURTHER INFORMATION Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hepatotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men and women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Risk of nephrotoxicity at high doses. Avoid in severe impairment.

Dose adjustments Reduce dose.

- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

Check immunity to varicella-zoster and consider vaccination before initiating therapy.

- **MONITORING REQUIREMENTS** Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- **PATIENT AND CARER ADVICE** Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen

Children and their carers should be counselled on the dose and use of NSAIDs.

Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/methotrexate-skin-conditions

► **Jylamvo** (Intrapharm Laboratories Ltd)

Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Jylamvo 2mg/ml oral solution sugar-free | 60 ml [PoM](#) £112.50

Nelarabine

24-Jul-2018

• **INDICATIONS AND DOSE**

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- **INTERACTIONS** → Appendix 1: nelarabine

• **SIDE-EFFECTS**

- **Common or very common** Anaemia · arthralgia · asthenia · ataxia · confusion · constipation · diarrhoea · drowsiness · electrolyte imbalance · fever · headache · hyperbilirubinaemia · hypoglycaemia · increased risk of infection · leucopenia · nausea · neutropenia · pain in extremity · peripheral neuropathy · seizures · sensation abnormal · sepsis · stomatitis · thrombocytopenia · tremor · vomiting
- **Rare or very rare** Rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION If neurotoxicity occurs, treatment should be discontinued.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **BREAST FEEDING** Discontinue breast-feeding.

• **MONITORING REQUIREMENTS**

- **Neurotoxicity** Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

• **PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

• **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2008) that the use of nelarabine (*Atriance*[®]) within NHS Scotland is restricted to bridging treatment before stem cell transplantation and restricted to use by haemato-oncology specialists.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM](#) £1,332.00

Tioguanine

(Tioguanine)

• **INDICATIONS AND DOSE**

Infant acute lymphoblastic leukaemia

- BY MOUTH

- Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 575.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
 - ▶ Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.
- **INTERACTIONS** → Appendix 1: tioguanine
- **SIDE-EFFECTS**
 - ▶ Common or very common Bone marrow failure · gastrointestinal disorders · hepatic disorders · hyperbilirubinaemia · hyperuricaemia · hyperuricosuria · nodular regenerative hyperplasia · oesophageal varices · sinusoidal obstruction syndrome · splenomegaly · stomatitis · thrombocytopenia · uric acid nephropathy · weight increased
 - ▶ Frequency not known Photosensitivity reaction
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** **Dose adjustments** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet▶ **Tioguanine (Non-proprietary)**

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet PoM
 £109.57 DT = £109.57

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

● **INDICATIONS AND DOSE**

Some germ cell tumours | Hodgkin's lymphoma

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute pulmonary infection · significantly reduced lung function
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: bleomycin
- **SIDE-EFFECTS**
 - ▶ Common or very common Alopecia · angular stomatitis · appetite decreased · chills · fever (after administration) · haemorrhage · headache · interstitial pneumonia ·
- leucopenia · malaise · nail discolouration · nail disorder · nausea · pain · pulmonary fibrosis (dose-related) · scleroderma · skin reactions · stomatitis · vomiting · weight decreased
- ▶ **Uncommon** Diarrhoea · dizziness · hepatocellular injury · oliguria · shock · urinary disorders · vein wall hypertrophy · venous stenosis
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT** **Dose adjustments** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection▶ **Bleo-Kyowa** (Kyowa Kirin Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa
 15,000unit powder for solution for injection vials | 10 vial PoM
 £190.60

Dactinomycin

(Actinomycin D)

● **INDICATIONS AND DOSE**

Wilms' tumour | Childhood rhabdomyosarcoma and other soft-tissue sarcomas | Ewing's sarcoma

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: dactinomycin
- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · appetite decreased · ascites · bone marrow disorders · diarrhoea · dysphagia · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · growth retardation · healing impaired · hepatic disorders · hypocalcaemia · increased risk of infection · lethargy · leucopenia · leukaemia secondary · malaise · myalgia · nausea · neutropenia · oedema · oral disorders · pneumonitis · renal impairment · reticulocytopenia · secondary neoplasm · sepsis · severe cutaneous adverse reactions (SCARs) · sinusoidal obstruction syndrome · skin reactions · soft tissue damage · thrombocytopenia · tumour lysis syndrome · venous thrombosis · vomiting
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be

appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
Dose adjustments Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

08-Mar-2019

● INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms' tumour | Some liver tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · asthenia · cardiovascular disorder · constipation · diarrhoea · gastrointestinal discomfort · haemorrhage · hypersensitivity · increased risk of infection · leucopenia · mucosal abnormalities · musculoskeletal disorder · nausea · neutropenia · ototoxicity · peripheral neuropathy · reflexes decreased · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · urogenital disorder · vision disorders · vomiting
 - ▶ **Rare or very rare** Angioedema
 - ▶ **Frequency not known** Appetite decreased · bone marrow failure · chills · dehydration · embolism · encephalopathy · extravasation necrosis · fever · haemolytic uraemic syndrome · heart failure · hypertension · hyponatraemia · hypotension · injection site necrosis · malaise · pancreatitis · stomatitis · stroke · treatment related secondary malignancy · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute/1.73 m².

Dose adjustments Reduce dose.

Monitoring Monitor haematological parameters in renal impairment.

Monitor renal function in renal impairment.

- **MONITORING REQUIREMENTS**
 - ▶ Consider therapeutic drug monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 - ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
Patients whose treatment was started before this guidance was published should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta284
 - ▶ **Bevacizumab in combination with gemcitabine and carboplatin for treating the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.
Patients whose treatment was started before this guidance was published should have the option to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta285

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM](#) £20.20–£21.70 (Hospital only)
Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM](#) £56.06–£60.59 (Hospital only)
Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM](#) £232.64–£264.53 (Hospital only)
Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM](#) £260.00 (Hospital only) | 1 vial [PoM](#) £260.00
Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM](#) £166.32–£181.77 (Hospital only)

Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM](#) £65.83 (Hospital only) | 1 vial [PoM](#) £65.83
Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM](#) £22.86 (Hospital only) | 1 vial [PoM](#) £22.86

Cisplatin

● INDICATIONS AND DOSE

Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Infant brain tumours | Intra-cranial germ-cell tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS**
Hydration Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing

potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.

- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · arrhythmias · bone marrow failure · electrolyte imbalance · extravasation necrosis · fever · leucopenia · nephrotoxicity (dose-related and potentially cumulative) · sepsis · thrombocytopenia
 - ▶ **Uncommon** Anaphylactoid reaction · ototoxicity (dose-related and potentially cumulative) · spermatogenesis abnormal
 - ▶ **Rare or very rare** Acute leukaemia · cardiac arrest · encephalopathy · myocardial infarction · nerve disorders · seizure · stomatitis
 - ▶ **Frequency not known** Alopecia · appetite decreased · asthenia · autonomic dysfunction · cardiac disorder · cerebrovascular insufficiency · deafness · dehydration · diarrhoea · haemolytic anaemia · hiccups · hyperuricaemia · infection · Lhermitte's sign · malaise · muscle spasms · myelopathy · nausea · papilloedema · pulmonary embolism · rash · Raynaud's phenomenon · renal impairment · renal tubular disorder · retinal discolouration · SIADH · taste loss · tetany · thrombotic microangiopathy · tinnitus · vision disorders · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic. **Monitoring** Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count.
 - ▶ Monitor audiology.
 - ▶ Monitor plasma electrolytes.
 - ▶ Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
 - ▶ For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
 - ▶ Monitor renal function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Cisplatin (Non-proprietary)

- Cisplatin 1 mg per 1 ml** Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £24.50–£28.11 DT = £19.50 (Hospital only)
- Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 DT = £29.83 (Hospital only) | 1 vial [PoM] £8.12 DT = £29.83
- Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £4.36–£28.11 DT = £19.50 | 1 vial [PoM] £25.37 DT = £19.50 (Hospital only)
- Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.36–£5.90 (Hospital only)
- Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22–£55.64 DT = £29.83 (Hospital only)

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

12-Jul-2018

● INDICATIONS AND DOSE

- Stage 4 neuroblastoma** | **Germ-cell tumours** | **Intracranial germ-cell tumours** | **Rhabdomyosarcoma** | **Soft-tissue sarcomas** | **Neuroectodermal tumours (including medulloblastoma)** | **Relapsed Hodgkin's disease** | **Non-Hodgkin's lymphoma** | **Ewing tumour** | **Acute lymphoblastic leukaemia** | **Acute myeloid leukaemia**
- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
 - ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **INTERACTIONS** → Appendix 1: etoposide
- **SIDE-EFFECTS**
 - **GENERAL SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · acute leukaemia · alopecia · anaemia · appetite decreased · arrhythmia · asthenia · bone marrow depression · constipation · diarrhoea · dizziness · hepatotoxicity · hypertension · leucopenia · malaise · mucositis · myocardial infarction · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
 - ▶ **Uncommon** Nerve disorders
 - ▶ **Rare or very rare** Dysphagia · neurotoxicity · radiation recall reaction · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · vision loss
 - **SPECIFIC SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intravenous use Anaphylactic reaction · hypotension · infection
 - ▶ With oral use Oesophagitis · stomatitis · transient systolic hypotension
 - ▶ **Uncommon**
 - ▶ With intravenous use Haemorrhage
 - ▶ **Rare or very rare**
 - ▶ With intravenous use Fever
 - ▶ With oral use Drowsiness
 - ▶ **Frequency not known**
 - ▶ With intravenous use Angioedema · extravasation necrosis · infertility · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of accumulation).
- **RENAL IMPAIRMENT** **Dose adjustments** Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Etoposide (Non-proprietary)

Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £11.50–£16.29 (Hospital only)
Etoposide 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] (Hospital only)

Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.70–£81.42 (Hospital only)

Capsule

CAUTIONARY AND ADVISORY LABELS 23

▶ Vepesid (Chepharm Arzneimittel GmbH)

Etoposide 50 mg Vepesid 50mg capsules | 20 capsule [PoM] £99.82

Etoposide 100 mg Vepesid 100mg capsules | 10 capsule [PoM] £87.23

Powder for solution for injection

▶ Etopophos (Chepharm Arzneimittel GmbH)

Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

03-Dec-2019

● INDICATIONS AND DOSE

Hodgkin's disease and other lymphomas

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**

- ▶ **Rare or very rare** Hearing impairment · nerve disorders · vestibular damage
- ▶ **Frequency not known** Abdominal pain · acute respiratory distress syndrome (ARDS) · alopecia (reversible) · anaemia · appetite decreased · asthenia · balance impaired · cancer pain · constipation · depression · diarrhoea · dizziness · dyspnoea · haemorrhage · headache · hypertension · ileus · increased risk of infection · leucopenia (dose-limiting) · malaise · mediastinal disorder · myalgia · myocardial infarction · nausea · nystagmus · oral blistering · pain · Raynaud's phenomenon · reflexes absent · seizure · sensation abnormal · SIADH · skin reactions · stroke · thrombocytopenia · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Constipation

Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in significantly impaired hepatic or biliary function.
Dose adjustments Manufacturer advises consider initial dose reduction in significantly impaired hepatic or biliary function.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Vinblastine sulfate (Non-proprietary)

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial [PoM] £85.00 (Hospital only)

Vincristine sulfate

03-Dec-2019

● INDICATIONS AND DOSE

Acute leukaemias | Lymphomas | Paediatric solid tumours

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · ileus · neuromuscular disease
- **INTERACTIONS** → Appendix 1: vinca alkaloids
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Hypersensitivity · rash · SIADH
- ▶ **Frequency not known** Abdominal cramps · adrenal disorder · alopecia · anaemia · appetite decreased · azotaemia · bladder atony · bronchospasm · connective tissue disorders · constipation · coronary artery disease · dehydration · diarrhoea · dizziness · dyspnoea · eighth cranial nerve damage · eye disorders · fever · gait abnormalities · gastrointestinal disorders · haemolytic anaemia · headache · hearing impairment · hypertension · hyponatraemia · hypotension · infection · leucopenia · movement disorders · muscle atrophy · myalgia · myocardial infarction · nausea · neuromuscular effects (dose-limiting) · neutropenia · oedema · oral disorders · pain · paralysis · paresis · reflexes absent · renal disorder · secondary malignancy · seizure · sensation abnormal · sepsis · throat pain · thrombocytopenia · urinary disorders · vertigo · vestibular damage · vision loss · vomiting · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION Bronchospasm

Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

Neurotoxicity Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, paresthesia, hyporeflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment

interruption or treatment discontinuation, depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

Constipation Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises dose reduction.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Vincristine sulfate (Non-proprietary)

Vincristine sulfate 1 mg per 1 ml Vincristine 1mg/1ml solution for injection vials | 1 vial [PoM] £13.47 (Hospital only) | 5 vial [PoM] £67.35 (Hospital only)
 Vincristine 2mg/2ml solution for injection vials | 1 vial [PoM] £26.66 (Hospital only) | 5 vial [PoM] £133.30 (Hospital only)
 Vincristine 5mg/5ml solution for injection vials | 5 vial [PoM] £329.50 (Hospital only)

ANTINEOPLASTIC DRUGS > OTHER

Asparaginase

11-Sep-2018

- **DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: (consult product literature or local protocols).
- Child 1-11 months: (consult product literature or local protocols)
- Child 1-17 years: 5000 units/m² every 3 days

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy · history of serious haemorrhage related to asparaginase therapy · history of serious thrombosis related to asparaginase therapy · pancreatitis · pre-existing known coagulopathy
- **CAUTIONS** Diabetes (may raise blood glucose) · hypersensitivity reactions · hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

CAUTIONS, FURTHER INFORMATION

- Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur— asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.
- **INTERACTIONS** → Appendix 1: asparaginase
- **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · agitation · anaemia · angioedema · appetite decreased · arthralgia · back pain · bronchospasm · confusion · depression ·

- diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · embolism and thrombosis · fatigue · flushing · haemorrhage · hallucination · hyperglycaemia · hypersensitivity · hypoalbuminaemia · hypoglycaemia · hypotension · increased risk of infection · leucopenia · nausea · neurological effects · oedema · pancreatitis · skin reactions · thrombocytopenia · vomiting · weight decreased
- **Uncommon** Headache · hyperammonaemia · hyperuricaemia

- **Rare or very rare** Coma · consciousness impaired · diabetic ketoacidosis · hepatic disorders · hyperparathyroidism · hypoparathyroidism · ischaemic stroke · necrotising pancreatitis · pancreatic pseudocyst · posterior reversible encephalopathy syndrome (PRES) · seizure · tremor
- SIDE-EFFECTS, FURTHER INFORMATION** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.

● PATIENT AND CARER ADVICE

- **Driving and skilled tasks** Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1319/18

The *Scottish Medicines Consortium* has advised (April 2018) that asparaginase (*Spectrila*®) is accepted for use within NHS Scotland when used as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Spectrila (medac UK) ▼

Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial [PoM] £450.00 (Hospital only)

Crisantaspase

16-Mar-2017

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac*® asparaginase and *Elspar*® asparaginase.
- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **CAUTIONS** Diabetes (may raise blood glucose)
- **INTERACTIONS** → Appendix 1: crisantaspase
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Chills · coagulation disorders · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · face oedema · fever · headache · hepatic disorders · hypersensitivity · limb swelling · lip swelling · neurotoxicity · pain · pallor · pancreatitis · seizures · skin reactions · thrombosis
 - ▶ **Uncommon** Hyperglycaemia · hyperlipidaemia · hypoxia · increased risk of infection · respiratory disorders
 - ▶ **Rare or very rare** Arthritis reactive · coma · diabetic ketoacidosis · dysphagia · dysphasia · encephalopathy · haemorrhage · level of consciousness decreased · myalgia · myocardial infarction · necrotising pancreatitis · neutropenia · paresis · sepsis · thrombocytopenia
 - ▶ **Frequency not known** Abdominal pain · flushing · hyperammonaemia · hypertension · hypotension · nausea · pseudocyst · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Erwinase** (Jazz Pharmaceuticals UK)
Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial [PoM] £3,065.00

Hydroxycarbamide

16-Oct-2019

(Hydroxyurea)

● INDICATIONS AND DOSE

SIKLOS®

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

- ▶ BY MOUTH
- ▶ Child 2-17 years: Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be

increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

XROMI®

Sickle-cell disease [prevention of vaso-occlusive complications] (specialist use only)

- ▶ BY MOUTH
- ▶ Child 2-17 years: Initially 15 mg/kg daily, increased in steps of 5 mg/kg daily, dose to be increased every 8 weeks according to response; usual maintenance 20–25 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- **INTERACTIONS** → Appendix 1: hydroxycarbamide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · bone marrow disorders · chills · constipation · cutaneous vasculitis · dermatomyositis · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · dysuria · fever · gastrointestinal discomfort · haemorrhage · hallucination · headache · hepatic disorders · leucopenia · malaise · mucositis · nail discolouration · nail disorder · nausea · neoplasms · neutropenia · oral disorders · pancreatitis · peripheral neuropathy · pulmonary oedema · red blood cell abnormalities · respiratory disorders · seizure · skin reactions · skin ulcers · sperm abnormalities · thrombocytopenia · vomiting
 - ▶ **Rare or very rare** Cutaneous lupus erythematosus · gangrene · systemic lupus erythematosus (SLE)
- **Frequency not known** Amenorrhoea · gastrointestinal disorders · hypomagnesaemia · Parvovirus B19 infection · vitamin D deficiency · weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (unless used for malignant conditions).
- **RENAL IMPAIRMENT** In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **Dose adjustments** In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal and hepatic function before and during treatment.
 - ▶ Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 to 3 months thereafter (or every 2 weeks if on maximum dose).
 - ▶ Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.
Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-sickle-cell-disease

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 27
EXCIPIENTS: May contain Hydroxybenzoates (parabens)

Hydroxycarbamide 100 mg per 1 ml Xromi 100mg/ml oral solution sugar-free | 150 ml PoM £250.00

Tablet

- ▶ **Siklos** (Masters Pharmaceuticals Ltd)

Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet PoM

£100.00 DT = £100.00

Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet PoM
£500.00 DT = £500.00

Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CAUTIONS** Avoid in Acute porphyrias p. 652 · risk of accumulation in overweight patients
- **INTERACTIONS** → Appendix 1: mitotane
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Adrenal insufficiency · anaemia · appetite decreased · asthenia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · dyslipidaemia · gastrointestinal discomfort · gynaecomastia · headache · hepatic disorders · leucopenia · movement disorders · mucositis · muscle weakness · nausea · paraesthesia · polyneuropathy · rash · thrombocytopenia · vertigo · vomiting
 - ▶ **Frequency not known** Encephalopathy · eye disorders · flushing · fungal infection · generalised pain · growth retardation · haemorrhage · hyperpyrexia · hypersalivation · hypertension · hypothyroidism · hypouricaemia · lens opacity · neuro-psychological retardation · ovarian cyst · postural hypotension · proteinuria · taste altered · thyroid disorder · vision disorders
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (limited information available).
Monitoring In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
Monitoring In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

MONITORING REQUIREMENTS

- ▶ Monitor plasma-mitotane concentration—consult product literature.

PRESCRIBING AND DISPENSING INFORMATION

- ▶ Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.
- **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).
Driving and skilled tasks Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

- ▶ **Lysodren** (HRA Pharma UK Ltd)

Mitotane 500 mg Lysodren 500mg tablets | 100 tablet PoM
£590.97 DT = £590.97

Pegaspargase

24-Jul-2018

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

INDICATIONS AND DOSE

Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

▶ Neonate: 82.5 units/kg every 14 days.

- ▶ Child (body surface area up to 0.6 m²): 82.5 units/kg every 14 days
- ▶ Child (body surface area 0.6 m² and above): 2500 units/m² every 14 days

IMPORTANT SAFETY INFORMATION

Be aware that doses are calculated either using units/kg or units/m², depending on the size of the child.

- **CONTRA-INDICATIONS** History of pancreatitis · history of serious haemorrhagic event with previous L-asparaginase therapy · history of serious thrombosis with previous L-asparaginase therapy
- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function · diabetes (may raise blood glucose) · hypersensitivity reactions · marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy
CAUTIONS, FURTHER INFORMATION
 - ▶ Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.
- **INTERACTIONS** → Appendix 1: pegaspargase
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · ascites · bone marrow disorders · coagulation disorders · diarrhoea · dyslipidaemia ·

embolism and thrombosis · febrile neutropenia · hepatic disorders · hyperglycaemia · hypersensitivity · hypoalbuminaemia · hypokalaemia · hypoxia · increased risk of infection · nausea · pain in extremity · pancreatitis (discontinue if suspected and do not restart if confirmed) · peripheral neuropathy · seizure · sepsis · skin reactions · stomatitis · syncope · vomiting · weight decreased

- ▶ **Rare or very rare** Haemorrhage · necrotising pancreatitis · posterior reversible encephalopathy syndrome (PRES)
- ▶ **Frequency not known** Acute kidney injury · confusion · diabetic ketoacidosis · drowsiness · fever · hyperammonaemia (monitor if symptoms present) · hypoglycaemia · pancreatic pseudocyst · stroke · toxic epidermal necrolysis · tremor

SIDE-EFFECTS, FURTHER INFORMATION There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegaspargase.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Manufacturer advises avoid unless essential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
 - ▶ Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 2 mL must be divided between more than one site.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.
- **PATIENT AND CARER ADVICE**

Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**

- ▶ Pegaspargase for treating acute lymphoblastic leukaemia (September 2016) NICE TA408
- Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue

treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta408

Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2016) that pegaspargase (*Oncaspar*[®]) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- Solution for injection**
 - ▶ **Oncaspar** (Servier Laboratories Ltd) ▼
Pegaspargase 750 unit per 1 ml Oncaspar 3,750units/5ml solution for injection vials | 1 vial [PoM] £1,296.19
- ▶ **Powder for solution for injection**
 - ▶ **Pegaspargase (non-proprietary)** ▼
Pegaspargase 3750 unit Oncaspar 3,750unit powder for solution for injection vials | 1 vial [PoM] £1,296.19 (Hospital only)

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

- **INDICATIONS AND DOSE**

Hodgkin's lymphoma

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1: procarbazine
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased
 - ▶ **Frequency not known** Azoospermia · hepatic disorders · infection · lethargy · leucopenia · nausea · neutropenia · ovarian failure · pneumonitis · skin reactions · thrombocytopenia · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

- ▶ **Procarbazine (Non-proprietary)**

Procarbazine (as Procarbazine hydrochloride)

50 mg Procarbazine 50mg capsules | 50 capsule [PoM] £411.35-£479.63 DT = £445.49

RETINOID AND RELATED DRUGS

Tretinoin

15-Jan-2020

● INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

► BY MOUTH

► Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL RETINOID MEDICINES: REVISED AND SIMPLIFIED PREGNANCY PREVENTION EDUCATIONAL MATERIALS FOR HEALTHCARE PROFESSIONALS AND WOMEN (JUNE 2019)

Materials to support the Pregnancy Prevention Programme in women and girls of childbearing potential taking oral acitretin, alitretinoin, or isotretinoin have been updated. Oral tretinoin and bexarotene do not have a Pregnancy Prevention Programme in light of their oncology indication and specialist care setting. However, healthcare professionals are advised that these medicines are extremely teratogenic and product information should be consulted for contraceptive and pregnancy testing requirements when used in females of childbearing potential.

Neuropsychiatric reactions have been reported in patients taking oral retinoids. Healthcare professionals are advised to monitor patients for signs of depression or suicidal ideation and refer for appropriate treatment, if necessary; particular care is needed in those with a history of depression. Patients should be advised to speak to their doctor if they experience any changes in mood or behaviour, and encouraged to ask family and friends to look out for any change in mood.

● **CAUTIONS** History of depression (risk of neuropsychiatric reactions) · increased risk of thromboembolism during first month of treatment

● **INTERACTIONS** → Appendix 1: retinoids

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · alopecia · anxiety · appetite decreased · arrhythmia · asthma · bone pain · cheilitis · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · flushing · headache · hearing impairment · hyperhidrosis · idiopathic intracranial hypertension (children particularly susceptible - consider dose reduction if intractable headache in children) · insomnia · intracranial pressure increased · malaise · nasal dryness · nausea · pancreatitis · paraesthesia · respiratory disorders · skin reactions · visual impairment · vomiting

► **Frequency not known** Embolism and thrombosis · erythema nodosum · genital ulceration · hepatotoxicity · hypercalcaemia · increased leucocytes · myocardial infarction · myositis · necrotising fasciitis · QT interval prolongation · stroke · thrombocytosis · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Children are particularly susceptible to nervous system effects.

Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

● **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

● **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Avoid (discontinue breast-feeding).

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments Manufacturer advises dose reduction.

● **RENAL IMPAIRMENT**

Dose adjustments Reduce dose—consult local treatment protocol for details.

● **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

● **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

● **PATIENT AND CARER ADVICE**

Risk of neuropsychiatric reactions The MHRA advises patients and carers to seek medical attention if changes in mood or behaviour occur.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

£300.00-£315.00 DT = £300.00

2.1 Cytotoxic drug-induced side effects

DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

Mesna

● INDICATIONS AND DOSE

Urothelial toxicity following oxazaphosphorine therapy

► BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION

► Child: (consult local protocol)

● **Mucolytic in cystic fibrosis**

► BY INHALATION OF NEBULISED SOLUTION

► Child: 3–6 mL twice daily, use a 20% solution

● **UNLICENSED USE** Not licensed for use in children.

● **SIDE-EFFECTS**

► **Common or very common** Appetite decreased · arthralgia · asthenia · chest pain · chills · concentration impaired · conjunctivitis · constipation · cough · dehydration · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · dysuria · fever · flatulence · flushing · gastrointestinal discomfort · haemorrhage · headache · hyperhidrosis · influenza like illness · laryngeal discomfort · lymphadenopathy · malaise · myalgia · nasal congestion · nausea · oral irritation · pain · palpitations · respiratory disorders · sensation abnormal · skin reactions · sleep disorders · syncope · vision disorders · vomiting

► **Frequency not known** Acute kidney injury · angioedema · drug reaction with eosinophilia and systemic symptoms (DRESS) · hypotension · hypoxia · oedema · tachycardia · ulcer · vulvovaginal rash

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.

● **PREGNANCY** Not known to be harmful. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mesna (Non-proprietary)**

Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule [PoM] £441.15–£447.15
Mesna 400mg/4ml solution for injection ampoules | 5 ampoule [PoM] £17.00 | 15 ampoule [PoM] £201.15

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

12-Apr-2019

- **INDICATIONS AND DOSE**

Reduction of methotrexate-induced toxicity

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Methotrexate overdose

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Megaloblastic anaemia due to folate deficiency

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 250 micrograms/kg once daily
- ▶ Child 12–17 years: 15 mg once daily

Metabolic disorders leading to folate deficiency

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: 15 mg once daily, larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- ▶ BY MOUTH
- ▶ Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.

- ▶ Child 1–11 months: 10 mg 3 times a week

SODIOFOLIN[®]

As an antidote to methotrexate

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Consult product literature for licensing status of individual preparations.

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea
- ▶ **Uncommon** Fever
- ▶ **Rare or very rare** Agitation (with high doses) · depression (with high doses) · epilepsy exacerbated · gastrointestinal disorder (with high doses) · insomnia (with high doses)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use Bone marrow failure · dehydration · mucositis · nausea · oral disorders · skin reactions · vomiting
- ▶ **Rare or very rare**
- ▶ With intravenous use Sensitisation
- ▶ **Frequency not known**
- ▶ With intravenous use Hyperammonaemia
- ▶ With oral use Leucopenia · stomatitis · thrombocytopenia
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Folinic acid (Non-proprietary)**

Sodiofolin 100mg/2ml solution for injection vials | 1 vial [PoM] £35.09 (Hospital only)

Levofolinic acid

18-May-2020

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

- **INDICATIONS AND DOSE**

Reduction of methotrexate-induced toxicity

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Methotrexate overdose

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1: folates

- **SIDE-EFFECTS**

- ▶ **Common or very common** Dehydration · diarrhoea · mucosal toxicity · nausea · vomiting
- ▶ **Uncommon** Fever
- ▶ **Rare or very rare** Agitation (with high doses) · depression (with high doses) · epilepsy exacerbated · gastrointestinal disorder · insomnia (with high doses) · urticaria
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Levofolinic acid (Non-proprietary)**

Levofolinic acid (as Disodium levofolinate) 50 mg per 1 ml Levofolinic acid 50mg/1ml solution for injection vials | 1 vial [PoM] £24.70 (Hospital only)

Levofolinic acid 200mg/4ml solution for injection vials | 1 vial [PoM] £80.40 (Hospital only)

► **Isovorin** (Pfizer Ltd)

Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only)
Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

2.1a Hyperuricaemia associated with cytotoxic drugs

Other drugs used for Hyperuricaemia associated with cytotoxic drugs Allopurinol, below

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● **INDICATIONS AND DOSE**

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · fever · headache · nausea · skin reactions · vomiting
 - **Uncommon** Bronchospasm · haemolysis · haemolytic anaemia · hypersensitivity · hypotension · methaemoglobinaemia · seizure
 - **Rare or very rare** Rhinitis
 - **Frequency not known** Muscle contractions involuntary
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **Fasturtec** (Sanofi)
 - Rasburicase 1.5 mg** Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial [PoM] £208.39 (Hospital only)
 - Rasburicase 7.5 mg** Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial [PoM] £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

03-Mar-2020

● **INDICATIONS AND DOSE**

Prophylaxis of hyperuricaemia associated with cancer chemotherapy | Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g Lesch-Nyhan syndrome

- BY MOUTH
 - Child 1 month–14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
 - Child 15–17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- **CAUTIONS** Ensure adequate fluid intake · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

- **INTERACTIONS** → Appendix 1: allopurinol

● **SIDE-EFFECTS**

- **Common or very common** Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
- **Uncommon** Hypersensitivity · nausea · vomiting
- **Rare or very rare** Agranulocytosis · alopecia · angina pectoris · angioedema · angioimmunoblastic T-cell lymphoma · aplastic anaemia · asthenia · ataxia · boil · bradycardia · cataract · coma · depression · diabetes mellitus · drowsiness · erectile dysfunction · fever · gastrointestinal disorders · gynaecomastia · haemorrhage · hair colour changes · headache · hepatic disorders · hyperlipidaemia · hypertension · infertility male · maculopathy · malaise · oedema · paraesthesia · paralysis · peripheral neuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · stomatitis · taste altered · thrombocytopenia · vertigo · visual impairment
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.

- **BREAST FEEDING** Present in milk—not known to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function periodically during early stages of therapy. **Dose adjustments** Manufacturer advises reduce dose.

● **RENAL IMPAIRMENT**

Dose adjustments Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Allopurinol for hyperuricaemia www.medicinesforchildren.org.uk/allopurinol-hyperuricaemia

3 Immunotherapy responsive malignancy

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

30-Mar-2017

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

● INDICATIONS AND DOSE

Induction of early regression of life-threatening corticosteroid resistant haemangiomas of infancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

INTRONA[®] PEN

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with oral ribavirin)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 3-17 years: 3 000 000 units/m² 3 times a week

INTRONA[®] VIALS

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with ribavirin)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 3-17 years: 3 000 000 units/m² 3 times a week

ROFERON-A[®]

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

- **UNLICENSED USE** Not licensed for use in children for chronic active hepatitis B.

ROFERON-A[®] Roferon-A[®] not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates (in neonates) · history of severe psychiatric illness

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature and local treatment protocol.

- **CAUTIONS** For cautions consult product literature and local treatment protocol.

Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

- **INTERACTIONS** → Appendix 1: interferons

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite abnormal · arthralgia · asthenia · behaviour abnormal · chest pain · chills · concentration impaired · confusion · conjunctivitis · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dysphonia · dyspnoea · epistaxis · eye pain · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · growth retardation · headache · hepatic function abnormal · hyperhidrosis · hyperkinesia · hyperthyroidism · hypertriglyceridaemia (sometimes severe) ·

hyperuricaemia · hypothyroidism · increased risk of infection · influenza like illness · lacrimation disorder · lymphadenopathy · malaise · menstrual cycle irregularities · mood altered · musculoskeletal pain · myalgia · nail disorder · nasal complaints · nausea · neoplasms · neutropenia · oedema · oral disorders · pallor · photosensitivity reaction · sensation abnormal · skin reactions · sleep disorders · suicidal ideation · tachypnoea · testicular pain · thrombocytopenia · tremor · urinary disorders · vaginal disorder · virilism · visual impairment · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Unlikely to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Monitoring** Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment. **Monitoring** Close monitoring required in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitoring of lipid concentration is recommended.
 - ▶ Monitoring of hepatic function is recommended.
- **DIRECTIONS FOR ADMINISTRATION**

INTRONA[®] VIALS *Introna[®]* injection vials for subcutaneous injection or intravenous infusion.

ROFERON-A[®] Roferon-A[®] injection for subcutaneous injection.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ **Roferon-A** (Roche Products Ltd)

Interferon alfa-2a 9 mega unit per 1 ml Roferon-A 4.5million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £21.29 DT = £21.29

Interferon alfa-2a 12 mega unit per 1 ml Roferon-A 6million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £28.37 DT = £28.37

Interferon gamma-1b

(Immune interferon)

● INDICATIONS AND DOSE

To reduce the frequency of serious infection in chronic granulomatous disease

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6 months-17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- ▶ Child 6 months-17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteopetrosis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- ▶ Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

- **CONTRA-INDICATIONS** Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response
- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · arthralgia · back pain · chills · depression · diarrhoea · fatigue · fever · headache · nausea · rash · vomiting
 - ▶ **Frequency not known** Atrioventricular block · chest discomfort · confusion · connective tissue disorders · embolism and thrombosis · gait abnormal · gastrointestinal haemorrhage · hallucination · heart failure · hepatic failure · hypertriglyceridaemia · hypoglycaemia · hyponatraemia · hypotension · influenza like illness · myocardial infarction · neutropenia · pancreatitis · parkinsonism · proteinuria · renal failure · respiratory disorders · seizure · syncope · systemic lupus erythematosus (SLE) · tachycardia · thrombocytopenia · transient ischaemic attack
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (increased risk of accumulation).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Immukin** (Cinigen Healthcare Ltd)

Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

IMMUNOSTIMULANTS > OTHER

Mifamurtide

● INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child 2-17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients under 2 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cancer pain · chest discomfort · chills · confusion · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness ·

drowsiness · dysmenorrhoea · dyspnoea · feeling cold · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing loss · hepatic pain · hyperhidrosis · hypertension · hypokalaemia · hypotension · hypothermia · increased risk of infection · insomnia · laryngeal pain · leucopenia · malaise · mucositis · muscle complaints · musculoskeletal stiffness · nasal congestion · nausea · neutropenia · oedema · pain · pallor · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · tachycardia · thrombocytopenia · tinnitus · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased

- **CONCEPTION AND CONTRACEPTION** Effective contraception required.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased half-life and exposure); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Use with caution—no information available.

- **MONITORING REQUIREMENTS**

- ▶ Monitor renal function, hepatic function and clotting parameters.

- ▶ Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- ▶ **Mifamurtide for the treatment of osteosarcoma (October 2011)** NICE TA235

Mifamurtide (*Mepact*®) in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme. www.nice.org.uk/guidance/ta235

ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

Dasatinib

05-Dec-2019

- **DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

● INDICATIONS AND DOSE

Chronic phase chronic myeloid leukaemia (initiated by a specialist) | Acute lymphoblastic leukaemia [in combination with chemotherapy] (initiated by a specialist)

- ▶ BY MOUTH USING TABLETS

- ▶ Child 1-17 years (body-weight 10-19 kg): 40 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for continued →

dose escalation, or dose adjustment due to side-effects—consult product literature

- ▶ Child 1-17 years (body-weight 20–29 kg): 60 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 30–44 kg): 70 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 45 kg and above): 100 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ BY MOUTH USING ORAL SUSPENSION
- ▶ Child 1-17 years (body-weight 5–9 kg): 40 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 10–19 kg): 60 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 20–29 kg): 90 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 30–44 kg): 105 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature
- ▶ Child 1-17 years (body-weight 45 kg and above): 120 mg once daily, adjust dose based on changes in body-weight every 3 months or more often if necessary; for dose escalation, or dose adjustment due to side-effects—consult product literature

DOSE EQUIVALENCE AND CONVERSION

- ▶ *Sprycel*® film-coated tablets and *Sprycel*® powder for oral suspension are **not** bioequivalent. Follow correct dosing recommendations for the dosage form when switching formulations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 575.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
- CAUTIONS, FURTHER INFORMATION**
- ▶ Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: dasatinib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite abnormal · arrhythmias · arthralgia · asthenia · bone disorders · bone marrow depression · cardiac disorder · cardiomyopathy · chest pain · chills · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · eye inflammation · facial swelling · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · genital abnormalities · growth retardation · haemorrhage · headache · heart failure · hypertension · hyperuricaemia · increased risk of infection · insomnia · milia · mucositis · muscle complaints · muscle weakness · musculoskeletal stiffness · myocardial dysfunction · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · palpitations · pericardial effusion · perinephric effusion · peripheral swelling · pulmonary hypertension · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sweat changes · taste altered · thrombocytopenia · tinnitus · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Acute coronary syndrome · anxiety · arthritis · ascites · asthma · cardiac inflammation · cardiomegaly · cerebrovascular insufficiency · cholecystitis · CNS haemorrhage · confusion · dysphagia · embolism and thrombosis · emotional lability · excessive tearing · gynaecomastia · hair disorder · hearing loss · hepatic disorders · hypercholesterolaemia · hypoalbuminaemia · hypotension · hypothyroidism · ischaemic heart disease · libido decreased · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual disorder · movement disorders · myopathy · nail disorder · osteonecrosis · pancreatitis · panniculitis · penile disorders · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · scrotal oedema · skin ulcer · syncope · tendinitis · testicular swelling · tremor · tumour lysis syndrome · urinary frequency increased · vertigo · vulvovaginal swelling
- ▶ **Rare or very rare** Cardiac arrest · dementia · diabetes mellitus · facial paralysis · gait abnormal · hypersensitivity vasculitis · hyperthyroidism · pure red cell aplasia · seizure · thyroiditis
- ▶ **Frequency not known** Hepatitis B reactivation · nephrotic syndrome · Stevens-Johnson syndrome · thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises evaluate for signs and symptoms of underlying cardiopulmonary disease before initiation of therapy—echocardiography should be performed at treatment initiation in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.
- ▶ Manufacturer advises monitor patients with risk factors or a history of cardiac disease for signs or symptoms of cardiac dysfunction during treatment.
- ▶ When used for Chronic phase chronic myeloid leukaemia Manufacturer advises monitor full blood count every 2 weeks for 3 months, then every 3 months or as clinically indicated thereafter.
- ▶ When used for Acute lymphoblastic leukaemia Manufacturer advises monitor full blood count prior to each treatment cycle and as clinically indicated thereafter. During

consolidation treatment, manufacturer advises monitor full blood count every 2 days until recovery.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2142

The *Scottish Medicines Consortium* has advised (April 2019) that dasatinib (*Sprycel*[®]) is accepted for use within NHS Scotland for the treatment of paediatric patients with newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (Ph+ CML-CP) or Ph+ CML-CP resistant or intolerant to prior therapy including imatinib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1514

The *All Wales Medicines Strategy Group* has advised (April 2019) that dasatinib (*Sprycel*[®]) is recommended as an option for use within NHS Wales for the treatment of paediatric patients weighing 10 kg and above with newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (Ph+ CML-CP) or Ph+ CML-CP resistant or intolerant to prior therapy including imatinib. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS
An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

● **CAUTIONS** Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure

CAUTIONS, FURTHER INFORMATION

▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

● **INTERACTIONS** → Appendix 1: imatinib

● **SIDE-EFFECTS**

▶ **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · insomnia · joint disorders · muscle complaints · nausea · neutropenia · oedema · pain · photosensitivity reaction · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vision blurred · vomiting · weight changes

▶ **Uncommon** Anxiety · arrhythmias · ascites · breast abnormalities · broken nails · burping · chest pain · CNS haemorrhage · congestive heart failure · depression · drowsiness · dysphagia · electrolyte imbalance · eosinophilia · eye discomfort · gout · gynaecomastia · hearing loss · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · laryngeal pain · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual cycle irregularities · nerve disorders · oral disorders · palpitations · pancreatitis · peripheral coldness · pulmonary oedema · Raynaud's phenomenon · renal impairment · renal pain · respiratory disorders · restless legs · scrotal oedema · sepsis · sexual dysfunction · syncope · thrombocytosis · tinnitus · tremor · urinary frequency increased · vertigo

▶ **Rare or very rare** Angina pectoris · angioedema · arthritis · cardiac arrest · cataract · confusion · glaucoma · haemolytic anaemia · haemorrhagic ovarian cyst · hepatic failure (including fatal cases) · hypersensitivity vasculitis · inflammatory bowel disease · intracranial pressure increased · muscle weakness · myocardial infarction · myopathy · nail discolouration · pericardial disorders · pulmonary hypertension · seizure · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome

▶ **Frequency not known** Embolism and thrombosis · growth retardation · hepatitis B reactivation · neoplasm complications · osteonecrosis · pericarditis

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments In adults, manufacturer advises dosing at minimum recommended dose and consider further dose reduction if not tolerated—consult product literature.

● **RENAL IMPAIRMENT**

Dose adjustments Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

● **MONITORING REQUIREMENTS**

▶ Monitor for gastrointestinal haemorrhage.

▶ Monitor complete blood counts regularly.

▶ Monitor for fluid retention.

▶ Monitor liver function.

- ▶ Monitor growth in children (may cause growth retardation).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water or apple juice.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

Larotrectinib

22-Oct-2019

- **DRUG ACTION** Larotrectinib is a tropomyosin receptor kinase inhibitor.

● **INDICATIONS AND DOSE**

Solid tumours with neurotrophic tyrosine receptor kinase gene fusion (initiated by a specialist)

▶ **BY MOUTH**

- ▶ **Child:** 100 mg/m² twice daily (max. per dose 100 mg), for dose adjustments, treatment interruption, or discontinuation due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce dose by 50%.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 575.

- **INTERACTIONS** → Appendix 1: larotrectinib
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · constipation · dizziness · fatigue · gait abnormal · leucopenia · muscle weakness · myalgia · nausea · neutropenia · paraesthesia · taste altered · vomiting · weight increased
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in females of childbearing potential and in men with a partner of childbearing potential, during treatment and for 1 month after last treatment; additional barrier method recommended in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **PREGNANCY** Manufacturer advises avoid—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 3 days after last treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (increased risk of exposure).
Dose adjustments Manufacturer advises dose reduction by 50% in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function (including ALT and AST) at

baseline, then monthly during the first 3 months of treatment, and periodically thereafter; more frequent monitoring should be performed in patients who develop transaminase elevations. Treatment should be withheld or permanently discontinued based on severity—consult product literature.

- **HANDLING AND STORAGE** For oral solution, manufacturer advises store in a refrigerator (2–8°C).
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and fatigue.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Hydroxybenzoates (parabens), potassium sorbate, propylene glycol, sorbitol, sucrose

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Clinically significant bradycardia · congestive heart failure · hepatitis B infection · history of pancreatitis · recent myocardial infarction · susceptibility to QT-interval prolongation (including electrolyte disturbances) · unstable angina

CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- **INTERACTIONS** → Appendix 1: nilotinib

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · angina pectoris · anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow disorders · cardiac conduction disorders · chest discomfort · constipation · cough · decreased leucocytes · depression · diabetes mellitus · diarrhoea · dizziness · dry eye · dyslipidaemia · dyspnoea · electrolyte imbalance · eosinophilia ·

eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · increased risk of infection · insomnia · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · palpitations · peripheral neuropathy · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vertigo · vomiting · weight changes

- ▶ **Uncommon** Atherosclerosis · cerebrovascular insufficiency · chills · cyanosis · erectile dysfunction · gout · haemorrhage · heart failure · hyperaemia · malaise · oral disorders · pancreatitis · peripheral vascular disease · temperature sensation altered · vision disorders

- ▶ **Frequency not known** Breast abnormalities · chorioretinopathy · diastolic dysfunction · dry mouth · facial swelling · gynaecomastia · hepatitis B reactivation · hyperparathyroidism · hyperuricaemia · hypoglycaemia · lethargy · memory loss · menorrhagia · oesophageal pain · oropharyngeal pain · pericardial effusion · pericarditis · restless legs · sebaceous hyperplasia · syncope · tremor · urinary disorders · urine discolouration

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 575.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

- **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
- ▶ Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
- ▶ Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
- ▶ Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.
- ▶ Manufacturer advises monitor liver function (including bilirubin and hepatic transaminases) monthly or as clinically indicated.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** All prescribers should be familiar with the *Summary of Key Safety Recommendations for Tasigna® (nilotinib)* provided by the manufacturer.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the *Important Information About How to Take Your Medication* leaflet provided by the manufacturer.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Blood and blood-forming organs

1 Anaemias

Anaemias

Anaemia treatment considerations

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and

increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 596 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can

be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Fluoroquinolones (including ciprofloxacin, moxifloxacin, norfloxacin, and ofloxacin)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (such as nalidixic acid [not on UK market])
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 678, antilymphocyte immunoglobulin, rituximab [unlicensed] p. 574, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 559 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities.

Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 399 treatment.

Corticosteroids have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 613 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

Oxymetholone

● INDICATIONS AND DOSE

Aplastic anaemia

- ▶ BY MOUTH
- ▶ Child: 1–5 mg/kg daily for 3 to 6 months

- **INTERACTIONS** → Appendix 1: oxymetholone

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

- ▶ **Oxymetholone (Non-proprietary)**
- ▶ **Oxymetholone 50 mg** Oxymetholone 50mg capsules | 50 capsule [PoM] £475.00 [CD4-2]

EPOETINS

Epoetins

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens–Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. Manufacturer advises haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · embolism and thrombosis · headache · hypertension (dose-dependent) · influenza like illness · skin reactions · stroke
 - ▶ **Uncommon** Hypertensive crisis (in isolated patients with normal or low blood pressure) · respiratory tract congestion · seizure
 - ▶ **Rare or very rare** Thrombocytosis
 - ▶ **Frequency not known** Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure) · severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION

Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

● MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds

continued →

2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **INTERACTIONS** → Appendix 1: darbepoetin alfa
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Hypersensitivity · oedema
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Prevention of anaemias of prematurity in neonates

▶ **BY SUBCUTANEOUS INJECTION**

- ▶ Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg): 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unpreserved injection.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2015) EPOETIN BETA (NEORECOMON): INCREASED RISK OF RETINOPATHY IN PRETERM INFANTS CANNOT BE EXCLUDED

There is a possible increased risk of retinopathy in premature infants, when epoetin beta is used for preventing anaemia of prematurity. When using epoetin beta in preterm infants:

- consider the benefits and risks of treatment, including the possible risk of retinopathy,
- monitor the infant for features of retinopathy, and
- advise parents or carers that their baby's eyes will be carefully monitored for any ill effects.

- **INTERACTIONS** → Appendix 1: epoetin beta

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

● **INDICATIONS AND DOSE****Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis**► **BY INTRAVENOUS INJECTION**

- **Child** (body-weight up to 10 kg): Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
- **Child** (body-weight 10–30 kg): Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
- **Child** (body-weight 31 kg and above): Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

- **INTERACTIONS** → Appendix 1: epoetin zeta

● **SIDE-EFFECTS**

- **Common or very common** Asthenia · dizziness
- **Uncommon** Intracranial haemorrhage
- **Rare or very rare** Angioedema

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES****Eculizumab**

22-Apr-2020

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

● **INDICATIONS AND DOSE****Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)**► **BY INTRAVENOUS INFUSION**

- **Child:** Refer for specialist advice, experience very limited

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 2 months–17 years (body-weight 5–9 kg): Initially 300 mg once weekly for 2 weeks, followed by 300 mg every 3 weeks
- Child 2 months–17 years (body-weight 10–19 kg): Initially 600 mg once weekly for 1 week, then reduced to 300 mg once weekly for 1 week, followed by 300 mg every 2 weeks
- Child 2 months–17 years (body-weight 20–29 kg): Initially 600 mg once weekly for 3 weeks, followed by 600 mg every 2 weeks
- Child 2 months–17 years (body-weight 30–39 kg): Initially 600 mg once weekly for 2 weeks, then increased to 900 mg once weekly for 1 week, followed by 900 mg every 2 weeks
- Child 2 months–17 years (body-weight 40 kg and above): Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by 1.2 g every 2 weeks

- **UNLICENSED USE** Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.
- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection
- **CAUTIONS, FURTHER INFORMATION**
 - Meningococcal infection Manufacturer advises vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (vaccines against serotypes A, C, Y, W135 and B where available, are recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · asthenia · chills · cough · decreased leucocytes · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · influenza like illness · joint disorders · muscle complaints · nausea · oropharyngeal pain · pain · skin reactions · sleep disorders · taste altered · tremor · vomiting
 - **Uncommon** Abscess · anxiety · appetite decreased · chest discomfort · constipation · cystitis · depression · dysuria · haemorrhage · hot flush · hyperhidrosis · hypersensitivity · hypotension · meningitis meningococcal · mood swings · nasal complaints · oedema · palpitations · paraesthesia · sepsis · spontaneous penile erection · throat irritation · tinnitus · vascular disorders · vertigo · vision blurred
 - **Rare or very rare** Abnormal clotting factor · conjunctival irritation · feeling hot · gastrooesophageal reflux disease · gingival discomfort · Grave's disease · infusion related reaction · jaundice · malignant melanoma · menstrual disorder · syncope · urogenital tract gonococcal infection
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available. Eculizumab is an immunoglobulin G (IgG) monoclonal antibody; human IgG antibodies are known to cross the placenta.

- **BREAST FEEDING** Manufacturer advises use with caution—limited information available; unlikely to be present in milk.

● **MONITORING REQUIREMENTS**

- Monitor for 1 hour after infusion.
- For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
- For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.

- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised to report promptly any signs of meningococcal infection. Advice about prevention of gonorrhoea should also be given.

A patient information card and a patient safety card should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Eculizumab for treating atypical haemolytic uraemic syndrome (January 2015)** NICE HST1

Eculizumab, within its marketing authorisation, is recommended for funding for treating atypical haemolytic uraemic syndrome, only if all the following arrangements are in place:

- coordination of eculizumab use through an expert centre, **and**
- monitoring systems to record the number of people with a diagnosis of atypical haemolytic uraemic syndrome and the number who have eculizumab, and the dose and duration of treatment, **and**
- a national protocol for starting and stopping eculizumab for clinical reasons, **and**
- a research programme with robust methods to evaluate when stopping treatment or dose adjustment might occur.

The long-term budget impact of eculizumab for treating atypical haemolytic uraemic syndrome is uncertain but will be considerable. NHS England and the manufacturer should consider what opportunities might exist to reduce the cost of eculizumab to the NHS.

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

Treatment of iron-deficiency anaemia

The oral dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates.

When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Iron content of different iron salts	
Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate, dried 200 mg	65 mg
sodium ferredetate 190 mg	27.5 mg

Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

Compound preparations

Some oral preparations contain ascorbic acid p. 680 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except folic acid p. 620 for pregnant women.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 617, iron sucrose p. 617 or ferric carboxymaltose p. 617. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

- **CONTRA-INDICATIONS** Disturbances in utilisation of iron · iron overload
- **CAUTIONS** Allergic disorders · eczema · hepatic dysfunction · immune conditions · infection (discontinue if ongoing bacteraemia) · inflammatory conditions · oral iron

should not be given until 5 days after the last injection · severe asthma

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flushing · headache · hypertension · hypophosphataemia · hypotension · nausea · skin reactions · taste altered
- ▶ **Uncommon** Arrhythmias · arthralgia · bronchospasm · chest pain · chills · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · hyperhidrosis · hypersensitivity · loss of consciousness · muscle complaints · pain · peripheral oedema · sensation abnormal · vision blurred · vomiting
- ▶ **Rare or very rare** Angioedema · anxiety · circulatory collapse · influenza like illness · malaise · pallor · palpitations · psychiatric disorder · seizure · syncope · tremor
- ▶ **Frequency not known** Kounis syndrome

SIDE-EFFECTS, FURTHER INFORMATION Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 891.

F 616

Ferric carboxymaltose

09-Apr-2019

● INDICATIONS AND DOSE

Iron-deficiency anaemia

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Child:** Dose calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE** Not licensed for use in children under 14 years.
- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Face oedema · flatulence
- **PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload increases risk of impairment (particularly porphyria cutanea tarda).
- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Iron (as iron sucrose) 20 mg per 1 ml Venofer 100mg/5ml solution for injection vials | 5 vial [PoM] £43.52
 Venofer 50mg/2.5ml solution for injection vials | 5 vial [PoM] £

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · nausea
- ▶ **Uncommon** Vomiting
- ▶ **Frequency not known** Appetite decreased · faeces discoloured

SIDE-EFFECTS, FURTHER INFORMATION Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Overdose Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 891.

● MONITORING REQUIREMENTS

- ▶ Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

- **PRESCRIBING AND DISPENSING INFORMATION** Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

The iron content of artificial formula feeds should also be considered.

The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

GALFER® SYRUP

Iron-deficiency anaemia (prophylaxis)

▶ BY MOUTH

- ▶ Neonate up to 36 weeks corrected gestational age (body-weight up to 3 kg): 0.5 mL daily, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

- ▶ Neonate: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

- ▶ Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day
- ▶ Child 12–17 years: 10 mL once daily

Ferrous fumarate

above

10-Mar-2020

● INDICATIONS AND DOSE

Iron-deficiency anaemia (prophylactic)

▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 210 mg 1–2 times a day

▶ BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 140 mg twice daily

Iron-deficiency anaemia (therapeutic)

▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 210 mg 2–3 times a day

▶ BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 280 mg twice daily

GALFER® CAPSULES

Iron-deficiency anaemia (prophylactic)

▶ BY MOUTH

- ▶ Child 12–17 years: 305 mg daily

Iron-deficiency anaemia (therapeutic)

▶ BY MOUTH

- ▶ Child 12–17 years: 305 mg twice daily

F 618

Ferrous gluconate

10-Mar-2020

● INDICATIONS AND DOSE

Prophylaxis of iron-deficiency anaemia

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6–11 years: 300–900 mg daily
- ▶ Child 12–17 years: 600 mg daily

Treatment of iron-deficiency anaemia

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6–11 years: 300–900 mg daily
- ▶ Child 12–17 years: 1.2–1.8 g daily in divided doses

- **INTERACTIONS** → Appendix 1: iron (oral)
- **SIDE-EFFECTS** Gastrointestinal disorders
- **PRESCRIBING AND DISPENSING INFORMATION** Ferrous gluconate 300 mg contains 35 mg iron.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Ferrous gluconate for iron-deficiency anaemia www.medicinesforchildren.org.uk/ferrous-gluconate-iron-deficiency-anaemia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Iron (as Sodium feredetate) 5.5 mg per 1 ml Sytron oral solution sugar-free | 500 ml [P] £14.95 DT = £14.95

cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in *chronic haemolytic states, malabsorption, or in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn's disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folic acid p. 600 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 688.

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare disorders of *congenital transcobalamin II deficiency* and *homocystinuria*.

Vitamin B₁₂ should be given prophylactically after *total ileal resection*.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 621 has completely replaced cyanocobalamin p. 621 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

10-Mar-2020

● **INDICATIONS AND DOSE**● **Folate-deficient megaloblastic anaemia**

▶ BY MOUTH

- ▶ Neonate: Initially 500 micrograms/kg once daily for up to 4 months.

- ▶ Child 1–11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- ▶ Child 1–17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

● **Folate supplementation in neonates**

▶ BY MOUTH

- ▶ Neonate: 50 micrograms once daily.

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 688)

► BY MOUTH

- Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 688)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

► BY MOUTH

- Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis of folate deficiency in dialysis

► BY MOUTH

- Child 1 month–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12–17 years: 5–10 mg once daily

Haemolytic anaemia | Metabolic disorders

► BY MOUTH

- Child 1 month–11 years: 2.5–5 mg once daily
- Child 12–17 years: 5–10 mg once daily

Prevention of methotrexate side-effects in juvenile idiopathic arthritis

► BY MOUTH

- Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose

- **UNLICENSED USE** Unlicensed for limiting methotrexate toxicity.
- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS** Abdominal distension · appetite decreased · flatulence · nausea · vitamin B12 deficiency exacerbated

● **INDICATIONS AND DOSE**

Macrocytic anaemia without neurological involvement

► BY INTRAMUSCULAR INJECTION

- Child: Initially 0.25–1 mg once daily on alternate days for 1–2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 2–3 months

Macrocytic anaemia with neurological involvement

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency

► BY INTRAMUSCULAR INJECTION

- Child: 1 mg every 2–3 months

Leber's optic atrophy

► BY INTRAMUSCULAR INJECTION

- Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Congenital transcobalamin II deficiency

► BY INTRAMUSCULAR INJECTION

- Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

- Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate continued →

Methylmalonic acidemia and homocystinuria

▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

Methylmalonic acidemia, maintenance once intramuscular response established

▶ BY MOUTH

- ▶ Child: 5–10 mg 1–2 times a week, some children do not respond to oral route

CYANOKIT®

Poisoning with cyanides

▶ BY INTRAVENOUS INFUSION

- ▶ Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

● UNLICENSED USE

- ▶ With intramuscular use or oral use Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

● CAUTIONS

- ▶ With intramuscular use or oral use Should not be given before diagnosis fully established

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Diarrhoea · dizziness · headache · hot flush · nausea · skin reactions · urine discolouration

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Arrhythmia · chills · drug fever · hypokalaemia · malaise · pain · thrombocytosis · tremor · vomiting
 - ▶ With intravenous use Angioedema · dysphagia · extrasystole · gastrointestinal discomfort · memory loss · mucosal discolouration red · peripheral oedema · pleural effusion · rash pustular · red discolouration of plasma · restlessness · swelling · throat complaints
- BREAST FEEDING Present in milk but not known to be harmful.
- EFFECT ON LABORATORY TESTS
- ▶ With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.
- DIRECTIONS FOR ADMINISTRATION
- ▶ With intravenous use For intravenous infusion (Cyanokit)®, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
 - ▶ With oral use For administration by mouth, injection solution may be given orally; it will not have prolonged effect via this route.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
- ▶ With intravenous use Cyanokit® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Cobalin-H® is not prescribable in NHS primary care.

Neo-Cytamen® is not prescribable in NHS primary care.

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 624 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid (vitamin C) p. 680 daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Deferasirox

28-Jun-2018

● **DRUG ACTION** Deferasirox is an oral iron chelator.

● **INDICATIONS AND DOSE**

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH

- Child 2-5 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

► BY MOUTH

- Child 6-17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

► BY MOUTH

- Child 2-17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

► BY MOUTH

- Child 10-17 years: Initially 7 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 7 mg/kg per day

● **CAUTIONS** History of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than 50×10^9 /litre · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

● **INTERACTIONS** → Appendix 1: iron chelators

● **SIDE-EFFECTS**

- **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · urine abnormalities · vomiting
- **Uncommon** Anxiety · cataract · cholelithiasis · dizziness · fatigue · fever · gastrointestinal disorders · gastrointestinal haemorrhage (including fatal cases) · hearing impairment ·

hepatic disorders · laryngeal pain · maculopathy · oedema · renal tubular disorders · sleep disorder

► **Rare or very rare** Optic neuritis · severe cutaneous adverse reactions (SCARs)

► **Frequency not known** Acute kidney injury · alopecia · anaemia aggravated · hyperammonaemic encephalopathy · hypersensitivity vasculitis · lens opacity · leucopenia · metabolic acidosis · nephritis tubulointerstitial · nephrolithiasis · neutropenia · pancreatitis acute · pancytopenia · renal tubular necrosis · thrombocytopenia

● **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises reduce initial dose considerably then gradually increase to max. 50% of normal dose in moderate impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute. **Dose adjustments** Manufacturer advises reduce dose if serum-creatinine increased above age-appropriate limits or creatinine clearance less than 90 mL/minute on 2 consecutive occasions—consult product literature.

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- Manufacturer advises monitor liver-iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is ≤ 800 micrograms/litre.
- Manufacturer advises monitor body-weight, height, and sexual development before treatment and then annually thereafter.

● **DIRECTIONS FOR ADMINISTRATION** For *film-coated tablets*, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferiasirox tablets. Medicines for Children leaflet: Deferiasirox for removing excess iron www.medicinesforchildren.org.uk/deferiasirox-removing-excess-iron-0

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (June 2017) that deferiasirox (*Exjade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Patients with myelodysplastic syndromes, the commonest cause of transfusion-dependent anaemia, were poorly represented in the clinical trial population and the economic case was not demonstrated in this group.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Exjade** (Novartis Pharmaceuticals UK Ltd) ▼
 - Deferasirox 90 mg Exjade 90mg tablets | 30 tablet [PoM] £126.00 DT = £126.00
 - Deferasirox 180 mg Exjade 180mg tablets | 30 tablet [PoM] £252.00 DT = £252.00
 - Deferasirox 360 mg Exjade 360mg tablets | 30 tablet [PoM] £504.00 DT = £504.00

Deferiprone

28-Jun-2018

- **DRUG ACTION** Deferiprone is an oral iron chelator.

● INDICATIONS AND DOSE

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

- ▶ **BY MOUTH**
 - ▶ Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia
- **INTERACTIONS** → Appendix 1: iron chelators
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain (reducing dose and increasing gradually may improve tolerance) · agranulocytosis · appetite increased · arthralgia · diarrhoea (reducing dose and increasing gradually may improve tolerance) · fatigue · headache · nausea (reducing dose and increasing gradually may improve tolerance) · neutropenia · urine discolouration · vomiting (reducing dose and increasing gradually may improve tolerance)
 - ▶ **Frequency not known** Skin reactions · zinc deficiency
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available)—monitor hepatic function and consider interrupting treatment if persistent elevation in serum alanine aminotransferase. Manufacturer advises caution in patients with hepatitis C (ensure iron chelation is optimal)—monitor liver histology.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- **PATIENT AND CARER ADVICE**

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Oral solution

Desferrioxamine mesilate

17-Mar-2020

(Deferoxamine Mesilate)

● INDICATIONS AND DOSE

Iron poisoning

▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

- ▶ **Neonate:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

- ▶ **Child:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

▶ **BY INTRAVENOUS INFUSION**

- ▶ Child: 5 mg/kg once weekly

Chronic iron overload (low iron overload)

▶ **BY SUBCUTANEOUS INFUSION**

- ▶ Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

Chronic iron overload (established overload)

▶ **BY SUBCUTANEOUS INFUSION**

- ▶ Child: 20–50 mg/kg daily

● UNLICENSED USE

- ▶ When used for Iron poisoning Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

- **INTERACTIONS** → Appendix 1: iron chelators

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · bone disorder · fever · growth retardation · headache · muscle complaints · nausea · skin reactions

- ▶ **Uncommon** Abdominal pain · asthma · deafness · neurosensory · tinnitus · vomiting

- ▶ **Rare or very rare** Angioedema · blood disorder · cataract · diarrhoea · dizziness · encephalopathy · eye disorders · hypersensitivity · hypotension (more common when given too rapidly by intravenous injection) · increased risk of infection · nerve disorders · nervous system disorder · paraesthesia · respiratory disorders · shock · tachycardia · thrombocytopenia · vision disorders

- ▶ **Frequency not known** Acute kidney injury · hypocalcaemia · leucopenia · renal tubular disorder · seizure · urine red

- **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

- ▶ Eye and ear examinations before treatment and at 3-month intervals during treatment.
- ▶ Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

- **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.
- ▶ When used for Chronic iron overload or Aluminium overload in dialysis patients For *intravenous* or *subcutaneous infusion*, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis* or *haemo-filtration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intraperitoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Desferrioxamine mesilate (Non-proprietary)**
 - Desferrioxamine mesilate 500 mg** Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £46.63 DT = £46.63
 - Desferrioxamine mesilate 2 gram** Desferrioxamine 2g powder for solution for injection vials | 10 vial [PoM] £186.60
- ▶ **Desferal** (Novartis Pharmaceuticals UK Ltd)
 - Desferrioxamine mesilate 500 mg** Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63 DT = £46.63

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) below and lenograstim (glycosylated rhG-CSF) p. 626 have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—splenic size should be monitored · sickle-cell disease

CAUTIONS, FURTHER INFORMATION

- ▶ Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · cutaneous vasculitis · dyspnoea · haemoptysis · headache · hypersensitivity · leucocytosis · pain · spleen abnormalities · thrombocytopenia
- ▶ **Uncommon** Acute febrile neutrophilic dermatosis · capillary leak syndrome · hypoxia · pulmonary oedema · respiratory disorders · sickle cell anaemia with crisis

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.

- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.

- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

● MONITORING REQUIREMENTS

- ▶ Full blood counts including differential white cell and platelet counts should be monitored.
- ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

Filgrastim

above

05-Aug-2019

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

● INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after continued →

completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 16–17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Neonate: 10 micrograms/kg daily, to be discontinued if white cell count exceeds $50 \times 10^9/\text{litre}$.

Glycogen storage disease type 1b (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 5 micrograms/kg daily, dose to be adjusted as necessary

- **UNLICENSED USE** Not licensed for treatment of glycogen storage disease or neonatal neutropenia.
- **CONTRA-INDICATIONS** Severe congenital neutropenia who develop leukaemia or have evidence of leukaemic evolution
- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · diarrhoea · dysuria · haemorrhage · hepatomegaly · hyperuricaemia · hypotension · osteoporosis · rash
 - ▶ **Uncommon** Fluid imbalance · graft versus host disease · peripheral vascular disease · pseudogout · rheumatoid arthritis aggravated · urine abnormalities
- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous or intravenous infusion*, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.
- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological*

medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Accofil** (Accord Healthcare Ltd)

 - Filgrastim 96 mega unit per 1 ml Zarzio 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £399.50 DT = £399.50

F 625

Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

● **INDICATIONS AND DOSE**

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only) |

Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

- **UNLICENSED USE** Not licensed for use in children for cytotoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cells transplantation.

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · asthenia
- ▶ **Rare or very rare** Erythema nodosum · pyoderma gangrenosum · toxic epidermal necrolysis

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (*Granocyte-13*) or 2.5 micrograms/mL (*Granocyte-34*) with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** *Granocyte*[®] solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

- ▶ **Granocyte** (Chugai Pharma UK Ltd)

Lenograstim 33.6 mega unit Granocyte 34million unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £62.54 DT = £62.54 | 5 pre-filled disposable injection [PoM] £312.69

3.2 Stem cell mobilisation

IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

13-Mar-2020

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

● INDICATIONS AND DOSE

Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or solid malignant tumours (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 1–17 years: 240 micrograms/kg daily usually for 2–4 days (and up to 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor; maximum 40 mg per day

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · constipation · diarrhoea · dizziness · dry mouth · erythema · fatigue · flatulence · gastrointestinal discomfort · headache · hyperhidrosis · malaise · musculoskeletal pain · nausea · oral hypoesthesia · sleep disorders · vomiting
- ▶ **Frequency not known** Postural hypotension · splenomegaly · syncope

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment—teratogenic in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless essential—teratogenic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** No information available if creatinine clearance less than 20 mL/minute.

Dose adjustments Manufacturer advises reduce dose to 160 micrograms/kg (maximum 27 mg) daily if creatinine clearance 20–50 mL/minute.

- **MONITORING REQUIREMENTS** Monitor platelets and white blood cell count.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, fatigue, or vasovagal reactions.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2249

The *Scottish Medicines Consortium* has advised (February 2020) that plerixafor (*Mozobil*[®]) is accepted for use within NHS Scotland in combination with granulocyte-colony stimulating factor to enhance mobilisation of haematopoietic stem cells to the peripheral blood for collection and subsequent autologous transplantation in children aged 1 year to less than 18 years with lymphoma or solid malignant tumours.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3297

The *All Wales Medicines Strategy Group* has advised (February 2020) that plerixafor (*Mozobil*[®]) is recommended for use within NHS Wales in combination with granulocyte colony stimulating factor to enhance mobilisation of haematopoietic stem cells to the peripheral blood for collection and subsequent autologous transplantation in children aged 1 year to less than 18 years with lymphoma or solid malignant tumours.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mozobil** (Sanofi)

Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials | 1 vial [PoM] £4,882.77

4 Platelet disorders

4.1 Essential thrombocythaemia

Other drugs used for Essential thrombocythaemia

Hydroxycarbamide, p. 596

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

28-May-2018

● INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

► BY MOUTH

► Child 7–17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

● **INTERACTIONS** → Appendix 1: anagrelide

● SIDE-EFFECTS

- **Common or very common** Anaemia · arrhythmias · asthenia · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · palpitations · skin reactions · vomiting
- **Uncommon** Alopecia · appetite decreased · arthralgia · chest pain · chills · confusion · congestive heart failure · constipation · depression · dry mouth · dyspnoea · erectile dysfunction · fever · haemorrhage · hypertension · insomnia · malaise · memory loss · myalgia · nervousness · oedema · pain · pancreatitis · pancytopenia · pneumonia · pulmonary hypertension · respiratory disorders · sensation abnormal · syncope · thrombocytopenia · weight changes
- **Rare or very rare** Angina pectoris · cardiomegaly · cardiomyopathy · coordination abnormal · drowsiness · dysarthria · influenza like illness · myocardial infarction · nocturia · pericardial effusion · postural hypotension · renal failure · tinnitus · vasodilation · vision disorders
- **Frequency not known** Hepatitis · nephritis · tubulointerstitial
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild impairment; avoid in moderate-to-severe impairment or if serum transaminases exceed 5 times the upper limit of normal.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²
- **MONITORING REQUIREMENTS**
 - Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
 - Monitor liver function.
 - Monitor serum creatinine.
 - Monitor urea.
 - Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
 - Monitor closely for further signs of disease progression such as malignant transformation.

● **PRESCRIBING AND DISPENSING INFORMATION** Initiate only when signs of disease progression or patient suffers from thrombosis.

Consider stopping treatment after 3 months if inadequate response.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

► **Anagrelide (Non-proprietary)**

Anagrelide (as Anagrelide hydrochloride)

500 microgram Anagrelide 500microgram capsules | 100 capsule [PoM](#) £404.57 DT = £402.87

► **Xagrid** (Shire Pharmaceuticals Ltd)

Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule [PoM](#) £404.57 DT = £402.87

4.2 Thrombocytopenias

4.2a Immune thrombocytopenia

Immune thrombocytopenic purpura

Overview

Acute immune (idiopathic) thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 478, is sometimes used if immune thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

Immunoglobulin preparations may be used in immune thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D (Rh₀) immunoglobulin p. 82 is licensed for the management of immune thrombocytopenic purpura.

Other therapies that have been tried under specialist supervision in refractory immune thrombocytopenic purpura include: azathioprine p. 558, cyclophosphamide p. 579, vincristine sulfate p. 594, and cyclosporin p. 559. Rituximab [unlicensed] p. 574 is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 87 may be given to reduce the severity of haemorrhage.

Eltrombopag p. 629 and romiplostim p. 630 are thrombopoietin receptor agonists. They are licensed for the treatment of chronic immune thrombocytopenic purpura in children who are refractory to other treatments, such as corticosteroids or immunoglobulins. They should both be used under the supervision of a specialist.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

22-Jan-2020

● **DRUG ACTION** Eltrombopag is a thrombopoietin receptor agonist that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

● INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

► BY MOUTH

- Child 1–5 years: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Child 6–17 years: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Child 6–17 years (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELTROMBOPAG (REVOLADE®): REPORTS OF INTERFERENCE WITH BILIRUBIN AND CREATININE TEST RESULTS (JULY 2018)

See *Effect on laboratory tests*.

- **CAUTIONS** Patients of East Asian origin · risk factors for thromboembolism
- **INTERACTIONS** → Appendix 1: eltrombopag
- **SIDE-EFFECTS**
- **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · cough · depression · diarrhoea · dry eye · dry mouth · fever · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · hepatic disorders · hyperbilirubinaemia · increased risk of infection · malaise · menorrhagia · muscle complaints · nasal complaints · nausea · oral disorders · oropharyngeal complaints · pain · peripheral oedema · QT interval prolongation · sensation abnormal · skin reactions · sleep disorder · sweat changes · vertigo · vision disorders · vomiting
- **Uncommon** Anisocytosis · arrhythmias · balance impaired · cardiovascular disorder · cataract cortical · chest pain · cyanosis · drowsiness · ear pain · electrolyte imbalance · embolism and thrombosis · eosinophilia · excessive tearing · eye inflammation · eye pain · feeling hot · feeling jittery · food poisoning · gout · haemorrhage · headaches · hemiparesis · increased leucocytes · lens opacity · mood altered · muscle weakness · myocardial infarction · nephritis lupus · nerve disorders · nocturia · rectosigmoid cancer · renal failure · retinal pigment epitheliopathy · sinus disorder · sleep apnoea · speech disorder · sunburn · thrombocytopenia · tremor · urine abnormalities · vasodilation · wound inflammation
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding.

Dose adjustments Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.

● **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

- Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- Manufacturer advises regular ophthalmological examinations for cataract formation.
- Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- Manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50×10^9 /litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

● **EFFECT ON LABORATORY TESTS** Eltrombopag is highly coloured and can cause serum discolouration and interference with total bilirubin and creatinine testing. If laboratory results are inconsistent with clinical observations, manufacturer advises re-testing using another method to help determine the validity of the result.

● **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

● **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1206/17

The *Scottish Medicines Consortium* has advised (January 2017) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who have severe symptomatic ITP or a high risk of bleeding, **and** are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2692

The *All Wales Medicines Strategy Group* has advised (October 2016) that eltrombopag (*Revolade*®) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only if the approved Wales Patient Access Scheme is used or where the list/contract price is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Revolade** (Novartis Pharmaceuticals UK Ltd)

Eltrombopag (as Eltrombopag olamine) 25 mg Revolade 25mg tablets | 28 tablet PoM £770.00 DT = £770.00

Eltrombopag (as Eltrombopag olamine) 50 mg Revolade 50mg tablets | 28 tablet [PoM](#) £1,540.00 DT = £1,540.00

Eltrombopag (as Eltrombopag olamine) 75 mg Revolade 75mg tablets | 28 tablet [PoM](#) £2,310.00 DT = £2,310.00

Romiplostim

28-Jan-2019

- **DRUG ACTION** Romiplostim is an Fc- γ peptide fusion protein that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

● INDICATIONS AND DOSE

Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

► BY SUBCUTANEOUS INJECTION

- Child 1-17 years: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50×10^9 /litre or more is reached, consult product literature for further details of dose adjustments; reassess bodyweight every 12 weeks, discontinue treatment if inadequate response after 4 weeks at maximum dose

- **CAUTIONS** Risk factors for thromboembolism
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia · angioedema · arthralgia · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · embolism and thrombosis · eye inflammation · fever · flushing · gastrointestinal discomfort · headaches · hypersensitivity · increased risk of infection · influenza like illness · muscle complaints · nausea · oropharyngeal pain · pain · palpitations · peripheral oedema · peripheral swelling · sensation abnormal · skin reactions · sleep disorders
 - **Uncommon** Alopecia · appetite decreased · chest pain · clonus · dehydration · depression · dry throat · dysphagia · dyspnoea · erythromelalgia · eye disorders · eye pruritus · feeling hot · feeling jittery · gastroesophageal reflux disease · gout · haemorrhage · hair growth abnormal · hypotension · irritability · leucocytosis · malaise · muscle weakness · myocardial infarction · nasal complaints · neoplasms · oral disorders · peripheral ischaemia · peripheral neuropathy · photosensitivity reaction · pleuritic pain · portal vein thrombosis · skin nodule · splenomegaly · taste altered · thrombocytosis · tooth discolouration · vertigo · vision disorders · vomiting · weight changes
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in moderate to severe impairment (risk of thromboembolic complications).
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - Manufacturer advises monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.
 - Manufacturer advises monitor platelet count weekly until platelet count reaches 50×10^9 /litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.
 - Manufacturer advises monitor platelet count following treatment discontinuation—risk of bleeding.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2126

The *Scottish Medicines Consortium* has advised (February 2019) that romiplostim (*Nplate*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged one year and older who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). Romiplostim is restricted to those with severe symptomatic ITP or those with a high risk of bleeding.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3103

The *All Wales Medicines Strategy Group* has advised (March 2019) that romiplostim (*Nplate*[®]) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in patients from 1 year of age up to 18 years of age who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

2 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 148 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride p. 651 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of **hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with

glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 164 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 642 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate p. 634 infusion should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water

Sodium chloride p. 636 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate p. 634 may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 636 or glucose 5% p. 638) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose p. 638. Solutions containing 20 mmol/litre of potassium chloride p. 651 meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

Fluid requirements for children over 1 month:

Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

Important The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Replacement therapy: initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Intravenous sodium

Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and glucose 5% allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride 0.9% intravenous infusion and glucose 5% intravenous infusion with potassium as appropriate.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Intravenous glucose

Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those

Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre

Pancreatic	-	120-140	5-15	70-110	40-80
Small bowel	-	120-140	5-15	20-40	90-130

to ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 636 is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and trometamol

Sodium bicarbonate is used to control severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) p. 634 can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In

severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 630, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

Plasma and plasma substitutes

Albumin solution p. 643, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Gelatin p. 644 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from

conditions such as burns or septicaemia; it may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypertonaemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypertonaemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

29-Jul-2019

● INDICATIONS AND DOSE

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

▶ BY MOUTH

▶ Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.

▶ Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Severe metabolic acidosis

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

Renal hyperkalaemia

▶ BY SLOW INTRAVENOUS INJECTION

▶ Neonate: 1 mmol/kg daily.

▶ Child: 1 mmol/kg daily

Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol

▶ BY INTRAVENOUS INFUSION

▶ Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

● **CONTRA-INDICATIONS** Salt restricted diet

● **CAUTIONS** Respiratory acidosis

● **INTERACTIONS** → Appendix 1: sodium bicarbonate

● SIDE-EFFECTS

▶ With intravenous use Skin exfoliation · soft tissue necrosis · ulcer

▶ With oral use Abdominal cramps · burping · flatulence · hypokalaemia · metabolic alkalosis

● HEPATIC IMPAIRMENT

▶ With oral use Manufacturer advises caution in cirrhosis.

● MONITORING REQUIREMENTS

▶ With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use For *peripheral infusion* dilute 8.4% solution at least 1 in 10. For *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.

▶ With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● PRESCRIBING AND DISPENSING INFORMATION

▶ With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of Na⁺ and HCO₃⁻; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

▶ With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

Medicines for Children leaflet: Sodium bicarbonate for acidosis www.medicinesforchildren.org.uk/sodium-bicarbonate-acidosis

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium chloride with calcium chloride dihydrate and sodium chloride

(Ringer's solution)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651, sodium chloride p. 636.

● INDICATIONS AND DOSE

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS** → Appendix 1: potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION** Ringer's solution for injection provides the following ions (in mmol/litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)**
Potassium chloride **300 microgram per 1 ml**, Calcium chloride **320 microgram per 1 ml**, Sodium chloride **8.6 mg per 1 ml** Steriflex No.9 ringers infusion 500ml bags | 1 bag **[PoM]** £1.96
Steriflex No.9 ringers infusion 1litre bags | 1 bag **[PoM]** £2.22
Polyfusor Ringers solution for infusion 500ml bottles | 1 bottle **[PoM]** £3.58

Potassium chloride with calcium chloride, sodium chloride and sodium lactate

(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651, sodium chloride p. 636, calcium chloride p. 642.

● INDICATIONS AND DOSE

For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts · potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION** Compound sodium lactate intravenous infusion contains Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Potassium chloride with calcium chloride, sodium chloride and sodium lactate (Non-proprietary)**
Calcium chloride **270 microgram per 1 ml**, Potassium chloride **400 microgram per 1 ml**, Sodium lactate **3.17 mg per 1 ml**, Sodium chloride **6 mg per 1 ml** Sodium lactate compound infusion 1litre bags | 1 bag **[PoM]** £

Potassium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651, glucose p. 638.

● INDICATIONS AND DOSE

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Dosed according to the deficit or daily maintenance requirements

- **INTERACTIONS** → Appendix 1: potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION** Potassium chloride 0.3% contains 40 mmol each of K⁺ and Cl⁻/litre or 0.15% contains 20 mmol each of K⁺ and Cl⁻/litre with 5% of anhydrous glucose.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- ▶ **Potassium chloride with glucose (Non-proprietary)**
Potassium chloride **3 mg per 1 ml**, Glucose anhydrous **50 mg per 1 ml** Potassium chloride 0.3% (potassium 20mmol/500ml) / Glucose 5% infusion 500ml bags | 1 bag **[PoM]** £
Potassium chloride 0.3% (potassium 40mmol/1litre) / Glucose 5% infusion 1litre bags | 1 bag **[PoM]** £1.30
Potassium chloride **2 mg per 1 ml**, Glucose anhydrous **50 mg per 1 ml** Steriflex No.29 potassium chloride 0.2% (potassium 27mmol/1litre) / glucose 5% infusion 1litre bags | 1 bag **[PoM]** £2.20
Steriflex No.29 potassium chloride 0.2% (potassium 13.3mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag **[PoM]** £1.67
Potassium chloride **1.5 mg per 1 ml**, Glucose anhydrous **50 mg per 1 ml** Potassium chloride 0.15% (potassium 20mmol/1litre) / Glucose 5% infusion 1litre bags | 1 bag **[PoM]** £

Potassium chloride 0.15% (potassium 10mmol/500ml) / Glucose 5% infusion 500ml bags | 1 bag [PoM] £1.30

Potassium chloride with glucose and sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651, glucose p. 638, sodium chloride below.

● INDICATIONS AND DOSE

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Dosed according to the deficit or daily maintenance requirements

- **INTERACTIONS** → Appendix 1: potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION**
Concentration of potassium chloride to be specified by the prescriber (usually K^+ 10–40 mmol/litre).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- ▶ **Potassium chloride with glucose and sodium chloride (Non-proprietary)**

Sodium chloride 1.8 mg per 1 ml, Potassium chloride 3 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Glucose 4% / Sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] [S]

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Potassium chloride 0.15% (potassium 20mmol/1litre) / Glucose 4% / Sodium chloride 0.18% infusion 1litre bags | 1 bag [PoM] [S]

Potassium chloride 0.15% (potassium 10mmol/500ml) / Glucose 4% / Sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] [S]

Sodium chloride 1.8 mg per 1 ml, Potassium chloride 2 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml Steriflex No.30 potassium chloride 0.2% (potassium 13.3mmol/500ml) / glucose 4% / sodium chloride 0.18% infusion 500ml bags | 1 bag [PoM] £1.67
Steriflex No.30 potassium chloride 0.2% (potassium 27mmol/1litre) / glucose 4% / sodium chloride 0.18% infusion 1litre bags | 1 bag [PoM] £2.20

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml Intraven potassium chloride 0.15% (potassium 10mmol/500ml) / glucose 5% / sodium chloride 0.45% infusion 500ml bags | 1 bag [PoM] £3.76

Potassium chloride with potassium bicarbonate

10-Mar-2020

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651.

● INDICATIONS AND DOSE

Potassium depletion

- ▶ BY MOUTH
- ▶ Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS** → Appendix 1: potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION** Each *Sando-K*[®] tablet contains potassium 470 mg (12 mmol of K^+) and chloride 285mg (8 mmol of Cl^-).
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Potassium chloride for potassium depletion www.medicinesforchildren.org.uk/potassium-chloride-potassium-depletion

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Sando-K** (HK Pharma Ltd)

Potassium bicarbonate 400 mg, Potassium chloride

600 mg Sando-K effervescent tablets | 100 tablet [P] £9.95 DT = £9.95

Potassium chloride with sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 651, sodium chloride below.

● INDICATIONS AND DOSE

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Depending on the deficit or the daily maintenance requirements (consult product literature)

- **INTERACTIONS** → Appendix 1: potassium chloride
- **PRESCRIBING AND DISPENSING INFORMATION** Potassium chloride 0.15% with sodium chloride 0.9% contains K^+ 20 mmol, Na^+ 150 mmol, and Cl^- 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K^+ 40 mmol, Na^+ 150 mmol, and Cl^- 190 mmol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- ▶ **Potassium chloride with sodium chloride (Non-proprietary)**

Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.3% (potassium 20mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag [PoM] [S]

Potassium chloride 0.3% (potassium 40mmol/1litre) / Sodium chloride 0.9% infusion 1litre bags | 1 bag [PoM] [S]

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 9 mg per 1 ml Potassium chloride 0.15% (potassium 20mmol/1litre) / Sodium chloride 0.9% infusion 1litre bags | 1 bag [PoM] [S]

Potassium chloride 0.15% (potassium 10mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag [PoM] £1.30

Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml Steriflex No.28 potassium chloride 0.2% (potassium 13.3mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag [PoM] £1.67

Steriflex No.28 potassium chloride 0.2% (potassium 27mmol/1litre) / sodium chloride 0.9% infusion 1litre bags | 1 bag [PoM] £2.20

ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

Sodium chloride

01-May-2020

● INDICATIONS AND DOSE

Chronic renal salt wasting

- ▶ BY MOUTH
- ▶ Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements

Sodium supplementation in neonates

- ▶ INITIALLY BY MOUTH

- ▶ Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).

Sodium replacement

- ▶ BY MOUTH USING MODIFIED-RELEASE TABLETS
- ▶ Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Diluent for instillation of drugs to the bladder

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Child: (consult product literature)

Skin cleansing

- ▶ TO THE SKIN
- ▶ Child: Use for topical irrigation of wounds

● CAUTIONS

- ▶ With intravenous use Avoid excessive administration · cardiac failure · cardio-respiratory diseases · children receiving glucocorticoids · dilutional hyponatraemia · hepatic cirrhosis · hypertension · peripheral oedema · pulmonary oedema · reduced fluid loss · renal insufficiency · restrict intake in impaired renal function · toxæmia of pregnancy

CAUTIONS, FURTHER INFORMATION

- ▶ Reduced fluid loss
- ▶ With intravenous use The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.
- ▶ Dilutional hyponatraemia
- ▶ With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

● SIDE-EFFECTS

- ▶ With intravenous use Chills · fever · hypervolaemia · hypotension · local reaction · localised pain · paraesthesia · skin reactions · tremor · vascular irritation · venous thrombosis
- ▶ With oral use Abdominal cramps · acidosis hyperchloraemic · diarrhoea · generalised oedema · hypertension · hypotension · irritability · muscle complaints · nausea · vomiting

● MONITORING REQUIREMENTS

- ▶ With intravenous use During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- ▶ With oral use Each *Slow Sodium*[®] tablet contains approximately 10 mmol each of Na⁺ and Cl⁻; *EvGr* tablets can be crushed before administration .

The RCPCH and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Sodium chloride for hyponatraemia
- ▶ With systemic use www.medicinesforchildren.org.uk/sodium-chloride-hyponatraemia

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 636, glucose below.

● INDICATIONS AND DOSE

Combined water and sodium depletion

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

- **CAUTIONS** Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.
- **MONITORING REQUIREMENTS**
 - ▶ Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
 - ▶ During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion **Infusion**

NUTRIENTS > SUGARS

Glucose

06-Feb-2020

(Dextrose Monohydrate)

● INDICATIONS AND DOSE

Establish presence of gestational diabetes

- ▶ BY MOUTH
- ▶ Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

- ▶ BY MOUTH
- ▶ Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 mL fluid

Neonatal hypoglycaemia

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

Hypoglycaemia

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant

Energy source

▶ BY INTRAVENOUS INFUSION

- ▶ Child: (consult product literature)

Water replacement

▶ BY INTRAVENOUS INFUSION

- ▶ Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis

▶ BY INTRAVENOUS INFUSION

- ▶ Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

DOSE EQUIVALENCE AND CONVERSION

- ▶ 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes · prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **SIDE-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

Combinations available: **Potassium chloride with glucose**, p. 635 • **Potassium chloride with glucose and sodium chloride**, p. 636 • **Sodium chloride with glucose**, p. 638

ORAL REHYDRATION SALTS**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

● INDICATIONS AND DOSE**Fluid and electrolyte loss in diarrhoea**

- ▶ BY MOUTH
- ▶ Child 1-11 months: 1–1½ times usual feed volume to be given
- ▶ Child 1-11 years: 200 mL, to be given after every loose motion
- ▶ Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram Dioralyte oral powder sachets citrus | 20 sachet [P] £6.72
Dioralyte oral powder sachets plain | 20 sachet [P] £6.72
Dioralyte oral powder sachets blackcurrant | 20 sachet [P] £6.72

Potassium chloride with rice powder, sodium chloride and sodium citrate

(Formulated as oral rehydration salts)

● INDICATIONS AND DOSE**Fluid and electrolyte loss in diarrhoea**

- ▶ BY MOUTH
- ▶ Child 1-11 months: 1–1½ times usual feed volume to be given
- ▶ Child 1-11 years: 200 mL, to be given after every loose motion
- ▶ Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **UNLICENSED USE** *Dioralyte Relief*[®] not licensed for use in children under 3 months.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 50 mmol and citrate 10 mmol.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include apricot, black currant, or raspberry.
- **PATIENT AND CARER ADVICE** Patients and carers should be advised how to reconstitute *Dioralyte*[®] Relief oral powder. After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

EXCIPIENTS: May contain Aspartame

- ▶ **Dioralyte Relief** (Sanofi)
Potassium chloride 300 mg, Sodium chloride 350 mg, Sodium citrate 580 mg, Rice powder pre-cooked 6 gram Dioralyte Relief oral powder sachets blackcurrant sugar-free | 20 sachet [P] £7.13

2.1 Calcium imbalance**Calcium imbalance****Calcium supplements**

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 674), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% p. 642 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 642 is also available, but is more irritant; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol p. 680 or calcitriol p. 681) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 636. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 506 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 508 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Calcium supplements in neonates

Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

2.1a Hypercalcaemia and hypercalciuria

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Cinacalcet

22-Jan-2020

- **DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

● INDICATIONS AND DOSE

Secondary hyperparathyroidism [in patients with end-stage renal disease on dialysis] (under expert supervision)

- ▶ BY MOUTH
- ▶ Child 3-17 years: (consult product literature)

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Conditions that may worsen with a decrease in serum-calcium concentrations
CAUTIONS, FURTHER INFORMATION Manufacturer advises caution with use in patients with conditions that may worsen with a decrease in serum-calcium concentrations, including predisposition to QT-interval prolongation, history of seizures, and history of impaired cardiac function—serum-calcium concentration should be closely monitored.
- **INTERACTIONS** → Appendix 1: cinacalcet
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Appetite decreased · asthenia · back pain · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypersensitivity · hypotension · muscle complaints · nausea · paraesthesia · rash · seizure · upper respiratory tract infection · vomiting
 - ▶ **Frequency not known** Heart failure aggravated · QT interval prolongation · ventricular arrhythmia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Manufacturer advises measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then weekly thereafter. Measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules containing granules should be opened and the granules sprinkled on to a small amount of soft food (apple sauce or yogurt) or liquid, then administered immediately. Capsules should not be swallowed whole. For administration advice via nasogastric or gastrostomy tube—consult product literature.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be counselled on the symptoms of hypocalcaemia and importance of serum-calcium monitoring.
Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and seizures.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Granules

Calcium carbonate

10-Mar-2020

● INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

▶ BY MOUTH

- ▶ Child 1-11 months: 120 mg 3-4 times a day, dose to be adjusted as necessary, to be taken with feeds
- ▶ Child 1-5 years: 300 mg 3-4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- ▶ Child 6-11 years: 600 mg 3-4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- ▶ Child 12-17 years: 1.25 g 3-4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

Calcium deficiency

▶ BY MOUTH

- ▶ Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.

- ▶ Child 1 month-4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 5-11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 12-17 years: 10 mmol 4 times a day, adjusted according to response

- **INTERACTIONS** → Appendix 1: calcium salts

● SIDE-EFFECTS

- ▶ **Uncommon** Hypercalcaemia

- ▶ **Rare or very rare** Flatulence · gastrointestinal discomfort · milk-alkali syndrome · skin reactions

● PRESCRIBING AND DISPENSING INFORMATION *Adcal*[®]

- contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol); *Calcichew*[®] contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol); *Calcichew Forte*[®] contains calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol); *Cacit*[®] contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

F 641

20-Nov-2019

Calcium gluconate● **INDICATIONS AND DOSE****Calcium deficiency | Mild asymptomatic hypocalcaemia**

- ▶ BY MOUTH
- ▶ Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- ▶ Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response

- ▶ Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

Acute hypocalcaemia, urgent correction | Hyperkalaemia (prevention of arrhythmias)

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.
- ▶ Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 mL calcium gluconate 10%)

Acute hypocalcaemia, maintenance

▶ BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.
- ▶ Child 1 month–1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation; Usual maximum 8.8 mmol
- ▶ Child 2–17 years: 8.8 mmol daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

DOSE EQUIVALENCE AND CONVERSION

- ▶ 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

- **INTERACTIONS** → Appendix 1: calcium salts
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS Arrhythmias
SPECIFIC SIDE-EFFECTS
 - ▶ With intravenous use Circulatory collapse · feeling hot · hyperhidrosis · hypotension · vasodilation · vomiting
 - ▶ With oral use Gastrointestinal disorder
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.
- **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or Ca²⁺ 2.23 mmol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

2.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution

30-Jan-2020

(Human Albumin Solution)

● INDICATIONS AND DOSE

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult product literature)

- **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiovascular disease · increased capillary permeability · risk of haemodilution (e.g. severe anaemia or haemorrhagic disorders) · risk of hypervolaemia (e.g. oesophageal varices or pulmonary oedema) · vaccination against hepatitis A and hepatitis B may be required

CAUTIONS, FURTHER INFORMATION

- ▶ Volume status Manufacturer advises adjust dose and rate of infusion to avoid fluid overload.
- **SIDE-EFFECTS**
- ▶ Rare or very rare Fever · flushing · nausea · shock · urticaria
- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

PLASMA SUBSTITUTES

Gelatin

● INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: Initially 10–20 mL/kilogram, use 3.5–4% solution

- **CAUTIONS** Cardiac disease · severe liver disease

CAUTIONS, FURTHER INFORMATION The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

● SIDE-EFFECTS

- ▶ **Rare or very rare** Chills · dyspnoea · fever · hyperhidrosis · hypersensitivity · hypertension · hypotension · hypoxia · tachycardia · tremor · urticaria · wheezing
- **PREGNANCY** Manufacturer of *Geloplasma*[®] advises avoid at the end of pregnancy.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid preparations that contain lactate (risk of impaired lactate metabolism).
- **RENAL IMPAIRMENT** Use with caution in renal impairment.
- **MONITORING REQUIREMENTS**
- ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

2.3 Magnesium imbalance

Magnesium imbalance

Overview

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 646 as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate p. 645 powder for oral solution is available as a licensed preparation.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

2.3a Hypomagnesaemia**ELECTROLYTES AND MINERALS > MAGNESIUM****Magnesium aspartate****● INDICATIONS AND DOSE****Treatment and prevention of magnesium deficiency****▶ BY MOUTH**

- ▶ Child 2–3 years: 4.5 mmol daily, given as one level 5 mL spoonful of *Magnaspartate*[®] powder.
- ▶ Child 4–9 years: 4.5 mmol daily, given as a 5 mL level spoonful of *Magnaspartate*[®] powder, alternatively 10 mmol daily, given as 1 sachet of *Magnaspartate*[®] powder.
- ▶ Child 10–17 years: 10 mmol daily, given as 1 sachet of *Magnaspartate*[®] powder.

- **CONTRA-INDICATIONS** Disorders of cardiac conduction

- **INTERACTIONS** → Appendix 1: magnesium

● SIDE-EFFECTS

- ▶ **Uncommon** Diarrhoea · faeces soft
- ▶ **Rare or very rare** Fatigue · hypermagnesaemia
- ▶ **Frequency not known** Gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).

- **DIRECTIONS FOR ADMINISTRATION** Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

● PRESCRIBING AND DISPENSING INFORMATION

Magnaspartate[®] contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer magnesium aspartate powder.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Powder

EXCIPIENTS: May contain Sucrose

Magnesium glycerophosphate

24-Oct-2017

● INDICATIONS AND DOSE**Hypomagnesaemia****▶ BY MOUTH**

- ▶ Child 1 month–11 years: Initially 0.2 mmol/kg 3 times a day, dose to be adjusted as necessary, dose expressed as Mg²⁺
- ▶ Child 12–17 years: Initially 4–8 mmol 3 times a day, dose to be adjusted as necessary, dose expressed as Mg²⁺

DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium glycerophosphate 1 g is approximately equivalent to Mg²⁺ 4 mmol or magnesium 97 mg.

NEOMAG[®] CHEWABLE TABLETS**Hypomagnesaemia****▶ BY MOUTH**

- ▶ Child 4–11 years: Initially 1 tablet twice daily, dose to be adjusted according to the serum total magnesium level
- ▶ Child 12–17 years: Initially 1 tablet 3 times a day, dose to be adjusted according to the serum total magnesium level

DOSE EQUIVALENCE AND CONVERSION

- ▶ Each *Neomag*[®] chewable tablet contains Mg²⁺ 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Preparations other than *Neomag*[®] are not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Diarrhoea · hypermagnesaemia

Overdose Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Increased risk of toxicity.

Dose adjustments Avoid or reduce dose.

- **NEOMAG[®] CHEWABLE TABLETS** Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum magnesium levels every 3–6 months.

● DIRECTIONS FOR ADMINISTRATION

NEOMAG[®] CHEWABLE TABLETS Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

● NATIONAL FUNDING/ACCESS DECISIONS**NEOMAG[®] CHEWABLE TABLETS****Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (September 2017) that magnesium glycerophosphate (*Neomag*[®]) is accepted for use within NHS Scotland as an oral magnesium supplement for the treatment of patients with chronic magnesium loss or hypomagnesaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, powder

Magnesium sulfate

13-Mar-2020

● INDICATIONS AND DOSE**Severe acute asthma | Continuing respiratory deterioration in anaphylaxis**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Persistent pulmonary hypertension of the newborn

- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Neonate: Initially 200 mg/kg, to be given over 20–30 minutes, then (by continuous intravenous infusion) 20–75 mg/kg/hour for up to 5 days if response occurs after initial dose (to maintain plasma magnesium concentration between 3.5–5.5 mmol/litre).

Hypomagnesaemia

- ▶ BY INTRAVENOUS INJECTION
- ▶ Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.
- ▶ Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes
- ▶ Child 12-17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 50–100 mg/kg daily; maximum 5 g per day

Neonatal hypocalcaemia

- ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Neonate: 100 mg/kg every 12 hours for 2–3 doses.

Torsade de pointes

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MAGNESIUM SULFATE: RISK OF SKELETAL ADVERSE EFFECTS IN THE NEONATE FOLLOWING PROLONGED OR REPEATED USE IN PREGNANCY (MAY 2019)

Maternal administration of magnesium sulfate for longer than 5–7 days in pregnancy has been associated with hypocalcaemia, hypermagnesaemia, and skeletal side-effects in neonates. Healthcare professionals are advised to consider monitoring neonates for abnormal calcium and magnesium levels, and skeletal side-effects if maternal treatment with magnesium sulfate during pregnancy is prolonged or repeated beyond current recommendations.

- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS** Bone demineralisation (reported in neonates following prolonged or repeated use in pregnancy) · electrolyte imbalance · osteopenia (reported in neonates following prolonged or repeated use in pregnancy)
- **Overdose** Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.
- **PREGNANCY** For information on the risk of side-effects in neonates following prolonged or repeated maternal use of magnesium sulfate during pregnancy, see *Important Safety Information*.
- ▶ When used for Neonatal hypocalcaemia or Hypomagnesaemia or Torsade de pointes or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Increased risk of toxicity.
Dose adjustments Avoid or reduce dose.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For *intravenous infusion*, in persistent pulmonary hypertension of the newborn, dilute to a max. concentration of 100 mg/mL (10%) (0.4 mmol/mL Mg^{2+}) magnesium sulfate heptahydrate (200 mg/mL (0.8 mmol/mL Mg^{2+}) if fluid restricted) with Glucose 5% or

Sodium Chloride 0.9%. For neonatal hypocalcaemia, hypomagnesaemia, and torsade de pointes, dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol Mg²⁺) in 1 mL) with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg²⁺) of magnesium sulfate heptahydrate.

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection

- ▶ **Magnesium sulfate (Non-proprietary)**

Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £87.20

2.4 Phosphate imbalance

Phosphate imbalance

Phosphate supplements

Oral phosphate supplements p. 649 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 674.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of *severe hypophosphatemia* because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of

calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 641.

Phosphate supplements in neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

2.4b Hypophosphataemia

DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

Burosumab

16-Nov-2018

- **DRUG ACTION** Burosumab is a human monoclonal antibody that inhibits the activity of fibroblast growth factor 23, thereby increasing renal tubular reabsorption of phosphate and increasing serum concentration of vitamin D.

● INDICATIONS AND DOSE

X-linked hypophosphataemia with radiographic evidence of bone disease in children and adolescents with growing skeletons (initiated by a specialist)

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 1–17 years: Initially 0.4 mg/kg, subsequent doses adjusted according to response and administered every 2 weeks. Dose may be increased in steps of 0.4 mg/kg at intervals of at least 4 weeks up to a maximum of 2 mg/kg (maximum dose 90 mg)—consult product literature; usual maintenance 0.8 mg/kg every 2 weeks (max. per dose 90 mg), to be administered into the arm, abdomen, buttock or thigh, each dose should be rounded to the nearest 10 mg

- **CONTRA-INDICATIONS** Concurrent use of oral phosphate or vitamin D analogues—discontinue 1 week before initiation of burosumab

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · headache · myalgia · pain in extremity · rash · tooth abscess · toothache

- **PREGNANCY** Manufacturer advises avoid— toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment— no information available.

● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor fasting serum-phosphate concentration before treatment initiation, every 2 weeks for the first month, every 4 weeks for the following 2 months, 4 weeks after dose adjustment, and as appropriate thereafter—target the lower end of the normal reference range for age to decrease the risk of ectopic mineralisation. Periodic measurement of post-prandial serum-phosphate concentration is also advised.
- ▶ Manufacturer advises monitor for signs and symptoms of nephrocalcinosis at treatment initiation, every 6 months for the first 12 months, and annually thereafter. Also monitor plasma alkaline phosphatases, calcium, parathyroid hormone, and creatinine every 6 months (every 3 months for children aged 1–2 years) or as indicated, and urine calcium and phosphate every 3 months.

- **DIRECTIONS FOR ADMINISTRATION** Maximum volume per injection site is 1.5 mL. If a volume over 1.5 mL is required on a given dosing day, manufacturer advises the total volume should be split and given at 2 different injection sites.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
 ▶ **Burosumab for treating X-linked hypophosphataemia in children and young people (October 2018)** NICE HST8 Burosumab (*Crysvita*®) is recommended, within its marketing authorisation, for treating X-linked hypophosphataemia with radiographic evidence of bone disease in children aged 1 year and over, and in young people with growing bones. It is recommended only if the manufacturer provides burosumab according to the commercial arrangement.
www.nice.org.uk/guidance/hst8

LAXATIVES > OSMOTIC LAXATIVES**Phosphate**

13-Mar-2020

• **INDICATIONS AND DOSE****Hypophosphataemia | Hypophosphataemic rickets | Osteomalacia**▶ **BY MOUTH USING EFFERVESCENT TABLETS**

- ▶ **Neonate:** 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details.
- ▶ **Child 1 month–4 years:** 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details; maximum 48 mmol per day
- ▶ **Child 5–17 years:** 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day

▶ **BY INTRAVENOUS INFUSION**

- ▶ **Neonate:** 1 mmol/kg daily, dose to be adjusted as necessary.
- ▶ **Child 1 month–1 year:** 0.7 mmol/kg daily, dose to be adjusted as necessary
- ▶ **Child 2–17 years:** 0.4 mmol/kg daily, dose to be adjusted as necessary

IMPORTANT SAFETY INFORMATION

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the *concentration* of potassium should not usually exceed 40 mmol/litre. The infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate

preparations may also limit the *rate* at which they may be administered.

• **CAUTIONS**

GENERAL CAUTIONS Cardiac disease · dehydration · diabetes mellitus · sodium and potassium concentrations of preparations

SPECIFIC CAUTIONS

- ▶ With intravenous use Avoid extravasation · severe tissue necrosis

• **SIDE-EFFECTS**

- ▶ With intravenous use Electrolyte imbalance
 - ▶ With oral use Abdominal distress · diarrhoea · nausea
- SIDE-EFFECTS, FURTHER INFORMATION** Diarrhoea is a common side-effect and should prompt a reduction in dosage.

• **RENAL IMPAIRMENT****Dose adjustments** Reduce dose.**Monitoring** Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

• **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice.

- **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol); *Polyfusor NA*® contains Na⁺ 162 mmol/litre, K⁺ 19 mmol/litre, PO₄³⁻ 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

2.5 Potassium imbalance

2.5a Hyperkalaemia

Other drugs used for Hyperkalaemia Calcium gluconate, p. 642 · Insulin, p. 491

ANTIDOTES AND CHELATORS > CATION EXCHANGE COMPOUNDS

Calcium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

▶ BY MOUTH

▶ Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

▶ BY RECTUM

▶ Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

▶ Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

● **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · reduced gut motility (in neonates) · sarcoidosis

● **CAUTIONS** Impaction of resin with excessive dosage or inadequate dilution

● **INTERACTIONS** → Appendix 1: polystyrene sulfonate

● **SIDE-EFFECTS** Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting

● **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

● **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

● DIRECTIONS FOR ADMINISTRATION

▶ With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbisterit® powder only)

EXCIPIENTS: May contain Sucrose

▶ Calcium Resonium (Sanofi)

Calcium polystyrene sulfonate 999.34 mg per 1 gram Calcium Resonium powder sugar-free | 300 gram P £82.16 DT = £82.16

Sodium polystyrene sulfonate

● INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

▶ BY MOUTH

▶ Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

▶ BY RECTUM

▶ Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

▶ Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

● **CONTRA-INDICATIONS** Obstructive bowel disease · reduced gut motility (in neonates)

● **CAUTIONS** Congestive heart failure · hypertension · impaction of resin with excessive dosage or inadequate dilution · oedema

● **INTERACTIONS** → Appendix 1: polystyrene sulfonate

● **SIDE-EFFECTS** Appetite decreased · bezoar · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · increased risk of infection · nausea · necrosis (in combination with sorbitol) · vomiting

● **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

● **RENAL IMPAIRMENT** Use with caution.

● **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

● DIRECTIONS FOR ADMINISTRATION

▶ With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

▶ With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Powder

CAUTIONARY AND ADVISORY LABELS 13

▶ Resonium A (Sanofi)

Sodium polystyrene sulfonate 999.34 mg per 1 gram Resonium A powder sugar-free | 454 gram P £81.11 DT = £81.11

2.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

● INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)

▶ BY MOUTH

▶ Child: (consult product literature)

● **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

● **CAUTIONS** Cardiac disease

● **SIDE-EFFECTS** Abdominal discomfort · flatulence

- **RENAL IMPAIRMENT** Avoid in severe impairment. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. **Effervescent tablet**
CAUTIONARY AND ADVISORY LABELS 13, 21
 - ▶ Potassium bicarbonate with potassium acid tartrate (Non-proprietary)
Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet [G5L] £91.66–£92.15 DT = £92.15

Potassium chloride

20-Nov-2019

● INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

▶ BY MOUTH

- ▶ Child: 1–2 mmol/kg daily; Usual maximum 50 mmol

Electrolyte imbalance

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.
- ▶ Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

Potassium depletion

▶ BY MOUTH

- ▶ Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.
- ▶ Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

NHS NEVER EVENT: MIS-SELECTION OF A STRONG POTASSIUM SOLUTION (JANUARY 2018)

Patients should not be inadvertently given a strong potassium solution ($\geq 10\%$ potassium w/v) intravenously, rather than the intended medication.

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
 - ▶ With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
 - ▶ With oral use Cardiac disease · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)
- **INTERACTIONS** → Appendix 1: potassium chloride
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
Hyperkalaemia

SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
 - ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
 - ▶ With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use in neonates Potassium chloride solutions suitable for use by mouth in neonates are available from 'special order' manufacturers or specialist importing companies; they should be used with care because they are hypertonic and can damage the gastric mucosa.
 - ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).
 - ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**.
 - ▶ With intravenous use Ready-mixed infusion solutions should be used when possible. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L[®] contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*[®] and *Ruthmol*[®]). These should not be used by patients with renal failure as potassium intoxication may result.
- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital, Medicines Information Centre
 (0151) 252 5381
 and
 Great Ormond Street Hospital for Children, pharmacy
 (020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 664 and sodium phenylbutyrate p. 665 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 662 or citrulline p. 663, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.

3.1 Acute porphyrias

Acute porphyrias

01-Oct-2017

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

[EvGr] Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below. **[E]**

Haem arginate p. 653 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

[EvGr] The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available. **[E]**

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS, see *Useful resources* below.

Further information may be obtained from: porphyria.eu/ and also from:

The UK Porphyria Medicines Information Service (UKPMIS)
 University Hospital of Wales
 CF14 4XW
 Cardiff
 (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diltiazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Ifosfamide
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
- Ketamine
- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Methyl dopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine
- Pentoxifylline
- Pergolide
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Pizotifen
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact UKPMIS for advice)
- Rifampicin
- Riluzole
- Risperidone
- Spironolactone
- Sulfinpyrazone
- Tamoxifen
- Temoporfin
- Thiotepa
- Tiagabine

- Tibolone
- Topiramate
- Toremfene
- Trimethoprim
- Valproate
- Verapamil
- Xipamide

BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES**Haem arginate**

(Human hemin)

● INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria

► BY INTRAVENOUS INFUSION

► Child: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

● SIDE-EFFECTS

- **Common or very common** Poor venous access
- **Rare or very rare** Fever
- **Frequency not known** Headache · injection site necrosis · skin discolouration · venous thrombosis
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Administer over at least 30 minutes through a filter via large antebraial or central vein; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Normosang** (Recordati Rare Diseases UK Ltd)

Haem arginate 25 mg per 1 ml Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule [PoM] £1,737.00

3.2 Carnitine deficiency**AMINO ACIDS AND DERIVATIVES****Levocarnitine**

29-Apr-2020

(Carnitine)

● INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

► BY MOUTH

► Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

► Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

► Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

continued →

- ▶ Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour
- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- ▶ Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Child: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

Organic acidemias

- ▶ BY MOUTH
- ▶ Neonate: Up to 200 mg/kg daily in 2–4 divided doses.
- ▶ Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day
- ▶ INITIALLY BY INTRAVENOUS INFUSION
- ▶ Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- ▶ Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour
- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- ▶ Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

● UNLICENSED USE

- ▶ With intravenous use Not licensed for use by intravenous infusion.
- ▶ With oral use Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children over 12 years. Not licensed for use in organic acidemias.

● CAUTIONS Diabetes mellitus

● SIDE-EFFECTS

- ▶ Rare or very rare Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

● PREGNANCY Appropriate to use; no evidence of teratogenicity in animal studies.

● RENAL IMPAIRMENT Accumulation of metabolites may occur with chronic oral administration in severe impairment.

● MONITORING REQUIREMENTS

- ▶ Monitoring of free and acyl carnitine in blood and urine recommended.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ When used for Organic acidemias Levocarnitine is used in the treatment of some organic acidemias; however, use in fatty acid oxidation is controversial.

● PATIENT AND CARER ADVICE

3.3 Cystinosis

3.3a Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

29-Apr-2020

(Cysteamine)

● INDICATIONS AND DOSE

Nephropathic cystinosis (specialist use only)

- ▶ BY MOUTH
- ▶ Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- ▶ Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- ▶ Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- ▶ Child 12–17 years (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use
- ▶ 1.3 g/m² is approximately equivalent to 50 mg/kg.

Corneal cystine crystal deposits in patients with cystinosis (specialist use only)

- ▶ TO THE EYE
- ▶ Child 2–17 years: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

IMPORTANT SAFETY INFORMATION**SAFE PRACTICE**

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

● CAUTIONS

- When used by eye Contact lens wearers
- With oral use Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

● SIDE-EFFECTS

- Common or very common**
 - When used by eye Dry eye · eye discomfort · eye disorders · vision blurred
 - With oral use Appetite decreased · asthenia · breath odour · diarrhoea · drowsiness · encephalopathy · fever · gastroenteritis · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- Uncommon**
 - With oral use Compression fracture · gastrointestinal ulcer · hair colour changes · hallucination · joint hyperextension · leg pain · leucopenia · musculoskeletal disorders · nephrotic syndrome · nervousness · osteopenia · seizure
- Frequency not known**
 - With oral use Depression · intracranial pressure increased · papilloedema

- ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

● PREGNANCY

- With oral use Manufacturer advises avoid—teratogenic and toxic in animal studies.

● BREAST FEEDING

- With oral use Manufacturer advises avoid—no information available.

● MONITORING REQUIREMENTS

- With oral use Leucocyte-cystine concentration and haematological monitoring required—consult product literature.
- All patients receiving mercaptamine should be registered (contact local specialist centre for details).

● DIRECTIONS FOR ADMINISTRATION

- With oral use For children under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice).

● PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● HANDLING AND STORAGE

- When used by eye Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mercaptamine eye drops for ocular symptoms of cystinosis www.medicinesforchildren.org.uk/mercaptamine-eye-drops-ocular-symptoms-cystinosis

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) decisions**

- With oral use The *Scottish Medicines Consortium* has advised (November 2017) that mercaptamine (*Procsybi*[®]) is **not** recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Gastro-resistant capsule

- Procsybi** (Chiesi Ltd)

Mercaptamine (as Mercaptamine bitartrate) 25 mg Procsybi
25mg gastro-resistant capsules | 60 capsule [PoM](#) £335.97

Mercaptamine (as Mercaptamine bitartrate) 75 mg Procsybi
75mg gastro-resistant capsules | 250 capsule [PoM](#) £4,199.65

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Cystaran** (Imported (United States))

Mercaptamine (as Mercaptamine hydrochloride) 4.4 mg per 1 ml Cystaran 0.44% eye drops | 15 ml [PoM](#) [S](#)

- ▶ **Cystadrops** (Recordati Rare Diseases UK Ltd)

Mercaptamine (as Mercaptamine hydrochloride) 3.8 mg per 1 ml Cystadrops 3.8mg/ml eye drops | 5 ml [PoM](#) £865.00

Capsule

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Cystagon** (Recordati Rare Diseases UK Ltd)

Mercaptamine (as Mercaptamine bitartrate) 50 mg Cystagon
50mg capsules | 100 capsule [PoM](#) £70.00 DT = £70.00

Mercaptamine (as Mercaptamine bitartrate) 150 mg Cystagon
150mg capsules | 100 capsule [PoM](#) £190.00 DT = £190.00

3.4 Fabry's disease

ENZYMES

Agalsidase alfa

24-Apr-2020

- DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE**Fabry's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child 7-17 years: 200 micrograms/kg every 2 weeks

- INTERACTIONS** → Appendix 1: agalsidase alfa

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmias · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · dyspnoea · excessive tearing · fever · flushing · gastrointestinal discomfort · headache · hoarseness · hypersomnia · hypertension · increased risk of infection · influenza like illness · joint disorders · malaise · musculoskeletal discomfort · myalgia · nausea · ototoxicity · pain · palpitations · peripheral oedema · peripheral swelling · rhinorrhoea · sensation abnormal · skin reactions · taste altered · temperature sensation altered · throat complaints · tremor · vomiting
- ▶ **Uncommon** Altered smell sensation · angoedema · hypersensitivity · sensation of pressure
- ▶ **Frequency not known** Heart failure · hyperhidrosis · hypotension · myocardial ischaemia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by interrupting the infusion, or minimise by pre-treatment with an antihistamine or corticosteroid — consult product literature.

- PREGNANCY** Use with caution.

- BREAST FEEDING** Use with caution—no information available.

- DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Replagal** (Shire Pharmaceuticals Ltd)

Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [PoM](#) £1,049.94

Agalsidase beta

24-Apr-2020

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE

Fabry's disease (specialist use only)

► BY INTRAVENOUS INFUSION

► Child 8-17 years: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase beta

● SIDE-EFFECTS
