Reference solution (b). A 0.001 per cent w/v solution of *D-α-(4–hydroxyphenyl)glycine IPRS (cefadroxil impurity A IPRS)* in mobile phase A.

Reference solution (c). Dissolve 10 mg of *7- amino desacetoxycephalosphorinic acid IPRS* (*cefadroxil impurity B IPRS*) in 10.0 ml of *phosphate buffer pH 7.0* and dilute to 100.0 ml with mobile phase A. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Lichrosorb RP–18),
- mobile phase: A. dissolve 5.44 g of *potassium dihydrogen orthophosphate* in 2000 ml of *water*, adjusted to pH 5.0 with *potassium hydroxide solution*, B. add 40 volumes of *acetonitrile* to 60 volumes of mobile phase A, adjusted to pH 5.0 with *orthophosphoric acid*,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
35	68	32
60	68	32
61	100	0
70	100	0

The retention time of cefadroxil is 14 to 20 minutes. If necessary, adjust the proportion of mobile phase A to mobile phase B to achieve the stated retention time.

Inject reference solution (a).The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to cefadroxil impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of the peak due to cefadroxil impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a weigh quantity of the suspension containing about 0.1g of cefadroxil to a 100-ml volumetric flask, add *phosphate buffer pH 5.0*, shake for 30 minutes, dilute to 100.0 ml with the same solvent and filter.

Reference solution. A 0.1 per cent w/v solution of *cefadroxil IPRS* in *phosphate buffer pH 5.0*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 96 volumes of *phosphate buffer pH 5.0* and 4 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_{16}H_{17}N_3O_5S$, weight in volume.

Repeat the procedure using a portion of the suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of active ingredient in terms of anhydrous cefadroxil.

Cefadroxil Tablets

Cefadroxil Tablets contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of anhydrous cefadroxil, $C_{16}H_{17}N_3O_5S$.

Usual strengths. The equivalent of 500 mg and 1 g of anhydrous cefadroxil.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H* and impregnating the dry plate by placing it in a tank containing a shallow layer of about 1 cm of a mixture of 95 volumes of *n-hexane* and 5 volumes of *1-tetradecane*, allowing the solvent to ascend to the top, removing the plate and allowing the solvent to evaporate.

Mobile phase. A mixture of 60 volumes of *0.1 M citric acid*, 40 volumes of *0.1 M disodium hydrogen phosphate* and 1.5 volumes of a 6.66 per cent w/v solution of *ninhydrin* in *acetone*.

Test solution. Shake a quantity of the powdered tablets with sufficient water to produce a solution containing 0.2 per cent w/v of cefadroxil. Filter the solution.

Reference solution (a). A 0.2 per cent w/v solution of *cefadroxil IPRS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 20 µl of each solution After development, dry the plate in air, spray with a 0.2 per cent w/v solution of *ninhydrin* in *ethanol*, dry at 110° for 10 minutes and examine. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{16}H_{17}N_3O_5S$ in the medium from the absorbance obtained from a solution of known concentration of *cefadroxil IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{17}N_3O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 0.5 g of anhydrous cefadroxil in 50 ml of the mobile phase, mix for 10 minutes and filter.

Reference solution (a). A 0.01 per cent w/v solution of *cefadroxil IPRS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *D-α-(4-hydroxyphenyl) glycine IPRS (cefadroxil impurity A IPRS)* in the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *7-aminodesacetoxycephalosporanic acid IPRS (cefadroxil impurity B IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (10 µm) (Such as µBondpak C18),
- column temperature: 40°,
- mobile phase: add 20 volumes of *1M potassium hydroxide*, 4 volumes of *0.4 M tetrabutylammonium hydroxide* and 8 volumes of *methanol* in 160 volumes of *water* and dilute to 200 volumes with *water*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject reference solution (a). The test is not valid unless the theoretical plates are not less than 1500 and tailing factor is not more than1.6 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a), (b), (c) and the test solution. For test solution, run the chromatogram 6 times the retention times of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to cefadroxil impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of peak corresponding to cefadroxil impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.5 g of the powdered tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the following solutions freshly.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.2 g of cefadroxil, dissolve in *phosphate buffer pH 5.0* by shaking for 30 minutes and dilute to 200.0 ml the same solvent. Filter the solution.

Reference solution. A 0.1 per cent w/v solution of *cefadroxil IPRS* in *phosphate buffer pH 5.0*.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 96 volumes of *phosphate buffer pH 5.0* and 4 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

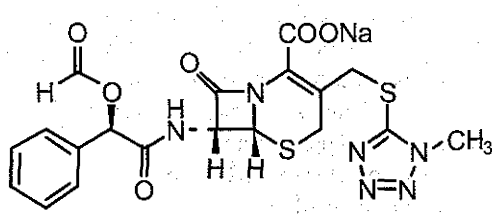
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_5S$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of anhydrous cefadroxil.

Cefamandole Nafate



$C_{19}H_{17}N_6NaO_6S_2$ Mol. Wt. 512.5

Cefamandole Nafate is 7-D-mandelamido-3-[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-3-cephem-4-carboxylic acid.

Cefamandole Nafate containt is not less than 93.0 per cent and not more than 102.0 per cent of $C_{19}H_{17}N_6NaO_6S_2$, calculated on the anhydrous and sodium carbonate-free basis, for the sum of the content of cefamandole nafate, and cefamandole sodium expressed as cefamandole nafate.

Cefamandole Sodium containt is not more than 10.0 per cent of $C_{18}H_{17}N_6NaO_5S_2$, calculated on the anhydrous and sodium carbonate-free basis.

Sodium Carbonate contains not less than 4.8 per cent and not more than 6.4 per cent of Na_2CO_3.

Category. Antibacterial.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefamandole nafate IPRS* or with the reference spectrum of cefamandole nafate.

B. Gives the reactions of sodium salt (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and its absorbance at 475 nm (2.4.7) is not more than 0.03.

pH (2.4.24). 6.0 to 8.0, measured after 30 minutes, determined in solution A.

Specific optical rotation (2.4.24). −45.0° to −35.0°, determined in a 10.0 per cent w/v solution in *acetate buffer* pH 4.7 calculated on anhydrous and sodium carbonate-free basis.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 18 volumes of *acetonitrile* and 75 volumes of a 10 per cent v/v solution of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid.*

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture, then heat at 60 ° for 30 minutes.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 1 volume of *triethylamine phosphate buffer* prepared by dissolving 2.0 g of *sodium pentanesulphonate* in 350 ml of *water,* add 40 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid* and dilute to 700 ml with *water,* and 2 volumes of *water,*

  B. a mixture of equal volumes of *triethylamine phosphate buffer*, *methanol* and *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
1	100	0
35	0	100
45	0	100
50	100	0

The relative retention time with reference to cefamandole nafate for cefamandole is about 0.8.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cefamandole and cefamandole nafate is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained in the with reference solution (b) (1.0 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent). Ignore any peaks with an area less than 0.1 time the area of the principle peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

2-Ethylhexanoic acid (2.3.51). Not more than 0.3 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Cefamandole Nafate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg of cefamandole nafate.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *cefamandole nafate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase, then heat at 60° for 30 minutes.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed, with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 10 per cent v/v solution of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 7.0. The relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{17}N_6NaO_6S_2$ as the sum of the areas of the two peaks corresponding to cefamandole nafate and cefamandole sodium expressed as cefamandole nafate.

1 mg of $C_{18}H_{17}N_6NaO_5S_2$ is equivalent to 1.0578 mg of $C_{19}H_{17}N_6NaO_6S_2$.

Sodium carbonate. Dissolve 0.5 g of the substance under examination in 50 ml of *water*. Titrate with *0.1 M hydrochloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.0053 g of Na_2CO_3.

Storage. Store protected from light and moisture, if the substance is sterile, store in a sterile, air tight, tamper proof container.

Labelling. The label states that the substance contains sodium carbonate.

Cefamandole Injection

Cefamandole Nafate Injection

Cefamandole Injection is a sterile material consisting of Cefamandole Nafate with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requiremens for the Clarity of Solution and Particulate matter stated under Parental Preparations (Injections).

Usual strengths. The equivalent of 1 g; 2 g and 10 g of cefamandole.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefamandole Injection contains not less than 90.0 per cent and not more than 115.0 per cent of stated amount of cefamandole, $C_{18}H_{18}N_6O_5S_2$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G 254*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 20 volumes of *acetone*, 10 volumes of *glacial acetic acid* and 10 volumes of *water*.

Test solution. Disperse a quantity of injection containing 100 mg of Cefamandole in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *cefamandole nafate IPRS* in the mobile phase.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8.0 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 8.0, determined in a 10.0 per cent w/v solution of cefamandole.

Bacterial endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg of cefamandole.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Disperse a quantity of the injection containing 50 mg of Cefamandole Nafate with the mobile phase and dilute to 100.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *cefamandole nafate IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase, then heat at 60° for 30 minutes.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 10 per cent v/v solution of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 7.0. The relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{17}N_6NaO_6S_2$ as the sum of the areas of the two peaks corresponding to cefamandole nafate and cefamandole sodium expressed as cefamandole nafate.

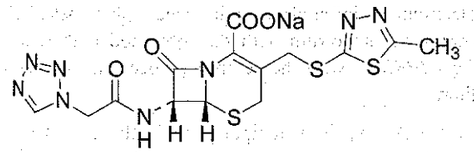
1 mg of $C_{19}H_{17}N_6NaO_6S_2$ (cefamandole nafate) is equivalent to 0.9024 mg of $C_{18}H_{18}N_6O_5S_2$ (cefamandole).

Storage. Store protected from moisture, in a sterile, tamper evident sealed container so as to exclude micro-organism, at a temperature not exceeding 30°.

Labelling. The label states the quantity of cefamandole nafade contained in the sealed container in terms of the equivalent amount of cefamandole.

Cefazolin Sodium

Cephazolin Sodium



$C_{14}H_{13}N_8NaO_4S_3$ Mol. Wt. 476.5

Cefazolin Sodium is sodium 7-[(1*H*)-tetrazol-1-ylacetamido]-3-(5-methyl-1,3,4-thiadiazol-2-ylthiomethyl)-3-cephem-4-carboxylate.

Cefazolin Sodium contains not less than 85.0 per cent and not more than 105.0 per cent of cefazolin $C_{14}H_{14}N_8O_4S_3$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefazolin sodium IPRS* or with the reference spectrum of cefazolin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reactions of sodium salts (2.2.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). –24.0° to –10.0°, determined in a 5.5 per cent w/v solution in *0.1 M sodium bicarbonate*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 20.0 ml of mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 20 mg of the substance under examination in 10 ml of 0.2 per cent w/v solution of *sodium hydroxide*, allow to stand for 30 minutes. Dilute 1.0 ml of the solution to 20.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 45°,
- mobile phase: A. a solution containing 1.45 per cent w/v of *disodium hydrogen phosphate* and 0.35 per cent w/v of *potassium dihydrogen phosphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
2	98	2
4	85	15
10	60	40
11.5	35	65
12	35	65
15	98	2
21	98	2

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefazolin and cefazolin impurity L is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any

secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the sum of area of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 6.0 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Prepared by dissolving 0.75 g of *salicylic acid* (internal standard) in 5 ml of *methanol* and diluting to 100.0 ml with *mixed phosphate buffer pH 7.0*.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *mixed phosphate buffer pH 7.0*. to 5.0 ml of the solution add 5.0 ml of solution A and add sufficient volume of *mixed phosphate buffer pH 7.0* to produce 100.0 ml and mix.

Reference solution. A 0.1 per cent w/v solution of *cefazolin sodium IPRS* in *mixed phosphate buffer pH 7.0*. To 5.0 ml of the solution add 5.0 ml of solution A and add sufficient volume of *mixed phosphate buffer pH 7.0* to produce 100.0 ml and mix.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 9 volumes of *phosphate buffer pH 3.6* and 1 volume of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative retention times of salicylic acid and cefazolin are 0.7 and 1.0 respectively.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{14}N_8O_4S_3$.

Cefazolin Sodium intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Bacterial endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg of cefazolin.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in sterile containers, sealed so as to exclude micro-organisms protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the quantity of Cefazolin Sodium contained in the sealed container in terms of the equivalent amount of cefazolin.

Cefazolin Sodium Injection

Cefazolin Injection; Cephazolin Sodium Injection; Cephazolin Injection

Cefazolin Sodium Injection is a sterile material consisting of Cefazolin Sodium with or without excipients. It is filled in sealed containers.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strengths. The equivalent of 125 mg; 250 mg; 500 mg; and 1 g of cefazolin.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefazolin Sodium Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of cefazolin, $C_{14}H_{14}N_8O_4S$.

Description. A white to off-white, crystalline powder; odourless.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefazolin sodium IPRS* or with the reference spectrum of cefazolin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reactions of sodium salts (2.2.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). −24.0° to −10.0°, determined in a 5.5 per cent w/v solution in *0.1 M sodium bicarbonate*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve an accurately weighed quantity of powder containing 0.25 g of cefazolin in 100.0 ml of mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 20 mg of *cefazolin IPRS* in 10 ml of 0.2 per cent w/v solution of *sodium hydroxide*, allow to stand for 30 minutes. Dilute 1.0 ml of the solution to 20.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Nucleosil C18),
- column temperature: 45°,
- mobile phase: A. a solution containing 1.45 per cent w/v of *disodium hydrogen phosphate* and 0.35 per cent w/v of *potassium dihydrogen phosphate*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
2	98	2
4	85	15

15	98	2
21	98	2

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cefazolin and cefazolin impurity L is not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the sum of areas of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.15 Endotoxin Unit per mg of cefazolin.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Prepare by dissolving 0.75 g of *salicylic acid* (internal standard) in 5 ml of *methanol* and diluting to 100.0 ml with *mixed phosphate buffer pH 7.0*.

Test solution. Determine the weight of the contents of 10 containers. Weigh accurately a quantity of the mixed contents of the 10 containers, dissolve in the *mixed phosphate buffer pH 7.0* and dilute to obtain a solution containing 0.1 per cent w/v of cefazolin. To 5.0 ml of the solution add 5.0 ml of solution A and add sufficient volume of *mixed phosphate buffer pH 7.0* to produce 100.0 ml and mix.

Reference solution. A 0.1 per cent w/v solution of *cefazolin sodium IPRS* in *mixed phosphate buffer pH 7.0*. To 5.0 ml of the solution add 5.0 ml of solution A and sufficient volume of *mixed phosphate buffer pH 7.0* to produce 100.0 ml and mix.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 9 volumes of *phosphate buffer pH 3.6* and 1 volume of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative retention times of salicylic acid and cefazolin are 0.7 and 1.0 respectively.

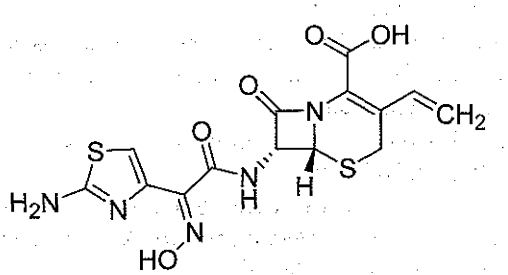
Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{14}N_8O_4S_3$ in the injection.

Storage. Store protected from moisture at a temperature not exceeding 30°. The constituted solution should be stored protected from light and used within 24 hours when stored at a temperature not exceeding 30° or within 4 days when stored between 2° and 8°.

Labelling. The label states the quantity of Cefazolin Sodium contained in the sealed container in terms of the equivalent amount of cefazolin.

Cefdinir



$C_{14}H_{13}N_5O_5S_2$ Mol.Wt. 395.4

Cefdinir is 5-thia 1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid.

Cefdinir contains not less than 94.0 per cent and not more than 103.0 per cent of $C_{14}H_{13}N_5O_5S_2$, calculated on the anhydrous basis.

Category. Antibiotic.

Description. A white to light-yellow crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefdinir IPRS* or with the reference spectrum of cefdinir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Specific optical rotation (2.4.22). – 67.0° to – 61.0° at 20°, determined in a 1.0 per cent w/v solution in solvent mixture as described under Assay.

Related substances. A. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution (a). Dissolve 0.1 g of the substance under examination in the solvent mixture and dilute to 10.0 ml with solvent mixture.

Test solution (b). Dilute 3.0 ml of test solution (a) to 20.0 ml with solution A.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 100.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with solution A.

Reference solution (c). A 0.15 per cent w/v solution of *cefdinir IPRS* and 0.01 per cent solution of *cefdinir impurity A IPRS* initially in the solvent mixture and then with solution A.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°
- mobile phase: A. a mixture of 1000 ml of solution A and add 0.4 ml of solution B,
  B. a mixture of 300 volumes of *acetonitrile*, 200 volumes of *methanol*, 500 volumes of a solution A and 0.4 volumes of solution B,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

[8](6*R*,7*R*)-7-[(*E*)-2-(2-Aminothiazol-4-yl-)-2-(hydroxyimino)acetamido]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,

[9](*Z*)-2-(2-Aminothiazol-4-yl)-2-(hydroxyimino)-*N*-{[(2RS,5RS)-5-methyl-7-oxo-2,4,5,7-tetrahydro-1*H*-furo[3,4-d][1,3]thiazin-2-yl]methyl}acetamide,

[a] Cefdinir decarboxy open ring lactone is a mixture of 2 isomers labeled cefdinir decarboxy open ring lactones a and b. The sum of the values is reported. The limit for sum of the 2 isomers is 0.5 per cent.116-demethylazithromycin.

Inject reference solution (a),(b) and (c). Cefdinir impurity A should produce four peaks.

The test is not valid unless the response ratio due to cefdinir peak obtained with reference solution (b) is between 7 per cent to 13 per cent of the response due to cefdinir peak obtained with reference solution (a) and the resolution between the peaks due cefdinir and third peak of cefdinir impurity A is not less than 1.5 obtained with reference solution (c).

Inject test solution (b). Run the chromatogram 1.8 times the retention time of the cefdinir peak.

In the chromatogram obtained with the test solution (b), the area of any peak corresponding to thiazolylacetyl glycine oxime and thiazolylacetyl glycine oxime acetal is not more than 0.5 per cent, the area of any peak corresponding to 3-methyl and thiazolylacetyl glycine oxime acetal is not more than 0.5 per cent, the area of any peak corresponding to cefdinir impurity A (cefdinir open ring lactone c) is not more than 0.7 per cent, the area of any peak corresponding to cefdinir lactone is not more than 0.5 per cent, the area of any peak corresponding to cefdinir isoxazole analog is not more than 0.5 per cent, the area of any peak corresponding to E-cefdinir is not more than 0.7 per cent, the area of any peak corresponding to cefdinir decarboxy open ring lactone b is not more than 0.5 per cent, the area of any secondary peak is not more (0.2 per cent) and the sum of the areas of all the secondary peaks is not 3.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for the heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 2.0 per cent for anhydrous form. Not less than 4.0 per cent and not more than 8.5 per cent for hydrated form, by using a mixture of 67 volumes of *formamide* and 33 volumes of *methanol*.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Dilute *tetramethylammonium hydroxide solution* with *water* to obtain 0.1 per cent w/v solution, adjusted to pH 5.5 with *orthophosphoric acid*.

Solution B. A 3.72 per cent w/v solution of *disodium edetate*.

Solvent mixture. A mixture of 67 volumes of solution prepared by dissolving 14.2 g of *anhydrous dibasic sodium phosphate* in 1000 ml of *water* and 33 volumes of solution prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusted to pH 7.0.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *cefdinir IPRS* and 0.05 per cent w/v of *cefdinir impurity A IPRS* in the solvent mixture.

Reference solution (b). A 0.02 per cent w/v solution of the *cefdinir IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 60 volumes of *acetonitrile*,40 volumes of *methanol*, 900 volumes of a solution A and 0.4 volumes of solution B,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

Inject reference solution (a) and (b). *Cefdinir impurity A IPRS* should produce four peaks.

The test is not valid unless the resolution between the peaks due to second peak of cefdinir impurity A and cefdinir is not less than 1.2 obtained with reference solution (a),the tailing factor is not more than 1.5 for cefdinir peak obtained with reference solution (a) and the relative standard deviation for replicate injections for cefdinir is not more than 1.0 per cent obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{13}N_5O_5S_2$.

Storage. Store protected from light and moisture.

Cefdinir Capsules

Cefdinir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefdinir, $C_{14}H_{13}N_5O_5S_2$.

Usual strength. 300 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution of capsule powder containing cefdinir in the buffer solution prepared by dissolving 10.7 g of *dibasic sodium phosphate* and 3.4 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 ± 0.05 with *dilute orthophosphoric acid* or *sodium hydroxide solution*, shows an absorption maxima and minima at the same wavelength as the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.05 M phosphate buffer pH 6.8*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter having an average pore size not greater than 0.45 µm, rejecting the first few ml of the filtrate. Measure the absorbance of the resulting solution, suitably diluted if necessary with the dissolution medium, at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{14}H_{13}N_5O_5S_2$ in the dissolution medium from the absorbance obtained from a solution of known concentration of *cefdinir IPRS* in dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{14}H_{13}N_5O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A mixture of solutions containing 2:1 ratio of a solution prepared by dissolving 14.2 g of *anhydrous dibasic sodium phosphate* in 1000 ml of *water* and 13.6 g of *monobasic potassium phosphate* in 1000 ml of *water*, is maintained, adjusted to pH 7.0 ± 0.1.

Solution A. A 0.1 per cent v/v solution of *tetramethylammonium hydroxide solution (10 per cent)* in *water*, adjusted to pH 5.5 ± 0.1 with *dilute phosphoric acid*.

Solution B. A 3.72 per cent w/v solution of *sodium edetate* in *water*.

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing 300 mg of cefdinir and transfer to a 200-ml volumetric flask. Dissolve in 30 ml of the buffer solution, and dilute to volume with solution A to obtain 0.15 per cent w/v solution of cefdinir.

Reference solution (a). A 0.004 per cent w/v solution of *cefdinir related compound A IPRS (2R)-2-[(Z)-2-(2-Aminothiazol-4-yl)-2-(hydroxyimino)acetamido]-2-[(2RS, 5RS)-5-methyl-7-oxo-2,4,5,7-tetrahydro-1H-furo[3,4-d][1,3] thiazin-2-yl]acetic acid* in solution A.

Reference solution (b). A 0.004 per cent w/v solution of *cefdinir related compound B IPRS (6R, 7R)-7-[2-(2-Amino-4-thiazolyl)acetamido]-8-oxo-3-vinyl-5-thia-1-azabicyclo [4.2.0]oct-2-ene-2-carboxylic acid* in solution A.

Reference solution (c). Transfer 37.5 mg of *cefdinir IPRS* to a 25-ml of volumetric flask. Add about 10 ml of the buffer solution. Add 5.0 ml each of reference solution (a) and reference solution (b), and dilute with solution A to volume.

Reference solution (d). A 0.075 per cent w/v solution of *cefdinir IPRS* in the buffer solution.

Reference solution (e). Dilute reference solution (d) to obtain a solution containing 0.0015 per cent w/v of *cefdinir IPRS* in solution A.

Inject reference solution (c) and (e). The test is not valid unless the resolution between the peaks due to cefdinir and cefdinir related compound A is not less than 1.5 in the chromatogram obtained with reference solution (c), the tailing factor for Cefdinir related compound B peak is not more than 1.5 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (e).

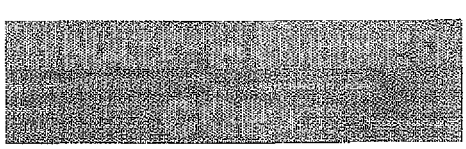
Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to : thiazolylacetyl glycine oxime, thiazolylacetyl glycine oxime acetal, cefdinir isoxazole analog and cefdinir impurity 2 is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent); cefdinir sulfoxide,7*S*-cefdinir, cefdinir related compound B, cefdinir glyoxalic analog and cefdinir impurity 3 is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent); cefdinir thiazine analog and 3- methyl cefdinir is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.7 per cent); cefdinir lactone, cefdinir decarboxy open ring lactone a, cefdinir decarboxy open ring lactone b is not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (1.0 per cent); *E*-cefdinir is not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.2 per cent); cefdinir impurity 1 is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent); cefdinir related compound A (cefdinir open ring lactone a, b, c and d) is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (2.5 per cent) and the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent). The sum of areas of all the secondary peaks is not more than 5.0 times the area of the principal peak in the chromatogram obtained with reference solution (e) (5.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. A mixture prepared by dissolving 10.7 g of *dibasic sodium phosphate* and 3.4 g of *monobasic potassium phosphate* in 1000 ml of *water,* adjusted to pH 7.0 ± 0.05 with *dilute orthophosphoric acid* or *sodium hydroxide solution* before final dilution.

Solution A. A 0.7 per cent w/v solution of *citric acid monohydrate* in *water,* adjusted to pH 2.0 ± 0.05 with *orthophosphoric acid.*



Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 100 mg of Cefdinir, dissolve in the buffer solution by shaking mechanically, dilute to 100.0 ml with the buffer solution and filter. Dilute 5.0 ml of the solution to 100.0 ml with the buffer solution.

Reference solution (a). A solution containing 0.005 per cent w/v of *cefdinir IPRS* and 0.0175 per cent w/v of *m-hydroxybenzoic acid* in the buffer solution.

Reference solution (b). A 0.005 per cent w/v solution of *cefdinir IPRS* in the buffer solution.

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 111 volumes of *methanol*, 28 volumes of *tetrahydrofuran* and 1000 volumes of solution A,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 15 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to cefdinir and *m*-hydroxybenzoic acid in the chromatogram obtained with reference solution (a) is not less than 3.0, the tailing factor for the peak due to cefdinir in the chromatogram obtained with reference solution (a) is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent for the peak due to cefdinir in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution.

Calculate the content of $C_{14}H_{13}N_5O_5S_2$ in the capsules.

Storage. Store protected from light, moisture and at a temperature not exceeding 25°.

Cefdinir Oral Suspension

Cefdinir Oral Suspension is a dry mixture consisting of Cefdinir with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of sealed container in the specified volume of *water* just before use.

Cefdinir Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of Cefdinir, $C_{14}H_{13}N_5O_5S_2$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of Cefdinir $C_{14}H_{13}N_5O_5S_2$.

Storage. Store protected from light and moisture.

Usual strength. Cefdinir 125 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

pH (2.4.24). 3.2 to 4.8.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution (a). 2 volumes of a solution prepared by dissolving 14.2 g of *anhydrous dibasic sodium phosphate* in 1000 ml *water* and 1 volume of a solution prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1000 ml *water*, to obtain a solution with a pH of 7.0.

Buffer solution (b). A 0.1per cent w/v solution of *tetramethylammonium hydroxide in water*, adjusted to pH 5.5 with *orthophosphoric acid*.

Buffer solution (c). A solution prepared by dissolving 37.2 g of *disodium edetate* in 1000 ml of *water*.

Test solution. Dissolve a quantity containing 0.15 g of cefdinir to a 100-ml volumetric flask in 30 ml of buffer solution (a), and dilute with buffer solution (b) to volume.

Reference solution (a). A 0.004 per cent w/v solution of *cefdinir related compound A IPRS* in buffer solution (b).

Reference solution (b). A 0.004 per cent w/v solution of *cefdinir related compound B IPRS* in buffer solution (a).

Reference solution (c). Weigh and transfer 37.5 mg of *cefdinir IPRS* to a 25 ml volumetric flask, and add about 10 ml of buffer solution (a). Add 5.0 ml each of reference solution (a) and reference solution (b), and dilute with buffer solution (b) to volume.

Reference solution (d). A 0.075 per cent w/v solution of *cefdinir IPRS* in buffer solution (a).

Reference solution (e). A 0.0015 per cent w/v solution of *cefdinir IPRS* from the reference solution (d) in buffer solution (b).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with *octadecyl silane* bonded to porous silica (5 µm),
- column temperature 40°,
- sample temperature 4°,
- mobile phase: A. a solution prepared by mixing 1000 ml of buffer solution (b) and 0.4 ml of buffer solution (c), B. a mixture of 150 volumes of *acetonitrile*, 100 volumes of *methanol*, 250 volumes of buffer solution (b) and 0.2 volume of buffer solution (c),

– a gradient programme using the conditions given below,

[15]Cefdinir decarboxy open ring lactone is a mixture of two isomers labeled cefdinirdecarboxy open ring lactone a and b. The sum of the values is reported; the limit for the sum of the two isomers is 1.1 per cent.

[16](*Z*)-2-(2-Aminothiazol-4-yl)-2-(hydroxyimino)-N-{[(2*RS* 5*RS*)-5-methyl-7-oxo-2,4,5,7-tetrahydro-1*H* -furo[3,4-d][1,3]thiazin-2-yl] methyl}acetamide.

Inject reference solution (c) and (e), The test is not valid unless the resolution between cefdinir and cefdinir related compound A is not less than 1.5, the tailing factor for the peak due to cefdinir related compound B in the chromatogram obtained with the reference solution (c) is not more than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (e).

Inject reference solution (e) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to thiazolylacetyl glycine oxime, is not more than 0.5 times (0.5 per cent) and thiazolylacetyl glycine oxime acetal is not more than 0.6 times (0.6 per cent) the area of the principal peak in the chromatogram obtained with reference solution (e), the area of any peak corresponding to cefdinir sulfoxide, cefdinir impurity 1,7S-cefdinir, cefdinir related compound B, cefdinir impurity 2, cefdinir glyoxalic analog, and cefdinir impurity 3 is not more than 0.2 times the area of

the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent), the area of any peak corresponding to cefdinir thiazine analog is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.3 per cent), the area of any peak corresponding to cefdinir isoxazole analog is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent), the area of any peak corresponding to 3-methyl cefdinir is not more than 0.7 times area of the principal peak in the chromatogram obtained with reference solution (e) (0.7 per cent), the area of any peak corresponding to cefdinir lactone is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.8 per cent), the area of any peak corresponding to cefdinir decarboxy open ring lactone a and cefdinir decarboxy open ring lactone b is not more than 1.1 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.1 per cent), the area of any peak corresponding to E-cefdinir is not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (e) (1.4 per cent), the area of any peak corresponding to Cefdinir related compound A (cefdinir open ring lactone a), cefdinir related compound A (cefdinir open ring lactone b), cefdinir related compound A (cefdinir open ring lactone c), and cefdinir related compound A (cefdinir open ring lactone d is not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (e) (3.3 per cent). The area of any individual unidentified impurities is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.2 per cent) and sum of the area of all the impurities is not more is not more than 6.2 times the area of the principal peak in the chromatogram obtained with reference solution (e) (6.2 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 10.7 g of *anhydrous dibasic sodium phosphate* and 3.4 g of *monobasic potassium phosphate* in 1000 ml of *water*. Adjusted to pH 7.0 with *dilute orthophosphoric acid* or *dilute sodium hydroxide* solution before final dilution.

Test solution. Disperse a quantity of the suspension containing 10 mg of cefdinir and transfer to a 200 ml volumetric flask, dilute with the buffer solution to the volume, filter, rejecting the first few ml of the filtrate and mix.

Reference solution (a). A solution containing 0.005 per cent w/v of *cefdinir IPRS* and 0.0175 per cent w/v of *m-hydroxybenzoic acid* in buffer solution.

Reference solution (b). 0.005 per cent solution of *cefdinir IPRS* in buffer solution.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecyl silane bonded to porous silica (4 µm),
- mobile phase: a mixture of 111 volumes of *methanol*, 28 volumes of *tetrahydrofuran* and 1000 volumes of a solution prepared by dissolving 7.0 g *citric acid monohydrate* in 1000 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume:15 µl.

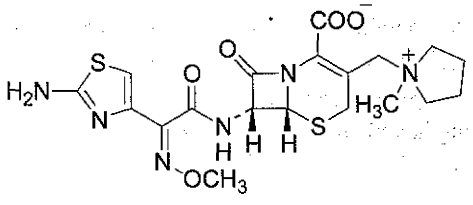
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to cefdinir and m-hydroxybenzoic acid is not less than 3.0, the tailing factor for the peak due to cefdinir is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent for the peak due to cefdinir.

Inject reference solution (b) and the test solution.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{14}H_{13}N_5O_5S_2$, weight in volume.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of cefdinir; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Cefepime Hydrochloride



, HCl, H_2O

$C_{19}H_{25}ClN_6O_5S_2,HCl,H_2O$ Mol. wt. 571.5

Cefepime Hydrochloride is 1-[[(6*R*, 7*R*)-7-[[(2*Z*)-(2-aminothiazol-4-yl) (methoxyimino)acetyl]amino]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-1-methylpyrrolidinium chloride monohydrochloride monohydrate.

Cefepime Hydrochloride contains not less than 825 µg and not more than 911 µg of cefepime, $C_{19}H_{24}N_6O_5S_2$, per mg, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to off-white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefepime*

hydrochloride IPRS or with the reference spectrum of cefepime hydrochloride.

Tests

Appearance of solution. A 10 per cent w/v solution is clear (2.4.1) and is not more intensely coloured than reference solution YS3 (2.4.1).

***N*-methylpyrrolidine.** Not more than 0.3 per cent.

Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *0.01 M nitric acid.*

Reference solution (a). Dilute 0.15 g of *N-methylpyrrolidine* to 100.0 ml with *water* and mix. Dilute 2.0 ml of the solution to 100.0 ml with *0.01 M nitric acid.*

Reference solution (b). Dilute 0.15 g of *pyrrolidine* to 100.0 ml with *water* and mix. Dilute 2.0 ml of the solution to 100.0 ml with *0.01 M nitric acid.* Mix 5.0 ml of the solution with 5.0 ml of reference solution (a).

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with a strong cation exchange resin (5 µm),
- mobile phase: a mixture of 100 volumes of *0.01 M nitric acid* and 1 volume of *acetonitrile*,
- flow rate: 1 ml per minute,
- conductivity detector,
- injection volume: 100 µl.

Inject reference solution (a) and (b). In the chromatogram obtained with reference solution (a) the tailing factor for the peak due to N-methylpyrrolidine is not more than 2.5 and the relative standard deviation for replicate injections of reference solution (a) is not more than 5.0 per cent. In the chromatogram obtained with reference solution (b) the peak to valley ratio between the peaks due to pyrrolidine and N-methylpyrrolidine is not less than 3.

Inject the test solution. Continue the chromatography for 1.1 times the retention time of cefepime (about 50 minutes), eluting as a broadened peak.

Calculate the content of N-methylpyrrolidine.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 70 mg of the substance under examination in mobile phase A, stir with the aid of ultrasound for about 5 minutes and add sufficient mobile phase to produce 50.0 ml

Reference solution (a). A 0.14 per cent w/v solution of *cefepime hydrochloride IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with mobile phase A. Dilute 2.0 ml of the solution to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of a 0.068 per cent w/v solution of *potassium dihydrogen phosphate,* adjusted to pH 5.0 with *dilute phosphoric acid,*

  B. a mixture of equal volumes of *acetonitrile* and a 0.068 per cent w/v solution of *potassium dihydrogen phosphate,* adjusted to pH 5.0 with *dilute orthophosphoric acid,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	100	0
10	100	0
30	50	50
35	50	50
36	100	0
45	100	0

The relative retention times with reference to cefepime are 2.5 for [(6*R*,7*R*)-7-[[(2*E*)-(2-aminothiazol-4-yl)(methoxyimino) acetyl]amino]-3-[(1-methylpyrrolidinio) methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0] oct-2-ene-2-carboxylate] (cefepime impurity A) and about 4.1 for [(6*R*,7*R*)-7-[[(2*Z*)-(2-aminothiazol-4-yl) (methoxyimino)acetyl]amino]thiazol-4-yl](methoxyimino) acetyl]amino]-3-[(1-methylpyrrolidinio) methyl-8-oxo-5-thia-1-azabicyclo[4.2.0] oct-2-ene-2-carboxylate] (cefepime impurity B).

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak due to cefepime impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.3 per cent), the area of any secondary peak due to cefepime impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0 per cent). Ignore any peak

with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 3.0 per cent to 4.5 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 70 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A 0.14 per cent w/v solution of *cefepime hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 94 volumes of a solution prepared by dissolving 5.76 g of *sodium 1-pentanesulfonate* in 2000 ml of *water*, adjusted to pH 3.4 with *glacial acetic acid* and then pH 4.0 with *potassium hydroxide*, and 6 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0. The column efficiency is not less than 1500 theoretical plates. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{24}N_6O_5S_2$.

Cefepime Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.04 Endotoxin Unit per mg.

Cefepime Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Cefepime Injection

Cefepime Hydrochloride Injection

Cefepime Injection is sterile mixture of Cefepime Hydrochloride and Arginine. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period not exceeding 7 days, recommended by the manufacturer provided the solution is stored in a refrigerator (2° to 8°).

Cefepime Injection contains Cefepime Hydrochloride equivalent to not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of cefepime, $C_{19}H_{24}N_6O_5S_2$.

Usual strengths. 250 mg; 500 mg; 1 g.

Description. A white to pale yellow powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for injection) and with the following requirements.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *n-propyl alcohol*, 50 volumes of *water* and 40 volumes of *strong ammonia solution*.

Test solution. Weigh accurately a quantity equivalent to about 0.4 g of cefepime and dissolve in sufficient *water* to produce 10 ml.

Reference solution. Weigh accurately about 0.2 g of *L-arginine IPRS* and dissolve in 10 ml of *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 100° until the ammonia disappears completely. Spray the plate with a 0.2 per cent w/v solution of *ninhydrin* in a mixture of 95 volumes of *butyl alcohol* and 5 volumes of *2 M acetic acid*. Heat the plate at 105° for 15 minutes. Cool and examine in daylight. The dark red spot due to arginine in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. In the Assay the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 6.0, determined in a solution containing about 100 mg of cefepime per ml.

***N*-methylpyrrolidine**. Not more than 1.0 per cent.

Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of injection containing 1.0 g of cefepime in *0.01 M nitric acid* and dilute to 100.0 ml with *0.01 M nitric acid*.

Reference solution (a). Dilute 0.5 g of *N-methylpyrrolidine* to 100.0 ml with *water* and mix. Dilute 2.0 ml of the solution to 100.0 ml with *0.01 M nitric acid*.

Reference solution (b). Dilute 0.15 g of *pyrrolidine* to 100.0 ml with *water* and mix. Dilute 2.0 ml of the solution to 100.0 ml with *0.01 M nitric acid*. Mix 5.0 ml of the solution with 5.0 ml of reference solution (a).

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with a strong cation exchange resin (5 µm),
- mobile phase: a mixture of 100 volumes of *0.01 M nitric acid* and 1 volume of *acetonitrile*,
- flow rate: 1 ml per minute,
- conductivity detector,
- injection volume: 100 µl.

Inject reference solution (a) and (b). In the chromatogram obtained with reference solution (a) the tailing factor for the peak due to N-methylpyrrolidine is not more than 2.5 and the relative standard deviation for replicate injections of reference solution (a) is not more than 5.0 per cent. In the chromatogram obtained with reference solution (b) the peak to valley ratio between the peaks due to pyrrolidine and *N*-methylpyrrolidine is not less than 3.

Inject the test solution. Continue the chromatography for 1.1 times the retention time of cefepime (about 50 minutes), eluting as a broadened peak.

Calculate the content of N-methylpyrrolidine.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use.

Test solution. Dissolve a quantity of injection containing 70 mg of cefepime in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). A 0.17 per cent w/v solution of *cefepime hydrochloride IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with mobile phase A. Dilute 2.0 ml of the solution to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of 0.068 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 5.0 with *dilute orthophosphoric acid*,

  B. a mixture of equal volumes of *acetonitrile* and a 0.068 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 5.0 with *dilute orthophosphoric acid*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	100	0
10	100	0
30	50	50
35	50	50
36	100	0
45	100	0

The relative retention times with reference to cefepime are 2.5 for (6*R*,7*R*)-7-[[(2*E*)-(2-aminothiazol-4-yl)(methoxyimino) acetyl]amino]-3-[(1-methylpyrrolidinio)methyl]-8-oxo-5-thia -1-azabicyclo[4.2.0] oct-2-ene-2-carboxylate (cefepime impurity A) and about 4.1 for (6*R*,7*R*)-7-[[(2*Z*)-(2-aminothiazol-4-yl) (methoxyimino) acetyl]amino]-4-yl](methoxyimino acetyl] amino]-4-yl] (methoxyimino)acetyl]amino]-3-[(1-methyl-pyrrolidinio) methyl]-8-oxo-5-thia-1-azabi-cyclo[4.2.0]oct-2-ene-2-carboxylate (cefepime impurity B).

Inject the reference solution (a). The test is not valid unless the column efficiency is not less than 4000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to cefepime impurity A is not more than 2.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to cefepime impurity B is not more than 2.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 7.5 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Bacterial Endotoxins (2.2.3). Not more than 0.06 Endotoxin Unit per mg of cefepime.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 containers. Dissolve a quantity of the mixed contents containing 70 mg of cefepime in 50 ml of the mobile phase.

Reference solution. A 0.17 per cent w/v solution of *cefepime hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 94 volumes of a solution prepared by dissolving 5.76 g of *sodium 1-pentanesulphonate* in 2000 ml of *water*, adjusted to pH 3.4 with *glacial acetic acid* and then pH 4.0 with *potassium hydroxide*, and 6 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

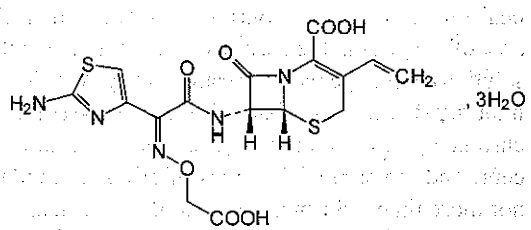
Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{24}N_6O_5S_2$ in the injection.

Storage. Store protected in sterile containers so as to exclude micro-organisms, at a temperature not exceeding 30°. Protect from light.

Labelling. The label states the strength in terms of the equivalent amount of cefepime.

Cefixime



$C_{16}H_{15}N_5O_7S_2, 3H_2O$ Mol. Wt. 507.5

Cefixime is (6*R*,7*R*)-7-[[(2*Z*)-2-(2-aminothiazol-4-yl)-[(carboxymethoxy)imino]acetyl]amino]-3-ethenyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid trihydrate.

Cefixime contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{16}H_{15}N_5O_7S_2$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to light yellow, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefixime IPRS*. If the spectra obtained show differences, dissolve the substance under examination and the reference substance separately in *methanol*, evaporate to dryness and record new spectra using the residues or with the reference spectrum of cefixime.

Tests

pH (2.4.24). 2.6 to 4.1, determined in a 5.0 per cent w/v suspension in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay.

Inject reference solution (b) and the test solution and continue the chromatography for 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak, other than the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, other than the principal peak, is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Ignore any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 9.0 per cent to 12.0 per cent, determined on 0.20 g.

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.0. Dissolve 7.1 g *dibasic sodium phosphate* in *water* and dilute to 500 ml with *water*. Adjust the pH of the solution to 7.0 with *monobasic potassium phosphate solution*.

Monobasic potassium phosphate solution. Dissolve 6.8 g of *monobasic potassium phosphate* in *water* and dilute to 500 ml with *water*.

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of *phosphate buffer pH 7.0*.

Reference solution (a). A 0.02 per cent w/v solution of *cefixime IPRS* in *phosphate buffer pH 7.0*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *phosphate buffer pH 7.0.*

Reference solution (c). Dissolve 10 mg of *cefixime IPRS* in 10 ml of *water*. Heat on a water-bath for 45 minutes. Cool and inject immediately.

Chromatographic system
- a stainless steel column 12.5 cm × 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a *tetrabutylammoniumhydroxide solution* prepared by diluting 25 ml of *0.4 M tetrabutylammoniumhydroxide solution* to 1000 ml with *water* and adjusted to pH 6.5 with *1.5 M ortho-phosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (c). The relative retention times are about 0.9 for cefixime *E*-isomer and 1.0 for cefixime and the resolution between cefixime and cefixime *E*-isomer is not less than 2.0.

Inject reference solution (a). The column efficiency is not less than 4000 theoretical plates, the tailing factor is not less than 0.9 and not more than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{15}N_5O_7S_2$.

Storage. Store protected from light.

Cefixime Oral Suspension

Cefixime Oral Suspension is a mixture consisting of Cefixime with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before use.

Cefixime Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of cefixime $C_{16}H_{15}N_5O_7S_2$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cefixime $C_{16}H_{15}N_5O_7S_2$.

Usual strengths. 100 mg per 5 ml; 200 mg per 5 ml; 400 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Water (2.3.43). Not more than 2.0 per cent.

The constituted suspension complies with the tests stated under Oral Liquids and with the following tests.

Tests

pH (2.4.24). 2.5 to 4.5.

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.0. Dissolve 7.1 g *dibasic sodium phosphate* in *water* and dilute to 500 ml with *water*. Adjusted to pH 7.0 with *monobasic potassium phosphate solution*.

Monobasic potassium phosphate solution. Dissolve 6.8 g of *monobasic potassium phosphate* in *water* and dilute to 500 ml with *water*.

Test solution. Dilute an accurately weighed quantity of the oral suspension with *phosphate buffer pH 7.0* to obtain a solution having a concentration of 0.2 mg of cefixime per ml.

Reference solution (a). A 0.02 per cent w/v solution of *cefixime IPRS* in *phosphate buffer pH 7.0.*

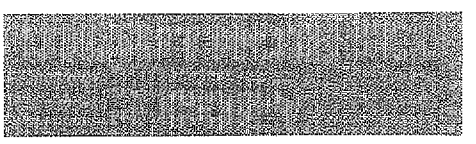
Reference solution (b). Dissolve 10 mg of *cefixime IPRS* in 10 ml of *water*. Heat the solution at 95° for 45 minutes. Cool and inject immediately.

Chromatographic system
- a stainless steel column 12.5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *tetrabutylammonium hydroxide solution* prepared by diluting 25 ml of *0.4 M tetrabutylammonium hydroxide solution* to 1000 ml with *water* and adjusted to pH 6.5 with *1.5 M orthophosphoric acid*, and 10 volumes of *acetonitrile*,
- flow rate adjusted so that the retention time of cefixime is about 10 minutes,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b).The relative retention times are about 0.9 for cefixime *E*-isomer and 1.0 for cefixime and the resolution between cefixime and cefixime *E*-isomer is not less than 2.0.

Inject reference solution (a). The column efficiency is not less than 4000 theoretical plates, the tailing factor is not less than 0.9 and not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.



Determine the weight per ml (2.4.29) of the oral suspension and calculate the content of $C_{16}H_{15}N_5O_7S_2$ weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at a temperature not exceeding 30°, for the period stated on the label. Calculate the content of $C_{16}H_{15}N_5O_7S_2$ weight in volume.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of cefixime; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Cefixime Dispersible Tablets

Cefixime Dispersible Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefixime, $C_{16}H_{15}N_5O_7S_2$.

Usual strengths. The equivalent of 50 mg ,100 mg and 200 mg of cefixime.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 10.0 per cent .

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.0. Dissolve 7.1 g *anhydrous dibasic sodium phosphate* in *water* and dilute to 500 ml with *water*. Adjust the pH of the solution to 7.0 with *monobasic potassium phosphate solution*.

Monobasic potassium phosphate solution. Dissolve 6.8 g of *monobasic potassium phosphate* in *water* and dilute to 500 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.4 g of Cefixime, disperse in 100.0 ml of *phosphate buffer pH 7.0*, mix with the aid of ultrasound and centrifuge. Dilute 5.0 ml of the clear supernatant to 100.0 ml with *phosphate buffer pH 7.0*.

Reference solution (a). A 0.022 per cent w/v solution of *cefixime IPRS* in *phosphate buffer pH 7.0*.

Reference solution (b). Dissolve 10 mg of *cefixime IPRS* in 10 ml of *water*. Heat the solution at 95° for 45 minutes. Cool and inject immediately.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *tetrabutylammonium hydroxide solution* prepared by diluting 25 ml of *0.4 M tetrabutylammonium hydroxide solution* to 1000 ml with *water*, adjusted to pH 6.5 with *dilute orthophosphoric acid*, and 10 volumes of *acetonitrile*,
- flow rate adjusted so that the retention time of cefixime is about 10 minutes,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b).The relative retention times are about 0.9 for cefixime *E*-isomer and 1.0 for cefixime and the resolution between cefixime and cefixime *E*-isomer is not less than 2.0.

Inject reference solution (a). The column efficiency is not less than 2000 theoretical plates, the tailing factor is not less than 0.9 and not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{15}N_5O_7S_2$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the strength in terms of the equivalent amount of cefixime; (2) that the tablets should be dispersed in *water* immediately before use.

Cefixime Tablets

Cefixime Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefixime, $C_{16}H_{15}N_5O_7S_2$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.05 M potassium phosphate buffer pH 7.2*, prepared by dissolving 6.8 g of *monobasic potassium*

phosphate in 1000 ml of *water*, adjusted to pH 7.2 with *1 M sodium hydroxide*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 288 nm (2.4.7). Calculate the content of $C_{16}H_{15}N_5O_7S_2$ in the medium from the absorbance obtained from a solution of known concentration of *cefixime IPRS* in the same medium.

NOTE — A small amount of methanol not exceeding 0.1 per cent of the total volume may be used to dissolve cefixime and the solution may be mixed with the aid of ultrasound to assure complete dissolution.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{15}N_5O_7S_2$.

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 10.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Phosphate buffer pH 7.0. Dissolve 7.1 g *dibasic sodium phosphate* in *water* and dilute to 500 ml with *water*. Adjust the pH of the solution to 7.0 with *monobasic potassium phosphate solution*.

Monobasic potassium phosphate solution. Dissolve 6.8 g of *monobasic potassium phosphate* in *water* and dilute to 500 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.4 g of cefixime, disperse in 100.0 ml of *phosphate buffer pH 7.0*, mix with the aid of ultrasound and centrifuge. Dilute 5.0 ml of the clear supernatant to 100.0 ml with *phosphate buffer pH 7.0*.

Reference solution (a). A 0.02 per cent w/v solution of *cefixime IPRS* in *phosphate buffer pH 7.0*.

Reference solution (b). Dissolve 10 mg of *cefixime IPRS* in 10 ml of *water*. Heat the solution at 95° for 45 minutes. Cool and inject immediately.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *tetrabutylammonium hydroxide solution* prepared by diluting 25 ml of *0.4 M tetrabutylammonium hydroxide solution* to 1000 ml with *water* and adjusted to pH 6.5 with *1.5 M orthophosphoric acid*, and 10 volumes of *acetonitrile*,
- flow rate adjusted so that the retention time of cefixime is about 10 minutes,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b).The relative retention times are about 0.9 for cefixime *E*-isomer and 1.0 for cefixime and the resolution between cefixime and cefixime *E*-isomer is not less than 2.0.

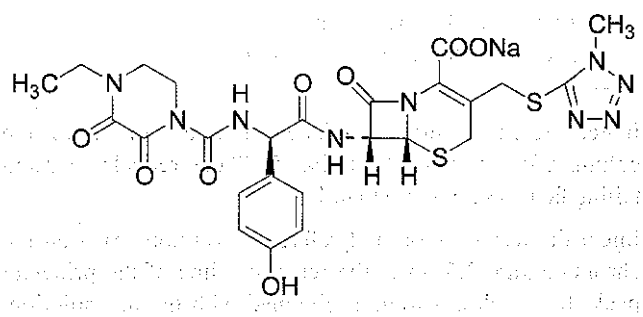
Inject reference solution (a). The column efficiency is not less than 2000 theoretical plates, the tailing factor is not less than 0.9 and not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{15}N_5O_7S_2$ in the tablets.

Storage. Store protected from moisture.

Cefoperazone Sodium



$C_{25}H_{26}N_9NaO_8S_2$ Mol Wt. 667.7

Cefoperazone sodium is sodium salt of 7-D-(-)-α-(4-ethyl-2,3-dioxo-1-piperazinecarboxamido)-α-(4-hydroxyphenyl) acetamido-3-[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl -3-cephem-4-carboxylic acid.

Cefoperazone Sodium contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{25}H_{26}N_9NaO_8S_2$, calculated on the anhydrous and solvent-free basis.

Category. Antibacterial.

Description. A white or almost white crystalline powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 25.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE —Use freshly prepared solutions.

Test solution. Dissolve 25 mg of the substance under examination in 50 ml of the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *cefoperazone sodium IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 884 volumes of *water*, 110 volumes of *acetonitrile*, 3.5 volumes of a 6 per cent w/v solution of *acetic acid*, 2.5 volumes of *triethylammonium acetate* solution prepared by diluting 14 ml of *triethylamine* and 5.7 ml of *glacial acetic acid* to 100 ml with *water*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates and tailing factor is not more than 1.6.

Inject the test solution and reference solution (b). Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the sum of areas of all the secondary peaks is not more than 4.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Acetone. Not more than 2.0 per cent.

Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.5 g of the substance under examination in 10.0 ml of *water*.

Reference solution. Dissolve 0.35 g of *acetone* in 100.0 ml of *water*. Dilute 10.0 ml of the solution to 100.0 ml with *water*.

Chromatographic system
- a fused-silica capillary or wide-bore column 30 m long and 0.32 mm or 0.53 mm, coated with *macrogol 20 000* (0.25 µm),
- temperature:
  column. 40°,
  inlet port. 140°,
- a flame ionisation detector at 250°,
- split ratio 1:5 with a linear velocity of about 35cm per second of the carrier gas.

Head-space injection conditions:
- equilibration time: 15 minutes,
- transfer-line temperature: 110°,

Inject 1 µl of the reference solution and the test solution.

Calculate the content of acetone.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *cefoperazone sodium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 884 volumes of *water*, 110 volumes of *acetonitrile*, 3.5 volumes of a 6 per cent w/v solution of *acetic acid* and 2.5 volumes of a solution prepared by dissolving 14 ml of *triethylamine* and 5.7 ml of *glacial acetic acid* in 100 ml of *water*, and mixed,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is at most 1.6 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{26}N_9NaO_8S_2$.

Cefoperazone Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of cefoperazone sodium.

Cefoperazone Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture.

Labelling. The label states whether it is intended for use in the manufacture of parenteral preparations.

Cefoperazone Injection

Cefoperazone Sodium Injection

Cefoperazone Injection is a sterile material consisting of Cefoperazone Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strengths. The equivalent of 250 mg; 500 mg; 1 g and 2 g of cefoperazone.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefoperazone Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of cefoperazone, $C_{25}H_{27}N_9O_8S_2$.

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. It gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 25.0 per cent w/v solution.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of cefoperazone.

Water (2.3.43). Not more than 5.0 per cent, except that where it is in the freeze-dried form, the limit is not more than 2.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 containers. Dissolve a quantity of the mixed contents containing 25 mg of cefoperazone, dissolve in the mobile phase and dilute to 250.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *cefoperazone sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 884 volumes of *water*, 110 volumes of *acetonitrile*, 3.5 volumes of a 6 per cent w/v solution of *acetic acid* and 2.5 volumes of a solution prepared by dissolving 14 ml of *triethylamine* and 5.7 ml of *glacial acetic acid* in 100 ml of *water*, and mixed,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 5000, the tailing factor is at most 1.6 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

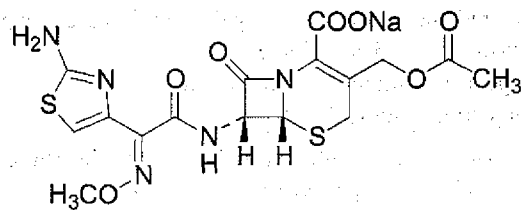
Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{27}N_9O_8S_2$ in the injection.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the quantity of Cefoperazone Sodium contained in the sealed container in terms of the equivalent amount of cefoperazone.

Cefotaxime Sodium



$C_{16}H_{16}N_5NaO_7S_2$ Mol. Wt. 477.4

Cefotaxime Sodium is sodium (7*R*)-3-acetoxymethyl-7-[(*Z*)-2-(2-aminothiazol-yl)-2-(methoxyimino) acetamido]-3-cepham-4-carboxylate.

Cefotaxime Sodium contains the equivalent of not less than 91.6 per cent and not more than 96.4 per cent of cefotaxime, $C_{16}H_{17}N_5O_7S_2$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. An off-white to pale yellow, crystalline powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. It gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 14 volumes of mobile phase B and 86 volumes of mobile phase A.

Test solution. Dissolve 40 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Add 1.0 ml of *dilute hydrochloric acid* to 4.0 ml of the test solution. Heat the solution at 40° for 2 hours. Add 5.0 ml of *buffer solution pH 6.6* and 1.0 ml of *dilute sodium hydroxide solution.*

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A. a 0.71 per cent w/v solution of *disodium hydrogen phosphate,* adjusted to pH 6.25 with *orthophosphoric acid,*
  B. *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	86	14
7	86	14
9	82	18
16	82	18
45	60	40
50	60	40
55	86	14
60	86	14

The retention time of cefotaxime is about 13 minutes and the relative retention time with reference to cefotaxime for cefotaxime impurity A is about 0.6.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to deacetylcefotaxime lactone (cefotaxime impurity A) and cefotaxime is not less than 3.5 and the tailing factor of the principal peak is not more than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 3.0 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.01 per cent w/v solution of the substance under examination in *water.*

Reference solution. A 0.01 per cent w/v solution of *cefotaxime sodium IPRS* in *water.*

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a solution prepared by dissolving 60 mg of *potassium dihydrogen phosphate* and 1.2 g of *disodium hydrogen phosphate* in 1000 ml of *water* and mixing with 120 ml of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{17}N_5O_7S_2$.

Cefotaxime Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of cefotaxime.

Cefotaxime Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture in tamper-evident containers.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Cefotaxime Sodium Injection

Cefotaxime Injection

Cefotaxime Sodium Injection is a sterile material consisting of Cefotaxime Sodium with or without excipients. It is filled in sealed containers.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefotaxime Sodium Injection contains a quantity of Cefotaxime Sodium equivalent to not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of cefotaxime, $C_{16}H_{17}N_5O_7S_2$.

Usual strengths. The equivalent of 250 mg, 1 g and 2 g of cefotaxime.

Description. An off-white to pale yellow, crystalline powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the injection containing about 0.1 g of Cefotaxime in 100.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: dissolve 3.5 g of *potassium dihydrogen orthophosphate* and 11.6 g of *disodium hydrogen orthophosphate* in 1000 ml of *water* and add 375 ml of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution. Run the chromatogram 8 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4.0 per cent).

Water (2.3.43). Not more than 3.0 per cent, determined on 0.15 g.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of cefotaxime.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 containers. Dissolve a quantity of the mixed contents containing 0.01 per cent w/v of cefotaxime.

Reference solution. A 0.01 per cent w/v solution of *cefotaxime sodium IPRS* in *water.*

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a solution prepared by dissolving 60 mg of *potassium dihydrogen phosphate* and 1.2 g of *disodium hydrogen phosphate* in 1000 ml of *water* and mixing with 120 ml of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

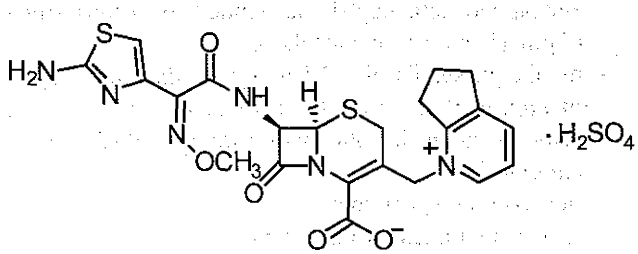
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{17}N_5O_7S_2$ in the injection.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of cefotaxime.

Cefpirome Sulphate



$C_{22}H_{22}N_6O_5S_2, H_2SO_4$ Mol. Wt. 612.66

Cefpirome Sulphate is –[[(6R,7R)-7-[[(2Z)-(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-6,7-dihydro-5*H*-cyclopenta[*b*]pyrindinium sulphate.

Cefpirome Sulphate is a sterile mixture of sterile cefpirome sulphate and sodium carbonate.

Cefpirome Sulphate contains not less than 95.0 per cent and not more than 105.0 per cent of cefpirome sulphate, calculated on the dried and sodium carbonate free basis.

Category. Antibacterial.

Description. An off-white to pale yellow powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. It gives reaction (a) of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 8.0, determined in a 4.0 per cent w/v solution.

Absorbance. Not more than 0.3, determined on a 8.0 per cent w/v solution at 430 nm (2.4.7).

Heavy metals (2.3.13). 1 g complies with limit test for heavy metals, Method B (20 ppm).

Sodium carbonate. Disperse 0.29 g of the substance under examination in *water* and dilute to 250 ml with *water*. Dilute with *water* to get solution containing 12.5 µg per ml of sodium carbonate. To 10 ml of the solution add 10 ml of *potassium chloride solution* (1.907 per cent w/v), dilute to 100 ml with *water* and determine the absorbance at 589 nm by atomic absorption spectrophotometery (2.4.2, Method A) using *sodium solution AAS*, suitably diluted with *water* for the reference solution.

1 g of Na is equivalent to 2.305 g of Na_2CO_3.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 90 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Disperse 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *cefpirome sulphate IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (c). To 10 ml of reference solution (a), add 10 ml of the solvent mixture. Heat the solution at 75° on water-bath for 1 hour, cool.

Chromatographic system

- a stainless steel column 2.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.84 g of *disodium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent v/v)
0	99	1
5	94	6
10	94	6
20	80	20
25	80	20
30	70	30
37	70	30
40	40	60
50	40	60
60	99	1
70	99	1

Inject reference solution (c). The test is not valid unless the resolution between the principal peak and thermally degraded impurity peak is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary

peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Loss on drying (2.4.19). Not more than 5.0 per cent determined on 1.0 g by drying under vaccum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of cefpirome.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *cefpirome sulphate IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). To 10 ml of reference solution (a), add about 10 ml of the mobile phase. Heat the solution at 75° on water-bath for about an hour and cool.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate* in 100 ml of *water* and 10 volumes of *acetonitrile*, adjusted to pH 5.6 with 1 per cent w/v solution of *sodium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

The relative retention time with reference to cefpirome for cyclopentenpyridine is about 2.8 and for thermally degraded impurity is about 1.84.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the principal peak and thermally degraded impurity peak is not less than 5.0 and the resolution between the thermally degraded impurity and cyclopentenpyridine is not less than 2.0 in the chromatogram obtained with reference solution (c). In the chromatogram obtained with reference solution (b), the relative standard deviation for replicate injections is not more than 1.0 per cent and the tailing factor is not more than 1.5.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{22}H_{22}N_6O_5S_2, H_2SO_4$.

Storage. Store protected from light and moisture.

Cefpirome Injection

Cefpirome Sulphate Injection

Cefpirome Injection is sterile material consisting of Cefpirome sulphate with or without auxiliary substances. It is filled in sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of Water for Injections immediately before use.

The constituted solution complies with the requirements for clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefpirome Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of cefpirome, $C_{22}H_{22}N_6O_5S_2$.

The contents of the sealed container comply with requirements stated under Parenteral Preparations (Powders for Injections) and with the following requirement.

Usual strengths. 250 mg; 500 mg; 1000 mg per vial.

Description. An off-white to pale yellow powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. It gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 8.0, determined in a 4.0 per cent w/v solution of cefpirome.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 90 volumes of mobile phase A and 10 volumes of mobile phase B.

Test solution. Disperse a quantity of powder containing 50 mg of Cefpirome Sulphate with 20 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *cefpirome sulphate IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (c). Transfer 10 ml of reference solution (a) to 50-ml volumetric flask, add about 10 ml of the solvent mixture. Heat the solution at 75° on water-bath for about an hour and cool.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.84 g of *disodium hydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the condition given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent v/v)
0	99	1
5	94	6
10	94	6
20	80	20
25	80	20
30	70	30
37	70	30
40	40	60
50	40	60
60	99	1
70	99	1

Inject reference solution (c). The test is not valid unless the resolution between the principal peak and thermally degraded impurity peak is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of cefpirome.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying under vaccum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 1.0 per cent w/v *sodium hydroxide solution*, pH 7.0.

Test solution. Mix the content of 10 containers containing 100 mg of Cefpirome Sulphate with 20 ml of the mobile phase with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *cefpirome sulphate IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate* in 100 ml of *water* and 10 volumes of *acetonitrile*, adjusted to pH 5.6 with 1.0 per cent w/v solution of *sodium hydroxide*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0.

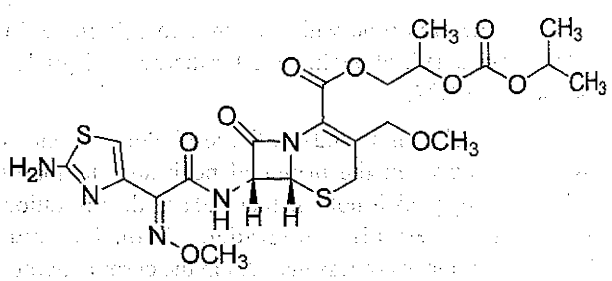
Inject reference solution (b) and the test solution.

Calculate the content of $C_{22}H_{22}N_6O_5S_2$ in the injection.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of Cefpirome.

Cefpodoxime Proxetil



$C_{21}H_{27}N_5O_9S_2$ Mol. Wt. 557.6

Cefpodoxime Proxetil is 1-(isopropoxycarbonyloxy)ethyl (6*R*, 7*R*)-7-[2-(2-amino-4-thiazolyl)-(*Z*)-2-(methoxyimino) acetamido]-3-methoxymethyl-3-cephem-4-carboxylate.

Cefpodoxime Proxetil contains not less than 690 µg and not more than 804 µg per mg of cefpodoxime, $C_{15}H_{17}N_5O_6S_2$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to light brownish-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefpodoxime proxetil IPRS* or with the reference spectrum of cefpodoxime proxetil.

Tests

Specific optical rotation (2.4.22). +35° to +48°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. 20 volumes of *water* and 10 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 5 ml of *methanol* and dilute to 50.0 ml with the solvent mixture. This solution should be injected promptly.

Reference solution. Dissolve a quantity of *cefpodoxime proxetil IPRS* in the solvent mixture to obtain a solution containing about 10 µg per ml.

NOTE — A volume of methanol not exceeding 10 per cent of the total volume in the final solution may be used to facilitate dissolution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A. *0.02 M ammonium acetate,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
10	68	32
40	68	32
80	50	50
85	50	50
90	25	75
95	25	75
100	90	10

Inject the reference solution. The retention time for the cefpodoxime proxetil *R*–epimer is between 37 and 42 minutes. The relative retention times for cefpodoxime proxetil *S*-epimer is about 0.9 and for cefpodoxime proxetil *R*-epimer is about 1.0, the resolution between cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer is not less than 4.0. The test is not valid unless the column efficiency for cefpodoxime proxetil *R*-epimer peak is not less than 15,000 theoretical plates.

Inject the test solution and measure the areas of all the peaks. Calculate the percentage of each impurity in the portion of cefpodoxime proxetil taken, from the expression, $100\ (r_i/r_s)$ where, r_i is the peak area for each impurity and r_s is the sum of the areas of all the peaks. Any peak at a relative retention time of about 0.86 is not more than 3.0 per cent, any peak at relative retention times of about 1.27, 1.39 is not more than 1.0 per cent, and other individual peaks having relative retention times higher than 2.0 is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 6.0 per cent. Ignore any peak with an area less than 0.05 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Isomer ratio. Using the chromatogram of the test solution obtained in the Assay, calculate the ratio of the cefpodoxime proxetil *R*-epimer peak response to the sum of the peak responses of the cefpodoxime proxetil *S*-epimer peak and the cefpodoxime proxetil *R*-epimer peak: the ratio is between 0.5 and 0.6.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *methanol*, dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture and filter.

Reference solution. Dissolve 25 mg of *cefpodoxime proxetil IPRS* in 5 ml of *methanol*, dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: A mixture of 60 volumes of *0.02 M ammonium acetate* and 40 volumes of *acetonitrile,*
- flow rate: 2 ml per minute,

- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative retention time for cefpodoxime proxetil *S*-epimer is about 0.9 and for cefpodoxime proxetil *R*-epimer is about 1.0. The resolution between cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer is not less than 2.5, the tailing factor for cefpodoxime proxetil *R*-epimer is not more than 1.5 and the relative standard deviation determined from the sum of the areas of the cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer peaks for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{17}N_5O_6S_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Cefpodoxime Oral Suspension

Cefpodoxime Proxetil Oral Suspension

Cefpodoxime Oral Suspension is a mixture consisting of Cefpodoxime Proxetil with buffering agents and other excipients. It contains a suitable flavouring agent.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Cefpodoxime Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefpodoxime, $C_{15}H_{17}N_5O_6S_2$.

Usual strengths. 50 mg per 5 ml; 100 mg per 5 ml.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cefpodoxime $C_{15}H_{17}N_5O_6S_2$.

Identification

In the Assay, the principal peaks of cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

pH (2.4.24). 4.0 to 5.5.

Water (2.3.43). Not more than 1.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Transfer a weighed a quantity containing 50 mg of cefpodoxime, disperse in 10 ml of *water*, add 20 ml of *acetonitrile*, mix with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture and filter.

Reference solution. Dissolve a quantity of *cefpodoxime proxetil IPRS* in the solvent mixture to obtain a solution containing about 30 µg per ml.

NOTE — A volume of methanol not exceeding 10 per cent of the total volume in the final solution may be used to facilitate dissolution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 60 volumes of *0.02 M ammonium acetate* and 40 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative retention time for cefpodoxime proxetil *S*-epimer is about 0.9 and for cefpodoxime proxetil *R*-epimer is about 1.0. The resolution between cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer is not less than 2.5, the tailing factor for cefpodoxime proxetil *R*-epimer is not more than 1.5 and the relative standard deviation determined from the sum of the areas of the cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer peaks for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{15}H_{17}N_5O_6S_2$, weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of cefpodoxime; (2) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Cefpodoxime Tablets

Cefpodoxime Proxetil Tablets

Cefpodoxime Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefpodoxime, $C_{15}H_{17}N_5O_6S_2$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

In the Assay, the principal peaks of cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a solution prepared by dissolving 3.03 g of *glycine* and 3.37 g of *sodium chloride* in about 500 ml of *water*, adding cautiously with swirling 0.8 ml of *hydrochloric acid*, adjusted to pH 3.0 and diluting to 1000 ml with *water*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 259 nm (2.4.7). Calculate the content of $C_{15}H_{17}N_5O_6S_2$ in the medium from the absorbance obtained from a solution of known concentration of *cefpodoxime proxetil IPRS* prepared by dissolving in minimum quantity of *methanol* and diluted with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{17}N_5O_6S_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of cefpodoxime, disperse in 100.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture and filter.

Reference solution. Dissolve a quantity of *cefpodoxime proxetil IPRS* in the solvent mixture to obtain a solution containing about 30 µg per ml.

NOTE — A volume of methanol not exceeding 10 per cent of the total volume in the final solution may be used to facilitate dissolution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 60 volumes of *0.02 M ammonium acetate* and 40 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 20 µl.

The test is not valid unless the relative retention time for cefpodoxime proxetil *S*-epimer is about 0.9 and for cefpodoxime proxetil *R*-epimer is about 1.0.

Inject the reference solution. The test is not valid unless the resolution between cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer is not less than 2.5, the tailing factor for cefpodoxime proxetil *R*-epimer is not more than 1.5 and the relative standard deviation determined from the sum of the areas of the cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer peaks for replicate injections is not more than 2.0 per cent.

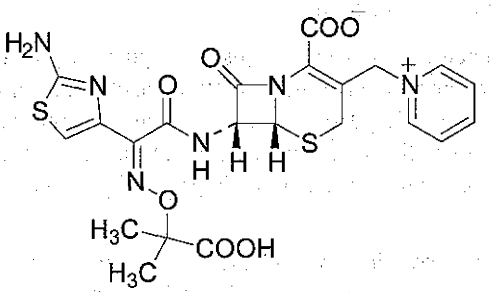
Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{17}N_5O_6S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Cefpodoxime. If the tablets are dispersible, the tablets should be dispersed in water immediately before use.

Ceftazidime



, $5H_2O$

$C_{22}H_{22}N_6O_7S_2,5H_2O$ Mol. Wt. 636.6

Ceftazidime is pentahydrate of the inner salt of (7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(1-carboxy-1-methylethoxyimino)-acetamido]-3-(1-pyridinomethyl)-3-cepham-4-carboxylate pentahydrate.

Ceftazidime contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{22}H_{22}N_6O_7S_2$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to cream-coloured, crystalline powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.0, determined in a 0.5 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination to 20.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (a). A 0.00125 per cent w/v solution of *Δ-2-ceftazidime* (*ceftazidime impurity A IPRS*) in the mobile phase.

Reference solution (b). A 0.00125 per cent w/v solution of *ceftazidime IPRS* in reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 7 volumes of *acetonitrile* and 93 volumes of a 2.26 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.9 with *orthophosphoric acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 20 µl.

Inject reference solution (b). Adjust the sensitivity of the system so that the heights of the 2 peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless in the resolution between the peaks due to ceftazidime and ceftazidime impurity A is not less than 5.9.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Pyridine. Not more than 500 ppm.

Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 0.5 g of the substance under examination in 100.0 ml of 10 per cent v/v solution of *phosphate buffer pH 7.0.*

Reference solution (a). Dissolve 1 g of *pyridine* in 100.0 ml of *water*. Dilute 5.0 ml of the solution to 200.0 ml with *water*. To 1.0 ml of the solution, add 10 ml of *phosphate buffer pH 7.0* and further dilute to 100 ml with *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with 10 per cent v/v solution of *phosphate buffer pH 7.0*. To 1.0 ml of the solution, add 20 ml of reference solution (a) and further dilute to 200 ml with a 10 per cent v/v solution of *phosphate buffer pH 7.0.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of 2.88 per cent w/v solution of *ammonium dihydrogen orthophosphate* in *water*, previously adjusted to pH 7.0 with *ammonia*, 24 volumes of *acetonitrile* and 68 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ceftazidime and pyridine is not less than 7.0.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Loss on drying (2.4.19). 13.0 to 15.0 per cent, determined on 0.3 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 30 mg of the substance under examination in 2.5 ml of *phosphate buffer pH 7.0*, dilute to 25.0 ml with *water* and mix. Protect the solution from light. Immediately before chromatography, dilute 5.0 ml of the solution to 50.0 ml with *water.*

Reference solution. Treat 30 mg *ceftazidime IPRS* in a similar manner.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 100 ml of *phosphate buffer pH 7.0* and 20 ml of *acetonitrile* diluted to 1000 ml with *water*,

- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_6O_7S_2$.

Ceftazidime intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.10 Endotoxin Unit per mg.

Ceftazidime intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture.

Ceftazidime for Injection

Ceftazidime for Injection is a sterile mixture of Sterile Ceftazidime and Sodium Carbonate or Arginine.

Ceftazidime for Injection contains not less than 90.0 per cent and not more than 105.0 per cent of ceftazidime, $C_{22}H_{22}N_6O_7S_2$, on the dried and sodium carbonate or arginine-free basis, and not less than 90.0 per cent and not more than 120.0 per cent of the labeled amount of ceftazidime, $C_{22}H_{22}N_6O_7S_2$.

Usual strengths. 500 mg; 1 g.

Description. A white or almost white powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Gives the reactions of sodium salts and reaction A of carbonates (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a solution containing 100 mg of anhydrous ceftazidime per ml.

Pyridine. Not more than 0.4 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity containing about 0.5 g of ceftazidime and dissolve in sufficient *mixed phosphate buffer pH 7.0* to produce 100.0 ml.

Reference solution. Weigh accurately about 0.2 g of *pyridine* and dissolve in sufficient *water* to produce 100.0 ml. Immediately prior to chromatography add to 2.0 ml of the resulting solution sufficient *mixed phosphate buffer pH 7.0* to produce 200.0 ml and mix well.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 10 volumes of a 2.88 per cent w/v solution of *ammonium dihydrogen phosphate* previously adjusted to *pH 7.0* with *dilute ammonia solution*, 30 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation of replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of pyridine.

Content of arginine *(if present).*

Test solution. Dissolve accurately a quantity of Ceftazidime for Injection in *water* to obtain a solution containing 0.02 per cent w/v of Ceftazidime.

Reference solution. A solution containing 0.02 per cent w/v, each of, *ceftazidime pentahydrate IPRS* and *l-arginine IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with dihydroxypropane bonded to porous silica (3 to 10 µm), attached with a saturator pre-column 50 cm x 4.6 mm, packed with porous silica,
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 1.15 g of *monobasic ammonium phosphate* in 1000 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid*, and 75 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 206 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peak due to ceftazidime and arginine is not less than 6.0 and the tailing factor is not more than 4.0 for arginine peak.

Inject the reference solution and the test solution.

Calculate the content of arginine.

Sodium carbonate. Weigh accurately a quantity containing about 50 mg of anhydrous ceftazidime and dissolve in sufficient *water* to produce 100.0 ml. Dilute the resulting solution appropriately with *water* and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *sodium solution FP*, suitably diluted with *water* for the reference solutions.

1 g of Na is equivalent to 2.305 g of Na_2CO_3.

Bacterial endotoxins (2.2.3). Not more than 0.10 Endotoxin Unit per mg of ceftazidime.

Sterility (2.2.11). Complies with the test for sterility.

Loss on drying (2.4.19). Not more than 12.5 per cent (if contains arginine) and not more than 13.5 per cent (if contains sodium carbonate), determined on 0.3 g by drying in vacuum at a pressure not exceeding 5 mm of Hg at 25° for 4 hours. Where it contains sodium carbonate, heat the residue in vacuum at a pressure not exceeding 5 mm of Hg at 100° an additional 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents 10 containers. Dissolve a quantitity of the mixed contents containing 50 mg of anhydrous ceftazidime dissolve in water and dilute to 50.0 ml with the same solvent. Protect the solution from light. Immediately before chromatography, dilute 5.0 ml to 50.0 ml with *water*.

Reference solution. Dissolve about 29 mg *ceftazidime IPRS* in 2.5 ml of *mixed phosphate buffer pH 7.0* and dilute to 25.0 ml with water. Protect the solution from light. Immediately before chromatography, dilute 5.0 ml to 50.0 ml with *water*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 100 ml of *phosphate buffer pH 7.0* and 20 ml of *acetonitrile* diluted to 1000 ml with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

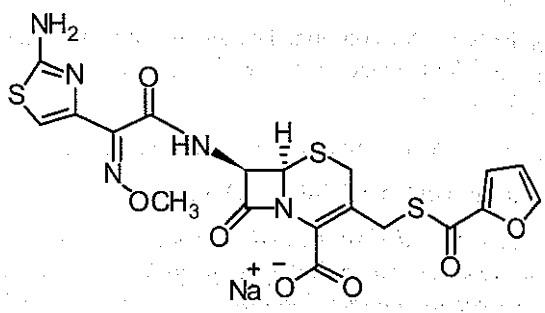
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}N_6O_7S_2$.

Storage. Store in sterile containers, sealed so as to exclude microorganisms, protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ceftazidime.

Ceftiofur Sodium



$C_{19}H_{16}N_5NaO_7S_3$ Mol. Wt. 545.5

$C_{19}H_{16}N_5NaO_7S_3,H_2O$ Mol. Wt. 563.5

$C_{19}H_{16}N_5NaO_7S_3,3H_2O$ Mol. Wt. 599.5

Ceftiofur Sodium is Sodium 7-[(*Z*)-2-(2-amino-1,3-thiazol-4-yl)-2-(methoxyimino)acetamido]-3-(2-furoylthiomethyl)-3-cephem-4-carboxylate.

Ceftiofur Sodium contains not less than 82.0 per cent and not more than 102.0 per cent of $C_{19}H_{16}N_5NaO_7S_3$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. An off white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ceftiofur sodium IPRS* or with the reference spectrum of ceftiofur sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1).

pH (2.4.24). 5.0 to 7.5 determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). – 70.0° to – 60.0°, determined in a 1.0 per cent w/v solution.

Absorbance. Absorbance of 2.0 per cent w/v solution at 420 nm (2.4.7) is not more than 0.3.

High molecular weight impurities. Not more than 12.0 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 15 ml of the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *ceftiofur sodium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 0.68 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 7.5 with *dilute potassium hydroxide solution*, add 10 g of *sodium lauryl sulphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention time of ceftiofur peak is about 3.0 minutes and high molecular weight impurities is about 1.7, 2.0 and 2.1.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of high molecular weight impurities by the area normalization using relative responses factor of 0.62.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 60 volumes of a 0.35 per cent w/v solution of *disodium hydrogen orthophosphate dihydrate*, adjusted to pH 8.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*.

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 100 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *ceftiofur sodium IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 95 volumes of a 0.1 per cent v/v solution of *trifluoroacetic acid* in *water* and 5 volumes of mobile phase B,
  B. a 0.1 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*,
- a gradient programme using the conditions given below;
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	82	18
50	82	18
110	40	60
111	100	0
120	100	0

Inject reference solution (a). Test is not valid unless the column efficiency is not less than 5500 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than the 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent). Ignore any peaks with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). Not more than 2.0 per cent for anhydrous form, not more than 4.0 per cent for monohydrate form and not more than 10.0 per cent for trihydrate form, determined on 1.0 g, 0.5 g and 0.2 g.

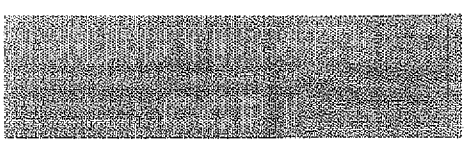
Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of a 0.35 per cent w/v solution of *disodium hydrogen orthophosphate dihydrate*, adjusted pH to 8.0 with *orthophosphoric acid* and 40 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solutuion of *ceftiofur sodium IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a 0.1 per cent v/v solution of *trifluoroacetic acid* in *water* and 25 volumes a 0.1 per cent v/v solution of *trifluoroacetic acid* in *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

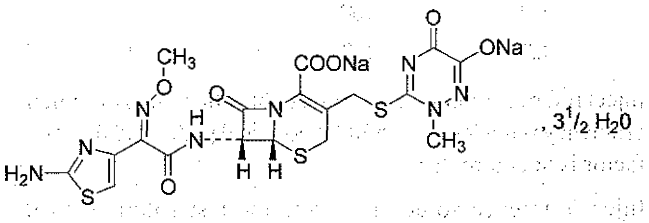


Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{16}N_5NaO_7S_3$.

Ceftriaxone Sodium



$C_{18}H_{16}N_8Na_2O_7S_3,3½H_2O$ Mol. Wt. 662.0

Ceftriaxone sodium is disodium (6*R*,7*R*)-7-[[(*Z*)-(2-aminothiazol-4-yl)(methoxyimino)acetyl]amino]-3-[[(2-methyl-6-oxido-5-oxo-2,5-dihydro-1,2,4-triazin-3-yl) sulphanyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate hemiheptahydrate.

Ceftriaxone sodium contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{18}H_{16}N_8Na_2O_7S_3$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or yellowish, crystalline powder, slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ceftriaxone sodium IPRS* or with the reference spectrum of ceftriaxone sodium.

B. Gives reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. Dissolve 2.4 g in 20 ml of *carbon dioxide-free water* (Solution A). Dilute 2 ml of solution A to 20 ml with *water*; the resulting solution is clear (2.4.1) and not more intensely coloured than reference solution BYS5 or YS5 (2.4.1).

pH (2.4.24). 6.0 to 8.0, determined in solution A.

Specific optical rotation (2.4.22). –170.0° to –155.0°, determined in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30.0 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.03 per cent w/v solution of *ceftriaxone sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *ceftriaxone sodium IPRS* and *ceftriaxone sodium E- isomer IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of the reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2.0 g of *tetradecylammonium bromide* and 2.0 g of *tetraheptylammonium bromide* in a mixture of 440 ml of *water*, 55 ml of *0.067 M mixed phosphate buffer solution pH 7.0*, 5.0 ml of a buffer solution prepared by dissolving 20.17 g of *citric acid* in 800 ml of *water*, adjusted to pH 5.0 with *strong sodium hydroxide solution* and diluting to 1000.0 ml with *water*, and 500 ml of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to ceftriaxone and ceftriaxone sodium *E*-isomer is at least 3.0.

Inject reference solution (b) and (c) and the test solution. Continue the chromatography for twice the retention time of the ceftriaxone peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent); the sum of the areas of all such peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (4.0 per cent). Ignore any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Water (2.3.43). 8.0 per cent to 11.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{16}N_8Na_2O_7S_3$.

Ceftriaxone sodium intended for use in the manufacture of parenteral preparations without a further appropriate

procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.20 Endotoxin Unit per mg of ceftriaxone sodium.

Ceftriaxone Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with following requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture.

Labelling. The label states, where applicable, that the substance is free from bacterial endotoxins.

Ceftriaxone Injection

Ceftriaxone Injection is a sterile material consisting of Ceftriaxone Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strengths. The equivalent of 250 mg; 500 mg; 1 g and 2 g of ceftriaxone.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ceftriaxone Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of ceftriaxone, $C_{18}H_{18}N_8O_7S_3$.

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ceftriaxone sodium IPRS* or with the reference spectrum of ceftriaxone sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

C. It gives the reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. A 1.2 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution BYS5 or YS5 (2.4.1).

pH (2.4.24). 6.0 to 8.0, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of injection containing 30 mg of ceftriaxone in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.03 per cent w/v solution of *ceftriaxone sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *ceftriaxone sodium IPRS* and *ceftriaxone sodium E-isomer IPRS* in the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

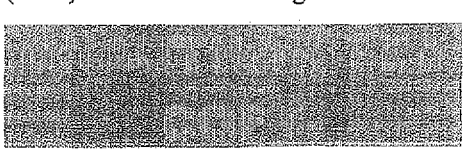
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Lichrosphere RP-18),
- mobile phase: dissolve 2 g of *tetradecylammonium bromide* and 2 g of *tetraheptylammonium bromide* in a mixture of 440 ml of *water*, 55 ml of *0.067 M mixed phosphate buffer pH 7.0*, 5 ml of a buffer prepared by dissolving 20.17 g of *citric acid* in 800 ml of *water*, adjusted to pH 5.0 with *10 M sodium hydroxide* and diluting to 1000 ml with *water*, and 500 ml of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is at least 3.0.

Inject reference solution (c) and the test solution. Run the chromatogram at least twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the sum of the areas of all the secondary peaks is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of ceftriaxone.

Water (2.3.43). Not more than 11.0 per cent, determined on 0.1 g.



Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{18}N_8O_7S_3$ in the injection.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label on the sealed container states the quantity of Ceftriaxone Sodium contained in it in terms of the equivalent amount of ceftriaxone.

Ceftriaxone and Sulbactam for Injection

Ceftriaxone Sodium and Sulbactam Sodium for Injection

Ceftriaxone and Sulbactam for Injection is a sterile material consisting of Ceftriaxone Sodium and Sulbactam Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ceftriaxone and Sulbactam for Injection contain ceftriaxone sodium and sulbactam sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of ceftriaxone, $C_{18}H_{18}N_8O_7S_3$ and sulbactam, $C_8H_{11}NO_5S$.

Description. A white to off white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. Ceftriaxone, 2000 mg and Sulbactam, 1000 mg; Ceftriaxone, 1000 mg and Sulbactam, 500 mg; Ceftriaxone, 500 mg and Sulbactam, 250 mg; Ceftriaxone, 250 mg and Sulbactam, 125 mg; Ceftriaxone, 125 mg and Sulbactam, 62.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

pH (2.4.24). 4.5 to 8.0, determined in 10 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the injection containing 30 mg of Ceftriaxone in 60 ml of *water* and dilute to 100.0 ml with *water*.

Reference solution. A 0.03 per cent w/v solution of *ceftriaxone sodium IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- sample temperature: 10°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 5 volumes of *methanol*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
15	80	20
25	80	20
30	60	40
50	60	40
55	95	5
60	95	5

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 1.0 per cent and the sum of the areas of all secondary peaks is not more than 5.0 per cent, calculated by area normalisation.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of ceftriaxone.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 vials. Disperse a quantity of the mixed contents containing 250 mg of Ceftriaxone in

100.0 ml of *water*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Weigh a suitable quantity of *ceftriaxone sodium IPRS* and dissolve in *water* to obtain a solution containing 0.025 w/v solution of ceftriaxone.

Reference solution (b). Weigh a suitable quantity of *sulbactam sodium IPRS* and dissolve in *water* to obtain a solution containing 0.025 w/v solution of sulbactam.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution having the similar concentration to the test solution.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2 ml of *triethylamine* and mix, adjusted to pH 4.5 with *orthophosphoric acid* and 25 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

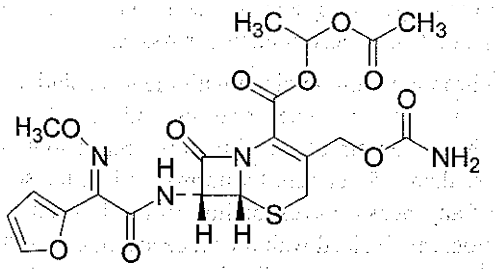
Inject reference solution (c). The test is not valid unless the tailing factor is not more than 2.0 for ceftriaxone peak and the relative standard deviation for replicate injections is not more than 2.0 for both the peaks.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{18}H_{18}N_8O_7S_3$ and $C_8H_{11}NO_5S$ in the injection.

Labelling. The label states the strength in terms of equivalent amount of ceftriaxone and sulbactam.

Cefuroxime Axetil



$C_{20}H_{22}N_4O_{10}S$ Mol. Wt. 510.5

Cefuroxime Axetil is a mixture of the 2 diastereoisomers of (1*RS*)-1-(acetyloxy)ethyl (6*R*,7*R*)-3-[(carbamoyloxy)methyl]-7-[[(*Z*)-2-(furan-2-yl)-2-(methoxyimino)acetyl]amino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Cefuroxime Axetil contains not less than 79.8 per cent and not more than 84.8 per cent of cefuroxime, $C_{16}H_{16}N_4O_8S$, calculated on the anhydrous and acetone-free basis.

Category. Antibacterial.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefuroxime axetil IPRS* or with the reference spectrum of cefuroxime axetil.

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks due to diastereomer A and B in the chromatogram obtained with reference solution (d).

Tests

Diastereoisomer ratio. Determine by liquid chromatography (2.4.14).

Use chromatographic system, test solution, reference solution (a), (b), (c) and (d), as described under Assay.

In the chromatogram obtained with the test solution, the ratio of the peak due to cefuroxime axetil diastereoisomer A to the sum of the peaks due to cefuroxime axetil diastereoisomers A and B is between 0.48 and 0.55 by the normalisation procedure.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Heat 5 ml of the test solution at 60° for one hour to generate the D^3-isomers.

Reference solution (c). Expose 5 ml of the test solution to ultraviolet light at 254 nm for 24 hours to generate *E*-isomers.

Reference solution (d). A 0.02 per cent w/v solution of *cefuroxime axetil IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with trimethylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 38 volumes of *methanol* and 62 volumes of a 2.3 per cent w/v solution of *ammonium dihydrogen phosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 20 µl.

The relative retention times with respect to cefuroxime axetil diastereoisomer A for cefuroxime axetil diastereoisomer B is about 0.9, for cefuroxime axetil D^3-isomers is about 1.2 and for *E*-isomers is about 1.7 and 2.1.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to cefuroxime axetil diastereoisomer A and cefuroxime axetil D^3-isomer is not less than 1.5.

Inject reference solution (a), (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to cefuroxime axetil D^3-isomers is not more than 1.5 times the sum of the area of the principal peaks in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of peak corresponding to cefuroxime axetil E-isomers is not more than the sum of the area of the principal peaks in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than 0.5 times the sum of the area of the principal peaks in the chromatogram obtained with reference solution (a) (0.5 per cent) and sum of all the secondary peaks is not more than 3 times the sum of the area of the principal peaks in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak with an area less than 0.05 times the sum of the area of the principal peaks in the chromatogram obtained with reference solution (a) (0.05 per cent).

Acetone (5.4). Not more than 1.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Use chromatographic system, test solution and reference solution (d), as described under Related substances.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to cefuroxime axetil diastereoisomers A and B is not less than 1.5 and the relative standard deviation for replicate injections for the sum of diastereomer A and B peaks is not more than 2.0 per cent.

Inject reference solution (d) and the test solution.

Calculate the content of $C_{16}H_{16}N_4O_8S$ as the sum of areas of the two diastereoisomer peaks.

1 mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

Storage. Store protected from light and moisture.

Cefuroxime Axetil Tablets

Cefuroxime Axetil Tablets contain Cefuroxime Axetil. They may be coated.

Cefuroxime Axetil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cefuroxime, $C_{16}H_{16}N_4O_8S$.

Usual strengths. 125 mg; 250 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.1 g of cefuroxime with 5 ml of *dichloromethane*, filter and evaporate the filtrate to dryness.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cefuroxime axetil IPRS* or with the reference spectrum of cefuroxime axetil.

B. In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks due to diastereomer A and B in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly. Use the filtrate, dilute if necessary, with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{16}H_{16}N_4O_8S$ in the medium from the absorbance obtained from a solution of known concentration of *cefuroxime axetil IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{16}N_4O_8S$.

Related substances. Determine by liquid chromatography (2.4.14).

Use chromatographic system, test solution, reference solution (a), (b), and (c), as described under Assay.

In the chromatogram obtained with the test solution the sum of the areas of the pair of peaks corresponding to the *E*-isomers in the chromatogram obtained with reference solution (b) is not more than 1.5 per cent by normalisation, the sum of the areas of any peaks corresponding to the D^3-isomers in the chromatogram obtained with reference solution (a) is not more than 2.0 per cent by normalisation and the area of any other secondary peak is not more than 1.0 per cent by normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE – Prepare the solutions immediately before use.

Test solution. Disperse 10 tablets in *0.2 M ammonium dihydrogen orthophosphate* with the pH previously adjusted to 2.4 with *orthophosphoric acid*, using 10 ml per g of the stated content of cefuroxime. Immediately add sufficient *methanol* to produce a solution containing the equivalent of 0.5 per cent w/v of cefuroxime and shake vigorously. Filter and dilute a quantity of the filtrate with sufficient of the mobile phase to produce a solution containing 0.025 per cent w/v of cefuroxime.

Reference solution (a). Warm a quantity of the test solution at 60° for one hour or until sufficient impurities (D^3-isomers) have been generated.

Reference solution (b). Expose a quantity of the test solution to ultraviolet light at 254 nm for 24 hours or until sufficient impurities (*E*-isomers) have been generated.

Reference solution (c). A 0.03 per cent w/v solution of *cefuroxime axetil IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with particles of silica (5 µm) the surface of which has been modified by chemically-bonded trimethylsilyl groups (Such as Hypersil SAS),
- mobile phase: a mixture of 38 volumes of *methanol* and 62 volumes of *0.2 M ammonium dihydrogen orthophosphate*, adjusted, if necessary, so that the resolution between the peaks corresponding to the cefuroxime axetil diastereoisomers A and B in reference solution (c) and between the peaks corresponding to cefuroxime axetil diastereoisomer A and the cefuroxime axetil D^3-isomer in reference solution (a) is in each case not less than 1.5,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution, reference solution (a), (b) and (c). The retention time relative to cefuroxime axetil diastereoisomer A are approximately 0.9 for cefuroxime axetil diastereoisomer B, 1.2 for the cefuroxime axetil D^3-isomers and 1.7 and 2.1 for the *E*-isomers.

Calculate the content of $C_{16}H_{16}N_4O_8S$ as the sum of the areas of the two peaks corresponding to diastereoisomers A and B.

1 mg of $C_{20}H_{22}N_4O_{10}S$ is equivalent to 0.8313 mg of $C_{16}H_{16}N_4O_8S$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of cefuroxime.

Cefuroxime Axetil and Potassium Clavulanate Tablets

Cefuroxime Axetil and Potassium Clavulanate Tablets contain Cefuroxime Axetil and Potassium Clavulanate or Potassium Clavulante Diluted. The tablets are coated.

Cefuroxime Axetil and Potassium Clavulanate Tablets contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amounts of cefuroxime, $C_{16}H_{16}N_4O_8S$ and clavulanic acid $C_8H_9NO_5$.

Usual strength. Cefuroxime, 250 mg and Cavulanic acid, 125 mg.

Identification

In the Assay, the retention time of the principal peaks in the chromatogram obtained with the test solution correspond to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus. No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the mobile phase.

Reference solution. Dissolve 34 mg of *cefuroxime axetil IPRS* and 14 mg of *lithium clavulanate IPRS* in 10 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml to 50.0 ml with mobile phase.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{16}N_4O_8S$ and $C_8H_8KNO_5$.

Q. Not less than 75 per cent of the stated amounts of $C_{20}H_{22}N_4O_{10}S$ and $C_8H_9NO_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 25 mg of cefuroxime in 10 ml of *methanol* and dilute to 50.0 ml with mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 34 mg of *cefuroxime axetil IPRS* and 14 mg of *lithium clavulanate IPRS* in 10 ml of *methanol*

and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml to 50.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 15°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 23.0 g of *ammonium di hydrogen phosphate* in 1000 ml *water* and 45 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent and the resolution between cefuroxime axetil and potassium clavulanate peaks is not less than 1.5

Inject the reference solution and the test solution.

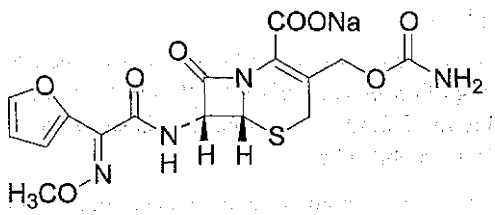
Calculate the contents of $C_{16}H_{16}N_4O_8S$ and $C_8H_9NO_5$ in the tablets.

1 mg of $C_8H_8LiNO_5$ is equivalent to 0.9711 mg of $C_8H_9NO_5$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labellilng. The label states the strength in terms of the equivalent amount of cefuroxime and clavulanic acid.

Cefuroxime Sodium



$C_{16}H_{15}N_4NaO_8S$ Mol. Wt. 446.4

Cefuroxime Sodium is sodium (7*R*)-3-carbamoyloxymethyl-7-[(*Z*)-furan-2-yl-2-methoxyiminoacetamido]-3-cephem-4-carboxylate.

Cefuroxime Sodium contains not less than 90.0 per cent and not more than 105.0 per cent of cefuroxime sodium, $C_{16}H_{15}N_4NaO_8S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or faintly yellow powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.0 to 8.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use or keep at 2° to 8°.

Test solution. Dissolve 25 mg of the substance under examination in *water* and dilute to 25.0 ml with *water.*

Reference solution (a). Dissolve 25 mg of *cefuroxime sodium IPRS* in *water* and dilute to 25.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *water*. Heat 20 ml of the solution in a water–bath at 80° for 15 minutes. Cool and inject immediately.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water.*

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with hexylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *acetonitrile* and 99 volumes of an *acetate buffer pH 3.4*, prepared by dissolving 6.01 g of *glacial acetic acid* and 0.68 g of *sodium acetate* in *water* and diluting to 1000 ml with *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 20 µl.

Inject reference solution (a).The test is not valid unless the resolution between the peaks due to cefuroxime and discarbamoyl cefuroxime (cefuroxime impurity A) is not less than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to cefuroxime impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.3.43). Not more than 3.5 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the *water* to produce 25.0 ml. Immediately transfer 5.0 ml of the solution to a 100-ml volumetric flask, add 20.0 ml of a 0.15 per cent w/v solution of *orcinol* (internal standard) in *water*, dilute to volume with *water* and mix.

Reference solution. Treat a quantity of *cefuroxime sodium IPRS* equivalent to 25 mg of cefuroxime in a similar manner.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with hexylsilane chemically bonded to totally porous silica particles (5 µm),
- mobile phase: a mixture of 100 volumes of *acetate buffer pH 3.4* and 10 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}N_4NaO_8S$.

Cefuroxime Sodium intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Bacterial endotoxins (2.2.3). Not more than 0.1 Endotoxin Unit per mg of cefuroxime sodium.

Sterility (2.2.11). Complies with the test for sterility, using the membrane filtration method.

Storage. Store protected from moisture. If it is intended for use in the manufacture of parenteral preparations, it should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of injectable preparations.

Cefuroxime Injection

Cefuroxime Sodium Injection

Cefuroxime Injection is a sterile material consisting of Cefuroxime Sodium, with or without auxiliary substances. It is filled in a sealed container.

The injection is constituted by dissolving the contents of a sealed container in the requisite amount of Water for Injections immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cefuroxime Injection contains a quantity of Cefuroxime Sodium equivalent to not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of cefuroxime, $C_{16}H_{16}N_4O_8S$.

Usual strengths: The equivalent of 250 mg, 750 mg and 1.5 g of cefuroxime.

Description. A white or faintly yellow powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with the reference solution.

B. It gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.0 to 8.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 containers. Dissolve a quantity of the mixed content containing 0.1 g of cefuroxime to 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v solution of *cefuroxime sodium IPRS* in *water*.

Reference solution (b). Heat 20.0 ml of reference solution (a) in water bath at 60° for 10 minutes, cool.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm packed with silica chemically bonded to hexylsilane groups (5 µm) (Such as Spherisorb S5 C6),
- mobile phase: a mixture of 1 volume of *acetonitrile* and 99 volumes of *acetate buffer pH 3.4*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 273 nm,
- injection volume: 20 µl.

Inject reference solution (b). The chromatogram obtained shows peaks corresponding to cefuroxime and descarbamoyl-

cefuroxime. The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject reference solution (c) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak due to descarbamoyl-cefuroxime is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (3.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Bacterial endotoxins (2.2.3). Not more than 0.1 Endotoxin Unit per mg of cefuroxime.

Water (2.3.43). Not more than 3.5 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 10 containers. Dissolve a quantity of the mixed contents containing 25 mg of cefuroxime and dissolve in sufficient *water* to produce 25.0 ml. Immediately transfer 5.0 ml of the resulting solution to a 100-ml volumetric flask, add 20.0 ml of a 0.15 per cent w/v solution of *orcinol* (internal standard) in *water,* dilute to volume with *water* and mix.

Reference solution. Treat a quantity of *cefuroxime sodium IPRS* equivalent to 25 mg of cefuroxime in a similar manner.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with hexylsilane chemically bonded to totally porous silica particles (5 µm),
- mobile phase: a mixture of 91 volumes of *acetate buffer pH 3.4* and 9 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

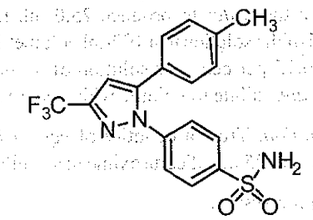
Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{16}N_4O_8S$ in the injection.

Storage. Store in tightly-closed containers protected from moisture at a temperature not exceeding 30°.

Labelling. The label on the sealed container states the quantity of Cefuroxime Sodium contained in it in terms of the equivalent amount of cefuroxime.

Celecoxib



$C_{17}H_{14}F_3N_3O_2S$ Mol. Wt. 381.4

Celecoxib is 4-[5-(4-methylphenyl)-3-(trifluoromethyl)-1*H*-pyrazol-1-yl]benzene sulphonamide.

Celecoxib contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{14}F_3N_3O_2S$, calculated on the anhydrous basis.

Category. Cyclo-oxygenase inhibitor, analgesic, antiinflamatory.

Description. A white or almost white, crystalline or amorphous powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *celecoxib IPRS* or with reference spectrum of celecoxib.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *water* and 75 volumes of *methanol*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *celecoxib IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.006 per cent w/v, each of, *celecoxib impurity A IPRS* and *celecoxib impurity B IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 25.0 ml with reference solution (a).

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),

- column temperature: 60°
- mobile phase: a mixture of 10 volumes of *acetonitrile*, 30 volumes of *methanol* and 60 volumes of buffer solution prepared by dissolving 2.7g *potassium dihydrogen phosphate* in 1000 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 25 µl.

Name	Relative retention time
Celecoxib impurity A[1]	0.9
Celecoxib (Retention time:about 27 minutes)	1.0
Celecoxib impurity B[2]	1.1

[1]4-[5-(3-methylphenyl)-3-(trifluoromethyl)-1*H*-pyrazol-1-yl] benzenesulphonamide,

[2]4-[3-(4-methylphenyl)-5-(trifluoromethyl)-1*H*-pyrazol-1-yl] benzenesulphonamide.

Inject reference solution (b). The test is not valid unless resolution between the peaks due to celecoxib impurity A and celecoxib is not less than 1.8 and the resolution between the peaks due to celecoxib impurity B and celecoxib is not less than 1.8.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to celecoxib impurity A is not more than 4 times the area of principal peak in the chromatogram obtained with reference solution (c) (0.4 per cent), the area of any other secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (c) (0.1per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area the area of principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.4 g.

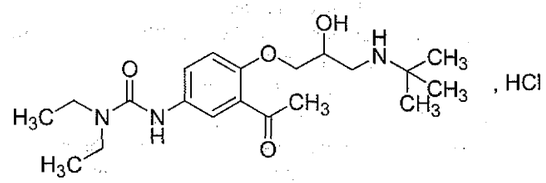
Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{14}F_3N_3O_2S$.

Storage. Store protected from moisture.

Celiprolol Hydrochloride



$C_{20}H_{33}N_3O_4.HCl$ Mol Wt. 416.0

Celiprolol Hydrochloride is (*RS*)-3-{3-Acetyl-4-[3-(*tert*.butylamino)-2-hydroxypropoxy]phenyl}-1,1-diethylurea hydrochloride.

Celiprolol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{20}H_{33}N_3O_4.HCl$ calculated on the dried basis.

Category. Antihypertensive.

Description. A white to very slightly yellow crystalline powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *celiprolol hydrochloride IPRS* or with the reference spectrum of celiprolol hydrochloride.

B. It gives reaction (a) of chlorides (2.3.1).

Tests

Optical rotation (2.4.22). – 0.1° to + 0.1°, determined on 10.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 100 mg of the substance under examination in 20.0 ml of mobile phase A.

Reference solution (a). A solution containing 0.004 per cent w/v, each of, the substance under examination and *acebutolol hydrochloride IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 91 ml of *tetrahydrofuran*, 63 ml of *acetonitrile*, 0.6 ml of *pentafluoropropanoic*

acid and 0.2 ml of *trifluoroacetic acid*, dilute to 1000 ml with *water*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
50	80	20
51	80	20
65	100	0

Name	Relative retention time	Correction factor
Celiprolol impurity A[1]	0.3	4.0
Celiprolol impurity D[2]	0.7	—
Celiprolol (Retention time: about 10 minutes)	1.0	—
Celiprolol impurity G[3]	1.2	—
Celiprolol impurity B[4]	1.4	1.5
Celiprolol impurity F[5]	1.6	0.5
Celiprolol impurity C[6]	2.2	—
Celiprolol impurity H[7]	2.5	—
Celiprolol impurity I[8]	2.5	1.7
Celiprolol impurity E[9]	3.9	2.3

[1]1-[5-amino-2-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]phenyl] ethanone,

[2]3-[3-acetyl-4-[(2*RS*)-3-(diethylamino)-2- hydroxypropoxy] phenyl]-1,1-diethylurea,

[3]3-[3-acetyl-4-[[(*RS*)-oxiranyl]methoxy]phenyl]-1,1-diethylurea,

[4]1,3-bis[3-acetyl-4-[3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy] phenyl]urea,

[5]3-(3-acetyl-4-hydroxyphenyl)-1,1-diethylurea,

[6]1-[3-acetyl-4-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxy-propoxy]phenyl]-3-(1,1-dimethylethyl) urea,

[7]3-[3- acetyl-4-[(2*RS*)-3-bromo-2- hydroxypropoxy]phenyl]-1,1-diethylurea,

[8]1-acetyl-1-(4-ethoxyphenyl)-3,3-diethylurea,

[9]1,1'-[[(1,1-dimethylethyl)imino]bis[(2-hydroxypropane-1,3-diyl)oxy(3-acetyl-1,4- phenylene)]]bis(3,3-diethylurea).

Inject reference solution (a). The test is not valid unless the resolution between the peak corresponding to celiprolol and acebutolol is not less than 4.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the area of not more than 1 such peak is more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 5 times area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hour.

Assay. Dissolve 0.35 g in 50.0 ml of *ethanol (95 per cent)* under nitrogen atmosphere, add 1 ml of *0.1 M hydrochloric acid* and titrate with *0.1 M sodium hydroxide* determining the end point potentiometrically (2.4.25). Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04160 g of $C_{20}H_{33}N_3O_4HCl$.

Storage. Store protected from light.

Celiprolol Tablets

Celiprolol Hydrochloride Tablets

Celiprolol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of celiprolol hydrochloride, $C_{20}H_{33}N_3O_4,HCl$.

Usual strengths. 100 mg; 200 mg; 400 mg.

Identification

Mix with the aid of ultrasound a quantity of the powdered tablets containing 200 mg of Celiprolol Hydrochloride with 100 ml of *dichloromethane* for 30 minutes, filter, remove the dichloromethane using a rotary evaporator and dry the residue over *phosphorus pentoxide* at 110° at a pressure not exceeding 2 kPa for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *celiprolol hydrochloride IPRS* or with the reference spectrum of celiprolol hydrochloride.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate, suitably with the dissolution medium and measure the absorbance at the maximum at about 231 nm (2.4.7).

Calculate the content of $C_{20}H_{33}N_3O_4$,HCl in the medium from the absorbance obtained from a solution of known concentration of *celiprolol hydrochloride IPRS*.

Q. Not less than 75 per cent of the stated amount $C_{20}H_{33}N_3O_4$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.1 g of Celiprolol Hydrochloride in 100.0 ml of the mobile phase with the aid of ultrasound for 15 minute, cool and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.1 per cent w/v of *celiprolol hydrochloride IPRS* in *water*, 5 drops of *5 M sodium hydroxide* and heat at 70° for 20 minutes (generates celiprolol impurity A).

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of 0.025 *M sodium dihydrogen phosphate monohydrate* adjusted to pH 3.0 with *3 M orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at: 233 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the peak due to celiprolol impurity A (3-acetyl-4-3-(1,1-dimethyl-ethylamino)-2-hydroxypropoxybutyranilide) is resolved from the solvent front.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to celiprolol impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of not more than one such peak has an area not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than a fifth of the area of the peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Celiprolol Hydrochloride in 100 ml of the mobile phase with the aid of ultrasound for 15 minutes, cool and filter. Dilute 1.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *celiprolol hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{33}N_3O_4$,HCl in the tablets.

Storage. Store protected from light.

Cellulose Acetate Phthalate

Cellacephate; Cellacefate

Cellulose Acetate Phthalate is a cellulose, some of the hydroxyl groups of which are esterified by acetyl groups and others by hydrogen phthaloyl groups.

Cellulose Acetate Phthalate contains not less than 17.0 per cent and not more than 26.0 per cent of acetyl groups, C_2H_3O and not less than 30.0 per cent and not more than 40.0 per cent of hydrogen phthaloyl groups, $C_8H_5O_3$ both calculated on the anhydrous, acid free basis.

Category. Pharmaceutical aid (for enteric coating of tablets).

Description. A white, free-flowing powder or colourless flakes; odourless or with a faint odour of acetic acid; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cellulose acetate phthalate IPRS* or with the reference spectrum of cellulose acetate phthalate.

B. To about 10 mg contained in a small test-tube add 10 mg of *resorcinol*, mix, add 0.5 ml of *sulphuric acid* and heat in a liquid paraffin bath at 160° for 3 minutes. Cool and pour the solution into a mixture of 25 ml of *sodium hydroxide solution* and 200 ml of *water*; the solution shows a vivid green fluorescence.

Tests

Viscosity (2.4.28). 50 mm^2s^{-1} to 90 mm^2s^{-1}, determined in the following manner. Weigh accurately about 15 g, previously dried at 105° for 2 hours, and dissolve in 85 g of a mixture of 249 parts of *dry acetone* and 1 part of *water*. Determine at 25° the viscosity of the resulting solution by Method A, using a size D viscometer.

Appearance of a film. Dissolve 3.0 g in 17 ml of *acetone* with a water content of 0.35 to 0.45 per cent w/w. Allow 1 ml of the solution to flow over a glass plate and dry; a thin, colourless, transparent and glossy film is produced.

Free acid. Not more than 3.0 per cent, calculated as phthalic acid, $C_8H_6O_4$, on the anhydrous basis and determined in the following manner. Weigh accurately 1.0 g, in fine powder, shake for 5 minutes with 100 ml of boiled *water* and filter. Wash the flask and the filter with two quantities, each of 10 ml, of *water*. Combine the filtrate and washings, add 5 drops of *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* until a faint pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0083 g of phthalic acid.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent, using 0.5 g dissolved in 20 ml of a mixture of equal volumes of *anhydrous methanol* and *chloroform*.

Assay. *For acetyl groups* — Weigh accurately about 0.1 g and heat on a water-bath for 30 minutes with 25.0 ml of *0.1 M sodium hydroxide* under reflux. Cool, add 5 drops of *phenolphthalein solution* and titrate with *0.1 M hydrochloric acid* until the colour is discharged. Carry out a blank titration. Calculate the acetyl groups, C_2H_3O, from the expression

$$0.43c/w-(0.578p+0.518s)$$

where, c = volume, in ml, of *0.1 M hydrochloric acid* consumed

w = weight, in g, of the sample, calculated with reference to anhydrous substance,

p = percentage of hydrogen phthaloyl groups as determined in Assay for hydrogen phthaloyl groups,

s = percentage of free acid.

For hydrogen phthaloyl groups — Weigh accurately about 0.4 g (calculated on the anhydrous basis) and dissolve without heating in 20 ml of *2-methoxyethanol*, previously neutralised in the presence of 5 drops of *phenolphthalein solution*. Titrate with *0.1 M sodium hydroxide* until a faint pink colour is produced. Calculate the hydrogen phthaloyl groups, $C_8H_5O_3$, from the expression

$$1.49b/w-1.795s$$

where, b = volume, in ml, of *0.1 M sodium hydroxide* consumed,

w = weight, in g, of the sample, calculated with reference to the anhydrous substance,

s = percentage of free acid.

Storage. Store protected from moisture at a temperature between 8° and 15°.

Hard Cellulose Capsule Shells

Hard Cellulose Capsule Shells are soluble containers for incorporation of drugs and/or medicaments, usually in the form of powders, pellets or granules, semisolids or liquids, and are commonly intended for oral administration. The shells are acted upon by digestive fluids and the filled contents are released. The shells are composed of Hydroxypropyl-methylcellulose or any other cellulose derivatives and water.

The capsule shell may contain gelling agents, gelling aids and other additives such as plasticizers, humectants, surfactants, dispersing agents, gliding agents, lubricating agents, flavouring agents, antimicrobial agents, sweetening agents, opacifying agents and one or more colouring agents permitted under the Drugs and Cosmetics Rules,1945.

Category. Pharmaceutical aid.

Description. Hard Cellulose Capsule Shells consist of two cylindrical, telescoping pieces (cap and body), one end of which is rounded and closed, and the other end is open. Shapes other than cylindrical can also be formed as per the requirements. The two pieces are coloured or uncoloured, of identical or different colours, transparent, translucent or opaque, and printed or unprinted or bear other surface markings. The cap overlaps the body and maintains a tight friction closure. The closure may be strengthened by suitable means.

The shells are of various sizes, usually designated by different numbers, 5 being the smallest and 000 the biggest. Shells of special lengths, shapes and designations are also available. The shells are smooth and uniform in size, shape and colour. Guidelines on dimensions in respect of different sizes of commonly used capsules are given in the table (5.8.2).

Identification

A. Add capsules, quantity equivalent to 1.0 g under constant stirring, into 50 ml of *carbon dioxide-free water* previously heated to 90°. Allow to cool, dilute to 100 ml with *carbon dioxide-free water* and continue stirring until solution is complete (solution A). If the capsules are not transparent, centrifuge the solution A & consider only supernatant liquid as solution A for further tests. Heat 10 ml of solution A in a water-bath with stirring. At temperatures above 50°, the solution becomes cloudy or a flocculent precipitate is formed. On cooling, the solution becomes clear or slightly opalescent.

B. To 10 ml of solution A add 10 ml of *1 M sodium hydroxide* or *1 M hydrochloric acid*; in either case the mixture remains stable.

C. To 10 ml of solution A add 0.3 ml of *2 M acetic acid* and 2.5 ml of a 10 per cent w/v solution of *tannic acid*; a yellowish white, flocculent precipitate is produced which dissolves in *6 M ammonia*.

D. Place 1 ml of solution A on a glass plate. After evaporation of the *water* a thin film is produced.

E. Without heating add 20 ml of solution A in 15 ml of a 70 per cent w/w solution of *sulphuric acid*, pour the solution with stirring into 80 ml of iced *water*. In a test-tube kept in ice, mix thoroughly 1 ml of the solution with 8 ml of *sulphuric acid*, added drop wise. Heat in a water-bath for exactly 3 minutes and cool immediately in ice. When the mixture is cool, carefully add 0.6 ml of a solution containing 3 g of *ninhydrin* in 100 ml of a 4.55 per cent w/v solution of *sodium metabisulphite*, mix well and allow to stand at 25°; a pink colour is produced immediately which becomes violet within 100 minutes.

F. Boil one capsule shell with 20 ml of *water*, allow to cool and centrifuge. To 5 ml of the supernatant liquid add 1 ml of *picric acid solution*; no precipitate is produced. Distinction from gelatin.

Tests

Odour. Keep 100 capsule shells in a well-closed bottle for 24 hours at a temperature between 30° and 40°; the shells do not develop any foreign odour.

NOTE — In order to ensure that the quality of the shells is not affected by temperature and humidity, the capsule shells should be conditioned at a temperature of 25° ± 2° and a relative humidity of 50 ± 5 per cent for not less than 12 hours before conducting the test for Average weight.

Average weight. Weigh 100 capsule shells and determine the average weight of a capsule. The average weight is within ± 10 per cent of the target weight shown in Table 1(Target weight for shells of special lengths, shapes and designations may be decided upon mutually between the manufacturer of the Hard cellulose Capsule Shells and the user).

Table 1-Average Weight of Hard Cellulose Capsule Shells

Size	Target average weight (mg)
000	163
00	123
0	98
1	78
2	64
3	50
4	40
5	28

Disintegration (2.5.1).Not more than 15 minutes, using discs.

Microbial contamination (2.2.9). Total microbial count not more than 1000 cfu per g, total yeast and mould count not more than 100 cfu per g, 1g is free from *Escherichia coli, Staphylococcus aureus, Pseudomonas aeruginosa* and 10g is free from *Salmonella* and *Shigella.*

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm) or determined by ICPMS (2.4.42)

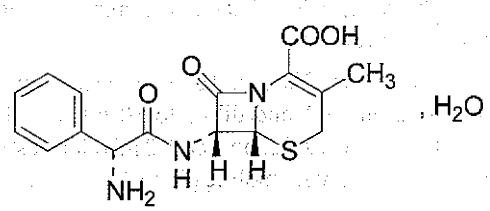
Arsenic (2.3.10). Dissolve 3.3 g of capsule shells in 20 ml of *carbon dioxide free water* and dilute to 50.0 ml with *carbon dioxide free water.* The resulting solution complies with the limit test for arsenic (3 ppm) or determined by ICPMS (2.4.42).

Loss on drying (2.4.19). 3.0 to 9.0 per cent, determined on 1g by drying in an oven at 105° for 4 hours or to constant weight.

Storage. Store protected from moisture at a temperature not exceeding 30°

Labelling The label states (1) the size of the capsule shells; (2) that only permitted colours, if any, have been used; (3) the storage conditions.

Cephalexin



$C_{16}H_{17}N_3O_4S,H_2O$ Mol. Wt. 365.4

Cephalexin is (7*R*)-3-methyl-7-(α-D-phenylglycylamino)-3-cephem-4-carboxylic acid monohydrate.

Cephalexin contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{16}H_{17}N_3O_4S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cephalexin IPRS* or with the reference spectrum of cephalexin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 0.5 per cent w/v solution.

Specific optical rotation (2.4.22). +149° to +158°, determined in a 0.5 per cent w/v solution in *phthalate buffer solution pH 4.4* and in a 2-dm tube.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *D-phenylglycine* in mobile phase A and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *7-amino-desacetoxycephalosporanic acid IPRS* in *phosphate buffer solution pH 7.0* and dilute to 10.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml , each of, reference solution (a) and reference solution (b) to 100.0 ml with mobile phase A.

Reference solution (d). Dissolve 10 mg of *dimethylformamide* and 10 mg of *dimethylacetamide* in mobile phase A and dilute to 10 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with mobile phase A.

Reference solution (e). Dilute 1.0 ml of reference solution (c) to 20.0 ml with mobile phase A.

Reference solution (f). Dissolve 10 mg of *cefotaxime sodium IPRS* in mobile phase A and dilute to 10 ml with the same solvent. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *phosphate buffer solution pH 5.0*, B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
1	98	2
20	70	30
23	98	2
30	98	2

Inject reference solution (c) and (f). In the chromatogram obtained with reference solution (c), the resolution between the peaks due to D-phenylglycine and 7-aminodesacetoxy-cephalosporanic acid is not less than 2.0 and in the chromatogram obtained with reference solution (f) the resolution between the peaks due to cephalexin and cefotaxime is not less than 1.5.

Inject reference solution (c), (d), (e) and the test solution . In the chromatogram obtained with the test solution the area of peak corresponding to D-phenylglycine is not more than the area of the first peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peaks due to dimethylformamide and dimethylacetamide, the area of any other secondary peak is not more than the area of the first peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the sum of the secondary peaks is not more than the three times the area of the first peak in the chromatogram obtained with reference solution (c). Ignore any peak with an area less than the second peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 4.0 to 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *cephalexin monohydrate IPRS* in *water* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *cephradine IPRS* in 20 ml of reference solution (a) and dilute to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 13.6 g per litre solution of *potassium dihydrogen phosphate* and 83 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). In the chromatogram obtained, the resolution between the peaks due to cephalexin and cephradine is not less than 4.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_4S$.

Storage. Store protected from light at a temperature not exceeding 30°.

Cephalexin Capsules

Cephalexin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous cephalexin, $C_{16}H_{17}N_3O_4S$.

Usual strengths. 250 mg; 500 mg.

Identification

Shake a quantity of the contents of the capsules containing 0.5 g of anhydrous cephalexin with 1 ml of *water* and 1.4 ml of *1 M hydrochloric acid*, filter and wash the filter with 1 ml of *water*. Add slowly to the filtrate a saturated solution of *sodium acetate* until precipitation occurs. Add 5 ml of *methanol*, filter and wash the precipitate with two quantities, each of 1 ml, of *methanol*. The residue after drying at a pressure not exceeding 0.7 kPa complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cephalexin IPRS* or with the reference spectrum of cephalexin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water* freshly prepared by distillation,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *water*. Measure the absorbance of the resulting solution at the maximum at about 261 nm (2.4.7). Calculate the content of $C_{16}H_{17}N_3O_4S$ taking 235 as the specific absorbance at 261 nm.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{17}N_3O_4S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF* (such as Analtech plates). Impregnate the plate by development with a 5 per cent v/v solution of *n-tetradecane* in *hexane*. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation.

Mobile phase. A mixture of 3 volumes of *acetone*, 80 volumes of a 7.2 per cent w/v solution of *disodium hydrogen orthophosphate* and 120 volumes of a 2.1 per cent w/v solution of *citric acid*.

Test solution. Shake a quantity of the contents of the capsules containing about 0.25 g of anhydrous cephalexin with 10 ml of *2 M hydrochloric acid*, filter and use the filtrate.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *2 M hydrochloric acid*.

Reference solution (b). A 0.025 per cent w/v solution of *7-amino-desacetoxycephalosporanic acid IPRS* in *2 M hydrochloric acid*.

Reference solution (c). A 0.025 per cent w/v solution of *DL-phenylglycine* in *2 M hydrochloric acid*.

Reference solution (d). A solution containing 2.5 per cent w/v of *cephalexin IPRS* and 0.025 per cent w/v, each of, *7-amino-desacetoxycephalosporanic acid IPRS* and *DL-phenylglycine* in *2 M hydrochloric acid*.

Apply to the plate 5 µl of each solutions. After development, dry the plate at 90° for 3 minutes, spray the hot plate with a 0.1 per cent w/v solution of *ninhydrin* in the mobile phase, heat the plate at 90° for 15 minutes and allow to cool. In the chromatogram obtained with the test solution any spot corresponding to 7-aminodesacetoxy-cephalosporanic acid is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent), any spot corresponding to *DL-phenylglycine* is not more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows three clearly separated spots.

Water (2.3.43). Not more than 10.0 per cent, determined on 0.3 g of the contents of the capsules.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered mixed contents of 20 capsules containing about 0.25 g of anhydrous cephalexin with 100.0 ml of *water* for 30 minutes, add sufficient amount of *water* to produce 250.0 ml and filter. Dilute 25.0 ml of the filtrate to 50.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *cephalexin IPRS* in *water*.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *cephalexin IPRS* and *cephradine IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C 18),
- mobile phase: a mixture of 2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 13.6 g per litre solution of *potassium dihydrogen phosphate* and 83 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to cephalexin and cephradine is at least 4.0.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_4S$ in the capsules.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous cephalexin.

Cephalexin Oral Suspension

Cephalexin Dry Syrup; Cephalexin Mixture

Cephalexin Oral Suspension is a mixture of Cephalexin with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Cephalexin Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of $C_{16}H_{17}N_3O_4S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cephalexin, $C_{16}H_{17}N_3O_4S$.

Usual strengths. 125 mg; 250 mg of anhydrous cephalexin per 5 ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

B. Weigh a quantity containing 0.1 g of anhydrous cephalexin, shake with 20 ml of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in the minimum volume of a 1 per cent v/v solution of *glacial acetic acid*, decolorise if necessary by the addition of sufficient *decolorising charcoal*, shake and filter. To 0.25 ml of the resulting solution add 0.1 ml of a 1 per cent w/v solution of *cupric sulphate* and 0.05 ml of *2 M sodium hydroxide*; an olive-green colour is produced.

Tests

Other tests. Comply with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake an accurately weighed quantity of the oral suspension containing about 0.25 g of anhydrous cephalexin with 100.0 ml of *water* for 30 minutes, add sufficient of *water* to produce 250.0 ml and filter. Dilute 25.0 ml of the filtrate to 50.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *cephalexin IPRS* in *water*.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *cephalexin IPRS* and *cephradine IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C 18),
- mobile phase: a mixture of 2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 13.6 g per litre solution of *potassium dihydrogen phosphate* and 83 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to cephalexin and cephradine is at least 4.0.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{16}H_{17}N_3O_4S$, weight in volume.

Repeat the procedure using a portion of the suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous cephalexin.

Cephalexin Tablets

Cephalexin Tablets contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of anhydrous cephalexin, $C_{16}H_{17}N_3O_4S$.

Usual strengths. 250 mg; 500 mg.

Identification

Remove any coating. Shake a quantity of the powdered tablet cores containing 0.5 g of anhydrous cephalexin with 1 ml of *water* and 1.4 ml of *1 M hydrochloric acid*, add 0.1 g of *decolorising charcoal*, shake, filter and wash the filter with 1 ml of *water*. Add slowly to the filtrate a saturated solution of *sodium acetate* until precipitation occurs. Add 5 ml of *methanol*, filter and wash the precipitate with two quantities, each of 1 ml, of *methanol*. The residue, after drying at a pressure not exceeding 0.7 kPa, complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cephalexin IPRS* or with the reference spectrum of cephalexin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water* freshly prepared by distillation,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *water*. Measure the absorbance of the resulting solution at the maximum at about 261 nm (2.4.7). Calculate the content of $C_{16}H_{17}N_3O_4S$ taking 235 as the specific absorbance at 261 nm.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{17}N_3O_4S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF*. Impregnate the plate by development with a 5 per cent v/v solution of *n-tetradecane* in hexane. Allow the solvent to evaporate and carry out the chromatography in the same direction as the impregnation.

Mobile phase. A mixture of 3 volumes of *acetone*, 80 volumes of a 7.2 per cent w/v solution of *disodium hydrogen orthophosphate* and 120 volumes of a 2.1 per cent w/v solution of *citric acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.25 g of anhydrous cephalexin with 10 ml of *2 M hydrochloric acid*, filter and use the filtrate.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *2 M hydrochloric acid*.

Reference solution (b). A 0.025 per cent w/v solution of *7-aminodesacetoxycephalosporanic acid IPRS* in *2 M hydrochloric acid*.

Reference solution (c). A 0.025 per cent w/v solution of DL-*phenylglycine* in *2 M hydrochloric acid*.

Reference solution (d). A solution containing 2.5 per cent w/v of *cephalexin IPRS* and 0.025 per cent w/v, each of, *7-amino-desacetoxycephalosporanic acid IPRS* and DL-*phenylglycine* in *2 M hydrochloric acid*.

Apply separately to the plate 5 µl of each solution. After development, dry the plate at 90° for 3 minutes, spray the hot plate with a 0.1 per cent w/v solution of *ninhydrin* in the mobile phase, heat the plate at 90° for 15 minutes and allow to cool. In the chromatogram obtained with the test solution any spot corresponding to 7-aminodesacetoxycephalosporanic acid is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent), any spot corresponding to DL-*phenylglycine* is not more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows three clearly separated spots.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.25 g of anhydrous cephalexin with 100.0 ml of *water* for 30 minutes, add sufficient amount of

water to produce 250.0 ml and filter. Dilute 25.0 ml of the filtrate to 50.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *cephalexin IPRS* in *water*.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *cephalexin IPRS* and *cephradine IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C 18),
- mobile phase: a mixture of 2 volumes of *methanol*, 5 volumes of *acetonitrile*, 10 volumes of a 13.6 g per litre solution of *potassium dihydrogen phosphate* and 83 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to cephalexin and cephradine is at least 4.0.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

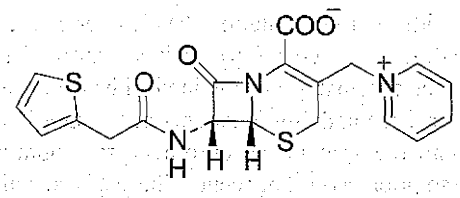
Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{17}N_3O_4S$ in the tablets.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous cephalexin. If the tablets are dispersible, the label also states that the tablets should be dispersed in water immediately before use.

Cephaloridine



$C_{19}H_{17}N_3O_4S_2$ Mol. Wt. 415.5

Cephaloridine is (7*R*)-3-(1-pyridiniomethyl)-7-[(2-thienyl)-acetamido]-3-cephem-4-carboxylate (α-form or δ -form).

Cephaloridine contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{19}H_{17}N_3O_4S_2$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cephaloridine (α-form) IPRS* or *cephaloridine (δ-form) IPRS* or with the reference spectrum of cephaloridine (α-form) *or* cephaloridine (δ -form).

B. Mix 20 mg with a few drops of an 80 per cent v/v solution of *sulphuric acid* containing 1 per cent v/v of *nitric acid;* a bluish-green colour is produced.

C. To a 0.5 per cent w/v solution add 1 ml of *chloramine solution* and 2 ml of *0.1 M sodium hydroxide*; a dull red colour is produced which persists for 1 minute.

D. It gives the reactions of penicillins and cephalosporins (2.3.1).

Tests

Appearance of solution (2.4.1). Solution A is clear.

pH (2.4.24). 4.0 to 6.0, determined in a 10.0 per cent w/v solution (solution A) prepared by dissolving in *carbon dioxide-free water,* warming to 30° and cooling to 20°.

Specific optical rotation (2.4.22). +46.0° to +50.0°, determined at 25° in a 1.0 per cent w/v solution.

Light absorption. When examined in the range 230 nm to 360 nm (2.4.7) a 0.0012 per cent w/v solution shows absorption maxima at about 240 nm and 255 nm; absorbance at the maximum at about 240 nm, 0.43 to 0.48. The ratio of the absorbance at the maximum at about 240 nm to that at about 255 nm is not more than 1.10.

Pyridine. Dissolve about 25 mg in 10 ml of *water* and add 2.5 ml of a buffer solution prepared by adjusting a 5 per cent w/v solution of *disodium hydrogen phosphate* to pH 6.0 with *phosphoric acid* and adding 1 per cent v/v of *aniline*. Add 1.25 ml of a solution prepared by decolorising a 0.5 per cent v/v solution of *bromine* with *potassium cyanide solution*, shaking and allowing to stand for 2 minutes, and sufficient *water* to produce 25 ml and allow to stand for 25 minutes. Measure the absorbance of the resulting solution at the maximum at about 462 nm, using as the blank a solution prepared in a similar manner but omitting the substance under examination (2.4.7). The absorbance is not more than that of a solution prepared by treating 2.5 ml of a 0.005 per cent w/v solution of *pyridine* in a similar manner.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent w/w (α-form) and not more than 3.0 per cent w/w (δ-form), determined on 0.25 g. Use as the solvent a mixture of equal volumes of dehydrated methanol and dehydrated pyridine in place of methanol.

Assay. Weigh accurately about 60 mg and dissolve in sufficient *water* to produce 50.0 ml. Transfer 10.0 ml to a stoppered flask, add 5 ml of *1 M sodium hydroxide* and allow to stand for 20 minutes. Add 20 ml of a buffer solution containing 35.0 per cent w/v of *sodium acetate* and 42.4 per cent v/v of *glacial acetic acid*, 5 ml of *1 M hydrochloric acid* and 25.0 ml of *0.01 M iodine*, close the flask with a wet stopper and allow to stand for 3 hours in a water-bath at 30°, protected from light. Titrate the excess of iodine with *0.02 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. To a further 10.0 ml of the solution add 20 ml of the buffer solution and 25.0 ml of *0.01 M iodine*, allow to stand for 3 hours in a water-bath at 30°, protected from light. Titrate the excess of iodine with *0.02 M sodium thiosulphate* using *starch* solution, added towards the end of the titration, as indicator. The difference between the titrations represents the volume of *0.01 M iodine* equivalent to the cephaloridine present. Calculate the content of $C_{19}H_{17}N_3O_4S_2$ from the difference obtained by simultaneously carrying out the Assay using *cephaloridine (δ-form) IPRS* instead of the substance under examination.

Cephaloridine intended for use in the manufacture of parenteral preparations complies with the following additional tests.

Pyrogens. Complies with the test for pyrogens (2.2.8), using not less than 50 mg per kg of the rabbit's weight, dissolved in 1 ml of Water for injections.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture in a refrigerator (8° to 15°). If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states (1) whether the contents are Cephaloridine (α-form) or Cephaloridine (δ-form); (2) whether or not it is intended for use in the manufacture of injectable preparations.

Cephaloridine Injection

Cephaloridine Injection is a sterile material consisting of Cephaloridine with or without auxiliary substances. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of Water for Injections immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cephaloridine Injection contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of anhydrous cephaloridine, $C_{19}H_{17}N_3O_4S_2$.

Usual strengths. 250 mg; 500 mg; 1 g.

Description. A white or almost white, crystalline powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cephaloridine (α-form) IPRS* or *cephaloridine (δ-form) IPRS* or with the reference spectrum of cephaloridine (α-form) or cephaloridine (δ-form).

B. Mix 20 mg with a few drops of an 80 per cent v/v solution of *sulphuric acid* containing 1 per cent v/v of *nitric acid;* a bluish-green colour is produced.

C. To a 0.5 per cent w/v solution add 1 ml of *chloramine solution* and 2 ml of *0.1 M sodium hydroxide*; a dull red colour is produced which persists for 1 minute.

D. It gives the reactions of penicillins and cephalosporins (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1).

pH (2.4.24). 4.0 to 6.0, determined in a 10.0 per cent w/v solution (solution A) prepared by dissolving in *carbon dioxide-free water,* warming to 30° and cooling to 20°.

Specific optical rotation (2.4.22). +46.0° to +50.0°, determined at 25° in a 1.0 per cent w/v solution.

Light absorption. When examined in the range 230 nm to 360 nm (2.4.7) a 0.0012 per cent w/v solution shows absorption maxima at about 240 nm and 255 nm; absorbance at the maximum at about 240 nm, 0.43 to 0.48. The ratio of the absorbance at the maximum at about 240 nm to that at about 255 nm is not more than 1.10.

Pyridine. Dissolve about 25 mg in 10 ml of *water* and add 2.5 ml of a buffer solution prepared by adjusting a 5 per cent w/v solution of *disodium hydrogen phosphate* to pH 6.0 with *phosphoric acid* and adding 1 per cent v/v of *aniline*. Add 1.25 ml of a solution prepared by decolorising a 0.5 per cent v/v solution of *bromine* with *potassium cyanide solution*, shaking and allowing to stand for 2 minutes, and sufficient *water* to produce 25 ml and allow to stand for 25 minutes. Measure the absorbance of the resulting solution at the maximum at about 462 nm, using as the blank a solution

prepared in a similar manner but omitting the substance under examination (2.4.7). The absorbance is not more than that of a solution prepared by treating 2.5 ml of a 0.005 per cent w/v solution of *pyridine* in a similar manner.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent w/w (α-form) and not more than 3.0 per cent w/w (δ-form), determined on 0.25 g. Use as the solvent a mixture of equal volumes of *dehydrated methanol* and dehydrated pyridine in place of *methanol*.

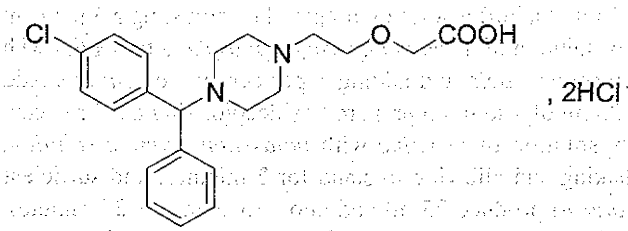
Assay. Determine the weight of the contents of 10 containers Weigh accurately a quantity of the mixed contents of the 10 containers containing about 60 mg of cephaloridine and dissolve in sufficient *water* to produce 50.0 ml. Transfer 10.0 ml to a stoppered flask, add 5 ml of *1 M sodium hydroxide* and allow to stand for 20 minutes. Add 20 ml of a buffer solution containing 35.0 per cent w/v of *sodium acetate* and 42.4 per cent v/v of *glacial acetic acid*, 5 ml of *1 M hydrochloric acid* and 25.0 ml of *0.01 M iodine*, close the flask with a wet stopper and allow to stand for 3 hours in a water-bath at 30°, protected from light. Titrate the excess of iodine with *0.02 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. To a further 10.0 ml of the solution add 20 ml of the buffer solution and 25.0 ml of *0.01 M iodine*, allow to stand for 3 hours in a water-bath at 30°, protected from light. Titrate the excess of iodine with *0.02 M sodium thiosulphate* using *starch* solution, added towards the end of the titration, as indicator. The difference between the titrations represents the volume of *0.01 M iodine* equivalent to the cephaloridine present. Calculate the content of $C_{19}H_{17}N_3O_4S_2$ from the difference obtained by simultaneously carrying out the Assay using *cephaloridine (δ-form) IPRS* instead of the substance under examination.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the weight of Cephaloridine contained in the sealed container; (2) whether the contents are Cephaloridine (α-form) or Cephaloridine (δ-form).

Cetirizine Hydrochloride

Cetirizine Dihydrochloride



$C_{21}H_{25}ClN_2O_3,2HCl$ Mol. Wt. 461.8

Cetirizine Hydrochloride is [2-[4-[(4-chlorophenyl) phenylmethyl]-1-piperazinyl]ethoxy]acetic acid dihydrochloride.

Cetirizine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{25}ClN_2O_3,2HCl$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white or almost white powder.

Identification

Test B and C may be omitted if tests A and D are carried out. Tests A may be omitted if test B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cetirizine hydrochloride IPRS* or with the reference spectrum of cetirizine hydrochloride.

B. Dissolve 20.0 mg in 50 ml of a 1.03 per cent w/v solution of *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with the acid.

When examined in the range 210 nm to 350 nm (2.4.7), the resulting solution shows an absorption maximum at about 231 nm. The specific absorbance at 231 nm is 359 to 381.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *ammonia, 10* volumes of *methanol* and 90 volumes of *dichloromethane*.

Test solution. Dissolve 10 mg of the substance under examination in *water* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *cetirizine hydrochloride IPRS* in *water* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *chlorphenamine maleate IPRS* in *water* and dilute to 5.0 ml with the same solvent. To 1 ml of the solution add 1 ml of reference solution (a).

Apply to the plate 5 µl of each solution. After development, dry in a current of cold air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 1.2 to 1.8, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A solution containing 0.02 per cent w/v, each of, *cetirizine dihydrochloride IPRS* and *(RS)-1-[(4-chlorophenyl)phenylmethyl]piperazine IPRS (cetirizine impurity A)* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: a mixture of 0.4 volume of *dilute sulphuric acid,* 6.6 volumes of *water* and 93 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm.
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cetirizine and impurity A is not less than 2 and the tailing factor is not more than 2.0 for cetirizine peak.

Inject reference solution (b) and the test solution. Run the chromatogram for 3 times the retention time of cetirizine. In the chromatogram obtained with the test solution, the area of any impurity peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all such peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° to 105°.

Assay. Weigh accurately about 0.1 g, dissolve in 70 ml of a mixture of 30 volumes of *water* and 70 volumes of *acetone.* Titrate with *0.1 M sodium hydroxide* to the second point of inflexion. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01539 g of $C_{21}H_{27}Cl_3N_2O_3$.

Storage. Store protected from light.

Cetirizine Syrup

Cetirizine Oral Liquid

Cetirizine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cetirizine hydrochloride $C_{21}H_{25}ClN_2O_3,2HCl$.

Usual strength. 5 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 5.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile.*

Test solution. Weigh accurately a quantity of the syrup containing 5 mg of Cetirizine Hydrochloride, dissolve in 100.0 ml of the solvent mixture and filter.

Reference solution. A 0.005 per cent w/v solution of *cetirizine dihydrochloride IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *0.0025 M 1-heptane sulphonic acid* prepared by dissolving 0.55 g of *1-heptane sulphonic acid sodium* in 1000 ml of *water,* adjusted to pH 3.5 with *0.1 M sulphuric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml (2.4.29) of the syrup and calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$, weight in volume.

Storage. Store protected from light, at a temperature not exceeding 30°.

Cetirizine Tablets

Cetirizine Hydrochloride Tablets

Cetirizine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cetirizine hydrochloride, $C_{21}H_{25}ClN_2O_3,2HCl$.

Usual strengths. 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 230 nm (2.4.7). Calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$ in the medium from the absorbance obtained from a solution of known concentration of *cetirizine hydrochloride IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{25}ClN_2O_3,2HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Cetirizine Hydrochloride, add 50 ml of the mobile phase, mix and dilute to 100 ml with the mobile phase.

Reference solution (a). A solution containing 0.02 per cent w/v, each of, *cetirizine hydrochloride IPRS* and *(RS)-1-[(4-chlorophenyl)phenylmethyl]piperazine IPRS (cetirizine impurity A)* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: a mixture of 0.4 volume of *dilute sulphuric acid,* 6.6 volumes of *water* and 93 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cetirizine and cetirizine impurity A is not less than 2.0 and the tailing factor is not more than 2.0 for cetirizine peak.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of cetirizine. In the chromatogram obtained with the test solution the area of any impurity peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all such peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 tablet in the mobile phase, mix and dilute to 100.0 ml with the mobile phase, filter. Dilute 5.0 ml of the solution to 10.0 ml with mobile phase.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Cetirizine Hydrochloride, add the mobile phase, mix and dilute to 50.0 ml with the mobile phase, filter. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. A 0.05 per cent w/v solution of *cetirizine hydrochloride IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: dissolve 0.19 g of *heptane sulphonic acid sodium salt* in 300 ml *water* add 700 ml *acetonitrile* and mix. Adjust pH to 3.2 with *0.05 M sulphuric acid*, filter,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{25}ClN_2O_3,2HCl$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Cetostearyl Alcohol

Cetostearyl Alcohol is a mixture of solid aliphatic alcohols consisting chiefly of stearyl and cetyl alcohols.

Cetostearyl Alcohol contains not less than 40.0 per cent of stearyl alcohol and sum of stearyl alcohol and cetyl alcohol is not less than 90.0 per cent.

Category. Pharmaceutical aid (ointment base).

Description. A white or pale yellow, wax like mass, plates, flakes or granules.

Identification

In the Assay, the two principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Melting range (2.4.21). 47° to 56°, determined by Method II. Introduce the substance under examination into the capillary tubes and allow to stand at 2° to 8° for 12 hours before carrying out the determination.

Appearance of solution. Dissolve 0.5 g in 20 ml of boiling *ethanol (95 per cent)*. The solution is clear (2.4.1) and not more intensely coloured than reference solution BS6 (2.4.1).

Acid value (2.3.23). Not more than 1.0.

Hydroxyl value (2.3.27). 208 to 228.

Saponification value (2.3.37). Not more than 2.0.

Iodine value (2.3.28). Not more than 3.0, determined by Method B in a 8.0 per cent w/v solution in *chloroform*.

Hydrocarbons. Dissolve 2.0 g in 100 ml of *light petroleum (40° to 60°)*, warming slightly if necessary, and transfer the solution to a column (25 cm x 10 mm) of *anhydrous alumina* which has been slurried with *light petroleum (40° to 60°)*. Elute with two portions, each of 50 ml, of *light petroleum (40° to 60°)* into a flask, remove the light petroleum and dry at 80°; the residue weighs not more than 30 mg.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of the *ethanol (95 per cent)*.

Reference solution. A solution containing 0.6 per cent w/v of *cetyl alcohol IPRS* and 0.4 per cent w/v of *stearyl alcohol IPRS* in *ethanol (95 per cent)*. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Chromatographic system

- a capillary column 30 m x 0.32 mm packed with poly(dimethyl)siloxane (1 µm),
- temperature:

column	time (min)	temperature (°)
	0-20	150-250
	20-40	250

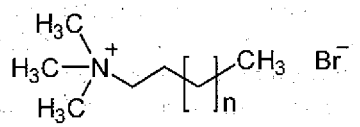
- Inlet port and detector at 250°,
- flame ionization detector,
- flow rate: 1ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to cetyl alcohol and stearyl alcohol is not less than 5.0.

Inject the test solution.

Calculate the content of cetyl alcohol, $C_{16}H_{34}O$ and stearyl alcohol, $C_{18}H_{38}O$ by area normalisation.

Cetrimide



Cetrimide consists of trimethyltetradecylammonium bromide (n = 11) with small amounts of trimethylhexadecylammonium bromide (n = 13) and trimethyldodecylammonium bromide (n = 9).

Cetrimide contains not less than 96.0 per cent and not more than 101.0 per cent of alkyltrimethylammonium bromides, calculated as $C_{17}H_{38}BrN$ (336.4) on the dried basis.

Category. Pharmaceutical aid; bactericide.

Description. A white or creamy-white, voluminous, free-flowing powder.

Identification

A. To 10 ml of a 1 per cent w/v solution add 2 ml of *potassium ferricyanide solution*; a yellow precipitate is produced.

B. To 10 ml of a 1 per cent w/v solution add 2 ml of a 10 per cent w/v solution of *sodium silicate*; a white flocculent precipitate is produced.

C. To 10 ml of a 1 per cent w/v solution add 2 ml of *dilute nitric acid*; a yellow precipitate is produced. Filter and to the filtrate add 2 ml of *dilute nitric acid* and 1 ml of *silver nitrate solution*; a yellow precipitate is produced.

D. Dissolve 0.25 g in sufficient *ethanol (95 per cent)* to produce 25 ml. Absorbance of the resulting solution between 260 nm and 280 nm (2.4.7) is not more than 0.05.

Tests

Appearance of solution. A 2.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. Dissolve 1.0 g in 50 ml of *water* and add 2 drops of *bromocresol purple solution*. Not more than 0.1 ml of either *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the solution.

Amine salts. Carry out the Assay described below using a further 25.0 ml of the original solution and 10 ml of *0.1 M hydrochloric acid* instead of the *0.1 M sodium hydroxide*. The difference between the volume of *0.05 M potassium iodate* required in the titration and that required in the Assay is not more than 1.0 ml for each g of the substance used.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh accurately about 2.0 g and dissolve in sufficient *water* to produce 100.0 ml. Transfer 25.0 ml of the solution to a separator, add 25 ml of *chloroform*, 10 ml of *0.1 M sodium hydroxide* and 10.0 ml of a freshly prepared 5.0 per cent w/v solution of *potassium iodide*. Shake well, allow to separate, and discard the chloroform layer. Shake the aqueous solution with three quantities, each of 10 ml, of *chloroform* and discard the *chloroform solution*. Add 40 ml of *hydrochloric acid*, allow to cool and titrate with *0.05 M potassium iodate* until the deep brown colour is almost discharged. Add 2 ml of *chloroform* and continue the titration, with shaking, until the chloroform layer no longer changes colour. Carry out a blank titration on a mixture of 20 ml of *water*, 10.0 ml of the freshly prepared *potassium iodide solution* and 40 ml of *hydrochloric acid*. The difference between the titrations represents the amount of potassium iodate required.

1 ml of *0.05 M potassium iodate* is equivalent to 0.03364 g of $C_{17}H_{38}BrN$.

Cetrimide Cream

Cetrimide	5 g
Cetostearyl Alcohol	50 g
Liquid Paraffin	500 g
Purified Water	1000 g

Melt the Cetostearyl Alcohol and heat with the Liquid Paraffin to about 60°. Dissolve the Cetrimide in sufficient Purified Water to produce about 450 g. Add the aqueous solution to the oily phase when both are at about 60° and mix. Stir gently until cool, add sufficient of the Purified Water to produce 1000 g and mix.

Cetrimide Cream contains not less than 88.0 per cent and not more than 106.0 per cent w/w of the stated amount of cetrimide, $C_{17}H_{38}BrN$.

Identification

Mix 1 g with 50 ml of *water*. The diluted cream complies with the following tests:

A. To 10 ml, add 2 ml of *potassium ferricyanide* solution; a yellow precipitate is produced.

B. Shake 3 ml of *water* with 1 ml of *1 M sulphuric acid*, 2 ml of *chloroform* and 0.5 ml of *methyl orange solution*. Add 2 ml of the diluted cream shake and allow to separate; a yellow colour develops in the chloroform layer.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Weigh a quantity of the cream containing 5 mg of Cetrimide add 10 ml of hot *water* and shake gently until dispersed. Add 5 ml of *1 M sulphuric acid*, 20 ml of *chloroform* and 0.25 ml of *dimethyl yellow solution* and titrate with *0.001 M dioctyl sodium sulphosuccinate*.

1 ml of *0.001 M dioctyl sodium sulphosuccinate* is equivalent to 0.0003364 g of $C_{17}H_{38}BrN$.

Labelling. The label states the strength as the percentage w/w of Cetrimide.

Cetrimide Emulsifying Ointment

Cetrimide Emulsifying Ointment is an ointment containing cetrimide in a suitable base.

Cetrimide Emulsifying Ointment contains not less than 2.5 per cent and not more than 3.3 per cent w/w of the stated amount of cetrimide, $C_{17}H_{38}BrN$.

Tests

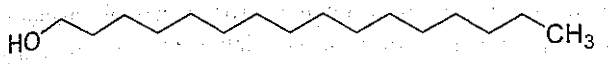
Other tests. Comply with the tests stated under Ointments.

Assay. To 0.3 g in a stoppered cylinder, add 10 ml of hot *water* and shake until the solid is dispersed. Add 5 ml of *1 M sulphuric acid*, 20 ml of *chloroform* and 1 ml of *dimethyl yellow and oracet blue B solution* and titrate with *0.001 M sodium dodecyl sulphate*.

1 ml of *0.001 M sodium dodecyl sulphate* is equivalent to 0.3364 mg of $C_{17}H_{38}BrN$.

Cetyl Alcohol

Palmityl Alcohol; *n*-Hexadecyl Alcohol; 1-Hexadecanol



Cetyl Alcohol is a mixture of solid alcohols consisting mainly of 1-hexadecanol, $C_{16}H_{34}O$.

Cetyl Alcohol contains not less than 95.0 per cent of $C_{16}H_{34}O$.

Category. Pharmaceutical aid (stiffening, emulsifying and tablet coating agent).

Description. A white, unctuous mass, powder, flakes or granules.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

Tests

Melting range (2.4.21). 46° to 52°, determined by Method II. Introduce the substance under examination into the capillary tubes and allow to stand at 2° to 8° for 12 hours before carrying out the determination.

Appearance of solution. Dissolve 0.5 g in boiling *ethanol (95 per cent)*, cool and dilute to 20 ml with the same solvent. The resulting solution is clear (2.4.1) and not more intensely coloured than reference solution BS6 (2.4.1).

Acid value (2.3.23). Not more than 1.0.

Hydroxyl value (2.3.27). 218 to 238.

Saponification value (2.3.37). Not more than 2.0.

Iodine value (2.3.28). Not more than 2.0, determined by Method B in a 8.0 per cent w/v solution in *chloroform*.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of the *ethanol (95 per cent)*.

Reference solution (a). Dissolve 50 mg of *cetyl alcohol IPRS* in 5.0 ml of the *ethanol (95 per cent)*.

Reference solution (b). Dissolve 50 mg of *stearyl alcohol IPRS* in 10.0 ml of the *ethanol (95 per cent)*.

Reference solution (c). Mix 1.0 ml, each of, reference solution (a) and (b) and dilute to 10.0 with the *ethanol (95 per cent)*.

Chromatographic system

- a capillary column 30 m x 0.32 mm packed with poly(dimethyl)siloxane (1 µm),
- temperature:

column	time (min)	temperature (°)
	0 - 20	150 - 250
	20 - 40	250

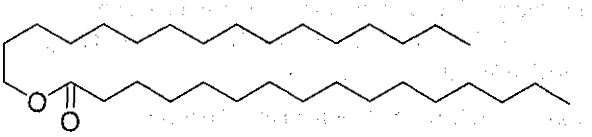
- inlet port and detector at 250°,
- flame ionization detector,
- flow rate: 1 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of reference solution (c). The test is not valid unless the resolution between the peaks due to cetyl alcohol and stearyl alcohol is not less than 5.0.

Inject reference solution (a) and the test solution.

Calculate the content of cetyl alcohol, $C_{16}H_{34}O$.

Cetyl Palmitate



$C_{32}H_{64}O_2$ Mol. Wt. 480.9

Cetyl Palmitate is hexadecyl palmitate.

Cetyl Palmitate is a mixture of C_{14} to C_{18} esters of lauric acid (dodecanoic), myristic acid (tetradecanoic), palmitic acid (hexadecanoic) and stearic acid (octadecanoic) (Cetyl esters wax).

Cetyl Palmitate contains not less than 10.0 per cent and not more than 20.0 per cent for cetyl palmitate 15; not less than 60.0 per cent and more than 70.0 per cent for cetyl palmitate 65 and not less than 90.0 per cent for Cetyl palmitate 95.

Category. Pharmaceutical aid.

Description. A white or almost white, waxy plates, flakes or powder.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a) and (b).

Tests

Appearance of solution. A 20.0 per cent w/v solution in *dichloromethane*, is not more intensely coloured than reference solution YS6 (2.4.1).

Melting point (2.4.21). About 45° for Cetyl palmitate 15 and Cetyl palmitate 65 and about 52° for Cetyl palmitate 95.

Acid value (2.3.23). Not more than 4.0. Dissolve 10 g in 50 ml of the solvent mixture described by heating under reflux on a water-bath for 5 minutes.

Hydroxyl value (2.3.27). Not more than 20.

Saponification value (2.3.37). 105 to 120. Heat under reflux for 2 hours.

Iodine value (2.3.28). Not more than 2.0.

Alkaline substances. Dissolve 2.0 g with gentle heating in a mixture of 1.5 ml of *ethanol (95 per cent)* and 3 ml of *toluene*. Add 0.05 ml of a 4 per cent w/v solution of *bromophenol blue* in *ethanol (95 per cent)*. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to yellow.

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20 ml with *water* (1 ppm).

Total ash (2.3.19). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.3 per cent w/w, determined on 1.0 g using a mixture of equal volumes of *anhydrous methanol* and *dichloromethane*.

Assay. Determine by gas chromatography (2.4.13), using area normalization method.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of *hexane*.

Reference solution (a). Dissolve 25 mg of *cetyl palmitate 95 IPRS* in 25.0 ml of *hexane*.

Reference solution (b). Dissolve 25 mg of *cetyl palmitate 15 RS* in 25.0 ml of *hexane*.

Chromatographic system

- a capillary column 10 m x 0.53 mm, packed with poly(dimethyl)siloxane (film thickness 2.65 µm),
- temperature:
  column 100° to 300° @ 10° per minute,
  inlet port and detector 350°,
- a flame ionisation detector,
- flow rate: 6.5 ml per minute, using nitrogen as the carrier gas.

The relative retention time with reference to cetyl palmitate is about 9 minutes, for cetyl alcohol is about 0.3, for palmitic acid is about 0.4, for lauric ester is about 0.8, for myristic ester is about 0.9 and for stearic ester is about 1.1

Inject 1 µl of reference solution (b). The test is not valid unless the resolution between the peaks due to cetyl palmitate and cetyl stearate is not less than 1.5.

Inject 1 µl each of reference solution (a), (b) and the test solution.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the type of cetyl palmitate.

Activated Charcoal

Decolorising Charcoal

Activated Charcoal is obtained from vegetable matter by suitable carbonisation processes intended to confer a high adsorbing power.

Category. Adsorbent.

Description. A light, black powder, free from grittiness.

Identification

A. When heated to redness, burns slowly without flame.

B. Complies with the test for Adsorbing power.

Tests

Acidity or alkalinity. Boil 2.0 g with 40 ml of *water* for 5 minutes. Cool, restore to the original volume with *carbon dioxide-free water* and filter, discarding the first 20 ml of the filtrate. To 10 ml of the filtrate add 0.25 ml of *bromothymol blue solution* and 0.25 ml of *0.02 M sodium hydroxide*. The solution is blue and not more than 0.75 ml of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Acid-soluble substances. Boil 1.0 g with a mixture of 20 ml of *water* and 5 ml of *hydrochloric acid* for 5 minutes, filter whilst hot and collect the filtrate in a previously weighed porcelain crucible, wash the residue with 10 ml of hot *water*, adding the washing to the filtrate. To the combined filtrate and washing add 1 ml of *hydrochloric acid*, evaporate to dryness and ignite gently to constant weight; the residue weighs not more than 30 mg.

Ethanol-soluble substances. Boil 2.0 g with 50 ml of *ethanol (95 per cent)* under a reflux condenser for 10 minutes. Filter immediately, cool and adjust the volume to 50 ml with *ethanol (95 per cent)*. The filtrate is not more intensely coloured than reference solution BYS6 or YS6 (2.4.1). Evaporate 40 ml of the filtrate to dryness; the residue, after drying to constant weight at 105°, weighs not more than 8 mg.

Alkali-soluble coloured matter. Boil 0.25 g with 10 ml of *2 M sodium hydroxide* for 1 minute, cool and filter; the filtrate, when diluted to 10 ml with *water*, is not more intensely coloured than reference solution GYS4, (2.4.1).

Chlorides (2.3.12). Boil 3.0 g with 75 ml of *water* for 5 minutes, cool. Dilute to 100.0 ml with *water* and filter; 6.0 ml of the filtrate complies with the limit test for chlorides. (0.14 per cent).

Sulphates (2.3.17). 10.0 ml of the filtrate obtained in the test for Chloride complies with the limit test for sulphates (500 ppm).

Sulphide. Heat 1.0 g with a mixture of 20 ml of *water* and 5 ml of *7 M hydrochloric acid* to boiling; the fumes evolved do not turn *lead acetate paper* brown.

Uncarbonised constituents. Boil 0.25 g with 10 ml of *1 M sodium hydroxide* for few seconds and filter; the filtrate is colourless.

Copper. Determine by atomic absorption spectrophotometry (2.4.2), measuring at 325.0 nm using an air-acetylene flame and a solution prepared in the following manner. Boil 2.0 g with 50 ml of *2 M hydrochloric acid* under a reflux condenser for 1 hour. Filter, wash the filter with *2 M hydrochloric acid* and evaporate the combined filtrate to dryness on a water-bath. Dissolve the residue in sufficient *0.1 M hydrochloric acid* to produce 50.0 ml. Use *copper solution AAS*, suitably diluted with *0.1 M hydrochloric acid*, for preparing the standard solution (25 ppm).

Reserve the solution for the tests for Lead and Zinc.

Lead. Determine by atomic absorption spectrophotometry (2.4.2), measuring at 283.3 nm or 217.0 nm using an air-acetylene flame. Use the solution prepared in the test for Copper as the test solution and *lead solution AAS*, suitably diluted with *0.1 M hydrochloric acid*, for preparing the standard solution (10 ppm).

Zinc. Determine by atomic absorption spectrophotometry (2.4.2), measuring at 214.0 nm using an air-acetylene flame. Use the solution prepared in the test for Copper as the test solution and *zinc solution AAS*, suitably diluted with *0.1 M hydrochloric acid*, for preparing the *standard solutions* (25 ppm).

Sulphated ash (2.3.18). Not more than 5.0 per cent.

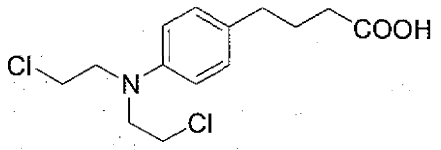
Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 1.0 g by drying in an oven at 120° for 4 hours.

Adsorbing power. Not less than 40 per cent of its own weight of *phenazone*, calculated on the dried basis, determined by the following method. To 0.3 g add 25 ml of a freshly prepared 1 per cent w/v solution of *phenazone*, shake thoroughly for 15 minutes, filter and discard the first 5 ml of the filtrate. To 10 ml of the filtrate add 1 g of *potassium bromide* and 20 ml of *2 M hydrochloric acid* and titrate with *0.0167 M potassium bromate*, using 0.1 ml of *methyl red solution* as indicator, until the colour changes from reddish pink to yellowish pink and titrate slowly towards the end of the titration (*a* ml). Repeat the titration using 10 ml of the phenazone solution beginning at the words "add 1 g..... titration" (*b* ml). Calculate the percentage of phenazone adsorbed with reference to the dried substance using the expression $2.353\ (a-b)/w$ where *w* is the weight, in g, of the substance under examination.

Microbial contamination (2.2.9). Total aerobic microbial count is not more than 10^3 CFU per g. Total fungal count is not more than 10^2 CFU per g. 1 g is free from *Escherichia coli* and 10 g is free from *Salmonella* and *Shigella*.

Storage. Store protected from moisture.

Chlorambucil



$C_{14}H_{19}Cl_2NO_2$ Mol. Wt. 304.2

Chlorambucil is 4-[4-bis(2-chloroethyl)amino]phenylbutyric acid.

Chlorambucil contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{14}H_{19}Cl_2NO_2$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white, crystalline powder.

CAUTION — Chlorambucil must be handled with care; contact with the skin and inhalation of airborne particles must be avoided.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorambucil IPRS* or with the reference spectrum of chlorambucil.

B. Shake 0.4 g with 10 ml of *2 M hydrochloric acid* and allow to stand for 30 minutes, shaking occasionally. Filter, wash the residue with two quantities, each of 10 ml, of *water* and add 0.5 ml of *potassium mercuri-iodide solution* to 10 ml of the mixed filtrate and washings; a buff precipitate is produced. To a further 10 ml add 0.5 ml of *potassium permanganate solution*; the purple colour is immediately discharged.

C. Dissolve 50 mg in 5 ml of *acetone* and dilute to 10 ml with *water*. Add 0.05 ml of *2 M nitric acid* and 0.2 ml of *dilute silver nitrate solution*; no opalescence is produced immediately. Heat on a water-bath; an opalescence is produced.

Tests

Impurity G. Determine by liquid chromatography (2.4.14).

NOTE — The solutions are stable for 8 hours at room temperature or for 24 hours at 4° to 8° and protect them from light.

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 20.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of 1 per cent v/v solution of *trifluoroacetic acid,*
- flow rate: 1.8 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

The relative retention time with reference to chlorambucil (retention time is about 11 minutes) for 4-[2-[bis(2-chloroethyl)amino]phenyl]butanoic acid or 4-[3-[bis(2-chloroethyl)amino]phenyl]butanoic acid (chlorambucil impurity G) is about 1.2.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak. The area of any peak due to chlorambucil impurity G is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use and protect from light.

Solvent mixture. 10 volumes of 1.0 per cent w/v solution of *hydrochloric acid* and 90 volumes of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 3.0 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 0.19 per cent w/v solution of *ammonium acetate*, adjusted to pH 3.9 with *acetic acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
5	60	40
15	10	90
25	10	90
26	60	40
30	60	40

Name	Relative retention time
Chlorambucil impurity B[1]	0.5
Chlorambucil (Retention time:about 12 minutes)	1.0
Chlorambucil impurity E[2]	1.4

[1]4-[4-[(2-chloroethyl)amino]phenyl]butanoic acid,

[2]4-[4-[[2-[[4-[4-[bis(2-chloroethyl)amino]phenyl]butanoyl]oxy]ethyl](2- chloroethyl)amino]phenyl]butanoic acid.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to chlorambucil impurity E is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent), the area of any peak due to chlorambucil impurity B is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.2 g, dissolve in 10 ml of *acetone*, add 10 ml of *water* and titrate with *0.1 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03042 g of $C_{14}H_{19}Cl_2NO_2$.

Storage. Store protected from light.

Chlorambucil Tablets

Chlorambucil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chlorambucil, $C_{14}H_{19}Cl_2NO_2$. The tablets are coated.

Usual strengths. 2 mg; 5 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve one tablet as completely as possible in 10 ml of *0.1 M hydrochloric acid*, add 40 ml of *acetonitrile* and mix in an ultrasonic bath for 5 minutes. Add sufficient *acetonitrile* to produce a solution containing 0.002 per cent w/v of Chlorambucil. Filter the solution, preferably through a glass microfibre filter paper (such as Whatman GF/C), discarding the first 20 ml of the filtrate, and use the filtrate.

Reference solution. A 0.002 per cent w/v solution of *chlorambucil IPRS* in a mixture of 90 volumes of *acetonitrile* and 10 volumes of *0.1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *acetonitrile* and 40 volumes of *0.02 M potassium dihydrogen phosphate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Calculate the content of $C_{14}H_{19}Cl_2NO_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

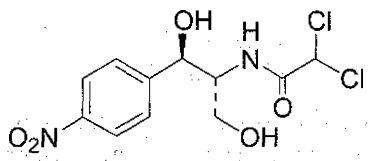
Test solution. Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 10 mg of Chlorambucil in a mixture of 25 ml of *0.1 M hydrochloric acid* and 100 ml of *acetonitrile* by mixing in an ultrasonic bath for at least 10 minutes. Dilute to 250.0 ml with *acetonitrile* and filter the solution, preferably through a glass microfibre filter paper (such as Whatman GF/C), discarding the first 20 ml of the filtrate. Dilute 50.0 ml of the filtrate to 100.0 ml with a mixture of 90 volumes of *acetonitrile* and 10 volumes of *0.1 M hydrochloric acid.*

Reference solution. A 0.002 per cent w/v solution of *chlorambucil IPRS* in a mixture of 90 volumes of *acetonitrile* and 10 volumes of *0.1 M hydrochloric acid.*

Carry out the chromatographic procedure described under Uniformity of content.

Calculate the content of $C_{14}H_{19}Cl_2NO_2$ in the tablets.

Chloramphenicol



$C_{11}H_{12}Cl_2N_2O_5$ Mol. Wt. 323.1

Chloramphenicol is 2,2-dichloro-*N*-[(1*R*,2*R*)-2-hydroxy-1-hydroxymethyl-2-(4-nitrophenyl)ethyl]acetamide. It is produced by the growth of certain strains of *Streptomyces venezuelae* in a suitable medium, but is normally prepared by synthesis.

Chloramphenicol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{11}H_{12}Cl_2N_2O_5$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to greyish-white or yellowish-white, fine crystalline powder or fine crystals, needles or elongated plates.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chloramphenicol IPRS* or with the reference spectrum of chloramphenicol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 10 mg in 1 ml of *ethanol (50 per cent)*, add 3 ml of a 1 per cent w/v solution of *calcium chloride* and 50 mg of *zinc powder* and heat on a water-bath for 10 minutes. Decant the clear supernatant liquid into a test-tube, add 0.1 g of *anhydrous sodium acetate* and 0.1 ml of *benzoyl chloride*, shake for 1 minute and add 0.5 ml of a 10.5 per cent w/v solution of *ferric chloride hexahydrate* and, if necessary, add sufficient *dilute hydrochloric acid* to produce a clear solution; a red-violet to

purple colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

D. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* in a covered test-tube on a water-bath for 15 minutes; the resulting solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.5, determined in a suspension prepared by shaking 50 mg with 10 ml of *carbon dioxide-free water.*

Specific optical rotation (2.4.22). +17.0° to +20.0°, determined in a 5.0 per cent w/v solution in *ethanol.*

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 90 volumes of *chloroform,* 10 volumes of *methanol* and 1 volume of *water.*

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *acetone.*

Reference solution (a). A 1 per cent w/v solution of *chloramphenicol IPRS* in *acetone.*

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 100 ml with *acetone.*

Apply to the plate 1 µl and 20 µl of the test solution, 1 µl of reference solution (a) and 20 µl of reference solution (b). After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with 20 µl of the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

Chlorides (2.3.12). To 2.0 g add 20 ml of *water* and 10 ml of *nitric acid* and shake for 5 minutes. Filter through a filter paper previously washed by filtering 5-ml quantities of *water* until 5 ml of the filtrate is no longer opalescent on addition of 0.1 ml of *nitric acid* and 0.1 ml of a 4.25 per cent w/v solution of *silver nitrate.* The resulting filtrate complies with the limit test for chlorides (125 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.125 g and dissolve in sufficient *water* to produce 250.0 ml. Dilute 10.0 ml with sufficient *water* to produce 250.0 ml. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ taking 297 as the specific absorbance at 278 nm.

Chloramphenicol intended for use in the manufacture of parenteral preparations without a further process for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of chloramphenicol.

Chloramphenicol intended for use in the manufacture of parenteral or ophthalmic preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If the material is intended for use in the manufacture of parenteral or ophthalmic preparations without a further appropriate procedure of sterilisation, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral or ophthalmic preparations.

Chloramphenicol Capsules

Chloramphenicol Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strengths. 250 mg; 500 mg.

Identification

Suspend a quantity of the contents of the capsules containing about 1.25 g of Chloramphenicol in 60 ml of *water* and extract with two quantities, each of 20 ml, of *light petroleum (60° to 80°)* or *light petroleum (100° to 120°).* Wash the combined extracts with two quantities, each of 15 ml, of *water,* add the washings to the aqueous layer, extract with four quantities, each of 50 ml, of *ether* and remove the ether from the combined extracts and evaporate to dryness. The residue, after drying to constant weight at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chloramphenicol IPRS* or with the reference spectrum of chloramphenicol.

B. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* in a covered test-tube on a water-bath for 15 minutes; the resulting solution gives the reactions of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). +17.0° to +20.0°, determined in a 5.0 per cent w/v solution in *ethanol* of the residue obtained in the test for Identification.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute 5.0 ml of the filtrate to 100.0 ml with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ taking 297 as the specific absorbance at 278 nm.

Q. Not less than 85 per cent of the stated amount of $C_{11}H_{12}Cl_2N_2O_5$.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 0.2 g of Chloramphenicol, dissolve in 800 ml of *water*, warming if necessary to effect solution and add sufficient *water* to produce 1000.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$, taking 297 as the specific absorbance at 278 nm.

Storage. Store protected from moisture.

Chloramphenicol Ear Drops

Chloramphenicol Ear Drops are a solution of Chloramphenicol in a suitable vehicle.

Chloramphenicol Ear Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strengths. 0.4 per cent w/v; 0.5 per cent w/v.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica GF254.*

Mobile phase. A mixture of 1 volume of *water*, 10 volumes of *methanol* and 90 volumes of *chloroform.*

Test solution. Dilute a volume of the ear drops containing 0.1 g of Chloramphenicol to 10 ml with *ethanol (95 per cent).*

Reference solution. A 1.0 per cent w/v solution of *chloramphenicol IPRS* in *ethanol (95 per cent).*

Apply to the plate 1 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dilute a volume of the ear drops containing 50 mg of Chloramphenicol to 10 ml with *ethanol (50 per cent).* To 2 ml, add 4.5 ml of *1 M sulphuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Decant the supernatant liquid or filter if necessary. Cool the resulting solution in ice and add 0.5 ml of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 ml of *2-naphthol solution* and 2 ml of *10 M sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

Tests

2-Amino-1-(4-nitrophenyl)propane-1,3-diol. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the ear drops with the mobile phase to obtain a solution containing 0.05 per cent w/v of Chloramphenicol.

Reference solution (a). A 0.0025 per cent w/v solution of *2-amino-1-(4-nitrophenyl)propane-1,3-diol IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *chloramphenicol IPRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol IPRS* in the mobile phase.

Use chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to chloramphenicol and 2-amino- 1-(4-nitrophenyl)propane-1,3-diol is not less than 8.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the solution, the area of any peak corresponding to 2-amino-1-(4-nitrophenyl)-propane-1,3-diol is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent).

Other tests. Comply with the tests stated under Ear Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the ear drops containing 25 mg of Chloramphenicol to 50 ml with *water.* Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *chloramphenicol IPRS* in *water.* Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.005 per cent w/v, each of, *chloramphenicol IPRS* and *2-amino-1-(4-nitrophenyl)propane-1,3-diol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 15 volumes of *acetonitrile* and 85 volumes of 0.21 per cent w/v solution of *sodium pentanesulphonate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to chloramphenicol and 2-amino- 1-(4-nitrophenyl)propane-1,3-diol is not less than 8.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the ear drops.

Storage. Store protected from light.

Chloramphenicol Eye Drops

Chloramphenicol Eye Drops are a sterile solution of Chloramphenicol in Purified water.

Chloramphenicol Eye Drops contain not less than 90.0 per cent and not more than 130.0 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strength. 0.5 per cent w/v.

Identification

To a volume containing 50 mg of Chloramphenicol add 15 ml of *water* and extract with four quantities, each of 25 ml, of *ether*. Combine the extracts and evaporate to dryness. The residue complies with the following tests.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 10 volumes of *methanol* and 1 volume of *water*.

Test solution. Dissolve 0.1 g of the residue in sufficient *ethanol (95 per cent)* to produce 10 ml.

Reference solution. Dissolve 0.1 g of *chloramphenicol IPRS* in sufficient *ethanol (95 per cent)* to produce 10 ml.

Apply to the plate 1µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dissolve 10 mg in 2 ml of *ethanol (50 per cent)*, add 4.5 ml of *1 M sulphuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Decant the supernatant liquid or filter, if necessary. Cool the resulting solution in ice and add 0.5 ml of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 ml of *2-naphthol solution* and 2 ml of *10 M sodium hydroxide*; a red colour is produced. Repeat the test omitting the zinc powder; no red colour is produced.

Tests

pH (2.4.24). 7.0 to 7.5.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing about 50 mg of chloramphenicol to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase and filter through a 0.5 µm or finer porosity filter and use the clear filtrate.

Reference solution. A 0.01 per cent w/v solution of *chloramphenicol IPRS* in the mobile phase. Filter the solution through a 0.5 µm or finer porosity filter and use the clear filtrate.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *methanol* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the eye drops.

Storage. Store in light resistant containers at a temperature not exceeding 30°.

Chloramphenicol Eye Ointment

Chloramphenicol Eye Ointment contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strength. 1 per cent w/w.

Identification

Mix a quantity of the eye ointment containing 30 mg of Chloramphenicol with 10 ml of *light petroleum (40° to 60°)*,

centrifuge and discard the supernatant liquid. Repeat this procedure using three quantities, each of 10 ml, of the same solvent. Dry the residue in oven at 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chloramphenicol IPRS* or with the reference spectrum of chloramphenicol.

B. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* in a covered test-tube on a water-bath for 15 minutes; the resulting solution gives the reactions of chlorides (2.3.1).

Tests

Other tests. Comply with the tests stated under Eye Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer an accurately weighed quantity of the ointment, containing about 25 mg of Chloramphenicol, to a suitable conical flask, add 20 ml of *cyclohexane*, mix with the aid of ultrasound for about 2 minutes add 60 ml of *methanol*, and mix. Filter this mixture, collecting the filtrate in a 100-ml volumetric flask. Wash the filter with *methanol*, collecting the washings in the volumetric flask. Dilute with *methanol* to volume, and mix. Transfer 50.0 ml of the resulting solution to a suitable round-bottom flask, and evaporate to dryness by rotating the flask under vacuum in a water-bath at 35°. Dissolve the residue in 50.0 ml of *methanol*. Transfer 10.0 ml of the resulting solution to a 25-ml volumetric flask, dilute with the mobile phase to volume, and mix. Filter a portion of the solution through a 0.5 µm or finer porosity filter, and use the clear filtrate.

Reference solution. A 0.01 per cent w/v solution of *chloramphenicol IPRS* in the mobile phase. Filter the solution through a 0.5 µm or finer porosity filter and use the clear filtrate.

Chromatographic system

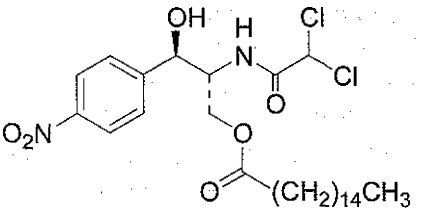
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *methanol* and 0.1 volume of *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ in the eye ointment.

Storage. Store at a temperature not exceeding 30°.

Chloramphenicol Palmitate



$C_{27}H_{42}Cl_2N_2O_6$ Mol. Wt. 561.6

Chloramphenicol Palmitate is (2*R*,3*R*)-2-(2,2-dichloroacetamido)-3-hydroxy-3-(4-nitrophenyl)propyl hexadecanoate.

Chloramphenicol Palmitate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{27}H_{42}Cl_2N_2O_6$, calculated on the dried basis.

Category. Antibacterial.

Description. A fine, white or almost white, unctuous powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.003 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at about 271 nm, about 0.53.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel H*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)* and 30 volumes of 10 per cent w/v solution of *ammonium acetate*.

Test solution. Dissolve 50 mg of the substance under examination in a mixture of 1 ml of *1 M sodium hydroxide* and 5 ml of *acetone*, allow to stand for 30 minutes and add 1.1 ml of *1 M hydrochloric acid* and 3 ml of *acetone*.

Reference solution (a). A 0.2 per cent w/v solution of *chloramphenicol IPRS* in *acetone*.

Reference solution (b). A 0.2 per cent w/v solution of *palmitic acid* in *acetone*.

Reference solution (c). A 0.2 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air and spray with a solution containing 0.02 per cent w/v of *2,7-dichlorofluorescein* and 0.01 per cent w/v of *rhodamine B* in *ethanol (95 per cent)*. Allow the plate to dry in air and examine under ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows three spots corresponding in position to the principal spots in chromatograms obtained with reference solution (a), (b) and (c).

C. Dissolve 10 mg in 4 ml of *ethanol (95 per cent)* add 1 ml of *1 M sulphuric acid* and 50 mg of *zinc powder* and allow to stand for 10 minutes. Filter, cool the filtrate in ice and add 0.5 ml of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 ml of *2-naphthol solution* and 2 ml of *10 M sodium hydroxide*; a red colour develops. Repeat the test omitting the zinc powder; no red colour is produced.

D. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* in a covered test-tube on a water-bath for 15 minutes; the resulting solution gives the reactions of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). +21.0° to +25.0°, determined in a 5.0 per cent w/v solution in *ethanol*.

Free acid. Dissolve 1.0 g by warming to 35° in 5 ml of a mixture of a equal volumes of *ethanol (95 per cent)* and *ether* and add 0.2 ml of *phenolphthalein solution*; not more than 0.4 ml of *0.1 M sodium hydroxide* is required to produce a pink colour persisting for 30 seconds.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Dissolve 1 g of the substance under examination in 100.0 ml of *acetone*.

Reference solution. Dilute 2.0 ml of the test solution to 100.0 ml with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Free chloramphenicol. Not more than 450 ppm, determined by the following method. Dissolve, with the aid of gentle heat, 1.0 g in 80 ml of *xylene*, cool and extract with three successive quantities, each of 15 ml, of *water*; discard the xylene and dilute the combined aqueous extracts to 50 ml with *water*. Extract the solution with 10 ml of *carbon tetrachloride*, allow to separate, discard the carbon tetrachloride and centrifuge a portion of the aqueous solution. Measure the absorbance of the clear aqueous solution at the maximum at about 278 nm, using as the blank a solution obtained by repeating the procedure without the substance under examination; the absorbance of this blank solution must not be greater than 0.05 (2.4.7). Calculate the content of free chloramphenicol, in ppm, from the expression $(A \times 10^4)/5.96$, where A is the absorbance of the clear aqueous solution of the substance under examination.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven over *phosphorus pentoxide* at 80° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. Weigh accurately about 60 mg and dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml. Dilute 10.0 ml of the solution to 200.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 271 nm (2.4.7). Calculate the content of $C_{27}H_{42}Cl_2N_2O_6$ taking 178 as the specific absorbance at 271 nm.

Storage. Store protected from light and moisture.

Chloramphenicol Oral Suspension

Chloramphenicol Palmitate Oral Suspension; Chloramphenicol Palmitate Mixture

Chloramphenicol Oral Suspension is a suspension of Chloramphenicol Palmitate in a suitable flavoured vehicle.

Chloramphenicol Oral Suspension contains not less than 95.0 per cent and not more than 115.0 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strength. The equivalent of 125 mg of chloramphenicol per 5 ml. (175 mg of chloramphenicol palmitate is approximately equivalent to 100 mg of chloramphenicol).

Identification

Extract a quantity of the suspension containing about 7.5 mg of chloramphenicol with 10 ml of *chloroform* and carefully evaporate the clear chloroform solution on a water-bath to dryness. Dissolve the residue in 250 ml of *ethanol (95 per cent.* When examined in the range 230 nm to 360 nm (2.4.7) the resulting solution shows an absorption maximum only at about 271 nm.

Tests

pH (2.4.24). 4.5 to 7.0.

Polymorph A. To a volume of the suspension containing 0.125 g of chloramphenicol add 35 ml of *water*, mix, centrifuge for 40 minutes at not less than 18,000 rpm and discard the supernatant liquid. Wash the residue by adding 2 ml of *water*, triturating to form a paste, adding 18 ml of *water*, mixing thoroughly centrifuging and discarding the supernatant liquid. Wash the residue twice more in a similar manner, dry at 20° for 16 hours at a pressure not exceeding 0.7 kPa and grind to a fine powder. Prepare a mull of the residue by triturating a small quantity with about twice its weight of *liquid paraffin* until a smooth creamy paste is obtained. Determine by infrared absorption spectrophotometry (2.4.6) over the range 770 cm^{-1} to 910 cm^{-1} using conditions such that between 20 per cent and 30 per cent transmittance occurs at 810 cm^{-1} to 910 cm^{-1}.

Repeat the operation using a mull prepared with a standard mixture obtained by mixing together thoroughly 1 part by weight of *chloramphenicol palmitate polymorph A IPRS* and 9 parts by weight of *chloramphenicol palmitate nonpolymorph A IPRS*. On each of the spectra, draw a straight base line between the minima occurring at about 880 cm^{-1} and 790 cm^{-1} and using these base lines measure the heights of the peaks occuring at the maxima at about 858 cm^{-1} and 840 cm^{-1}. In the spectrum obtained with preparation under examination, the ratio of the peak height at about 858 cm^{-1} to that at the maximum at about 840 cm^{-1} is greater than the corresponding ratio in the spectrum obtained with the standard mixture.

Other tests. Comply with the tests stated under Oral Liquids.

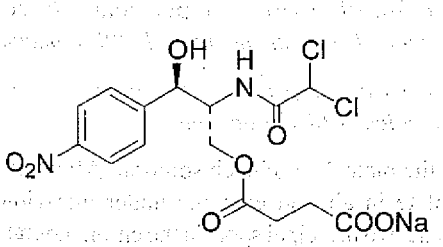
Assay. Weigh accurately a quantity of the suspension containing about 0.125 g of chloramphenicol, add 10 ml of *water* and shake with four quantities, each of 20 ml, of *chloroform*, filtering each extract through cotton wool, previously washed with *chloroform*, into a 100-ml volumetric flask. Dilute to volume with *chloroform* and mix well. Dilute 2.0 ml of the solution to 100.0 with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 271 nm using 1 ml of *chloroform* diluted to 50 ml with *ethanol (95 per cent)* as the blank (2.4.7). Calculate the content of chloramphenicol palmitate, $C_{27}H_{42}Cl_2N_2O_6$, taking 178 as the specific absorbance at 271 nm.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$, weight in volume using a factor of 0.575 for the conversion of the content of chloramphenicol palmitate to chloramphenicol.

Storage. Store protected from light.

Labelling. The label states (1) the strength in terms of the equivalent amount of chloramphenicol; (2) that if the preparation is diluted, it must be used immediately after dilution.

Chloramphenicol Sodium Succinate



$C_{15}H_{15}Cl_2N_2NaO_8$ Mol. Wt. 445.2

Chloramphenicol Sodium Succinate is a mixture of variable proportions of sodium (2*R*,3*R*)-2-(2,2-dichloroacetamido)-3-hydroxy-3-(4-nitrophenyl)propyl succinate (3-isomer) and of sodium (1*R*,2*R*)-2-(2,2-dichloroacetamido)-3-hydroxy-1-(4-nitrophenyl)propyl succinate (1-isomer).

Chloramphenicol Sodium Succinate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{15}Cl_2N_2NaO_8$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or yellowish-white powder; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 85 volumes of *chloroform*, 14 volumes of *methanol* and 1 volume of *2 M acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *acetone*.

Reference solution (a). A 1 per cent w/v solution of *chloramphenicol sodium succinate IPRS* in *acetone*.

Reference solution (b). A 1 per cent w/v solution of *chloramphenicol IPRS* in *acetone*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution are similar in position and size to those in the chromatogram obtained with reference solution (a) and their positions are different from that of the principal spot in the chromatogram obtained with reference solution (b).

B. Dissolve 10 mg in 2 ml of *ethanol (95 per cent)* add 4.5 ml of *1 M sulphuric acid* and 50 mg of *zinc powder*, allow to stand for 10 minutes and decant the supernatant liquid or filter, if necessary. Cool the resulting solution in ice and add 0.5 ml of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 ml of *2-naphthol solution* and 2 ml of *10 M sodium hydroxide*; a red colour develops. Repeat the test omitting the zinc powder; no red colour is produced.

C. To 5 ml of a 0.1 per cent w/v solution add a few drops of *silver nitrate solution*; no precipitate is produced. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* on a water-bath for 15 minutes, add 50 mg of *decolorising charcoal*, shake and filter. The filtrate when treated with *silver nitrate solution*, yields a curdy precipitate which is insoluble in *nitric acid* but soluble, after being well washed with *water*, in *dilute ammonia solution* from which it is reprecipitated on addition of *nitric acid*.

D. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.4 to 7.0, determined in a 25.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 5.0° to + 8.0°, determined in a 5.0 per cent w/v solution.

Free chloramphenicol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 10 volumes of *methanol* and 1 volume of *water*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.02 per cent w/v solution of *chloramphenicol IPRS* in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any spot corresponding to chloramphenicol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.3 g.

Assay. Weigh accurately about 0.2 g and dissolve in sufficient *water* to produce 500.0 ml; dilute 5.0 ml of the solution to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{15}H_{15}Cl_2N_2NaO_8$ taking 220 as the specific absorbance at 276 nm.

Chloramphenicol Sodium Succinate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of chloramphenicol.

Chloramphenicol Sodium Succinate intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Chloramphenicol Sodium Succinate Injection

Chloramphenicol Sodium Succinate Injection is a sterile material consisting of Chloramphenicol Sodium Succinate with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Chloramphenicol Sodium Succinate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chloramphenicol, $C_{11}H_{12}Cl_2N_2O_5$.

Usual strengths. The equivalent of 300 mg and 1 g of chloramphenicol. (140 mg of chloramphenicol sodium succinate is approximately equivalent to 100 mg of chloramphenicol).

Description. A white or yellowish-white powder; hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powder for Injections) and with the following requirements.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 85 volumes of *chloroform*, 14 volumes of *methanol* and 1 volume of *2 M acetic acid*.

Test solution. Dissolve a quantity of injection containing 0.1 g of chloramphenicol sodium succinate in *acetone* and dilute to 10.0 ml with *acetone*.

Reference Solution (a). A 1 per cent w/v solution of *chloramphenicol sodium succinate IPRS* in *acetone*.

Reference solution (b). A 1 per cent w/v solution of *chloramphenicol IPRS* in *acetone*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution are similar in position and size to those in the chromatogram obtained with reference solution (a) and their positions are different from that of the principal spot in the chromatogram obtained with reference solution (b).

B. Dissolve 10 mg in 2 ml of *ethanol (95 per cent)* add 4.5 ml of *1 M sulphuric acid* and 50 mg of *zinc powder*, allow to stand for 10 minutes and decant the supernatant liquid or filter, if necessary. Cool the resulting solution in ice and add 0.5 ml of *sodium nitrite solution* and, after 2 minutes, 1 g of *urea* followed by 1 ml of *2-naphthol solution* and 2 ml of *10 M sodium hydroxide*; a red colour develops. Repeat the test omitting the zinc powder; no red colour is produced.

C. To 5 ml of a 0.1 per cent w/v solution add a few drops of *silver nitrate solution*; no precipitate is produced. Heat 50 mg with 2 ml of *ethanolic potassium hydroxide solution* on a water-bath for 15 minutes, add 50 mg of *decolorising charcoal*, shake and filter. The filtrate when treated with *silver nitrate solution*, yields a curdy precipitate which is insoluble in *nitric acid* but soluble, after being well washed with *water*, in *dilute ammonia solution* from which it is reprecipitated on addition of *nitric acid*.

D. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 6.4 to 7.0, determined in a 25.0 per cent w/v solution.

Specific optical rotation (2.4.22). + 5.0° to + 8.0°, determined in a 5.0 per cent w/v solution.

Free chloramphenicol. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 10 volumes of *methanol* and 1 volume of *water*.

Test solution. Dissolve a quantity of injection containing 0.1 g of chloramphenicol sodium succinate in *acetone* and dilute to 10.0 ml with *acetone*.

Reference solution. A 0.02 per cent w/v solution of *chloramphenicol IPRS* in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any spot corresponding to chloramphenicol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.3 g.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of chloramphenicol.

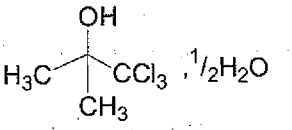
Assay. Determine the weight of the contents of 10 containers. Weigh accurately about 0.2 g of the mixed contents of the 10 containers and dissolve in sufficient *water* to produce 500.0 ml; dilute 5.0 ml of the solution to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{15}H_{15}Cl_2N_2NaO_8$ taking 220 as the specific absorbance at 276 nm. 1 mg of $C_{15}H_{15}Cl_2N_2NaO_8$ is equivalent to 0.7257 mg of $C_{11}H_{12}Cl_2N_2O_5$.

Storage. Store protected from light and moisture.

Labelling. The label states the quantity of Chloramphenicol Sodium Succinate in the sealed container in terms of the equivalent amount of chloramphenicol.

Chlorbutol

Chlorobutanol



$C_4H_7Cl_3O, ½ H_2O$ Mol.Wt. 186.5

Chlorbutol is 1,1,1-trichloro-2-methylpropan-2-ol hemihydrate.

Chlorbutol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_7Cl_3O$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative), analgesic; local anaesthetic.

Description. Colourless crystals or a white, crystalline powder; sublimes readily.

Identification

A. To 5 ml of a freshly prepared 0.5 per cent w/v solution add 1 ml of *1 M sodium hydroxide* and then, slowly, 2 ml of *iodine solution*; a yellow precipitate of iodoform is produced.

B. Heat about 20 mg with 2 ml of *10 M sodium hydroxide* and 1 ml of *pyridine* on a water-bath and shake; the separated pyridine layer becomes red.

C. Warm gently about 20 mg with 5 ml of *ammoniacal silver nitrate solution*; a black precipitate is produced.

Tests

Appearance of solution. A 50.0 per cent w/v solution in *ethanol (95 per cent)* is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

Acidity. Dissolve 2.0 g in 20 ml of *ethanol (95 per cent)*, add 0.1 ml of *bromothymol blue solution* and titrate with *0.1 M*

sodium hydroxide; not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Chlorides (2.3.12). 0.5 g dissolved in 10 ml of *ethanol (95 per cent)* complies with the limit test for chlorides (500 ppm). Use 5 ml of *ethanol (95 per cent)* in place of 5 ml of *water* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

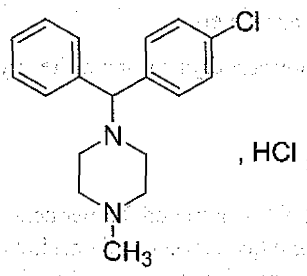
Water (2.3.43). 4.5 per cent to 6.0 per cent, determined on 0.3 g.

Assay. Weigh accurately about 0.2 g and dissolve in 5 ml of *ethanol (95 per cent)*. Add 5 ml of *sodium hydroxide solution* and boil under a reflux condenser for 15 minutes. Cool, dilute with 20 ml of *water*, add 5 ml of *nitric acid*, 1 ml of *nitrobenzene* and 50.0 ml of *0.1 M silver nitrate* and shake vigorously for 1 minute. Add 4 ml of *ferric ammonium sulphate solution* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate*.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005917 g of $C_4H_7Cl_3O$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Chlorcyclizine Hydrochloride



$C_{18}H_{21}ClN_2,HCl$ Mol. Wt. 337.3

Chlorcyclizine Hydrochloride is 1-(4-chlorobenzhydryl)-4-methylpiperazine hydrochloride.

Chlorcyclizine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of the stated amount of $C_{18}H_{21}ClN_2,HCl$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorcyclizine hydrochloride IPRS* or with the reference spectrum of chlorcyclizine hydrochloride.

B. Weigh accurately about 10 mg, dissolve in 100 ml of 0.5 per cent w/v of *sulphuric acid*. Dilute 10 ml of the solution to 100 ml with 0.5 per cent w/v *sulphuric acid*. When examined in the range 215 to 300 nm (2.4.7), exhibits maximum at about 231 nm, about 0.475 to 0.525.

C. In the test for Related substances, the principle spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

D. It gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 1.0 per cent w/v solution.

Related substance. Determine by thin layer chromatography (2.4.17). coating the plate with *silica gel*.

Mobile phase. A mixture of 85 volumes of *dichloromethane*, 13 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution (a). A 2.0 per cent w/v solution of the substance under examination in *methanol*.

Test solution (b). A 0.1 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (a). A 0.10 per cent w/v solution of *chlorcyclizine hydrochloride IPRS* in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *methylpiperzine IPRS* in *methanol*.

Reference solution (c). A 0.004 per cent w/v solution of the substance under examination in *methane*.

Reference solution (d). A solution containing 0.10 per cent w/v, each of, *hydroxyzine hydrochloride IPRS* and *chlorcyclizine hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and expose to iodine vapours for 10 minutes. In the chromatogram obtained with test solution (a), any spot corresponding to methylpiperazine is not more intense than the spot in the chromatogram obtained with reference solution (b)(0.5 per cent). Any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

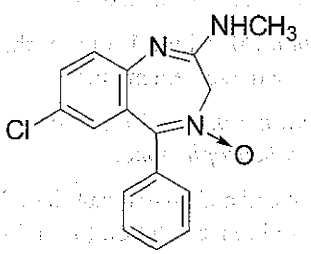
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 130°.

Assay. Weigh accurately about 0.2 g, dissolve in 1 ml of *0.1 M hydrochloric acid* and add 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03373 g of $C_{18}H_{21}ClN_2HCl$.

Storage. Store protected from light and moisture.

Chlordiazepoxide



$C_{16}H_{14}ClN_3O$ Mol. Wt. 299.8

Chlordiazepoxide is 7-chloro-2-methylamino-5-phenyl-3*H*-1,4-benzodiazepine 4-oxide.

Chlordiazepoxide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{14}ClN_3O$, calculated on the dried basis.

Category. Anxiolytic.

Description. An almost white to light yellow, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlordiazepoxide IPRS* or with the reference spectrum of chlordiazepoxide.

B. When examined in the range 230 nm to 360 nm (2.4.7) a 0.0005 per cent w/v solution prepared immediately before use in subdued light in *0.1 M hydrochloric acid* shows absorption maxima at about 246 nm and 308 nm. Absorbance at the maximum at about 246 nm, 0.56 to 0.60 and at the maximum at about 308 nm, 0.16 to 0.17.

C. Dissolve 0.2 g in 4 ml of hot *dilute hydrochloric acid*, heat at 100° for 10 minutes, cool and filter. 2 ml of the filtrate gives the reactions of primary aromatic amines (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions and protected from light.

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *chlordiazepoxide impurity A IPRS* in the mobile phase, add 25.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 4 mg of *aminochlorobenzophenone* in 100 ml of the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to chlordiazepoxide for 7-chloro-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one 4-oxide (chlordiazepoxide impurity A) is about 0.7; for 6-chloro-2-(chloromethyl)-4-phenylquinazoline 3-oxide (chlordiazepoxide impurity B) is about 2.3; for aminochlorobenzophenone (chlordiazepoxide impurity C) is about 3.9.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to chlordiazepoxide impurity A and chlordiazepoxide is not less than 5.0.

Inject reference solution (a), (c) and the test solution. Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to chlordiazepoxide impurities A and B, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any peak corresponding to chlordiazepoxide impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram

obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g and dissolve by heating, if necessary, in 80 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02998 g of $C_{16}H_{14}ClN_3O$.

Storage. Store protected from light and moisture.

Chlordiazepoxide Tablets

Chlordiazepoxide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chlordiazepoxide, $C_{16}H_{14}ClN_3O$.

Usual strengths. 5 mg; 10 mg; 25 mg.

Identification

A. Dilute 1 ml of the final solution obtained in the Assay to 2 ml with *0.1 M hydrochloric acid*. When examined in the range 230 nm to 360 nm (2.4.7) the resulting solution shows absorption maxima at about 246 nm and 308 nm.

B. To a quantity of the powdered tablets containing 0.2 g of Chlordiazepoxide add 4 ml of hot *2 M hydrochloric acid*, heat at 100° for 10 minutes, cool and filter; 2 ml of the filtrate gives the reactions of primary aromatic amines (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium: 900 ml of gastric juice, artificial (without enzyme),
Speed and time. 100 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the resulting solution at the maximum at about 309 nm (2.4.7). Calculate the content of chlordiazepoxide, $C_{16}H_{14}ClN_3O$ in the medium from the absorbance obtained from a solution of known concentration of *chlordiazepoxide IPRS* in the dissolution medium.

Q. Not less than 85 per cent of the stated amount of $C_{16}H_{14}ClN_3O$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 85 volumes of *chloroform*, 14 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Chlordiazepoxide with 10 ml of a mixture of *acetone* containing 2 per cent v/v of *strong ammonia solution* and 8 per cent v/v of *water*, allow to settle and use the clear supernatant liquid.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the same solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the same solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *2-amino-5-chlorobenzophenone*.

Apply to the plate 2 µl and 20 µl quantities of the test solution, 2 µl of each of reference solution (a) and (b) and 20 µl of reference solution (c). After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with 2 µl of the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with a freshly prepared 1 per cent w/v solution of *sodium nitrite* in *1 M hydrochloric acid*, dry it in a current of air and spray with a 0.4 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *ethanol (95 per cent)*. Any violet spot corresponding to 2-amino-5-chlorobenzophenone in the chromatogram obtained with 20 µl of the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c).

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, shake with 50 ml of *0.1 M hydrochloric acid* for 20 minutes and add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Filter and dilute a suitable volume of the filtrate containing 0.8 mg of Chlordiazepoxide with sufficient *0.1 M hydrochloric acid* to produce 50.0 ml. Measure the absorbance of the resulting solution at the maximum at about 308 nm (2.4.7). Calculate the content of $C_{16}H_{14}ClN_3O$ in the tablet taking 327 as the specific absorbance at 308 nm.

Other tests. Comply with the tests stated under Tablets.

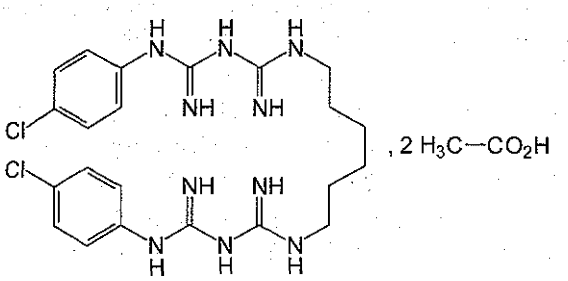
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 20 mg of Chlordiazepoxide and

shake with 150 ml of *0.1 M hydrochloric acid* for 20 minutes. Add sufficient *0.1 M hydrochloric acid* to produce 250.0 ml and filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 308 nm (2.4.7). Calculate the content of $C_{16}H_{14}ClN_3O$ taking 327 as the specific absorbance at 308 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

Chlorhexidine Acetate

Chlorhexidine Diacetate



$C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$ Mol. Wt. 625.6

Chlorhexidine Acetate is 1,1'-(hexane-1,6-diyl)bis[5-(4-chlorophenyl)biguanide] diacetate.

Chlorhexidine Acetate contains not less than 98.0 per cent and not more than 101.0 per cent of chlorhexidine diacetate, $C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$, calculated on the dried basis.

Category. Antiseptic.

Description. A white or almost white, microcrystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorhexidine acetate IPRS* or with the reference spectrum of chlorhexidine acetate.

B. Dissolve about 5 mg in 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *strong sodium hydroxide solution* and 1 ml of *bromine water*. A deep red colour is produced.

C. Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 40 ml of *water*, filter if necessary and cool in ice *water*. Make alkaline to *titan yellow paper* by adding dropwise and with stirring *strong sodium hydroxide solution* and add 1 ml in excess. Filter, wash the precipitate with *water* until the washings are free from alkali and recrystallise from *alcohol (70 per cent v/v)*. Dry at 100° to 105°. Melting point (2.4.21). 132° to 136°.

D. It gives reaction (A) of acetates (2.3.1).

Tests

Chloroaniline. Dissolve 0.2 g of the substance under examination in 25 ml of *water* with shaking if necessary. Add 1 ml of *hydrochloric acid* and dilute to 30 ml with *water*. Add rapidly and with thorough mixing after each addition, 2.5 ml of *dilute hydrochloric acid*, 0.35 ml of *sodium nitrite solution*, 2 ml of a 5.0 per cent w/v solution of *ammonium sulphamate*, 5 ml of a 0.1 per cent w/v solution of *naphthylethylenediamine dihydrochloride* and 1 ml of *alcohol*, dilute to 50.0 ml with *water* and allow to stand for 30 minutes. Any reddish-blue colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 10.0 ml of 0.001 per cent w/v solution of *chloroaniline* in *dilute hydrochloric acid* and 20 ml of *dilute hydrochloric acid* instead of the solution of the substance under examination (500 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.15 per cent w/v solution of *chlorhexidine acetate IPRS* in the mobile phase.

Reference solution (b). Dilute 2.5 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c) Dilute 2.0 ml of reference solution (b) to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 2.0 g of *sodium octanesulphonate* in a mixture of 120 ml of *glacial acetic acid*, 270 ml of *water* and 730 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Equilibrate the column with the mobile phase for at least 1 hour. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject the test solution and reference solution (a), (b) and (c). Record the chromatograms of reference solution (b) and (c)

until the peak due to chlorhexidine has been eluted and record the chromatogram of the test solution for six times the retention time of the peak due to chlorhexidine. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak with a relative retention time of 0.25 or less with respect to the principal peak and any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (c).

Loss on drying (2.4.19). Not more than 3.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Sulphated ash (2.3.18). Not more than 0.15 per cent.

Assay. Dissolve 0.14 g in 100 ml of *anhydrous acetic acid* and titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.01564 g of $C_{26}H_{38}Cl_2N_{10}O_4$.

Chlorhexidine Gluconate Solution

Chlorhexidine Gluconate Solution is an aqueous solution of 1,1'-hexamethylenebis [5-(4-chlorophenyl)biguanide] digluconate.

Chlorhexidine Gluconate Solution contains not less than 19.0 per cent w/v and not more than 21.0 per cent w/v of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

Category. Antiseptic.

Description. An almost colourless or pale yellowish, clear or slightly opalescent liquid.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out

A. To 2 ml add 80 ml of *water*, cool in ice, add *5 M sodium hydroxide* dropwise with stirring until the solution is slightly alkaline to titan yellow paper and add 2 ml in excess. Filter, wash the precipitate with *water* until the washings are free from alkali, dissolve it in about 25 ml of *ethanol* on a boiling water-bath and heat until the volume is reduced to about 5 ml. Cool in ice, induce crystallisation, if necessary, by scratching the side of the vessel with a glass rod, filter and dry the crystals at 105°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorhexidine IPRS* or with the reference spectrum of chlorhexidine. Examine the substance as a dispersion in *potassium bromide IR* without excessive grinding.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethanol (95 per cent)*, 30 volumes of *water*, 10 volumes of *strong ammonia solution* and 10 volumes of *ethyl acetate*.

Test solution. Dilute 10 ml of the substance under examination to 50.0 ml with *water*.

Reference solution. A 2.5 per cent w/v solution of *calcium gluconate IPRS* in *water*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 100° for 20 minutes, allow to cool, spray with a 5 per cent w/v solution of *potassium dichromate* in a 40 per cent w/w solution of *sulphuric acid* and allow to stand for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. To 0.5 ml add 10 ml of *water* and 0.5 ml of *cupric sulphate solution*; a white precipitate is produced which on boiling flocculates and changes to a pale purple colour.

D. To 0.05 ml add 5 ml of a 1 per cent w/v solution of *cetrimide*, 1 ml of *10 M sodium hydroxide* and 1 ml of *bromine water*; a deep red colour is produced.

Tests

pH (2.4.24). 5.5 to 7.0, determined in a solution obtained by diluting 5 ml to 100 ml.

Weight per ml (2.4.29). 1.06 g to 1.07 g.

Related substances. Determine by thin-layer chromatography (2.4.17), coating a 0.5-mm thick plate with a slurry consisting of 8 g of *silica gel GF254* and 16 ml of *water* containing 1 g of *sodium formate*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 50 volumes of *ethanol (95 per cent)* and 7 volumes of *formic acid*.

Test solution. Dilute 1 ml of the substance under examination to 20 ml with *1.5 M acetic acid*.

Apply to the plate, in the form of a band 4 cm wide, 20 µl of the test solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Mark the area around each group of bands above and below the principal band, transfer quantitatively the enclosed areas of silica gel to a glass-stoppered tube, add 5.0 ml of *methanol*, shake for 15 minutes, centrifuge and measure the absorbance of the clear, supernatant liquid at the maximum at about 256 nm (2.4.7), using as the blank a solution prepared by heating in a similar manner equivalent-sized areas of silica gel removed from the coating adjacent to the areas previously removed. The absorbance is not more than that obtained with a solution prepared by

diluting 2 ml of the substance under examination with sufficient *1.5 M acetic acid* to produce 10 ml and diluting 0.2 ml of the solution to 50 ml with *methanol*.

4-Chloroaniline. Not more than 0.25 per cent, calculated with reference to chlorhexidine solution at a nominal concentration of 20 per cent w/v, determined by the following method. Dilute 2.0 ml to 100.0 with *water*. To 10.0 ml of the solution add 2.5 ml of *2 M hydrochloric acid* and dilute to 20 ml with *water*. Add rapidly, with continuous mixing after each addition, 0.35 ml of *sodium nitrite* solution, 2 ml of a 5 per cent w/v solution of *ammonium sulphamate* and 5 ml of a 0.01 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*. Add 1 ml of *ethanol (95 per cent)* and sufficient *water* to produce 50 ml, mix and set aside for 30 minutes. Any reddish blue colour produced is not more intense than that produced by treating at the same time in the same manner a mixture of 10.0 ml of 0.001 per cent w/v solution of *4-chloroaniline* in *2 M hydrochloric acid* and 10 ml of *water* in place of the dilution of the substance under examination.

Assay. Weigh accurately about 1.0 g and evaporate to a low bulk. Dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

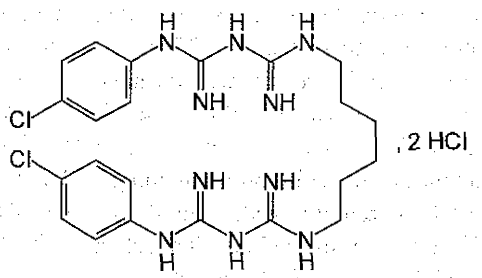
1 ml of *0.1 M perchloric acid* is equivalent to 0.02244 g of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

Determine the weight per ml (2.4.29) and calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$, weight in volume.

Storage. Store protected from light.

Chlorhexidine Hydrochloride

Chlorhexidine Dihydrochloride



$C_{22}H_{30}Cl_2N_{10},2HCl$ Mol. Wt. 578.4

Chlorhexidine Hydrochloride is 1,1'-(hexane-1,6-diyl)bis[5-(4-chlorophenyl)biguanide] dihydrochloride.

Chlorhexidine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of chlorhexidine dihydrochloride, $C_{22}H_{30}Cl_2N_{10}$, 2HCl calculated on the dried basis.

Category. Antiseptic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorhexidine hydrochloride IPRS* or with the reference spectrum of chlorhexidine hydrochloride.

B. Dissolve about 5 mg in 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *strong sodium hydroxide solution* and 1 ml of *bromine water*. A deep red colour is produced.

C. Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 40 ml of *water*, filter if necessary and cool in ice *water*. Make alkaline to titan yellow paper by adding dropwise and with stirring *strong sodium hydroxide solution* and add 1 ml in excess. Filter, wash the precipitate with *water* until the washings are free from alkali and recrystallise from *alcohol (70 per cent v/v)*. Dry at 100° to 105°. Melting point (2.4.21). 132° to 136°.

D. It gives reaction (a) of chlorides (2.3.1).

Tests

Chloroaniline. To 0.2 g of the substance under examination, add 1 ml of *hydrochloric acid*, dilute to 30 ml with *water* and shake until a clear solution is obtained. Add rapidly and with thorough mixing after each addition, 2.5 ml of *dilute hydrochloric acid*, 0.35 ml of *sodium nitrite solution*, 2 ml of a 5.0 per cent w/v solution of *ammonium sulphamate*, 5 ml of a 0.1 per cent w/v solution of *naphthylethylenediamine dihydrochloride* and 1 ml of *alcohol*, dilute to 50.0 ml with *water* and allow to stand for 30 minutes. Any reddish-blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 ml of a 0.001 per cent solution of *chloroaniline* in *dilute hydrochloric acid* and 20 ml of *dilute hydrochloric acid* instead of the solution of the substance under examination (500 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.15 per cent w/v solution of *chlorhexidine hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 2.5 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 2.0 g of *sodium octanesulphonate* in a mixture of 120 ml of *glacial acetic acid*, 270 ml of *water* and 730 ml of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Equilibrate the column with the mobile phase for at least 1 hour.

Inject reference solution (a), (b), (c) and the test solution. Record the chromatograms until the peak due to chlorhexidine has been eluted and record the chromatogram of the test solution for six times the retention time of the peak due to chlorhexidine. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak with a relative retention time of 0.25 or less with respect to the principal peak and any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in 5 ml of *anhydrous formic acid* and add 70 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.01446 g of $C_{22}H_{32}Cl_4N_{10}$.

Chlorhexidine Mouthwash

Chlorhexidine Mouthwash contains Chlorhexidine Gluconate Solution in a suitable flavoured and coloured vehicle.

Chlorhexidine Mouthwash contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chlorhexidine gluconate, $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

Usual strengths. 0.2 per cent w/v; 0.4 per cent w/v; 0.5 per cent w/v; 4 per cent w/v; 20 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

4-Chloroaniline. Not more than 0.3 per cent.

Determine by gas chromatography (2.4.13).

Test solution (a). Dilute a volume of the mouthwash containing 25 mg of chlorhexidine gluconate to 50 ml with *water*, shake with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of *0.6 M sodium hydrogen carbonate solution*, allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulphate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µl of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 ml of *0.6 M sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer.

Test solution (b). Dilute a volume of the mouthwash containing 25 mg of chlorhexidine gluconate to 50 ml with *water*, add 2 ml of reference solution (a), shake with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of *0.6 M sodium hydrogen carbonate solution* allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulphate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µl of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 ml of *0.6 M sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer.

Reference solution (a). Dissolve 80 mg of *2,6-dimethylaniline* (internal standard) in 1.0 ml of *1M hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100.0 ml and dilute 1.0 volume of the solution to 100.0 volumes with *0.01M hydrochloric acid* .

Reference solution (b). Prepare a series of reference solutions in the following manner. Dissolve 25 mg of *4-chloroaniline* in 1 ml of *1M hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 ml and dilute 1 volume to 10 volumes with the same solvent. To separate 0, 2, 4, 6 and 8 ml volumes of the solution (containing 0, 25, 50, 75 and 100 µg of 4-chloroaniline) add 2 ml of reference solution (a) and sufficient *water* to produce 50 ml, shake with 20 ml of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 ml of *0.6M sodium hydrogen carbonate solution* allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulphate* and filter through silica treated filter paper (Whatman 1PS is suitable), add 100 µl of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 ml of *0.6 M sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer.

Chromatographic system
- a glass column 1.5 m x 4.0 mm, packed with acid-washed, silanised diatomaceous support coated with 15 per cent w/w cyanopropylmetylphenyl methyl silicon fluid (Such as OV-225),
- temperature:
  column at 190°,
  inlet port at 200° and detector at 270°,
- electron capture detector,
- flow rate: 50 ml per minute using nitrogen as the carrier gas.

Inject 1 µl the reference solutions and construct a calibration curve of the concentration of 4-chloroaniline against the ratio of the area of the peak corresponding to 4-chloroaniline to the area of the peak corresponding to reference solution (a).

Inject 1 µl test solution (b). Determine the ratio of the area of any peak corresponding to 4-chloroaniline to the area of the peak corresponding to reference solution (a) and hence calculate the content of 4-chloroaniline in the mouthwash with respect to the labelled content of chlorhexidine gluconate.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a quantity of mouthwash with the mobile phase to obtain a solution containing 0.01 per cent w/v of chlorhexidine gluconate.

Reference solution. A 0.008 per cent w/v solution of *chlorhexidine acetate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 2.0 g of *sodium octanesulphonate* in a mixture of 120 volumes of *glacial acetic acid*, 270 volumes of *water* and 730 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equillibrate the column atleast for 1 hour.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ in the mouthwash.

1 mg of chlorhexidine acetate is equivalent to 1.435 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

Storage. Store protected from light.

Chlorinated Lime

$Ca(ClO)_2$ Mol. Wt. 143.0

Chlorinated Lime contains not less than 30 per cent w/w of available chlorine.

Category. Disinfectant.

Description. An off white powder.

Identification

A. Evolves chlorine copiously on the addition of *2 M hydrochloric acid.*

B. When shaken with *water* and filtered, the filtrate gives reaction (C) of calcium salts and reaction (A) of chlorides (2.3.1).

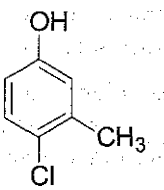
Test

Assay. Triturate 4 g of substance under examination with small quantities of *water* and dilute to 1000 ml with *water;* mix thoroughly. Mix 100 ml of the resulting suspension with a solution containing 3 g of *potassium iodide* in 100 ml of *water*, acidify with 5 ml of *6 M acetic acid* and titrate the liberated iodine with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution* added towards the end of titrations as an indicator.

1.0 ml of *0.1 M sodium thiosulphate* is equivalent to 0.003545 g of available chlorine.

Storage. Store protected from moisture.

Chlorocresol



C_7H_7ClO Mol. Wt. 142.6

Chlorocresol is 4-chloro-3-methylphenol.

Chlorocresol contains not less than 98.0 per cent and not more than 101.0 per cent of C_7H_7ClO.

Category. Antiseptic; pharmaceutical aid (antimicrobial preservative).

Description. Colourless or almost colourless crystals or a white, crystalline powder; volatile in steam.

Identification

A. To a saturated solution in *water* add one drop of *ferric chloride test solution*; a bluish colour is produced.

B. To 0.1 g add 0.2 ml of *benzoyl chloride* and 0.5 ml of *2 M sodium hydroxide*. Shake vigorously until a white precipitate is produced, add 5 ml of *water* and filter. The melting range of the residue, after crystallisation from *methanol* and drying at 70°, is 85° to 88° (2.4.21).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or alkalinity. To 10 ml of a 5.0 per cent w/v solution add 0.1 ml of *methyl red solution*. The solution is orange or red and not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to yellow.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. A 1.0 per cent w/v solution of the substance under examination in *acetone*.

Chromatographic system
- a glass column 1.8m x 3.5 mm, packed with silanised diatomaceous support (80 to 120 mesh) impregnated with 3 to 5 per cent w/w of phenyl methyl silicone fluid (50 per cent phenyl) (Such as OV-17),
- temperature:
  column.125°,
  inlet port. 210°,
  detector. 230°,
- flow rate: 30 ml per minute using nitrogen as the carrier gas.

Allow the chromatography to proceed for three times the retention time of chlorocresol (about 8 minutes).

Inject 1 µl the test solution. The sum of the areas of all secondary peaks in the chromatogram is not greater than 1.0 per cent of the total area of the peaks.

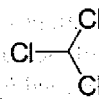
Non-volatile matter. Not more than 0.1 per cent, determined on 2.0 g by volatilising on a water-bath and drying at 105°.

Assay. Weigh accurately about 70 mg, dissolve in 30 ml of *glacial acetic acid*, add 25.0 ml of *0.0167 M potassium bromate*, 20.0 ml of a 15 per cent w/v solution of *potassium bromide* and 10 ml of *hydrochloric acid*. Stopper the flask and allow to stand in the dark for 15 minutes, shaking occasionally. Add 1 g of *potassium iodide* and 100 ml of *water*. Titrate with *0.1 M sodium thiosulphate*, shaking vigorously and using *starch solution*, added towards the end of the titration, as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of potassium bromate required.

1 ml of *0.0167 M potassium bromate* is equivalent to 0.003565 g of C_7H_7ClO.

Storage. Store protected from light and moisture.

Chloroform



$CHCl_3$ Mol. Wt. 119.4

Chloroform is trichloromethane to which either 1.0 per cent to 2.0 per cent v/v of ethanol or 50 mg per litre of amylene has been added.

Category. Pharmaceutical aid (solvent and antimicrobial preservative).

Description. A colourless, volatile liquid.

NOTE — Care should be taken not to vaporise chloroform in the presence of a flame because of the production of harmful gases.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Shake with an equal volume of *water* and dry with *anhydrous sodium sulphate*. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chloroform IPRS* or the spectrum with the reference spectrum of chloroform.

B. Non-flammable. The vapour introduced into a Bunsen flame produces a green colour and gives rise to noxious vapours having a characteristic odour.

C. Warm 0.5 ml with 0.05 ml of *aniline* and 1 ml of *5 M sodium hydroxide*. The characteristic odour of phenyl isocyanide is produced.

Tests

Weight per ml (2.4.29). 1.474 g to 1.478 g.

Boiling range (2.4.8). Not more than 5.0 per cent v/v distils below 60° and the remainder distils between 60° and 62°.

Acidity or alkalinity. Shake 10 ml with 20 ml of freshly boiled and cooled *water* for 3 minutes and allow to separate. To 5 ml of the aqueous layer (solution A) add 0.1 ml of *litmus solution*; the

colour produced is similar to that produced on adding 0.1 ml of *litmus solution* to 5 ml of freshly boiled and cooled *water*.

Chlorides. To 5 ml of solution A add 5 ml of *water* and 0.2 ml of *silver nitrate solution*; the solution is *clear*.

Free chlorine. To 10 ml of solution A add 1 ml of *cadmium iodide solution* and 2 drops of *starch solution*; no blue colour is produced.

Aldehyde. Shake 5 ml with 5 ml of *water* and 0.2 ml of *alkaline potassium mercuri-iodide solution* in a stoppered bottle and set aside in the dark for 15 minutes; not more than a pale yellow colour is produced.

Foreign chlorine compounds. Shake 20 ml with 10 ml of *sulphuric acid* in a stoppered flask for 5 minutes, allow to stand in the dark for 30 minutes and discard the acid layer. Shake 15 ml of the chloroform layer with 30 ml of *water* in a stoppered flask for 3 minutes and allow to separate. To the aqueous layer add 0.2 ml of *silver nitrate solution* and set aside in the dark for 5 minutes; no opalescence is produced.

Related substances. Determine by gas chromatography (2.4.13).

Test solution (a). A solution containing 0.2 per cent v/v of *carbon tetrachloride*, 0.2 per cent v/v of *1,1,1-trichloroethane* (internal standard), 0.2 per cent v/v of *dichloromethane*, 0.2 per cent v/v of *ethanol*, 0.5 per cent v/v of *bromochloromethane* and 0.2 per cent v/v of the substance under examination in *1-propanol*.

Test solution (b). The substance under examination.

Reference solution (a). A solution containing 0.2 per cent v/v of the internal standard in the substance under examination.

Reference solution (b). *1-propanol*.

Chromatographic system

- a glass column 4 m x 3 mm, packed with acid-washed kieselguhr (60 to 100 mesh) coated with 15 per cent w/w of *di-2-cyanoethyl ether*,
- temperature:
  column 40°,
  inlet port and detector 100°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas,
- inject 0.1 µl of each solution.

The test is not valid unless the column efficiency, determined using the chloroform peak in the chromatogram obtained with test solution (a), is greater than 700 plates per metre and the total number of plates is greater than 2,500.

In the chromatogram obtained with test solution (a) the peaks, in the order of emergence, are due to carbon tetrachloride, 1,1,1-trichloroethane, dichloromethane, chloroform, ethanol, bromochloromethane and 1-propanol (solvent).

Using the chromatogram obtained with reference solution (b) make any corrections due to the contribution of secondary peaks from the solvent to the peaks in the chromatogram obtained with test solution (a).

In the chromatogram obtained with reference solution (a), the ratio of the areas of any peaks due to carbon tetrachloride, dichloromethane and bromochloromethane to the area of the peak due to the internal standard is not more than the corresponding ratios in the chromatogram obtained with test solution (a) and the ratio of the area of any other secondary peak that elutes prior to the solvent peak, except for the peak corresponding to ethanol, to the area of the peak due to the internal standard is not more than the ratio of the area of the peak due to chloroform to the area of the peak due to the internal standard in the chromatogram obtained with test solution (a).

Calculate the content of each of the specified impurities and also calculate the content of each of any other impurities assuming the same response per unit volume as with chloroform. The total content of all impurities is not more than 1.0 per cent v/v.

Ethanol *(if present)*. Determine by gas chromatography (2.4.13).

Test solution (a). The substance under examination.

Test solution (b). A solution containing 1.0 per cent v/v of *1-propanol* (internal standard) in the substance under examination.

Reference solution. A solution containing 1.0 per cent v/v of *ethanol* and 1.0 per cent v/v of the internal standard in *water*.

Inject 0.1 µl of each solution.

Use the chromatographic procedure described under Related substances.

The test is not valid unless the height of the trough separating the ethanol peak from the chloroform peak in the chromatogram obtained with test solution (a) is less than 15 per cent of the height of the ethanol peak.

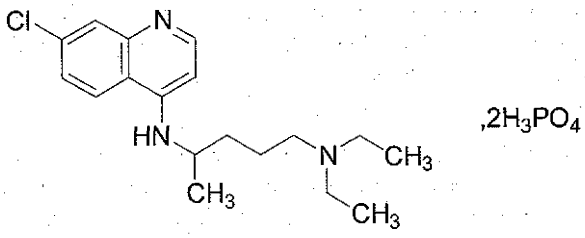
Calculate the content of ethanol from the areas of the peaks due to ethanol and the internal standard in the chromatograms obtained with reference solution and test solution (b).

Non-volatile matter. Not more than 0.004 per cent w/v, determined on 25 ml by evaporation to dryness and drying at 105°.

Storage. Store protected from light in tightly-closed, glass-stoppered containers.

Labelling. The label states whether it contains ethanol or amylene.

Chloroquine Phosphate



$C_{18}H_{26}ClN_3,2H_3PO_4$ Mol. Wt. 515.9

Chloroquine Phosphate is (*RS*)-7-chloro-4-(4-diethylamino-1-methylbutylamino)quinoline diphosphate.

Chloroquine Phosphate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{26}ClN_3,2H_3PO_4$, calculated on the anhydrous basis.

Category. Antimalarial; antiamoebic.

Description. A white or almost white, crystalline powder. It slowly gets discoloured on exposure to light. It may exist in two polymorphic forms differing in their behaviour, one of which melts at about 195° and the other at about 218°.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Dissolve 0.1 g in 10 ml of *water*, add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 80 mg of *chloroquine phosphate IPRS* treated in the same manner or with the reference spectrum of chloroquine.

B. When examined in the range 210 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution shows absorption maxima at about 220 nm, 235 nm, 256 nm, 329 nm and 342 nm; absorbance at about 220 nm, 0.60 to 0.66, at about 235 nm, 0.35 to 0.39, at about 256 nm, 0.30 to 0.33, at about 329 nm, 0.325 to 0.355 and at about 342 nm, 0.36 to 0.39.

C. Dissolve 25 mg in 20 ml of *water* and add 8 ml of *picric acid solution*; the precipitate, after washing successively with *water*, *ethanol (95 per cent)* and *ether*, melts at 205° to 210° (2.4.21).

D. Neutralise with *dilute nitric acid* the aqueous layer obtained in test A. Add an equal volume of *ammonium molybdate solution* and warm; a yellow precipitate is produced.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS5 or GYS5 (2.4.1).

pH (2.4.24). 3.5 to 4.5, determined in a 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *cyclohexane* and 10 volumes of *diethylamine*.

Test solution. A 5.0 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (b). Dilute 25 ml of reference solution (a) to 50.0 ml with *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 15 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.015 per cent w/v solution of *chloroquine phosphate IPRS* in *water*.

Reference solution (b). A solution containing 0.015 per cent w/v of *chloroquine phosphate IPRS* and 0.0015 per cent w/v of *hydroxychloroquine sulphate IPRS* in *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 78 volumes of buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000.0 ml of *water*, add 1.0 ml of *perchloric acid*, adjusted to pH 2.5 with *orthophosphoric acid* and 22 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 224 nm,
- injection volume: 10 µl.

The relative retention time with reference to chloroquine phosphate for hydroxychloroquine sulphate is about 0.8.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to chloroquine phosphate and hydroxychloroquine sulphate is not less than 1.5. The column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{26}ClN_3,2H_3PO_4$.

Storage. Store protected from light.

Chloroquine Phosphate Injection

Chloroquine Phosphate Injection is a sterile solution of Chloroquine Phosphate in Water for Injections.

Chloroquine Phosphate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chloroquine, $C_{18}H_{26}ClN_3$.

Usual strength. The equivalent of 40 mg of chloroquine per ml. (250 mg of chloroquine phosphate is approximately equivalent to 155 mg of chloroquine).

Description. A clear, colourless or almost colourless solution.

Identification

A. To a volume of the injection containing 60 mg of chloroquine add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 80 mg of *chloroquine phosphate IPRS* treated in the same manner or with the reference spectrum of chloroquine.

B. Dilute a volume of the injection containing 15 mg of chloroquine to 20 ml with *water* and add 8 ml of *picric acid solution*; the precipitate, after washing successively with *water*, *ethanol (95 per cent)* and *ether*, melts at about 207° (2.4.21).

C. Neutralise the aqueous layer obtained in test A with *dilute nitric acid*, add an equal volume of *ammonium molybdate solution* and warm; a yellow precipitate is produced.

Tests

pH (2.4.24). 3.5 to 4.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume of the injection containing 0.4 g of chloroquine add 20 ml of *1 M sodium hydroxide* and extract with four quantities, each of 25 ml, of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous glacial acetic acid* and mix. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01599 g of chloroquine, $C_{18}H_{26}ClN_3$.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of chloroquine in a suitable dose-volume.

Chloroquine Phosphate Suspension

Chloroquine Phosphate Suspension is a suspension of Chloroquine Phosphate in a suitable flavoured vehicle.

Chloroquine Phosphate Suspension contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chloroquine, $C_{18}H_{26}ClN_3$.

Usual strength. The equivalent of 50 mg of chloroquine in 5 ml. (80 mg of chloroquine phosphate is approximately equivalent to 50 mg of chloroquine).

Identification

To a volume of the suspension containing 50 mg of chloroquine add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 80 mg of *chloroquine phosphate IPRS* treated in the same manner or with the reference spectrum of chloroquine.

Tests

pH (2.4.24). 5.5 to 6.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh accurately a quantity of the suspension containing about 100 mg of chloroquine, add 50 ml of *1 M hydrochloric acid*, shake well and dilute to 100.0 ml with *1 M hydrochloric acid*. Filter and discard the first few ml of the

filtrate. Dilute 10.0 ml of the filtrate to 100.0 ml with *1 M hydrochloric acid* and mix. Further dilute 10.0 ml to 100.0 ml with the same solvent and mix. Measure the absorbance of the resulting solution at the maximum at about 342 nm (2.4.7). Calculate the content of $C_{18}H_{26}ClN_3$ from the absorbance obtained by repeating the operation using *chloroquine phosphate IPRS* in place of the substance under examination.

Chloroquine Phosphate Tablets

Chloroquine Phosphate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chloroquine phosphate, $C_{18}H_{26}ClN_3,2H_3PO_4$. The tablets are coated.

Usual strength. 250 mg. (250 mg of chloroquine phosphate is approximately equivalent to 155 mg of chloroquine).

Identification

A. To a quantity of the powdered tablets containing 0.1 g of Chloroquine Phosphate add 10 ml of *water* and 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with 80 mg of *chloroquine phosphate IPRS* treated in the same manner or with the reference spectrum of chloroquine.

B. Extract a quantity of the powdered tablets containing 25 mg of Chloroquine Phosphate with 20 ml of *water*, filter and to the filtrate add 8 ml of *picric acid solution*; the precipitate, after washing successively with *water*, *ethanol (95 per cent)* and *ether*, melts at about 207° (2.4.21).

C. Extract a quantity of the powdered tablets containing 0.5 g of Chloroquine Phosphate with 25 ml of *water* and filter. To the filtrate add 2.5 ml of *5 M sodium hydroxide* and extract with three quantities, each of 10 ml, of *ether*. The aqueous layer, after neutralisation with *2 M nitric acid*, gives the reactions of phosphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 344 nm (2.4.7). Calculate the content of $C_{18}H_{26}ClN_3,2H_3PO_4$ in the medium taking 371 as the specific absorbance at 344 nm.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{26}ClN_3,2H_3PO_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *cyclohexane* and 10 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets containing 1.0 g of Chloroquine Phosphate with 20.0 ml of *water* for 30 minutes, centrifuge and use the clear, supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (b). Dilute 25.0 ml of reference solution (a) to 50.0 ml with *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 15 mg of Chloroquine Phosphate in *water* and dilute to 100.0 ml with *water*, with the aid of ultrasound for 20 minutes and filter.

Reference solution (a). A 0.015 per cent w/v solution of *chloroquine phosphate IPRS* in *water*.

Reference solution (b). A solution containing 0.015 per cent w/v of *chloroquine phosphate IPRS* and 0.0015 per cent w/v of *hydroxychloroquine sulphate IPRS* in *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 78 volumes of buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000.0 ml of *water*, add 1.0 ml of *perchloric acid* and adjusted to pH 2.5 with *orthophosphoric acid* and 22 volumes of *methanol*,

– flow rate: 1.2 ml per minute,
– spectrophotometer set at 224 nm,
– injection volume: 10 µl.

The relative retention time with reference to chloroquine phosphate for hydroxychloroquine sulphate is about 0.8.

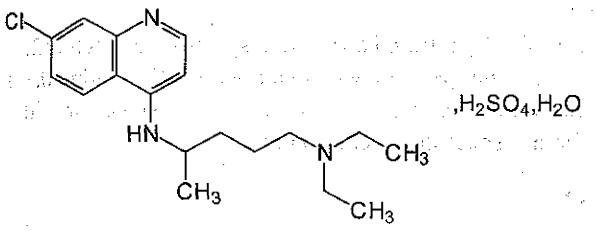
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to chloroquine phosphate and hydroxychloroquine sulphate is not less than 1.5. The tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{26}ClN_3,2H_3PO_4$ in the tablets.

Storage. Store protected from light.

Chloroquine Sulphate



$C_{18}H_{26}ClN_3,H_2SO_4,H_2O$ Mol. Wt. 435.9

Chloroquine Sulphate is *(RS)*-4-(7-chloro-4- quinolyl-amino) pentyldiethylamine sulphate monohydrate.

Chloroquine Sulphate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{26}ClN_3,H_2SO_4$, calculated on the anhydrous basis.

Category. Antimalarial; antiamoebic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Dissolve 0.1 g in 10 ml of *water*, add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by treating 0.1 g of *chloroquine sulphate IPRS* in the same manner or with the reference spectrum of chloroquine.

B. When examined in the range 210 nm to 360 nm, a 0.001 per cent w/v solution shows absorption maxima at about 220 nm, 235 nm, 256 nm, 329 nm and 342 nm; absorbance at about 220 nm, 0.73 to 0.81, at about 235 nm, 0.43 to 0.47, at about 256 nm, 0.37 to 0.41, at about 329 nm, 0.40 to 0.44 and at about 342 nm, 0.43 to 0.47 (2.4.7).

C. Dissolve 25 mg in 20 ml of *water* and add 8 ml of *picric acid solution*; the precipitate, after washing successively with *water*, *ethanol (95 per cent)* and *ether*, melts at 205° to 210° (2.4.21).

D. Gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. An 8.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS5 or GYS5 (2.4.1).

pH (2.4.24). 4.0 to 5.0, determined in an 8.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *cyclohexane* and 10 volumes of *diethylamine*.

Test solution. A 5.0 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (b). Dilute 25.0 ml of reference solution (a) to 50.0 ml with *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g dissolved in 25 ml of *water* complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). 1.25 g complies with the limit test for chlorides (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 3.0 to 5.0 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.5 g and dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0418 g of $C_{18}H_{26}ClN_3,H_2SO_4$.

Storage. Store protected from light.

Chloroquine Sulphate Injection

Chloroquine Sulphate Injection is a sterile solution of Chloroquine Sulphate in Water for Injections.

Chloroquine Sulphate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chloroquine, $C_{18}H_{26}ClN_3$.

Usual strength. The equivalent of 40 mg of chloroquine per ml. (200 mg of chloroquine sulphate is approximately equivalent to 147 mg of chloroquine).

Description. A clear, colourless or almost colourless solution.

Identification

A. To a volume of the injection containing 70 mg of chloroquine add sufficient *water* to produce 10 ml, add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by treating 0.1 g of *chloroquine sulphate IPRS* in the same manner or with the reference spectrum of chloroquine.

B. When examined in the range 210 nm to 360 nm, a 0.001 per cent w/v solution shows absorption maxima at about 220 nm, 235 nm, 256 nm, 329 nm and 342 nm; absorbance at about 220 nm, 0.73 to 0.81, at about 235 nm, 0.43 to 0.47, at about 256 nm, 0.37 to 0.41, at about 329 nm, 0.40 to 0.44 and at about 342 nm, 0.43 to 0.47 (2.4.7).

C. It gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume of the injection containing 0.4 g of chloroquine add 20 ml of *1 M sodium hydroxide* and extract with four quantities, each of 25 ml, of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous glacial acetic acid* and mix. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml *0.1 M perchloric acid* is equivalent to 0.01599 g of $C_{18}H_{26}ClN_3$.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of chloroquine in a suitable dose-volume.

Chloroquine Syrup

Chloroquine Syrup is a solution of Chloroquine Phosphate or Chloroquine Sulphate in a suitable flavoured vehicle.

Chloroquine Syrup contains Chloroquine Phosphate or Chloroquine Sulphate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chloroquine, $C_{18}H_{26}ClN_3$.

Usual strength. The equivalent of 50 mg of chloroquine in 5 ml. (80 mg of Chloroquine Phosphate or 67 mg of Chloroquine Sulphate is approximately equivalent to 50 mg of chloroquine).

Identification

To a volume of the syrup containing 50 mg of chloroquine add 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with water, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by treating 0.1 g of *chloroquine sulphate IPRS* in the same manner or with the reference spectrum of chloroquine.

Tests

pH (2.4.24). 4.0 to 6.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. To an accurately measured volume of the syrup containing about 0.4 g of chloroquine add 20 ml of *1 M sodium hydroxide* and extract with four quantities, each of 25 ml, of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous glacial acetic acid* and mix. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01599 g of $C_{18}H_{26}ClN_3$.

Storage. Store protected from light.

Labelling. The label states (1) whether the syrup contains Chloroquine Phosphate or Chloroquine Sulphate; (2) the strength in terms of equivalent amount of chloroquine in each 5 ml.

Chloroquine Sulphate Tablets

Chloroquine Sulphate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chloroquine sulphate, $C_{18}H_{26}ClN_3,H_2SO_4$. The tablets are coated.

Usual strength. 200 mg. (200 mg of chloroquine sulphate is approximately equivalent to 147 mg of chloroquine).

Identification

A. To a quantity of the powdered tablets equivalent to 0.1 g of Chloroquine Sulphate add 10 ml of *water* and 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the combined chloroform extracts with *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by treating 0.1 g of *chloroquine sulphate IPRS* in the same manner or with the reference spectrum of chloroquine.

B. Extract a quantity of the powdered tablets containing 25 mg of Chloroquine Sulphate with 20 ml of *water*, filter and to the filtrate add 8 ml of *picric acid solution*; the precipitate, after washing successively with *water*, *ethanol (95 per cent)* and *ether*, melts at about 207° (2.4.21).

C. Extract a quantity of the powdered tablets containing about 0.1 g of Chloroquine Sulphate with 10 ml of *water* and 1 ml of *dilute hydrochloric acid* and filter. To the filtrate add 1 ml of *barium chloride solution*; a white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 344 nm (2.4.7). Calculate the content of $C_{18}H_{26}ClN_3,H_2SO_4$ in the medium taking 450 as the specific absorbance at 344 nm.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{26}ClN_3,H_2SO_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 40 volumes of *cyclohexane* and 10 volumes of *diethylamine*.

Test solution. Shake a quantity of powdered tablets containing about 2.0 g of Chloroquine Sulphate with 50 ml of *water* for 30 minutes, centrifuge and use the supernatant liquid, if necessary filter through suitable filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (b). Dilute 25.0 ml of reference solution (a) to 50.0 ml with *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

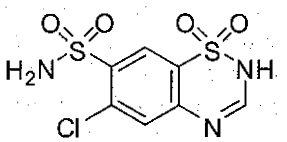
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.5 g of Chloroquine Sulphate, add 20 ml of *1 M sodium hydroxide* and extract with four quantities, each of 25 ml, of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous glacial acetic acid* and mix. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0209 g of $C_{18}H_{26}ClN_3,H_2SO_4$.

Storage. Store protected from light.

Chlorothiazide



$C_7H_6ClN_3O_4S_2$ Mol. Wt. 295.7

Chlorothiazide is 6-chloro-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide

Chlorothiazide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_6ClN_3O_4S_2$, calculated on the dried basis.

Category. Diuretic; antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorothiazide IPRS* or with the reference spectrum of chlorothiazide.

B. Dissolve 80 mg in 100 ml of *0.1 M sodium hydroxide* and dilute to 1000.0 ml with *water*. Dilute 10.0 ml of the solution to 100.0 ml with *0.01 M sodium hydroxide*. When examined in the range 220 nm to 320 nm (2.4.7), shows two absorption maxima at about 225 nm and 292 nm. The specific absorbance at the maxima are 725 to 800 and 425 to 450 respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. Ethyl acetate.

Test solution. Dissolve 25 mg of the substance under examination in 5.0 ml of *acetone*.

Reference solution. A 0.5 per cent w/v solution of *chlorothiazide IPRS* in *acetone*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

D. To 0.1 g, add a pellet of *sodium hydroxide* and heat strongly. Gas is evolved which turns *red litmus paper* to blue. After cooling, take up the residue with 10 ml of *dilute hydrochloric acid*. Gas is evolved which turns *lead acetate paper* to black.

Tests

Solution A. Dissolve 1.0 g of the substance under examination in 50 ml of *water*.

Acidity or alkalinity. To 10 ml of solution A, add 0.2 ml of *0.01 M sodium hydroxide* and 0.15 ml of *methyl red solution*. The solution is yellow. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Determine by thin-layer chromatography (2:4.17) coating the plate with *silica gel G*.

Mobile phase. A mixture of 15 volumes of *2-propanol* and 85 volumes of *ethyl acetate*.

Test solution. Dissolve 25 mg of the substance under examination in 5.0 ml of *acetone*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetone*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with a mixture of equal volumes of *alcoholic solution of sulphuric acid* and *alcohol*. Heat the plate at 105° for 30 minutes and immediately place the plate in the tank having 10 ml of a saturated solution of *sodium nitrite* in a beaker. Carefully add 0.5 ml of *sulphuric acid* to the *sodium nitrite solution*, close the tank, and allow to stand for 15 minutes. Remove the plate, heat in a ventilated oven at 40° for 15 minutes and spray with three quantities, each of 5 ml, of a freshly prepared 0.5 per cent w/v solution of *naphthylethylenediamine dihydrochloride* in *alcohol*. Examine the plate in day light. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Chlorides (2.3.12). Dissolve 1.5 g in 15 ml of *water*, filter. The solution complies with the limit test for chlorides (160 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 50 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide* in *2-propanol* to the first point of inflexion. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02957 g of $C_7H_6ClN_3O_4S_2$.

Chlorothiazide Oral Suspension

Chlorothiazide Oral Suspension is a dry mixture of Chlorothiazide with buffering agent and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the content of the sealed container in the specified volume of water just before use.

Chlorothiazide Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chlorothiazide, $C_7H_6ClN_3O_4S_2$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of chlorothiazide, $C_7H_6ClN_3O_4S_2$.

Usual strength. 50 mg per ml.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

The constituted suspension complies with the tests stated under Oral Liquids and with the following tests.

Identification

When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the assay shows an absorption maxima

at the same wavelength as that of solution of *chlorothiazide IPRS* prepared in the same manner.

Tests

pH (2.4.24). 3.2 to 4.0, determined on constituted solution.

Other tests. Comply with tests stated under Oral Suspension.

Assay. Weigh accurately a quantity of the suspension containing about 0.25 g of chlorothiazide, diluted to 250.0 ml with *sodium hydroxide solution* (1 in 250) and mix. Dilute 10.0 ml of the solution to 100.0 ml with *diluted hydrochloric acid* (1 in 100) and mix. Transfer 50.0 ml of the resulting solution to a 125-ml separator, and wash with two, 25 ml portions of *chloroform*, discarding the washing. Dilute 10.0 ml of the washed solution to 100 ml with *sodium hydroxide solution* (1 in 250) and mix. Dissolve an accurately weighed quantity of *chlorothizide IPRS* in *sodium hydroxide solution* (1 in 250) to obtain a concentration of about 10 µg per ml and measure the absorbance of the both solutions at the maxima (2.4.7) at about 292 nm.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of chlorothiazide $C_7H_6ClN_3O_4S_2$ weight in oral suspension.

Chlorothiazide Tablets

Chlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chlorothiazide, $C_7H_6ClN_3O_4S_2$.

Usual strengths. 250 mg; 500 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Gives the reaction of sulphite (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 8.0*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Use the filtrate, dilute if necessary, with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 294 nm (2.4.7). Calculate the content of $C_7H_6ClN_3O_4S_2$ in the medium from the absorbance obtained from a solution of known concentration of *chlorothiazide IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_7H_6ClN_3O_4S_2$.

Other tests. Comply with tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 Tablets. Disperse a quantity of the powder containing about 0.25 g of Chlorothiazide with 50.0 ml of *0.05 M monobasic sodium phosphate buffer*, shake for 15 minutes and add 100.0 ml of *acetonitrile*, dilute to 500.0 ml with *water*, filter.

Reference solution. Dissolve 25 mg of *chlorothiazide IPRS* in 5.0 ml of *0.05 M monobasic sodium phosphate buffer*, add 10.0 ml of *acetonitrile* and dilute to 50.0 ml with *water*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 95 volumes of *0.08 M monobasic sodium phosphate*, adjusted to pH 2.9 with *orthophosphoric acid* and 5 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

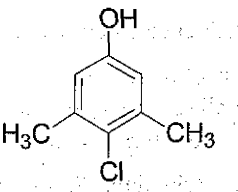
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1300 theoretical plates, the capacity factor is not less than 4.3. The tailing factor is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_6ClN_3O_4S_2$ in the tablets.

Storage. Store protected from moisture.

Chloroxylenol



C_8H_9ClO Mol. Wt. 156.6

Chloroxylenol is 4-chloro-3,5-dimethylphenol.

Chloroxylenol contains not less than 98.0 per cent and not more than 103.0 per cent of C_8H_9ClO.

Category. Antiseptic; disinfectant.

Description. A white or creamy-white crystals or crystalline powder. It is volatile in steam.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chloroxylenol IPRS* or with the reference spectrum of chloroxylenol.

B. Dissolve 0.1 g in 5 ml of *chloroform* and add 0.5 ml of filtered 1 per cent w/v solution of *ferric chloride* in *chloroform* and 0.1 ml of *pyridine*; a blue colour is produced.

C. To 5 ml of a saturated solution in *water* add 0.5 ml of *ferric chloride test solution*; no blue colour is produced.

D. Mix 50 mg with 0.5 g of *anhydrous sodium carbonate* and ignite strongly, cool, boil the residue with 5 ml of *water*, acidify with *nitric acid*, filter and add 2 ml of *silver nitrate solution*; a white precipitate is produced.

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution. A 2.0 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution. A solution containing 2.0 per cent w/v of the substance under examination and 0.04 per cent w/v of *4-chloro-o-cresol* (internal standard) in chloroform.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with acid-washed diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of polyethylene glycol (Such as Carbowax 20M),
- temperature:
  column 160°,
  inlet port and detector. 220°,
- a flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution and the test solution.

In the chromatogram obtained with the reference solution the sum of the areas of all secondary peaks is not greater than the area of the peak due to internal standard.

Assay. Weigh accurately about 70 mg, dissolve in 30 ml of *glacial acetic acid*, add 25.0 ml of *0.0167 M potassium bromate*, 20 ml of 15 per cent w/v solution of *potassium bromide* and 10 ml of *hydrochloric acid*, stopper the flask and allow to stand protected from light for 15 minutes. Add 1 g of *potassium iodide* and 100 ml of *water* and titrate with *0.1 M sodium thiosulphate*, shaking vigorously and using 1 ml of *starch solution* as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of *potassium bromate* required.

1 ml of *0.0167 M potassium bromate* is equivalent to 0.003915 g of C_8H_9ClO.

Chloroxylenol Solution

Chloroxylenol solution is a solution of Chloroxylenol solubilised in a saponaceous base containing Ethanol (95 per cent) and essential oils. Ethanol (95 per cent) may be replaced by Industrial Methylated Spirit in making Chloroxylenol Solution.

Chloroxylenol Solution contains not less than 4.75 per cent and not more than 5.25 per cent of C_8H_9ClO.

Usual strength. 5 per cent w/v.

Tests

pH (2.4.24). 7.0 to 11.0.

Ethanol content (2.3.45). 16 to 21 per cent v/v.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Extract 4 ml of the solution under examination with 20.0 ml of *chloroform* after adding 4 ml of *2 M hydrochloric acid*. Extract with two further quantities, each of 10.0 ml, of *chloroform*. Combine the chloroform extracts, shake with *anhydrous sodium sulphate* and filter.

Reference solution (a). Dissolve 0.1 g of *chloroxylenol IPRS* in 10.0 ml of a 0.8 per cent w/v solution of *4-chloro-o-cresol* (internal standard) in *chloroform* (solution A) and dilute to 20.0 ml with *chloroform*.

Reference solution (b). Prepare in the same manner as the test solution but use 20.0 ml of solution A instead of 20 ml of *chloroform*.

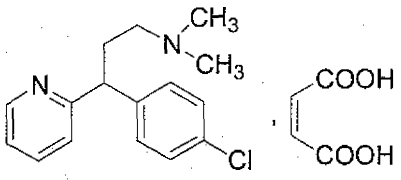
Chromatographic system
- a glass column 1.5 m x 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 100 mesh) coated with 3 per cent w/w of polyethylene glycol (Such as Carbowax 20M),
- temperature:
  column 160°,
  inlet port and detector. 220°,
- a flame ionisation detector,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of reference solution (a), (b) and the test solution.

Calculate the content of C_8H_9ClO in the solution.

Labelling. The label states that the preparation is meant for external use only.

Chlorpheniramine Maleate



$C_{16}H_{19}ClN_2,C_4H_4O_4$ Mol. Wt. 390.9

Chlorpheniramine Maleate is (*RS*)-3-(4-chlorophenyl)-3-(pyrid-2-yl)propyldimethylamine hydrogen maleate.

Chlorpheniramine Maleate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{16}H_{19}ClN_2,C_4H_4O_4$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorpheniramine maleate IPRS* or with the reference spectrum of chlorpheniramine maleate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.0 to 5.0, determined in a 1.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. A 5.0 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform* and mix. Dilute 5.0 ml of the resulting solution to 25.0 ml with *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any spot remaining on the line of application.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *chlorpheniramine maleate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- column temperature: 25°,
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of a buffer solution prepared by dissolving 8.57 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

The retention time of principal peak is about 11 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Storage. Store protected from light and moisture.

Chlorpheniramine Injection

Chlorpheniramine Maleate Injection

Chlorpheniramine Injection is a sterile solution of Chlorpheniramine Maleate in Water for Injections free from dissolved air and containing suitable buffering and stabilising agents.

Chlorpheniramine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of chlorpheniramine maleate, $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Usual strength. 10 mg in 1 ml.

Description. A colourless solution.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Heat the plate at 105° for 30 minutes before use.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *methanol* and 20 volumes of *1 M acetic acid*.

Test solution. Evaporate an appropriate volume of the injection to dryness in a current of nitrogen using the minimum amount of heat, dissolve the residue as completely as possible in sufficient *chloroform* to produce a solution containing 0.5 per cent w/v of Chlorpheniramine Maleate and centrifuge.

Reference solution. A 0.5 per cent w/v solution of *chlorpheniramine maleate IPRS* in *chloroform*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution. Spray the plate with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.0 to 5.2.

Related substances. Carry out the method described under the Identification test using as the test solution a solution prepared in the following manner. Evaporate an appropriate volume of the injection to dryness in a current of nitrogen using the minimum amount of heat. Dissolve the residue in sufficient *chloroform* to produce a solution containing 5.0 per cent w/v of Chlorpheniramine Maleate and centrifuge. For the reference solution, dilute 1 volume of the test solution to 500 volumes with *chloroform*. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Bacterial endotoxins (2.2.3). Not more than 8.8 Endotoxin Units per mg of chlorpheniramine maleate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute an accurately measured volume of the injection containing 10 mg of Chlorpheniramine Maleate to 500.0 ml with *0.25 M sulphuric acid*. Measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ taking 212 as the specific absorbance at 265 nm.

Storage. Store protected from light.

Chlorpheniramine Tablets

Chlorpheniramine Maleate Tablets

Chlorpheniramine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chlorpheniramine maleate, $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Usual strengths. 4 mg; 8 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Heat the plate at 105° for 30 minutes before use.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *methanol* and 20 volumes of *1 M acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 5 mg of Chlorpheniramine Maleate with *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *chloroform*.

Reference solution. A 0.5 per cent w/v solution of *chlorpheniramine maleate IPRS* in *chloroform*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The two principal spots obtained in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution. Spray the plate with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted if necessary, at the maximum at about 265 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *chlorpheniramine maleate IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 100 mg of Chlorpheniramine Maleate with *chloroform*, filter, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with *chloroform* and dilute 1.0 ml of the resulting solution to 10.0 ml with the same solvent.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any spot remaining on the line of application.

Uniformity of content. Complies with test stated under Tablets.

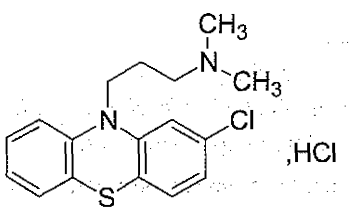
Powder one tablet and carry out the Assay beginning at the words "shake with 20 ml of *0.05 M sulphuric acid*...". Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 4 mg of Chlorpheniramine Maleate, shake with 20 ml of *0.05 M sulphuric acid* for 5 minutes, add 20 ml of *ether*, shake carefully and filter the acid layer into a second separator. Extract the ether layer with two quantities, each of 10 ml, of *0.05 M sulphuric acid*, filter each acid layer into the second separator and wash the filter with *0.05 M sulphuric acid*. Make the combined acid extracts and washing just alkaline to *litmus paper* with *1 M sodium hydroxide*, add 2 ml in excess, and extract with two quantities, each of 50 ml, of ether. Wash each ether extract with the same 20 ml of *water* and extract in succession with 20, 20 and 5 ml of *0.25 M sulphuric acid*, dilute the combined acid extracts to 50.0 ml with *0.25 M sulphuric acid*; dilute 10.0 ml to 50.0 ml with *0.25 M sulphuric acid* and measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$, taking 212 as the specific absorbance at 265 nm.

Storage. Store protected from light and moisture.

Chlorpromazine Hydrochloride



$C_{17}H_{19}ClN_2S,HCl$ Mol. Wt. 355.3

Chlorpromazine Hydrochloride is 2-chloro-10-(3-dimethylaminopropyl)phenothiazine hydrochloride.

Chlorpromazine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{19}ClN_2S,HCl$, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Description. A white or creamy-white, crystalline powder. It decomposes on exposure to air and light becoming yellow, pink and finally violet.

Identification

Test A may be omitted if tests B, C and D are carried out. Test B may be omitted if tests A, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorpromazine hydrochloride IPRS* or with the reference spectrum of chlorpromazine hydrochloride.

B. When examined in the range 230 nm to 360 nm, a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 254 nm and 306 nm, 0.45 to 0.48 (2.4.7).

C. Complies with the test for identification of phenothiazines (2.3.3)

D. A 5 per cent w/v solution gives reaction (B) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 4.5, determined in a 10.0 per cent solution.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase (a).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.6 g, dissolve in 200 ml of *acetone* and add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03553 g of $C_{17}H_{19}ClN_2S,HCl$.

Storage. Store protected from light and moisture.

Chlorpromazine Injection

Chlorpromazine Hydrochloride Injection

Chlorpromazine Injection is a sterile solution of Chlorpromazine hydrochloride in Water for Injections free from air and containing buffering and stabilizing agents.

Chlorpromazine Hydrochloride contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S,HCl$.

NOTE — Protect the solutions from light throughout the tests.

Usual strength. 25 mg per ml.

Description. A colourless or almost colourless solution.

Identification

A. To a volume containing 0.1 g of Chlorpromazine Hydrochloride, add 20 ml *of water* and 2 ml *of 10 M sodium hydroxide*. Extract with 25 ml *of ether*, wash the ether extract with two quantities, each of 5 ml, of *water*, dry the ether extract with *anhydrous sodium sulphate*, evaporate the ether and dissolve the residue in 1 ml of *chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorpromazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of chlorpromazine.

B. Dilute a volume of the injection with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.0005 per cent w/v of Chlorpromazine Hydrochloride. The resulting solution, when examined in the range 230 nm to 360 nm shows absorption maxima at about 254 nm and 306 nm, 0.45 to 0.48 (2.4.7).

C. It gives reaction (B) of chlorides (2.3.1).

Tests

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase (a) and the following solution.

Test solution. Dilute a volume of the injection with sufficient of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to produce a solution containing 2.0 per cent of Chlorpromazine Hydrochloride.

Bacterial endotoxins (2.2.3). Not more than 6.9 Endotoxin Units per mg of chlorpromazine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute an accurately measured volume of the injection with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.0005 per cent w/v of Chlorpromazine Hydrochloride and measure the absorbance of the resulting solution at the maximum at about 254 nm (2.4.7). Calculate the content of $C_{17}H_{19}ClN_2S,HCl$, taking 915 as the specific absorbance at 254 nm.

Storage. Store protected from light.

Chlorpromazine Tablets

Chlorpromazine Hydrochloride Tablets

Chlorpromazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S,HCl$. The tablets are coated.

NOTE — Protect the solutions from light throughout the tests.

Usual strengths. 10 mg; 25 mg; 50 mg; 100 mg; 200 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Chlorpromazine Hydrochloride add 10 ml of *water* and 2 ml of *10 M sodium hydroxide*. Extract with 15 ml of *ether* and wash the ether extract with two quantities each of 5 ml, *of water*, dry with *anhydrous sodium sulphate*. Evaporate the ether and dissolve the residue in 0.4 ml *of chloroform*. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorpromazine hydrochloride IPRS* treated in the same manner or with the reference spectrum of chlorpromazine.

B. Digest a quantity of the powdered tablets containing 25 mg of Chlorpromazine Hydrochloride with 25 ml of *water* and filter. Reserve a portion of the filtrate for Identification C. Dilute a volume of the filtrate with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.0005 per cent w/v of Chlorpromazine Hydrochloride. The resulting solution, when examined in the range 230 nm to 360 nm shows absorption maxima at about 254 nm and 306 nm, 0.45 to 0.48 (2.4.7).

C. The filtrate reserved in test B gives reaction B of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium: 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium, if necessary. Measure the absorbance of the

resulting solution at the maximum at about 254 nm (2.4.7). Calculate the content of chlorpromazine hydrochloride, $C_{17}H_{19}ClN_2S$, HCl in the medium from the absorbance obtained from a solution of known concentration of *chlorpromazine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{19}ClN_2S$, HCl.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase (a) and the following solutions.

Test solution. Extract a quantity of the powdered tablets containing 0.2 g of Chlorpromazine Hydrochloride with 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filter.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Uniformity of content. Complies with the test stated under Tablets.

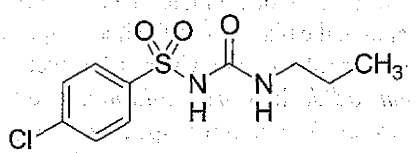
Powder one tablet, shake with 1 ml *of dilute hydrochloric acid* and 40 ml of *water* for 15 minutes, add sufficient *water* to produce 100.0 ml and mix. Centrifuge about 15 ml and to 10.0 ml of the clear, supernatant liquid add 2 ml of *1 M hydrochloric acid* and sufficient *water* to produce a solution containing about 0.0005 per cent w/v of Chlorpromazine Hydrochloride. Measure the absorbance of the resulting solution at the maximum at about 254 nm (2.4.7). Calculate the content of $C_{17}H_{19}ClN_2S$,HCl in the tablet taking 915 as the specific absorbance at 254 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Chlorpromazine Hydrochloride, add 5 ml of *dilute hydrochloric acid* and 200 ml of *water*. Shake for 15 minutes and add sufficient *water* to produce 500.0 ml. Centrifuge about 15 ml and to 5.0 ml of the clear, supernatant liquid add 10 ml of *dilute hydrochloric acid* and sufficient *water* to produce 200.0 ml. Measure the absorbance of the resulting solution at the maximum at about 254 nm (2.4.7). Calculate the content of $C_{17}H_{19}ClN_2S$,HCl, taking 915 as the specific absorbance at 254 nm.

Storage. Store protected from light.

Chlorpropamide



$C_{10}H_{13}ClN_2O_3S$ Mol. Wt. 276.7

Chlorpropamide is 1-(4-chlorobenzenesulphonyl)-3-propylurea.

Chlorpropamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{13}ClN_2O_3S$, calculated on the dried basis.

Category. Hypoglycaemic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorpropamide IPRS* or with the reference spectrum of chlorpropamide.

B. Dissolve 0.16 g in 50 ml of *methanol*, dilute 5 ml to 100 ml with *0.01 M hydrochloric acid* and dilute 5 ml of the solution to 100 ml with *0.01 M hydrochloric acid*. When examined in the range 220 nm to 360 nm, the resulting solution shows an absorption maximum at about 232 nm, about 0.48 (2.4.7).

C. Boil 0.1 g with 8 ml of 50 per cent w/v solution of *sulphuric acid* under a reflux condenser for 30 minutes, cool and filter, reserving the filtrate for test D. The precipitate, after recrystallisation from *water* and drying, melts at about 143° (2.4.21).

D. Make the filtrate reserved in test C alkaline with *sodium hydroxide solution* and heat; an ammonical odour is produced.

E. Heat 0.1 g with 1 g of *anhydrous sodium carbonate* at a dull red heat for 10 minutes. Cool, extract the residue with *water* and filter. Acidify the filtrate with *dilute nitric acid* and add *silver nitrate solution*; a white precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 50 volumes of *methanol*, 30 volumes of *cyclohexane* and 11.5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.6 g of the substance under examination in 10 ml of *acetone*.

Reference solution (a). A 0.02 per cent w/v solution of *4-chlorobenzenesulphonamide* in *acetone*.

Reference solution (b). A 0.02 per cent w/v solution of *1,3-dipropylurea IPRS* in *acetone*.

Reference solution (c). A 0.02 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of cold air, heat at 110° for 10 minutes,

place the plate, while hot, in a tank of chlorine gas prepared by adding *hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry it in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5 per cent w/v solution of *potassium iodide* in *starch solution;* avoid prolonged exposure to cold air. Any spots corresponding to 4-chlorobenzenesulphonamide and 1,3-dipropylurea in the chromatogram obtained with the test solution are not more intense than the spots in the chromato-gram obtained with reference solution (a) and (b) respectively. Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c).

Heavy metals (2.3.13). 0.66 g complies with the limit test for heavy metals, Method B (30 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g and dissolve in 50 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution*. Add 25 ml of *water* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02767 g of $C_{10}H_{13}ClN_2O_3S$.

Chlorpropamide Tablets

Chlorpropamide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chlorpropamide, $C_{10}H_{13}ClN_2O_3S$.

Usual strengths. 100 mg; 250 mg.

Identification

Extract a quantity of the powdered tablets containing 1 g of Chlorpropamide with five quantities, each of 4 ml, of *acetone*, filter and carefully evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Boil 0.1 g with 8 ml of 50 per cent w/v solution of *sulphuric acid* under a reflux condenser for 30 minutes, cool and filter, reserving the filtrate for test B. The precipitate, after recrystallisation from *water* and drying, melts at about 143° (2.4.21).

B. Make the filtrate reserved in test A alkaline with *sodium hydroxide solution* and heat; an ammonical odour is produced.

C. Heat 0.1 g with 1 g of *anhydrous sodium carbonate* at a dull red heat for 10 minutes. Cool, extract the residue with *water* and filter. Acidify the filtrate with *dilute nitric acid* and add *silver nitrate solution*; a white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus. No. 2 (Paddle),
Medium. 900 ml of a 0.68 per cent w/v solution of *potassium dihydrogen phosphate* adjusted to pH 7.4 by the addition of *1 M sodium hydroxide*.
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid* to obtain a solution containing about 10 µg of chlorpropamide per ml. Measure the absorbance of the resulting solution at the maximum at about 232 nm (2.4.7). Calculate the content of $C_{10}H_{13}ClN_2O_3S$ taking 598 as the specific absorbance at 232 nm.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{13}ClN_2O_3S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 50 volumes of *methanol*, 30 volumes of *cyclohexane* and 11.5 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.6 g of Chlorpropamide with 10 ml of *acetone* and filter.

Reference solution (a). A 0.02 per cent w/v solution of *4-chlorobenzenesulphonamide* in *acetone*.

Reference solution (b). A 0.02 per cent w/v solution of *1,3-dipropylurea IPRS* in *acetone*.

Reference solution (c). A 0.02 per cent w/v solution of the substance under examination in *acetone*.

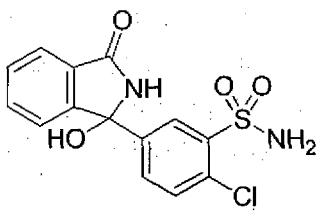
Apply to the plate 5 µl of each solution. After development, dry the plate in a current of cold air, heat at 110° for 10 minutes, place the plate, while hot, in a tank of chlorine gas prepared by adding *hydrochloric acid* to a 5 per cent w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry it in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5 per cent w/v solution of *potassium iodide* in *starch solution;* avoid prolonged exposure to cold air. Any spots corresponding to 4-chlorobenzenesulphonamide and 1,3-dipropylurea in the chromatogram obtained with the test solution are not more

intense than the spots in the chromatogram obtained with reference solution (a) and (b) respectively. Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.25 g of Chlorpropamide and shake with 40 ml of *methanol* for 20 minutes, add sufficient *methanol* to produce 50.0 ml, mix, filter and dilute 5.0 ml of the filtrate to 100.0 ml with *0.1 M hydrochloric acid*. Mix, dilute 10.0 ml of the solution to 250.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 232 nm (2.4.7). Calculate the content of $C_{10}H_{13}ClN_2O_3S$ taking 598 as the specific absorbance at 232 nm.

Chlorthalidone



$C_{14}H_{11}ClN_2O_4S$ Mol. Wt. 338.8

Chlorthalidone is (*RS*)-2-chloro-5-(1-hydroxy-3-oxoisoindolin-1-yl)benzenesulphonamide.

Chlorthalidone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{11}ClN_2O_4S$, calculated on the dried basis.

Category. Diuretic.

Description. A white to yellowish-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorthalidone IPRS* or with the reference spectrum of chlorthalidone.

B. When examined in the range 230 nm to 360 nm, a 0.01 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at about 275 nm and at about 284 nm; absorbance at about 275 nm, about 0.6 and at about 284 nm, about 0.45 (2.4.7).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 197 volumes of *ethyl acetate* and 3 volumes of *water*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *acetone*.

Reference solution. A 0.1 per cent w/v solution of *chlorthalidone IPRS* in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg in 1 ml of *sulphuric acid*; an intense yellow colour is produced.

Tests

Appearance of solution. Dissolve 1.0 g in sufficient *2 M sodium hydroxide* to produce 10 ml. The solution is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solution (2.4.1).

Acidity. Dissolve 1 g in a mixture of 25 ml of *acetone* and 25 ml of *carbon dioxide-free water* with the aid of heat, cool and titrate with *0.1 M sodium hydroxide* using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations is not more than 0.75 ml.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 2 volumes of a 0.2 per cent w/v solution of *sodium hydroxide*, 48 volumes of mobile phase B and 50 volumes of mobile phase A.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.0001 per cent w/v solution of *chlorthalidone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica gel (5 µm),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving 1.32 g of *diammonium hydrogen orthophosphate* in 900 ml of *water*, adjusted to pH 5.5 with *dilute orthophosphoric acid* and dilute to 1000 ml with *water*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
16	65	35
21	50	50
35	50	50
45	65	35

Name	Relative retention time
Chlorthalidone impurity B[1]	0.7
Chlorthalidone impurity J[2]	0.9
Chlorthalidone(retention time: about 7 minutes)	1.0
Chlorthalidone impurity G[3]	6.0

[1]2-(4-chloro-3-sulfamoylbenzoyl)benzoic acid,

[2]impurity of unknown structure with a relative retention of about 0.9,

[3](3*RS*)-3-(3,4-dichlorophenyl)-3-hydroxy-2,3-dihydro-1*H*-isoindol-1-one.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to impurity B is not more than 7 times the area of principal peak in the chromatogram obtained with the reference solution (0.7 per cent), the area of any peak due to impurity J is not more than 3 times the area of principal peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of any peak due to impurity G is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 12 times the area of the principal peak in the chromatogram with the reference solution(1.2 per cent).

Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorides (2.3.12). Triturate 0.5 g with 30 ml of *water*, shake for 5 minutes and filter. 15 ml of the filtrate complies with the limit test for chlorides. Use 5.0 ml of *chloride standard solution (25 ppm Cl)* to prepare the standard (500 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of *methanol*. Take 5.0 ml of the resulting solution, dilute with *water* to 50.0 ml and mix.

Reference solution. A 0.1 per cent w/v solution of *chlorthalidone IPRS* in *methanol*. Take 5.0 ml of the solution dilute with 50.0 ml of *water* and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *0.01 M dibasic ammonium phosphate* and 40 volumes of *methanol* adjusted to pH 5.5 with *orthophosphoric acid*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{11}ClN_2O_4S$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Chlorthalidone Tablets

Chlorthalidone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of chlorthalidone, $C_{14}H_{11}ClN_2O_4S$.

Usual strength. 50 mg.

Identification

Heat a quantity of the powdered tablets containing 0.2 g of Chlorthalidone with 20 ml of *acetone* on a water-bath for 10 minutes, cool and filter. Add 40 ml of *water* to the filtrate and heat on a water-bath for 20 minutes using a gentle current of air to remove the solvent. Cool to room temperature and allow to stand, filter and dry the crystals at 105° for 4 hours. The crystals comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorthalidone IPRS* or with the reference spectrum of chlorthalidone.

B. When examined in the range 230 nm to 360 nm, a 0.01 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at about 275 nm and at about 284 nm; absorbance at about 275 nm, about 0.6 and at about 284 nm, about 0.45 (2.4.7).

C. Wash with *water* a quantity of the crystals obtained in test A and dissolve 50 mg in 3 ml of *sulphuric acid*; an intense yellow colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{14}H_{11}ClN_2O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *chlorthalidone IPRS*, prepared by dissolving in *methanol* and diluted with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_{11}ClN_2O_4S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *butanol* and 15 volumes of *1M ammonia*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Chlorthalidone with 5.0 ml of *acetone*, centrifuge and use the supernatant liquid.

Reference solution. A solution containing 0.01 per cent w/v of *2-(4-chloro-3-sulphamoylbenzoyl)benzoic acid IPRS* in *acetone*.

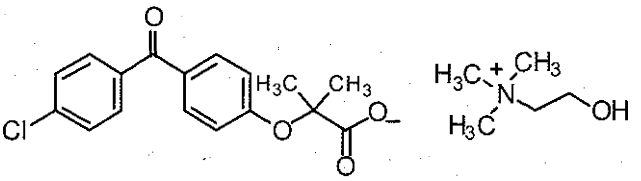
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Chlorthalidone, boil with 30 ml of *methanol* under a reflux condenser for 5 minutes, shake vigorously for 15 minutes, cool and filter; wash the residue with *methanol* and filter. Dilute the combined filtrate and washings to 100.0 ml with *methanol*. To 5.0 ml add 2 ml of *1M hydrochloric acid* and sufficient *methanol* to produce 50.0 ml. Measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{14}H_{11}ClN_2O_4S$ taking 57.4 as the specific absorbance at 275 nm.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Choline Fenofibrate



$C_{22}H_{28}ClNO_5$ Mol Wt. 421.9

Choline Fenofibrate is 2-[4-(4-Chlorophenylcarbonyl) phenoxy]-2-methylpropanoate choline salt.

Choline Fenofibrate contains fenofibric acid not less than 72.0 per cent and not more than 76.0 per cent and choline not less than 23.0 per cent and not more than 26.0 per cent, calculated on the dried basis.

Category. Antihyperlipidaemic.

Description. A white to off white crystalline powder.

Identification

A. In the test for Related substances, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase and dilute to 25.0 ml with mobile phase.

Reference solution. A 0.1 per cent w/v solution of *choline fenofibrate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *water* ,adjusted to pH 2.5 with *phosphoric acid* and 70 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks is not more than 0.5 per cent, calcuated by area normalisation.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. *For Fenofibric acid*—Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase and dilute to 25.0 ml with mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with mobile phase.

Reference solution. A 0.025 per cent w/v solution of *fenofibric acid IPRS* in the mobile phase.

Use the chromatographic system described as in the Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of fenofibric acid.

For Choline — Weigh 0.3 g, dissolve in 70 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1ml of *0.1 M perchloric acid* is equivalent to 0.0104 g of choline.

Chorionic Gonadotrophin

Human Chorionic Gonadotrophin

Chorionic Gonadotrophin is a dry, sterile preparation of placental glycoproteins that has luteinising activity. It is extracted from the urine of pregnant women. The material is sterilised by filtration and dried under reduced pressure or freeze-dried.

Chorionic Gonadotrophin contains not less than 2500 Units per mg.

Category. Gonadotrophic hormone.

Description. A white or almost white, amorphous powder.

Identification

It causes an increase in the weight of the seminal vesicles or of the prostate glands of immature male rats when administered as directed in the Assay.

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

Water (2.3.43). Not more than 5.0 per cent, determined on 0.2 g.

Assay. Carry out the biological assay of chorionic gonadotrophin described below.

Standard preparation. The 3rd International Standard for Chorionic Gonadotrophin, human, established in 1986, consisting of a freeze-dried extract of human chorionic gonadotrophin with human albumin (supplied in ampoules containing 650 Units), or another suitable preparation the potency of which has been determined in relation to the International Standard.

Dissolve a sufficient quantity corresponding to the daily doses to be used in sufficient *albumin-phosphate buffer pH 7.2* so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test preparation. Dissolve a sufficient quantity of the preparation under examination corresponding to the daily doses to be used in sufficient *albumin-phosphate buffer pH 7.2* so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Use immature male rats of the same strain, approximately 21 days old and of approximately equal weight within the range 25 to 35 g. Assign the rats at random to four equal groups of at least eight animals. If sets of four littermates are available, allot one littermate from each set at random to each group and mark according to the litter.

Choose two doses of the standard preparation and two of the test solution such that the smaller dose is sufficient to produce a positive response in some of the rats and the larger dose does not produce a maximum response in all of the rats. As an initial approximation, doses of 7.5 and 15 Units may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Inject subcutaneously into each rat the daily dose allocated to its group on 4 consecutive days at the same time each day. On the fifth day, about 24 hours after the last injection, kill the rats and remove the seminal vesicles or the prostate glands from each animal. Remove any extraneous fluid and tissue from the vesicles or glands and weigh them immediately. Calculate the result of the assay by standard statistical methods using the weight of the vesicles or prostate glands as the response.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of the stated potency.

Chorionic Gonadotrophin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 15.0 Endotoxin Units per ml of a solution prepared in the following manner. Dissolve a quantity in *water BET* to obtain a solution containing 500 units of chorionic gonadotrophin per ml. Carry out the test using Maximum Valid dilution of the solution calculated from the declared sensitivity of the lysate used in the test.

Chorionic Gonadotrophin intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirements.

Sterility (2.2.11). Complies with the test for sterility.

Abnormal toxicity (2.2.1). Complies with the test for abnormal toxicity (2.2.1) using a quantity equivalent to 1000 Units dissolved in 0.5 ml of *sodium chloride injection* and observing the animals for 48 hours.

Storage. Store protected from light in a tamper-evident container, which is sealed so as to exclude micro-organisms, in a refrigerator (2° to 8°).

Labelling. The label states (1) the number of Units contained in the container; (2) the number of Units per mg; (3) whether or not it is intended for use in the manufacture of parenteral preparations.

Chorionic Gonadotrophin Injection

Chorionic Gonadotrophin Injection is a sterile material consisting of Chorionic Gonadotrophin with or without excipients such as buffers, diluents or other inert substances such as Lactose or Sodium Chloride. It may also contain an antimicrobial agent. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections or a suitable diluent supplied by the manufacturer, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Chorionic Gonadotrophin Injection contains not less than 80.0 per cent and not more than 125.0 per cent of the stated potency.

Usual strengths. 500, 1000, 2000, 5000 and 10,000 Units in each sealed container.

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Identification

It causes an increase in the weight of the seminal vesicles or of the prostate glands of immature male rats when administered as directed in the Assay.

Tests

pH (2.4.24). 6.0 to 8.0, determined in a 1.0 per cent w/v solution.

Assay. Carry out the biological assay of chorionic gonadotrophin described below.

Standard preparation. The 3rd International Standard for Chorionic Gonadotrophin, human, established in 1986, consisting of a freeze-dried extract of human chorionic gonadotrophin with human albumin (supplied in ampoules containing 650 Units), or another suitable preparation the potency of which has been determined in relation to the International Standard.

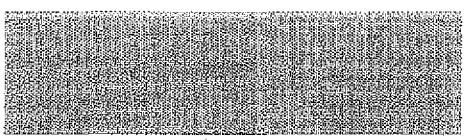
Dissolve a sufficient quantity corresponding to the daily doses to be used in sufficient *albumin-phosphate buffer pH 7.2* so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Test preparation. Dissolve a sufficient quantity of the injection under examination corresponding to the daily doses to be used in sufficient *albumin-phosphate buffer pH 7.2* so that the daily dose is about 0.2 ml. Add a suitable antimicrobial preservative such as 0.4 per cent w/v of *phenol* or 0.002 per cent w/v of *thiomersal*. Store the solution at a temperature of 2° to 8°.

Use immature male rats of the same strain, approximately 21 days old and of approximately equal weight within the range 25 to 35 g. Assign the rats at random to four equal groups of at least eight animals. If sets of four littermates are available, allot one littermate from each set at random to each group and mark according to the litter.

Choose two doses of the standard preparation and two of the test solution such that the smaller dose is sufficient to produce a positive response in some of the rats and the larger dose does not produce a maximum response in all of the rats. As an initial approximation, doses of 7.5 and 15 Units may be tried although the dose will depend on the sensitivity of the animals used that may vary widely.

Inject subcutaneously into each rat the daily dose allocated to its group on 4 consecutive days at the same time each day. On the fifth day, about 24 hours after the last injection, kill the rats and remove the seminal vesicles or the prostate glands from each animal. Remove any extraneous fluid and tissue from the vesicles or glands and weigh them immediately.



Calculate the result of the assay by standard statistical methods using the weight of the vesicles or prostate glands as the response.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The fiducial limits of error are not less than 64 per cent and not more than 156 per cent of the stated potency.

Bacterial endotoxins (2.2.3). Not more than 15 Endotoxin Units per ml of a solution prepared in the following manner. Dissolve the contents of a sealed container in *water BET* to obtain a solution containing 500 units of chorionic gonadotrophin per ml. Carry out the test using Maximum Valid Dilution of the solution calculated from the declared sensitivity of the lysate used in the test.

Abnormal toxicity (2.2.1). Use a quantity equivalent to 1000 Units dissolved in 0.5 ml of *sodium chloride injection* and observing the animals for 48 hours.

Storage. Store protected from light in containers, which are sealed so as to exclude micro-organisms, at a temperature not exceeding 20°.

Labelling. The label states (1) the number of Units contained in the sealed container; (2) the name(s) of any added substance(s).

Chymotrypsin

Chymotrypsin is a proteolytic enzyme obtained by the activation of chymotrypsinogen extracted from the pancreas of beef *(Bos taurus* L.*)*. It has an activity of not less than 5.0 microkatals per milligram. In solution it has maximal enzymic activity at about pH 8; the activity is reversibly inhibited at pH 3, the pH at which it is most stable.

Category. Proteolytic enzyme.

Production

The animals from which chymotrypsin is derived must fulfil the requirements for the health of animals suitable for human consumption. Furthermore, the tissues used shall not include any specified risk material as defined by any relevant international or, where appropriate, national legislation.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Histamine (2.2.7). Not more than 1 µg (calculated as histamine base) per 5 microkatals of chymotrypsin activity. Before carrying out the test, heat the solution of the substance under examination on a water-bath for 30 minutes.

Description. A white or almost white, crystalline or amorphous powder.

Identification

Substrate solution. To 24 mg of *acetyltyrosine ethyl ester* add 0.2 ml of *ethanol (95 per cent)*, and swirl until solution is effected. Add 2.0 ml of *0.067 M phosphate buffer solution pH 7.0* and 1 ml of *methyl red mixed solution* and dilute to 10.0 ml with *water*.

A. A 1.0 per cent w/v solution in *carbon dioxide-free water* (Solution A). Dilute 1 ml of solution A to 10 ml with *water*. In a depression in a white spot plate, mix 0.05 ml of the solution with 0.2 ml of substrate solution; a purple colour develops.

B. Dilute 0.5 ml of solution A to 5 ml with *water*. Add 0.1 ml of a 2 per cent w/v solution of *tosylphenylalanylchloromethane* in *ethanol (95 per cent)*. Adjusted to pH 7.0 and shake for 2 hours. In a depression in a white spot plate, mix 0.05 ml of the solution with 0.2 ml of the substrate solution; no colour develops within 3 minutes of mixing.

Tests

Appearance of solution. Solution A is not more opalescent than Opalescence standard OS2 (2.4.1).

pH (2.4.24). 3.0 to 5.0, determined in solution A.

Light absorption. Dissolve 30 mg in 100.0 ml of *0.001 M hydrochloric acid*. The solution shows an absorption maximum at 281 nm and a minimum at 250 nm (2.4.7). The specific absorbance at the absorption maximum is 18.5 to 22.5 and at the absorption minimum is not more than 8.

Trypsin. Transfer to a depression in a white spot plate 0.05 ml of *tris (hydroxymethyl)aminomethane buffer solution pH 8.1* and 0.1 ml of solution A. Add 0.2 ml of substrate solution. At the same time and in the same manner, prepare a reference solution using the substance under examination to which not more than 1 per cent w/w of *trypsin* has been added. Start a timer. No colour appears in the test solution within 3-5 minutes after the addition of the substrate solution. A purple colour is produced in the control solution.

Substrate solution. To 98.5 mg of *tosylarginine methyl ester hydrochloride*, suitable for assaying trypsin, add 5 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 8.1* and swirl to dissolve. Add 2.5 ml of *methyl red mixed solution* and dilute to 25.0 ml with *water*.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying at 60° at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. The activity of chymotrypsin is determined by comparing the rate at which it hydrolyses *acetyltyrosine ethyl ester* with the rate at which *chymotrypsin IPRS* hydrolyses the same substrate under the same conditions.

Apparatus

Use a reaction vessel of about 30 ml capacity provided with:

– a device that will maintain a temperature of 25.0 ± 0.1°;
– a stirring device, for example a magnetic stirrer;
– a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. For the latter the burette is graduated in 0.005 ml and the pH meter is provided with a wide scale and glass- calomel or glass-silver-silver chloride electrodes.

Test solution. Dissolve 25 mg of the substance under examination in 250.0 ml of *0.001 M hydrochloric acid.*

Reference solution. A 0.01 per cent w/v solution of *chymotrypsin IPRS* in *0.001 M hydrochloric acid.*

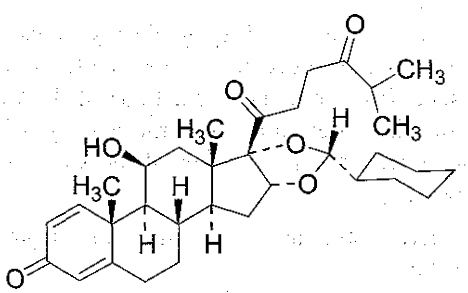
Store the solutions at below 5°. Warm 1 ml of each solution to about 25° over 15 minutes and use 50 µl of each solution (corresponding to about 25 nanokatals) for each titration. Carry out the titration in an atmosphere of nitrogen. Transfer 10.0 ml of *0.01 M calcium chloride solution* to the reaction vessel and, while stirring, add 0.35 ml of *0.2 M acetyltyrosine ethyl ester solution* . When the temperature is steady at 25.0 ± 0.1° (after about 5 minutes) adjusted to pH exactly 8.0 with *0.02 M sodium hydroxide*. Add 50 µl of the test solution (equivalent to about 5 µg of the substance under examination) and start a timer. Maintain the pH at 8.0 by the addition of *0.02 M sodium hydroxide*, noting the volume added every 30 seconds. Calculate the volume of *0.02 M sodium hydroxide* used per second between 30 seconds and 210 seconds. Carry out a titration in the same manner using the reference solution and calculate the volume of *0.02 M sodium hydroxide* used per second.

Calculate the activity in microkatals per milligram.

Storage. Store protected from light, in a refrigerator (2° to 8°).

Labelling. The quantity of chymotrypsin and the total activity in microkatals per container; for the amorphous substance, that it is hygroscopic.

Ciclesonide



$C_{32}H_{44}O_7$ Mol. Wt. 540.7

Ciclesonide is (11β,16α)-16,17-[(*R*)-cyclohexylmethylene] bis(oxy)-11-hydroxy-21-(2-methyl-1-oxopropoxy)pregna-1,4-diene-3,20-dione.

Ciclesonide contains not less than 98.0 per cent and not more than 102.0 per cent of ciclesonide, $C_{32}H_{44}O_7$, calculated on the anhydrous basis.

Category. Glucocorticoid.

Description. A white to-off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ciclesonide* RS or with the reference spectrum of ciclesonide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +90.0° to +98.0°, determined in a 0.5 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of *methanol.*

Reference solution. A 0.001 per cent w/v solution of *ciclesonide IPRS* in *methanol.*

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
– mobile phase: A. dilute 1 volume of *orthophosphoric acid* to 1000 ml with *water*,
B. *acetonitrile,*
– a gradient programme using the conditions given below,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 240 nm,
– injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
20	25	75
40	25	75
45	65	35
55	65	35

Inject the reference solution. The test is not valid unless the column efficiency is not less than 30000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Any individual impurity is not more than 0.5 per cent and the sum of all the impurities found is not more than 1.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of *methanol*. Dilute 5 ml of the resulting solution to 50.0 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *ciclesonide IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of 0.1 per cent *orthophosphoric acid* and 70 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{44}O_7$.

Storage. Store protected from light, at a temperature not exceeding 30°.

Ciclesonide Inhalation

Ciclesonide Inhalation is a suspension or solution of microfine Ciclesonide in a suitable liquid filled in a suitable pressurized container. It may contain suitable pharmaceutical aids such as surfactants, stabilizing agents.

Ciclesonide Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of ciclesonide, $C_{32}H_{44}O_7$, per inhalation by actuation of the valve.

Usual strengths. 80 µg per metered dose; 160 µg per metered dose.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *water* and *acetonitrile*.

Test solution. Prepare using the solvent mixture as described under the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Reference solution (a). A 0.04 per cent w/v solution of *ciclesonide IPRS* in *acetonitrile*.

Reference solution (b). Dilute reference solution (a) with the solvent mixture to obtain a solution containing 32 µg of Ciclesonide per ml.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by diluting 1 ml of *orthophosphoric acid* to 1000 ml with *water* and 70 volumes of *acetonitrile*,
- flow rate: 3 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 200 µl or 100 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 3500 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

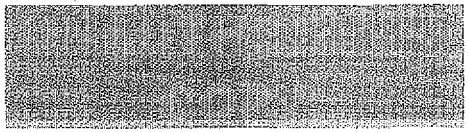
Inject reference solution (b) and the test solution.

Calculate the content of $C_{32}H_{44}O_7$ in the solution and the amount of $C_{32}H_{44}O_7$ delivered per actuation of the valve.

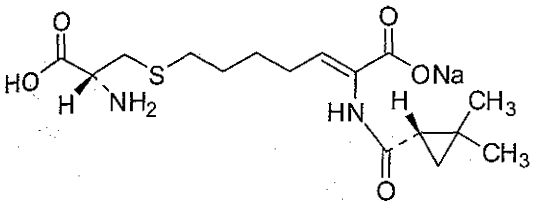
Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{32}H_{44}O_7$ delivered per actuation of the valve meets the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amount of active ingredient delivered per inhalation.



Cilastatin Sodium



$C_{16}H_{25}N_2NaO_5S$ Mol. Wt. 380.4

Cilastatin sodium is sodium (*Z*)-7-[[(*R*)-2-amino-2-carboxyethyl]sulphanyl]-2-[[[(1*S*)-2,2-dimethyl-cyclopropyl]carbonyl]amino]hept-2-enoate.

Cilastatin Sodium contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{16}H_{25}N_2NaO_5S$, calculated on the anhydrous and solvent free basis.

Category. Antibacterial.

Description. A white or light yellow amorphous powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cilastatin sodium IPRS* or with the reference spectrum of cilastatin sodium.

B. It gives reaction A of sodium (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon-dioxide free water* (Solution A) is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 6.5 to 7.5, determined in solution A.

Specific optical rotation (2.4.22). +41.5° to +44.5°, determined in 1.0 per cent w/v solution in a mixture of 1 volume of *hydrochloric acid* and 120 volumes of *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 32 mg of the substance under examination in 20.0 ml of *water*.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 100.0 ml with *water*.

Reference solution (b). Dilute 5.0 ml the test solution to 100.0 ml with *water*. Dilute 5.0 ml of the solution to 50.0 ml with *water*.

Reference solution (c). Dissolve 16 mg of the substance under examination in *dilute hydrogen peroxide solution* and dilute to 10.0 ml with the same solvent. Allow to stand for 30 minutes. Dilute 1 ml of the solution to 100 ml with *water*.

Reference solution (d). Dissolve 32 mg of *mesityl oxide* in 100 ml of *water*. Dilute 1 ml of the solution to 50 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. a mixture of 30 volumes of *acetonitrile* and 70 volumes of a 0.1 per cent v/v solution of *orthophosphoric acid* in *water*,
  B. a 0.1 per cent v/v solution of *orthophosphoric acid* in *water*,
- a gradient programme using the conditions given below,
- flow rate: 2.0 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	15	85
30	100	0
46	100	0
56	15	85

Equilibrate the column with a mixture of 15 per cent v/v of mobile phase A and 85 per cent v/v of mobile phase B. Inject separately each solution. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 15 per cent of the full scale of the recorder.

Inject reference solution (a) and (c). The test is not valid unless, the chromatogram obtained with reference solution (c) shows three principal peaks: the first two peaks (cilastatin impurity A) may elute without being completely resolved and the capacity factor of the third peak (cilastatin) is not less than 10; in the chromatogram obtained with reference solution (a), the principal peak has a signal-to-noise ratio is not less than 5.0.

Inject reference solution (a), (b), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (a) and any peak corresponding to the principal peak in the chromatogram obtained with reference solution (d).

Mesityl oxide, acetone and methanol. Not more than 1.0 per cent w/w of *acetone*, 0.5 per cent w/w of *methanol* and 0.4 per cent w/w of *mesityl oxide*.

Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 0.5 ml of *propanol* in *water* and dilute to 1000 ml with the same solvent.

Test solution. Dissolve 0.2 g of the substance under examination in *water*, add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *water*.

Reference solution. Dissolve 2.0 ml of *acetone*, 0.5 ml of *methanol* and 0.5 ml of *mesityl oxide* in *water* and dilute to 1000 ml with the same solvent. To 2.0 ml of the solution add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *water*. This solution contains 316 µg of acetone, 79 µg of methanol and 86 µg of mesityl oxide per milliliter.

Chromatographic system
- a fused-silica column 30 m x 0.53 mm, packed with macrogol 20000 (film thickness 1.0 µm),
- temperature:
  column 50° from 0 to 2.5 minutes, 50° - 70° from 2.5 to 5 minutes and hold at 70° from 5 to 5.5 minutes,
  inlet port at 160°and detector at 220°,
- a flame-ionisation detector,
- flow rate: 9 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution and the test solution. Calculate the contents of acetone, methanol and mesityl oxide.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Dissolve 0.3 g in 30 ml of *methanol* and add 5 ml of *water*. Add *0.1 M hydrochloric acid* to a pH of about 3.0. Titrate with *0.1 M sodium hydroxide*, determining the end point potentiometrically (2.4.25). Three jumps of potential are observed, titrate to the third equivalence point. Use the volume added between the first and third point of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01902 g of $C_{16}H_{25}N_2NaO_5S$.

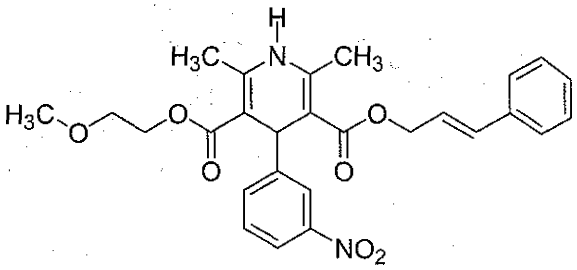
Cilastatin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.17 Endotoxin Units per mg of cilastatin sodium.

Storage. Store protected from moisture, at a temperature not exceeding 8°. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

Labelling. The label states, where applicable, that the substance is free from bacterial endotoxins.

Cilnidipine



$C_{27}H_{28}N_2O_7$ Mol. Wt. 492.5

Cilnidipine is 1,4-Dihydro-2,6-dimethyl-4-(3-nitrophenyl)-3,5-pyridinedicarboxylic acid 2-methoxyethyl (2*E*)-3-phenyl-2-propenyl ester.

Cilnidipine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{28}N_2O_7$, calculated on the dried basis.

Category. Antihypertensive, calcium channel blocker.

Description. Light yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with the *cilnidipine IPRS* or with the reference spectrum of cilnidipine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Melting range (2.4.21). 108° to 113°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.0001 per cent w/v solution of *cilnidipine impurity A IPRS [bis(2-methoxyethyl)2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate]* and *cilnidipine IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Inertsil-ODS-3V),
- mobile phase: a mixture of 20 volumes of *water*, 40 volumes of *acetonitrile* and 40 volumes of *methanol*,

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

The retention time of the cilnidipine impurity A is about 3.5 minutes and cilnidipine is about 7 minutes.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to cilnidipine impurity A and cilnidipine is not less than 6.5, the column efficiency for the peaks due to cilnidipine impurity A and cilnidipine is not less than 3000 theoretical plates and the tailing factor for the peaks due to cilnidipine impurity A and cilnidipine is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak of cilnidipine (about 25 minutes). In the chromatogram obtained with the test solution, the area of secondary peak corresponding to cilnidipine impurity A is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak of cilnidipine in the chromatogram obtained with reference solution (0.10 per cent) and the sum of the areas of all other secondary peaks is not more than 3 times the area of the principal peak of cilnidipine in the chromatogram obtained with the reference solution (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak of cilnidipine in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 60° for 1 hour under vacuum (reduce pressure of minimum 100 mm Hg).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol*; further dilute 1.0 ml of the solution to 100.0 ml with *methanol*.

Reference solution. A 0.001 per cent w/v solution of *cilnidipine IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Prodigy ODS 3V),
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of *0.01M sodium acetate buffer* prepared by dissolving 0.82 g of *sodium acetate anhydrous* in *water* and dilute to 1000 ml with *water* and adjusted to pH 5.0 with *dilute orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{28}N_2O_7$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Cilnidipine Tablets

Cilnidipine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Cilnidipine, $C_{27}H_{28}N_2O_7$.

Usual Strengths. 5 mg; 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 1.0 per cent w/v solution of *sodium lauryl sulphate* in *citro-phosphate* buffer solution prepared by dissolving 4.1363 g of *disodium hydrogen phosphate* and 0.475 g of *citric acid monohydrate* in 200 ml *water*, add 0.125 ml of *orthophosphoric acid* and dilute with *water* to 1000 ml. Adjusted to pH 6.8 with *2 M sodium hydroxide* or *ortho phosphoric acid* as required,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of medium and filter. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with dissolution medium. Measure the absorbance of the filtered solution at the maximum at about 243 nm (2.4.7). Calculate the content of *cilnidipine*, $C_{27}H_{28}N_2O_7$ in the medium from the absorbance obtained from a solution of known concentration of *cilnidipine IPRS* prepared by dissolving weighed quantity of *cilnidipine IPRS* in *methanol* and diluting further with the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{27}H_{28}N_2O_7$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing 50 mg of cilnidipine, disperse in 20 ml *methanol* with the aid of ultrasound for 20 minutes with intermediate shaking and dilute to 50.0 ml with mobile phase A, centrifuge and filter.

Reference solution. A 0.0002 per cent w/v solution of *cilnidipine IPRS* prepared by dissolving weighed quantity of *cilnidipine IPRS* completely in *methanol* and diluting further with the mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm), (Such as Kinetex C18),
- mobile phase: A. a mixture of 35 volumes of a buffer solution prepared by dissolving 2.0 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *dilute ortho phosphoric acid* and 65 volumes of *methanol*,

  B. a mixture of 40 volumes of a buffer solution prepared by dissolving 2.0 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *dilute phosphoric acid* and 60 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	45	55
12	45	55
20	35	65
28	35	65
45	35	65
55	45	55
60	45	55

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak of cilnidipine in the chromatogram obtained with reference solution (1.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in 50 ml solvent mixture with the aid of ultrasound for 15 minutes with intermediate shaking and dilute to volume to obtain a solution containing 0.005 per cent w/v of cilnidipine in solvent mixture.

Calculate the content of $C_{27}H_{28}N_2O_7$ in the Tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *acetonitrile,* 40 volumes of *methanol* and 20 volumes of a buffer solution prepared by dissolving 2.0 g of *ammonium dihydrogen phosphate,* in 1000 ml of *water*, adjusted to pH 3.0 with 10 per cent w/v solution of *ortho phosphoric acid.*

Test Solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 100 mg of cilnidipine, disperse in 50 ml solvent mixture with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with solvent mixture and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *cilnidipine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as YMC ODS-AM),
- mobile phase: a mixture of 25 volumes of a buffer solution prepared by dissolving 2.0 g of *ammonium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *dilute ortho phosphoric acid* and 75 volumes of *methanol*,
- column temperature: 40°,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

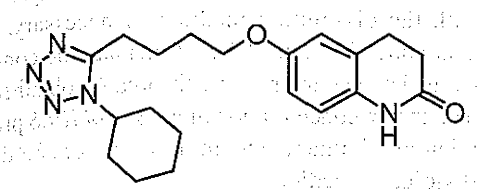
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{28}N_2O_7$ in the tablets.

Storage. Store protected from light and moisture.

Cilostazol



$C_{20}H_{27}N_5O_2$ Mol. Wt. 369.5

Cilostazol is 6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydroquinolin-2(1*H*)-one.

Cilostazol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{27}N_5O_2$, calculated on the dried basis.

Category. Indicated in intermittent claudication

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cilostazol IPRS* or with the reference spectrum of cilostazol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Dissolve 20 mg of Cilostazol in 20 ml of *acetonitrile* and dilute to 50.0 ml with *water*.

Reference solution. A solution containing 0.05 per cent w/v each of *cilostazol IPRS* and *cilostazol impurity C IPRS* in *acetonitrile*. Dilute 4.0 ml of the solution to a 10.0 ml with *water*. Further dilute the solution to obtain a 0.00004 per cent w/v of cilostazol with the solvent mixture.

Use chromatographic system as described under Assay.

Name	Relative retention time	Correction factor
Cilostazol impurity A[1]	0.2	0.59
Cilostazol impurity B[2]	0.9	1.72
Cilostazol	1.0	1.0
Cilostazol impurity C[3]	1.9	—
Any other impurity	—	1.0

[1]6-hydroxy-3,4-dihydro-1*H*-quinolin-2-one,

[2]6-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)-butoxy]-1*H*-quinolin-2-one,

[3]1-(4-(5-cyclohexyl-1*H*-tetrazol-1-yl)butyl)-6-(4-(1-cyclohexyl-1*H*-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1*H*)-one.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). The sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (0.4 per cent).

Chlorides. Not more than 0.018 per cent.

Test solution. Dissolve 0.5 g of Cilostazol in 40 ml of *dimethylformamide*, add 6 ml of *dilute nitric acid* and dilute to 50 ml with *dimethylformamide*.

Reference solution. To 0.25 ml of *0.01 M hydrochloric acid*, add 6 ml of *dilute nitric acid* and dilute to 50 ml with *dimethylformamide*.

Add 1 ml of 5.0 per cent w/v solution of *silver nitrate* to the solutions, mix well and allow to stand for 5 minutes, protecting from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely. The opalescence developed in the test solution is not more than that of the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.3 per cent, determined on 1.0 g by drying in an oven at 110° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Dissolve 20 mg of Cilostazol dissolve in 20 ml of *acetonitrile* and dilute to 50.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.005 per cent w/v, each of, *cilostazol IPRS*, *cilostazol impurity A IPRS* and *cilostazol impurity B IPRS* in the solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *cilostazol IPRS* in *acetonitrile*. Dilute 4.0 ml of the solution to a 10.0 ml with *water*. Further dilute the solution to obtain a solution of 0.004 per cent w/v of cilostazol with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 70 volumes of *water* and 30 volumes of *acetonitrile*,

B. a mixture of 50 volumes of *water* and 50 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent v/v)
0	100	0
6.5	50	50
10	0	100
20	0	100
20.1	100	0
28	100	0

Inject reference solution (a). The test is not valid unless the the resolution between cilostazol impuirity B and cilostazol is not less than 3.0, the tailing factor for cilostazol peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{20}H_{27}N_5O_2$.

Storage. Store protected from moisture and at room temperature.

Cilostazol Tablets

Cilostazol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cilostazol, $C_{20}H_{27}N_5O_2$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

A. To powdered tablets containing 0.1 g of Cilostazol, add 1 ml of *chloroform*, shake for 1 minute and filter. On the filtrate, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cilostazol IPRS* or with the reference spectrum of cilostazol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.3 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 257 nm (2.4.7). Calculate the content of $C_{20}H_{27}N_5O_2$ in the medium from the absorbance obtained from a solution of known concentration of *cilostazol IPRS* prepared by dissolving in minimum amount of *methanol* and diluting with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{27}N_5O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.004 per cent w/v solution of *benzophenone* in *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 50 mg of Cilostazol in the internal standard solution and dilute with the same solution to obtain a solution containing 0.01 per cent w/v of cilostazol and filter.

Reference solution. A 0.01 per cent w/v solution of *cilostazol IPRS* in the internal standard solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile*, 30 volumes of *methanol* and 100 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

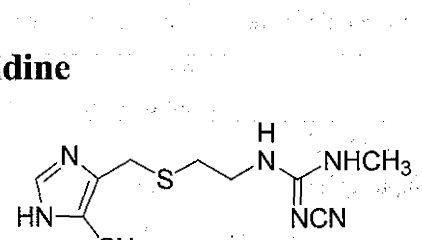
Inject the reference solution. The test is not valid unless the resolution between the cilostazol and benzophenone peak is not less than 9.0 and the relative standard deviation for replicate injections of the principal peakis not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{27}N_5O_2$ in the tablets.

Storage. Store protected from light and moisture.

Cimetidine



$C_{10}H_{16}N_6S$. Mol Wt. 252.3

Cimetidine is 2-cyano-1-methyl-3-[2-(5-methylimidazol-4-ylmethylthio)ethyl]guanidine.

Cimetidine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{10}H_{16}N_6S$, calculated on the dried basis.

Category. Antiulcer.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), using a *potassium bromide* dispersion obtained from the solid state without prior solvent treatment. Compare the spectrum with that obtained with *cimetidine IPRS* or with the reference spectrum of cimetidine. No shoulder or peak should be discernible at 1190 cm^{-1}.

B. When examined in the range 210 nm to 360 nm, a 0.0008 per cent w/v solution in *1 M sulphuric acid* shows an absorption maximum at 218 nm and a minimum at 260 nm (2.4.7).

C. In the test for related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

D. Dissolve about 1 mg in a mixture of 1 ml of *ethanol* and 5 ml of a freshly prepared 2 per cent w/v solution of *citric acid* in *acetic anhydride*. Heat in a water-bath for 10 to 15 minutes; a reddish violet colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). A 0.004 per cent w/v solution of *cimetidine IPRS* in mobile phase A.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 0.4 volume of *diethylamine* and 780 volumes of a 0.11 per cent w/v solution of *sodium hexanesulphonate*, adjusted to pH 2.8 with *orthophosphoric acid* and 250 volumes of *methanol*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
65	90	10
120	90	10

Name	Relative retention time	Correction factor
Cimetidine impurity G[1]	0.2	0.6
Cimetidine impurity E[2]	0.4	0.7
Cimetidine (Retention time: about 18 minutes)	1.0	—
Cimetidine impurity D[3]	1.5	3.3
Cimetidine impurity C[4]	1.6	2.5
Cimetidine impurity B[5]	2.0	—
Cimetidine impurity H[6]	2.3	—
Cimetidine impurity F[7]	4.6	—

[1]2-cyano-1,3-dimethylguanidine,

[2]2-cyano-1-methyl-3[2-[[(5-methyl-1*H*-imidazol-4-yl)methyl] sulfinyl]ethyl] guanidine,

[3]1-methyl-3-[2-[[(5-methyl-1*H*-imidazol-4-yl)methyl]sulfanyl]ethyl] guanidine,

[4]1-[(methylamino)[[2-[[(5-methyl-1*H*- imidazol-4-yl)methyl]sulfanyl] ethyl]amino] methylidene]urea,

[5]methyl 3-cyano-1-[2-[[(5-methyl-1*H*-imidazol-4- yl)methyl]sulfanyl] ethyl]carbamimidate,

[6]1,1'-(disulfanediyldiethylene)bis(2-cyano-3-methylguanidine),

[7]2-cyano-1,3-bis[2-[[(5-methyl-1*H*-imidazol-4-yl)methyl]sulfanyl] ethyl]guanidine.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g and dissolve in 75 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02523 g of $C_{10}H_{16}N_6S$.

Storage. Store protected from light.

Cimetidine Tablets

Cimetidine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cimetidine, $C_{10}H_{16}N_6S$.

Usual strengths. 200 mg; 400 mg; 800 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Cimetidine with 10 ml of *methanol*, filter, evaporate the filtrate to dryness using gentle heat and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cimetidine IPRS* or with the reference spectrum of cimetidine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (d).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 15 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted if necessary with dissolution medium at 218 nm. Calculate the content of cimetidine, $C_{10}H_{16}N_6S$ in the medium from the absorbance obtained from a solution of known concentration of *cimetidiene IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{10}H_{16}N_6S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase (a). A mixture of 65 volumes of *ethyl acetate*, 20 volumes of *methanol* and 15 volumes of *strong ammonia solution*.

Mobile phase (b). A mixture of 84 volumes of *ethyl acetate*, 8 volumes of *methanol* and 8 volumes of *strong ammonia solution*.

Test solution (a). Add 20 ml of *methanol* to a quantity of the powdered tablets containing 1 g of Cimetidine, mix with the aid of ultrasound for 2 minutes, shake for 3 minutes and filter using a suitable 0.2 µm filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 20.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with *methanol*. Dilute 20.0 ml of the solution to 100.0 ml with *methanol*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 10.0 ml with *methanol*.

Reference solution (d). Dissolve 10 mg of *cimetidine IPRS* in 2 ml of *methanol*.

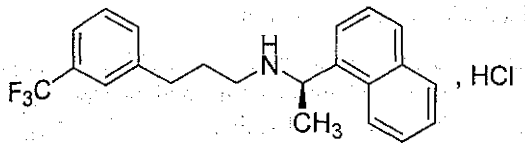
Apply separately to two plates 4 µl of each solution. Allow the first plate to stand for 15 minutes in the tank saturated with vapour from mobile phase (a). Develop the second plate using mobile phase (b). After development, dry the plates in a current of air, expose to iodine vapour until maximum contrast of the spots has been obtained and examine under ultraviolet light at 254 nm. The following limits apply to both methods. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows a clearly visible spot.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.25 g of Cimetidine and stir with 20 ml of warm *methanol*. Filter and repeat the extraction with three quantities, each of 20 ml, of warm *methanol*. Evaporate the combined filtrate and washings to dryness and dissolve the residue in 75 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02523 g of $C_{10}H_{16}N_6S$.

Cinacalcet Hydrochloride



$C_{22}H_{22}F_3N,HCl$ Mol. Wt. 393.9

Cinacalcet Hydrochloride is (*R*)-*N*-(3-(3-(trifluoromethyl) phenyl)propyl)-1-(1-napthyl)ethylamine hydrochloride.

Cinacalcet Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{22}F_3N,HCl$, calculated on the dried basis.

Category. Antihyperparathyroid.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cinacalcet hydrochloride IPRS* or with the reference spectrum of cinacalcet hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction A of chlorides (2.3.1)

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of a buffer solution containing *0.01M sodium perchlorate*, adjusted to pH 2.5 with *perchloric acid* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution. A 0.0005 per cent solution of *cinacalcet hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with phenyl group (3.5 µm) (Such as Zorbax SB-Phenyl),
- column temperature: 60°,
- mobile phase: A. *0.01M sodium perchlorate*, adjusted to pH 2.5 with *perchloric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 5µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
3	60	40
16	40	60
20	40	60
21	60	40
26	60	40

Name	Relative retention time	Correction factor
Cinacalcet impurity A[1]	0.22	0.44
Cinacalcet impurity B[2]	0.94	6.67
Cinacalcet (Retention time: about 7 minutes)	1.0	—
Cinacalcet impurity C[3]	1.32	1.16

[1]1-(Naphthalen-1-yl) ethanamine,

[2]Methanesulphonic acid 3-(3- trifluoro methyl-phenyl)-propyl ester,

[3]1-Naphthalen-1-yl-ethyl)-[3-(3-trifluoromethyl-cyclohexyl)-propyl]-amine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0.

Inject the reference solution and test solution. In the chromatogram obtained with the test solution the area of each peak due to cinacalcet impurity A, cinacalcet impurity B and cinacalcet impurity C is not more than 0.3 times the area of principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than two times the area of the principal peak in the chromatogram with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14), using the chromatographic system as described under Related substances.

Solvent mixture. A mixture of equal volumes of a buffer solution containing *0.01M sodium perchlorate*, adjusted to pH 2.5 with *perchloric acid* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *cinacalcet hydrochloride IPRS* in solvent mixture.

Chromatographic system
- column temperature: 40°,
- mobile phase: a mixture of 55 volumes of a buffer solution containing *0.01 M sodium perchlorate*, adjusted to pH 2.5 with *perchloric acid* and 45 volumes of *acetonitrile*,
- injection volume: 5 µl.

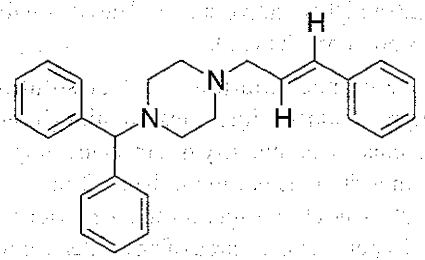
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{22}F_3N,HCl$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Cinnarizine



$C_{26}H_{28}N_2$ Mol. Wt. 368.5

Cinnarizine is (*E*)-1-(diphenylmethyl)-4-(3-phenylprop-2-enyl)piperazine.

Cinnarizine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{26}H_{28}N_2$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cinnarizine IPRS* or with the reference spectrum of cinnarizine.

B. In the test for Related substances the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak due to cinnarizine in the chromatogram obtained with reference solution (a).

C. Dissolve 0.2 g of *anhydrous citric acid* in 10 ml of *acetic anhydride* in a water-bath at 80° and maintain the temperature of the water-bath at 80° for 10 minutes. Add about 20 mg of the substance under examination; a purple colour is produced.

Tests

Appearance of solution. A 2.5 per cent w/v solution in *dichloromethane* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or Alkalinity. Suspend 0.5 g in 15 ml of *water*. Boil for 2 minutes, cool and filter. Dilute the filtrate to 20 ml with *carbon dioxide-free water*. To 10 ml add 0.1 ml of *phenolphthalein solution* and 0.25 ml of *0.01 M sodium hydroxide*; the solution is pink. To 10 ml add 0.1 ml of *methyl red solution* and 0.25 ml of *0.01 M hydrochloric acid*; the solution is red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the *methanol*.

Reference solution (a). Dissolve 12.5 mg of *cinnarizine IPRS* and 15.0 mg of *flunarizine dihydrochloride IPRS* in 100.0 ml of the *methanol*. Dilute 1.0 ml of the solution to 20.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 20.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 10 cm x 4 mm packed with base-deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 1 per cent w/v solution of *ammonium acetate*,
  B. 0.2 per cent v/v solution of *glacial acetic acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
20	10	90
25	10	90
28	75	25

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to cinnarizine and flunarizine is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the sum of area of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g in a mixture of 85 volumes of *acetone* and 15 volumes of *water* and add *dilute hydrochloric acid* until dissolution is complete. Dilute to 20 ml with the same mixture of *acetone* and *water*. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb)* obtained by diluting *lead standard solution (100 ppm Pb)* with the mixture of *acetone* and *water*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh accurately about 0.15 g and dissolve in a mixture of 70 volumes of *2-butanone* and 10 volumes of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *α-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01843 g of $C_{26}H_{28}N_2$.

Cinnarizine Tablets

Cinnarizine tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cinnarizine, $C_{26}H_{28}N_2$.

Usual strength. 25 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.1 g of Cinnarizine with 20 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cinnarizine IPRS* or with the reference spectrum of cinnarizine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of gastric juice, artificial (without enzyme) prepared by dissolving 2.0 g of *sodium chloride* in 80 ml of *1M hydrochloric acid* and dilute to 1000 ml with *water*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 253 nm (2.4.7). Calculate the content of $C_{26}H_{28}N_2$ in the medium from the absorbance obtained from a solution of known concentration of *cinnarizine IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{26}H_{28}N_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a suitable quantity of the powdered tablets containing 25 mg of Cinnarizine with *methanol*, dilute to 10 ml with the same solvent and filter.

Reference solution (a). Dissolve 12.5 mg of *cinnarizine IPRS* and 15 mg of *flunarizine dihydrochloride IPRS* in *methanol* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 20 ml with *methanol*.

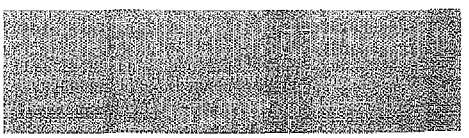
Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 20.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 10 cm x 4 mm, packed with base-deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a 1.0 per cent w/v solution of *ammonium acetate*,
  B. a 0.2 per cent v/v solution of *glacial acetic acid* in *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 10 µl.

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
20	10	90
25	10	90
30	75	25

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the



chromatogram obtained is at least 50 per cent of the full scale of the recorder. If necessary, adjust the concentration of *glacial acetic acid* in mobile phase B to obtain a horizontal base-line in the chromatogram.

Inject reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: cinnarizine about 11 min and flunarizine about 11.5 minutes. The test is not valid unless the resolution between the peaks corresponding to cinnarizine and flunarizine is at least 5.0. If necessary, adjust the time programme for the gradient elution.

Inject the blank, the test solution and reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, other than the principal peak, is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of the peaks, other than the principal peak, is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak due to the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under tablets.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following solutions.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Cinnarazine with *methanol*, dilute to 50.0 ml with the same solvent and filter. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

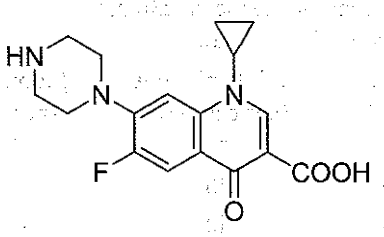
Reference solution. A 0.005 per cent w/v solution of *cinnarzine IPRS* in *methanol*.

Inject the reference solution and the test solution.

Calculate the content of $C_{26}H_{28}N_2$ in the tablets.

Storage. Store protected from light.

Ciprofloxacin



$C_{17}H_{18}FN_3O_3$ Mol. Wt. 331.4

Ciprofloxacin is 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(piperazin-1-yl)quinoline-3-carboxylic acid.

Ciprofloxacin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{18}FN_3O_3$, calculated on the dried basis.

Category. Antibacterial.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *ciprofloxacin IPRS* or with the reference spectrum of ciprofloxacin.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *acetonitrile*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *6 M ammonia*.

Reference solution. A 1 per cent w/v solution of *ciprofloxacin IPRS* in *6 M ammonia*.

Apply to the plate, as 1-cm bands, 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber containing the mobile phase. Allow the mobile phase to rise 12 cm. Dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm and at 365 nm. The principal band in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 2.5 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1).

Related substances. Carry out the method described under Assay and calculate the percentage of each impurity from the chromatogram obtained with the test solution. The content of ciprofloxacin ethylenediamine analog or of any other individual impurity peak found is not more than 0.2 per cent and the sum of all the impurity peaks is not more than 0.5 per cent.

Fluoroquinolonic acid. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia* solution and 10 volumes of *acetonitrile*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *0.1 M acetic acid*.

Reference solution. Weigh 10 mg of *fluoroquinolonic acid IPRS*, add 0.1 ml of *6 M ammonia* and dilute to 100.0 ml with *water*. Dilute 2.0 ml of the solution to 10.0 ml with *water*.

Apply to the plate 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes. Remove the plate and place it in a chamber containing the mobile phase. After development, dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution corresponding to the spot of fluoroquinolonic acid is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). To 2.0 g add 30 ml of *water*, shake for 5 minutes and filter through a chloride-free filter paper. 15 ml of the filtrate complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). Dissolve 0.75 g in 5.0 ml of *2 M acetic acid* and 20.0 ml of *water*. 10 ml of the resulting solution complies with the limit test for sulphates (400 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 120° for 6 hours at a pressure not exceeding 0.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 25 mg, add 0.2 ml of a solution containing 7 per cent v/v of *orthophosphoric acid* and add sufficient of the mobile phase to produce 50.0 ml.

Reference solution (a). Prepare in the same manner as the test solution using an accurately weighed quantity of *ciprofloxacin IPRS* in place of the substance under examination.

Reference solution (b). A 0.05 per cent w/v solution of *ciprofloxacin ethylenediamine analog IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperaure: 30° ± 1°,
- mobile phase: a mixture of 87 volumes of *0.025 M orthophosphoric acid*, previously adjusted to pH 3.0 ± 0.1 with *triethylamine* and 13 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b) and record the chromatogram adjusting the sensitivity and flow rate suitably so that the retention time for ciprofloxacin is between 6.4 and 10.8 minutes, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin and the resolution between ciprofloxacin ethylenediamine analog peak and ciprofloxacin peak is not less than 6.

Inject reference solution (a). The column efficiency, determined from ciprofloxacin peak, is not less than 2500 theoretical plates, the tailing factor for the ciprofloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}FN_3O_3$.

Ciprofloxacin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg of ciprofloxacin.

Storage. Store protected from light.

Ciprofloxacin Injection

Ciprofloxacin Injection is a sterile solution of Ciprofloxacin or Ciprofloxacin Hydrochloride in 5 per cent Dextrose Injection or in Sodium Chloride Injection prepared with the aid of Lactic Acid.

Ciprofloxacin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ciprofloxacin, $C_{17}H_{18}FN_3O_3$.

Usual strength. 2 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *acetonitrile*.

Test solution. Dilute sufficient of the injection with *water* to obtain a solution containing the equivalent of 0.05 per cent w/v of Ciprofloxacin.

Reference solution. A 0.05 per cent w/v solution of *ciprofloxacin IPRS* in *6 M ammonia*.

Apply to the plate, as 1-cm bands, 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes

and transfer it to an unsaturated chamber containing the mobile phase. Allow the mobile phase to rise 12 cm. Dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm and at 365 nm. The principal band in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.5 to 4.6.

Ciprofloxacin ethylenediamine analog. Not more than 0.5 per cent, determined by the method described under Assay. Calculate the percentage of ciprofloxacin ethylenediamine analog from the chromatogram obtained with the test solution from the following expression.

$$\text{Per cent of the analog} = \frac{0.7 \times r_a}{0.7 \times (r_a + r_c)} \times 100$$

where 0.7 is the response factor for ciprofloxacin ethylenediamine analog relative to that of ciprofloxacin, r_a and r_c are the responses of ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak respectively.

Lactic acid. 0.288 mg to 0.352 mg for each mg of Ciprofloxacin stated on the label.

Determine by liquid chromatography (2.4.14).

Test solution. The substance under examination.

Reference solution. A 0.08 per cent w/v solution of *sodium lactate IPRS* in *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 to 11 µm),
- column temperature: 40° ± 1°,
- mobile phase: a mixture of 85 volumes of *0.0025 M sulphuric acid* and 15 volumes of *acetonitrile*,
- flow rate: 0.6 ml per minute,
- spectrophotometer set at 208 nm,
- injection volume: 20 µl.

Inject the reference solution and record the chromatograms adjusting the sensitivity and flow rate suitably so that the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution, record the chromatograms and measure the peak responses for the major peaks. Calculate the content of lactic acid, $C_3H_6O_3$, in the substance under examination.

NOTE — After each analysis, the column should be rinsed with a mixture of 85 volumes of 0.005 M sulphuric acid and 15 volumes of acetonitrile to elute the ciprofloxacin from the column. The column may be regenerated with 0.005 M sulphuric acid and may be reused or stored.

Dextrose *(if present)*. 4.75 per cent to 5.25 per cent w/v of $C_6H_{12}O_6,H_2O$, determined by the following method. To 50.0 ml add 0.2 ml of *6 M ammonia* and dilute to 100.0 ml. Mix well and determine the optical rotation at 25° in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 2.085 represents the percentage of dextrose monohydrate, $C_6H_{12}O_6,H_2O$, in the preparation under examination.

Sodium chloride *(if present)*. 0.855 per cent to 0.945 per cent w/v of NaCl, determined by the following method. To 10.0 ml add 150 ml of *water* and titrate with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of ciprofloxacin.

Sterility (2.2.11). Complies with the test for sterility, using Method A.

Particulate contamination (2.5.9). Complies with the limit test for particulate contamination.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 25 mg of Ciprofloxacin to 100.0 ml with the mobile phase and mix.

Reference solution (a). A 0.03 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dissolve a sufficient quantity of *ciprofloxacin ethylenediamine analog IPRS* in reference solution (a) so as to obtain a solution containing 0.025 per cent w/v of the reference substance.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperaure: 30° ± 1°,
- mobile phase: a mixture of 87 volumes of *0.025 M phosphoric acid*, previously adjusted to pH 3.0 ± 0.1 with *triethyl-amine* and 13 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b) and record the chromatogram adjusting the sensitivity and flow rate suitably so that the retention time for ciprofloxacin is between 6.4 and 10.8 minutes, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin and the

resolution between ciprofloxacin ethylenediamine analog peak and ciprofloxacin peak is not less than 6.

Inject reference solution (a). The column efficiency, determined from ciprofloxacin peak, is not less than 2500 theoretical plates, the tailing factor for the ciprofloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

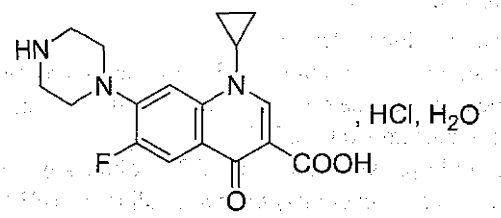
Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the injection.

Storage. Store protected from light at a temperature not exceeding 30°. The contents should not be allowed to freeze.

Labelling. The label states whether Dextrose or Sodium Chloride has been used for preparing the injection.

Ciprofloxacin Hydrochloride



$C_{17}H_{18}FN_3O_3,HCl,H_2O$ Mol. Wt. 385.8

Ciprofloxacin Hydrochloride is 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid hydrochloride monohydrate.

Ciprofloxacin Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{18}FN_3O_3,HCl$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ciprofloxacin hydrochloride IPRS* or with the reference spectrum of ciprofloxacin hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia* solution and 10 volumes of *acetonitrile*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *water*.

Reference solution. A 1 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in *water*.

Apply to the plate, as 1-cm bands, 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber containing the mobile phase. Allow the mobile phase to rise 12 cm. Dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm and at 365 nm. The principal band in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 3.0 to 4.5, determined in a 2.5 per cent w/v solution.

Related substances. Carry out the method described under Assay and calculate the percentage of each impurity peak in the chromatogram obtained with the test solution. The content of ciprofloxacin ethylenediamine analog or of any other individual impurity peak found is not more than 0.2 per cent and the sum of all the impurity peaks is not more than 0.5 per cent.

Fluoroquinolonic acid. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia* solution and 10 volumes of *acetonitrile*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *water*.

Reference solution. Weigh 10 mg of *fluoroquinolonic acid IPRS*, add 0.1 ml of *6 M ammonia* and dilute to 100.0 ml with *water*. Dilute 2.0 ml of the solution to 10.0 ml with *water*.

Apply to the plate 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes. Remove the plate and place it in a chamber containing the mobile phase. After development, dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution corresponding to the spot of fluoroquinolonic acid is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphates (2.3.17). 0.375 g complies with the limit test for sulphates (400 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.7 to 6.7 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 50 mg of the substance under examination and dissolve in 100.0 ml of *water.*

Reference solution (a). A 0.05 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in *water.*

Reference solution (b). A 0.05 per cent w/v solution of *ciprofloxacin ethylenediamine analog IPRS* in *reference solution (a).*

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 87 volumes of *0.025 M phosphoric acid*, previously adjusted to pH 3.0 ± 0.1 with *triethylamine* and 13 volumes of *acetonitrile,*
- flow rate: 1.5 ml per minute,
- column temperature: 30° ± 1°,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b) and record the chromatogram adjusting the sensitivity and flow rate suitably so that the retention time for ciprofloxacin is between 6.4 and 10.8 minutes, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin and the resolution between ciprofloxacin ethylenediamine analog peak and ciprofloxacin peak is not less than 6.

Inject reference solution (a). The test is not valid unless the column efficiency, determined from ciprofloxacin peak, is not less than 2500 theoretical plates, the tailing factor for the ciprofloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}FN_3O_3$,HCl.

Storage. Store protected from light.

Ciprofloxacin Eye Drops

Ciprofloxacin Hydrochloride Eye Drops

Ciprofloxacin Eye Drops are a sterile solution of Ciprofloxacin Hydrochloride in Purified water.

Ciprofloxacin Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ciprofloxacin, $C_{17}H_{18}FN_3O_3$.

Usual strength. 0.3 per cent w/v.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

B. It give reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Transfer an accurately measured volume of Eye drops containing 6 mg of ciprofloxacin, to a 50-ml volumetric flask, dilute with *water* to volume, and mix.

Reference solution (a). A 0.014 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in *water.*

Reference solution (b). A 0.001 per cent w/v solution of *ciprofloxacin ethylenediamine analog IPRS* in *reference solution (a).*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 75 volumes of *0.005 M tetrabutylammonium phosphate*, adjusted to pH 2.0 with *orthophosphoric acid* and 25 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject reference solution (b). The relative retention time are about 0.8 for the ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin and the resolution between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak is not less than 1.5.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 500 theoretical plates, the tailing factor not more than 2.0, and the relative standard deviation for replicate injections is not more than 2 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the eye drops.

Storage. Store protected from light.

Ciprofloxacin Tablets

Ciprofloxacin Hydrochloride Tablets

Ciprofloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ciprofloxacin, $C_{17}H_{18}FN_3O_3$.

Usual strengths. The equivalent of 250 mg; 500 mg; 750 mg of ciprofloxacin.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *acetonitrile*.

Test solution. Shake a quantity of the powdered tablets containing about 0.15 g of ciprofloxacin with 75 ml of *water* for 20 minutes, dilute to 100.0 ml with *water*, mix, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.15 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in *water*.

Apply to the plate, as 1-cm bands, 5 µl of each solution. Place the plate in an atmosphere of ammonia for about 15 minutes and transfer it to an unsaturated chamber containing the mobile phase. Allow the mobile phase to rise 12 cm. Dry the plate in air for 15 minutes and examine under ultraviolet light at 254 nm and at 365 nm. The principal band in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with *water* if necessary, at the maximum at about 276 nm (2.4.7). Calculate the content of ciprofloxacin, $C_{17}H_{18}FN_3O_3$, in the medium from the absorbance obtained by repeating the determination using a solution of known concentration of *ciprofloxacin hydrochloride IPRS*.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{18}FN_3O_3$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 1.25 g of ciprofloxacin, add about 400 ml of *0.01 M hydrochloric acid*, shake for 20 minutes, dilute to 500.0 ml with *0.01 M hydrochloric acid*. and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *0.01 M hydrochloric acid*.

Reference solution (a). A 0.03 per cent w/v solution of *ciprofloxacin hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.05 per cent w/v solution of *ciprofloxacin ethylenediamine analog IPRS* in *reference solution (a)*.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30° ± 1°,
- mobile phase: a mixture of 87 volumes of *0.025 M phosphoric acid*, previously adjusted to pH 3.0 ± 0.1 with *triethylamine* and 13 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 278 nm,
- injection volume: 10 µl.

Inject reference solution (b) and record the chromatogram adjusting the sensitivity and flow rate suitably so that the retention time for ciprofloxacin is between 6.4 and 10.8 minutes, the relative retention times are about 0.7 for ciprofloxacin ethylenediamine analog and 1.0 for ciprofloxacin and the resolution between ciprofloxacin ethylenediamine analog peak and ciprofloxacin peak is not less than 6.

Inject reference solution (a). The column efficiency determined from ciprofloxacin peak, is not less than 2500 theoretical plates, the tailing factor for the ciprofloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

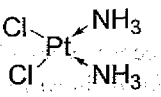
Inject reference solution (a) and the test solution.

Calculate the content of $C_{17}H_{18}FN_3O_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of ciprofloxacin.

Cisplatin



$H_6Cl_2N_2Pt$ Mol. Wt. 300.0

Cisplatin is *cis*-diamminedichloroplatinum(II).

Cisplatin contains not less than 97.0 per cent and not more than 102.0 per cent of $H_6Cl_2N_2Pt$.

Description. A yellow powder or orange yellow crystals.

CAUTION — Cisplatin is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

NOTE — Carry out all the tests and the Assay, except Identification tests A and C and the test for Silver, protected from light.

Category. Anticancer.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cisplatin IPRS* or with the reference spectrum of cisplatin.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *cellulose*.

Mobile phase. A mixture of 10 volumes of *acetone* and 90 volumes of *dimethylformamide*.

Test solution. A 0.2 per cent w/v solution of the substance under examination in *dimethylformamide*.

Reference solution. A 0.2 per cent w/v solution of *cisplatin IPRS* in *dimethylformamide*.

Activate the plate by heating at 150° for 1 hour. Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and spray with a 5.0 per cent w/v solution of *stannous chloride* in a mixture of equal volumes of *dilute hydrochloric acid* and *water*. Examine after 1 hour. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Add 50 mg to 2 ml of *2 M sodium hydroxide*, evaporate to dryness, dissolve the residue in a mixture of 0.5 ml of *nitric acid* and 1.5 ml of *hydrochloric acid* and evaporate to dryness again; the residue is orange. Dissolve the residue in 0.5 ml of *water* and add 0.5 ml of *ammonium chloride solution*; a yellow crystalline precipitate is produced.

Tests

Solution A. A 0.1 per cent w/v solution in 0.9 per cent w/v solution of *sodium chloride* in *carbon dioxide-free water*.

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution GYS5 (2.4.1). A 2.0 per cent w/v solution in *dimethylformamide* is clear (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in solution A, measured immediately after preparation.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light. Do not heat or sonicate any platinum-containing solution. All solutions are to be used within 4 hours.

Saline solution. A 0.9 per cent w/v solution of *sodium chloride* in *water*.

Test solution. Dissolve 25 mg of the substance under examination in saline solution and dilute to 25.0 ml with saline solution.

Reference solution (a). A 0.1 per cent w/v solution of *cisplatin IPRS* in saline solution.

Reference solution (b). A solution containing 0.0002 per cent w/v of the substance under examination, 0.002 per cent w/v of *cisplatin impurity A IPRS* and 0.00112 per cent w/v of *cisplatin impurity B IPRS* in saline solution.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 20.0 ml with saline solution.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with base deactivated octylsilane bonded to porous silica (4 µm),
- mobile phase: dissolve 1.08 g of *sodium octanesulphonate*, 1.7 g of *tetrabutylammonium hydrogen sulphate* and 2.72 g of *potassium dihydrogen phosphate* in *water* and dilute to 950 ml with *water*, adjusted to pH 5.9 with *1 M sodium hydroxide* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time
Displacement peak	0.5
Cisplatin impurity A[1]	0.6
Cisplatin impurity B[2]	0.7
Cisplatin (retention time: about 3.8 minutes)	1.0
Cisplatin aquo complex	1.2

[1]transplatin,

[2]amminetrichloroplatinate.

The displacement peak is the latest eluting peak of the group of injection peaks in the chromatogram obtained with the blank solution.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cisplatin impurities A and B is not less than 2.5. The displacement peak and the peak due to cisplatin impurity A are well separated.

Inject reference solution (b) and (c) and the test solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to cisplatin impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2.0 per cent). The area of any peak corresponding to cisplatin impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the peak due to cisplatin in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks other than cisplatin impurities A and B is not more than 2.5 times the area of the peak due to cisplatin in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than the area of the peak in the chromatogram obtained with reference solution (c) (0.05 per cent) and due to the cisplatin aquo complex.

Silver. Not more than 250 ppm.

Determine by atomic absorption spectrophotometry (2.4.2), measuring at 328 nm using air-acetylene flame and silver hollow-cathode lamp using a transmission band of 0.5 nm.

Test solution. Dissolve 0.1 g in 15 ml of *nitric acid*, heating at 80°. Cool and dilute to 25.0 ml with *water*.

Reference solutions. To suitable volumes (10 ml to 30 ml) of *silver standard solution (5 ppm Ag)*, add 50 ml of *nitric acid* and dilute to 100.0 ml with *water*.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

- injection volume: 10 µl.

Inject reference solution (a) and the test solution.

Calculate the content of $H_6Cl_2N_2Pt$.

Storage. Store protected from light and moisture.

Cisplatin Injection

Cisplatin Injection is a sterile solution of Cisplatin in Water for Injections. It is either supplied as a ready-to-use solution or it is prepared by dissolving Cisplatin for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

Cisplatin Injection contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of cisplatin, $Cl_2H_6N_2Pt$.

Usual strengths. 50 mg per 50 ml; 10 mg per 20 ml.

Description. A clear, colourless to pale yellow solution.

NOTE — Except identification test A, carry out the tests protected from light.

Identification

A. When examined in the range 230 nm to 350 nm (2.4.7) of a solution diluted, if necessary to contain a 0.1 per cent w/v of Cisplatin shows an absorption maximum at 300 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.5 to 6.5.

Trichloroammineplatinate. Determine by liquid chromatography (2.4.14).

NOTE — prepare the solutions immediately before use and protect from light.

Saline solution. A 0.9 per cent w/v *sodium chloride* in *water*.

Test solution. Dilute the injection with saline solution to obtain a solution containing 0.05 per cent w/v of Cisplatin.

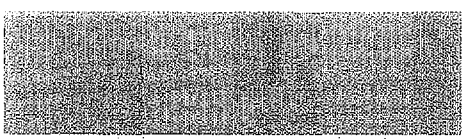
Reference solution. Dissolve a quantity of *potassium trichloroammineplatinate IPRS* in saline solution to obtain a solution containing 0.0015 per cent w/v of trichloroammineplatinate.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica chemically bonded with strongly basic quaternary ammonium anion-exchange coating (10 µm) (Such as Spherisorb SAX),
- mobile phase: a 0.04 per cent w/v solution of *ammonium sulphate*, adjusted to pH between pH 5.8 to 6.0,
- flow rate: 2 ml per minute,
- spectrophotometer set at 209 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between sodium chloride and trichloroammineplatinate is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to trichloroammineplatinate is not more than the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent).



Transplatin. Determine by liquid chromatography (2.4.14).

Saline solution. A 0.9 per cent w/v *sodium chloride* in *water*.

Test solution. Prepare in the same manner as reference solution (a) but using 10 ml of the injection, diluted if necessary, with saline solution to produce a solution containing 0.05 per cent w/v of Cisplatin in place of the 10 ml of solution A.

Reference solution (a). Add 10 ml of a 0.005 per cent w/v solution of *transplatin IPRS* in saline solution to 25 mg of *cisplatin IPRS*, dilute to 25 ml with saline solution, shake for 30 minutes to effect dissolution and add sufficient saline solution to produce 50 ml (Solution A). Mix 5 ml of a freshly prepared 0.5 per cent w/v solution of *thiourea*, 5 ml of *1 M hydrochloric acid* and 10 ml of solution A, heat an aliquot in a reaction vial at 60° for 1 hour and cool.

Reference solution (b). Prepare in the same manner as reference solution (a) but using a mixture of 10 ml of a solution containing 0.005 per cent w/v of *cisplatin IPRS* in saline solution and 10 ml of a 0.005 per cent w/v solution of *transplatin IPRS* in saline solution in place of 10 ml of solution A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica chemically bonded with strongly acidic cation-exchange coating (10 µm) (Such as Maxsil SCX),
- column temperature: 45°,
- mobile phase: a 2.5 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 3.2 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- Injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cisplatin and transplatin is not less than 1.7 and the column efficiency due to transplatin peak is not less than 2500 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to transplatin is not more than the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of Cisplatin.

Assay. Determine by liquid chromatography (2.4.14).

Saline solution. A 0.9 per cent w/v *sodium chloride* in *water*.

Test solution. Dilute the injection with saline solution to obtain a solution of 0.1 per cent w/v of Cisplatin.

Reference solution (a). A 0.1 per cent w/v solution of *cisplatin IPRS* in saline solution.

Reference solution (b). A solution containing 0.05 per cent w/v of *cisplatin IPRS* and 0.005 per cent w/v of *transplatin IPRS* in saline solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with silica chemically bonded with amine groups (10 µm) (Such as Lichrosorb NH_2),
- mobile phase: a mixture of 10 volumes of *water* and 90 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cisplatin and transplatin is not less than 3.5.

Inject reference solution (a) and the test solution.

Calculate the content of $Cl_2H_6N_2Pt$ in injection.

Storage. Store protected from light. It should not be refrigerated.

Cisplatin for Injection

Cisplatin for Injection is a freeze dried mixture of Cisplatin, Mannitol and Sodium Chloride. It is supplied in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Cisplatin for Injection contains Cisplatin not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cisplatin, $Cl_2H_6N_2Pt$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for injection) and with the following requirements.

NOTE — With the exception of Identification test A, carry out the tests protected from light.

Identification

A. When examined in the range 230 nm to 350 nm (2.4.7) of a solution containing a 0.1 per cent w/v of Cisplatin in *0.1M hydrochloric acid* shows an absorption maximum at 300 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 3.5 to 6.5 in a solution containing 0.1 per cent w/v of Cisplatin.

NOTE — Prepare the solutions immediately before use and protect from light.

Trichloroammineplatinate. Complies with the test described for ready-to-use solution with the following modification.

Test solution. Dissolve the contents of a sealed container in saline solution to obtain a solution containing 0.05 per cent w/v of Cisplatin.

Transplatin. Complies with the test described for ready-to-use solution with the following modification.

Test solution. Prepare in the same manner as reference solution (a) but using 10 ml of a solution prepared by shaking the contents of a sealed container with sufficient saline solution for 30 minutes to produce a solution containing 0.1 per cent w/v of Cisplatin in place of 10 ml of solution A.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of Cisplatin.

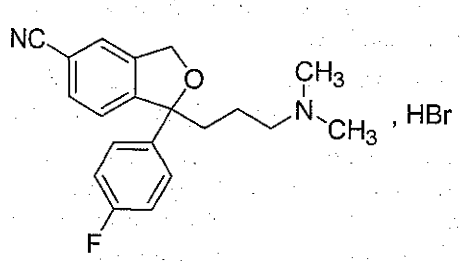
Assay. Complies with the test described for ready-to-use solution with the following modification.

Test solution. Dissolve the contents of a sealed container in saline solution to produce a solution containing 0.1 per cent w/v of Cisplatin.

Calculate the content of $Cl_2H_6N_2Pt$ in the injection.

Storage. Store protected from light. It should not be refrigerated.

Citalopram Hydrobromide



, HBr

$C_{20}H_{21}FN_2O,HBr$ Mol.Wt. 405.3

Citalopram Hydrobromide is (*RS*)-1-(3-dimethylaminopropyl)-1-(4-fluorophenyl)-1,3-dihydroisobenzofuran-5-carbonitrile hydrobromide.

Citalopram Hydrobromide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{21}FN_2O,HBr$, calculated on the anhydrous basis.

Category. Antidepressent.

Description. A white to off-white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *citalopram hydrobromide IPRS* or with the reference spectrum of citalopram hydrobromide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives the reactions of bromides (2.3.1).

Tests

pH (2.4.24). 5.5 to 6.5, determined in a 0.5 per cent w/v solution in *water*.

Optical rotation (2.4.22). – 0.1° to + 0.1°, determined at 20°, in a 5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water*.

Test solution. Dissolve 62.5 mg of the substance under examination in 100.0 ml of the solvent mixture and filter.

Reference solution (a). A 0.625 µg per ml solution of *citalopram hydrobromide IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.0001 per cent w/v, each of, *citalopram hydrobromide IPRS* and *citalopram impurity A IPRS [[1-(4- Fluorophenyl)-1-(-3-(methylamino [propyl-1,dihydroiso-benzofuran-5-carbonitrile hydrochloride] IPRS]* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.0 g of *sodium acetate* in 800 ml of *water*, adding 6 ml of *triethylamine*, adjusted to pH 4.6 with *acetic acid*, and diluting to 1000 ml with *water*, and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

The relative retention time for impurity A with respect to citalopram is about 0.9.

Inject reference solution (b). The test is not valid unless the resolution between impurity A and citalopram is not less than 1.8, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *methanol* and 50 volumes of *water*.

Test solution. Weigh accurately about 62.5 mg of the substance under examination, dissolve in 100.0 ml of the solvent mixture and filter.

Reference solution. A 0.0625 per cent w/v solution of *citalopram hydrobromide IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.0 g of *sodium acetate* in 800 ml of *water*, adding 6 ml of *triethylamine*, adjusted to pH 4.6 with *acetic acid and* diluting to 1000 ml with *water*, and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_2O$, HBr.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Citalopram Tablets

Citalopram Hydrobromide Tablets

Citalopram Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of citalopram, $C_{20}H_{21}FN_2O$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of a buffer solution prepared by mixing 118 ml of *1 M hydrochloric acid* and 82 ml of *1 M sodium hydroxide* and diluting to 1000 ml with *water*. Adjusted to pH 1.5 with *1 M sodium hydroxide*,

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{20}H_{21}FN_2O$ in the medium from the absorbance obtained from a solution of known concentration of *citalopram hydrobromide IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{21}FN_2O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing 50.0 mg of citalopram, disperse in 100.0 ml of the mobile phase and filter.

Reference solution (a). A 0.625 µg per ml solution of *citalopram hydrobromide IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0001 per cent w/v of *citalopram impurity B IPRS [[3-(3N,N-dimethylamino)-1-(4-fluorophenyl)-6-c vano-1(3H)-isobenzofuranone]IPRS]* and 0.025 per cent w/v of *citalopram hydrobromide IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.15 g of *potassium dihydrogen phosphate* and 3.6 g of *disodium hydrogen phosphate*

in 1000 ml of *water*, 38 volumes of *methanol* and 7 volumes of *acetonitrile*, adjusted to pH 6.5 with *orthophosphoric acid*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between impurity B and citalopram is not less than 3.0.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than 8 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.8 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Use the chromatographic system described under Assay using the following test solution.

Test solution. Powder one tablet, disperse in 10 ml of a 0.142 per cent w/v solution of *anhydrous dibasic sodium phosphate*, add 40 ml of *methanol* and mix with the aid of ultrasound for 5 minutes. Add sufficient volume of the internal standard solution and dilute stepwise, if necessary with the solvent mixture to obtain a solution containing 0.01 per cent w/v of citalopram and 0.0025 per cent w/v of internal standard solution and filter.

Calculate the content of $C_{20}H_{21}FN_2O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol* and 20 volumes of a 0.142 per cent w/v solution of *anhydrous dibasic sodium phosphate*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 100 mg of citalopram, disperse in 100.0 ml of the solvent mixture and filter. To 5.0 ml of the solution, add 5.0 ml of the internal standard solution and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.125 per cent w/v solution of *citalopram hydrobromide IPRS* (equivalent to 0.1 per cent w/v of citalopram) in the solvent mixture. To 5.0 ml of the solution, add 5.0 ml of the internal standard solution and dilute to 50.0 ml with the solvent mixture.

Internal standard solution. A 0.025 per cent w/v solution of *dimethyl-(1-methyl-3,3-diphenylallyl)amine hydrochloride IPRS* (*citalopram impurity C IPRS*) in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: a 0.077 per cent w/v solution of *dodecyltrimethylammonium bromide* in the solvent mixture,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The relative retention time for citalopram impurity C is about 1.36 and the resolution between citalopram and citalopram impurity C is not less than 1.5. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 1.5 per cent.

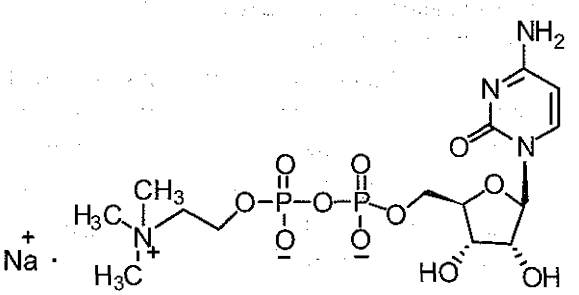
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}FN_2O$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of citalopram.

Citicoline Sodium



$C_{14}H_{25}N_4NaO_{11}P_2$ Mol. Wt. 510.3

Citicoline Sodium is Cytidine-5'-diphosphocholine sodium.

Citicoline Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{25}N_4NaO_{11}P_2$, calculated on the anhydrous basis.

Category. Nootropic.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *citicoline sodium IPRS* or with the reference spectrum of citicoline sodium.

B. It gives the reactions of sodium salt (2.3.1).

Tests

pH (2.4.24). 6.5 to 7.5, determined on 20 per cent w/v solution in *water*.

Related substances. Determined by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in *water* and dilute to 50.0 ml with *water*.

Reference solution (a). A 0.001 per cent w/v solution of *citicoline sodium IPRS* in *water*.

Reference solution (b). A solution containing 0.2 per cent w/v of *citicoline sodium IPRS* and 0.002 per cent w/v of *citicoline impurity B IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- sample temperature: 10°,
- mobile phase: A. a mixture of 1 volume of *methanol* and 99 volumes of 0.2 per cent v/v solution of *formic acid*, adjusted to pH 7.5 with *triethylamine*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 10 µl.

Time (in mins.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
40	75	25
45	75	25
47	100	0
60	100	0

Name	Relative retention time	Correction factor
Citicoline impurity A[1]	1.2	—
Citicoline impurity B[2]	1.57	0.67
Citicoline impurity C[3]	3.62	0.64
Citicoline impurity D[4]	4.00	1.00

[1]desmethyl cytidine-5'-diphosphocholine sodium,

[2]cytidine-5'-monophosphate; 5-CMP,

[3]methyl ester of cytidine-5'-monophosphate; 5-CMP ester,

[4]cytidine-5'-monophosphomorpholidate; 5-CMP morpholidate.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 6000 theoretical plates and the tailing factor is not more than 1.5.

Inject reference solution (b). The test is not valid unless the resolution between the citicoline impurity B and principal peak is not less than 7.0.

Inject reference solution (a) and the test solution. The area of any secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2 times the area of principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Iron (2.3.14). 4 g complies with the limit test for iron (10 ppm).

Chlorides (2.3.12). 0.5 g complies with the limit test for chlorides (500 ppm).

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Heavy metals (2.3.13). 2 g complies with the limit test for heavy metals, Method B (10 ppm).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *water* and dilute to 100.0 ml with *water*.

Reference solution. A 0.05 per cent w/v solution of *citicoline sodium IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- sample temperature: 10°,
- mobile phase: a mixture of 1 volume of *methanol* and 99 volumes of 0.2 per cent v/v solution of *formic acid*, adjusted to pH 7.5 with *triethylamine*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{25}N_4NaO_{11}P_2$.

Storage. Store protected from moisture.

Citicoline Injection

Citicoline Sodium Injection

Citicoline Injection is a sterile solution of Citicoline Sodium in Water for Injections.

Citicoline Injection contains Citicoline Sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of citicoline, $C_{14}H_{26}N_4O_{11}P_2$.

Usual strength. 250 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.3 to 8.0.

Related Substances. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency.

Test solution. Dilute a volume of injection containing 0.25 g of citicoline to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase and filter.

Reference solution (a). Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase to obtain a solution containing 0.0005 per cent w/v of citicoline.

Reference solution (b). A solution containing 0.00025 per cent, w/v each, of *citicoline sodium IPRS* and *5'-cytidylic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 95 volumes of buffer solution prepared by dissolving 1.697 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *dilute acetic acid* and 5 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Equilibrate the column with mobile phase for at least 90 minutes.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the principal peak and 5'-cytidylic acid peak is not less than 6.0 in the chromatogram obtained with reference solution (b) and the tailing factor is not more than 2.0, the relative standard deviation for replicate injections is not more than 3.0 per cent in the chromatogram obtained with the reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to 5'-cytidylic acid multiplying by correction factor of 0.7 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks other than the 5'-cytidylic acid peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.175 Endotoxin Unit per mg of Citicoline.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency

Test solution. Mix the content of 10 containers. Dilute a volume of the injection containing 0.25 g of citicoline with the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase and filter.

Reference solution. Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase to obtain a solution containing 0.005 per cent w/v of citicoline.

Use chromatographic system as described under Related substances.

Equilibrate the column with mobile phase for at least 90 minutes.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{26}N_4O_{11}P_2$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 25°.

Labelling. The label states (1) the strength in terms of the equivalent amount of citicoline; (2) the preparation is intended for intramuscular and intravenous injection only.

Citicoline Prolonged-release Tablets

Citicoline Sustained-release Tablets; Citicoline Extended-release Tablets; Citicoline Sodium Prolonged-release Tablets; Citicoline Sodium Sustained-release Tablets; Citicoline Sodium Extended-release Tablets

Citicoline Prolonged-release Tablets contain Citicoline Sodium.

Citicoline Prolonged-release Tablets are manufactured by different manufacturers, whilst complying with the

requirements of the monograph are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Citicoline Prolonged-release Tablets contain Citicoline Sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of citicoline, $C_{14}H_{26}N_4O_{11}P_2$.

Usual strength. 1000 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency.

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of citicoline in the mobile phase with the aid of ultrasound for 30 minutes and dilute to 200.0 ml with the mobile phase.

Reference solution (a). Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase to obtain a solution containing 0.0005 per cent w/v of citicoline.

Reference solution (b). A solution containing 0.00025 per cent w/v, each of, *citicoline sodium IPRS* and *5'-cytidylic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 30°,
- mobile phase: a mixture of 95 volumes of buffer solution prepared by dissolving 1.697 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *dilute acetic acid* and 5 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Equilibrate the column with mobile phase for at least 90 minutes.

Inject reference solution (a) and (b). The test is not valid unless the tailing factor is not more than 2.0, the relative standard deviation for replicate injections is not more than 3.0 per cent in the chromatogram obtained with the reference solution (a) and the resolution between the principal peak and 5'-cytidylic acid peak is not less than 6.0 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to 5'-cytidylic acid multiplying by correction factor of 0.7 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks other than the 5'-cytidylic acid peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of citicoline in the mobile phase with the aid of ultrasound for 30 minutes and dilute to 200.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase and dilute to obtain a solution containing 0.005 per cent w/v of citicoline.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 95 volumes of buffer solution prepared by dissolving 1.697 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *dilute acetic acid* and 5 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for at least 90 minutes.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{26}N_4O_{11}P_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of the equivalent of amount of citicoline.

Citicoline Tablets

Citicoline Sodium Tablets

Citicoline Tablets contain Citicoline Sodium.

Citicoline Tablets contain Citicoline Sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of citicoline, $C_{14}H_{26}N_4O_{11}P_2$.

Usual strengths. 100 mg; 250 mg; 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate if necessary, with dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{14}H_{25}N_4O_{11}P_2$ in the medium from the absorbance obtained from a solution of known concentration of *citicoline sodium IPRS.*

Q. Not less than 75 per cent of the stated amount of $C_{14}H_{26}N_4O_{11}P_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency.

Test solution. Disperse a quantity of the powdered tablets containing 100 mg of citicoline in the mobile phase with the aid of ultrasound for 30 minutes and dilute to 200.0 ml with the mobile phase and filter.

Reference solution (a). Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase to obtain a solution containing 0.0005 per cent w/v of citicoline.

Reference solution (b). A solution containing 0.00025 per cent w/v, each of, *citicoline sodium IPRS* and *5'-cytidylic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 95 volumes of buffer solution prepared by dissolving 1.697 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *dilute acetic acid* and 5 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Equilibrate the column with mobile phase for at least 90 minutes.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the principal peak and 5'-cytidylic acid peak is not less than 6.0 in the chromatogram obtained with reference solution (b) and the tailing factor is not more than 2.0, the relative standard deviation for replicate injections is not more than 3.0 per cent in the chromatogram obtained with the reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of peak due to 5'-cytidylic acid multiplying by correction factor of 0.7 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks other than the 5'-cytidylic acid peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Determine water content of citicoline sodium IPRS before use and calculate the potency.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of citicoline in the mobile phase with the aid of ultrasound for 30 minutes and dilute to 200.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase and filter.

Reference solution. Dissolve a quantity of *citicoline sodium IPRS* in the mobile phase to obtain a solution containing 0.005 per cent w/v of citicoline.

Use chromatographic system as described under Related substances.

Equilibrate the column with mobile phase for at least 90 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

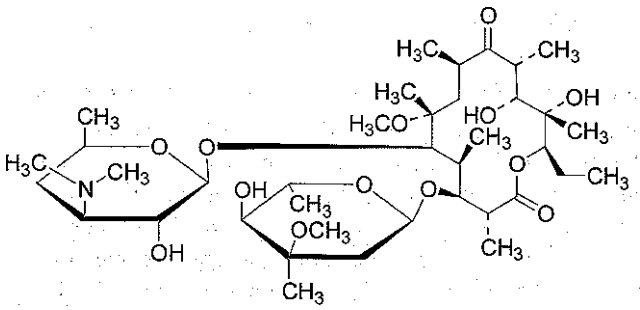
Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{26}N_4O_{11}P_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Labelling. The label states the strength in terms of the equivalent of amount of citicoline.

Clarithromycin



$C_{38}H_{69}NO_{13}$ Mol. Wt. 748.0

Clarithromycin is (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-Dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyl)oxy]-14-ethyl-12,13-dihydroxy-7-methoxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-α-D-xylo-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (6-O-methylerythromycin A).

Clarithromycin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{38}H_{69}NO_{13}$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clarithromycin IPRS* or with the reference spectrum of clarithromycin.

Tests

Specific optical rotation (2.4.22). –102° to – 94°, determined on a 1 per cent w/v solution in *dichloromethane* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in 25 ml of *acetonitrile* and dilute to 50.0 ml with *water*.

Reference solution (a). Dissolve 7.5 mg of *clarithromycin IPRS* in 2.5 ml of *acetonitrile* and dilute to 5.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with equal volumes of *acetonitrile* and *water*.

Use chromatographic system as described under Assay.

Inject reference solution (b). the test is not valid unless the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3.5 times the area of the peak in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore any peak with an area less than 0.2 times of the principal peak obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.3.13). Dissolve 2 g in a mixture of 15 volumes of *water* and 85 volumes of *dioxan* and dilute to 20 ml with the same solvent mixture. 12 ml of the solution complies with limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (2 ppm Pb)* in the same solvent mixture.

Water (2.3.43). Not more than 2.0 per cent w/w, determined on 0.5 g using *methanol* as solvent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in 25 ml of *acetonitrile* and dilute to 50.0 ml with *water*.

Reference solution. Dissolve 15 mg of the *clarithromycin IPRS* in 5 ml of *acetonitrile* and dilute to 10.0 ml with *water*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3.5µm),
- column temperature: 40°,
- mobile phase: A. 0.476 per cent w/v solution of *potassium dihydrogen phosphate* adjusted to pH 4.4 with *dilute orthophosphoric acid* or a 4.5 per cent solution of *potassium hydroxide*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

Time (in mins.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

42	75	25

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{69}NO_{13}$.

Storage. Store protected from moisture.

Clarithromycin Tablets

Clarithromycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clarithromycin, $C_{38}H_{69}NO_{13}$.

Usual strengths. 250 mg; 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. Use 900 ml of a solution containing 1000 volumes of a 1.361 per cent w/v solution of *sodium acetate* and 350 volumes of 0.1M *acetic acid*, adjusted to pH 5.0 with *0.1M acetic acid*, at a temperature of 37° ± 0.5°, as the medium,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Weigh a suitable quantity of *clarithromycin IPRS*, dissolve in *methanol*, dilute with dissolution medium to obtain a solution having a known concentration of about 0.125 mg per ml.

Use chromatographic system as described under Assay.

Calculate the content of $C_{38}H_{69}NO_{13}$ in the tablet.

Q. Not less than 75 per cent of the stated amount of $C_{38}H_{69}NO_{13}$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of powdered tablets containing 75 mg of Clarithromycin in 50.0 ml of the solvent mixture, filter.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.0015 per cent w/v solution of *3"-N-demethyl-6-O-methylerythromycin A IPRS (clarithromycin impurity D IPRS)* in the test solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Kingsorb C18),
- column temperature: 40°,
- mobile phase: A. a 0.476 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to

pH 4.4 with *orthophosphoric acid* or *potassium hydroxide solution*,

B. *acetonitrile*,

- a gradient programme using the conditions given below,
- flow rate: 1.1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 10 µl.

[15]6-*O*-methylerythromycin A (*E*)-9-(*O*-methyloxime),

[16]3"-*N*-demethyl-3'-*N*-formyl-6-*O*-methylerythromycin A.

Inject reference solution (a) and (c). The test is not valid unless the tailing factor of the principal peak is not more than 1.75 in the chromatogram obtained with reference solution (a) and in the chromatogram obtained with reference solution (c), the peak to valley ratio is not less than 3.0, where H_p is the height above the baseline of the peak due to clarithromycin impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to clarithromycin.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore any peak less than 0.2 times of the principal peak obtained with reference solution (b) (0.1 per cent) and the peaks eluting before impurity I and after impurity H.

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 1 g by drying in an oven at 110°, under vacuum, for 3 hours.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.125 g of Clarithromycin in 200.0 ml with *methanol* and filter. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Reference solution. A 0.0625 per cent w/v solution of *clarithromycin IPRS* in *methanol*. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of *0.067 M monobasic potassium phosphate* adjusted to pH 4.0 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 750 theoretical plates, the

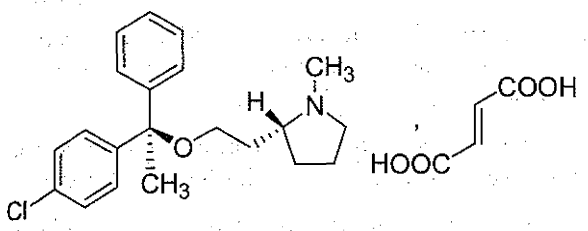
tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{38}H_{69}NO_{13}$.

Storage. Store protected from moisture.

Clemastine Fumarate



$C_{21}H_{26}ClNO,C_4H_4O_4$ Mol. Wt.460.0

Clemastine Fumarate is (2*R*)-2-{2-[(1*R*)-1-(4-Chlorophenyl)-1-phenylethoxy]ethyl}-1-methylpyrrolidine fumarate.

Clemastine Fumarate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{21}H_{26}ClNO,C_4H_4O_4$, calculated on the dried basis.

Category. Antiallergic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *clemastine fumarate IPRS* or with the reference spectrum of clemastine fumarate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 5 volumes of *water*, 25 volumes of *anhydrous formic acid* and 70 volumes of *di-isopropyl ether.*

Test solution. Dissolve 40 mg of the substance under examination in *methanol* and dilute to 2.0 ml of *methanol.*

Reference solution. A 0.5 per cent w/v solution of *fumaric acid IPRS* in *ethanol (95 per cent).*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, heat at 105° for 30 minutes and spray with a 1.6 per cent w/v solution of *potassium permanganate* and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Solution A. A 1.0 per cent w/v solution in *methanol.*

Appearance of solution. Solution A is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 3.2 to 4.2, determined in a 10.0 per cent w/v solution in *carbon dioxide-free water.*

Specific optical rotation (2.4.22). +15.0° to +18.0°, determined in solution A.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 20 volumes of *methanol* and 80 volumes of *tetrahydrofuran.*

Test solution (a) Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 5.0 ml of *methanol.*

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol.*

Reference solution (a). A 0.2 per cent w/v solution of *clemastine fumarate IPRS* in *methanol.*

Reference solution (b). Dilute 1.5 ml of test solution (b) to 50.0 ml with *methanol.*

Reference solution (c). Dilute 0.5 ml of test solution (b) to 50.0 ml with *methanol.*

Reference solution (d). Dissolve 10 mg of *diphenhydramine hydrochloride IPRS* in 5.0 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in cold air for 5 minutes and spray with a freshly prepared mixture of 1.0 ml of *potassium iodobismuthate solution* and 10.0 ml of *dilute acetic acid* and then with *dilute hydrogen peroxide solution*, cover the plate immediately with a glass plate of the same size and examine the chromatograms after 2 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more than the principal spot in the chromatogram obtained with reference solution (b) (0.3 per cent), and at most 4 such spots are more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.1 per cent). Ignore any spot remaining at the point of application (*fumaric acid*). The spot in the chromatogram obtained with reference solution (d) shows 2 clearly separated spots.

Impurity C. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of 1.0 per cent w/v solution of *ammonium dihydrogen phosphate.*

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.006 per cent w/v solution of *clemastine impurity C IPRS (1-(4-chlorophenyl)-1-phenyl ethanol IPRS)* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. To 1.0 ml of the solution, add 1.0 ml of reference solution (a) and dilute to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 45 volumes of *acetonitrile* and 55 volumes of 1.0 per cent w/v solution of *ammonium dihydrogenphosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 100 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to clemastine and clemastine impurity C is not less than 2.2.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to clemastine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 6 hours.

Assay. Dissolve 0.35 g in 60 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*. Determine the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.046 g of $C_{25}H_{30}ClNO_5$.

Clemastine Oral Solution

Clemastine Fumarate Oral Solution

Clemastine Oral Solution contains Clemastine Fumarate in a suitable vehicle. Clemastine Oral Solution contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of clemastine, $C_{21}H_{26}ClNO$.

Usual strength. 0.1 mg per ml.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Impurity C. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of a 1.0 per cent w/v solution of *ammonium dihydrogen orthophosphate*.

Test solution. Dilute a quantity of the oral solution containing 0.5 mg of clemastine to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.00008 per cent w/v solution of *clemastine impurity C IPRS (1-(4-chlorophenyl)-1-phenylethanol IPRS)* in the solvent mixture.

Reference solution (b). A solution containing 0.000335 per cent w/v of *clemastine fumarate IPRS* and 0.00008 per cent w/v of *1-(4- chlorophenyl)-1-phenylethanol IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 45 volumes of *acetonitrile* and 55 volumes of a 1.0 per cent w/v solution of *ammonium dihydrogen orthophosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject reference solution (b).The test is not valid unless the resolution between the peaks due to clemastine fumarate and clemastine impurity C is not less than 2.2.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to clemastine impurity C is not more than the area of the peak in the chromatogram obtained with reference solution (a) (3.0 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. 1 volume of *13.5M ammonia*, 20 volumes of *methanol* and 80 volumes of *stabiliser-free tetrahydrofuran*.

Test solution (a). To a volume of oral solution containing 8 mg of clemastine, add 20 ml of *water*, 20 ml of a saturated

solution of *sodium chloride* and 2.0 ml of *13.5M ammonia*, extract with four 40 ml quantities of *dichloromethane*, washing each extract with the same 40 ml of *water*, filter the dichloromethane extracts and evaporate to dryness at a temperature of 30° to 40° under reduced pressure. Dissolve the residue in 50.0 ml of *methanol*, evaporate to dryness under the same conditions and dissolve the residue in 4 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). A 0.027 per cent w/v solution of *clemastine fumarate IPRS* in *methanol*.

Reference solution (b). A 0.00135 per cent w/v solution of *clemastine fumarate IPRS* in *methanol*.

Reference solution (c). A solution containing 0.0135 per cent w/v, each of, *clemastine fumarate IPRS* and *diphenhydramine hydrochloride IPRS* in *methanol*.

Reference solution (d). A 0.0054 per cent w/v solution of *2-(2-hydroxyethyl)-1-methylpyrrolidine IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of cold air for 5 minutes. Spray with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution* and 10 volumes of *2M acetic acid* and then with 10 volumes of *hydrogen peroxide solution*. Cover the plate immediately with a glass plate of the same size and examine the chromatograms after 2 minutes. The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots. In the chromatogram obtained with test solution (a), any spot corresponding to *2-(2-hydroxyethyl)-1-methylpyrrolidine* is not more intense than the spot in the chromatogram obtained with reference solution (d) (2.0 per cent, with reference to clemastine fumarate) and any orange-brown secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent, with reference to clemastine fumarate). Ignore any spot remaining on the line of application and any spot with an R_f value greater than that of the principal spot.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of a 1.0 per cent w/v solution of *ammonium dihydrogen orthophosphate*.

Test solution. Dilute a quantity of the oral solution containing 0.5 mg of clemastine to 20.0 ml with the solvent mixture.

Reference solution. A 0.00335 per cent w/v solution of *clemastine fumarate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 45 volumes of *acetonitrile* and 55 volumes of a 1.0 per cent w/v solution of *ammonium dihydrogen orthophosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Determinethe weight per ml (2.4.29) of the oral solution and calculate the content of $C_{21}H_{26}ClNO$, weight in volume.

Labelling. The label states the quantity of the active ingredient in terms of the equivalent amount of clemastine.

Clemastine Tablets

Clemastine Fumarate Tablets

Clemastine Tablets contain not less than 93.0 per cent and not more than 105.0 per cent of the stated amount of clemastine, $C_{21}H_{26}ClNO$.

Usual strength. 1 mg.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

B. In the test for Impurity C, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of a buffer solution pH 4.0, prepared by dissolving 10 g of *citric acid monohydrate* in 500 ml of *water*, add 11.0 ml of 30 per cent w/v of *sodium hydroxide* and 4.4 ml of *hydrochloric acid* and dilute with *water* to 1000 ml, if necessary adjusted to pH 4.0 with 50 per cent w/v of *sodium hydroxide*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium, centrifuge for 20 minutes at 4000 rpm and filter, Transfer 50.0 ml of the medium to 125-ml separating funnels, add 10 ml of 0.02 per cent w/v of *methyl orange solution*, mix, add 20.0 ml of *chloroform*, shake

mechanically for 10 minutes, remove the chloroform layer and centrifuge the chloroform layer for 10 minute at 4000 rpm. Measure the absorbance at the maximum at about 420 nm. (2.4.7). Calculate the content of $C_{21}H_{26}ClNO,C_4H_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *clemastine fumarate IPRS* treated in the same manner.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{26}ClNO,C_4H_4O_4$.

Impurity C. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of a 1 per cent w/v solution of *ammonium dihydrogen orthophosphate*.

Test solution. Disperse a quantity of the powdered tablets containing 10 mg of clemastine in 200 ml of the solvent mixture, with the aid of ultrasound for 45 minutes. Centrifuge at 4000 rpm for 10 minutes and use supernatant liquid.

Reference solution (a). A 0.0000335 per cent w/v solution of *clemastine impurity C IPRS (1-(4-chlorophenyl)-1-phenylethanol IPRS)* in the solvent mixture.

Reference solution (b). A 0.0067 per cent w/v solution of *clemastine fumarate IPRS* in the solvent mixture

Reference solution (c). A solution containing 0.000335 per cent w/v of *clemastine fumarate IPRS* and 0.000064 per cent w/v of *clemastine impurity C IPRS* in the solvent mixture.

Use chromatographic system as described under Assay using 100 µl injection volume:

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to clemastine fumarate and clemastine impurity C is not less than 2.2.

Inject referene solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to clemastine impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 20 volumes of *methanol* and 80 volumes of *tetrahydrofuran*.

Test solution (a). Disperse a quantity of the powdered tablets containing 8 mg of clemastine in 4 ml of *methanol* with the aid of ultrasound for 15 minutes. Centrifuge at 4000 rpm for 10 minutes and use supernatant liquid.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol* .

Reference solution (a). A 0.027 per cent w/v solution of *clemastine fumarate IPRS* in *methanol*.

Reference solution (b). A 0.00135 per cent w/v solution of *clemastine fumarate* in *methanol*.

Reference solution (c). A solution containing 0.0135 per cent w/v of *clemastine fumarate IPRS* and *diphenhydramine hydrochloride IPRS* in *methanol*.

Reference solution (d). A 0.00135 per cent w/v solution of *2-(2-hydroxyethyl)-1-methylpyrrolidine IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in cold air for 5 minutes and spray with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution* and 10 volumes of *2 M acetic acid* and then with *hydrogen peroxide solution (10 volume)*. Cover the plate immediately with a glass plate of the same size and examine the chromatograms after 2 minutes.

In the chromatogram obtained with test solution (a), any spot corresponding to 2-(2-hydroxyethyl)-1-methylpyrrolidine is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent with reference to clemastine fumarate), any orange-brown secondary spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent with reference to clemastine fumarate). Ignore any spot remaining on the line of application and any spot with an R_f value more than that of the principal spot. The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using following solutions.

Test solution. Disperse 1 tablet with 40 ml of the solvent mixture with the aid of ultrasound for 45 minutes, cool and dilute to 50.0 ml with the solvent mixture, centrifuge and use a clear supernatant liquid.

Reference solution. A 0.0027 per cent w/v solution of *clemastine fumarate IPRS* in the solvent mixture.

Calculate the content of $C_{21}H_{26}ClNO$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of a 1 per cent w/v solution of *ammonium dihydrogen orthophosphate*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of clemastine in 200 ml of the solvent mixture, with the aid of ultrasound for 45 minutes.Centrifuge at 4000 rpm for 10 minutes and use the supernatant liquid.

Reference solution. A 0.0067 per cent w/v solution of *clemastine fumarate IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 50 volumes of *acetonitrile* and 50 volumes of a 1.0 per cent w/v solution of *ammonium dihydrogen orthophosphate*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

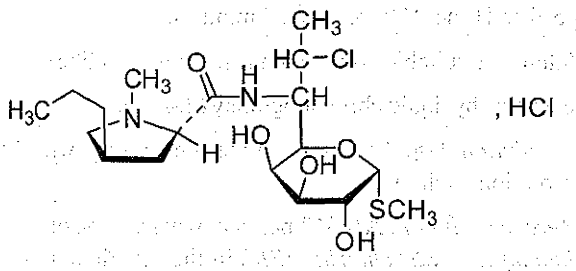
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{26}ClNO$ in the tablets.

Labelling. The quantity of the active ingredient is stated in terms of the equivalent amount of clemastine.

Clindamycin Hydrochloride



$C_{18}H_{33}ClN_2O_5S,HCl$ Mol. Wt. 461.5

Clindamycin Hydrochloride is methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propyl-2-pyrrolidinyl] carbonyl] amino]-1-thio-L-*threo*-α-D-*galacto*-octopyranoside hydrochloride.

Clindamycin Hydrochloride contains not less than 91.0 per cent and not more than 102.0 per cent of $C_{18}H_{33}ClN_2O_5S,HCl$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *clindamycin hydrochloride IPRS* or with the reference spectrum of clindamycin hydrochloride.

B. Determine by thin- layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 19 volumes of *2-propanol*, 38 volumes of a 15 per cent w/v solution of *ammonium acetate*, adjusted to pH 9.6 with *ammonia* and 43 volumes of *ethyl acetate*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *clindamycin hydrochloride IPRS* in the *methanol*.

Reference solution (b). A solution containing 0.1 per cent w/v, each of, *clindamycin hydrochloride IPRS* and *lincomycin hydrochloride IPRS* in the *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the pate in air, spray with a 0.1 per cent w/v solution of *potassium permanganate*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

C. Dissolve about 10 mg of the substance under examination in 2 ml of *dilute hydrochloric acid* and heat on a water-bath for 3 minutes, add 3 ml of *sodium carbonate solution* and 1 ml of a 2 per cent w/v solution of *sodium nitroprusside*, a violet-red colour is produced.

D. A 1 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.0 to 5.0, determined in a 10 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +135° to +150°, determined in a 4.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *clindamycin hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of a 0.68 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 7.5 with a 25 per cent w/v solution of *potassium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The relative retention time with reference to clindamycin for methyl 6,8-dideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-*erythro*-α-D-galacto-octopyranoside (clindamycin impurity A) is about 0.4; for methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-4-ethyl-1-methylpyrrolidin-2-yl]carbonyl]amino]-1-thio-L-*threo*-α-D-galacto-octopyranoside (clindamycin impurity B) is about 0.65 and for methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-*erythro*-α-D-galacto- octopyranoside (clindamycin impurity C) is about 0.8.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution the area of the peak due to clindamycin impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). The area of peak corresponding to clindamycin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent). Ignore any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). 3.0 per cent to 6.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{33}ClN_2O_5S$,HCl.

Storage. Store protected from moisture.

Clindamycin Capsules

Clindamycin Hydrochloride Capsules

Clindmycin Capsules contain Clindamycin Hydrochloride equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clindamycin, $C_{18}H_{33}ClN_2O_5S$.

Usual strength. 150 mg.

Identification

A. Shake a quantity of the content of capsules containing about 30 mg of clindamycin with 15 ml of *chloroform*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clindamycin hydrochloride IPRS* or with the reference spectrum of clindamycin hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.017 per cent w/v solution of *clindamycin hydrochloride IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: Dissolve 4 g of *d-10-camphorsulfonic acid*, 2 g of *ammonium acetate*, and 2 ml of *glacial acetic acid* in 400 ml of *water* and dilute to 1000.0 ml with *methanol*, adjusted to pH 6.0 with *hydrochloric acid* or *5 M sodium hydroxide*,
- flow rate: 2 ml per minute,
- refractive index detector,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the medium.

Q. Not less than 80 per cent of the stated amount of clindamycin $C_{18}H_{33}ClN_2O_5S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the content of capsules containing about 50 mg of clindamycin with 50 ml of the mobile phase for 15 minutes and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). A 0.1 per cent w/v solution of *clindamycin hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of 0.68 per cent w/v solution of *potassium dihydrogen orthophosphate*, adjusted to pH 7.5 with 25 per cent w/v solution of *potassium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The relative retention time with reference to clindamycin for methyl 6,8-dideoxy-6-[[[(2*S*,4*R*)-1- methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-erythro-α-D-galacto- octopyranoside (lincomycin) (clindamycin impurity A) is about 0.4, for methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-4-ethyl- 1-methylpyrrolidin-2-yl]carbonyl]amino]-1-thio-*L-threo*-α-D-*galacto*-octopyranoside (clindamycin B) (clindamycin impurity B) is about 0.65 and for methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*- octopyranoside (7-epiclindamycin) (clindamycin impurity C) is about 0.8.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak corresponding to clindamycin impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of peak corresponding to clindamycin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (6.0 per cent). Ignore any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Water (2.3.43). Not more than 7.0 per cent, determined on 1 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the content of 20 capsules containing about 50 mg of clindamycin with 50 ml of the mobile phase for 15 minutes and filter.

Reference solution. A 0.11 per cent w/v solution of *clindamycin hydrochloride IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

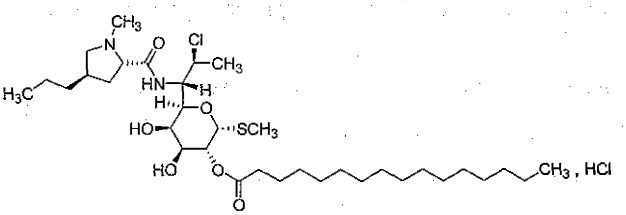
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the capsules.

1 mg of $C_{18}H_{33}ClN_2O_5S$, HCl is equivalent to 0.9209 mg of $C_{18}H_{33}ClN_2O_5S$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of clindamycin.

Clindamycin Palmitate Hydrochloride



$C_{34}H_{63}ClN_2O_6S,HCl$ Mol. Wt. 699.9

Clindamycin Palmitate Hydrochloride is L-*threo*-α-D-*galacto*-Octopyranoside, methyl 7-chloro-6,7,8-trideoxy-6-[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-2-hexadecanoate, monohydrochloride, (2*S-trans*)-;Methyl 7-chloro-6,7,8-trideoxy-6-(1-methyl-*trans*-4-propyl-L-2-pyrrolidinecarboxamido)-1-thio-L *threo*-α-D-*galacto*-octopyranoside 2-palmitate monohydrochloride.

Clindamycin Palmitate Hydrochloride has a potency equivalent to not less than 540 µg of clindamycin per mg.

Category. Antibiotics.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clindamycin palmitate hydrochloride IPRS* or with the reference spectrum of clindamycin palmitate hydrochloride.

Tests

pH (2.4.24). 2.8 to 3.8, determined in a 1.0 per cent w/v solution.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 3.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.35 g of the substances under examination in the mobile phase and dilute to 25.0 ml with the same solvent.

Reference solution. A 1.4 per cent w/v solution of *clindamycin palmitate hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase. Dissolve 2 g of *docusate sodium* and 1.54 g of *ammonium acetate* in a mixture of 2 ml of *glacial acetic acid* and 75 ml of *water* and dilute with *methanol* to 1000 ml and pass through a suitable filter and degas,
- flow rate: 1.2 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and test solution.

Calculate the content of $C_{34}H_{63}ClN_2O_6S$.

Storage. Store protected from moisture

Clindamycin Palmitate Hydrochloride Oral Suspension

Clindamycin Palmitate Hydrochloride Oral Solution is a mixture consisting of clindamycin palmitate hydrochloride and one or more suitable buffers, colours, diluents, flavours, and preservatives. It is filled in sealed containers. The oral solution is constituted by dispersing the contents of the sealed container in the specified volume of *water* just before use.

Clindamycin Palmitate Hydrochloride Oral Solution contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of clindamycin, $C_{18}H_{33}ClN_2O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted solution may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of clindamycin $C_{18}H_{33}ClN_2O_5S$.

Usual strength. 15 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

The constituted solution complies with the tests stated under oral liquids and with the following tests.

Tests

pH (2.4.24). 2.5 to 5.0, in the solution constituted as directed in the labelling.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Other tests. Comply with the tests stated under Oral Powders.

Assay. Determine by gas chromatography (2.4.13).

Solution A. A 30.0 per cent w/v of *sodium carbonate*.

Internal standard solution. A. 0.5 per cent w/v of cholesteryl benzoate in *chloroform*.

Test solution. Transfer 5 ml of the constituted solution to a centrifuge tube. Add 5.0 ml of internal standard solution and 1 ml of solution A. Insert the stopper, shake vigorously for 10 minutes and centrifuge. Remove the upper aqueous layer, and transfer 1.0 ml of the lower chloroform layer to a centrifuge tube. Add 1.0 ml of *pyridine* and 1.0 ml of *acetic anhydride*. Agitate the tube to ensure complete mixing, cover the top of the centrifuge tube with a plastic cap through which a small hole has been punched, heat at 100° for 2.5 hours, and allow to cool, Mix and centrifuge, if necessary.

Reference solution. Transfer 150 mg of *clindamycin palmitate hydrochloride IPRS* to a centrifuge tube. Add 5 ml of *water*, 5.0 ml of internal standard solution, and 1 ml of solution A. Insert the stopper, shake vigorously for 10 minutes and centrifuge. Remove the upper aqueous layer and transfer 1.0 ml of the lower chloroform layer to a centrifuge tube. Add 1.0 ml of *pyridine* and 1.0 ml of *acetic anhydride*. Agitate the tube to ensure complete mixing, cover the top of the centrifuge tube with a plastic cap through which a small hole has been punched, heat at 100° for 2.5 hours and allow to cool. Mix and centrifuge, if necessary.

Chromatographic system

- a glass column 0.6 m x 3.0 mm packed with 1 per cent vinyl 5 per cent phenylmethylpolysiloxane,
- temperature column: 290°,

- flame ionization detector at 320°,
- flow rate: 60 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The elution order of peaks is cholesteryl benzoate and clindamycin palmitate.

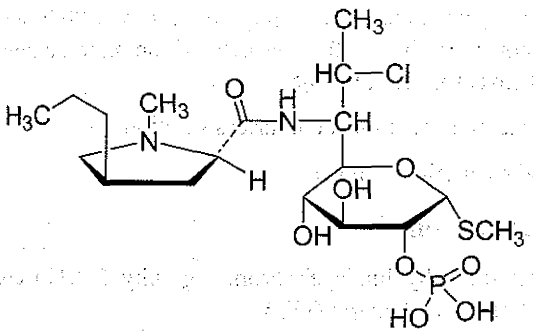
Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of clindamycin, $C_{18}H_{33}ClN_2O_5S$, weight in volume.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. (1) The label states the strength in terms of the equivalent amount of clindamycin; (2) The temperature of storage and the period during which the constituted oral liquids may be expected to be satisfactory for use.

Clindamycin Phosphate



$C_{18}H_{34}ClN_2O_8PS$ Mol. Wt. 505.0

Clindamycin Phosphate is methyl 7-chloro-6,7,8-trideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-L-threo-α-D-galacto-octopyranoside 2-(dihydrogen phosphate). It is a semi-synthetic product derived from a fermentation product.

Clindamycin Phosphate contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{18}H_{34}ClN_2O_8PS$, calculated on the anhydrous basis.

Category. Lincosamide antibacterial.

Description. A white or almost white, slightly hygroscopic powder. It shows polymorphism (2.5.11).

Identification

Tests B, C and D may be omitted if tests A and D are carried out. Tests A and D may be omitted if tests B, C and D are carried out.

A. In 2 separate tubes place 50 mg of the substance under examination and 50 mg of *clindamycin phosphate IPRS*. Add 0.2 ml of *water* and heat until completely dissolved. Evaporate to dryness under reduced pressure and dry the residues at 100° to 105° for 2 hours. On the residue, determine by infrared absorption spectrophotometry (2.4.6), compare the spectrum with that obtained with *clindamycin phosphate IPRS* or with the reference spectrum of clindamycin phosphate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *glacial acetic acid*, 20 volumes of *water* and 60 volumes of *butanol*.

Test solution. Dissolve 20 mg of the substance under examination in *methanol* and dilute to 10 ml with *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *clindamycin phosphate IPRS* in *methanol*.

Reference solution (b). Dissolve 10 mg of *lincomycin hydrochloride IPRS* in 5 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 100 to 105° for 30 minutes and spray with a 0.1 per cent w/v solution of *potassium permanganate*. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution (a). The chromatogram obtained with reference solution (b) shows 2 principal spots.

C. Dissolve 10 mg in 2 ml of *dilute hydrochloric acid* and heat in a water-bath for 3 minutes. Add 4 ml of *sodium carbonate solution* and 1 ml of a 2.0 per cent w/v solution of *sodium nitroprusside*. Prepare a reference solution in the same manner using *clindamycin phosphate IPRS*. The colour of the test solution corresponds to that of the reference solution.

D. Boil 0.1 g under a reflux condenser with a mixture of 5 ml of *strong sodium hydroxidesolution* and 5 ml of *water* for 90 minutes. Cool and add 5 ml of *nitric acid*. Extract with 3 quantities, each of 15-ml, of *dichloromethane* and discard the extracts. Filter the upper layer through a paper filter. The filtrate gives reaction (b) of phosphates (2.3.1).

Tests

Solution A. Dissolve 1.0 g in *carbon dioxide-free water*. Heat gently if necessary. Cool and dilute to 25.0 ml with *carbon dioxide-free water*.

Appearance of the solution. Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 3.5 to 4.5, determined by diluting 5.0 ml of solution A to 20 ml with *carbon dioxide-free water*.

Specific optical rotation (2.4.22). + 115.0° to + 130.0°, determined on 1.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). A 0.3 per cent w/v solution of *clindamycin phosphate IPRS* in the mobile phase.

Reference solution (b). Dissolve 5 mg of *clindamycin impurity A IPRS (lincomycin hydrochloride IPRS)* and 15.0 mg of *clindamycin impurity E IPRS (clindamycin hydrochloride IPRS)* in 5.0 ml of reference solution (a) and then dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 200 volumes of *acetonitrile* and 800 volumes of a 1.36 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to clindamycin phosphate (2nd peak) and clindamycin impurity E (3rd peak) is not less than 6.0, the tailing factor for the peak due to clindamycin phosphate is not more than 1.5. The peak due to clindamycin impurity A (1st peak) is clearly separated from the peak due to the solvent.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak due to clindamycin phosphate in the chromatogram obtained with reference solution (c) (2.5 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the peak due to clindamycin phosphate in the chromatogram obtained with reference solution (c) (4.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Water (2.3.43). Not more than 6.0 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{34}ClN_2O_8PS$.

Clindamycin Phosphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.6 Endotoxin Unit per mg.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Clindamycin Injection

Clindamycin Phosphate Injection

Clindamycin Injection is a sterile solution of Clindamycin Phosphate in Water for Injections.

Clindamycin Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of clindamycin, $C_{18}H_{33}ClN_2O_5S$.

Description. An almost colourless solution.

Usual strength. 150 mg per ml.

Identification

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1.5 volumes of *18 M ammonia*, 30 volumes of *toluene* and 70 volumes of *methanol*.

Test solution. Dilute a volume of the injection containing 50 mg of Clindamycin to 10 ml with *methanol*.

Reference solution. A 0.5 per cent w/v solution of *clindamycin phosphate IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.5 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with the mobile phase to obtain a solution containing 0.3 per cent w/v of Clindamycin.

Reference solution. A solution containing 0.012 per cent w/v, each of, *lincomycin hydrochloride IPRS*, 0.024 per cent w/v of *clindamycin phosphate IPRS* and 0.0015 per cent v/v of *benzyl alcohol* in the mobile phase.

Use chromatographic system as described under Assay.

The order of elution is lincomycin phosphate, clindamycin phosphate and benzyl alcohol.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to lincomycin hydrochloride and clindamycin phosphate is not less than 7.7.

Inject the test solution. The sum of the areas of all the secondary peaks is not more than 8.0 per cent, calculated by area normalization. Ignore any peak obtained due to benzyl alcohol.

Bacterial endotoxins (2.2.3). Dilute the injection in *water BET* to give a solution containing 10 mg per ml. The solution contains not more than 6.0 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dilute a volume of the injection with the mobile phase to obtain a solution containing 0.015 per cent w/v of Clindamycin.

Reference solution (a). A 0.018 per cent w/v solution of *clindamycin phosphate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.012 per cent w/v of *lincomycin hydrochloride IPRS*, 0.024 per cent w/v of *clindamycin phosphate IPRS* and 0.0015 per cent v/v of *benzyl alcohol* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes 1.36 per cent w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to lincomycin hydrochloride and clindamycin phosphate is not less than 7.7.

Inject reference solution (a) and the test solution.

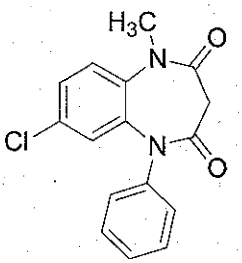
Calculate the content of $C_{18}H_{33}ClN_2O_5S$ in the injection.

1 mg of $C_{18}H_{34}ClN_2O_8PS$ is equivalent to 0.8416 mg of $C_{18}H_{33}ClN_2O_5S$.

Storage. Store at a temperature not exceeding 30°. The injection should not be refrigerated and it should not be allowed to freeze.

Labelling. The label states the strength in terms of the equivalent amount of Clindamycin in a suitable dose volume.

Clobazam



$C_{16}H_{13}ClN_2O_2$ Mol. Wt. 300.7

Clobazam is 7-chloro-1-methyl-5-phenyl-1,5-dihydro-3*H*-1,5-benzodiazepine-2,4-dione.

Clobazam contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{16}H_{13}ClN_2O_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clobazam IPRS* or with the reference spectrum of clobazam.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 50 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *7-chloro-5-phenyl-1,5-dihydro-3H-1,5-benzodiazepine-2,4-dione IPRS (clobazam impurity A)* in the mobile phase and dilute to 50 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg, each of, *chlordiazepoxide IPRS* and *clonazepam IPRS* in the mobile phase and dilute to 50 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (b). The resolution between the peaks due to chlordiazepoxide and clonazepam is not less than 1.3.

Inject the test solution and reference solution (a) and (c). Continue the chromatography for 5 times the retention time of clobazam (about 15 minutes). In the chromatogram obtained with the test solution the area of the peak obtained due to impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any other impurity peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all other impurity peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on the residue obtained in the test for Loss on drying.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° to 105°.

Assay. Weigh accurately about 50 mg and dissolve in 100.0 ml of *ethanol (95 per cent)*. Dilute 2.0 ml of the solution to 250.0 ml with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 232 nm (2.4.7), taking 1380 as the specific absorbance at 232 nm.

Calculate the content of $C_{16}H_{13}ClN_2O_2$.

Storage. Store protected from moisture.

Clobazam Tablets

Clobazam Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clobazam, $C_{16}H_{13}ClN_2O_2$.

Usual strengths. 5mg; 10 mg; 20 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Clobazam with 10 ml of *dichloromethane*, filter and evaporate the filtrate to dryness. Dissolve the residue in the minimum amount of *methanol*, evaporate to dryness and dry the residue at 105° for 10 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clobazam IPRS* or with the reference spectrum of clobazam.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1M hydrochloric acid*,
Speed and time: 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute with equal volumes of *acetonitrile* and *water*, if necessary, to produce a solution expected to contain 0.0005 per cent w/v of clobazam.

Reference solution. A 0.0005 per cent w/v solution of *clobazam IPRS* in a mixture of equal volumes of *acetonitrile* and *water*.

Use the chromatographic system as described under Related substances, using 50 µl injection volume.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{13}ClN_2O_2$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{13}ClN_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of Clobazam in 25 ml of mobile phase, mix with the aid of ultrasound, dilute to 50.0 ml with the mobile phase centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase and further dilute 1.0 ml the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *7-chloro-1,5-dihydro-5-phenyl-1, 5-benzodiazepine-2,4(3H)-dione IPRS* (*clobazam impurity A IPRS*) in *methanol*. Dilute 2.5 ml of the solution to100.0 ml with the mobile phase.

Reference solution (c). A 0.01 per cent w/v solution of *7-chloro-1,5-dihydro-5-phenyl-1,5- benzodiazepine-2,4(3H)-*

dione IPRS (clobazam impurity A IPRS) in *methanol*. Dilute 1.0 ml of the solution to 2.0 ml with a 0.1 per cent w/v solution of *clobazam IPRS* in the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 2.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 2.0 mm, packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Nucleosil C18),
- column temperature: 40°,
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*,
- flow rate: 0.25 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 25 µl.

Inject reference solution (c). The test is not valid unless, the resolution between the peaks due to clobazam impurity A and clobazam is not less than 3.0.

Inject reference solution (a), (b), (d) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to clobazam impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay with the following test solution.

Test solution. Transfer one tablet in a 50.0 ml volumetric flask, add 3 ml of *water* and allow the tablet to disperse with the aid of ultrasound. Add 30 ml of mobile phase and mix with the aid of ultrasound for 10 minutes, dilute to 50.0 ml with mobile phase and filter. Dilute the filtrate with mobile phase to obtain a solution containing 0.002 per cent of clobazam.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances with the following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Clobazam in 80 ml of mobile phase, mix with the aid of ultrasound, dilute to 100.0 with mobile phase and centrifuge. Dilute 1.0 ml of the supernatant liquid to 10.0 ml with mobile phase.

Reference solution (a). A 0.002 per cent w/v solution of *clobazam IPRS* in mobile phase.

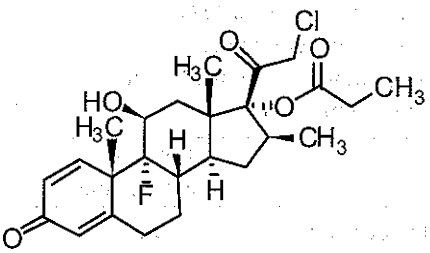
Reference solution (b). A 0.01 per cent w/v solution of *7-chloro-1,5-dihydro-5-phenyl-1,5- benzodiazepine-2,4(3H)-dione IPRS* (*clobazam impurity A IPRS*) in mobile phase. Dilute 1.0 ml of the solution to 2.0 ml with a 0.1 per cent w/v solution of *clobazam IPRS* in the mobile phase.

Inject reference solution (b). The test is not valid unless, the resolutionbetween clobazam impurity A and clobazam is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{13}ClN_2O_2$ in the tablets.

Clobetasol Propionate



$C_{25}H_{32}ClFO_5$ Mol. Wt. 467.0

Clobetasol Propionate is 21-chloro-9α-fluoro-11b-hydroxy-16β-methylpregna-1,4-diene-3,20-dion-17α–yl propionate..

Clobetaol propionate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{25}H_{32}ClFO_5$, calculated on the dried basis.

Category. Glucocorticoid.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clobetasol propionate IPRS* or with the reference spectrum of clobetasol propionate.

Tests

Specific optical rotation (2.4.22). + 112° to + 118°, determined in a 1.0 per cent w/v solution in *acetone*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase.

Test solution (b). Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *clobetasol impurity J IPRS* in 2.0 ml of the mobile phase. To 0.5 ml of the solution, add 0.5 ml of test solution (b) and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 50.0 ml with the mobile phase. Further dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol*, 42.5 volumes of a 0.785 per cent w/v solution of *sodium dihydrogen phosphate monohydrate,* adjusted to pH 5.5 with 10 per cent w/v of *sodium hydroxide* and 47.5 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Clobetasol impurity A[1]	0.4	—
Clobetasol impurity B[2]	0.6	0.6
Clobetasol impurity C[3]	0.9	1.5
Clobetasol	1.0	—
Clobetasol impurity J[4]	1.1	—
Clobetasol impurity D[5]	1.2	—
Clobetasol impurity L[6]	1.3	—
Clobetasol impurity M[7]	1.6	—
Clobetasol impurity E[8]	2.1	—

[1]betamethasone 17-propionate,

[2]21-chloro-9-fluoro-11β-hydroxy-16-methylpregna-1,4,16-triene-3,20-dione,

[3]21-chloro-9-fluoro-11b-hydroxy-16a-methyl-3,20-dioxopregna-1,4-dien-17-yl propanoate,

[4](17R)-4'-chloro-5'-ethyl-9-fluoro-11b-hydroxy-16b-methylspiro[androsta-1,4-diene-17,2'(3'H)-furan]-3,3'-dione,

[5]1,2-dihydroclobetasol 17-propionate,

[6]unknown structure,

[7]unknown structure,

[8]21-chloro-16b-methyl-3,20-dioxopregna-1,4-dien-17-yl propanoate.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to clobetasol propionate and clobetasol propionate impurity J is not less than 2.0.

Inject reference solution (b) and test solution (a). Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution (a), the area of any peak due to clobetasol impurity E is not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent). The area of any peak due to clobetasol impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to clobetasol impurities B and C is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to clobetasol impurities A, L and M is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using following solutions.

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *clobetasol propionate IPRS* in the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{25}H_{32}ClFO_5$.

Storage. Store protected from light.

Clobetasol Cream

Clobetasol Propionate Cream

Clobetasol Cream contains Clobetasol Propionate in a suitable cream base.

Clobetasol Cream contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of clobetasol propionate, $C_{25}H_{32}ClFO_5$.

Usual strength. 0.05 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 5 volumes of *ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane*.

Test solution. Transfer a quantity of the cream containing 0.75 mg of Clobetasol Propionate to a 25-ml centrifuge tube, add 10 ml of *methanol* and heat in a water-bath at 60° for 4 minutes. Remove from the water-bath and shake vigorously. Repeat the heating and shaking, cool to room temperature, add 3.5 ml of *water* and mix. Centrifuge for 10 minutes. Transfer 10 ml of the clear supernatant liquid to a 100-ml separating funnel, add 1 g of *sodium chloride* and 10 ml of *water* and mix. Add 5 ml of *dichloromethane* and shake for 1 minute. Evaporate the dichloromethane layer to dryness in a current of nitrogen with gentle heating and dissolve the residue in 0.5 ml of *dichloromethane*.

Reference solution (a). A 0.05 per cent w/v solution of *clobetasol propionate IPRS* in *dichloromethane*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After removal of the plate, dry in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (a) corresponds to the peak in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

CAUTION — Prepare the test solutions with full facial protection and wearing heat-resistant gloves.

Test solution (a). Disperse a quantity of the cream containing 1 mg of Clobetasol Propionate in 10 ml of *ethanol*, stopper firmly using a plastic stopper, heat on a water-bath with intermittent shaking until the cream is completely dispersed. Cool the contents in ice for 30 minutes, centrifuge and dilute 5 ml of the supernatant liquid to 10 ml with *ethanol*.

Test solution (b). Prepare in the same manner as test solution (a), but add 5 ml of a 0.04 per cent w/v solution of *beclometasone dipropionate IPRS* in *ethanol* and 5 ml of *ethanol*.

Reference solution. A solution containing 0.005 per cent w/v of *clobetasol propionate IPRS* and 0.01 per cent w/v of *beclometasone dipropionate IPRS* (internal standard) in *ethanol*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 45 volumes of *ethanol* and 55 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution, test solution (a) and (b).

Calculate the content of $C_{25}H_{32}ClFO_5$ in the cream.

Storage. Store at a temperature not exceeding 30°.

Clobetasol Ointment

Clobetasol Propionate Ointment

Clobetasol Ointment contains Clobetasol Propionate in a suitable base.

Clobetasol Ointment contains not less than 90.0 per cent and not more than 115.0 per cent w/w of clobetasol propionate, $C_{25}H_{32}ClFO_5$.

Usual strength. 0.05 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *ethanol*, 10 volumes of *acetone* and 100 volumes of *dichloromethane*.

Test solution. Disperse a quantity of ointment containing 0.5 mg of Clobetasol Propionate to a 25-ml centrifuge tube, add 10 ml of *methanol* and heat in a water-bath at 70° for 4 minutes. Remove from the water- bath and shake vigorously. Repeat the heating and shaking, cool in ice for 5 minutes and centrifuge for 10 minutes. Transfer 5 ml of the clear supernatant liquid to a suitable vial, evaporate to dryness in a current of nitrogen and dissolve the residue in 0.5 ml of *dichloromethane*.

Reference solution (a). A 0.05 per cent w/v solution of *clobetasol propionate IPRS* in *dichloromethane*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After removal of the plate, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Other tests. Comply with the tests stated under Ointments.

Assay. Determine by liquid chromatography (2.4.14).

CAUTION—Prepare the solutions with full facial protection and wearing heat-resistant gloves.

Test solution. Disperse a quantity of the ointment containing 1 mg of clobetasol Propionate with 10 ml of *ethanol*, stopper firmly using a plastic stopper, heat on a water-bath with intermittent shaking. Cool the contents in ice for 30 minutes, centrifuge and dilute 5 ml of the supernatant liquid to 10 ml with *ethanol*.

Reference solution (a). A solution containing 0.005 per cent w/v of *clobetasol propionate IPRS* and 0.01 per cent w/v of *beclometasone dipropionate IPRS* (internal standard) in *ethanol*.

Reference solution (b). Disperse a quantity of the ointment containing1 mg of clobetasol Propionate with 5 ml of 0.04 per cent w/v solution of *beclometasone dipropionate IPRS* in *ethanol* and 5 ml of *ethanol*, heat on a water-bath with intermittent shaking. Cool the contents in ice for 30 minutes, centrifuge and dilute 5 ml of the supernatant liquid to 10 ml with *ethanol*.

Chromatographic system

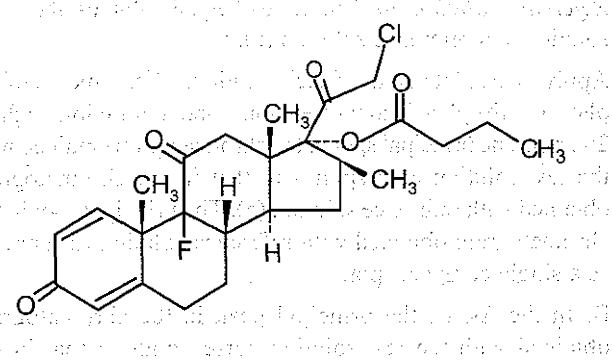
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 45 volumes of *ethanol* and 55 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and the test solution.

Calculate the content of $C_{25}H_{32}ClFO_5$ in the ointment.

Storage. Store at a temperature not exceeding 30°.

Clobetasone Butyrate



$C_{26}H_{32}ClFO_5$ Mol. Wt. 479.0

Clobetasone Butyrate is (16β)-21-chloro-9-fluoro-16-methylpregna-1,4-dien—3,11,20-trione-17-butyrate.

Clobetasone Butyrate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{26}H_{32}ClFO_5$, calculated on the dried basis.

Category. Glucocorticoid.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clobetasone butyrate IPRS* or with the reference spectrum of clobetasone butyrate.

Tests

Specific optical rotation (2.4.22). + 131.0° to + 138.0°, determined in a 1.0 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use.

Solvent mixture. A mixture of 0.1 volume of *anhydrous formic acid*, 43 volumes of *acetonitrile* and 57 volumes of *water*.

Test solution. Dissolve 65 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 0.1 volume of *anhydrous formic acid* and 99.9 volumes of *water*,
  B: a mixture of 0.1 volume of *anhydrous formic acid* and 99.9 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cen v/v)	Mobile phase B (per cent v/v)
0	57	43
3	57	43
26	43	57
30	57	43

The relative retention time with reference to clobetasone butyrate (Retention time: about 14 minutes) for clobetasone impurity F (16α-methyl clobetasone butyrate) is about 0.9.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 20 mg in *ethanol (95 per cent)* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance at the absorption maximum at 235 nm (2.4.7). Calculate the content of $C_{26}H_{32}ClFO_5$, taking 327 as the specific absorbance at 235 nm.

Storage. Store protected from light.

Clobetasone Cream

Clobetasone Butyrate Cream

Clobetasone Cream contains clobetasone butyrate in a suitable cream base.

Clobetasone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clobetasone butyrate, $C_{26}H_{32}ClFO_5$.

Usual strength. 0.05 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *ethanol*, 10 volumes of *acetone* and 100 volumes of *chloroform*.

Test solution. Disperse a quantity of the cream containing 0.5 mg of Clobetasone Butyrate in a mixture of 5 volumes of *ethanol (80 per cent)* and 10 volumes of *n-hexane*, taking 15 ml of the solvent mixture for each g of cream. Shake the mixture, allow to separate, filter the aqueous layer and add 1 ml of *water* for every 10 ml of *n-hexane* used. Cool the solution in ice for 30 minutes, centrifuge, filter the supernatant liquid and dilute with 10 ml of *water* for every 10 ml of *n-hexane* used. Add 1 g of *sodium chloride* for every 10 ml of *water* used and extract with 5 ml of *chloroform* for every 10 ml of *water* used. Evaporate the chloroform layer to dryness in a current of dry nitrogen with gentle heating and dissolve the residue in 0.5 ml of *chloroform*.

Reference solution (a). A 0.1 per cent w/v of *clobetasone butyrate IPRS* in *chloroform*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After removal of the plate, allow it to dry in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with test solution (a) corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

CAUTION — Prepare the test solutions with full facial protection and wearing heat-resistant gloves.

Test solution (a). Add 10 ml of *ethanol* to a quantity of the cream containing 1 mg of Clobetasone Butyrate. Stopper firmly using a plastic stopper and heat on a water-bath with intermittent shaking until the cream is completely dispersed. Cool the contents in ice for 30 minutes, centrifuge. Dilute 5 ml of the supernatant liquid to 10 ml with *ethanol*.

Test solution (b). Prepare in the same manner as test solution (a) but adding 5 ml of *ethanol* and 5 ml of a 0.014 per cent w/v solution of the internal standard in *ethanol*.

Reference solution. A solution containing 0.005 per cent w/v of *clobetasone butyrate IPRS* and 0.0035 per cent w/v of *clobetasol propionate IPRS* (internal standard) in *ethanol*.

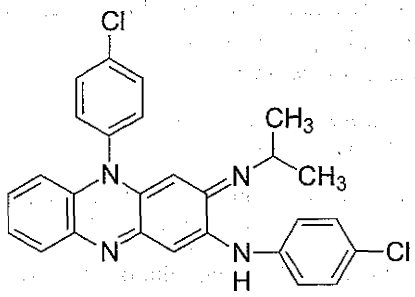
Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 60°,
- mobile phase: a mixture of 40 volumes of *ethanol* and 60 volumes of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 241 nm,
- injection volume: 20 µl.

Calculate the content of $C_{26}H_{32}ClFO_5$ in the cream.

Storage. Store at a temperature not exceeding 30°.

Clofazimine



$C_{27}H_{22}Cl_2N_4$ Mol. Wt. 473.4

Clofazimine is 3-(4-chloroanilino)-10-(4-chlorophenyl)-2,10-dihydro-2-(isopropylimino)phenazine.

Clofazimine contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{27}H_{22}Cl_2N_4$, calculated on the dried basis.

Category. Antibacterial (antileprotic).

Description. Dark red crystals or a reddish-brown, fine powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clofazimine IPRS* or with the reference spectrum of clofazimine.

B. When examined in the range 230 nm to 600 nm, a 0.0005 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows absorption maxima, at about 283 nm and 487 nm; absorbance at about 283 nm, about 0.65 and at about 487 nm, about 0.32 (2.4.7).

C. Dissolve 2 mg in 3 ml of *acetone* and add 0.1 ml of *hydrochloric acid;* an intense violet colour is produced. Add 0.5 ml of *5 M sodium hydroxide*; the colour changes to orange-red.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *clofazimine IPRS* and *iminophenazine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of buffer solution prepared by dissolving 2.25 g of *sodium lauryl sulphate*, 0.85 g of *tetrabutylammonium hydrogen sulphate* and 0.885 g of *disodium hydrogen phosphate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 500 ml with *water* and 65 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Clofazimine impurity A[1]	0.7
Clofazimine impurity B[2]	0.8
Clofazimine (Retention time: about 15 minutes)	1.0

[1] (*N*,5-bis(4-chlorophenyl)-3-imino-3,5-dihydrophenazin-2-amine),

[2](5-(4-chlorophenyl)-3-[(1-methylethyl)imino]-*N*-phenyl-3,5-dihydrophenazin-2-amine).

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0 and the column efficiency of the peak due to clofazimine is not less than 3000 theoretical plates.

Inject reference solution (a) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to clofazimine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the area of peak corresponding to clofazimine impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g and dissolve in 20 ml of *chloroform*. Add 50 ml of *acetone* and titrate with *0.1 M perchloric acid* in *dioxan*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04734 g of $C_{27}H_{22}Cl_2N_4$.

Clofazimine Capsules

Clofazimine Capsules contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clofazimine, $C_{27}H_{22}Cl_2N_4$.

Usual strength. 100 mg.

Identification

A. When examined in the range 260 nm to 600 nm (2.4.7), a 0.0005 per cent w/v solution in a mixture prepared by dissolving 2.25 g of *sodium dodecyl sulphate*, 0.85 g of *tertbutylammonium hydrogen sulphate* and 0.885 g of *disodium hydrogen orthophosphate* in 500 ml of *water*, adjusted to pH 3.0 with *orthophophoric acid* and 65 volumes of *acetonitrile*, shows two absorbance maximum at 289 nm and 491 nm.

B. To 5 mg of the contents of a capsule add 3 ml of *chloroform* and 1 ml of *2 M hydrochloric acid*; the colour of the chloroform layer changes to violet. Add 2 ml of *2 M sodium hydroxide*; the colour changes to brownish-yellow.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the contents of capsules containing 0.5 g of Clofazimine in the mobile phase and dilute to 100.0 ml with the mobile phase and filter. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). A 0.0000125 per cent w/v solution of *iminophenazine IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v, each of, *clofazimine IPRS* and *iminophenazine IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Nucleosil C8),
- mobile phase: a mixture of 35 volumes of buffer solution prepared by dissolving 2.25 g of *sodium dodecyl sulphate*, 0.85 g of *tetrabutylammonium hydrogen sulphate* and 0.885 g of *disodium hydrogen orthophosphate* in 500 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 65 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time
Iminophenazine	0.7
Clofazimine (Retention time: about 15 minutes)	1.0

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0 and the column efficiency of the peak due to clofazimine is not less than 3000 theoretical plates.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

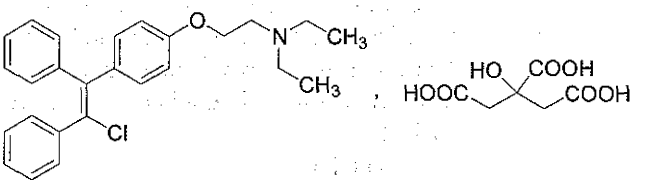
Other tests. Comply with the tests stated under Capsules.

Assay. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 0.15 g of Clofazimine and dissolve in sufficient *chloroform* to produce 100.0 ml. Filter through a chloroform-washed plug of cotton wool. Dilute 5.0 ml of the clear filtrate to 100.0 ml with *chloroform*. To 5.0 ml add 5.0 ml of *0.1 M methanolic hydrochloric acid* and sufficient *chloroform* to produce 50.0 ml. Measure the *absorbance* of the resulting solution at the maximum at about 491 nm (2.4.7), using as the blank a mixture of 5.0 ml of *0.1 M methanolic hydrochloric acid* and sufficient *chloroform* to produce 50.0 ml. Calculate the content of $C_{27}H_{22}Cl_2N_4$ taking 650 as the specific absorbance at 491 nm.

Storage. Store protected from moisture.

Clomifene Citrate

Clomiphene Citrate



$C_{26}H_{28}ClNO,C_6H_8O_7$ Mol. Wt. 598.1

Clomifene citrate is a mixture of *E*- and *Z*-isomers of 2-[4-(2-chloro-1,2-diphenylvinyl)phenoxy]triethylamine dihydrogen citrate.

Clomifene Citrate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{26}H_{28}ClNO,C_6H_8O_7$, calculated on the anhydrous basis.

Category. Ovulation inducer.

Description. A white or pale yellow, crystalline powder.

Identification

Tests B and C may be omitted if test A is carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clomifene citrate IPRS* or with the reference spectrum of clomifene citrate.

B. Dissolve about 5 mg in 5 ml of a mixture of 10 volumes of *acetic anhydride* and 50 volumes of *pyridine* and heat in a water-bath; a deep red colour is produced.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

NOTE — In the following tests, the solutions should be protected from light in amber-coloured glassware. Ensure minimum exposure of the solutions to daylight until they are required for chromatography.

Related substances. Determine by liquid chromatography (2.4.14)

Test solution. A 0.125 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution (a). A solution containing 0.125 per cent w/v of *clomifene citrate for performance test IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with butylsilane bonded to porous silica (Such as Vydac C4),
- mobile phase: mix 400 volumes of acetonitrile with 600 volumes of *water* and add 8 ml of *diethylamine*, adjust the pH of the mixture to 6.2 by the addition of about 1 to 2 ml of *phosphoric acid* taking care to reduce progressively the volume of each addition as the required pH is approached,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 233 nm,
- injection volume: 10 µl.

Equilibrate the column with the mobile phase at a flow rate of 1.2 ml per minute for about one hour.

Inject reference solution (a). Continue the chromatography for twice the retention time of the principal peak. Measure the height (A) above the baseline of the peak due to clomifene impurity A and the height (B) above the baseline of the lowest point of the curve separating this peak from the peak due to clomifene. The test is not valid unless A is greater than 15 times B and the chromatogram obtained resembles the reference chromatogram. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography for four times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak due to 2-[4-(1,2-diphenylvinyl) phenoxy]triethylamine is not greater than that of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the area of any other secondary peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of any secondary peaks is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Ignore any peak with a retention time relative to the clomifene peak of 0.2 or less and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

***Z*-isomer**. 30 to 50 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25 ml of *0.1 M hydrochloric acid*, add 5 ml of *1 M sodium hydroxide* and shake with three quantities, each of 25 ml, of *ethanol-free chloroform*. Wash the combined extracts with 10 ml of *water*, dry over *anhydrous sodium sulphate* and dilute to 100.0 ml with *ethanol-free chloroform*. To 20.0 ml of the solution add 0.1 ml of *triethylamine* and dilute to 100.0 ml with *hexane*.

Reference solution. Dissolve 25 mg of *clomifene citrate IPRS* in 25 ml of *0.1 M hydrochloric acid*, add 5 ml of *1 M sodium hydroxide* and shake with three quantities, each of 25 ml, of *ethanol-free chloroform*. Wash the combined extracts with 10 ml of *water*, dry over *anhydrous sodium sulphate* and dilute to 100.0 ml with *ethanol-free chloroform*. To 20.0 ml of the solution add 0.1 ml of *triethylamine* and dilute to 100.0 ml with *hexane*.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with porous silica particles (10 µm) (Such as Parasol),
- mobile phase: a mixture of 1 volume of *triethylamine*, 200 volumes of *ethanol-free chloroform* and 800 volumes of *hexane*,

– flow rate: 2 ml per minute,
– spectrophotometer set at 302 nm,
– injection volume: 50 µl.

Equilibrate the column with the mobile phase for about 2 hours.

Inject the reference solution. The chromatogram obtained shows a peak due to *E*-isomer just before a peak due to *Z*-isomer. The test is not valid unless the resolution between the peaks corresponding to *E*- and *Z*-isomers is at least 1.0. If necessary, adjust the relative proportions of ethanol-free chloroform and hexane in the mobile phase. Measure the area of the peak due to the *Z*-isomer in the chromatogram obtained with the test solution and the reference solution.

Calculate the content of *Z*-isomer as a percentage of the total clomifene citrate present.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.5 g and dissolve in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05981 g of $C_{26}H_{28}ClNO,C_6H_8O_7$.

Clomifene Tablets

Clomifene Citrate Tablets; Clomiphene Citrate Tablets; Clomiphene Tablets

Clomifene Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of clomifene citrate, $C_{26}H_{28}ClNO,C_6H_8O_7$.

Usual strengths. 25 mg; 50 mg.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 235 nm and 292 nm.

B. Dissolve a quantity of the powdered tablets containing 5 mg of Clomifene Citrate in 5 ml of a mixture of 10 volumes of *acetic anhydride* and 50 volumes of *pyridine* and heat in a water-bath; a deep red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 232 nm (2.4.7). Calculate the content of $C_{26}H_{28}ClNO,C_6H_8O_7$ in the medium taking 317 as the specific absorbance at 232 nm.

Q. Not less than 70 per cent of the stated amount of $C_{26}H_{28}ClNO,C_6H_8O_7$.

***Z*-isomer**. 30 to 50 per cent of the content of clomifene citrate as determined in the Assay.

Determine by liquid chromatography (2.4.14)

Test solution. Shake a quantity of the powdered tablets containing about 50 mg of Clomifene Citrate with 50 ml of *0.1 M hydrochloric acid* for 10 minutes and filter. To 25 ml of the filtrate add 5 ml of *1 M sodium hydroxide* and extract with three quantities, each of 25 ml, of *ethanol-free chloroform*. Wash the combined extracts with 10 ml of *water*, dry over *anhydrous sodium sulphate* and add sufficient *ethanol-free chloroform* to produce 100.0 ml. To 20.0 ml of the resulting solution add 0.1 ml of *triethylamine* and sufficient *hexane* to produce 100 ml.

Chromatographic system
– a stainless steel column 30 cm x 4 mm, packed with porous silica particles (10 µm) (Such as Parasol),
– mobile phase: a mixture of *ethanol-free chloroform* and *hexane*, each containing 0.10 per cent v/v of *triethylamine*, adjusted so that the baseline separation is obtained between *E*- and *Z*-isomers of clomifene (a mixture of 20 volumes of *ethanol-free chloroform* and 80 volumes of *hexane* is suitable),
– flow rate: 2 ml per minute,
– spectrophotometer set at 302 nm,
– injection volume: 50 µl.

Stabilise the system by passing about 250 ml of the mobile phase.

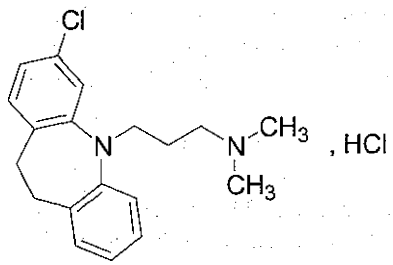
Inject the test solution. In the chromatogram a peak due to the *E*-isomer precedes that due to the *Z*-isomer of clomifene. The test is not valid unless baseline separation is achieved between *E*- and *Z*-clomifene and the column efficiency is greater than 10,000 theoretical plates per metre determine using the peak due to E-isomer.

Calculate the percentage of *Z*-isomer from the expression $100A_Z/(1.08A_E+A_Z)$ where A_Z and A_E are the areas of the peaks due to the *Z*- and *E*-isomers respectively.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Clomifene Citrate, shake for 30 minutes with 70 ml of *0.1 M hydrochloric acid* prepared in a 30 per cent v/v solution of *2-propanol* (instead of water normally used for the purpose as solvent), dilute to 100.0 ml with the propanolic hydrochloric acid and filter. Dissolve 5.0 ml of the filtrate to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 292 nm (2.4.7), using a solution prepared by diluting 5 ml of the propanolic hydrochloric acid to 100 ml with *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_{26}H_{28}ClNO,C_6H_8O_7$ taking 175 as the specific absorbance at 292 nm.

Clomipramine Hydrochloride



$C_{19}H_{23}ClN_2,HCl$ Mol. Wt. 351.3

Clomipramine is 3-(3-chloro-10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepin-5-yl)-*N*,*N*-dimethylpropan-1-amine hydrochloride.

Clomipramine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{23}ClN_2,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. A white or slightly yellow, crystalline powder, slightly hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clomipramine hydrochloride IPRS* or with the reference spectrum of clomipramine hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *ammonia*, 25 volumes of *acetone* and 75 volumes of *ethyl acetate*.

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of *methanol*.

Reference solution. A 0.2 per cent w/v solution of *clomipramine hydrochloride IPRS* in *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air, spray with 0.5 per cent solution of *potassium dichromate* in a 20 per cent solution of *sulphuric acid*. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve about 5 mg in 2 ml of *nitric acid*. An intense blue colour develops.

D. Dissolve about 50 mg in 5 ml of *water* and add 1 ml of *dilute ammonia*. Allow to stand for 5 minutes and filter. Acidify the filtrate with *dilute nitric acid*. The solution gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10 per cent w/v solution in *carbon dioxide-free water* (Solution A) is clear (2.4.1) and not more intensely coloured than reference solution YS3 (2.4.1).

pH (2.4.24). 3.5 to 5.0, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of mobile phase B and 75 volumes of mobile phase A.

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *clomipramine hydrochloride IPRS* in solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with cyanopropylsilyl silica (5 µm),
- mobile phase: A. 1.2 g of *sodium dihydrogen phosphate* in *water*, add 1.1 ml of *nonylamine*, adjusted to pH 3.0 with *phosphoric acid* and dilute to 1000 ml with *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	65	35
32	65	35
44	75	25

Inject reference solution (a). Test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 2 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 50.0 ml of *ethanol* and add 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*. Determine the end-point potentiometrically (2.4.25).

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03513 g of $C_{19}H_{24}Cl_2N_2$.

Storage. Store protected from light and moisture.

Clomipramine Capsules

Clomipramine Hydrochloride Capsules

Clomipramine Capsules contain Clomipramine Hydrochloride.

Clomipramine Capsules contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clomipramine hydrochloride, $C_{19}H_{23}ClN_2,HCl$.

Usual strengths. 25 mg; 75 mg; 100 mg.

Identification

Triturate a quantity of the contents of the capsules containing 0.15 g of Clomipramine Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clomipramine hydrochloride IPRS* or with the reference spectrum of clomipramine hydrochloride.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted with the medium, if necessary, at the maximum at about 252 nm (2.4.7). Calculate the content of $C_{19}H_{23}ClN_2,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *clomipramine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{23}ClN_2,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 20 mg of Clomipramine Hydrochloride with 5 ml of mobile phase A with the aid of ultrasound for 15 minutes, dilute to 10.0 ml with the same solvent and filter.

Reference solution (a). A 0.2 per cent w/v solution of *clomipramine hydrochloride IPRS* in mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with cyanopropylsilyl silica (5 µm) (Such as Hypersil BDS CN),
- mobile phase: A. a mixture of 75 volumes of solution prepared by dissolving 1.2 g of *sodium dihydrogen orthophosphate* in 950 ml of *water*, add 1.1 ml of *nonylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and add sufficient *water* to produce 1000 ml (solution A) and 25 volumes of *acetonitrile*,
  B. a mixture of 65 volumes of solution A and 35 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
10	65	35
32	65	35
44	75	25
50	75	25

Inject reference solution (a). Test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

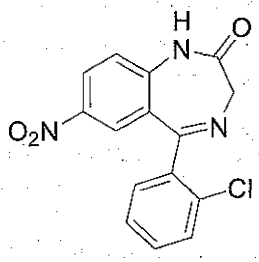
Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b)

(0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Other test. Comply with the tests stated under Capsules.

Assay. Shake a quantity of the mixed contents of 20 capsules containing 50 mg of Clomipramine Hydrochloride with 200 ml of *0.1M hydrochloric acid* for 1 hour, dilute to 250 ml with 0.1 *M hydrochloric acid* and filter. Dilute 15 ml of the filtrate to 100 ml with *0.1M hydrochloric acid.* Measure the absorbance of the resulting solution at 252 nm, (2.4.7). Calculate the content of $C_{19}H_{23}ClN_2,HCl$, taking 226 as specific absorbance at the maximum at 252 nm.

Clonazepam



$C_{15}H_{10}ClN_3O_3$ Mol. Wt. 315.7

Clonazepam is 5-(2-chlorophenyl)-7-nitro-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Clonazepam contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{10}ClN_3O_3$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A slightly yellowish, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clonazepam IPRS* or with the reference spectrum of clonazepam

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of *water*.

Test solution. Dissolve 0.05 g of the substance under examination in 10 ml of *methanol* and dilute to 100 ml with the solvent mixture.

Reference solution (a). Dissolve 25 mg of *clonazepam IPRS* in 5 ml of *methanol* and dilute to 50 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of a 0.66 per cent solution of *ammonium phosphate* previously adjusted to pH 8.0 with a 4 per cent w/v of *sodium hydroxide* or *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (a). Test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *clonazepam IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances with injection volume 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}ClN_3O_3$.

Storage. Store protected from light.

Clonazepam Injection

Clonazepam Injection is a sterile solution of Clonazepam. It is prepared immediately before use by diluting Sterile

Clonazepam Concentrate with Water for Injections in accordance with the manufacturer's instructions.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The injection complies with the requirements stated under Parenteral Preparations (Injections).

Sterile Clonazepam Concentrate

Sterile Clonazepam Concentrate is a sterile solution of clonazepam in a suitable solvent.

The concentrate complies with the requirements of Concentrate for Injections stated under Parenteral Preparations and with the following requirements.

Sterile Clonazepam Concentrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clonazepam, $C_{15}H_{10}ClN_3O_3$.

Description. A clear, colourless or slightly greenish yellow solution.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 2 volumes of *strong ammonia solution*, 15 volumes of *n-heptane*, 30 volumes of *nitromethane* and 60 volumes of *ether*.

Test solution. Dilute a volume of the injection containing 3 mg of Clonazepam in a stoppered tube with an equal volume of *water*, shake with 1 ml of *chloroform*, allow to separate and use the chloroform layer.

Reference solution. Dissolve 3 mg of *clonazepam IPRS* in 1 ml of *chloroform*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. After development, dry the plate in a current of cold air, spray with *2 M sodium hydroxide* and heat at 120° for 15 minutes. The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution.

Tests

pH (2.4.24). 3.4 to 4.3.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *chloroform* and 80 volumes of *ether*.

Test solution. Dilute, if necessary, a volume of the solution containing 10 mg of Clonazepam to 20 ml with *water* and extract with three 3 ml quantities of *chloroform*. Wash each *chloroform* extract separately with the same 10 ml volume of *water*, combine the extracts and add sufficient *chloroform* to produce 10 ml.

Reference solution (a). A 0.0005 per cent w/v solution of *2-amino-2'-chloro-5-nitrobenzophenone IPRS* (nitrobenzophenone) in *chloroform*.

Reference solution (b). A 0.0002 per cent w/v solution of *2-amino-2'-chloro-5-nitrobenzophenone IPRS* (nitrobenzophenone) in *chloroform*.

Reference solution (c). A 0.0002 per cent w/v of *3-amino-4-(2-chlorophenyl)-6-nitroquinolin-2-one IPRS* (carbostyril) in *chloroform*.

Apply to the plate 50 µl of each solution. After development, dry the plate in a current of cold air. For the second development use a mixture of 10 volumes of *ether* and 90 volumes of *nitromethane*. After development, dry the plate, heat at a pressure of 2 kPa at 120° for 3 hours, allow to cool and spray with a 10 per cent w/v solution of *zinc chloride* in *0.1 M hydrochloric acid*. Dry the plate in air and examine in visual light. Any spots in the chromatogram obtained with test solution corresponding to the nitrobenzophenone and carbostyril impurities are not more intense than the spots in the chromatograms obtained with reference solution (b) and (c) respectively (0.2 per cent). Any other secondary spot in the chromatogram obtained with test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Assay. *Protect the solutions from light throughout the assay.*

To a volume of injection containing 20 mg of Clonazepam, dilute to 100.0 ml with *propan-2-ol*. Dilute 10.0 ml of the solution to 100.0 ml with *propan-2-ol*. Measure the absorbance of the resulting solution at the maximum at 310 nm (2.4.7). Calculate the content of $C_{15}H_{10}ClN_3O_3$ taking 364 as the specific absorbance at 310 nm.

Storage. Store protected from light.

Labelling. The label states (1) 'Sterile Clonazepam Concentrate'; (2) that the diluted injection is to be given by intravenous injection.

Clonazepam Tablets

Clonazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clonazepam, $C_{15}H_{10}ClN_3O_3$.

Usual strengths. 0.5 mg; 1 mg; 2 mg.

Identification

A. To an amount of the finely powdered tablets containing about 10 mg of Clonazepam in a small separator add 25 ml of *water*, shake for 2 minutes, and extract with two quantities, each of 40 ml, of *chloroform*. Pass the extracts through *anhydrous sodium sulphate*, combine them, and evaporate to dryness at room temperature with the aid of a stream of nitrogen; the residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clonazepam IPRS* or with the reference spectrum of clonazepam.

B. In the Assay, the chromatogram obtained with the test solution corresponds to the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of degassed *water*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter, discarding about 10 ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. A 0.005 per cent w/v solution of *clonazepam IPRS* in *methanol*. Dilute suitably with the dissolution medium to produce a solution with a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 30 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *water*, 30 volumes of *methanol* and 30 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Q. Not less than 70 per cent of the stated amount of $C_{15}H_{10}ClN_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Clonazepam, dissolve in 75 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). Dissolve 25 mg of *clonazepam IPRS* in 150 ml of the solvent mixture and dilute to 250.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of a 0.66 per cent w/v solution of *ammonium phosphate*, adjusted to pH 8.0 with 4 per cent w/v solution of *sodium hydroxide* or *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent). Ignore any peaks with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. To one tablet add 5 ml of the solvent mixture, disperse with the aid of ultrasound for 10 minutes, dilute, if necessary, with sufficient of the solvent mixture to produce a solution containing 0.01 per cent of Clonazepam and filter.

Calculate the content of $C_{15}H_{10}ClN_3O_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 10 mg of Clonazepam, dissolve in 75

ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture and filter.

Reference solution. Dissolve 25 mg of *clonazepam IPRS* in 150 ml of the solvent mixture and dilute to 250.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 42 volumes of *methanol* and 48 volumes of a 0.66 per cent w/v solution of *ammonium phosphate*, adjusted to pH 8.0 with 4 per cent w/v solution of *sodium hydroxide* or *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

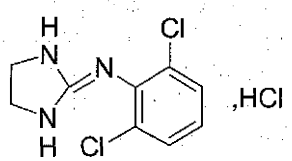
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{15}H_{10}ClN_3O_3$ in the tablets.

Storage. Store protected from moisture.

Clonidine Hydrochloride



$C_9H_9Cl_2N_3,HCl$ Mol. Wt. 266.6

Clonidine Hydrochloride is 2-[(2,6-dichlorophenyl)imino]-imidazolidine hydrochloride.

Clonidine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_9Cl_2N_3,HCl$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clonidine hydrochloride IPRS* or with the reference spectrum of clonidine hydrochloride.

B. When examined in the range 230 nm to 600 nm, a 0.03 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima, at about 272 nm and 279 nm and an inflection at about 265 nm (2.4.7)

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 4.0 to 5.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 5 mg of *clonidine impurity B IPRS (1-acetyl-2-[(2,6-dichlorophenyl)amino]-4,5-dihydro-1H-imidazole IPRS)* in 2 ml of *acetonitrile* and dilute to 5.0 ml with mobile phase A. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 10.0 ml with mobile phase A.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with propylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. dissolve 4 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid*,
  B. a mixture of 25 volumes of mobile phase A and 75 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
15	30	70
15.1	90	10
20	90	10

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to clonidine and clonidine impurity B is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g and dissolve in 70 ml of *ethanol (95 per cent)*. Titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02666 g of $C_9H_9Cl_2N_3,HCl$.

Clonidine Injection

Clonidine Hydrochloride Injection

Clonidine Injection is a sterile solution of Clonidine Hydrochloride in Water for Injections.

Clonidine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clonidine hydrochloride, $C_9H_9Cl_2N_3,HCl$.

Usual strength. 150 µg in 1 ml.

Identification

A. Dilute a volume containing 300 µg of Clonidine Hydrochloride to 5 ml with *0.01 M hydrochloric acid*. When examined in the range 230 nm to 360 nm, the resulting solution shows absorption maxima at about 272 nm and 279 nm and an inflection at about 265 nm (2.4.7).

B. To a volume containing 150 µg of Clonidine Hydrochloride add 1 ml of a 10 per cent w/v solution of *ammonium reineckate* and keep aside for 5 minutes; a pink precipitate is obtained.

Tests

pH (2.4.24). 4.0 to 7.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Shake together 50 volumes of *water*, 40 volumes of *1-butanol* and 10 volumes of *glacial acetic acid* and allow the layers to separate. Use the filtered upper layer.

Test solution. Add 10 ml of *methanol* to a volume containing 750 µg of Clonidine Hydrochloride, evaporate to dryness and dissolve the residue in 0.5 ml of *methanol*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and spray with *modified potassium iodobismuthate solution*. Allow to dry in air for 1 hour, spray again with the same reagent and immediately spray with a 5 per cent w/v solution of *sodium nitrite*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume of the injection containing 150 µg of Clonidine Hydrochloride add 25 ml of *citrophosphate buffer pH 7.6*, 5 ml of *water*, and 1 ml of a solution containing 0.15 per cent w/v of *bromothymol blue* and 0.15 per cent w/v of *anhydrous sodium carbonate*. Add 30 ml of *chloroform*, shake for 1 minute and centrifuge. To 15.0 ml of the chloroform layer add 10 ml of *boric acid solution* and measure the absorbance of the resulting solution at the maximum at about 420 nm (2.4.7), using as the blank a solution prepared by diluting 10 ml of *boric acid solution* to 25.0 ml with *chloroform*. Repeat the operation by adding to 5.0 ml of a 0.003 per cent w/v solution of *clonidine hydrochloride IPRS*, previously dried to constant weight at 105°, 20 ml of *citrophosphate buffer pH 7.6* and completing the procedure described above beginning at the words "5 ml of *water*". Calculate the content of $C_9H_9Cl_2N_3,HCl$ from the absorbance obtained using *clonidine hydrochloride IPRS* in place of the substance under examination.

Storage. Store in single dose containers.

Clonidine Tablets

Clonidine Hydrochloride Tablets

Clonidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clonidine hydrochloride, $C_9H_9Cl_2N_3,HCl$.

Usual strengths. 25 µg; 100 µg; 300 µg

Identification

To a quantity of the powdered tablets containing 500 µg of Clonidine Hydrochloride add 30 ml of *water* and 5 ml of *1 M sodium hydroxide*. Swirl gently and extract with 20 ml of *chloroform*. Remove the chloroform layer, dry with *anhydrous*

sodium sulphate, filter and evaporate the filtrate to dryness. Dissolve the residue in 8 ml of *0.01 M hydrochloric acid*. The resulting solution complies with the following tests.

A. When examined in the range 230 nm to 360 nm, it shows absorption maxima at about 272 nm and 279 nm and an inflection at about 265 nm (2.4.7).

B. To 2 ml add 1 ml of a 10 per cent w/v solution of *ammonium reineckate* and allow to stand for 5 minutes; a pink precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01 M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *clonidine hydrochloride IPRS* in the dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the test solution.

Use the chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_9Cl_2N_3$,HCl in the medium.

Q. Not less than 75 per cent of the stated amount of $C_9H_9Cl_2N_3$,HCl.

Uniformity of content. Complies with the test stated under Tablets.

For tablets containing 300 µg or more of Clonidine Hydrochloride—

To one tablet add 20 ml of *citrophosphate buffer pH 7.6*, shake until disintegrated and dilute with *citrophosphate buffer pH 7.6*, if necessary, to give a solution containing about 0.0015 per cent w/v of Clonidine Hydrochloride. To 5 ml of the supernatant liquid add 1 ml of a solution containing 0.15 per cent w/v of *bromothymol blue* and 0.15 per cent w/v of *anhydrous sodium carbonate*. Add 10 ml of *chloroform*, shake for 1 minute and centrifuge. To 5 ml of the chloroform layer add 5 ml of *boric acid solution* and measure the absorbance of a 2-cm layer of the resulting solution at the maximum at about 420 nm (2.4.7), using as the blank a mixture of 5 ml of *boric acid solution* and 5 ml of *chloroform*. Repeat the operation by using a solution prepared by diluting 5 ml of a 0.03 per cent w/v solution of *clonidine hydrochloride IPRS* to 100 ml with *citrophosphate buffer pH 7.6*, transferring 5 ml to a separator and completing the procedure described above beginning at the words "add 1 ml of a solution...".

Calculate the content of $C_9H_9Cl_2N_3$,HCl in the tablet from the absorbance obtained using *clonidine hydrochloride IPRS* in place of the tablet.

For tablets containing less than 300 µg of Clonidine Hydrochloride—

Use the same procedure but with a concentration of 0.001 per cent w/v or 0.0005 per cent w/v of Clonidine Hydrochloride as appropriate and with corresponding smaller concentrations of *clonidine hydrochloride IPRS*.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder equivalent to 0.1 mg of clonidine hydrochloride to a 100 ml volumetric flask. Add about 60 ml of mobile phase, shake by mechanical means for 15–30 min, dilute with mobile phase to volume, and mix. Centrifuge a portion of the solution to obtain a clear solution.

Reference solution (a). A 0.01 per cent w/v solution of *clonidine hydrochloride IPRS* in mobile phase.

Reference solution (b). Dilute reference solution (a) to obtain a solution of 0.0001 per cent w/v of clonidine hydrochloride in mobile phase.

Reference solution (c). A 0.0012 per cent w/v solution of *2,6-dichloroaniline* in mobile phase.

Reference solution (d). Dilute reference solution (a) and reference solution (c) to obtain 0.0002 per cent w/v solution of clonidine hydrochloride and 0.00024 per cent w/v solution of 2,6-dichloroaniline in mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with deactivated for basic compounds octylsilane bonded to porous silica(5 µm),
- mobile phase: a mixture of 500 volumes of *methanol*, 500 volumes of 0.22 per cent w/v solution of *sodium octanesulphonate* in *water* and 1 volume of *phosphoric acid*, adjusted to pH 3.0 with *1 M sodium hydroxide*.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the relative standard deviation of clonidine peak is not more than 2.0 per cent.

Inject reference solution (d). The relative retention time for clonidine and 2,6-dichlroaniline are about 0.5 and 1.0 respectively. The test is not valid unless the theoretical plate is not less than 3500 and the tailing factor of clonidine peak is not more than 1.5.

Inject reference solution (b) and the test solution.

Calculate the content of $C_9H_9Cl_2N_3,HCl$ in the tablets.

Clonidine Hydrochloride and Chlorthalidone Tablets

Clonidine Hydrochloride and Chlorthalidone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of clonidine hydrochloride, $C_9H_9Cl_2N_3,HCl$ and chlorthalidone, $C_{14}H_{11}ClN_2O_4S$.

Usual strengths. Clonidine Hydrochloride, 0.1 mg and Chlorthalidone, 15 mg; Clonidine Hydrochloride, 0.2 mg and Chlorthalidone, 15 mg.

Identification

A. Weigh a quantity of powdered tablets containing about 1 mg of clonidine hydrochloride to a beaker. Add 30 ml of *water*, stir for 5 minutes and pass through a filter of medium pore size into a sintered-glass funnel. Transfer the filtrate in to a separator, add 2.0 ml of *0.1 M sodium hydroxide* and extract with 10.0 ml of *chloroform*, collect the chloroform extract in to separator. Extract the chloroform layer with 5.0 ml of *0.01M hydrochloric acid*, collect the acid extract in a beaker. Remove any residual chloroform from the acid extract by heating on a water-bath.

When examined in the range 200 nm to 400 nm (2.4.7), the test solution exhibits maximum and minimum adsorption at the same wavelengths with that obtained with *clonidine hydrochloride IPRS* treated in the similar manner.

B. Powder 10 tablets and transfer into a 50 ml beaker. Add 10 ml of *methanol*, boil on a water-bath for 5 minutes, and filter. Add 20 ml of *water* to the filtrate, and boil on a water-bath for 5 minutes. Cool with stirring in ice until crystals forms. Filter the crystals and dry at 105° for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *chlorthalidone IPRS* or with the reference spectrum of chlorthalidone.

C. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Take 20 ml of the filtrate into a 25.0 ml volumetric flask and dilute with 0.5 per cent w/v solution of *monobasic ammonium phosphate* to volume.

Reference solution (a). A 0.001 per cent w/v solution of *clonidine hydrochloride IPRS* in 0.5 per cent w/v solution of *monobasic ammonium phosphate.*

Reference solution (b). A 0.015 per cent w/v solution of *chlorthalidone IPRS* in *methanol.*

Reference solution (c). Dilute reference solution (a) and (b) with 0.5 per cent w/v solution of *monobasic ammonium phosphate* to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Calculate the content of $C_{14}H_{11}ClN_2O_4S$ and $C_9H_9Cl_2N_3,HCl$.

Q. Not less than 50 per cent of the stated amount of $C_{14}H_{11}ClN_2O_4S$ and not less than 80 per cent of the stated amount of $C_9H_9Cl_2N_3,HCl$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and the reference solution described under Assay.

Test solution. Transfer one tablet to a 100.0 ml volumetric flask. Add 10.0 ml of *methanol*, disperse with the aid of ultrasound for 5 minutes, add 50.0 ml buffer solution and sonicate for 5 minutes. Allow to cool and diluted to volume with buffer solution. Mix well and centrifuge.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100.0 ml with buffer solution.

Inject reference solution (d) and the test solution.

Calculate the content of $C_9H_9Cl_2N_3,HCl$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.1 per cent w/v solution of *monobasic ammonium phosphate* in *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 15 mg of chlorthalidone to a 100-ml volumetric flask, add 10.0 ml of *methanol* and sonicate for 5

minutes. Add 40.0 ml of buffer solution and sonicate until the solution is free from agglomerates. Allow to cool and dilute to volume. Mix and centrifuge.

Reference solution (a). A 0.01 per cent w/v solution of *clonidine hydrochloride IPRS* in *methanol*.

Reference solution (b). A 0.15 per cent w/v solution of *chlorthalidone IPRS* in *methanol*.

Reference solution (c). Dilute reference solution (a) and (b) with buffer solution to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octaylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 100 volumes of *methanol*, 100 volumes of *acetonitrile* and 800 volumes of buffer solution,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention times with respect to chlorthalidone for clonidine hydrochloride is about 0.2.

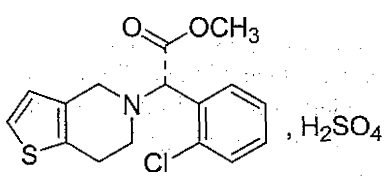
Inject reference solution (c). The test is not valid unless the resolution between the peaks due to clonidine hydrochloride and chlorthalidone is not less than 3.0 and the relative standard deviation for replicate injections for each of the peaks corresponding to clonidine hydrochloride and chlorthalidone is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{14}H_{11}ClN_2O_4S$ and $C_9H_9Cl_2N_3,HCl$ in the tablets.

Storage. Store protected from moisture.

Clopidogrel Bisulphate



$C_{16}H_{16}ClNO_2S, H_2SO_4$ Mol. Wt. 419.9

Clopidogrel Bisulphate is methyl (*S*)-α-(*o*-chlorophenyl)-6,7-dihydrothieno[3,2-*c*]pyridine-5-(4*H*)-acetate sulphate.

Clopidogrel Bisulphate contains not less than 97.0 per cent and not more than 101.5 per cent of $C_{16}H_{16}ClNO_2S,H_2SO_4$, calculated on the dried basis.

Category. Antithrombotic.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clopidogrel bisulphate IPRS* or with the reference spectrum of clopidogrel bisulphate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

C. Gives reaction A of sulphates (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — For all clopidogrel related compounds, the concentrations are expressed as bi-sulphate salts. Use bi-sulphate salt equivalents stated on reference substances labels to calculate the concentrations as appropriate.

Test solution. Dissolve 100 mg of the substance under examination in 5.0 ml of *methanol* and dilute to 200.0 ml with the mobile phase.

Reference solution. A solution containing 20 µg per ml of *clopidogrel bisulphate IPRS*, 40 µg per ml of *(+)-(S)-(o-chloro-phenyl)-6,7-dihydrothieno(3,2-c]pyridine-5(4H)-acetic acid IPRS* (*clopidogrel impurity A IPRS)*, 120 µg per ml of *methyl(±)-(o)-chlorophenyl)-4,5 dihydrothieno (2,3-c)pyridine-6(7H)-acetate, hydrochloride IPRS (clopidogrel impurity B IPRS)*, and 200 µg per ml of *methyl (-)-(R)-o-chlorophenyl)-6,7 dihydrothieno(3,2-c)pyridine-5(4H)-acetate,hydrogen sulphate IPRS (clopidogrel impurity C IPRS)*, in *methanol*. Dilute 5.0 ml of the solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with chiral recognition protein, ovomucoid, chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium phosphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time with respect to clopidogrel, for impurity A is about 0.5, for enantiomers of clopidogrel impurity B, about 0.8 and 1.2 and for clopidogrel impurity C, about 2.0.

Inject the reference solution. The test is not valid unless the resolution between clopidogrel and the first enantiomer of clopidogrel impurity B is not less than 2.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of the peak due to clopidogrel impurity A is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of the peak due to the first enantiomer of clopidogrel impurity B, multiplied with correction factor 0.5 is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent) and the area of the peak due to clopidogrel impurity C is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent), the area of any peak due to other impurities is not more than the area of the peak due to *clopidogrel bisulphate IPRS* in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of all the impurities is not more than 1.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 100 mg of the substance under examination and dissolve in 100.0 ml of *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *clopidogrel bisulphate IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A solution containing 100 µg per ml of *clopidogrel bisulphate IPRS* and 200 µg per ml of *clopidogrel impurity B IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with chiral recognition protein, ovomucoid, chemically bonded to porous silica (5 µm),
- mobile phase : a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Inject reference solution (b). The relative retention times with respect to clopidogrel, for enantiomers of clopidogrel impurity B are about 0.8 and 1.2 and the resolution between clopidogrel and the first enantiomer of clopidogrel impurity B is not less than 2.5.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{16}ClNO_2S,H_2SO_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Clopidogrel Tablets

Clopidogrel Bisulphate Tablets

Clopidogrel Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clopidogrel, $C_{16}H_{16}ClNO_2S$.

Usual strength: 75 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{16}H_{16}ClNO_2S$ in the medium from the absorbance obtained from a solution of known concentration of clopidogrel prepared by dissolving a suitable quantity of *clopidogrel bisulphate IPRS* in 20 ml of *methanol* and further diluting with the medium.

Q. Not less than 80 per cent of the stated amount of $C_{16}H_{16}ClNO_2S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 75 mg of Clopidogrel, add 5 ml of *methanol* and dilute to 200.0 ml with the mobile phase. Allow to stand for 10 minutes and mix and filter.

Reference solution (a). A solution containing *clopidogrel bisulphate IPRS* equivalent to 40 µg per ml of clopidogrel, 250 µg per ml of *[(+)-(S)-(o-chlorophenyl)-6,7-dihydro-thieno(3,2-c]pyridine-5(4H)-acetic acid] IPRS (clopidogrel impurity A IPRS)* and 300 µg per ml of *[methyl(-)-(R)-o-chlorophenyl)-6,7 dihydrothieno(3,2-c)pyridine-5(4H)-acetate,hydrogen sulphate]IPRS (clopidogrel impurity C IPRS)* in *methanol*. Dilute 5.0 ml of the solution to 200.0 ml with the mobile phase.

Reference solution (b). A solution containing *clopidogrel bisulphate IPRS* equivalent to 100 µg per ml of clopidogrel, and 200 µg per ml of *[methyl(±)-(o)-chlorophenyl)-4,5 dihydro-thieno(2,3-c)pyridine-6(7H)-acetate, hydrogen sulphate] IPRS (clopidogrel impurity B IPRS)* in *methanol*. Dilute 5.0 ml of the solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with chiral recognition protein, ovomucoid, chemically bonded to porous silica (5 µm),
- mobile phase : a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium phosphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention times with respect to clopidogrel for enantiomers of clopidogrel impurity B are about 0.8 and 1.2, for clopidogrel impurity A is about 0.5 and for clopidogrel impurity C is about 2.0.

Inject reference solution (b). The resolution between clopidogrel and the first enantiomer of clopidogrel impurity B is not less than 2.5. Inject reference solution (a). The relative standard deviation for replicate injections is not more than 15.0 per cent for each peak.

In the chromatogram obtained with the test solution the area of the peak due to clopidogrel impurity A is not more than 0.7 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.2 per cent), and the area of the peak due to clopidogrel impurity C is not more than 0.75 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.5 per cent), the area of any peak due to other impurities is not more than 0.75 times the area of the peak due to *clopidogrel bisulphate IPRS* in the chromatogram obtained with reference solution (a) (0.2 per cent, excluding impurity B) and the sum of all the impurities is not more than 2.5 per cent, excluding impurity B.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder equivalent to 75 mg of clopidogrel, disperse in 100.0 ml of the *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the *methanol* and filter.

Reference solution (a). A 0.01 per cent w/v solution of *clopidogrel bisulphate IPRS* in *methanol*.

Reference solution (b). A solution containing *clopidogrel bisulphate IPRS* equivalent to 100 µg per ml of clopidogrel and 200 µg per ml of *[methyl(±)-(o)-chlorophenyl)-4,5 dihydro-thieno(2,3-c)pyridine-6(7H)-acetate, hydrogen sulphate] IPRS (clopidogrel impurity B IPRS)* in *methanol*. Dilute 5.0 ml of the solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with chiral recognition protein, ovomucoid, chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of a buffer solution prepared by dissolving 1.36 g of *monobasic potassium phosphate* in 1000 ml of *water* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention times with respect to clopidogrel, for enantiomers of clopidogrel impurity B are about 0.8 and 1.2

Inject reference solution (b). The test is not valid unless the resolution between clopidogrel and the first enantiomer of clopidogrel impurity B is not less than 2.5.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{16}ClNO_2S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of clopidogrel.

Clopidogrel and Aspirin Tablets

Clopidogrel and Aspirin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clopidogrel, $C_{16}H_{16}ClNO_2S$ and aspirin, $C_9H_8O_4$.

Usual strengths. Clopidogrel 300 mg and Aspirin 150 mg; Clopidogrel 75 mg and Aspirin 75 mg; Clopidogrel 75 mg and Aspirin 150 mg

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

For Clopidogrel —

Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *clopidogrel bisulphate IPRS* in dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS, C8),
- mobile phase: a mixture of 3 volumes of *0.05 M sodium dihydrogen orthophosphate* and 1 volume of *acetonitrile*, adjusted the pH 2.0 with dilute *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The elution order of chromatogram is aspirin and clopidogrel respectively.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution

Calculate the content of $C_{16}H_{16}ClNO_2S$ in the tablet.

1 mg of $C_{16}H_{18}ClNO_6S_2$ is equivalent to 0.7664 mg of $C_{16}H_{16}ClNO_2S$

Q. Not less than 70 per cent of the stated amount of $C_{16}H_{16}ClNO_2S$

For Aspirin —

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 2.99 g of *sodium acetate trihydrate* containing 1.7 ml of *glacial acetic acid* in 1000 ml of *water*, adjusted to pH 4.5 with *sodium hydroxide solution*.

Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared reference solution and test solution.

Test solution. Dilute the filtrate if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *aspirin IPRS* in dissolution medium and dilute with the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C8),
- mobile phase: a mixture of 3 volumes of *0.05 M sodium dihydrogen orthophosphate* and 1 volume of *acetonitrile*, adjusted the pH 2.0 with *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

The elution order is Aspirin and Clopidogrel.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_9H_8O_4$ in the tablet.

Q. Not less than 70 per cent of the stated amount of $C_9H_8O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

For Clopidogrel —

Test solution. Disperse a quantity of the powdered tablet containing about 50 mg of clopidogrel in 30 ml of mobile phase, with the aid of ultrasound for 15 minutes. Cool and dilute to 50.0 ml with the mobile phase and filter.

Reference solution (a). A 0.065 per cent w/v solution of *clopidogrel bisulphate IPRS* in the mobile phase.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 200.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C8),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 0.33 g of *diammonium hydrogen orthophosphate* and 0.2 g of *tetrabutylammonium hydrogen sulphate* in 100 ml of *water*, adjusted the pH 7.0 and 55 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

For Aspirin —

Free salicylic acid. Not more than 3.0 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 99 volumes of *acetonitrile* and 1 volume of *formic acid*.

Test solution: Disperse a quantity of the powdered tablet containing about 300 mg of aspirin in 70 ml of the solvent mixture, with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with the mobile phase and filter.

Reference solution (a). A 0.01 per cent w/v solution of *salicylic acid IPRS* in the solvent mixture.

Reference solution (b). A 0.3 per cent w/v solution of *aspirin IPRS* and *clopidogrel bisulphate IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil C18),
- sample temperature: 5°,
- mobile phase: a mixture of 75 volumes of *0.05M* of *sodium dihydrogen orthophosphate dihydrate* and 25 volumes of *acetonitrile*, adjusted the pH 2.0 with *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

The elution order of peaks in the chromatogram is aspirin, salicylic acid and clopidogrel bisulphate respectively.

Inject reference solution (a) and (b). The test is not valid unless the resolution between salicylic acid and aspirin is not less than 2.0 and salicylic acid and clopidogrel is not less than 1.5 with reference solution (b). The column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of free salicylic acid.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 100 mg of Clopidogrel in 250-ml volumetric flask, add sufficient amount of *methanol* disperse with the aid of ultrasound for 15 minutes. Cool and dilute to volume with *methanol*, mix and filter. Dilute 5.0 ml of the filtrate to 25.0 ml with the mobile phase.

Reference solution (a). A 0.08 per cent w/v solution of *clopidogrel bisulphate IPRS* in *methanol*.

Reference solution (b). A 0.08 per cent w/v solution of *aspirin IPRS* in *methanol*.

Reference solution (c). Dilute reference solution (a) and (b) with the mobile phase to obtain a solution having similar concentration to the test solution.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C8),
- mobile phase: a mixture of 3 volumes of *0.05 M sodium dihydrogen orthophosphate* and 1 volume of *acetonitrile*, adjusted the pH 2.0 with *dilute orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

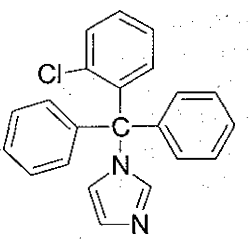
Inject reference solution (c) and the test solution.

Calculate the contents of $C_{16}H_{16}ClNO_2S$ and $C_9H_8O_4$.

1 mg of $C_{16}H_{18}ClNO_6S_2$ is equivalent to 0.7664 mg of $C_{16}H_{16}ClNO_2S$.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Clotrimazole



$C_{22}H_{17}ClN_2$ Mol. Wt. 344.8

Clotrimazole is 1-[(2-chlorophenyl)diphenylmethyl]-1*H*-imidazole.

Clotrimazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{17}ClN_2$, calculated on the dried basis.

Category. Antifungal.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clotrimazole IPRS* or with the reference spectrum of clotrimazole.

B. When examined in the range 230 nm to 360 nm, a 0.04 per cent w/v solution in a mixture of 1 volume of *0.1 M hydrochloric acid* and 9 volumes of *methanol* shows absorption maxima at about 262 and 265 nm; absorbance at about 262 nm, about 0.9 and at about 265 nm, about 0.92 (2.4.7).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *acetonitrile* and dilute to 50.0 ml with *acetonitrile*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *acetonitrile*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *acetonitrile*.

Reference solution (c). A solution containing 0.0002 per cent w/v, each of, *clotrimazole impurity D IPRS* and *clotrimazole impurity E IPRS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: A. dissolve 1.0 g of *potassium dihydrogen phosphate* and 0.5 g of *tetrabutyl ammonium hydrogen sulphate* in *water* and dilute to 1000 ml with *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
3	75	25
25	20	80
30	20	80
35	75	25

Name	Relative retention time
Clotrimazole impurity D[1]	0.1
Clotrimazole impurity F[2]	0.9
Clotrimazole (Retention time: about 12 minutes)	1.0
Clotrimazole impurity B[3]	1.1
Clotrimazole impurity E[4]	1.5
Clotrimazole impurity A[5]	1.8

[1]imidazole,

[2]deschloroclotrimazole,

[3]1-[(4-chlorophenyl)diphenylmethyl]-1H-imidazole,

[4]2-chlorobenzophenone,

[5](2-chlorophenyl)diphenylmethanol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to clotrimazole impurities A and B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of peak corresponding to clotrimazole impurities D and E is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of peak corresponding to clotrimazole impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.3 g and dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator to a green end-point. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03448 g of $C_{22}H_{17}ClN_2$.

Storage. Store protected from light.

Clotrimazole Cream

Clotrimazole Cream contains Clotrimazole in a suitable cream base.

Clotrimazole Cream contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clotrimazole, $C_{22}H_{17}ClN_2$.

Usual strengths. 1 per cent w/w; 2 per cent w/w.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. *Di-isopropyl ether* in a chromatography tank, containing 25 ml of *strong ammonia solution* in a beaker.

Test solution. Shake a quantity of the cream containing 20 mg of Clotrimazole with 4 ml of *dichloromethane* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *clotrimazole IPRS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air and spray with *dilute potassium iodobismuthate solution*. The spot in the chromatogram obtained with the test solution is reddish brown and corresponds to the spot in the chromatogram obtained with the reference solution.

Tests

2-Chlorotritanol. Determine by liquid chromatography (2.4.14).

Test solution. Extract a quantity of the cream containing 20 mg of Clotrimazole by warming with 20 ml of *methanol* in a water-bath at 50° for 5 minutes, shaking occasionally. Remove from the water-bath, shake the mixture vigorously while cooling to room temperature, cool in ice for 15 minutes, centrifuge for 5 minutes and decant the supernatant liquid. Repeat the extractions with two further quantities, each of 20 ml, of *methanol*. To the combined methanol extracts add 10 ml of *methanol* and dilute to 100.0 ml with *methanol*. Cool in ice and filter through a membrane filter.

Reference solution (a). A 0.0002 per cent w/v solution of *2-chlorotritanol IPRS* in *methanol*.

Reference solution (b). Dilute 1 volume of the test solution to 50 volumes with *methanol*.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of *0.02 M phosphoric acid* adjusted to pH 7.5 with a 10 per cent w/v solution of *triethylamine* in *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1800 theoretical plates.

Inject reference solution (a) and the test solution. Allow the chromatography to proceed for 1.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. The area of any peak corresponding to 2-chlorotritanol in the chromatogram obtained with the test solution is not greater then the area of the peak in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Extract a quantity of the cream containing 25 mg of Clotrimazole by warming with 25 ml of *methanol* in a water-bath at 50° for 5 minutes, shaking occasionally. Remove from the water-bath, shake the mixture vigorously while cooling to room temperature, cool in ice for 15 minutes, centrifuge for 5 minutes and decant the supernatant liquid. Repeat the extraction with 20 ml, of *methanol*. Dilute the combined methanol extracts to 50.0 ml with *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *clotrimazole IPRS* in *methanol*.

Reference solution (b). A solution containing 0.01 per cent w/v solution, each of, *clotrimazole IPRS* and *2-chlorotritanol IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of *acetonitrile* and 25 volumes of a buffer solution prepared by dissolving 4.35 g of *dibasic potassium phosphate* in 1000 ml of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

The relative retention time with reference to clotrimazole for 2-chlorotritanol is about 1.2.

Inject reference solution (b). The test is not valid unless the resolution between clotrimazole and 2-chlorotritanol peaks is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{17}ClN_2$ in the cream.

Storage. Store at a temperature not exceeding 30°.

Clotrimazole Lotion

Clotrimazole Lotion contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clotrimazole, $C_{22}H_{17}ClN_2$.

Usual strength. 1.0 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (c).

Tests

pH (2.4.24). 5.0 to 7.0.

Clotrimazole related compound A. Not more than 5.0 per cent.

Determine by liquid chromatography (2.4.14), as described under Assay.

Calculate the percentage of clotrimazole related compound A using the chromatograms of reference solution (c) and the test solution.

Microbial contamination (2.2.9). 1.0 g is free from *Staphylococcus aureus* and *Pseudomonas aeruginosa.*

Other tests. Comply with the tests stated under Lotions.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. A 0.007 per cent w/v solution of *testosterone propionate* in *dehydrated alcohol.*

Test solution. Transfer the equivalent of 10 mg of Clotrimazole from freshly mixed lotion to a screw-capped, 50-ml centrifuge tube. Add 10.0 ml of *internal standard solution*, place the cap on the tube, and heat at 50° in a water bath for 5 minutes, with occasional shaking. Remove the tube from the bath, and shake vigorously for 5 minutes. Cool in a methanol–ice bath for 15 minutes, and promptly centrifuge. Transfer the supernatant liquid to a test tube. Add 10.0 ml of *dehydrated alcohol* to the residue in the centrifuge tube, and repeat the extraction as directed above, beginning with "place the cap on the tube". Transfer the supernatant liquid to the test tube containing the supernatant liquid from the first extraction.

Reference solution (a). A 0.2 per cent w/v solution of *clotrimazole IPRS* in *dehydrated alcohol.*

Reference solution (b). A 0.01 per cent w/v solution of *clotrimazole related compound A IPRS [(o-Chlorophenyl) diphenylmethanol IPRS]* in *dehydrated alcohol.*

Reference solution (c). Mix 5.0 ml, each of, reference solution (a), reference solution (b) and 10.0 ml of the internal standard solution.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) and a guard column 6 cm × 2.1 mm, packed with the same column material (10 µm),
- mobile phase: a mixture of 1 volume of a buffer solution prepared by dissolving 4.35 g of *dibasic potassium phosphate* in 1000 ml of *water* and 3 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The relative retention time with respect to clotrimazole for clotrimazole related compound A and testosterone propionate is about 0.9 and 1.5, respectively.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to clotrimazole related compound A and clotrimazole is not less than 1.2 and the resolution between the peaks due to clotrimazole and testosterone propionate is not less than 1.9. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{22}H_{17}ClN_2$ in the lotion.

Storage. Store protected from moisture, at a temperature between 2° to 30°.

Clotrimazole Pessaries

Clotrimazole Vaginal Tablets

Clotrimazole Pessaries contain Clotrimazole in a suitable base.

Clotrimazole Pessaries contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of clotrimazole, $C_{22}H_{17}ClN_2$.

Usual strengths. 100 mg; 200 mg; 500 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. Di-isopropyl ether in a chromatography tank, containing 25 ml of *strong ammonia solution* in a beaker.

Test solution. Shake a quantity of the powdered pessaries containing 20 mg of Clotrimazole with 4 ml of *dichloromethane* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *clotrimazole IPRS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of air and spray with *dilute potassium iodobismuthate solution*. The spot in the chromatogram obtained with the test solution is reddish brown and corresponds to the spot in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Add 50 ml of *methanol* to a quantity of the powdered pessaries containing 0.1 g of Clotrimazole and shake for 20 minutes. Dilute to 100 ml with *methanol* and filter. To 20 ml of the filtrate add 50 ml *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution (a). A 0.0002 per cent w/v solution of *2-chlorotritanol IPRS* in *methanol*.

Reference solution (b). Dilute 1 volume of the test solution to 50 volumes with *methanol*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of *0.02 M orthophosphoric acid* adjusted to pH 7.5 with a 10 per cent w/v solution of *triethylamine* in *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (b). The column efficiency, determined using the principal peak in the chromatogram obtained is not less than 1800 theoretical plates.

Inject reference solution (a) and the test solution. Allow the chromatography to proceed for 1.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. The area of any peak corresponding to 2-chlorotritanol in the chromatogram obtained with the test solution is not greater then the area of the peak in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Pessaries.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 pessaries. Disperse a quantity of the powder containing about 0.1 g of Clotrimazole, add 50 ml of *methanol* and shake for 20 minutes, dilute to 250.0 ml with *methanol* and filter. To 10.0 ml of the filtrate add 60 ml of *methanol* and dilute to 100.0 ml with *methanol*.

Reference solution. Dissolve 20 mg of *clotrimazole IPRS* in 70 ml of *methanol*, add sufficient *0.02 M orthophosphoric acid* to produce 100.0 ml and dilute 1.0 ml of the resulting solution to 5.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of *0.02 M orthophosphoric acid*, adjusted to pH 7.5 with a 10 per cent w/v solution of *triethylamine* in *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

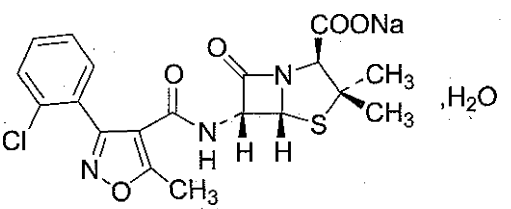
Inject the reference solution. The column efficiency, determined using the peak in the chromatogram obtained should be not less than 1800 theoretical plates.

Inject the reference solution and the test solution. Allow the chromatography to proceed for 1.5 times the retention time of the principal peak in the chromatogram obtained with the test solution.

Calculate the content of $C_{22}H_{17}ClN_2$ in the pessaries.

Storage. Store protected from moisture and crushing.

Cloxacillin Sodium



$C_{19}H_{17}ClN_3NaO_5S, H_2O$ Mol. Wt. 475.9

Cloxacillin Sodium is sodium (6*R*)-6-[3-(2-chlorophenyl)-5-methylisoxazole-4-carboxamido]penicillanate monohydrate.

Cloxacillin Sodium contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{19}H_{17}ClN_3NaO_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cloxacillin sodium IPRS* or with the reference spectrum of cloxacillin sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1); absorbance of the solution at about 430 nm, not more than 0.04 (2.4.7).

pH (2.4.24). 5.0 to 7.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +160° to +169°, determined at 20° in a 1.0 per cent w/v solution.

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *flucloxacillin sodium IPRS* and *cloxacillin sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 5.0 with *dilute sodium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cloxacillin (first peak) and flucloxacillin (second peak) is not less than 2.5.

Inject reference solution (a) and the test solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 4.5 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Prepare a *0.02 M monobasic potassium phosphate* solution and adjusted to pH 6.6 with *2 M sodium hydroxide*.

Test solution. Weigh accurately about 55 mg of the substance under examination and dilute to 100.0 ml with the buffer solution. Dilute 1.0 ml of the solution to 10.0 ml with the buffer solution.

Reference solution. Weigh a suitable quantity of *cloxacillin sodium IPRS* dissolve in the buffer solution and dilute with the buffer solution to obtain a solution containing a known concentration of about 0.0055 per cent w/v of Cloxacillin Sodium.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 80 volumes of the buffer solution and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{17}ClN_3NaO_5S$.

Cloxacillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.40 Endotoxin Unit per mg of cloxacillin.

Cloxacillin Sodium intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of

parenteral preparations, the containers should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Cloxacillin Capsules

Cloxacillin Sodium Capsules

Cloxacillin Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of cloxacillin, $C_{19}H_{18}ClN_3O_5S$.

Usual strengths. The equivalent of 250 mg and 500 mg of cloxacillin.

Identification

A. Determine on the contents of the capsules by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cloxacillin sodium IPRS* or with the reference spectrum of cloxacillin sodium.

B. The contents of the capsules give reactions (A) and (B) of sodium salts (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Use the filtrate, dilute if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 271 nm (2.4.7). Similarly measure the absorbance of a standard solution of known concentration of *cloxacillin sodium IPRS* in place of the contents of the capsules. Calculate the content of $C_{19}H_{18}ClN_3O_5S$.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{18}ClN_3O_5S$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Prepare a *0.02 M monobasic potassium phosphate* solution and adjusted to pH 6.6 with *2 M sodium hydroxide*.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 50 mg of Cloxacillin, dissolve in the buffer solution by stirring for 10 minutes, dilute to 100.0 ml with the buffer solution. Dilute 1.0 ml of the solution to 10.0 ml with the buffer solution and filter.

Reference solution. Weigh accurately a suitable quantity of *cloxacillin sodium IPRS* dissolve in the buffer solution and dilute to obtain a solution containing a known concentration of about 0.0055 per cent w/v of cloxacillin sodium.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 80 volumes of the buffer solution and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{18}ClN_3O_5S$ in the capsules.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of cloxacillin.

Cloxacillin Injection

Cloxacillin Sodium Injection

Cloxacillin Injection is a sterile material consisting of Cloxacillin Sodium with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cloxacillin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cloxacillin, $C_{19}H_{18}ClN_3O_5S$.

Usual strengths. The equivalent of 250 mg and 500 mg of cloxacillin.

Description. A white or almost white powder; very hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cloxacillin sodium IPRS* or with the reference spectrum of cloxacillin sodium.

B. It gives reaction (A) of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0, determined in a 10 per cent w/v solution.

Bacterial endotoxins (2.2.3). Not more than 0.40 Endotoxin Unit per mg of cloxacillin.

Water (2.3.43). Not more than 4.5 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Prepare a *0.02 M monobasic potassium phosphate* solution and adjusted to pH 6.6 with *2 M sodium hydroxide.*

Test solution. Determine the weight of the content of 10 containers. Weigh accurately a suitable quantity of the mixed contents of the 10 containers containing about 50 mg of Cloxacillin, dissolve in the buffer solution by shaking and dilute to 100.0 ml with the buffer solution.

Reference solution. Weigh accurately a suitable quantity of *cloxacillin sodium IPRS* dissolve in the buffer solution and dilute to obtain a solution containing a known concentration of about 0.55 mg per ml.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 80 volumes of the buffer solution and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{18}ClN_3O_5S$ in the injection.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the quantity of Cloxacillin Sodium contained in the sealed container in terms of the equivalent amount of cloxacillin.

Cloxacillin Syrup

Cloxacillin Sodium Syrup; Cloxacillin Elixir; Cloxacillin Sodium Elixir; Cloxacillin Oral Solution; Cloxacillin Sodium Oral Solution

Cloxacillin Syrup is a mixture consisting of Cloxacillin Sodium with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before use.

Cloxacillin Syrup contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of $C_{19}H_{18}ClN_3O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of cloxacillin, $C_{19}H_{18}ClN_3O_5S$.

Usual strength. The equivalent of 125 mg of cloxacillin per 5 ml when reconstituted with water.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

The constituted suspension complies with the tests stated under Oral liquids and with the following tests.

Tests

pH (2.4.24). 4.0 to 7.0.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Prepare a *0.02 M monobasic potassium phosphate* solution and adjusted to pH 6.6 with *1 M sodium hydroxide.*

Test solution. Transfer an accurately weighed quantity of the oral suspension containing about 0.125 g of the cloxacillin to a 250-ml volumetric flask and dissolve in the buffer solution by stirring for 15 minutes, dilute to 250.0 ml with the buffer solution.

Reference solution. Weigh accurately a suitable quantity of *cloxacillin sodium IPRS* dissolve in the buffer solution and dilute to obtain a solution containing a known concentration of about 0.55 mg per ml.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 80 volumes of the buffer solution and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.8 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

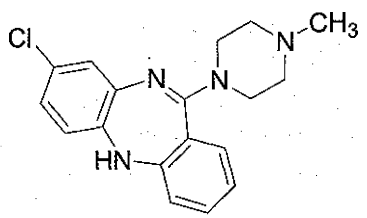
Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{19}H_{18}ClN_3O_5S$ weight in volume.

Repeat the procedure using a portion of the constituted suspension that has been stored at the temperature and for the period stated on the label.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of cloxacillin.

Clozapine



$C_{18}H_{19}ClN_4$ Mol. Wt. 326.8

Clozapine is 8-chloro-11-(4-methylpiperazin-1-yl)-5*H*-dibenzo[*b*,*e*][1,4]diazepine.

Clozapine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{19}ClN_4$, calculated on the dried basis.

Category. Antipsychotic.

Description. A yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *clozapine IPRS* or with the reference spectrum of clozapine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 20 volumes of *water* and 80 volumes of *methanol*.

Test solution. Dissolve 75 mg of the substance under examination in 80 ml of *methanol* and dilute to 100.0 ml with *water*.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 10 volumes of *methanol* and 80 volumes of buffer solution prepared by dissolving 2.04 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 2.4 with *orthophosphoric acid*,
  B. a mixture of 40 volumes of *acetonitrile*, 40 volumes of *methanol* and 20 volumes of buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
4	100	0
24	0	100
29	0	100
30	100	0
35	100	0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and tailing factor is not more than 2.0 per cent. The relative retention time with reference to clozapine for 8-chloro-11-(piperazin-1-yl)-5*H*-dibenzo[*b*,*e*][1,4]diazepine (clozapine impurity C) is about 0.9, for 1-[2-[(2-amino-4-chlorophenyl)amino]benzoyl]-4-methylpiperazine (clozapine impurity D) is about 1.1, for 8-chloro-5,10-dihydro-11*H*-dibenzo[*b*,*e*][1,4]diazepin-11-one (clozapine impurity A) is about 1.6, for 11,11'-(piperazine-1,4-diyl)bis(8-chloro-5*H*-dibenzo[*b*,*e*][1,4]diazepine) (clozapine impurity B) is about 1.7.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the

peak due to clozapine impurity A is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent). The area of any peak due to clozapine impurity B, clozapine impurity D multiplied with correction factor 2.7, is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent), the area of the peak due to clozapine impurity C is not more than three times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.6 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh accurately about 0.115 g, dissolve in 70 ml of *glacial acetic acid* and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01634 g of $C_{18}H_{19}ClN_4$.

Storage. Store protected from light.

Clozapine Tablets

Clozapine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of clozapine, $C_{18}H_{19}ClN_4$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. In the Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with the reference solution (a).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),

Medium. 900 ml of acetate buffer pH 4.0, prepared by dissolving 2 g of *sodium hydroxide* in 450 ml of *water*, adjusted to pH 4.0 with *glacial acetic acid* and diluting with *water* to 1000 ml,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute the filtrate if necessary, with the dissolution medium. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Similarly measure the absorbance of a standard solution of known concentration of *clozapine IPRS* and calculate the content of $C_{18}H_{19}ClN_4$.

Q. Not less than 80 per cent of the stated amount of $C_{18}H_{19}ClN_4$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform* and 25 volumes of *methanol*.

Solvent mixture. 80 volumes of *chloroform* and 20 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.125 g of Clozapine and dissolve in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.5 per cent w/v solution of *clozapine IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 250.0 ml with the solvent mixture.

Reference solution (d). Dilute 3.0 ml of reference solution (a) to 1000.0 ml with the solvent mixture.

Reference solution (e). Dilute 1.0 ml of reference solution (a) to 500.0 ml with the solvent mixture.

Reference solution (f). Dilute 1.0 ml of reference solution (a) to 1000.0 ml with the solvent mixture.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Compare the intensities of any secondary spots observed in the chromatogram obtained with the test solution with those of the principal spots in the chromatogram obtained with the reference solutions : no secondary spot from the chromatogram obtained with the test solution is larger or more intense than the principal spot obtained with reference solution (b) (0.5 per cent); and the sum of the intensities of all secondary spots obtained with the test solution corresponds to not more than 2.0 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.125 g of Clozapine, dissolve in 640 ml of *methanol* and add sufficient *water* to produce 1000 ml.

Reference solution (a). Weigh 12.5 mg of *clozapine IPRS* in 80 ml of *methanol* and dilute to 100.0 ml with *water*.

Reference solution (b). Weigh accurately about 10 mg of Clozapine, add 5 ml of *0.1 M hydrochloric acid* and heat for 2 hours at 90°. Cool, add 15 ml of *water*, dilute with *methanol* to 100.0 ml and mix. To 10.0 ml of the solution add 10.0 ml of reference solution (a) and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: 800 volumes of *methanol*, 200 volumes of *water* and 0.75 volumes of *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume: 10 µl.

Inject the reference solution (a). The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

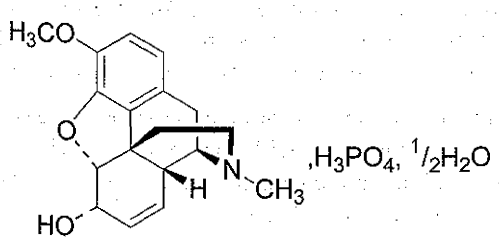
Inject reference solution (b). The resolution between the clozapine peak and any secondary peak is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}ClN_4$ in the tablets.

Codeine Phosphate

Codeine Phosphate Hemihydrate



$C_{18}H_{21}NO_3,H_3PO_4,½\,H_2O$ Mol. Wt. 406.4

Codeine Phosphate is *(5R,6S)*-7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6-ol dihydrogen phosphate hemihydrate, an alkaloid occurring in *Papaver somniferum*.

Codeine Phosphate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{21}NO_3,H_3PO_4$, calculated on the dried basis.

Category. Analgesic; antidiarrhoeal; cough suppressant.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests B, C, D and E may be omitted if tests A and F are carried out.

A. Dissolve 0.2 g in 4 ml of *water*, add 2 ml of *2 M sodium hydroxide* and induce crystallisation, if necessary by scratching the wall of the tube with a glass rod and cooling in ice. The residue after washing with *water* and drying at 100° to 105° complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *codeine phosphate IPRS* treated in the same manner or with the reference spectrum of codeine.

B. To 25 ml of a 0.04 per cent w/v solution add 25 ml of *water* and 10 ml of *1 M sodium hydroxide* and dilute to 100 ml of *water*. When examined in the range 230 nm to 360 nm, the resulting solution shows an absorption maximum at 284 nm, about 0.38 (2.4.7).

C. On the surface of one drop of *nitric acid* place a little of the powder; a yellow but not red colour is produced (distinction from morphine).

D. Dissolve 0.1 g in 1 ml of *sulphuric acid* and 1 drop of *ferric chloride test solution* and warm gently; a bluish violet colour is produced. Add 1 drop of *dilute nitric acid*; the colour changes to red.

E. It gives the reaction of alkaloids (2.3.1).

F. It gives reaction (A) of phosphates (2.3.1).

Tests

Appearance of solution. A 4.0 per cent w/v solution in *carbon dioxide-free water* prepared from *distilled water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.2 to 5.0, determined in a 4.0 per cent w/v solution.

Specific optical rotation (2.4.22). – 102° to – 98.0° to, determined in a 2.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g each of the substance under examination and *sodium octanesulphonate* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *codeine impurity A IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). To 0.25 ml of the test solution, add 2.5 ml of reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.08 g of *sodium octanesulphonate* in a mixture of 20 ml of *glacial acetic acid* and 250 ml of *acetonitrile* and dilute to 1000 ml with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Codeine impurity B[1]	0.7	—
Codeine impurity E[2]	0.7	—
Codeine (Retention time: about 6 minutes)	1.0	—
Codeine impurity A[3]	2.0	—
Codeine impurity C[4]	2.3	0.25
Codeine impurity D[5]	3.6	—

[1]morphine,

[2]7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α,10-diol,

[3]Methylcodeine,

[4] Codeine dimer,

[5]3-*O*-(codein-2-yl)morphine.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to codeine and codeine impurity A is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 10 times the retention time of codeine peak. In the chromatogram obtained with the test solution, the area of peak corresponding to codeine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The sum of areas of the peak corresponding to codeine impurities B and E is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). The area of peak corresponding to codeine impurities C and D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of areas of all the secondary peaks other than codeine impurity A is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphates (2.3.17). 7.5 ml of a 2.0 per cent w/v solution in *distilled water* complies with the limit test for sulphates (0.1 per cent).

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.4 g of the substance under examination and dissolve in a mixture of 10 ml of *anhydrous glacial acetic acid* and 20 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, using a few drops of crystal violet solution as indicator. Carry out blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03974 g of $C_{18}H_{21}NO_3,H_3PO_4$.

Storage. Store protected from light.

Codeine Syrup

Codeine Phosphate Syrup

Codeine Syrup is a 0.5 per cent w/v solution of Codeine Phosphate in a suitable flavoured vehicle.

Codeine Syrup contains not less than 0.48 per cent w/v and not more than 0.52 per cent w/v of codeine phosphate, $C_{18}H_{21}NO_3,H_3PO_4,½\,H_2O$.

Identification

To 10 ml of the syrup add sufficient *dilute ammonia solution* until the solution is alkaline and extract with three quantities, each of 10 ml, of *chloroform*. Evaporate the combined chloroform extracts to dryness on a water-bath and dry the residue at 80°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *codeine phosphate IPRS* treated in the same manner or with the reference spectrum of codeine.

B. Dissolve 10 mg in 1 ml of *sulphuric acid* and 1 drop of *ferric chloride test solution* and warm gently; a bluish violet colour is produced. Add 1 drop of *dilute nitric acid*; the colour changes to red.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 72 volumes of *ethanol*, 30 volumes of *cyclohexane* and 6 volumes of *strong ammonia solution.*

Test solution. To 20 ml of the syrup add 20 ml of *water* and 2 ml of *strong ammonia solution* and extract with two quantities, each of 20 ml, of *chloroform.* Dry the combined extracts with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *chloroform.*

Reference solution (a). Dilute 1.5 volumes of the test solution to 100 volumes with the same solvent.

Reference solution (b). Dilute 1 volume of the test solution to 100 volumes with the same solvent.

Apply separately to the plate 10 µl of each solution. After development, dry the plate in air and spray with *acidic potassium iodobismuthate solution.* Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot, with an R_f value higher than that of the principal spot, is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh accurately about 10.0 g, add *dilute ammonia solution* until the solution is alkaline to *litmus paper* and extract with four quantities, each of 25 ml, of *chloroform.* Wash each extract successively with the same 10 ml of *water*; combine the chloroform extracts and evaporate to dryness on a water-bath. To the residue add 5 ml of *ethanol (95 per cent)* and again evaporate to dryness. Dissolve the residue in 5.0 ml of *0.05 M hydrochloric acid* and titrate the excess of acid with *0.05 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *0.05 M hydrochloric acid* is equivalent to 0.02032 g of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$.

Determine the weight per ml of the syrup (2.4.29) and calculate the content of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$, weight in volume.

Storage. Store protected from light.

Codeine Tablets

Codeine Phosphate Tablets

Codeine Phosphate Tablets contain Codeine Phosphate Hemihydrate.

Codeine Phosphate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of codeine phosphate hemihydrate, $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$.

Usual strength. 10 mg.

Identification

Macerate a quantity of the powdered tablets containing 50 mg of Codeine Phosphate with 5 ml of *1 M sulphuric acid* and 15 ml of *water*. Filter, make alkaline with *5 M ammonia*, extract with successive quantities of *chloroform* and evaporate the combined chloroform extracts to dryness on a water-bath. The residue complies with the following tests.

A. Place a few mg of residue on the surface of a drop of *nitric acid.* A yellow but no red colour is produced (distinction from morphine).

B. Dissolve 10 mg in 1 ml of *sulphuric acid* and 1 drop of *ferric chloride test solution* and warm gently; a bluish violet colour is produced. Add 1 drop of *dilute nitric acid*; the colour changes to red.

C. Dissolve a quantity of powdered tablets containing 20 mg of codeine phosphate in *water* and filter. Filtrate gives reaction (A) of phosphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 284 nm (2.4.7). Calculate the content of $C_{18}H_{21}NO_3.H_3PO_4,½H_2O$ in the medium from the absorbance obtained from a solution of known concentration of *codeine phosphate IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{21}NO_3.H_3PO_4,½H_2O$.

Foreign alkaloids. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 72 volumes of *ethanol*, 30 volumes of *cyclohexane* and 6 volumes of *strong ammonia solution.*

Test solution. Shake a quantity of the powdered tablets containing 0.25 g of Codeine Phosphate with 10 ml of a mixture of 4 volumes of *0.01 M hydrochloric acid* and 1 volume of *ethanol* for 15 minutes and filter.

Reference solution (a). Dilute 1.5 ml of the test solution to 100.0 ml with *0.01 M hydrochloric acid.*

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *0.01 M hydrochloric acid.*

Apply separately to the plate 20 µl of each solution. After development, dry the plate in air and spray with *acidic potassium iodobismuthate solution.* Any secondary spot in

the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.5 per cent) and not more than one such spot, with an R_f value higher than that of the principal spot, is more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

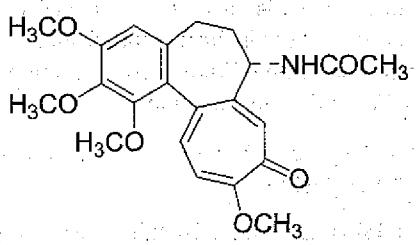
Other tests. Comply with the tests stated under Tablets.

Assay. Disperse a quantity of the powdered tablets containing 0.3 g of Codeine Phosphate, dissolve in 20 ml of *0.25 M sulphuric acid*, filter and wash the residue with *0.25 M sulphuric acid*. Make alkaline with *5 M ammonia* and extract with successive quantities of *chloroform*. Wash each *chloroform solution* with 10 ml of *water* and evaporate the chloroform. To the residue add 5 ml of *ethanol (95 per cent)* and again evaporate to dryness. Dissolve the residue in 1 ml of neutralised *ethanol (95 per cent)*, add 10.0 ml of *0.1 M hydrochloric acid* and 10 ml of *water*. Titrate with *0.1 M sodium hydroxide* using *methyl red solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.04064 g of $C_{18}H_{21}NO_3,H_3PO_4,½H_2O$.

Storage. Store protected from light.

Colchicine



$C_{22}H_{25}NO_6$ Mol. Wt. 399.4

Colchicine is *N*-[(7*S*, 12a*M*)-1, 2, 3, 10-tetramethoxy-9-oxo-5, 6, 7, 9-tetrahydrobenzo[*a*]heptalen-7-yl] acetamide, an alkaloid which occurs in the corm and seeds of various species of *Colchicum*.

Colchicine contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{22}H_{25}NO_6$, calculated on the anhydrous and solvent free basis.

NOTE — Colchicine is extremely poisonous, handle with caution.

Category. Gout suppressant.

Description. A pale yellow, amorphous or crystalline powder.

Identification

Tests A, C and D may be omitted if test B, is carried out. Test B may be omitted if tests A, C and D are carried out.

A. When examined in the range 230 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima, at about 243 nm and 350 nm and the absorbance ratio of A_{243}/A_{350} is 1.7 to 1.9.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *colchicine IPRS* or with the reference spectrum of colchicine. Ignore any peak at 1735 cm^{-1}.

C. To 0.5 ml of solution A (see Test), add 0.5 ml of *dilute hydrochloric acid* and 0.15 ml of a 10.5 per cent w/v solution of *ferric chloride hexahydrate*. The solution is yellow and becomes dark green on boiling for 30 seconds. Cool, add 2 ml of *methylene chloride* and shake. The organic layer is greenish-yellow.

D. Dissolve 30 mg in 1.0 ml of *ethanol (95 per cent)* and add 0.15 ml of a 10.5 per cent w/v solution of *ferric chloride hexahydrate*. A brownish red colour develops.

Tests

Appearance of solution. A 0.5 per cent w/v solution in *carbon dioxide-free water* (Solution A) is clear (2.4.1) and not more intensely coloured than reference solution GYS3 (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.1 ml of *bromothymol blue solution*; either the solution does not change colour or it becomes green. Not more than 0.1 ml of *0.01 M sodiumhydroxide* is required to change the colour of the indicator to blue.

Specific optical rotation (2.4.22). –250° to –235°, determined in a 0.5 per cent w/v solution in *ethanol (95 per cent)* at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *water*.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of *colchicine for peak identification IPRS* (containing impurities A, E and G) in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution (b). A 0.001 per cent w/v solution of *colchicine IPRS* in the solvent mixture.

Chromatographic system

– a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 450 volumes of a 0.68 per cent w/v solution of *potassium dihydrogen orthophosphate* and 530 volumes of *methanol,* cool to room temperature and dilute to 1000 ml with *methanol,* adjusted to the pH 5.5 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Name	Relative retention time
Colchicine impurity E[1]	0.6
Colchicine impurity B[2]	0.9
Colchicine impurity A[3]	0.94
Colchicine (Retention time: about 7 minutes)	1.0
Colchicine impurity G[4]	1.4

[1]3-*O*-demethylcolchicine,
[2]conformational isomer,
[3]*N*-deacetyl-*N*-formylcolchicine,
[4]Y-lumicolchicine.

Inject reference solution (a). Adjust the sensitivity of the system so that the peak-to-valley ratio is minimum 2.0, where H_p is height above the baseline of the peak due to impurity A and H_V is the height above the baseline of the lowest point of the curve separating this peak from the peak due to colchicine, the peak-to-valley ratio is minimum 2.0, where H_p is height above the baseline of the peak due to impurity B and H_V is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. The area of any peak corresponding to colchicine impurity A is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent), the area of any peak corresponding to colchicine impurity G multiplied with correction factor 1.6, is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the area of any peak corresponding to colchicine impurity E is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and peak due to colchicine impurity B.

Impurity F (Colchiceine). Not more than 0.2 per cent.

Dissolve 50 mg in 5 ml of *water,* add 0.1 ml of a 10.5 per cent w/v solution of *ferric chloride hexahydrate.* Any colour produced is not more than intense than that obtained by mixing 2.0 ml of *ferric chloride colorimetric solution (FCS)* with 1.0 ml of *cobaltous chloride colorimetric solution (CCS)* and 2.0 ml of *cupric sulphate colorimetric solution (CSS)* (2.4.1).

Ethyl acetate. Not more than 8.0 per cent w/w.

Determine by gas chromatography (2.4.13).

Internal standard solution. Dilute 0.5 ml of *n-propyl alcohol* to 100.0 ml with *water.*

Test solution. Dissolve 0.25g of the substance under examination in 8 ml of *water,* add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *water.*

Reference solution. A 0.09 per cent w/v solution of *ethyl acetate* prepared by mixing 1.0 ml of *ethyl acetate,* 0.5 ml of *diacetone alcohol,* and 0.5 ml of *n-propyl alcohol* and diluted to 1000.0 ml with *water.*

Chromatographic system
- a fused silica column 30 m x 0.53 mm, packed with polyethylene glycol 20 M (film thickness 1.0 µm),
- temperature:
  column.40°, hold for 20 minutes, 40° to 200° @ 20°per minute and hold for 10 minutes,
- inlet port 180° and detector at 220°,
- split ratio: 15:1,
- flame ionization detector,
- flow rate: 5.72 ml per minute using nitrogen as the carrier gas,
- injection volume: 2 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation of peak area ratio of ethyl acetate to n-propyl alcohol and diacetone alcohol to n-propyl alcohol peak, from replicate injections is not more than 15.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of ethyl acetate.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light and prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *methanol* and *water.*

Test solution. Dissolve 30 mg of Colchicine in about 50 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture and filter.

Reference solution. A 0.0006 per cent w/v solution of *colchicine IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5µm),
- mobile phase: dilute 45 ml of *0.5 M monobasic potassium phosphate* to 450 ml, with *water* add about 530 ml of *methanol,* cool to room temperature and dilute to 1000 ml with *methanol,* adjusted to pH 5.5 with *0.5 M orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 4500 theoretical plates and the relative standard deviation for replicate injections is not more than 2 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{25}NO_6$.

Storage. Store protected from light and moisture.

Colchicine Tablets

Colchicine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of colchicine, $C_{22}H_{25}NO_6$

Usual strengths. 250 µg; 500 µg.

Identification

A. Disperse a quantity of the powdered tablets containing 5 mg of Colchicine in 50 ml of *methanol (50 per cent)* and filter. Dilute 10 ml of the filtrate to 100 ml with *methanol (50 per cent).* When examined the solution in the range 220 nm to 400 nm (2.4.7), shows absorption maxima at about 246 nm and 352 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of a buffer solution pH 6.8 prepared by mixing 3.52 g of *sodium dihydrogen orthophosphate monohydrate* and 4.35 g of *disodium hydrogen orthophosphate dihydrate* in sufficient *water* to produce 1000 ml,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), using chromatographic system, as described under Related substances with 50 µl injection volume and spectrophotometer set at 243 nm.

NOTE — Carry out the test protected from light.

Test solution. Dilute the filtrate if necessary, with the dissolution medium to obtain a solution containing 0.0001 per cent w/v of Colchicine.

Reference solution. A 0.0001 per cent w/v solution of *colchicine IPRS* in the dissolution medium.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{25}NO_6$ in the medium

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{25}NO_6$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Disperse a quantity of powdered tablets containing 5 mg of Colchicine in 40 ml of *methanol (50 per cent)* with the aid of ultrasound and dilute to 50.0 ml with the same solvent, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol (50 per cent).*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *methanol (50 per cent).*

Reference solution (c). A 0.1 per cent w/v solution of *colchicine for system suitability A IPRS* in *methanol (50 per cent).*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Lichrosorb RP 8),
- mobile phase: A. *water,*
  B. *methanol,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	52	48
12	52	48
25	20	80
30	20	80
32	52	48
38	52	48

The relative retention time with reference to colchicine (retention time: about 13 minutes) for impurity A is about 0.9.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to colchicine impurity A and colchicine peak is not less than 1.5.

Inject the test solution, reference solution (a) and (b). In the chromatogram obtained with the test solution, the area of any peak corresponding to colchicine impurity A is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (5.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications..

Test solution. Disperse one tablet in 4 ml of the solvent mixture, with the aid of ultrasound and dilute to 5.0 ml with the solvent mixture, filter.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{25}NO_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Solvent mixture. Equal volumes of *methanol* and *water.*

Test solution. Disperse 10 intact tablets in 40 ml of the solvent mixture, with the aid of ultrasound and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution (a). Dissolve quantity of *colchicine IPRS* in the solvent mixture and dilute with the solvent mixture to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Reference solution (b). A 0.1 per cent w/v solution of *colchicine for system suitability A IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to colchicine impurity A and colchicine is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{25}NO_6$ in the tablets.

Storage. Store protected from light.

Colchicine and Probenecid Tablets

Colchicine and Probenecid Tablets contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of colchicine, $C_{22}H_{25}NO_6$, and not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of probenecid, $C_{13}H_{19}NO_4S$.

Usual strength. Colchicine, 1 mg and Probenecid, 250 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution.*

Test solution (a). Shake a quantity of the powdered tablets containing 1 mg of Colchicine with 15 ml of *water*, mix, filter, extract the filtrate with 25 ml of *chloroform* and evaporate the chloroform extract to a volume of about 1 ml.

Test solution (b). Shake a quantity of the powdered tablets containing 10 mg of Probenecid with 10 ml of *chloroform,* allow to settle and decant the clear supernatant liquid.

Reference solution (a). A solution containing 0.1 per cent w/v of *colchicine IPRS.*

Reference solution (b). A solution containing 0.1 per cent w/v of *probenecid IPRS.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (a) corresponds to that in the chromatogram obtained with reference solution (a). Similarly, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Uniformity of content. *For colchicine* — Complies with the test stated under Tablets using the method described under Assay.

Other tests. Comply with the tests stated under Tablets.

Assay. *For colchicine — Carry out the determination without delay, under subdued light, using low actinic glassware.*

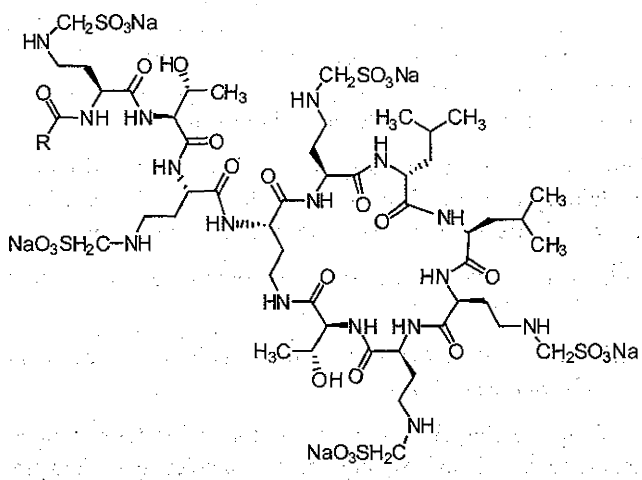
Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 1 mg of Colchicine, shake with 75 ml of *ethanolic sodium carbonate* for 30 minutes, add sufficient of *ethanolic sodium carbonate* to produce 100.0 ml and filter. Measure the absorbance of the resulting solution at the maximum at about

350 nm (2.4.7). Calculate the content of $C_{22}H_{25}NO_6$ taking 440 as the specific absorbance at 350 nm.

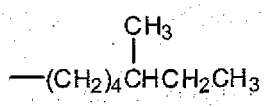
For probenecid — Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.25 g of Probenecid, shake with 100 ml of *0.1 M sodium hydroxide* for 10 minutes, add sufficient of *0.1 M sodium hydroxide* to produce 250.0 ml, mix and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *0.1 M sodium hydroxide*. Dilute 10.0 ml to 50.0 ml with the same solvent and measure the absorbance of the resulting solution at the maximum at about 248 nm (2.4.7). Calculate the content of $C_{13}H_{19}NO_4S$ taking 332 as the specific absorbance at 248 nm.

Storage. Store protected from light.

Colistimethate Sodium

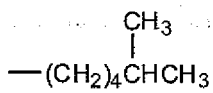


Colistin A component R =



$C_{58}H_{105}N_{16}Na_5O_{28}S_5$ Mol. Wt.: 1749.8

Colistin B component R =



$C_{57}H_{103}N_{16}Na_5O_{28}S_5$ Mol. Wt.: 1735.8

Colistimethate Sodium is prepared from colistin by the action of formaldehyde and sodium hydrogen sulphite.

Semi-synthetic product derived from a fermentation product.

Colistimethate Sodium contains not less than 11500 Units per mg, calculated on the dried basis.

Category. Antibiotic.

Description. A white or almost white, hygroscopic powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

NOTE — Protect the solutions from light.

Mobile phase. A mixture of 25 volume of *water* and 75 volumes of *phenol*.

Test solution. Dissolve 5 mg of the substance under examination in 1.0 ml of a mixture of equal volumes of *hydrochloric acid* and *water*, heat in a sealed tube at 135° for 5 hours, evaporate to dryness on a water-bath, continue to heat until the *hydrochloric acid* has evaporated and dissolve the residue in 0.5 ml of *water*.

Reference solution (a). A 0.2 per cent w/v solution of *leucine* in *water*.

Reference solution (b). A 0.2 per cent w/v solution of *threonine* in *water*.

Reference solution (c). A 0.2 per cent w/v solution of *phenylalanine* in *water*.

Reference solution (d). A 0.2 per cent w/v solution of *serine* in *water*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 105°, spray with *ethanolic ninhydrin solution* and heat at 110° for 5 minutes. The spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution (a) and (b), but shows no spots corresponding to those in the chromatograms obtained with reference solution (c) and (d). It also shows a spot with a very low Rf value (2,4-diaminobutyric acid).

B. Dissolve 5 mg in 3 ml of *water*, add 3 ml of *dilute sodium hydroxide solution*. Shake and add 0.5 ml of a 1.0 per cent w/v solution of *copper sulphate;* a violet colour is produced.

C. Dissolve 50 mg in 1 ml of *1 M hydrochloric acid*, add 0.5 ml of *0.01 M iodine*. The solution is decolourised and gives the reaction (a) of sulphates (2.3.1).

D. It gives reaction (b) of sodium salts (2.3.1).

Tests

Appearance of solution. A 1.6 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 6.5 to 8.5, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*, measure after 30 minutes.

Specific optical rotation (2.4.22). −51.0° to −46.0°, determined in a 5.0 per cent w/v solution in *water*.

Free colistin. Dissolve 80 mg in 3 ml of *water*, add 0.1 ml of a 10.0 per cent w/v solution of *silicotungstic acid*; after 10 to 20 seconds, the solution is not more opalescent than opalescence standard OS2 (2.4.1).

Sulphated ash (2.3.18). 16.0 per cent to 21.0 per cent, determined on 0.5 g.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° over *diphosphorus pentoxide* at a pressure not exceeding 0.67 kPa for 3 hours.

Colistimethate sodium intended for use in the manufacture of parenteral preparation without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per mg of colistin.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

Storage. Store protected from light and moisture.

Colistimethate Injection

Colistimethate Injection is a sterile solution of Colistimethate Sodium in Sodium Chloride Intravenous Infusion. It is prepared by dissolving Colistimethate Sodium for Injection in the requisite amount of Sodium Chloride Intravenous Infusion.

Storage. Colistimethate Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

Colistimethate Sodium for Injection

Colistimethate Sodium for Injection is a sterile material consisting of Colistimethate Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Colistimethate Sodium for Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of colistimethate sodium.

Usual strengths. 1 million IU and 2 million IU per vial.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

NOTE—Protect the solutions from light.

Mobile phase. A mixture of 25 volume of *water* and 75 volumes of *phenol*.

Test solution. Dissolve a quantity containing 62,500 Units of Colistimethate Sodium in 1 ml of a mixture of equal volumes of *hydrochloric acid* and *water*, heat in a sealed tube at 135° for 5 hours, evaporate to dryness on a water-bath, continue to heat until the *hydrochloric acid* has evaporated and dissolve the residue in 0.5 ml of *water*.

Reference solution (a). A 0.2 per cent w/v solution of *leucine* in *water*.

Reference solution (b). A 0.2 per cent w/v solution of *threonine* in *water*.

Reference solution (c). A 0.2 per cent w/v solution of *phenylalanine* in *water*.

Reference solution (d). A 0.2 per cent w/v solution of *serine* in *water*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 105°, spray with *ethanolic ninhydrin solution* and heat at 110° for 5 minutes. The spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution (a) and (b), but shows no spots corresponding to those in the chromatograms obtained with reference solution (c) and (d). It also shows a spot with a very low R_f value (2,4-diaminobutyric acid).

B. Dissolve a quantity containing 125,000 IU in 5 ml of *water*. Heat 0.5 ml of the solution with 0.5 ml of *chromotropic acid–sulphuric acid solution* at 100° for 30 minutes; a purple colour is produced (distinction from colistin sulphate).

C. Dissolve a quantity containing 625,000 IU in 1 ml of *1 M hydrochloric acid*, add 0.5 ml of *0.01 M iodine*. The solution is decolourised and gives the reaction (a) of sulphates (2.3.1).

D. It gives the reaction (b) of sodium salts (2.3.1).

Tests

pH (2.4.24). Dissolve a quantity in *carbon dioxide-free water* to obtain a solution containing 125,000 IU per ml. The pH of the solution, measured 30 minutes after preparation, is 6.5 to 8.5.

Free colistin. Dissolve a quantity containing 1,000,000 IU in 3 ml of *water*, add 0.1 ml of a 10.0 per cent w/v solution of *silicotungstic acid* and allow to stand for 10 to 20 seconds. The solution is not more opalescent than opalescence standard OS2 (2.4.1).

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° over *diphosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Colistimethate Sodium intended for use in the manufacture of parenteral preparation without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 43.75 Endotoxin Unit per ml of a solution containing 250,000 IU per ml in Water for Injections.

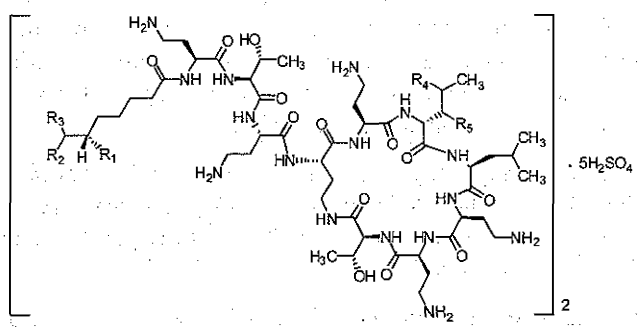
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Mix the contents of the 10 containers and carry out the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture.

Labelling. The label of the sealed container states the total number of IU (units) contained in it.

Colistin Sulphate



Polymyxin	R1	R2	R3	R4	R5	Mol. Formula	M_r
E1	CH_3	CH_3	H	CH_3	H	$C_{53}H_{100}N_{15}O_{13}$	1170
E2	CH_3	H	H	CH_3	H	$C_{52}H_{98}N_{15}O_{13}$	1155
E3	H	CH_3	H	CH_3	H	$C_{52}H_{98}N_{15}O_{13}$	1155
E1-I	CH_3	CH_3	H	H	CH_3	$C_{53}H_{100}N_{15}O_{13}$	1170
E1-7MOA	H	CH_3	CH_3	CH_3	H	$C_{53}H_{100}N_{15}O_{13}$	1170

Category. Antibacterial.

Colistin Sulphate is a mixture of the sulphates of polypeptides produced by the growth of certain strains of *Bacillus polymyxa* var. *colistinus* or by any other means.

Colistin Sulphate contains not less than 77.0 per cent sum of *polymyxins E1, E2, E3, E1-I* and *E1-7MOA*, and not more than 10.0 per cent each of *polymyxins E1-I, E1-7MOA* and *polymyxin E3*, calculated on the dried basis.

Description. A white or almost white powder; hygroscopic.

Identification

Test A, C and D may be omitted if tests B and E are carried out. Tests B may be omitted if test A, C, D and E are carried out.

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

NOTE — Carry out the test protected from light.

Mobile phase. A mixture of 75 volumes of *phenol* and 25 volumes of *water*.

Test solution. Dissolve 5 mg of the substance under examination in 1 ml of equal volume of *hydrochloric acid* and *water*, heat at 135° for 5 hours in a sealed tube. Evaporate to dryness on a water-bath and continue the heating until the *litmus paper* has turned red and dissolve the residue in 0.5 ml of *water*.

Reference solution (a). A 0.2 per cent w/v solution of *leucine IPRS* in *water*.

Reference solution (b). A 0.2 per cent w/v solution of *threonine IPRS* in *water*.

Reference solution (c). A 0.2 per cent w/v solution of *phenylalanine IPRS* in *water*.

Reference solution (d). A 0.2 per cent w/v solution of *serine IPRS* in *water*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. After development, dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatograms obtained with reference solution (a) and (b), but shows no spots corresponding to those in the chromatograms obtained with reference solution (c) and (d); the spot obtained with the test solution also shows a spot with a very low R_f value of *2, 4-diaminobutyric acid*.

B. In the Assay, the peaks due to *polymyxin E1* and *polymyxin E2* in the chromatogram obtained with the test solution corresponds to the peaks in the chromatogram obtained with reference solution (a).

C. Dissolve 5 mg in 3 ml of *water*, add 3 ml of *dilute sodium hydroxide solution*. Shake and add 0.5 ml of a 1.0 per cent solution of *copper sulphate;* A violet colour is produced.

D. Dissolve 50 mg in 1 ml of *1 M hydrochloric acid*; add 0.5 ml of *0.01 M iodine*. The solution remains colored.

E. It gives reaction (A) of sulphates (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in 1.0 per cent w/v solution in *carbon dioxide-free water.*

Specific optical rotation (2.4.22). –73° to –63° determined in a 5.0 per cent w/v solution in *water.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 40 ml of *water* and dilute to 50.0 ml with *acetonitrile.*

Reference solution (a). Dissolve 25 mg of *colistin sulphate IPRS* in 40 ml of *water* and dilute to 50.0 ml with *acetonitrile.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of 20 volumes of *acetonitrile* and 80 volumes of *water.*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution prepared by dissolving 4.46 g of *anhydrous sodium sulphate* in 900 ml of *water*, adjusted to pH 2.4 with *dilute phosphoric acid* and dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time
polymyxin E2	0.45
polymyxin E3	0.5
polymyxin E1-1	0.8
polymyxin E1(Retention time about 16 minutes)	1.0
polymyxin E1-7MOA	1.1

Inject reference solution (a). Run the chromatogram 1.5 times the retention time of polymyxin E1.

The test is not valid unless the resolution between the peak due to polymyxin E2 and polymyxin E1 is not less than 8.0, between the peaks due to polymyxin E2 and polymyxin E1-I is not less than 6.0, between the peaks due to polymyxin E1-I and polymyxin E1 is not less than 2.5 and between the peaks due to polymyxin E1 and polymyxin E1-7MOA is not less than 1.5.

Inject reference solution (b) and the test solution. The area of any peak other than principal peak in the chromatogram obtained with test solution is not greater than 4.0 per cent and sum of all the peaks is not greater than 23.0 per cent. Ignore any peak with area due to polymyxin E1 in the chromatogram obtained with reference solution (b); and polymyxins E2, E3, E1-I, E1 and E1-7MOA.

Sulphates. 16.0 to 18.0 per cent calculated on dried basis, determined by following method.

Dissolve 0.25 g in 100 ml of *distilled water* and adjusted to pH 11 with *concentrated ammonia*. Add 10.0 ml of *0.1 M barium chloride* and 0.5 mg of *phthalein purple* as an indicator and titrate with *0.1 M sodium edetate*, when the colour of the solution begins to change add 50 ml *ethanol (95 per cent)* and continuing the titration until the violet-blue colour disappears. Perform the blank determination and make any necessary correction.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of SO_4.

Sulphated ash (2.3.18). Not more than 1.0 per cent, determined on 1.0 g.

Loss on drying (2.4.19). Not more than 3.5 per cent, determined on 1.0 g by drying in an oven at 60° over *diphosphorus pentoxide* at a pressure not exceeding 670 Pa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 40 ml of *water* and dilute to 50.0 ml with *acetonitrile.*

Reference solution. Dissolve 25 mg of *colistin sulphate IPRS* in 40 ml of *water* and dilute to 50.0 ml with *acetonitrile.*

Use the Chromatographic system as described under Related substances.

Inject the reference solution and the test solution.

Calculate the percentage content of polymyxin E3, of polymyxin E1-I, of polymyxin E1-7MOA, and the sum of polymyxins E1, E2, E3, E1-I and E1-7MOA. Using the following expression.

$$C_{Ei} = \frac{A_{Ei} \times m_2 \times D_{Ei}}{m_1 \times B_{Ei}}$$

where, C_{EI} = percentage content of polymyxin *Ei*,

A_{EI} = area of the peak due to polymyxin *Ei* in the chromatogram obtained with the test solution,

m_1 = mass in milligrams of the substance to be examined (dried substance) in the test solution,

B_{EI} = area of the peak due to polymyxin *E1* in the chromatogram obtained with reference solution (a),

m_2 = mass in milligrams of *colistin sulphate IPRS* in reference solution (a),

D_{EI} = declared percentage content for polymyxin *E1* in *colistin sulphate IPRS*.

Storage. Store protected from light and moisture.

Colistin Sulphate Oral Suspension

Colistin Sulphate Oral Suspension is a dry mixture of Colistin Sulphate with or without one or more suitable buffers, colours, diluents, dispersants, and flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of Water just before use.

Colistin Sulphate Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of colistin.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of colistin.

Tests

pH (2.4.24). 5.0 to 6.0 in the constituted suspension.

Other tests. Comply with the tests stated under Oral Liquids.

Loss on drying (2.4.19). Not more than 3.0 per cent determined on 0.1 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.67 kPa.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the result in mg of Colistin per ml.

Storage. Store protected from light and moisture.

Colistin Tablets

Colistin Sulphate Tablets

Colistin Tablets contain not less than 77.0 per cent contain sum of *polymyxins E1, E2, E3, E1-I* and *E1-7MOA* of the stated amount of Colistin sulphate, and not more than 10.0 per cent of each *polymyxins E1-I, E1-7MOA* and *polymyxin E3*.

Usual strengths. 1000,000 Units (equivalent to 80 mg).

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

NOTE—Carry out the test protected from light.

Mobile phase. A mixture of 75 volumes of *phenol* and 25 volumes of *water*.

Test solution. Shake a quantity of powdered tablets containing 10 mg of Colistin Sulphate with 10 ml of *water* and filter, add 0.5 ml of *hydrochloric acid* to 0.5 ml of the filtrate, heat in a sealed tube at 135° for 5 hours, evaporate to dryness on a water bath, continue to heat until any residual hydrogen chloride has been removed. Dissolve the residue in 0.5 ml of *water* and centrifuge, if necessary.

Reference solution (a). A 0.25 per cent w/v solution of L-*leucine IPRS* in *water*.

Reference solution (b). A 0.25 per cent w/v solution of L-*threonine IPRS* in *water*.

Reference solution (c). A 0.25 per cent w/v solution of L- *phenylalanine IPRS* in *water*.

Reference solution (d). A 0.25 per cent w/v solution of L-*serine IPRS* in *water*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. After development, dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatograms obtained with reference solution (a) and (b), but shows no spots corresponding to those in the chromatograms obtained with reference solution (c) and (d); the spot obtained with the test solution also shows a spot with a very low R_f value of *2, 4-diaminobutyric acid*.

B. Heat 0.5 ml of the filtrate with 0.5 ml of *chromotropic acid-sulphuric acid solution* at 100° for 30 minutes. No purple colour is produced (distinction from colistin sulfomethate).

C. The filtrate gives reaction (A) of *sulphates* (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Colistin Sulphate for 20 minutes with 40 ml of *water*, dilute to 50.0 ml with *acetonitrile* and filter.

Reference solution (a). Dissolve 25 mg of *colistin sulphates IPRS*, add 40 ml of *water* and dilute to 50 ml with *acetonitrile*.

Reference solution (b). Dilute 1 volume of reference solution (a) to 100 volumes with a mixture of 20 volumes of *acetonitrile* and 80 volumes of *water*.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (3.5 µm).
- column temperature: 30°,
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution prepared by dissolving 4.46 g of *anhydrous sodium sulphate* in 900 ml of *water*, adjusted to pH 2.4 with *dilute orthophosphoric acid* and dilute to 1000 ml with *water*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (a). Run the chromatogram 1.5 times the retention time of polymyxin E1. The relative retention time with reference to polymyxin E1 is about 16, for polymyxin E2 is about 0.45, for polymyxin E3 is about 0.5, for polymyxin E1-I is about 0.8 and polymyxin E1-7MOA is about 1.1.

The test is not valid unless the resolution between the peak due to polymyxin E2 and polymyxin E1 is not less than 8.0; between the peaks due to polymyxin E2 and polymyxin E1-I is not less than 6.0; between the peaks due to polymyxin E1-I and polymyxin E1 is not less than 2.5 and between the peaks due to polymyxin E1 and polymyxin E1-7MOA is not less than 1.5.

Inject reference solution (b) and the test solution. The area of any peak other than principal peak in the chromatogram obtained with test solution is not greater than 4.0 per cent and sum of all the peaks is not greater than 23.0 per cent. Ignore any peak with area less than the area of peak due to polymyxin E1 in the chromatogram obtained with reference solution (b) and any peak due to polymyxin E2, E3, E1-I, E1 and E1-7MOA.

Other tests. Comply with the test stated under Tablets.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10).

The precision of the assay is such that the fiducial limits of error are not less than 95 per cent and not more than 105 per cent of the estimated potency. The upper fiducial limit of error is not less than 97.0 per cent and the lower fiducial limit of error is not more than 110.0 per cent of the stated number of units.

Storage. Store protected from light.

Corn Oil

Corn Oil is the refined fixed oil obtained from the embryo of *Zea mays* Linne (Fam. Gramineae).

Category. Pharmaceutical aid.

Description. A clear, light yellow-coloured, oily liquid with a faint characteristic odour and slightly nutty, sweet taste resembling cooked sweet corn.

Identification

Complies with the test of Fatty Acid Composition by Gas Chromatography (2.3.50) and exhibits the following composition profile of fatty acids.

Carbon-Chain length	No. of Double bonds	percentage
<14	0	≤0.1
14	0	≤0.1
16	0	8.6 to 16.5
16	1	≤0.5
18	0	1.0 to 3.3
18	1	20.0 to 42.2
18	2	39.4 to 62.0
18	3	0.5 to 1.5
20	0	≤0.8
20	1	≤0.5
22	0	≤0.3
22	1	≤0.1
24	0	≤0.4

Tests

Weight per ml (2.4.29). 0.914 g to 0.921 g.

Refractive index (2.4.27). 1.470 to 1.474.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Acid value (2.3.23). Not more than 0.2.

Peroxide value (2.3.35). Not more than 10.0.

Iodine value (2.3.28). 102 to 130.

Saponification value (2.3.37). 187 to 193.

Unsaponifiable matter (2.3.39). Not more than 1.5 per cent.

Water (2.3.43). Not more than 0.1 per cent, determined on 0.5 g in a mixture of equal volumes of *decanol* and *methanol*.

Alkaline impurities. Not more than 0.1 ml of *0.01 M hydrochloric acid* is used.

Mix 10 ml of *acetone* and 0.3 ml of *water*, and add 0.05 ml of *bromophenol blue TS*. Neutralize the solution to a green colour if necessary with *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide*. Add 10 ml of Corn Oil, shake, well and allow to stand. Titrate with *0.01 M hydrochloric acid* to change the colour of the upper layer to yellow.

Storage. Store protected from light, moisture and avoid exposure to excessive heat

Labelling. The label states the name and quantity of any added antioxidant.

Cortisone Acetate

$C_{23}H_{30}O_6$ Mol. Wt 402.5

Cortisone Acetate is 17α,21-dihydroxypregn-4-ene-3,11,20-trione 21-acetate.

Cortisone Acetate contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{23}H_{30}O_6$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cortisone acetate IPRS* or with the reference spectrum of cortisone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide.*

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the substance under examination in 10.0 ml of the same solvent mixture.

Reference solution (a). Dissolve 25 mg of *cortisone acetate IPRS* in 10.0 ml of the same solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v).* Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. 10 mg gives the reactions of acetyl groups (2.3.1).

Tests

Specific optical rotation (2.4.22). +211° to +220°, determined in a 1.0 per cent w/v solution in *dioxan.*

Light absorption (2.4.7). Dissolve 50 mg in sufficient *ethanol (95 per cent)* to produce 100 ml and dilute 2 ml to 100 ml with the same solvent. Absorbance of the resulting solution at the maximum at about 240 nm, 0.375 to 0.405.

Related substances. Determine by liquid chromatography (2.4.14).

Prepare the following solutions immediately before use.

Test solution. Dissolve 25.0 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *cortisone acetate IPRS* and 2 mg of *hydrocortisone acetate IPRS* in *acetonitrile* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 400 ml of *acetonitrile* and 550 ml of *water,* allowed to equilibrate sufficient *water* added to produce 1000 ml and mixed,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for 30 minutes.

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the

chromatogram is at least 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are: hydrocortisone acetate, about 10 minutes and cortisone acetate, about 12 minutes. The test is not valid unless the resolution between the peaks due to hydrocortisone acetate and cortisone acetate is at least 4.2.

Inject reference solution (b) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks other than the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.1 g in *ethanol* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol*. Measure the absorbance at the maximum at about 237 nm (2.4.7).

Calculate the content of $C_{23}H_{30}O_6$ taking 395 as the specific absorbance at 237 nm.

Storage. Store protected from light.

Cortisone Injection

Cortisone Acetate Injection

Cortisone Injection is a sterile suspension of a very fine powder of Cortisone Acetate in Sodium Chloride Injection containing suitable dispersing agents.

Cortisone Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cortisone acetate, $C_{23}H_{30}O_6$.

Usual strength. 25 mg per ml.

Description. A white suspension, which settles on standing, but readily disperses on shaking.

Identification

Extract a volume of the injection containing 0.1 g of Cortisone Acetate with 6 ml of *chloroform*, filter and evaporate the *chloroform*. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cortisone acetate IPRS* or with the reference spectrum of cortisone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Dissolve a quantity of injection containing 25 mg of cortisone in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 25 mg of *cortisone acetate IPRS* in 10.0 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. 10 mg gives the reactions of acetyle groups (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.2.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix a quantity of the suspension containing 25 mg of Cortisone Acetate with 15 ml of *isopropyl alcohol*, evaporate to dryness on a steam bath. To the residue add 10 ml of the mobile phase, shake, mix with the aid of ultrasound and filter (such as Whatman GF/C filter).

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v, each of, *cortisone acetate IPRS* and *hydrocortisone acetate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 400 ml *of acetonitrile* and 550 ml of *water*, allowed to equilibrate and sufficient *water* added to produce 1000 ml,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention times are: hydrocortisone acetate, about 10 minutes and cortisone acetate, about 12 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to hydrocortisone acetate and cortisone acetate is at least 4.2.

Inject reference solution (a) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the secondary peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add 50 ml of *methanol* to a quantity of the injection containing about 10 mg of Cortisone Acetate, shake, mix with the aid of ultrasound for 2 minutes, dilute to 100.0 ml with *water*, shake, centrifuge and use the supernatant liquid.

Reference solution. Dilute 50 ml of a solution in *methanol* containing 0.02 per cent w/v, each of, *cortisone acetate IPRS* and *prednisolone IPRS* to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: *methanol (60 per cent)*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to cortisone acetate and prednisolone in the chromatogram obtained is at least 5.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{30}O_6$ in the injection.

Storage. Store protected from light in single dose or multiple dose containers at a temperature not exceeding 30°. It should not be allowed to freeze.

Labelling. The label states (1) the name(s) of the dispersing agent(s) added; (2) that it is not meant to be given by intravenous injection; (3) that the container should be gently shaken before a dose is withdrawn.

Cortisone Tablets

Cortisone Acetate Tablets

Cortisone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cortisone acetate, $C_{23}H_{30}O_6$.

Usual strengths. 5 mg; 25 mg.

Identification

Extract a quantity of the powdered tablets containing 0.1 g of Cortisone Acetate with 5 ml of *chloroform*, filter and evaporate the *chloroform*. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cortisone acetate IPRS* or with the reference spectrum of cortisone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *dimethylformamide*.

Mobile phase. *Chloroform*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the same solvent mixture.

Reference solution (a). Dissolve 25 mg of *cortisone acetate IPRS* in 10.0 ml of the same solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray

the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. 10 mg gives the reactions of acetyl groups (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (paddle),
Medium. 900 ml of a mixture of a 0.3 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary with the medium, at the maximum at about 242 nm (2.4.7). Calculate the content of $C_{23}H_{30}O_6$ in the medium from the absorbance obtained from a solution of known concentration of *cortisone acetate IPRS* in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{23}H_{30}O_6$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix a quantity of the powdered tablets containing 25 mg of Cortisone Acetate with 10.0 ml of the mobile phase, place in an ultrasonic bath for 10 minutes and filter (such as Whatman GF/C filter).

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v, each of, *cortisone acetate IPRS* and *hydrocortisone acetate IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 400 ml *of acetonitrile* and 550 ml of *water*, allowed to equilibrate and sufficient *water* added to produce 1000 ml,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The retention times are: hydrocortisone acetate, about 10 minutes and cortisone acetate, about 12 minutes. The test is not valid unless the resolution between the peaks due to hydrocortisone acetate and cortisone acetate is at least 4.2.

Inject reference solution (a) and the test solution. Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the secondary peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Powder one tablet, add 50 ml of *ethanol*, shake for 30 minutes and add sufficient *ethanol* to produce 100.0 ml. Centrifuge and dilute a suitable volume of the supernatant liquid containing 0.5 mg of Cortisone Acetate to 50.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{23}H_{30}O_6$ taking 390 as the specific absorbance at 240 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Add 50 ml of *methanol* to a quantity of the powder containing about 10 mg of Cortisone Acetate, shake, mix with the aid of ultrasound for 2 minutes, dilute to 100.0ml with *water*, shake, centrifuge and use the supernatant liquid.

Reference solution. Dilute 50 ml of a solution in *methanol* containing 0.02 per cent w/v, each of, *cortisone acetate IPRS* and prednisolone to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: *methanol (60 per cent)*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to cortisone acetate and prednisolone in the chromatogram obtained is at least 5.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{23}H_{30}O_6$ in the tablets.

Storage. Store protected from light.

Absorbent Cotton

Absorbent Cotton Wool

Absorbent Cotton consists of the new fibres or good quality new combers obtained from the seed coat of various species of the genus Gossypium Linn., cleaned, purified, bleached and carded. It does not contain any compensatory colouring matter.

Category. Surgical dressing.

Description. White, well-carded fibres of average staple length not less than 10 mm, containing not more than traces of leaf residue, seed coat and other impurities. It offers appreciable resistance when pulled and does not shed a significant quantity of dust when shaken gently.

Identification

A. When examined under a microscope, each fibre is seen to consist of a single cell, up to about 4 cm long and up to 40 µm wide, in the form of a flattened tube with thick and rounded walls and often twisted.

B. Treat with *iodinated zinc chloride solution;* the fibres become violet.

C. To 0.1 g add 10 ml of *zinc chloride solution,* heat to 40° and allowed to stand for 2 ½ hours, shaking occasionally; the fibres do not dissolve.

Tests

Solution A. To 15.0 g add 150 ml of *water,* macerate for 2 hours in a closed vessel, decant the liquid, carefully squeezing out the residual liquid with a glass rod and mix. Reserve 10 ml for the test for surface-active substances and filter the remainder.

Acidity or alkalinity.To 25 ml of solution A add 0.1 ml of *dilute phenolphthalein solution;* to another 25 ml add 0.05 ml of *methyl orange solution.* Neither solution shows a pink colour.

Surface-active substances. Into a 25-ml graduated, ground-glass stoppered cylinder with external diameter of 18 to 22 mm, previously rinsed with *sulphuric acid* and then with *water,* add the 10 ml portion of solution A, shake vigorously 30 times in 10 seconds, allow to stand for 1 minute and shake again 30 times. After 5 minutes, any foam present must not cover the entire surface of the liquid.

Absorbency

Apparatus. A dry, cylindrical wire basket, 80 mm high and 50 mm in diameter, fabricated from wire of diameter 0.4 mm and having a mesh aperture of 15 to 20 mm; the basket weighs 2.4 to 3.0 g.

Sinking time. Not more than 10 seconds, determined by the following method.

Weigh the basket to the nearest 10 mg. Take five samples, each of approximately 1 g, from different places in the material being examined, pack loosely in the basket and weigh the packed basket to the nearest 10 mg. Hold the basket with its long axis in the horizontal position and drop it from a height of about 10 mm into *water* at 25° contained in a beaker at least 12 cm in diameter and filled to a depth of 10 cm. Measure with a stopwatch the time taken by the basket to sink below the surface of the water. Repeat the procedure on two further samples and calculate the average value.

Water-holding capacity. Not less than 23.0 g per g, determined by the following method.

After the sinking time has been recorded in test A, remove the basket from the water, allow it to drain for exactly 30 seconds with its long axis in the horizontal position, transfer it to a tared beaker and weigh to the nearest 10 mg. Calculate the weight of water retained by the sample. Repeat the procedure on two further samples and calculate the average value.

Foreign fibres. When examined under a microscope, it is seen to consist exclusively of typical cotton fibres, except that occasionally a few isolated foreign fibres may be seen.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It shows only a slight, brownish-violet fluorescence and a few yellow particles. Not more than a few isolated fibres show an intense blue fluorescence.

Colouring matter. Slowly extract 10 g in a narrow percolator with *ethanol (95 per cent)* until 50 ml of extract is obtained. The extract is not more intensely coloured than reference solution YS5 or GYS6 (2.4.1) or a solution prepared in the following manner. To 3.0 ml of CSS add 7.0 ml of a solution of *hydrochloric acid* containing 1.0 per cent v/v of *hydrochloric acid* and dilute 0.5 ml of the resulting solution to 10 ml with the same solution of *hydrochloric acid*.

Ether-soluble substances. Not more than 0.5 per cent determined by the following method. Extract 5 g with *ether* in a continuous extraction apparatus (2.1.8), for 4 hours in such a way that the rate is at least four extractions per hour. Evaporate the ether and dry the residue to constant weight at 105°.

Water-soluble substances. Not more than 0.5 per cent, determined by the following method. Boil 5 g with 500 ml of *water* for 30 minutes, stirring frequently and replacing the water lost by evaporation. Decant the liquid into a beaker, squeeze the residual liquid from the material carefully with a glass rod, mix the liquids and filter the extract. Evaporate 400 ml of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant weight at 105°.

Neps. A thin layer approximately equivalent to 0.5 g for an area of 450 sq. cm. spread uniformly between two glass plates, and viewed by the naked eye under transmitted light, does not show more neps than about an average of 250 for three tests.

Sulphated ash (2.3.18). Not more than 0.5 per cent, determined on 5.0 g, using 2 ml of *sulphuric acid*.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 5.0 g by drying in an oven at 105°.

Storage. Store in a dust-proof package, in a dry place.

Cottonseed Oil

Cottonseed Oil is the refined fixed oil obtained from the seed of cultivated plants of various varieties of *Gossypium hirsutum* Linne or of other species of *Gossypium* (Fam. Malvaceae). It may contain suitable antioxidants.

Category. Pharmaceutical aid.

Description. A Pale yellow or bright golden yellow-coloured, clear oily liquid. It is odourless, or nearly so, with a bland, nutty taste. At temperatures below 10° particles of solid fat may separate from the oil, and at about -5° to 0° the oil becomes solid or nearly so. If it solidifies, the oil should be remelted and thoroughly mixed before use.

Identification

Complies with the test of Fatty Acid Composition by Gas chromatography, Method A (2.3.50) and exhibits the following composition profile of fatty acids.

Carbon-Chain length	No. of Double bonds	percentage
<14	0 or 1	≤0.2
14	0	0.3 to 1.0
16	0	18.0 to 26.4
16	1	≤1.2
18	0	2.1 to 3.3
18	1	14.0 to 21.7
18	2	46.7 to 58.3
18	3	≤1.0
20	0	≤1.0
20	1	≤0.5
22	0	≤0.6
22	1	≤0.5
24	0	≤0.5

Tests

Weight per ml (2.4.29). 0.915 g to 0.921 g.

Refractive index (2.4.27). 1.4645 to 1.4655.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Acid value (2.3.23). Not more than 0.2.

Peroxide value (2.3.35). Not more than 10.0.

Iodine value (2.3.28). 109 to 120.

Unsaponifiable matter (2.3.39). Not more than 1.5 per cent.

Water (2.3.43). Not more than 0.1 per cent, determined on 0.5 g.

Alkaline impurities. Not more than 0.1 ml of *0.01 M hydrochloric acid* is used.

Mix 10 ml of *acetone* and 0.3 ml of *water*, and add 0.05 ml of *bromophenol blue*. Neutralize the solution to a green colour, if necessary, with *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide*. Add 10 ml of cotton seed oil, shake, and allow to stand. Titrate with *0.01 M hydrochloric acid* to change the color of the upper layer to yellow.

Storage. Store protected from light, moisture and avoid exposure to excessive heat.

Labelling. The label states the name and quantity of any added antioxidant.

Cresol

Cresol is a mixture of cresols and other phenols obtained from coal tar.

Category. Disinfectant; pharmaceutical aid (antimicrobial preservative).

Description. An almost colourless to pale brownish-yellow liquid, becoming darker on keeping or on exposure to light; odour, resembling that of phenol but more tarry.

Identification

To 0.5 ml add 300 ml of *water*, shake and filter. Divide the filtrate into two parts. To one part add *ferric chloride test solution*; a transient bluish colour is produced. To the other part add *bromine solution*; a pale yellow flocculent precipitate is produced.

Tests

Distillation range (2.4.8). Not more than 2.0 per cent v/v distils below 188° and not less than 80.0 per cent v/v between 195° and 205°.

Acidity. A 2 per cent w/v solution is neutral to *bromocresol purple solution*.

Weight per ml (2.4.29). 1.029 g to 1.044 g.

Hydrocarbons and volatile bases. Place 50 ml in a 500-ml round-bottomed flask, add about 83 ml of a 27 per cent w/v solution of *sodium hydroxide* and 100 ml of *water* and mix thoroughly.

Connect the flask to a splash-bulb and air condenser about 60 cm long, with the end of the air-condenser fitting closely into the neck of a 250-ml pear-shaped separator and passing well into the separator, which has a cylindrical graduated portion above the stopcock. Fill the graduated portion of the separator with *water*. Distil rapidly until 75 ml of distillate has been collected, cooling the separator in running *water*, if necessary. Allow the separator to stand in a vertical position until separation is complete and draw off the aqueous liquid into a titration flask.

Hydrocarbons — Allow the separator to stand for a short time, measure the volume of hydrocarbon oil in the graduated portion and warm if necessary in order to keep the oil in the liquid state; subtract the volume of volatile bases in the hydrocarbon oil, as determined in the following test; not more than 0.5 per cent v/v of hydrocarbon oil is present.

Volatile bases — To the aqueous portion of the distillate obtained in the preceding test, add any aqueous liquid still remaining in the separator and neutralise it if necessary with *0.1 M hydrochloric acid*, using *phenolphthalein solution* as indicator. Titrate with *1 M hydrochloric acid* using *methyl orange solution* as indicator. Wash the oil from the separator into the titration flask with water and again titrate with *1 M hydrochloric acid*. From the volume of additional *1 M hydrochloric acid* calculate the proportion of volatile bases in the hydrocarbon oil. From the total volume of *1 M hydrochloric acid* used in both titrations calculate the proportion of volatile bases in cresol.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08 ml of volatile bases; not more than 0.15 per cent v/v of volatile bases, calculated as pyridine, are present.

Sulphur compounds. Place about 20 ml in a small conical flask. Moisten a piece of filter paper with a 10 per cent w/v solution of *lead acetate* and fix it on the mouth of the flask; heat the flask on a water-bath for 5 minutes; the filter paper shows not more than a light yellow colour.

Non-volatile matter. Not more than 0.1 per cent w/v when evaporated on a water-bath and dried to constant weight at 105°.

Storage. Store protected from light.

Cresol with Soap Solution

Cresol with Soap Solution is prepared by the saponification of a mixture of Cresol with vegetable oils such as cotton seed, linseed, soyabean or similar oils but excluding coconut and palm kernel oils. Alternatively, the mixed fatty acids derived from these oils may be used.

Cresol with Soap Solution contains not less than 47.0 per cent v/v and not more than 53.0 per cent v/v of Cresol.

Category. Disinfectant.

Description. An amber-coloured to reddish-brown liquid; odour, that of cresol; soapy to touch.

Tests

Appearance of solution. 5 ml mixed with 95 ml of *water* forms a clear solution without producing any opalescence on standing for 3 hours.

Alkalinity. Dilute 5 ml with 50 ml of *ethanol (95 per cent)* neutralised to phenol red solution and titrate with *1 M sulphuric acid*, using *phenol red solution* as indicator; not more than 0.6 ml is required.

Hydrocarbons and volatile bases. Distil 120 ml until all the water and 50 ml of cresol have been collected. Place the cresol thus recovered in a 500-ml round-bottomed flask, add about 83 ml of a 27 per cent w/v solution of *sodium hydroxide* and 100 ml of *water* and mix thoroughly. Connect the flask to a splash-bulb and air condenser about 60 cm long, with the end of the air-condenser fitting closely into the neck of a 250-ml pear-shaped separator and passing well into the separator, which has a cylindrical graduated portion above the stopcock. Fill the graduated portion of the separator with *water*. Distil rapidly until 75 ml of distillate has been collected, cooling the separator in running *water*, if necessary. Allow the separator to stand in a vertical position until separation is complete and draw off the aqueous liquid into a titration flask.

Hydrocarbons — Allow the separator to stand for a short time, measure the volume of hydrocarbon oil in the graduated portion and warm if necessary in order to keep the oil in the liquid state; subtract the volume of volatile bases in the hydrocarbon oil, as determined in the following test; not more than 0.5 per cent v/v of hydrocarbon oil is present.

Volatile bases —To the aqueous portion of the distillate obtained in the preceding test, add any aqueous liquid still remaining in the separator and neutralise it if necessary with *0.1 M hydrochloric acid*, using *phenolphthalein solution* as indicator. Titrate with *1 M hydrochloric acid* using *methyl orange solution* as indicator. Wash the oil from the separator into the titration flask with water and again titrate with *1 M hydrochloric acid*. From the volume of additional *1 M hydrochloric acid* calculate the proportion of volatile bases in the hydrocarbon oil. From the total volume of *1 M hydrochloric acid* used in both titrations calculate the proportion of volatile bases in cresol.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08 ml of volatile bases; not more than 0.15 per cent v/v of volatile bases, calculated as pyridine, are present.

Sulphur compounds. Complies with the test for Sulphur compounds described under Cresol.

Assay. To 50 ml, accurately measured, add 150 ml of *kerosene*, mix and add little powdered *pumice stone* and 3 g of *sodium bicarbonate*. Distil into a separator, the rate of distillation being not more than 2 drops per second until the kerosene and cresol have completely distilled. This is indicated by the distillate being yellow in colour. Stop the distillation, add 50 ml of *kerosene* and collect a further 50 ml of the distillate. Discard the lower aqueous layer in the separator, dry the remainder with *anhydrous calcium chloride* and shake with 10 ml of *sulphuric acid (50 per cent w/w)*. Set aside for 2 hours, reject the acid layer and to the kerosene layer add 40 ml of *sodium hydroxide solution* and shake for 5 minutes. Transfer the alkaline layer to a 100-ml volumetric flask and extract the kerosene layer with 20 ml of *sodium hydroxide solution* adding the alkaline layer to that in the 100-ml volumetric flask. Add *sodium hydroxide solution* from a burette to make the volume in the flask to 100 ml. The difference between the burette reading and 40.5 is equal to the volume of cresol in 50 ml of the sample.

Storage. Store protected from light.

Croscarmellose Sodium

Croscarmellose sodium (cross-linked sodium carboxymethyl cellulose) is the sodium salt of a cross-linked, partly *O*-carboxymethylated cellulose.

Category. Excipient.

Description. A white or greyish-white powder.

Identification

A. Shake 1 g with 100 ml of 0.0004 per cent w/v solution of *methylene blue* and allow to settle. The substance under examination absorbs the methylene blue and settles as a blue, fibrous mass.

B. Shake 1 g with 50 ml of *water*. Transfer 1 ml of the mixture to a test-tube, add 1 ml of *water* and 0.05 ml of a freshly prepared 4.0 per cent w/v solution of *α-naphthol* in *methanol*. Incline the test-tube and add carefully 2 ml of *sulphuric acid* down the side so that it forms a lower layer. A reddish-violet colour develops at the interface.

C. The solution prepared from the sulphated ash in the test for Heavy metals (see Tests) gives reaction (a) of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0, determined on 1.0 per cent w/v solution in *carbon dioxide-free water*.

Degree of substitution. Take 1.0 g in 500 ml conical flask, add 300 ml of a 10 per cent w/v solution of *sodium chloride*, 25.0 ml of *0.1 M sodium hydroxide*, stopper the flask and allow to stand for 5 minutes, shaking occasionally. Add 0.05 ml of *m-cresol purple solution* and about 15 ml of *0.1 M hydrochloric acid* from a burette. Insert the stopper and shake. If the solution is violet, add *0.1 M hydrochloric acid* in 1 ml portions until the solution becomes yellow, shaking after each addition. Titrate with *0.1 M sodium hydroxide* until the colour turns to violet.

Calculate the number of milliequivalents (M) of base required for the neutralisation equivalent to 1 g of dried substance.

Calculate the degree of acid carboxymethyl substitution (A) from the expression:

$$\frac{1150\,M}{(7102 - 412\,M - 80\,C)}$$

where, C = sulphated ash as a percentage

Calculate the degree of sodium carboxymethyl substitution (S) from the expression:

$$\frac{(162 + 58\,A)\,C}{(7102 - 80\,C)}$$

The degree of substitution is the sum of $A + S$ and it is between 0.60 and 0.85, calculated on the dried basis.

Sodium chloride and sodium glycollate. The sum of the percentage contents of sodium chloride and sodium glycollate is not more than 0.5 per cent, calculated on the dried basis.

Sodium chloride. Place 5.0 g in a 250 ml conical flask, add 50 ml of *water* and 5 ml of *strong hydrogen peroxide solution* and heat on a water-bath for 20 minutes stirring occasionally to ensure total hydration. Cool, add 100 ml of *water* and 10 ml of *nitric acid*. Titrate with *0.05 M silver nitrate* determining the end-point potentiometrically (2.4.25) using a silver indicator electrode and a double-junction reference electrode containing a 10 per cent w/v solution of *potassium nitrate* in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly.

1 ml of *0.05 M silver nitrate* is equivalent to 0.002922 g of NaCl.

Sodium glycollate. Place 0.5 g of the substance under examination in a 100 ml beaker. Add 5 ml of *glacial acetic acid* and 5 ml of *water* and stir to ensure total hydration (about 15 minutes). Add 50 ml of *acetone* and 1 g of *sodium chloride*. Stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a fast filter paper impregnated with *acetone* into a volumetric flask, rinse the beaker and filter with 30 ml of *acetone* and dilute the filtrate to

100.0 ml with the same solvent. Allow to stand for 24 hours without shaking. Use the clear supernatant to prepare the test solution.

Reference solution. Dissolve 0.1 g of *glycollic acid* in 100 ml of *water*. Use the solution within 30 days. Transfer 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of the solution to separate volumetric flasks; dilute the contents of each flask to 5.0 ml with *water*, add 5 ml of *glacial acetic acid*, dilute to 100.0 ml with *acetone* and mix.

Transfer 2.0 ml of the test solution and 2.0 ml of each of the reference solutions to separate 25 ml volumetric flasks. Heat the uncovered flasks for 20 minutes on a water-bath to eliminate *acetone*. Allow to cool and add 5.0 ml of *2,7-dihydroxynaphthalene solution* to each flask. Mix, add a further 15.0 ml of *2,7-dihydroxynaphthalene solution* and mix again. Close the flasks with aluminium foil and heat on a water-bath for 20 minutes. Cool and dilute to 25.0 ml with *sulphuric acid*.

Measure the absorbance (2.4.7) of each solution at 540 nm. Prepare a blank using 2.0 ml of a solution containing 5 per cent v/v each of *glacial acetic acid* and *water* in *acetone*. Prepare a standard curve using the absorbances obtained with the reference solutions. From the standard curve and the absorbance of the test solution, determine the mass, in milligrams, of glycollic acid in the substance under examination, and calculate the content of sodium glycollate from the expression:

$$\frac{10 \times 1.29 \times a}{(100 - b)\,m}$$

where, 1.29 = the factor converting glycollic acid to sodium glycollate
b = loss on drying as a percentage
m = mass of the substance under examination, in grams

Water-soluble substances. Not more than 10.0 per cent. Disperse 10.0 g in 800.0 ml of *water* and stir for 1 minute every 10 minutes during the first 30 minutes. Allow to stand for 1 hour and centrifuge, if necessary. Decant 200.0 ml of the supernatant liquid on to a fast filter paper in a vacuum filtration funnel, apply vacuum and collect 150.0 ml of the filtrate. Evaporate to dryness and dry the residue at 100° to 105° for 4 hours.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Settling volume. 10.0 to 30.0 ml. Place 75 ml of *water* in a 100 ml graduated cylinder and add 1.5 g of the substance under examination in 0.5 g portions, shaking vigorously after each addition. Dilute to 100.0 ml with *water* and shake again until the substance is homogeneously distributed. Allow to stand for 4 hours. Note the volume of the settled mass.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^3 CFU per g and total fungal count is not more than 10^2 CFU per g determined by plate count. 1 g is free from *Escherichia coli*.

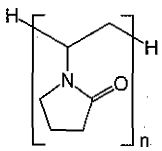
Sulphated ash (2.3.18). 14.0 to 28.0 per cent, calculated on the dried basis.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 1.0 g by drying in an oven at 105° for 6 hours.

Storage. Store protected from moisture.

Crospovidone

1-Ethenyl-2-pyrrolidinone homopolymer; 1-Vinyl-2-pyrrolidinone homopolymer



$(C_6H_9NO)_n$ Mol. Wt. (111.1)$_n$

Crospovidone is a water-insoluble synthetic crosslinked homopolymer of *N*-vinyl-2-pyrrolidinone.

Crospovidone contains not less than 11.0 per cent and not more than 12.8 per cent of nitrogen (N), calculated on the anhydrous basis.

Category. Excipient.

Description. A white to creamy white hygroscopic powder having a faint odour.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6) on specimen previously dried in vacuum at 105° for 1 hour. Compare the spectrum with that obtained with *crospovidone IPRS* or with the reference spectrum of crospovidone.

B. Suspend 1 g in 10 ml of *water*, add 0.1 ml of *0.1 M iodine*, and shake for 30 seconds. Add 1 ml of *starch solution*, and shake; no blue color develops.

Tests

pH (2.4.24). 5.0 to 8.0, determined in a 1.0 per cent w/v aqueous suspension.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Water-soluble substances. Transfer 25.0 g to a 400 ml beaker, add 200 ml of *water*, and stir on a magnetic stirrer, using a 5-cm stirring bar, for 1 hour. Transfer to a 250 ml volumetric flask with the aid of about 25 ml of *water*, add *water* to volume, and mix. Allow the bulk of the solids to settle. Pass about 100 ml of the relatively clear supernatant through a membrane filter having a 0.45 mm porosity, protected against clogging by superimposing a membrane filter. Transfer 50.0 ml of the clear filtrate to a tared 100 ml beaker, evaporate to dryness, and dry at 110° for 3 hours: the weight of the residue does not exceed 75 mg (1.5 per cent).

Impurity A. Determine by liquid chromatography (2.4.14).

Test solution. Shake 1.25 g of the substance under examination in 50.0 ml of *methanol* for 60 minutes and filter.

Reference solution (a). Dissolve 50 mg of *1-vinylpyrrolidin-2-one* in 100.0 ml of the *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *1-vinylpyrrolidin-2-one (crospovidone impurity A IPRS)* and 50 mg of *vinyl acetate* in 10.0 ml of the *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *water*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume: 50 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to crospovidone impurity A and vinyl acetate is not less than 2.0.

Inject reference solution (a) and the test solution. The relative standard deviation for replicate injections is not more than 2.0. In the chromatogram obtained with the test solution, the area of secondary peak due to crospovidone impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

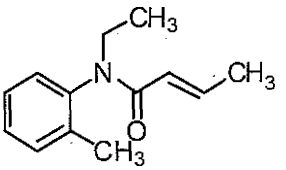
Nitrogen (2.3.30). Place 0.1 g of the substance under examination (*m* mg) in a combustion flask, add 5 g of a mixture of 1 g of *copper sulphate*, 1 g of *titanium dioxide* and 33 g of *dipotassium sulphate*, and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of *water*. Add 7 ml of *sulphuric acid*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of *sulphuric acid*. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulphuric acid in the neck of the flask; precautions are to be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 45 minutes. Cool, dissolve the solid material by cautiously adding to the mixture 20 ml of *water*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution* through the funnel, rinse the funnel cautiously with 10 ml of *water* and distil immediately by passing steam through the mixture. Collect 80-100 ml of distillate in a mixture of 30 ml of a 4.0 per cent w/v solution of *boric acid* and 0.05 ml of *bromocresol green-methyl red solution* and enough *water* to cover the tip of the condenser. Towards the end of the distillation lower the receiver so that the tip of the condenser is above the surface of the acid solution and rinse the end part of the condenser with a small quantity of *water*. Titrate the distillate with *0.025 M sulphuric acid* until the colour of the solution changes from green through pale greyish-blue to pale greyish-red-purple (n_1 ml of *0.025 M sulphuric acid*).

Repeat the test using about 100 mg of *glucose* in place of the substance under examination (n_2 ml of *0.025 M sulphuric acid*).

$$\text{Percent content of nitrogen} = \frac{0.7004(n_1 - n_2)}{m} \times 100$$

Storage. Store protected from moisture.

Crotamiton



$C_{13}H_{17}NO$ Mol. Wt. 203.3

Crotamiton is (*E*)-*N*-Ethyl-*N*-(2-methylphenyl)-2-butenamide.

Crotamiton is the sum of the (E)- and (Z)-isomers contains not less than 96.0 per cent and not more than 102.0 per cent, and (Z)-isomer is not more than 15.0 per cent.

Category. Scabicide and pediculicide.

Description. A colourless or pale yellow, oily liquid.

Identification

Test B may be omitted if tests A, C and D are carried out. Tests A, C and D may be omitted if test B is carried out.

A. When examined in the range 220 nm to 300 nm (2.4.7), a 0.0025 per cent w/v solution in *cyclohexane* shows an absorption maximum at 242 nm and specific absorbance at the absorption maxima is 300 to 330.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *crotamiton IPRS* or with the reference spectrum of crotamiton.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 97 volumes of the solution prepared by mixing 98.0 ml of *dichloromethane* with 2.0 ml of *ammonia*, dry over *anhydrous sodium sulphate* and 3 volumes of *2-propanol*.

Test solution. Dissolve 25 mg of the substance under examination in *ethanol* and dilute to 10 ml with *ethanol*.

Reference solution. A 0.25 per cent w/v solution of *crotamiton IPRS* in *ethanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 10 ml of a saturated solution add a few drops of a 0.3 per cent w/v solution of *potassium permanganate*. A brown colour is obtain and a brown precipitate is formed on standing.

Tests

Relative density (2.4.29). 1.006 to 1.011 at 20°.

Refractive index (2.4.27). 1.540 to 1.542.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *crotamiton IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). A 0.075 per cent w/v solution of *crotamiton impurity A IPRS* (*N-ethyl-N-(2-methylphenyl)but-3-enamide IPRS)* in the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). A 0.015 per cent w/v solution of *crotamiton impurity A IPRS* in the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with test solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with silica (5 µm),
- mobile phase: a mixture of 8 volumes of *tetrahydrofuran* and 92 volumes of *cyclohexane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

The relative retention time with reference to *(E)*-isomer for *(Z)*-isomer is about 0.5 and for crotamiton impurity A is about 0.8.

Injection reference solution (d). The test is not valid unless the resolution between the peaks corresponding to crotamiton impurity A and the *(E)*-isomer is not less than 4.5.

Injection reference solution (b), (c) and test solution (a). Run the chromatograms for 2.5 times the retention time of the *(E)*-isomer. In the chromatogram obtained with test solution (a) the area of any peak corresponding to crotamiton impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (3.0 per cent), the area of any other secondary peak is not more than 0.1 times the sum of the areas of the peaks corresponding to the *(Z)*- and *(E)*- isomers in the chromatogram obtained with reference solution (c) (0.1 per cent), The sum of areas of all the secondary peaks other than crotamiton impurity A is not more than the sum of the areas of the peaks corresponding to the *(Z)*- and *(E)*-isomers in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.02 times the sum of the areas of the peaks corresponding to the *(Z)*- and *(E)*-isomers in the chromatogram obtained with reference solution (c) (0.02 per cent).

Free amines. Dissolve 5.0 g in 16 ml of *dichloromethane* and add 4.0 ml of *glacial acetic acid*. Add 0.1 ml of *metanil yellow solution* and 1.0 ml of *0.02 M perchloric acid*. The solution is red-violet.

Chlorides. Boil 5.0 g under a reflux condenser for 1 hour with 25 ml of *ethanol (95 per cent)* and 5 ml of a 20.0 per cent w/v solution of *sodium hydroxide*. Cool, add 5 ml of *water* and shake with 25 ml of *ether*. Dilute the lower layer to 20 ml with *water*, add 5 ml of *nitric acid*, dilute to 50 ml with *water* and add 1 ml of a freshly prepared 5.0 per cent w/v solution of *silver nitrate*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of a freshly prepared 5.0 per cent w/v solution of *silver nitrate* and a solution

prepared by diluting 5 ml of a 20.0 per cent w/v solution of *sodium hydroxide* to 20 ml with *water* and adding 1.5 ml of *0.01 M hydrochloric acid*, 5 ml of *nitric acid* and diluting to 50 ml with *water* (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances, using the following modification.

Injection reference solution (a) and test solution (b).

Calculate the content of $C_{13}H_{17}NO$ from the sum of the areas of the peaks corresponding to the (*Z*)- and (*E*)-isomers in the chromatograms obtained. Calculate the content of the (*Z*)-isomer, as a percentage of the total content of the (*E*)- and (*Z*)- isomers, from the chromatogram obtained with test solution (b).

Storage. Store protected from light.

Crotamiton Cream

Crotamiton Cream contains Crotamiton in a suitable cream base.

Crotamiton Cream contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of crotamiton, $C_{13}H_{17}NO$.

Usual strength. 10 per cent w/w.

Identification

A. Mix a quantity of the cream containing 0.5 g of Crotamiton with 150 ml of *water* and then slowly add 50 ml of *1 M sodium hydroxide* while stirring vigorously. Filter the mixture, adjusted the filtrate to pH 7 with *5 M hydrochloric acid* and extract with 50 ml of *ether*. Wash the ether layer with 10 ml of a saturated solution of *sodium chloride*, dry the organic layer over *anhydrous sodium sulphate*, filter and evaporate to an oily residue. When examined in the range 220 nm to 350 nm (2.4.7), a 0.003 per cet w/v solution of the residue in *cyclohexane*, shows absorption maximum only at 242 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 97 volumes of the solution prepared by shaking 98 ml of *chloroform* with 2 ml of *18 M ammonia*, dry over *anhydrous sodium sulphate* and 3 volumes of *2-propanol*.

Test solution. A 0.25 per cent w/v of the residue obtained in test A with *ethanol*.

Reference solution (a). A 0.25 per cent w/v of *crotamiton IPRS* in *ethanol*.

Reference solution (b). A mixture of equal volumes of the test solution and reference soluton (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise the plate to 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a), but if not, the principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

C. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the principal peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay, using following modification.

Inject reference solution (b), (c) , (e) and the test solution (a). Run the chromatogram 2.5 the retention time of the principal peak for test solution (a), the area of any peak corresponding to crotamiton impurity A is not more than the area of corresponding peak in the chromatogram obtained with reference solution (b) (3 per cent), the sum of the areas of all the secondary peaks other than the peaks corresponding to the *Z*-isomer and to crotamiton impurity A is not more than the sum of the areas of the peaks corresponding to the *E*- and *Z*-isomers in the chromatogram obtained with reference solution (c) (1.0 per cent). Ignore any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.02 per cent) and any peak with the same retention time as the principal peak in the chromatogram obtained with reference solution (e).

***Z*-Isomer**. Not more than 15 per cent of the total content of *E*- and *Z*-isomers determined in the Assay.

Other tests. Comply with the tests stated under Cream.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Add 2 ml of *water* and 100 ml of *cyclohexane* to a quantity of the preparation under examination containing 0.1 g of Crotamiton, shake for 10 minutes and separate the lower, aqueous layer. Repeat the extraction using two 10-ml quantities of *cyclohexane*, filter the combined extracts and add sufficient *cyclohexane* to obtain 200.0 ml.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with *cyclohexane*.

Reference solution (a). A 0.0025 per cent w/v solution of *crotamiton IPRS* in *cyclohexane*.

Reference solution (b). A 0.0015 per cent w/v solution of *crotamiton impurity A IPRS (N-ethyl-N-(2-methylphenyl)but-3-enamide IPRS)* in *cyclohexane*.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with *cyclohexane.*

Reference solution (d). Dilute 1.0 ml of 0.015 per cent w/v solution of *crotamiton impurity A IPRS* to 10.0 ml with test solution (a).

Reference solution (e). A 0.001 per cent w/v solution of *methyl hydroxybenzoate* in *cyclohexane.*

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with silica gel (5 µm) (Such as Lichrosorb Si60),
- mobile phase: a mixture of 8 volumes of *tetrahydrofuran* and 92 volumes of *cyclohexane,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

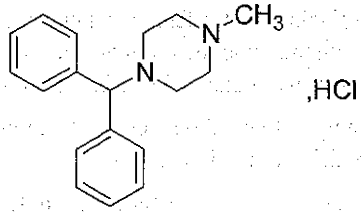
The relative retention time with reference to E-crotamiton for (*Z*)-isomer is about 0.5 and for crotamiton impurity A is about 0.8.

Inject reference solution (d). The test is not valid unless the resolution between the peaks corresponding to the (*E*)-isomer and crotamiton impurity A is not less than 4.5.

Inject reference solution (a), (b) and test solution (b).

Calculate the content of $C_{13}H_{17}NO$ by summing E and Z-isomers.

Cyclizine Hydrochloride



$C_{18}H_{22}N_2$, HCl Mol. Wt. 302.8

Cyclizine Hydrochloride is 1-(diphenylmethyl)-4-methylpiperazine hydrochloride.

Cyclizine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{18}H_{22}N_2$,HCl, calculated on the dried basis.

Category. Antiemetic.

Description. A white, crystalline powder.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclizine hydrochloride IPRS* or with the reference spectrum of cyclizine hydrochloride.

B. When examined in the range 220 nm to 360 nm, a freshly prepared 0.002 per cent w/v solution in *0.05 M sulphuric acid* shows absorption maximum only at about 225 nm, about 0.78 (2.4.7).

C. Dissolve 0.5 g in 10 ml of *ethanol (95 per cent),* warming if necessary, cool in ice, add 1 ml of *5 M sodium hydroxide* and sufficient *water* to produce 20 ml. Stir well and filter; the precipitate, after washing with *water* and drying at 60° at a pressure not exceeding 0.7 kPa for 2 hours, melts at about 107° (2.4.21).

D. Gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by gas chromatography (2.4.13).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 0.25 g of the substance under examination in 4.0 ml of *methanol* and dilute to 5.0 ml with *1 M sodium hydroxide.*

Reference solution (a). A 0.005 per cent w/v solution of *cyclizine hydrochloride IPRS* in *methanol.*

Reference solution (b). A solution containing 0.025 per cent w/v each of the substance under examination, *cyclizine impurity A IPRS* and *cyclizine impurity B IPRS* in *methanol.*

Chromatographic system

- a fused silica column 25 m x 0.33 mm, packed with poly(dimethyl)(diphenyl)siloxane (film thickness 0.5 µm),
- temperature:

column	time (min.)	temperature (°)
	0-14	100→240
	14-16	240→270
	16-30	270

- inlet port at 250 and detector at 290°,
- split ratio. 1:25,
- flame ionization detector,
- flow rate: 1 ml per minute using nitrogen as the carrier gas.

Name	Relative retention time
Cyclizine impurity A[1]	0.2
Cyclizine impurity B[2]	0.7
Cyclizine (Retention time: about 15 minutes)	1.0

[1]1-methylpiperazine,

[2]diphenylmethanol.

Inject 1 µl of reference solution (b). The test is not valid unless peak-to-valley ratio is not less than 50, where H_p is the height above the baseline of the peak due to cyclizine impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to methanol.

Inject 1 µl of reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to cyclizine impurities A and B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 130°.

Assay. Weigh 0.1 g, dissolve in 20 ml of *anhydrous glacial acetic acid* and add 50 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01514 g of $C_{18}H_{22}N_2,HCl$.

Storage. Store protected from light.

Cyclizine Tablets

Cyclizine Hydrochloride Tablets

Cyclizine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of cyclizine hydrochloride, $C_{18}H_{22}N_2,HCl$.

Usual strength. 50 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.1 g of Cyclizine Hydrochloride with 10 ml of *ethanol (95 per cent)*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclizine hydrochloride IPRS* or with the reference spectrum of cyclizine hydrochloride.

B. Extract a quantity of the powdered tablets containing 0.5 g of Cyclizine Hydrochloride with 20 ml of *water* and filter. The filtrate gives reaction A of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted with 1 per cent v/v of *sulphuric acid*, at the maximum at about 264 nm. (2.4.7). Calculate the content of $C_{18}H_{22}N_2,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *cyclizine hydrochloride IPRS* in 1 per cent v/v of *sulphuric acid*.

Q. Not less than 75 per cent of the stated amount of $C_{18}H_{22}N_2,HCl$.

***N*-Methylpiperazine.** Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 8 volumes of *methanol and* 2 volumes of *strong ammonia solution*.

NOTE — Prepare the following solutions freshly.

Test solution. Triturate a quantity of the powdered tablets containing 0.1 g of Cyclizine Hydrochloride with 10 ml of *methanol* and filter.

Reference solution. A 0.005 per cent w/v solution of *N-methylpiperazine IPRS* in *methanol*.

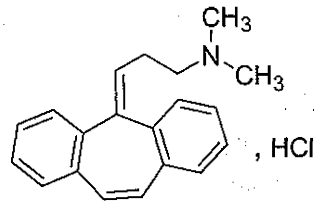
Apply to the plate 20 µl of each solution. After development, dry the plate in air and expose to iodine vapours for 10 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.125 g of Cyclizine Hydrochloride and shake with 400 ml of *0.05 M sulphuric acid* for 15 minutes. Add sufficient *0.05 M sulphuric acid* to produce 500.0 ml and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with *0.05 M sulphuric acid* and measure the absorbance of the resulting solution at the maximum at about 225 nm (2.4.7). Calculate the content of $C_{18}H_{22}N_2,HCl$ taking 390 as the specific absorbance at 225 nm.

Storage. Store protected from light.

Cyclobenzaprine Hydrochloride



$C_{20}H_{21}N,HCl$ Mol Wt. 311.9

Cyclobenzaprine Hydrochloride is1-propanamine,3-(5*H*-dibenzo[a,d]cyclohepten-5-ylidene)-*N*,*N*-dimethyl-hydrochloride; *N*,*N*-Dimethyl-5*H*-dibenzo[a,d]cycloheptene-δ^5,γ-propylamine hydrochloride.

Cyclobenzaprine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{21}N,HCl$ calculated on the dried basis.

Category. Muscle relaxant.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *cyclobenzaprine hydrochloride IPRS* or with the reference spectrum of cyclobenzaprine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. It gives a reaction (a) of chloride (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substances under examination in 100.0 ml of the mobile phase.

Reference solution. A solution containing 0.04 per cent w/v solution of *cyclobenzaprine hydrochloride IPRS* and each of 0.00006 per cent *cyclobenzaprine related compound A IPRS* and *cyclobenzaprine related compound B IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octaylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 4.0 g of *ammonium acetate* in 350 ml of *water*. Add 650 ml of *methanol* and adjusted to pH 7.2 with *dilute ammonia solution* or *dilute acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Cyclobenzaprine related compound A	0.51	1.51
Cyclobenzaprine related compound B	0.59	1.0
Cyclobenzaprine N-oxide[1]	0.74	1.08
Cyclobenzaprine	1.0	—
Amitryptyline[2]	1.3	2.78
Dibenzocycloheptenone[3]	1.6	1.56

[1]3-(5*H*-Dibenzo[a,d]cyclohepten-5-ylidene)-*N*,*N*-dimethyl-1-propanamine *N*-oxide,

[2]10,11-Dihydro-*N*,*N*-dimethyl-5*H*-dibenzo[a,d]cycloheptene-δ^5,γ-propylamine,

[3]Dibenzo[a,d]cyclohepten-5-one.

Inject the reference solution. Run the chromatogram 3 times of the principal peak. The test is not valid unless the resolution between the cyclobenzaprine related compound A and cyclobenzaprine related compound B is not less than 2.0. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution. The area of peak due to cyclobenzaprine related compound A, the area of peak due of cyclobenzaprine related compound B, the area of peak due to cyclobenzaprine N-oxide, the area of peak due to cyclobenzaprine, the area of peak due to amitryptyline and the area of peak due to dibenzocycloheptenone is not more than (0.15 per cent), the area of any other impurity is not more than (0.1 per cent) and sum of area of all the secondary peak is not more than (1.0 per cent), calculated by area normalization.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substances under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *cyclobenzaprine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of a buffer solution prepared by dissolving 2.0 g of *ammonium acetate* in 1000 ml of *water* and

adjusted to pH 8.9 with 25 per cent w/v solution of *ammonium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 per cent and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}N,HCl$.

Storage. Store protected from moisture.

Cyclobenzaprine Tablets

Cyclobenzaprine Hydrochloride Tablets

Cyclobenzaprine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyclobenzaprine hydrochloride, $C_{20}H_{21}N,HCl$.

Usual strengths. 5 mg, 10 mg.

Identification

A. Dissolve a quantity of the powdered tablet containing 50 mg of cyclobenzaprine hydrochloride from a quantity of finely powdered tablets, to a small flask. Add 10 ml of *methylene chloride*, swirl to dissolve, and filter. Evaporate the clear filtrate to about 5 ml, transfer to a centrifuge tube, and add 1 to 2 ml of *ether*. Evaporate about 1 ml of *ether* and agitate until crystallization occurs. Wash the crystals with several portions of *ether*, and dry in air. On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclobenzaprine hydrochloride IPRS* or with the reference spectrum of cyclobenzaprine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution

Tests

Dissolution (2.5.2).
Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance (2.4.7) of the filtrate, suitably diluted, if necessary with dissolution medium at 290 nm. Calculate the content of cyclobenzaprine hydrochloride, in the medium from the absorbance obtained from a solution of known concentration of *cyclobenzaprine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{21}N,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 40 mg of cyclobenzaprine hydrochloride in 100-ml volumetric flask. Add mobile phase and sonicate for 30 minutes. Allow the solution to cool to room temperature, and then dilute with mobile phase to volume. Centrifuge the solution, and use the supernatant.

Reference solution. A 0.00006 per cent w/v solution of *cyclobenzaprine hydrochloride IPRS*, *cyclobenzaprine related compound A IPRS* and *cyclobenzaprine related compound B IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture 65 volumes of *methanol* and 35 volumes of a buffer solution prepared by dissolving 11.4 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 7.2 with *dilute ammonium solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Name	Relative retention time
Cyclobenzaprine related compound A[1]	0.51
Cyclobenzaprine related compound B[1]	0.59
Cyclobenzaprine *N*-oxide[2]	0.74
Cyclobenzaprine	1.0
Amitriptyline[1,3]	1.3
Dibenzocycloheptenone[4]	1.6

[1]Process impurity include for identification only and not included in the calculation of total degradation products,

[2]3-(5*H*-dibenzo[a,d]cyclohepten-5-ylidene)-*N*,*N*-dimethyl-1-propanamine *N*-oxide,

[3]10,11-Dihydro-*N*,*N*,-dimethyl-5*H*-dibenzo[a,d]cycloheptene-propylamine,

[4]Dibenzo[*a*,*d*]cyclohepten-5-one.

Inject the reference solution. Run the chromatogram 3 times of principle peak. The test is not valid unless the resolution between the cyclobenzaprine related compound A and cyclobenzaprine related compound B is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to impurity cyclobenzaprine N-oxide is

not more than the area of corresponding peak obtained with the reference solution (0.15 per cent), in the chromatogram obtained with the test solution the area of any peak corresponding to impurity dibenzocycloheptenone is not more than the area of corresponding peak obtained with the reference solution (0.15 per cent), the area of any other impurity is not more than 0.66 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the area of total impurity is not more than 13.33 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. To one tablet add 20 ml of the mobile phase, disperse with the aid of ultrasound for 10 minutes, dilute, if necessary, with sufficient of the mobile phase to produce a solution containing 0.02 per cent of cyclobenzaprine hydrochloride and filter.

Calculate the content of $C_{20}H_{21}N,HCl$ in the Tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Cyclobenzaprine Hydrochloride in 100.0 ml volumetric flask. Add mobile phase and sonicate for 30 minutes. Allow the solution to cool to room temperature, and then dilute with mobile phase to volume. Centrifuge the solution, and use the supernatant.

Reference solution. A 0.02 per cent w/v solution of *cyclobenzaprine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of a buffer solution prepared by dissolving 11.4 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 7.2 with *ammonium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 226 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 per cent and the relative standard deviation for replicate injections is not more than 0.85 per cent.

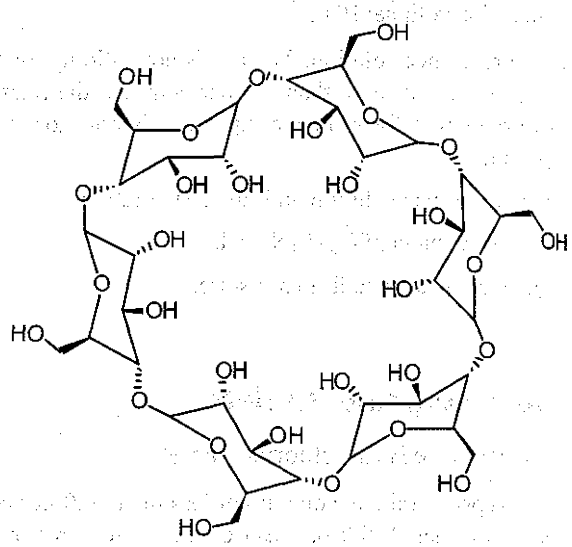
Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{21}N,HCl$ in tablets.

Storage. Store protected from moisture.

Alfa-Cyclodextrin

α-cyclodextrin; Alfadex



$C_{36}H_{60}O_{30}$ Mol. Wt. 972.8

Alfa-Cyclodextrin is six alpha-(1-4) linked glucopyranosyl units.

Alfa-Cyclodextrin contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_6H_{10}O_5)_6$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white, or almost white, amorphous or crystalline powder.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *alfa-cyclodextrin IPRS* or with the reference spectrum of alfa-cyclodextrin.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

C. Mix 0.2 g with 2 ml of *iodine solution*, warm in a water-bath to dissolve and allow to stand at room temperature; a yellow-brown precipitate is formed.

D. Specific optical rotation (see Tests).

Tests

Specific optical rotation (2.4.22). +147° to +152°, determined in 1.0 per cent w/v solution at 20°.

pH (2.4.24). 5.0 to 8.0, determined on a mixture of 30 ml of 1.0 per cent w/v of alfa-cyclodextrin and 1 ml of 22.4 per cent w/v of *potassium chloride*.

Reducing sugars

Test solution. To 1 ml of 1.0 per cent w/v solution, add 1 ml of *cupri-tartaric solution.* Heat on a water-bath for 10 minutes, cool to room temperature. Add 10 ml of *ammonium molybdate reagent* and allow to stand for 15 minutes.

Reference solution. To 1 ml of a 0.002 per cent w/v solution of *glucose*, add 1 ml of *cupri-tartaric solution.* Heat on a water-bath for 10 minutes, cool to room temperature. Add 10 ml of *ammonium molybdate reagent* and allow to stand for 15 minutes.

Measure the absorbance at the maximum at 740 nm (2.4.7) using *water* as blank. The absorbance of the test solution is not more than that of the reference solution (0.2 per cent).

Light-absorbing impurities. When a 1.0 per cent w/v solution examined in the range 230 nm to 350 nm (2.4.7), the absorbance is not more than 0.1 and in the range 350 nm to 750 nm (2.4.7), the absorbance is not more than 0.05.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay with the following modifications.

Inject reference solution (b) and test solution (a). Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any peak corresponding to betadex or gamma-cyclodextrin is not more than 0.5 times the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of areas of all the secondary peaks other than the peaks corresponding to betadex or gamma-cyclodextrin, is not more than 0.5 times the area of the peak corresponding to alfadex in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 11.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 0.25 g of the substance under examination in *water* with heating, cool and dilute to 25.0 ml with *water.*

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with *water.*

Reference solution (a). A solution containing 0.05 per cent w/v, each of, *beta-cyclodextrin IPRS*, *gamma-cyclodextrin IPRS* and 0.1 per cent w/v of *alfa-cyclodextrin IPRS* in *water.*

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water.*

Reference solution (c). A 0.1 per cent w/v solution of *alfa-cyclodextrin IPRS* in *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 10 volumes of *methanol* and 90 volumes of *water*,
- flow rate: 1.5 ml per minute,
- a differential refractometer,
- injection volume: 50 µl.

Equilibrate the column atleast for about 3 hours.

Name	Relative retention time
Gamma-cyclodextrin	0.7
Alfa-cyclodextrin (retention time: about 10 minutes)	1.0
Beta-cyclodextrin	2.2

Inject reference solution (a). Run the chromatograms for 3.5 times the retention time of the principal peak. The test is not valid unless the resolution between the peaks corresponding to gamma-cyclodextrin and alfadex is not less than 1.5 and the relative standard deviation for replicate injections due to alfa-cyclodextrin is not more than 2.0 per cent.

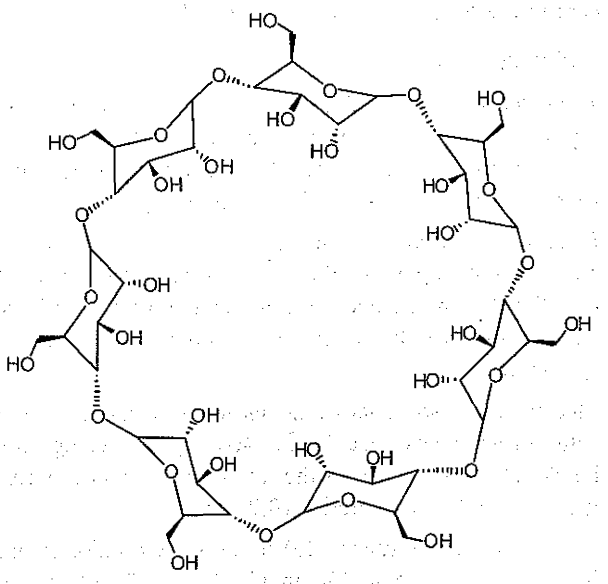
Inject reference solution (c) and test solution (b).

Calculate the content of $(C_6H_{10}O_5)_6$.

Storage. Store protected from moisture.

Beta-Cyclodextrin

β-cyclodextrin; Betadex



$C_{42}H_{70}O_{35}$ Mol. Wt. 1135.0

Beta-cyclodextrin is composed of seven alpha-(1-4) linked D-glucopyranosyl units.

Beta-cyclodextrin contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_6H_{10}O_5)_7$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Description. A white or almost white, amorphous or crystalline powder.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *beta-cyclodextrin IPRS* or with the reference spectrum of beta-cyclodextrin.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

C. Mix 0.2 g with 2 ml of *iodine solution*, warm in a water-bath to dissolve and allow to stand at room temperature; a yellow-brown precipitate is formed.

D. Specific optical rotation (see Tests).

Tests

Specific optical rotation (2.4.22). +160.0° to +164.0°, determined in a 1.0 per cent w/v solution at 20°.

pH (2.4.24). 5.0 to 8.0, determined in a mixture of 30 ml of 1.0 per cent w/v solution of beta-cyclodextrin and 1 ml of 22.36 per cent w/v solution of *potassium chloride*.

Reducing sugars

Test solution. To 1 ml of 1.0 per cent w/v solution, add 1 ml of *cupri-tartaric solution*. Heat on a water-bath for 10 minutes, cool to room temperature. Add 10 ml of *ammonium molybdate reagent* and allow to stand for 15 minutes.

Reference solution. To 1 ml of a 0.002 per cent w/v solution of *glucose*, add 1 ml of *cupri-tartaric solution*. Heat on a water-bath for 10 minutes, cool to room temperature. Add 10 ml of *ammonium molybdate reagent* and allow to stand for 15 minutes.

Measure the absorbance of the test solution and the reference solution at the maxima at about 740 nm (2.4.7) using *water* as blank. The absorbance of the test solution is not more than that of the reference solution (0.2 per cent).

Light absorption. When a 1.0 per cent w/v solution examined in the range 230 nm to 350 nm (2.4.7), the absorbance is not more than 0.1 and in the range 350 nm to 750 nm, the absorbance is not more than 0.05.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject reference solution (b) and test solution (a). Run the chromatogram 1.5 times the retention time of peak due to beta-cyclodextrin. In the chromatogram obtained with test solution (a), the areas of any peaks corresponding to gamma-cyclodextrin and alfa-cyclodextrin are not more than 0.5 times the area of the corresponding peaks in the chromatogram obtained with reference solution (b) (0.25 per cent) and the sum of areas of all other secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 14.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 0.25 g of the substance under examination in *water* with heating, cool and dilute to 25.0 ml with *water*.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with *water*.

Reference solution (a). A solution containing 0.05 per cent w/v, each of *alfa-cyclodextrin IPRS* and *gamma-cyclodextrin IPRS* and 0.1 per cent w/v of *beta-cyclodextrin IPRS* in *water*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water*.

Reference solution (c). A 0.1 per cent w/v solution of *beta-cyclodextrin IPRS* in *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 10 volumes of *methanol* and 90 volumes of *water*,
- flow rate: 1.5 ml per minute,
- a differential refractometer,
- injection volume: 50 µl.

Equilibrate the column for about 3 hours.

Name	Relative retention time
Gamma-cyclodextrin	0.3
Alfa-cyclodextrin	0.45
Beta-cyclodextrin	1.0

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to gammacyclodextrin and

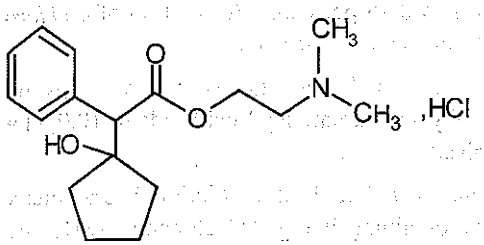
alfadex is not less than 1.5 and the relative standard deviation for replicate injections for beta-cyclodextrin is not more than 2.0 per cent.

Inject reference solution (c) and test solution (b).

Calculate the content of $(C_6H_{10}O_5)_7$.

Storage. Store protected from moisture.

Cyclopentolate Hydrochloride



$C_{17}H_{25}NO_3,HCl$ Mol. Wt.327.8

Cyclopentolate Hydrochloride is 2-(dimethylamino)ethyl α-(1-hydroxycyclopentyl)(phenyl)acetate hydrochloride.

Cyclopentolate Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{17}H_{25}NO_3,HCl$, calculated on the dried basis.

Category. Anticholinergic.

Description. A white or almost white, crystalline powder. It shows polymorphism (2.5.11).

Identification

Test B may be omitted if tests A and C are carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclopentolate hydrochloride IPRS* or with the reference spectrum of cyclopentolate hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *ammonia*, 15 volumes of *water*, 30 volumes of *butyl acetate* and 50 volumes of *2-propanol*.

Test solution. Dissolve 10 mg of the substance under examination in 5 ml of *ethanol (95 per cent)*.

Reference solution. A 0.2 per cent w/v solution of *cyclopentolate hydrochloride IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with alcoholic solution of *sulphuric acid* and heat at 120° for 30 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v solution in *carbon dioxide free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use.

Test solution. Dissolve 20 mg of the substance under examination in *water* and dilute to 20.0 ml with *water*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with endcapped hexylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of a solution prepared by dissolving 0.66 g of *ammonium phosphate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 45 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Cyclopentolate impurity C[1]	0.9	2.0
Cyclopentolate (Retention time: about 4 minutes)	1.0	—

[1]2-(dimethylamino) ethyl phenylacetate.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to cyclopentolate impurity C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal

peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Dissolve 0.25 g in a mixture of 1.0 ml of *0.1 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (2.4.25). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03279 g of $C_{17}H_{26}ClNO_3$.

Cyclopentolate Eye Drops

Cyclopentolate Hydrochloride Eye Drops

Cyclopentolate Eye Drops are a sterile solution of Cyclopentolate Hydrochloride in Purified Water.

Cyclopentolate Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyclopentolate hydrochloride $C_{17}H_{25}NO_3$,HCl.

Usual strength. 1 per cent w/v.

Identification

Add *2 M ammonia* to a volume of the eye drops containing 25 mg of Cyclopentolate Hydrochloride until alkaline and extract immediately with 50 ml of *ether*. Wash the extract with 5 ml of *water*, filter through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. On the oily residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclopentolate hydrochloride IPRS* treated in the same manner or with the reference spectrum of cyclopentolate.

Tests

pH (2.4.24). 3.0 to 5.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *13.5 M ammonia*, 15 volumes of *water*, 30 volumes of *butyl acetate* and 50 volumes of *propan-2-ol*.

Test solution. Dilute a volume of eye drops to obtain a solution containing 0.5 per cent w/v of Cyclopentolate Hydrochloride in *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *water*.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with *water*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate at 120° for 5 minutes, spray with *ethanolic sulphuric acid (10 per cent)*, heat at 120° for 30 minutes and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. A 0.25 per cent w/v solution of *4-chlorophenol* (internal standard) in *methanol*.

Test solution (a). Dilute a volume of the eye drops containing 20 mg of Cyclopentolate Hydrochloride to 10.0 ml with the mobile phase.

Test solution (b). Add 4 ml of solution A to a volume of the eye drops containing 20 mg of Cyclopentolate Hydrochloride and dilute to 10.0 ml with the mobile phase.

Reference solution. Add 4 ml of solution A to 4 ml of a 0.5 per cent w/v solution of *cyclopentolate hydrochloride IPRS* in *water* and dilute to 10.0 ml with the mobile phase.

Chromatographic system

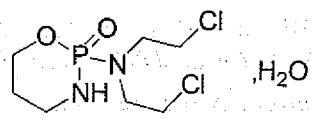
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 45 volumes of *0.2 M sodium dihydrogen orthophosphate* and 55 volumes of *methanol*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to cyclopentolate hydrochloride and the internal standard is not less than 4.0.

Inject the reference solution, test solution (a) and (b).

Calculate the content of $C_{17}H_{25}NO_3$, HCl in the eye drops.

Cyclophosphamide



$,H_2O$

$C_7H_{15}Cl_2N_2O_2P,H_2O$ Mol. Wt. 279.1

Cyclophosphamide is (*RS*)-2-bis(2-chloro-ethyl) amino-perhydro-1,3,2-oxazaphosphorinane 2-oxide monohydrate.

Cyclophosphamide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_7H_{15}Cl_2N_2O_2P$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclophosphamide IPRS* or with the reference spectrum of cyclophosphamide.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 0.1 g in 10 ml of *water* and add 5 ml of *silver nitrate solution*; no precipitate is produced. Boil; a white precipitate is produced which is insoluble in *dilute nitric acid* but is soluble in *dilute ammonia solution* from which it can be reprecipitated by the addition of *dilute nitric acid*.

D. Dissolve 0.1 g in 3 ml of *nitric acid* and 1 ml of *sulphuric acid*, heat till brown fumes are evolved and the solution becomes colourless. Cool, add 10 ml of *water*, heat again up to 60° and add 10 ml of *ammonium molybdate solution*; a bright yellow precipitate is slowly formed.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 4.0 to 6.0, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *2-butanone*, 12 volumes of *water*, 4 volumes of *acetone* and 2 volumes of *anhydrous formic acid*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Test solution (b). Dilute 5 ml of test solution (a) to 50.0 ml with *ethanol (95 per cent)*.

Reference solution (a). Dilute 5 ml of test solution (b) to 50.0 ml with *ethanol (95 per cent)*.

Reference solution (b). A 0.2 per cent w/v solution of *cyclophosphamide IPRS* in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and heat at 110° for 10 minutes. Place the plate while hot in a tank in which is placed a dish containing equal volumes of a 5 per cent w/v solution of *potassium permanganate* and *hydrochloric acid*, close the tank and allow to stand for 2 minutes. Remove the plate and place it in a current of cold air until excess chlorine is removed and an area of coating below the line of application gives not more than a faint blue colour with *potassium iodide* and *starch solution*; do not expose long to cold air. Spray the plate with potassium iodide and starch solution and allow to stand for 5 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). 1.0 g dissolved in 2 ml of *dilute acetic acid* and diluted to 25 ml with *water* complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). A freshly prepared solution of 0.75 g in sufficient *water* to produce 25 ml complies with the limit test for chlorides (330 ppm).

Water (2.3.43). 5.8 to 7.0 per cent, determined on 0.3 g.

Assay. Weigh 0.1 g and dissolve in 50 ml of a 0.1 per cent w/v solution of *sodium hydroxide* in *ethylene glycol*; boil under a reflux condenser for 30 minutes and allow to cool. Rinse the condenser with 25 ml of *water*, add 75 ml of *2-propanol*, 15 ml of *2 M nitric acid*, 10.0 ml of *0.1 M silver nitrate* and 2 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate*. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.01305 g of $C_7H_{15}Cl_2N_2O_2P$.

Cyclophosphamide Phosphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

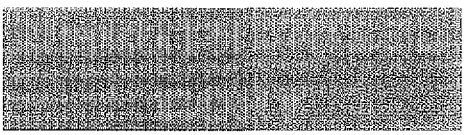
Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of cyclophosphamide.

Cyclophosphamide Phosphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterlity. Complies with the test for sterility (2.2.11).

Storage. Store at a temperature not exceeding 30°. Avoid long exposure to temperatures above 30°.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.



Cyclophosphamide Injection

Cyclophosphamide Injection is a sterile material consisting of Cyclophosphamide with or without auxiliary substances. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cyclophosphamide Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of cyclophosphamide, $C_7H_{15}Cl_2N_2O_2P$.

Usual strengths. 100 mg; 200 mg; 500 mg; 1 g.

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Shake a quantity containing 0.2 g of anhydrous cyclophosphamide with 2 ml of *chloroform* and filter. The solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclophosphamide IPRS* or with the reference spectrum of cyclophosphamide.

B. Extract a quantity containing 0.2 g of anhydrous cyclophosphamide with *ether* and evaporate the extract to dryness. Reserve a portion of the residue for identification test C. Dissolve 0.1 g in 10 ml of *water* and add 5 ml of *silver nitrate solution*; no precipitate is produced. Boil; a white precipitate is produced which is insoluble in *dilute nitric acid* but is soluble in *dilute ammonia solution* from which it can be reprecipitated by the addition of *dilute nitric acid*.

C. Dissolve 0.1 g of the residue from test B in 3 ml of *nitric acid* and 1 ml of *sulphuric acid*, heat till brown fumes are evolved and the solution becomes colourless. Cool, add 10 ml of *water*, heat again up to 60° and add 10 ml of *ammonium molybdate solution*; a bright yellow precipitate is slowly formed.

Tests

pH (2.4.24). 3.0 to 6.0, determined in a 2.0 per cent w/v solution immediately after preparation.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *2-butanone*, 12 volumes of *water*, 4 volumes of *acetone* and 2 volumes of *anhydrous formic acid*.

Test solution. Dissolve a quantity of the contents of the sealed container containing 0.2 g of anhydrous cyclophosphamide in sufficient *ethanol (95 per cent)* to produce 10 ml and filter.

Reference solution. Dilute 1 volume of solution (1) to 100 volumes with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and heat at 110° for 10 minutes. Place the plate while hot in a tank in which is placed a dish containing equal volumes of a 5 per cent w/v solution of *potassium permanganate* and *hydrochloric acid*, close the tank and allow to stand for 2 minutes. Remove the plate and place it in a current of cold air until excess chlorine is removed and an area of coating below the line of application gives not more than a faint blue colour with *potassium iodide* and *starch solution*; do not expose long to cold air. Spray the plate with *potassium iodide* and *starch solution* and allow to stand for 5 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any spot remaining on the line of application.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of cyclophosphamide.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Determine the weight of the content of 10 containers. Weigh accurately a suitable quantity of the mixed contents of the 10 containers containing about 50 mg of Cyclophosphamide, dissolve in *water* and dilute to 100.0 ml with *water*.

Reference solution (a). A 0.05 per cent w/v solution of *cyclophosphamide IPRS* in *water*.

Reference solution (b). Dissolve 25 mg of *cyclophosphamide IPRS* in 25 ml of *water*, add 5.0 ml of ethylparaben solution prepared by dissolving 185 mg of ethylparaben in 250 ml of *ethanol (95 per cent)* and dilute to 1000 ml with *water*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 195 nm,
- injection volume: 25 µl.

The relative retention time with reference to ethylparaben for cyclophosphamide is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between cyclophosphamide and ethylparaben is not less than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the injection.

Storage. Store at a temperature not exceeding 30°. Avoid long exposure to temperatures above 30°. The solution should be used immediately after preparation as it deteriorates on storage.

Labelling. The label states (1) the quantity of Cyclophosphamide in terms of the equivalent amount of anhydrous cyclophosphamide; (2) the volume of Water for Injections to be added; (3) that the solution should be used immediately after preparation.

Cyclophosphamide Tablets

Cyclophosphamide Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of anhydrous cyclophosphamide, $C_7H_{15}Cl_2N_2O_2P$. The tablets are coated.

Usual strengths. 10 mg; 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.2 g of anhydrous cyclophosphamide with 2 ml of *chloroform* and filter. The resulting solution complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyclophosphamide IPRS* or with the reference spectrum of cyclophosphamide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A 0.001 per cent w/v solution of *cyclophosphamide IPRS* in the dissolution medium.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 70 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 195 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_7H_{15}Cl_2N_2O_2P$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one intact tablet in 30 ml of *water* with the aid of ultrasound for 15 minutes with intermittent shaking, dilute to 50.0 ml with *water* and filter. Further, dilute quantitatively with *water* to obtain a solution of about the same concentration as the reference solution.

Reference solution (a). A 0.02 per cent w/v solution of *cyclophosphamide IPRS* in *water*.

Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of Cyclophosphamide in *water*, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 100.0 ml with *water* and filter.

Reference solution (a). A 0.05 per cent w/v solution of *cyclophosphamide IPRS* in *water*.

Reference solution (b). Dissolve 18.5 mg of *ethylparaben* in 25 ml of *ethanol* and dilute to 100.0 ml with *water*.

Reference solution (c). Dissolve 25 mg of *cyclophosphamide IPRS* in 25 ml of *water*, add 5.0 ml of reference solution (b) and dilute to 50.0 with *water*.

Use the chromatographic system as described under Dissolution with the following modification
- injection volume: 25 µl.

Inject reference solution (a) and (c). The test is not valid unless resolution between the peaks due to cyclophosphamide and ethylparaben is not less than 2.0 in the chromatogram obtain with reference solution (c) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtain with reference solution (a).

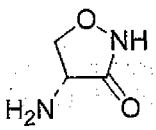
Inject reference solution (a) and the test solution.

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of anhydrous cyclophosphamide.

Cycloserine



$C_3H_6N_2O_2$ Mol. Wt. 102.1

Cycloserine is (*R*)-4-aminoisoxazolidin-3-one, an antimicrobial substance produced by the growth of certain strains of *Streptomyces orchidaceous* or *S. garyphalus* or obtained by synthesis.

Cycloserine contains not less than 98.0 per cent and not more than 100.5 per cent of $C_3H_6N_2O_2$, calculated on the dried basis.

Category. Antibacterial.

Description. A white or pale yellow, crystalline powder; hygroscopic.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. To 1 ml of a 0.01 per cent w/v solution in *0.1 M sodium hydroxide* add 3 ml of *1 M acetic acid* and 1 ml of a freshly prepared mixture of equal volumes of a 4 per cent w/v solution of *sodium nitroprusside* and *5 M sodium hydroxide*; a blue colour is produced slowly.

Tests

pH (2.4.24). 5.5 to 6.5, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +108° to +114°, determined in a 5.0 per cent w/v solution in *2 M sodium hydroxide*.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Condensation products. Absorbance of a 0.04 per cent w/v solution in *0.1 M sodium hydroxide* at about 285 nm, not more than 0.32 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve about 10 mg of the substance under examination in 20.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 10 mg of the *cycloserine IPRS* in 20.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Wakosil C8 RS),
- mobile phase: 0.1 per cent w/v of *methane sulphonic acid* and 0.78 per cent w/v of *sodium dihydrogen orthophosphate* in *water*, adjusted to pH 6.0 with *dilute sodium hydroxide* and filtered,
- flow rate: 1 ml per minute,
- spectrophotometer set at 227 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_6N_2O_2$.

Storage. Store protected from moisture

Cycloserine Capsules

Cycloserine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cycloserine, $C_3H_6N_2O_2$.

Usual strength. 250 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 10 mg of Cycloserine with 100 ml of *0.1 M sodium hydroxide* and filter. To 1 ml of the filtrate add 3 ml of *1 M acetic acid* and 1 ml of a freshly prepared mixture of equal volumes of a 4 per cent w/v solution of *sodium nitroprusside* and *5 M sodium hydroxide*; a blue colour is produced slowly.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate diluted to produce a 0.028 per cent w/v solution.

Reference solution. A 0.028 per cent w/v solution of *cycloserine IPRS* in the dissolution medium.

Use the chromatographic system described under Assay.

Calculate the content of $C_3H_6N_2O_2$.

Q. Not less than 80 per cent of the stated amount of $C_3H_6N_2O_2$.

Condensation products. Weigh the contents of the capsules containing about 0.5 g of Cycloserine, dissolve in 250 ml of *0.1 M sodium hydroxide* solution, disperse with the aid of ultrasound for 5 minutes. Dilute 5 ml of the solution to 25 ml with *0.1 M sodium hydroxide*. Absorbance of the resulting solution at about 285 nm, not more than 0.32 (2.4.7).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g of the contents of the capsules, by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Weigh accurately a quantity of the mixed contents of the capsules containing about 250.0 mg of Cycloserine dissolve in *phosphate buffer pH 6.8,* dilute to 250.0 ml with the same solvent and filter. Dilute 5.0 ml of the filtrate to 25.0 ml with *phosphate buffer pH 6.8.*

Reference solution. A 0.02 per cent w/v solution of *cycloserine IPRS* in *phosphate buffer pH 6.8.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Warkosil C8 RS),
- mobile phase: dissolve 1.0 g of *methane sulphonic acid* and 7.8 g of *sodium dihydrogen orthophosphate dihydrate* in 1000 ml of *water* and adjusted to pH 6.0 with *dilute sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 227 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_3H_6N_2O_2$ in the capsules.

Storage. Store protected from moisture.

Cycloserine Tablets

Cycloserine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of cycloserine, $C_3H_6N_2O_2$.

Usual strengths. 125 mg; 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.5 g of Cycloserine with 25 ml of *0.1 M sodium hydroxide* for 5 minutes and filter. The optical rotation of the filtrate is about +2.2°(2.4.22).

B. To 0.2 ml of the filtrate obtained in test A add 3 ml of *1 M acetic acid* and 1 ml of a freshly prepared mixture of equal volumes of a 4 per cent w/v solution of *sodium nitroprusside* and *5 M sodium hydroxide*; a blue colour is produced slowly.

Tests

Light absorption. Shake a quantity of the powdered tablets containing 0.25 g of Cycloserine with 80 ml of *0.1 M sodium hydroxide* for 10 minutes, add sufficient *0.1 M sodium hydroxide* to produce 100.0 ml, mix and filter. Dilute a suitable volume of the filtrate with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.0025 per cent w/v of Cycloserine. Absorbance of the resulting solution, measured within 15 minutes of preparing the final solution, at the maximum at about 219 nm, 0.78 to 0.96 (2.4.7).

Disintegration (2.5.1). Not more than 30 minutes.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g of the powdered tablets, by drying in an oven at about 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Tablets.

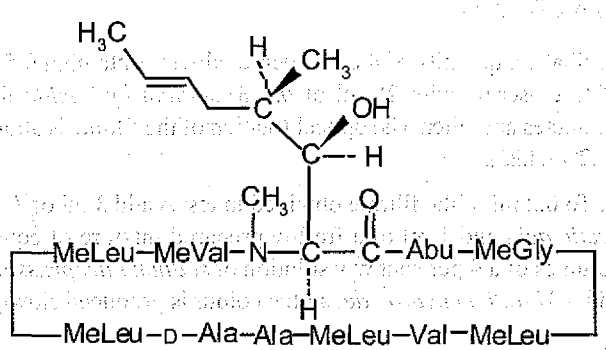
Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.1 g of Cycloserine, shake with 150 ml of *water* for 30 minutes, add sufficient *water* to produce 200.0 ml and filter. To 10.0 ml of the filtrate add

10 ml of *water* and 25 ml of *0.2 M sodium hydroxide*, dilute to 50.0 ml with *water* and mix. To 4.0 ml of the mixture add 10 ml of *1 M acetic acid* and 4 ml of *sodium nitroprusside solution*, dilute to 20 ml with *1 M acetic acid*, mix and allow to stand for 15 minutes. Measure the absorbance of the resulting solution at the maximum at about 625 nm (2.4.7), using as the blank a solution prepared by treating 4.0 ml of *0.1 M sodium hydroxide* in the same manner beginning at the words "add 10 ml of *1 M acetic acid*..." Calculate the content of $C_3H_6N_2O_2$ from the absorbance obtained by repeating the operation using *cycloserine IPRS* in place of the powdered tablets.

Storage. Store at a temperature not exceeding 30°.

Cyclosporine

Cyclosporin A



$C_{62}H_{111}N_{11}O_{12}$ Mol. Wt. 1202.6

Cyclosporine is cyclo[[(*E*)-(2*S*,3*R*,4*R*)-3-hydroxy-4-methyl-2-(methylamino)-6-octenoyl]-L-2-aminobutyryl-*N*-methylglycyl-*N*-methyl-L-leucyl-L-valyl-*N*-methyl-L-leucyl-L-alanyl-D-alanyl-*N*-methyl-L-leucyl-*N*-methyl-L-leucyl-*N*-methyl-L-valyl].

Cyclosporine contains not less than 97.0 per cent and not more than 101.5 per cent of cyclosporine A, $C_{62}H_{111}N_{11}O_{12}$, calculated on the dried basis.

Category. Immunosuppresant.

Description. A white to off-white powder.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 10.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent) and sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 0.1 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *cyclosporine IPRS* in the solvent mixture.

Reference solution (b). A 0.001 per cent w/v solution of *cyclosporine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 80°,
- mobile phase: a mixture of 52 volumes of *water*, 43 volumes of *acetonitrile*, 5 volumes of *tert-butyl methyl ether* and 0.1 volume of *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$.

Storage. Store protected from light and moisture.

Cyclosporine Capsules

Cyclosporine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyclosporine, $C_{62}H_{111}N_{11}O_{12}$.

Usual strengths. 25 mg; 50 mg; 100 mg; 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

For capsules containing liquid —

Apparatus No. 2 (Paddle),
Medium. 500 ml of *water*,
Speed and time. 50 rpm and 15 minutes.

Place 1 capsule in each vessel, and allow the capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each Capsule shell to rupture.

Tolerances — The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 minutes but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 minutes but not more than 30 minutes.

For capsules containing powder —

Apparatus No. 1 (Basket),
Medium. 1000 ml of *0.1 M hydrochloric acid* containing 0.5 per cent of *sodium lauryl sulphate*,
Speed and time. 150 rpm and 90 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw a suitable volume of the medium and filter. Dilute 5.0 ml of the solution to 10.0 ml with *acetonitrile*.

Reference solution. A solution of *cyclosporine IPRS* in the dissolution medium suitably diluted with the *acetonitrile* to obtain a solution having the same concentration as that of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 80°,
- mobile phase: a mixture of 900 volumes of *acetonitrile*, 450 volumes of *water*, 50 volumes of *methanol* and 0.5 volume of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$.

Q. Not less than 80 per cent of the stated amount of $C_{62}H_{111}N_{11}O_{12}$.

Water (2.3.43). Not more than 3.5 per cent w/w, for Capsules that contain powder, using finely ground Capsule contents.

Other tests. Comply with the tests stated under Capsules.

Assay

Where capsules contain liquid—

Test solution. Using a sharp blade, carefully cut open not fewer than 20 capsules, and with the aid of *ethanol* transfer the contents of the capsules to a suitable volumetric flask. Wash the blade with *ethanol*, and transfer the washings to the volumetric flask. Dilute the contents of the volumetric flask with *ethanol* to volume and mix. Quantitatively dilute an accurately measured volume of the solution with *ethanol* to obtain a solution having a concentration of 1 mg of cyclosporine per ml.

Reference solution. A 0.1 per cent w/v solution of *cyclosporine IPRS* in *ethanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with dimethylsilane bonded to porous silica (5 to 10 µm),
- column temperature: 70°,
- mobile phase: a mixture of 550 volumes of *acetonitrile*, 400 volumes of *water*, 50 volumes of *methanol* and 0.5 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$.

Where capsules contain powder—

Solvent mixture. 9 volumes of *acetonitrile*, 5 volumes of *tetrahydrofuran* and 4 volumes of *ethanol*.

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 0.1 g of cyclosporine with 10 ml of *water* and 40 ml of the solvent mixture, dissolve with the aid of ultrasound, dilute to 100.0 ml with the solvent mixture and filter.

Reference solution. Disperse 25 mg of *cyclosporine IPRS* with 2.5 ml of *water* with the aid of ultrasound for 10 minutes. Add about 10 ml of the solvent mixture, sonicate for 5 minutes and dilute to 25.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with trimethylsilane bonded to porous silica (3 to 10 µm),
- column temperature: 70°,
- mobile phase: a mixture of 605 volumes of *acetonitrile*, 400 volumes of *water*, 50 volumes of *methanol* and 0.5 volume of *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the cpasules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Cyclosporine Eye Drops

Cyclosporine Eye Drops is a sterile solution of Cyclosporine in a suitable vehicle.

Cyclosporine Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cyclosporine, $C_{62}H_{111}N_{11}O_{12}$.

Usual strengths. 0.05 per cent w/v; 0.1 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops containing 20 mg of Cyclosporine to 100.0 ml with *methanol.*

Reference solution. A 0.02 per cent w/v solution of *cyclosporine IPRS* in *methanol.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with dimethylsilane bonded to porous silica (5 µm),
- column temperature: 70°,
- mobile phase: a mixture of 55 volumes of *acetonitrile*, 40 volumes of *water*, 5 volumes of *methanol* and 0.05 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the eye drops.

Storage. Store protected from light, at a temperature not exceeding 30°.

Cyclosporine Injection

Cyclosporine Injection is a sterile solution of Cyclosporine in a suitable vehicle.

Cyclosporine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyclosporine, $C_{62}H_{111}N_{11}O_{12}$.

Usual strengths. 50 mg per ml; 100 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase A. Ethyl ether.

Mobile phase B. A mixture of 60 volumes of *ethyl acetate*, 40 volumes of *methyl ethyl ketone*, 2 volumes of *water* and 1 volume of *formic acid.*

Spray reagent A. Mix 5 ml of 1.7 per cent w/v solution of *bismuth subnitrate* in 20 per cent v/v solution of *acetic acid*, 5 ml of 40 per cent w/v solution of *potassium iodide* and 20 ml of *glacial acetic acid*, dilute to 100 ml with *water.*

Spray reagent B. Hydrogen peroxide solution (10 vol).

Test solution. Dilute a volume of the injection containing 50 mg of Cyclosporine to 100.0 ml with *methanol.*

Reference solution. A 0.05 per cent w/v solution of *cyclosporine IPRS* in *methanol.*

Apply to the plate 10 µl of each solution. Allow the spots to dry in a current of air. Develop the chromatogram using mobile phase A to three fourth length of the plate. Dry the plate in air until the odour of the solvent is no longer detectable. Place the plate in second chromatographic chamber and develop the chromatogram using mobile phase B until the solvent front has moved about three fourth length of the plate. Again dry the plate in hot air and spray the plate with spray reagent A, immediately. Again spray plate with spray reagent B. The principal spot at Rf value of about 0.45 in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Ethanol *(if present).* 80.0 to 120.0 per cent of the labelled amount.

Determine by gas chromatography (2.4.13).

Internal standard solution. A 6 per cent v/v solution of *n-propyl alcohol* in *butyl alcohol.*

Test solution. Transfer a volume of the injection containing 0.256 g of *ethanol* to 20-ml volumetric flask, add 5.0 ml of the internal standard solution and dilute to volume with *butyl alcohol.*

Reference solution. Transfer 0.256 g of *ethanol* to 20-ml volumetric flask, add 5.0 ml of the internal standard solution and dilute to volume with *butyl alcohol.*

Chromatographic system

- a glass column 2 m x 2 mm, packed with ethylvinylbenzene-divinylbenzene copolymer, having a nominal surface area 500 to 600 m^2 per g and an average pore diameter of 0.0075 µm,
- temperature:
  column 145° for 8 minutes, 145° to 270° @ 32° per minute, inlet port. 280° and detector. 290°,
- a flame ionisation detector,
- flow rate: 35 ml per minute, using nitrogen as the carrier gas.
- injection volume: 1 µl.

The elution order is ethanol, n-propyl alcohol and butyl alcohol.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections from the peak area ratio of the ethanol to n-propyl alcohol is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of ethanol from the peak area ratio of the ethanol to n-propyl alcohol in the chromatograms obtained with the reference solution and the test solution.

Sterility (2.2.11). Complies with the test for sterility.

Bacterial endotoxins (2.2.3). Not more than 0.84 Endotoxin Unit per mg of cyclosporine.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volumes of the injection in *methanol* to obtain a solution containing 0.05 per cent w/v of Cyclosporine.

Reference solution. A 0.05 per cent w/v solution of *cyclosporine IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with dimethylsilane bonded to porous silica (5 µm),
- column temperature: 70°,
- mobile phase: a mixture of 55 volumes of *acetonitrile,* 40 volumes of *water*, 5 volumes of *methanol* and 0.05 volume of *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless, the column efficiency is not less than 700 theoretical plates, the tailing factoris not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the injection.

Storage. Store at a temperature not exceeding 30°, in single dose or multiple-dose container.

Labelling. The label states that it is to be diluted with a suitable parenteral vehicle before intravenous infusion.

Cyclosporine Oral Solution

Cyclosporine Oral Solution is a solution of Cyclosporine in a suitable vehicle.

Cyclosporine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyclosporine, $C_{62}H_{111}N_{11}O_{12}$.

Usual strength. 100 mg per ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 80 volumes of *methanol* and 20 volumes of *chloroform*.

Test solution. Dilute a volume of the oral solution with the solvent mixture to obtain a 0.1 per cent w/v solution of Cyclosporine.

Reference solution. A 0.1 per cent w/v solution of *cyclosporine IPRS* in the solvent mixture.

Mobile phase A. *Ethyl ether,*

Mobile phase B. A mixture of 60 volumes of *ethyl acetate,* 40 volumes of *methyl ethyl ketone,* 2 volumes of *water* and 1 volume of *formic acid.*

Spray reagent A. Mix 5 ml each of 1.7 per cent w/v solution of *bismuth subnitrate* in 20 per cent w/v solution of *acetic acid* and 40.0 per cent w/v solution of *potassium iodide* and 20 ml of *glacial acetic acid,* and dilute with *water* to 100.0 ml. Prepare freshly.

Spray reagent B. Hydrogen peroxide solution (10 volume).

Apply to the plate 10 µl of the reference solution and the test solution. After development, dry the plate in a current of air, place the plate in a suitable chromatographic chamber, and develop the chromatogram, using mobile phase A, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow it to dry. Place the plate in a second chromatographic chamber, and develop the chromatogram in mobile phase B until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow it to dry. Spray the plate with spray reagent A. Immediately again spray the plate with spray reagent B. Cyclosporine appears as a brown spot having an Rf value of about 0.45.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Alcohol *(if present).* 80.0 per cent w/w to 120.0 per cent w/w, determined by gas chromatography (2.4.13).

Internal standard. A mixture of 3 volumes of *n-propyl alcohol* and 50 volumes of *butyl alcohol.*

Test solution. Transfer a suitable quantity of oral solution to a suitable volumetric flask. Add 24 per cent *internal standard solution* of the final volume, and dilute with *butyl alcohol* to obtain a 1.0 per cent w/v solution of alcohol.

Reference solution (a). A 5.0 per cent w/v solution of *ethanol* in *butyl alcohol.*

Reference solution (b). Transfer a suitable quantity of reference solution (a) to a suitable volumetric flask. Add 24 per cent *internal standard solution* of the final volume, and dilute with *butyl alcohol* to obtain a 1.0 per cent w/v solution of alcohol.

Chromatographic system

- a glass column 2.0 m × 2 mm, packed with support (copolymer of ethylvinylbenzene and divinylbenzene, nominal surface area 500 to 600 m^2 per g, average pore diameter 0.0076 µm),
- temperature:

column	time (min.)	temperature (°)
	0-8	145
	8-12	145→270

- inlet port: 280°,
- flame ionisation detector at 290°,
- flow rate: 35 ml per minute, using nitrogen as the carrier gas.

The elution order of the peaks is alcohol, *n*-propyl alcohol, and butyl alcohol.

Inject 1 µl of reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject 1 µl each of reference solution (b) and the test solution.

Calculate the content of C_2H_5O H in the oral solution.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol* and 20 volumes of *chloroform.*

Test solution. Dilute a volume of the oral solution with the solvent mixture to obtain 0.1 per cent w/v solution of Cyclosporine. Use the solution immediately after preparation.

Reference solution. A 0.1 per cent w/v solution of *cyclosporine IPRS* in the solvent mixture. Use the solution immediately after preparation.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with dimethylsilane bonded to porous silica (5 to 10 µm),
- column temperature: 50°,
- mobile phase : a mixture of 55 volumes of *acetonitrile,* 5 volumes of *methanol,* 40 volumes of *water* and 0.05 volume of *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

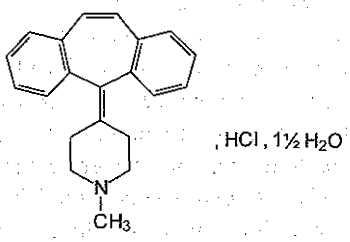
Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates, tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ in the oral solution.

Storage. Store protected from moisture.

Cyproheptadine Hydrochloride



$C_{21}H_{21}N, HCl, 1½H_2O$ Mol. Wt. 350.9

Cyproheptadine Hydrochloride is 4-(5*H*-dibenzo[*a,d*]-cyclohepten-5-ylidene)-1-methylpiperidine hydrochloride sesquihydrate.

Cyproheptadine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{21}H_{21}N,HCl$, calculated on anhydrous basis.

Category. Histamine H_1-receptor antagonist.

Description. A white or slightly yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Dissolve 0.1 g in 10 ml of water, make alkaline with *1 M sodium hydroxide*, extract with 5 ml of *dichloromethane*, dry over *anhydrous sodium sulphate* and remove the solvent with the aid of a current of nitrogen. The oily residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyproheptadine hydrochloride IPRS* treated in the same manner or with the reference spectrum of cyproheptadine.

B. When examined in the range 230 nm to 360 nm, a 0.002 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 286 nm, about 0.67 (2.4.7).

C. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *cyclohexane*, 20 volumes of *ether* and 5 volumes of *diethylamine*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *cyproheptadine hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v, each of, *imipramine hydrochloride IPRS* and *cyproheptadine hydrochloride IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

D. A saturated solution gives reaction A of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 2 mg each of *cyproheptadine impurity A IPRS, cyproheptadine impurity B IPRS* and *cyproheptadine impurity C IPRS* in mobile phase A, add 1.0 ml of the test solution and dilute to 100.0 ml with mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 60 volumes of a solution prepared by dissolving 6.12 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 40 volumes of *acetonitrile*,

  B. a mixture of 40 volumes of a solution prepared by dissolving 6.12 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 60 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,

– flow rate: 1 ml per minute,
– spectrophotometer set at 230 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
10	100	0
10.1	0	100
35	0	100
36	100	0
45	100	0

Name	Relative retention time
Cyproheptadine impurity C[1]	0.7
Cyproheptadine (Retention time: about 8 minutes)	1.0
Cyproheptadine impurity B[2]	2.6
Cyproheptadine impurity A[3]	3.9

[1]5-(1-methylpiperidin-4-yl)-5*H*-dibenzo[*a*,*d*][7]annulen-5-ol,

[2]dibenzosuberone,

[3]dibenzocycloheptene.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cyproheptadine impurity C and cyproheptadine is not less than 7.0.

Inject reference solution (a), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to each cyproheptadine impurities A, B, C is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 7.0 to 9.0 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.5 g, dissolve in 0.5 ml of *acetic anhydride* and 20 ml of *anhydrous glacial acetic acid* and add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03239 g of $C_{21}H_{21}N,HCl$.

Storage. Store protected from light.

Cyproheptadine Syrup

Cyproheptadine Hydrochloride Syrup

Cyproheptadine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyproheptadine hydrochloride, $C_{21}H_{21}N,HCl$.

Usual strength. 2 mg in 5 ml.

Identification

To 5 ml add 5 ml of a 1 per cent w/v solution of *sodium bicarbonate* and extract with three quantities, each of 15 ml, of *2,2,4-trimethylpentane*. Wash the combined 2,2,4-trimethylpentane extracts with 5 ml of the *sodium bicarbonate solution* and discard the washings. Evaporate the *2,2,4-trimethylpentane solution* to dryness on a water-bath and dissolve the residue in 100 ml of *ethanol (95 per cent)*. When examined in the range 230 nm to 360 nm, the resulting solution shows an absorption maximum only at about 286 nm (2.4.7).

Tests

pH (2.4.24). 3.5 to 4.5.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the syrup containing 2 mg of Cyproheptadine Hydrochloride in the mobile phase and dilute to 100.0 ml with the mobile phase and filter.

Reference solution. A 0.002 per cent w/v solution of *cyproheptadine hydrochloride IPRS* in the mobile phase.

Chromatographic system
– a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 65 volumes of 0.3 per cent v/v *methanesulphonic acid*, 20 volumes of *acetonitrile*, and 15 volumes of *isopropyl alcohol* adjusted to pH 4.0 with *triethylamine*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 285 nm,
– injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml (2.4.29) of the syrup and calculate the content of $C_{21}H_{21}N,HCl$, weight in volume.

Storage. Store protected from light and moisture.

Cyproheptadine Tablets

Cyproheptadine Hydrochloride Tablets

Cyproheptadine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of cyproheptadine hydrochloride, $C_{21}H_{21}N,HCl$.

Usual strength. 4 mg.

Identification

A. To a quantity of the powdered tablets containing 20 mg of Cyproheptadine Hydrochloride add 10 ml of *water* and 2.5 ml of *0.1 M sodium hydroxide*, extract with 10 ml of *dichloromethane*, filter through *anhydrous sodium sulphate* placed over absorbent cotton moistened with *dichloromethane* and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyproheptadine hydrochloride IPRS* treated in the same manner or with the reference spectrum of cyproheptadine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Extract a quantity of the powdered tablets containing 20 mg of Cyproheptadine Hydrochloride with 7 ml of *water*, filter, add 0.3 ml of *5 M ammonia* to the filtrate and filter again. The filtrate gives reaction A of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted with the medium, if necessary, at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{21}H_{21}N,HCl$ in the medium from the absorbance obtained from a solution of known concentration of *cyproheptadine hydrochloride IPRS* in the dissolution medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{21}N,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), using a precoated silica gel plate.

Mobile phase. A mixture of 90 volumes of *dichloromethane* and 10 volumes of *methanol*.

Test solution (a). Shake mechanically for 10 minutes a quantity of the powdered tablets containing 50 mg of Cyproheptadine Hydrochloride with 5 ml of the mobile phase and filter (such as Whatman GF/C filter paper).

Test solution (b). Dilute 1 volume of test solution (a) to 10 volumes with the mobile phase.

Reference solution (a). Dilute 1 volume of test solution (a) serially in two steps to 1000 volumes with the mobile phase.

Reference solution (b). A solution containing 0.1 per cent w/v of *cyproheptadine hydrochloride IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.002 per cent w/v of *dibenzocycloheptatriene IPRS* in the mobile phase.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *ethanolic sulphuric acid (20 per cent)*. Heat at 110° for 30 minutes and examine under ultraviolet light at 365 nm. In the chromatogram obtained with test solution (a) any spot corresponding to dibenzocycloheptatriene is not more intense than the spot in the chromatogram obtained with reference solution (c) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following test solution.

Test solution. Disperse one tablet in the mobile phase and dilute to 50.0 ml with the mobile phase.

Calculate the content of $C_{21}H_{21}N,HCl$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 80 mg of Cyproheptadine Hydrochloride in 500 ml of the mobile phase, with the aid of ultrasound for 15 minutes and agitate for 30 minutes and dilute to 1000.0 ml with the mobile phase, filter.

Reference solution. A 0.008 per cent w/v solution of *cyproheptadine hydrochloride IPRS* in the mobile phase.

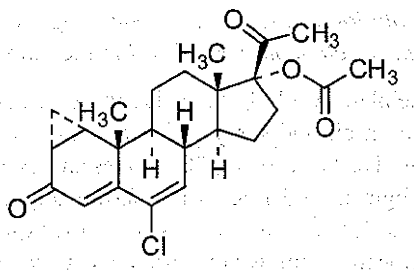
Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a 0.3 per cent v/v *methanesulphonic acid*, 20 volumes of *acetonitrile*, and 15 volumes of *isopropyl alcohol* adjusted to pH 4.0 with *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{21}N,HCl$ in the tablets.

Cyproterone Acetate



$C_{24}H_{29}ClO_4$ Mol. Wt. 416.9

Cyproterone Acetate is (1*β*, 2*β*)-6-chloro-1,2-dihydro-17-acetyloxy-3'*H*-cyclopropa[1,2]pregna-1,4,6-triene-3,20-dione.

Cyproterone Acetate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{24}H_{29}ClO_4$, calculated on the dried basis.

Category. Anticancer.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyproterone acetate IPRS* or with the reference spectrum of cyproterone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. a mixture of equal volumes of *cyclohexane* and *ethyl acetate*.

Test solution. Dissolve 0.02 g of the substance under examination in *dichloromethane* and dilute to 10 ml with the same solvent.

Reference solution. A 0.2 per cent w/v solution of *cyproterone acetate IPRS* in *dichloromethane*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dissolve about 1.0 mg with 2 ml of *sulphuric acid* and heat on a water-bath for 2 minutes. A red colour develops. Cool and add the solution cautiously to 4 ml of *water* and shake. The solution becomes violet.

D. Incinerate about 30 mg with 0.3 g of *anhydrous sodium carbonate* over a naked flame for about 10 minutes. Cool, dissolve the residue in 5 ml of *dilute nitric acid* and filter. To 1 ml of the filtrate, add 1 ml of *water*. The solution gives reaction A of chlorides (2.3.1).

E. It gives the reactions of acetyl groups (2.3.1).

Tests

Specific optical rotation (2.4.22). +152° to +157°, determined in a 1.0 per cent w/v solution in *acetone*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *acetonitrile* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*.

Reference solution (b). Dissolve 5 mg of *medroxy-progesterone acetate IPRS* in *acetonitrile* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cyproterone acetate and medroxyprogesterone acetate is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram at least twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 80° at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh accurately about 0.05 g, dissolve in *methanol* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 282 nm (2.4.7). Calculate the content of $C_{24}H_{29}ClO_4$ taking 414 as the specific absorbance at 282 nm.

Storage. Store protected from light.

Cyproterone Tablets

Cyproterone Acetate Tablets

Cyproterone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cyproterone acetate, $C_{24}H_{29}ClO_4$.

Usual strength. 50 mg.

Identification

A. Shake a quantity of powdered tablets containing about 100 mg of cyproterone acetate with 20 ml of *dichloromethane*, filter and evaporate the filtrate to dryness using a rotary evaporator and a water-bath at 40°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cyproterone acetate IPRS* or with the reference spectrum of cyproterone acetate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.07 per cent w/v solution of *sodium dodecyl sulphate* in *0.1M hydrochloric acid* (For tablets containing less than 100 mg of Cyproterone Acetate); 900 ml of 0.1 per cent w/v solution of *sodium dodecyl sulphate* in *0.1M hydrochloric acid* (For tablets containing more than 100 mg of Cyproterone Acetate),
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary with dissolution medium at 285 nm (2.4.7). Calculate the content of cyproterone acetate, $C_{24}H_{29}ClO_4$ in the medium from the absorbances obtained from a solution of known concentration of *cyproterone acetate IPRS*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *acetonitrile* and 20 volumes of *water*.

Test solution. Shake a quantity of powdered tablets containing about 0.1 g of Cyproterone Acetate in 50 ml of the solvent mixture for 5 minutes, dilute to 100 ml with *water* and filter.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *cyproterone acetate IPRS* and *medroxyprogesterone acetate IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Spherisorb ODS 2),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to cyproterone acetate and medroxyprogesterone acetate is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of powdered tablets containing about 50 mg of Cyproterone Acetate in 100 ml of the solvent mixture and filter. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *cyproterone acetate IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v, each of, *cyproterone acetate IPRS* and *medroxyprogesterone*

acetate IPRS in the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Use the chromatographic system as described under Related substances.

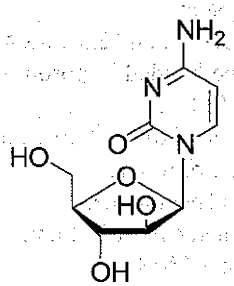
Inject reference solution (b). The test is not valid unless the resolution between the peak due to cyproterone and medroxyprogesterone is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{24}H_{29}ClO_4$ in the tablets.

Cytarabine

β-Cytosine Arabinoside



$C_9H_{13}N_3O_5$ Mol. Wt. 243.2

Cytarabine is 1-β-D-arabinofuranosylcytosine.

Cytarabine contains not less than 99.0 per cent and not more than 100.5 per cent of $C_9H_{13}N_3O_5$, calculated on the dried basis.

Category. Anticancer.

Description. A white or almost white, crystalline powder.

CAUTION — Cytarabine is very poisonous. Great care should be taken to avoid inhaling the particles of cytarabine and exposing the skin to the dried substance.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cytarabine IPRS* or with the reference spectrum of cytarabine.

B. When examined in the range 230 nm to 360 nm, a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 280 nm, about 0.55 (2.4.7).

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Specific optical rotation (2.4.22). +154° to +160°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *2-butanone*, 20 volumes of *acetone* and 15 volumes of *water*.

Test solution (a). A 5 per cent w/v solution of the substance under examination in *water*.

Test solution (b). A 0.2 per cent w/v solution of the substance under examination in *water*.

Reference solution (a). A 0.025 per cent w/v solution of the substance under examination in *water*.

Reference solution (b). A 0.2 per cent w/v solution of *cytarabine IPRS* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven over *phosphorus pentoxide* at 60° for 3 hours at a pressure of 0.2 kPa to 0.7 kPa.

Assay. Weigh accurately about 0.5 g and dissolve in 40 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02432 g of $C_9H_{13}N_3O_5$.

Cytarabine intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.07 Endotoxin Unit per mg.

Cytarabine intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from light. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labeling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Cytarabine Injection

β-Cytosine Arabinoside Injection

Cytarabine Injection is a sterile material consisting of Cytarabine with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Cytarabine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of cytarabine, $C_9H_{13}N_3O_5$.

Usual strengths. 100 mg per vial; 500 mg per vial; 1 g per vial.

Description. A white or almost white powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Mix a qunatity of injection containing 0.1 g of cytarabine with 10 ml of hot *ethanol (95 per cent)*, filter, allow the filtrate to cool and induce crystallisation if necessary. Filter, wash the crystals with 2 ml of *ethanol (95 per cent)* and dry at 60° at a pressure of 0.7 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *cytarabine IPRS* or with the reference spectrum of cytarabine.

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 2.0 per cent w/v solution in the solvent stated on the label.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *2-butanone*, 20 volumes of *acetone* and 15 volumes of *water*.

Test solution. Dissolve a quantity of injection to obtain a solution containing 4.0 per cent w/v of cytarabine in *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *water*.

Reference solution (b). A solution containing 0.04 per cent w/v solution of *uridine* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution with an R_f value of about 1.1 relative to the spot in the chromatogram obtained with reference solution (b) is not more intense than the spot in the chromatogram obtained with reference solution (b). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a).

Water (2.3.43). Not more than 3.0 per cent, determined on 0.8 g.

Bacterial endotoxins (2.2.3). Not more than 0.07 Endotoxin unit per mg.

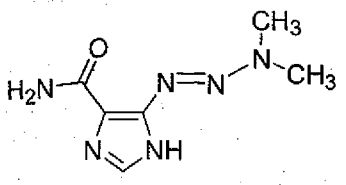
Assay. Determine the weight of the contents of 10 containers. Weigh accurately about 0.5 g of the mixed contents of the 10 containers and dissolve by heating, if necessary, in 80 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02432 g of $C_9H_{13}N_3O_5$.

Storage. Store protected from light.

D

Dacarbazine



$C_6H_{10}N_6O$ Mol Wt. 182.2

Dacarbazine is 5-[1E)-(3,3-dimethyltriaz-1-enyl)-1*H*-imidazole-4-carboxamide.

Dacarbazine contains not less than 98.5 per cent and not more than 101.0 per cent of $C_6H_{10}N_6O$, calculated on the anhydrous basis.

Category. Antineoplastic and immunomodulating alkylating agent.

Description. A white or slightly yellowish, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *dacarbazine IPRS* or with the reference spectrum of dacarbazine.

B. When examined in the range 200 nm to 400 nm, a 0.00075 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at 323 nm and a shoulder at 275 nm (2.4.7).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *glacial acetic acid*, 20 volumes of *water*, 50 volumes of *butanol*.

Test solution. A 0.04 per cent w/v solution of substances under examination in *methanol*.

Reference solution. A 0.04 per cent w/v solution of *dacarbazine IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. Dissolve 0.25 g in 21 per cent w/v solution of *citric acid* and dilute to 25.0 ml with the same solution. The solution is clear and not more intensely coloured than reference solution BYS6 (2.4.1).

Related substances. A. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 50 mg of the substance under examination and 75 mg of *citric acid* in *water* and dilute to 5.0 ml with the same solvent.

Reference solution(a). A 0.002 per cent w/v solution of *3,7-dihyro-4H-imidazol[4,5-d]-1,2,3-triazin-4-one IPRS* (dacarbazine impurity A) in *water*.

Reference solution(b). Dissolve 5.0 mg of *5-amino-1H-imidazole-4-carboxamide IPRS* (dacarbazine impurity B) in *water*, add 0.5 ml of the test solution and dilute to 10.0 ml with *water*. Dilute 1.0 ml of the solution to 50.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a solution of 1.563 per cent w/v of *glacial acetic acid* in *water* containing 0.233 per cent w/v of *sodium dioctyl sulphosuccinate*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 25 µl.

The retention time of dacarbazine impurity A is about 3 minutes.

Inject reference solution (a) and test solution. Run the chromatogram three times the retention time of dacarbazine impurity A. In the chromatogram obtained with the test solution, the area of any peak corresponding to dacarbazine impurity A is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

B. Determine by liquid chromatography (2.4.14).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm).
- mobile phase: A mixture of 45 volumes of 1.563 per cent w/v solution *of glacial acetic acid* containing 0.233 per cent w/v of *sodium dioctyl sulphosuccinate* and 55 volumes of *methanol*.
- flow rate: 1.2 ml per minute.
- spectrophotometer set at 254 nm.
- injection volume: 10 µl.

The relative retention time with reference to dacarbazine for *5-amino-1H-imidazole-4-carboxamide* (dacarbazine impurity B) is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to dacarbazine and dacarbazine impurity B is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to dacarbazine impurity B is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity D. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.2 g of the substance under examination in 5 µl of *water* and seal the vial.

Reference solution (a). Dilute 2.5 ml of *dimethylamine solution* (dacarbazine impurity D) to 100.0 ml with *water*. Transfer 10 µl of the solution in a vial and seal.

Reference solution (b). A mixture of 10 µl of reference solution (a) and 10 µl of 1 per cent w/v solution of *triethylamine* in sealed vial.

Chromatographic system

- a fused-silica capillary column 30 m x 0.53 mm, packed with base-deactivated polyethylene glycol (film thickness: 1.0 µm),
- temperature:

column	time (min.)	temperature (°)
	0-3	35
	3-11	35 → 165

- inlet port at 180° and detector at 220°,
- a flame ionisation detector,
- flow rate: 13 ml per minute, using helium or nitrogen as the carrier gas,
- split ratio of 1:1,
- injection volume 1ml.

Static head-space conditions which may be used:

- equilibration temperature 60°,
- equilibration time 10 minutes,
- transfer line temperature 90°,
- pressurisation time 30 seconds.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to triethylamine and dacarbazine impurity D is not less than 2.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to dacarbazine impurity D is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.150 g in 30 ml of *anhydrous glacial acetic acid* and titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01822 g of $C_6H_{10}N_6O$.

Storage. Store protected from light, at a temperature between 2° to 8°.

Dacarbazine Injection

Dacarbazine Injection is a sterile material consisting of Dacarbazine with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of sealed container in the requisite amount of sterile water for Injections, immediately before use.

The constituted solution complies with the requirements for clarity of solution and particulate matter stated under parenteral preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Dacarbazine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dacarbazine, $C_6H_{10}N_6O$.

Usual strengths. 100 mg per vial; 200 mg per vial.

Description. A white or pale yellow powder.

The contents of the sealed container comply with the requirements stated under parenteral preparations (Powders for Injection) and with the following requirements.

Identification

A. When examined in the range of 210 nm to 360 nm, a 0.0006 per cent w/v solution of dacarbazine in *mixed phosphate buffer* pH 7.0, shows absorption maxima at 237 nm and 330 nm (2.4.7).

B. In the test for 5-aminoimidazole-4-carboxamide hydrochloride, the principal peak in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

5-Aminoimidazole-4-carboxamide hydrochloride. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve an accurately weighed quantity of powder containing 0.2 g of dacarbazine in 50.0 ml of *0.1 M acetic acid.*

Test solution (b). Dilute 1.0 ml of the test solution (a) to 100.0 ml with *0.1 M acetic acid.*

Reference solution (a). A 0.004 per cent w/v solution of *dacarbazine IPRS* in *0.1 M acetic acid.*

Reference solution (b). A 0.0024 per cent w/v solution of 5-aminoimidazole-4-carboxamide in *0.1 M acetic acid.*

Chromatographic system

- a stainless steel column 20 cm x 4 mm, packed with end-capped octadecylsilyl silica gel (10 µm) (Such as Nucleosil C18),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 3 volumes of *glacial acetic acid,* 87 volumes of *water* and 110 volumes of *methanol,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b) and test solution (a). In the chromatogram obtained with the test solution (a), the area of any peak corresponding to 5-aminoimidazole-4-carboxamide hydrochloride is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.6 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Carry out the test protected from light.

Test solution. Dissolve an accurately weighed quantity of powder containing about 0.2 g of Dacarbazine in 50.0 ml of *0.25 M acetic acid.*

Reference solution. A 0.004 per cent w/v solution of *2-azahypoxanthine IPRS* in *0.25 M acetic acid.*

Chromatographic system

- a stainless steel column 20 cm x 4.0 mm, packed with end-capped octadecylsilyl silica gel (10 µm) (Such as Nucleosil C18),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 1.5 volumes of *glacial acetic acid* and 98.5 volumes of *water,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

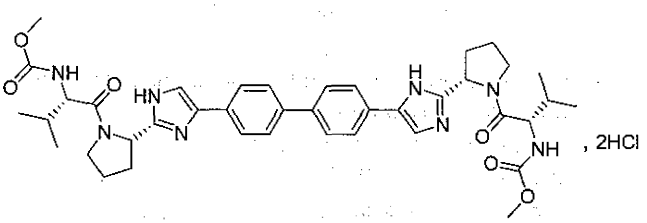
Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and not more than one such peak has an area more than 0.5 times the principal peak in the chromatogram obtained with reference solution (0.5 per cent), and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (3 per cent).

Bacterial endotoxin (2.2.3). Not more than 0.52 Endotoxin Unit per mg of dacarbazine.

Assay. Weigh a quantity of the mixed contents of 10 containers containing 80 mg of Dacarbazine and dissolved in sufficient *0.1 M hydrochloric acid* to produce 100.0 ml; dilute 1.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at 323 nm (2.4.7). Calculate the content of $C_6H_{10}N_6O$ taking 1090 as the specific absorbance at 323 nm.

Storage. Store protected from light and moisture, at a temperature between 2° to 8°.

Daclatasvir Dihydrochloride



$C_{40}H_{50}N_8O_6,2HCl$ Mol. Wt. 811.8

Daclatasvir Dihydrochloride is Methyl((1*S*)-1-(((2*S*)-2-(5-(4'-(2-((2*S*)-1-((2S)-2-((methoxycarbonyl)amino)-3-methylbutanoyl)-2-pyrrolidinyl)-1*H*-imidazol-5-yl)-4-biphenylyl)-1*H*-imidazol-2-yl)-1-pyrrolidinyl) carbonyl)-2-methylpropyl) carbamate dihydrochloride.

Daclatasvir Dihydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent, of $C_{40}H_{50}N_8O_6,HCl$ calculated on the anhydrous and solvent free basis.

Category. Antiviral.

Description. A White to yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *daclatasvir dihydrochloride IPRS* or with the reference spectrum of daclatasvir dihydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). – 102° to – 92°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of mobile phase A and 20 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the same solvent.

Reference solution. A 0.00005 per cent w/v solution of *daclatasvir dihydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with phenyl group bonded to porous silica (5µm) (Such as Kromasil Eternity XT-5),
- column temperature: 45°,
- mobile phase A: a buffer solution prepared by dissolving 3.5 g of *sodium dihydrogen phosphate* in 1000 ml of 0.1 per cent v/v solution of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid.*

  B: *acetonitrile,*
- a gradient program using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
25	55	45
30	55	45
35	85	15
40	85	15

Retention time of the daclatasvir dihydrochloride peak is about 16 minutes.

Inject the reference solution. The test is not valid unless, the column efficiency is not less than 2000 theoretical plates the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than ten times the area of the principal peak in the chromatogram with reference solution (1.0 per cent).

Enantiomeric purity. Not more than 0.15 per cent of D, D daclatasvir dihydrochloride.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of substance under examination in 50.0 ml of mobile phase.

Reference solution (a). A 0.0064 per cent w/v solution of *DD daclatasvir dihydrochloride (Methyl((1R)-1-((2R)-2-(5-(4'-2-((2R)-1-((2R)-2-((methoxy carbonyl)amino)-3-methyl-butanoyl)-2-pyrrolidinyl)-1H-imidazol-5-yl)-4-biphenylyl)-1H-imidazol-2-yl-1-pyrrolidinyl)carbonyl)-2-methylpropyl carbamate dihydrochloride) IPRS* in the mobile phase.

Reference solution (b). Dissolve 50 mg of *daclatasvir dihydrochloride IPRS* in 100.0 ml of mobile phase containing 3.0 ml of reference solution (a).

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with cellulose tris-(3,5-dichlorophenyl carbamate bonded to porous silica (3µm) (Such as Chiralpak IC-3),
- column temperature: 40°,
- mobile phase: 30 volumes of a buffer solution prepared by dissolving 1.58 g of *ammonium bicarbonate* in 1000 ml of *water* and 70 volumes of *acetonitrile.*
- flow rate: 1 ml per minute.
- spectrophotometer set at 320 nm,
- injection volume:10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to daclatasvir dihydrochloride and DD-daclatasvir dihydrochloride is not less than 2.0. The relative retention time of DD-daclatasvir dihydrochloride with respect to daclatasvir is about 1.57.

Inject the test solution and calculate the content of DD daclatasvir dihydrochloride in daclatasvir dihydrochloride by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Chloride content. Not less than 8.0 per cent and not more than 10.0 per cent.

Dissolve about 0.1g of the substance under examination in a mixture of 50.0 ml of *methanol*, 5.0 ml of *glacial acetic acid* and 5.0 ml of *water*. Titrate with *0.1 M silver nitrate*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of chloride.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.1 g in *methanol*.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the sample under examination in 20.0 ml of *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with *methanol*.

Reference solution. A 0.01 per cent w/v solution of *daclatasvir dihydrochloride IPRS* in *methanol.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5µm) (Such as Zorbax Rx, C8),
- column temperature: 35°,
- mobile phase: a mixture of 70 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water* with 10.0 ml of *formic acid* and 5.0 ml of *trimethylamine*, adjusted to pH 2.5 with *formic acid* and 30 volumes of *acetonitrile,*
- spectrophotometer set at 300 nm,
- flow rate: 1.2 ml per minute,
- injection volume: 10 µl

Retention time of the principal peak is about 4 minutes.

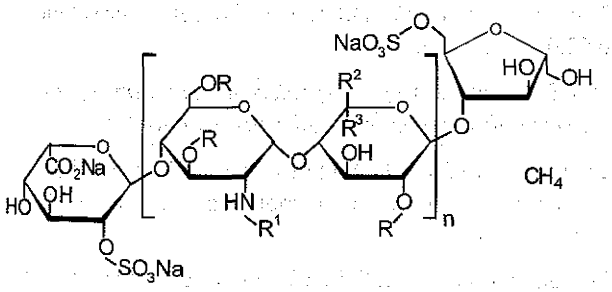
Inject the reference solution. The test is not valid unless, the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{40}H_{50}N_8O_6,2HCl$.

Storage. Store at a temperature between 15° to 30°.

Dalteparin Sodium



n = 3 to 20, R = H or SO_3Na, R^1 = SO_3Na or CO-CH_3
R^2 = H and R^3 = CO_2Na or R^2 = CO_2Na and R^3 = H

Dalteparin Sodium is the sodium salt of a low-molecular-mass heparin that is obtained by nitrous acid depolymerisation of heparin from porcine intestinal mucosa. The majority of the components have a 2-*O*-sulfo-α-L-idopyranosuronic acid structure at the non-reducing end and a 6-*O*-sulfo-2, 5-anhydro-D-mannitol structure at the reducing end of their chain.

Dalteparin Sodium complies with the monograph Enoxaparin Sodium with the modifications and additional requirements below.

The mass-average relative molecular mass range is not less than 5600 and not more than 6400, with a characteristic value of about 6000.

The degree of sulfatation is 2.0 to 2.5 per disaccharide unit.

The potency is not less than 110 IU and not more than 210 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The anti- factor IIa activity is not less than 35 IU per mg and not more than 100 IU per mg, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 1.9 and 3.2.

Production

Dalteparin sodium is produced by a validated manufacturing and purification procedure under conditions designed to minimise the presence of N-NO groups.

The manufacturing procedure must have been shown to reduce any contamination by N-NO groups to approved limits using an appropriate, validated quantification method.

Category. Anticogulant; antithrombotic.

Identification

A. Determine by nuclear magnetic resonance spectrometry (2.4.34).

Solvent mixture. 20 ml of *deuterium oxide* and 80 ml of *water.*

Test solution. Dissolve 0.2 g of the substance under examination in 1.0 ml of the solvent mixture.

Reference solution. A 20.0 per cent w/v solution of *dalteparin sodium IPRS* in the solvent mixture.

Using a pulsed (Fourier transform) NMR spectrometer operating at 75 MHz for ^{13}C. Record the spectra at 40°, using cells 5 mm in diameter. . Use deuterated *methanol* as internal reference at δ = 50.0 ppm.

The spectrum obtained is similar to the appropriate specific low-molecular-mass heparin reference standard.

B. Determined by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 20 mg of the substance under examination in 2 ml of the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *heparin low-molecular-mass for calibration IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 7.5 mm, packed with porous silica beads (5 µm) with a fractionation range for proteins of approximately 15000 to 100000,

- mobile phase: a 2.84 per cent w/v solution of *anhydrous sodium sulphate*, adjusted to pH 5.0 with 10 per cent *sulphuric acid*,
- flow rate: 0.5 ml per minute,
- refractive index detector,
- injection volume: 25 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates.

For detection, use a differential refractive index (RI) detector connected in series to a ultraviolet spectrophotometer (UV) set at 234 nm such that the UV monitor is connected to the column outlet, and the RI detector to the UV-monitor outlet.

The normalisation factor used to calculate the relative molecular mass from the RI/UV ratio is obtained as follows: calculate the total area under the UV_{234} (ΣUV_{234}) and the RI (ΣRI) curves by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram). Calculate the ratio r using the following expression.

$$\frac{\sum RI}{\sum UV_{234}}$$

Calculate the factor *f* using the following expression:

$$\frac{M_{na}}{r}$$

where, M_{na} = assigned number-average relative molecular mass of the *heparin low-molecular-mass for calibration IPRS* found in the leaflet supplied with the RS.

Provided the UV_{234} and the RI responses are aligned, the relative molecular mass *M* at any point is calculated using the following expression.

$$f\frac{RI}{UV_{234}}$$

The resulting table of retention times and relative molecular masses may be used to derive a calibration for the chromatographic system by fitting a suitable mathematical relationship to the data. A polynomial of the 3rd degree is recommended. *(It must be stressed that the extrapolation of this fitted calibration curve to higher molecular masses is not valid).*

Inject 25 µl of the test solution and record the chromatogram for a period of time, ensuring complete elution of sample and solvent peaks.

The mass-average relative molecular mass is defined by the following expression.

$$\frac{\sum(RI_i M_i)}{\sum RI_i}$$

where, RI_i = mass of substance eluting in the fraction *i*;
M_i = relative molecular mass corresponding to fraction *i*.

The mass-average relative molecular mass ranges between 5600 and 6400. The mass percentage of chains lower than 3000 is not more than 13.0 per cent. The mass percentage of chains higher than 8000 ranges between 15.0 per cent and 25.0 per cent.

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Nitrite. Not more than 5 ppm.

Determine by liquid chromatography (2.4.14).

NOTE — Rinse all volumetric flasks at least three times with water before the preparation of the solutions.

Test solution. Dissolve 80 mg of the substance under examination in *water* and dilute to 10.0 ml with *water*. Allow to stand for at least 30 minutes.

Reference solution (a). Dissolve 60 mg of *sodium nitrite* in *water* and dilute to 1000.0 ml with *water*.

(For the preparation of reference solution (b), use a pipette previously rinsed with reference solution (a)).

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with *water*.

NOTE — Before preparing reference solution (c), (d) and (e), rinse all pipettes with reference solution (b).

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml *with water (*corresponding to 1 ppm of nitrite in the test sample).

Reference solution (d). Dilute 3.0 ml of reference solution (b) to 100.0 ml with *water* (corresponding to 3 ppm of nitrite in the test sample).

Reference solution (e). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water* (corresponding to 5 ppm of nitrite in the test sample).

Chromatographic system

- a stainless steel column 12.5 cm x 4.3 mm, packed with strong anion-exchange resin,
- mobile phase: a solution consisting of 13.61 g of *sodium acetate* dissolved in *water*, adjusted to pH 4.3 with *phosphoric acid* and diluted to 1000 ml with *water*,

- flow rate: 1 ml per minute,
- conductivity detector as an appropriate electrochemical device with the following characteristics and settings: a suitable working electrode, a detector potential of + 1.00 V versus Ag/AgCl reference electrode and a detector sensitivity of 0.1 µA full scale,
- injection volume: 100 µl.

Inject reference solution (d). The retention time for nitrite is 3.3 to 4.0 minutes. The test is not valid unless the column efficiency is not less than 7000 theoretical plates for the nitrite peak. (Dalteparin sodium will block the binding sites of the stationary phase, which will cause shorter retention times and lower separation efficiency for the analyte; the initial performance of the column may be partially restored using a 5.8 per cent w/v solution of *sodium chloride* at a flow rate of 1.0 ml per minute for 1 hour; after regeneration the column is rinsed with 200 ml to 400 ml of *water).* The tailing factor for the peak due to nitrite is not more than 3.0 and the relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject reference solution (c) and (e). The test is not valid unless the correlation factor for a linear relationship between concentration and response for reference solution (c), (d) and (e) is not less than 0.995 and the signal-to-noise ratio for reference solution (c) is not less than 5.

Inject the test solution. Calculate the content of nitrite from the peak areas in the chromatogram obtained with reference solution (c), (d) and (e).

Boron. Not more than 1 ppm.

Determine by inductively coupled plasma atomic emission spectroscopy (2.4.3).

Boron is determined by measurement of the emission from inductively coupled plasma (ICP) at a wavelength specific to boron. The emission line at 249.733 nm is used. Use an appropriate apparatus, whose settings have been optimised as directed by the manufacturer.

Test solution. Dissolve 0.25 g of the substance under examination in about 2 ml of *water,* add 100 µl of *nitric acid* and dilute to 10.0 ml with 1.0 per cent v/v solution of *nitric acid.*

Reference solution (a). A 1.0 per cent v/v solution of *nitric acid* in *water* (blank).

Reference solution (b). A 11.4 µg per ml solution of *boric acid* in a 1 per cent v/v solution of *nitric acid* in *water* (STD_{cal}).

Reference solution (c). Dissolve 0.25 g of *dalteparin sodium IPRS* with no detectable boron in about 2 ml of *water,* add 100 µl of *nitric acid,* and dilute to 10.0 ml with1.0 per cent v/v solution of nitric acid (STD_0).

Reference solution (d). Dissolve 0.25 g of a reference dalteparin sodium with no boron detected in about 2 ml of a 1 per cent v/v solution of *nitric acid* in *water,* add 10 µl of a 5.7 mg per ml solution of *boric acid* and dilute to 10.0 ml with the same solvent (STD_1). This solution contains 1 µg per ml of boron.

Calculate the content of boron in the substance under examination, using the following correction factor:

$$f = \frac{(STD_1 - STD_0) \times 2}{(STD_{cal} - \text{blank})}$$

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° over *diphosphorus pentoxide* at a pressure not exceeding 670 Pa for 3 hours.

Storage. Store protected from light and moisture and below 40° temperature.

Dalteparin Sodium Injection

Dalteparin Sodium Injection is a sterile solution of Dalteparin Sodium in a suitable diluent.

The estimated activity of anti-factor Xa is not less than 90 per cent and not more than 110 per cent of the stated activity.

Production

The final product is produced by methods of manufacturing designed to ensure that substances lowering blood pressure are not introduced and to ensure freedom from contamination by over-sulphated glycosaminoglycans.

Usual strengths. 2000 IU per 0.2 ml; 2500 IU per 0.2 ml; 5000 IU per 0.2 ml; 7500 IU per 0.2 ml.

Identification

A. Determine by size-exclusion chromatography (2.4.16) using the following solutions in the mobile phase.

Test solution. Dilute the injection to contain 1600 units of anti-factor Xa per ml.

Reference solution. A 1.0 per cent w/v solution of *heparin low-molecular-mass for calibration IPRS.*

Chromatographic system

- a stainless steel column 30 cm x 7.5 mm, packed with appropriate porous silica beads (5 µm) with a fractionation range for proteins of approximately 15 000 to 100 000 (Such as Waters Protein-Pak and Toso Hass TSK G2000SW),

- mobile phase: a 2.84 per cent w/v solution of *anhydrous sodium sulphate* adjusted to pH 5.0 with *dilute sulphuric acid*,
- flow rate: 0.5 ml per minute,
- a differential refractometer (RI) detector connected in series to an ultraviolet spectrophotometer (UV) set at 234 nm such that the UV monitor is connected to the column outlet, and the RI detector to the UV-monitor outlet. It is necessary to measure the time lapse between the 2 detectors accurately so that their chromatograms can be aligned correctly. The retention times used in the calibration must be those from the RI detector,
- injection volume: 25 µl.

The normalisation factor used to calculate the relative molecular mass from the RI/UV ratio is obtained as follows. Calculate the total area under the UV_{234} (SUV_{234}) and the RI (SRI) curves by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram). Calculate the ratio r using the following expression.

$$\frac{\sum RI}{\sum UV_{234}}$$

Calculate the factor *f* using the following expression.

$$\frac{M_{na}}{r}$$

where, M_{na} = assigned number-average relative molecular mass of the *heparin low-molecular-mass for calibration IPRS* found in the leaflet supplied with the RS.

Provided the UV_{234} and the RI responses are aligned, the relative molecular mass *M* at any point is calculated using the following expression.

$$f\frac{RI}{UV_{234}}$$

The resulting table of retention times and relative molecular masses may be used to derive a calibration curve for the chromatographic system by fitting a suitable mathematical relationship to the data. A polynomial of the 3rd degree is recommended. *(It must be stressed that the extrapolation of this fitted calibration curve to higher molecular masses is not valid).*

Inject the reference solution. The test is not valid unless the column efficiency is not less than 20000 theoretical plates.

Inject the test solution.

The mass-average relative molecular mass is defined by the following expression.

$$\frac{\sum(RI_iM_i)}{\sum RI_i}$$

Where, RI_i = mass of substance eluting in the fraction *i*;
M_i = relative molecular mass corresponding to fraction *i*.

The mass-average relative molecular mass ranges between 5600 and 6400. The mass percentage of chains lower than 3000 is not more than 13.0 per cent. The mass percentage of chains higher than 8000 ranges between 15.0 per cent and 25.0 per cent.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.9 and not more than 3.2.

C. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution The solution is clear (2.4.1) and not more intensely coloured than reference solutionYS3 (2.4.1).

pH (2.4.24). 5.0 to 7.5,

Bacterial endotoxins (2.2.3). Not more than 0.01 Endotoxin Units per IU of anti-Xa activity.

Other tests. Comply with the tests stated under Parenteral Preparation (Injections).

Assay

Anti-factor Xa activity. Not less than 90 and not more than 110 Anti-Factor Xa IU per mg.

Acetic acid solution. Transfer 42 ml of *glacial acetic acid* to a 100-ml volumetric flask, dilute with *water* to volume, and mix.

Polyethylene glycol 6000 buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl)aminomethane* and 8.77 g of *sodium chloride* in 500 ml of *water.* Add 1.0 g of *polyethylene glycol 6000*, adjusted to pH 7.4 with *hydrochloric acid* and dilute with *water* to 1000 ml.

Buffer pH 7.4. Dissolve 6.08 g of *tris(hydroxymethyl) aminomethane* and 8.77 g of *sodium chloride* in 500 ml of *water.* Adjusted to pH 7.4 with *hydrochloric acid* and dilute to 1000 ml with *water.*

Buffer pH 8.4. Dissolve 3.03 g of *tris(hydroxymethyl) aminomethane*, 5.12 g of *sodium chloride* and 1.40 g of *edetate*

sodium in 250 ml of *water*. Adjusted to pH 8.4 with *hydrochloric acid* and dilute to 500 ml with *water*.

Human antithrombin III solution. Reconstitute a vial of antithrombin III in *water* to obtain a solution containing 5 Antithrombin III Units per ml. Dilute the solution with *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution having a concentration of 1.0 Antithrombin III Unit per ml.

Factor Xa solution. Reconstitute a weighed quantity of bovine factor X*a* in *Polyethylene glycol 6000* buffer pH 7.4 to obtain a solution that gives an increase in absorbance value at 405 nm of not more than 0.20 absorbance units per minute when assayed as described below but using as an appropriate volume (V, in µl) of Buffer pH 7.4 instead of *V* µl of the dalteparin solution.

Chromogenic substrate solution. Prepare a solution of a suitable chromogenic substrate for amidolytic test for factor X*a* in water to obtain a concentration of about 3 mM. Dilute with buffer pH 8.4 to obtain a solution having a concentration of 0.5 mM.

Reference solutions. Dilute low molecular mass heparins with Buffer pH 7.4 to obtain four dilutions in the concentration range between 0.025 and 0.2 USP Anti-Factor X*a* IU per ml.

Test solutions. Proceed as directed for reference solutions to obtain concentrations of Dalteparin Sodium similar to those obtained for the reference solutions.

Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the test solutions; and S1, S2, S3, and S4 each in duplicate for the dilutions of the reference solutions. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.] To each tube add the same volume, V, (20 to 50 µl) of *Human antithrombin III solution* and an equal volume, V, of either the blank, buffer pH 7.4, or an appropriate dilution of the test solutions and reference solutions. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 minute. Add to each tube volume 2V (40 to100 µl) of *Factor* Xa solution, and incubate for 1.0 minute. Add 5V (100 to 250 µl) volume of *chromogenic substrate solution*. Stop the reaction after 4.0 minutes with 5V (100 to 375 µl) volume of *acetic acid solution*. Measure the absorbance of each solution at 405 nm against blank B1.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and reference solutions, and calculate the potency of the dalteparin sodium in IU of anti-factor Xa activity per ml using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated. Express the anti-factor X*a* activity of Dalteparin Sodium per mg, calculated on the dried basis.

Anti-factor IIa activity

Reference solutions. Dilute low molecular mass heparins with Buffer pH 7.4 to obtain four dilutions in the concentration range between 0.015 and 0.075 USP Anti-Factor II_a activity per ml.

Test solutions. Proceed as directed for reference solutions to obtain concentrations of Dalteparin Sodium similar to those obtained for the reference solutions.

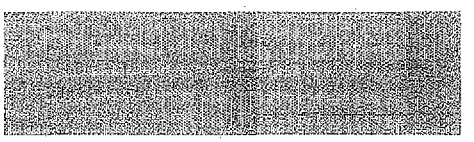
Label 18 suitable tubes: B1 and B2 for blanks; T1, T2, T3, and T4 each in duplicate for the dilutions of the test solutions; and S1, S2, S3, and S4 each in duplicate for the dilutions of the reference solutions. *[NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, T1, T2, T3, T4, T1, T2, T3, T4, S1, S2, S3, S4, B2.]* To each tube add the same volume, V, (20 to 50 µl) of *Human antithrombin III solution* and an equal volume, V, of either the blank, buffer pH 7.4, or an appropriate dilution of the test solutions and reference solutions. Mix, but do not allow bubbles to form. Incubate at 37° for 1.0 minute. Add to each tube volume 2V (40 to100 µl) of *Factor* Xa solution, and incubate for 1 minute. Add 5V (100 to 250 µl) volume of *chromogenic substrate solution*. Stop the reaction after 4.0 minutes with 5V (100 to 375 µl) volume of *acetic acid solution*. Measure the absorbance of each solution at 405 nm against blank B1.

For each series, calculate the regression of the absorbance against log concentrations of the test solutions and reference solutions, and calculate the potency of the dalteparin sodium in IU of anti-factor Xa activity per ml using statistical methods for parallel-line assays. The four independent log relative potency estimates are then combined to obtain the final geometric mean. Its confidence limits are calculated. Express the anti-factor X*a* activity of Dalteparin Sodium per mg, calculated on the dried basis.

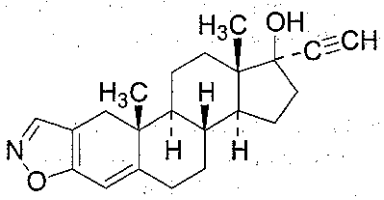
Anti-factor X*a* to anti-factor II*a* ratio. The ratio of the numerical value of the anti-factor X*a* activity in Anti-Factor X*a* IU per mg to the numerical value of the anti-factor II*a* activity in Anti-Factor II*a* IU per mg, as determined by the Assay (anti-factor Xa activity) and the Anti-factor IIa activity, respectively, is not less than 1.9 and not more than 3.2.

Storage. Store at a temperature not exceeding 30°.

Labelling. The label states (a) the number of International Units of anti-factor Xa activity per miligram; (b) the number of International Units of anti-factor IIa activity per miligram; (c) the mass-average molecular mass and the percentage of molecules within defined molecular mass ranges; (d) where applicable, that the contents are the sodium salt.



Danazol



$C_{22}H_{27}NO_2$ Mol. Wt. 337.5

Danazol is 17α-pregna-2,4-diene-20-yno[2,3-*d*]isoxazol-17-ol.

Danazol contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{22}H_{27}NO_2$, calculated on the dried basis.

Category. Antigonadotrophin.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *danazol IPRS* or with the reference spectrum of danazol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 285 nm.

Tests

Specific optical rotation (2.4.22). +21.0° to +27.0°, determined in a 1.0 per cent w/v solution in *chloroform*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 9 volumes of *chloroform* and 1 volume of *methanol*.

Mobile phase. A mixture of 70 volumes of *cyclohexane* and 30 volumes of *ethyl acetate*.

Test solution. Dissolve 0.5 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dissolve 50 mg of *danazol IPRS* in 100.0 ml of the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 20.0 ml with the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in warm air and examine under ultraviolet light at 254 nm. Expose the plate to the vapour of iodine for 5 minutes and examine the plate again. By both methods of visualisation, any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 2.7 kPa.

Assay. Weigh 0.1 g, previously dried, dissolve in 50 ml of *ethanol (95 per cent)*, swirling until dissolved, and dilute to 100.0 ml with *ethanol (95 per cent)*. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{22}H_{27}NO_2$ from the absorbance obtained by repeating the procedure using a solution containing 0.002 per cent w/v of *danazol IPRS* in place of the substance under examination.

Storage. Store protected from light.

Danazol Capsules

Danazol Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of danazol, $C_{22}H_{27}NO_2$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

A. Extract the contents of the capsules containing about 50 mg of Danazol with 50 ml of *chloroform*, filter and evaporate the filtrate to dryness on a water-bath in a stream of nitrogen. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *danazol IPRS* or with the reference spectrum of danazol.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.75 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary with dissolution medium at 286 nm (2.4.7). Calculate the content of danazol, $C_{22}H_{27}NO_2$, in the medium from the absorbance obtained from a solution of known concentration of *danazol IPRS*, prepared by dissolving in minimum quantity of *isopropyl alcohol* and diluted with dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{27}NO_2$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the mixed contents of 20 capsules containing 100 mg of Danazol in 50 ml of the mobile phase for 10 minutes and dilute to 100.0 ml with the mobile phase and filter. Dilute 5.0 ml of the filtrate to 25.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *danazol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 30 volumes of *methanol* and 30 volumes of *water*,
- flow rate: 1.5 ml per minute.
- spectrophotometer set at 270 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

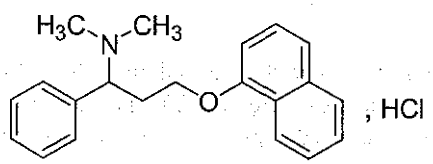
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{27}NO_2$ in the capsules.

Storage. Store protected from light.

Dapoxetine Hydrochloride

Dapoxetine Hydrochloride monohydrate



$C_{21}H_{23}NO,HCl$ Mol wt. 341.9

Dapoxetine Hydrochloride is (*RS*)-*N*,*N*-Dimethyl-3-(1-naphthyloxy)-1-phenylpropylamine hydrochloride.

Dapoxetine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{23}NO,HCl$, calculated on the dried basis.

Category. Selective serotonin re-uptake inhibitor (SSRI).

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dapoxetine hydrochloride IPRS* or with the reference spectrum of dapoxetine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. A 0.0004 per cent w/v solution of *dapoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of 0.1 per cent v/v solution of *trifluoroacetic acid* in *water* and 60 volumes 0.1 per cent v/v solution *trifluoroacetic acid* in *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, tailing factor is not more than 2.0.

Inject the test solution, the area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Enantiomeric purity. D-isomer is 48.5 to 51.5 per cent and *L*- isomer is 48.5 to 51.5 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with mobile phase.

Reference solution. A 0.05 per cent w/v solution of *dapoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, (Such as chiralcel OJ-RH) (5 µm)
- mobile phase: a mixture of 80 volumes of *methanol*, 20 volumes of *ethanol* and 0.1 volumes of *triethylamine*,
- flow rate: 1ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of *D*-isomer and *L*-isomer is not more than 2.0

and the resolution between D-isomer and L-isomer is not less than 1.5.

Inject the reference solution and the test solution.

Calculate the content of D-isomer and L-isomer.

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in mobile phase and dilute to 100.0 ml with mobile phase.

Reference solution. A 0.025 per cent w/v solution of *dapoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of 0.1 per cent *trifluoroacetic acid* in *water* and 60 volumes 0.1 per cent *trifluoroacetic acid* in *acetonitrile*.
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO$,HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Dapoxetine Tablets

Dapoxetine Hydrochloride Tablets.

Dapoxetine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dapoxetine, $C_{21}H_{23}NO$.

Usual strengths. The equivalent of 30 mg; 60 mg of dapoxetine.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *dapoxetine hydrochloride IPRS* in the dissolution medium to obtain a solution of known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 5.0 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 3 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl,
- run time: about 10 minutes.

Inject the reference solution and the test solution.

Q. Not less than 70.0 per cent of the stated amount of $C_{21}H_{23}NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Prepared by dissolving 6.8 g of potassium dihydrogen orthophosphate in 1000 ml of *water*, add 3 ml of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. A mixture of equal volumes of buffer and *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 30 mg of dapoxetine add 50 ml of solvent mixture, sonicate for 5 minutes, dilute to 100.0 ml with the solvent mixture. Centrifuge the solution if required.

Reference solution. Dissolve 34 mg of *dapoxetine hydrochloride IPRS* in 50 ml of solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm),

- mobile phase: A. 80 volumes of buffer solution and 20 volumes of *acetonitrile*,
  B. a mixture of 30 volumes of buffer solution and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
8	50	50
14	50	50
15	70	30
20	70	30

Inject the reference solution. The test is not valid unless the column efficiency in not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution, the area of any secondary peak is not more than 1.0 per cent and the sum of area of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 30 mg of Dapoxetine, and transfer to a 100-ml volumetric flask. Add about 50 ml of mobile phase and disperse with the aid of ultrasound for 20 minutes, cool and dilute to volume with mobile phase, filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.033 per cent w/v solution of *dapoxetine hydrochloride IPRS* in mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Use the chromatographic condition as described under Dissolution.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

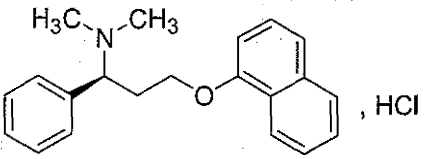
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of dapoxetine.

S-Dapoxetine Hydrochloride



$C_{21}H_{23}NO,HCl$ Mol wt. 341.9

S-Dapoxetine Hydrochloride is (*S*)-*N*,*N*-Dimethyl-3-(1-naphthyloxy)-1-phenylpropylamine hydrochloride.

S-Dapoxetine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{23}NO,HCl$, calculated on the anhydrous basis.

Category. Selective serotonin re-uptake inhibitor (SSRI).

Description. A white to off white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *S-dapoxetine hydrochloride IPRS* or with the reference spectrum of *S*-dapoxetine hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in to a 1000 ml *water*, add 3 ml of *triethylamine* and adjusted to pH 3.0 with *orthophosphoric acid*.

Solvent mixture. Equal volumes of buffer solution and *acetonitrile*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture, sonicate to dissolve and dilute to 10.0 ml with the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *S-dapoxetine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 2.1 mm, packed with octadecylsilane bonded to porous silica (1.7 µm) (Such as Acquity UPLC R BEH),
- column temperature: 50°,
- sample temperature: 5°,
- mobile phase: A. a mixture of 80 volumes of buffer solution and 20 volumes of *acetonitrile*,
  B. a mixture of 30 volumes of buffer solution and 70 volumes of *acetonitrile*,

- flow rate: 0.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 1 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
15	70	30
20	50	50
22	50	50
22.1	85	15
24	85	15

Name	Relative retention time
1-Fluoronephtanlene	2.34
Dapoxetine HCl	1.0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 10000 theoretical plates, tailing factor is not more than 3.0.

Inject the test solution, the area of any secondary peak is not more than 0.2 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Enantiomeric purity. R-isomer is not more than 1 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5.0 mg of the substance under examination in *ethanol*, sonicate to dissolve and dilute to 10.0 ml with the same solvent.

Reference solution. A 0.05 per cent w/v solution of *S-dapoxetine hydrochloride IPRS* in with the *ethanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, (Such as Chiralpak AD-H),
- mobile phase: a mixture of 90 volumes of *n-hexane*, 10 volumes of *isopropyl alcohol*, 0.2 volume of *diethylamine* and 0.2 volume of *trifluoroacetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

The retention time of *S*-dapoxetine and *R*-dapoxetine is about 9.8 and 8.8 minutes respectively.

Inject the reference solution. The test is not valid unless resolution between *R*-isomer and *S*-isomer is not less than 1.5.

Inject the test solution. Calculate the content of *R*-isomer by area normalization method.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Dissolve 0.25g in a 50.0 ml of a mixture of 1 per cent w/v solution of *mercuric acetate* in *anhydrous acetic acid*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03419 g of $C_{21}H_{23}NO,HCl$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

S-Dapoxetine Tablets

S-Dapoxetine Hydrochloride Tablets

S-Dapoxetine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of *S*-dapoxetine, $C_{21}H_{23}NO$.

Usual strengths. 30 mg; 60 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve 15 mg of *S-dapoxetine hydrochloride IPRS* and in 60.0 ml of the dissolution medium and sonicate for 10 minutes and dilute to 100.0 ml with the dissolution medium. Dilute 5.0 ml of the solution to 100.0 ml with same solvent.

Use the chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{23}NO$.

Q. Not less than 70 per cent of the stated amounts of $C_{21}H_{23}NO$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water*, add 3 ml of *triethylamine* and adjusted to pH 3.0 with *orthophosphoric acid.*

Solvent mixture. A mixture of equal volumes of buffer solution and *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 30 mg of *S*-Dapoxetine to a100-ml volumetric flask, add 50.0 ml of solvent mixture and sonicate for 5 minutes. Make up the volume with solvent mixture mix and centrifuge.

Reference solution (a). 0.034 per cent w/v solution of *S-dapoxetine hydrochloride IPRS* in solvent mixture.

Reference solution (b). 0.030 per cent w/v solution of *1-flouro napthalene impurity IPRS* in solvent mixture.

Reference solution (c). Dilute 1.0 ml of each reference solution (a) and reference solution (b) to 100.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil BDS),
- mobile phase: A. a mixture of 80 volumes of buffer solution and 20 volumes of *acetonitrile*,
  B. a mixture of 30 volumes of buffer solution and 70 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
8	50	50
14	50	50
15	70	30
20	70	30

Name	Relative retention time
1-Fluoronephtanlene	2.67
Dapoxetine hydrochloride	1.0

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 5000 theoretical plates, tailing factor is not more than 2.0 for *S*-dapoxetine and the resolution between *S*-dapoxetine and1-fluoronephthalene is not less than 20.0

Inject the test solution, the area of any secondary peak is not more than 1.0 per cent and the sum of areas of all the secondary peaks is not more than 2.0 per cent, calculated by area normalization.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 30 mg of *S*-Dapoxetine to a 100-ml volumetric flask, add 50.0 ml of mobile phase and sonicate for 20 minutes. Make up the volume with mobile phase and centrifuge. Dilute 2.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution. A 0.0027 per cent w/v solution of *S-dapoxetine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: a mixture of 650 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml *water,* 3.0 ml of *triethylamine* adjusted to pH 3.0 with *orthophosphoric acid* and 350 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0.

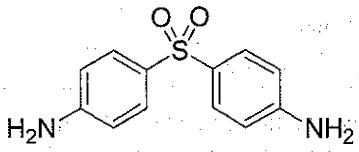
Inject the reference solution and the test solution.

Calculate the contents of $C_{21}H_{23}NO$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of *S*-dapoxetine.

Dapsone



$C_{12}H_{12}N_2O_2S$ Mol. Wt. 248.3

Dapsone is the bis(4-aminophenyl)sulphone.

Dapsone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{12}N_2O_2S$, calculated on the dried basis.

Category. Antileprotic.

Description. A white or creamy-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dapsone IPRS* or with the reference spectrum of dapsone.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *methanol* shows absorption maxima at 260 nm and 295 nm; absorbance at about 260 nm, about 0.36 and at 295 nm, about 0.6.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. 2 ml of a 0.005 per cent w/v solution in *0.1 M hydrochloric acid* gives the reaction of primary aromatic amines (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *n-heptane*, 20 volumes of *ethyl acetate*, 6 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 10.0 ml with *methanol*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with methanol.

Reference solution (c). A 0.1 per cent w/v solution of *dapsone IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with a 0.1 per cent w/v solution of *4-dimethylaminocinnamaldehyde* in a mixture of 99 volumes of *ethanol (95 per cent)* and 1 volume of *hydrochloric acid* and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. A 0.0025 per cent w/v solution of *dapsone IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 4.0 mm, packed with porous silica particles (10 µm),
- mobile phase: a mixture of 10 volumes of *isopropyl alcohol*, 10 volumes of *acetonitrile*, 10 volumes of *ethyl acetate* and 70 volumes of *hexane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak.

Calculate the content of $C_{12}H_{12}N_2O_2S$.

Storage. Store protected from light.

Dapsone Gel

Dapsone Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Dapsone $C_{12}H_{12}N_2O_2S$.

Usual strength. 5 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.5 to 7.0

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. a mixture of 75 volumes of *methanol* and 25 volumes of *water*.

Test solution. Disperse a quantity of the gel containing about 50 mg of Dapsone in 35 ml of the solvent mixture, vortex to disperse the sample completely. Further ultrasound for 15 minutes, cool and dilute to 50.0 ml with the solvent mixture and filter, discarding the first few ml of filtrate.

Reference solution. A 0.001 per cent w/v solution of *dapsone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A . 0.1 per cent solution of *triethylamine* in *water* adjusted to pH 3.0 with *orthophosphoric acid* and filter,

  B. a mixture of 7 volumes of *acetonitrile* and 23 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	85	15
30	85	15
35	70	30
60	70	30
65	85	15
70	85	15

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Gel.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. a mixture of 75 volumes of *methanol* and 25volumes of *water*.

Test solution. Disperse a quantity of the gel containing about 50 mg of Dapsone in 35 ml of the solvent mixture, vortex to disperse the sample completely, ultrasound for 15 minutes, cool and dilute to 50.0 ml with the solvent mixture and filter. Discarding the first few ml of filtrate. Dilute 5.0 ml to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *dapsone IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase. a mixture of 70 volumes of 0.1 per cent solution of *triethylamine* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and filter and 30 volumes of mixture of 7 volumes of *acetonitrile* and 23 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{12}H_{12}N_2O_2S$ in the gel.

Storage. Store below 25°, protect from light and moisture.

Dapsone Tablets

Dapsone Tablets contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of dapsone, $C_{12}H_{12}N_2O_2S$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1g of Dapsone with 10 ml of *acetone*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dapsone IPRS* or with the reference spectrum of dapsone.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a 2 per cent w/v solution of *hydrochloric acid*,

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Transfer a measured volume of the filtrate containing about 0.2 mg of Dapsone to a 25-ml volumetric flask, add 5 ml of *1 M sodium hydroxide*, dilute to volume with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{12}H_{12}N_2O_2S$ from the absorbance obtained from a solution prepared by adding 5 ml of *1 M sodium hydroxide* to 20 ml of a 2 per cent v/v solution of *hydrochloric acid* containing 0.2 mg of *dapsone IPRS* and adding sufficient *water* to produce 25.0 ml.

Q. Not less than 75 per cent of the stated amount of $C_{12}H_{12}N_2O_2S$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 20 volumes of *n-heptane*, 20 volumes of *ethyl acetate*, 6 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (a). Shake a quantity of the powdered tablets containing 0.1 g of Dapsone with 10 ml of *methanol* and filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of test solution (b) to 10.0 ml with *methanol*.

Reference solution (b). Dilute 2 ml of reference solution (a) to 10 ml with *methanol*.

Reference solution (c). A 0.1 per cent w/v solution of *dapsone IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with a 0.1 per cent w/v solution of *4-dimethylaminocinnamaldehyde* in a mixture of 99 volumes of *ethanol (95 per cent)* and 1 volume of *hydrochloric acid* and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

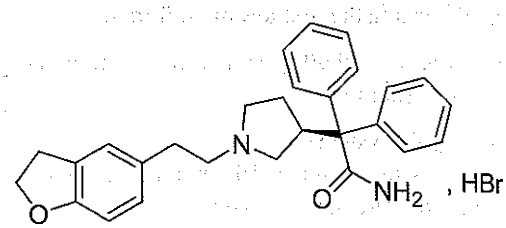
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.25 g of Dapsone and dissolve in a mixture of 15 ml of *water* and 15 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*. Cool the solution to about 15° and determine by the nitrite titration (2.3.31). Carry out a blank titration.

1 ml of *0.1 M sodium nitrite* is equivalent to 0.01242 g of $C_{12}H_{12}N_2O_2S$.

Storage. Store protected from light.

Darifenacin Hydrobromide



$C_{28}H_{30}N_2O_2,HBr$ Mol. Wt. 507.5

Darifenacin Hydrobromide is (3S)-1-[2-(2,3-dihydrobenzofuran-5-yl)ethyl]-3-pyrrolidnyl}-2,2-diphenylacetamide hydrobromide.

Darifenacin Hydrobromide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{28}H_{30}N_2O_2,HBr$, calculated on the anhydrous basis.

Category. Antispasmodic.

Description. A white to almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *darifenacin hydrobromide IPRS* or with the reference spectrum of darifenacin hydrobromide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of bromides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 30.0 ml solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). 0.015 per cent w/v solution of *hydrobromic acid* in the solvent mixture.

Reference solution (b). 0.0005 per cent w/v solution of *darifenacin hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane chemically bonded to porous silica (5 µm) (Such as Hypersil BDS),
- mobile phase: A. a buffer solution prepared by dissolving 2.76 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of 0.2 per cent v/v solution of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid* and filter,

  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	74	26
2	74	26
12	70	30
25	65	35
40	35	65
41	74	26
50	74	26

Name	Relative retention time	Correction factor
Hydrobromic acid	0.11	—
Darifenacin impurity A[1]	0.23	1.24
Darifenacin impurity B[2]	0.59	1.37
Darifenacin (Retention time: about 16 minutes)	1.0	—
Darifenacin impurity D[3]	1.39	0.79
Darifenacin impurity E[4]	1.57	0.87
Darifenacin impurity F[5]	1.95	1.14
Darifenacin impurity G[6]	2.14	1.18
Darifenacin impurity H[7]	2.25	1.1

[1]dari acetamide compound, [diphenyl [(3S)-pyrrolidin-3-yl]acetamide tartrate],

[2]dari cyano compound, [diphenyl [(3S)-pyrrolidin-3-yl] acetonitrile hydrobromide],

[3]darifenacin oxidised impurity, {2-[1-(2-benzofuran-5-yl)ethyl] pyrrolidin-3-yl}-2,2- diphenylacetamide,

[4] bromo darifenacin impurity, 2{1-[2-(7-bromo-2, 3- dihydrobenzofuran-5-yl)ethyl]-3- pyrrolidinyl)-2,2- diphenylacetamide,

[5]cyano darifenacin impurity, [2-(1-(2-(2,3- dihydrobenzofuran-5-yl) ethyl) pyrrolidin 3-yl)-2,2- diphenylacetonitrile],

[6]darifenacin bromo compound, [5-(2-bromoethy)-2,3-dihydro-benzofuran,

[7]darifenacin dimer impurity [2-(1-(2-(2,3-dihydrobenzofuran-5-yl) ethyl)pyrrolidin-3-yl)-*N*-(2-(2,3-dihydrobenzofuran-5-yl)ethyl)-2,2-diphenylacetamide].

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor for the principal peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to darifenacin impurities A, B,D,E,F,G and H, each of, are not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram with reference solution (b) (1.0 per cent). Ignore any peak due to hydrobromic acid.

Enantiomeric purity. Not more than 1.0 per cent of R-enantiomer.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, (Such as chiralpak IC) (5 µm),
- column temperature: 15°,
- mobile phase: a mixture of 50 volumes of *n-hexane*, 50 volumes of *ethanol* and 0.3 volumes of *diethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

The relative retention time of R-enantiomer with respect to darifenacin is about 0.8.

Inject the test solution. Calculate the content of the *R*-enantiomer by area normalization.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.1g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 30.0 ml of solvent mixture and dilute to 50.0 ml

with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *darifenacin hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane chemically bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 2.76 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of 0.2 per cent v/v solution of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*,

B. *acetonitrile,*

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	74	26
2	74	26
17	68	32
19	25	75
22	25	75
23	74	26
28	74	26

Retention time of the principal peak is about 16 minutes.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{30}N_2O_2$,HBr.

Storage. Store protected from light and moisture.

Darifenacin Prolonged-release Tablets

Darifenacin Hydrobromide Prolonged-release Tablets

Darifenacin Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Darifenacin Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of darifenacin, $C_{28}H_{30}N_2O_2$.

Usual strengths. 7.5 mg; 15 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powdered tablets containing 30 mg of darifenacin in 30 ml of *acetonitrile* with the aid of ultrasound for 20 minutes, cool, dilute to 50.0 ml with *acetonitrile* and filter. Dilute 5 .0 ml of the solution to 10.0 ml with the *water.*

Reference solution. A 0.00036 per cent w/v solution of *darifenacin hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: A. Dissolve 1.38 g of *sodium dihydrogen phosphate monohydrate* in 1000 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and filter,

B. *acetonitrile,*

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
25	55	45
30	45	55
33	45	55
35	80	20
38	80	20

Name	Relative retention time	Correction factor
Darifenacin	1.0	—
Darifenacin impurity D[1]	1.20	0.76
Darifenacin impurity E[2]	1.32	0.85

[1]darifenacin oxidised impurity, {2-[1-(2-benzofuran-5-yl)ethyl] pyrrolidin-3-yl}-2,2- diphenylacetamide,

'bromo darifenacin impurity, 2{1-[2-(7-bromo-2, 3- dihydrobenzofuran-5-yl)ethyl]-3- pyrrolidinyl)-2,2- diphenylacetamide.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to darifenacin impurity D and E is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 0. 2 times the area of the principal peak in the chromatogram obtained with the reference solution (0. 2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and peaks with relative retention time 0.11 with reference to principal peak.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4. 14), as described under Assay, using the following solution.

Test solution. Disperse one intact tablet in 15.0 ml *methanol* with the aid of ultrasound for 10 minutes and dilute to 25.0 ml with the *methanol*, filter. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution. Dissolve 36 mg of *darifenacin hydrobromide IPRS* in 70 ml of *methanol* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{30}N_2O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60.0 mg of darifenacin in 70.0 ml of *methanol* with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the *methanol*, filter. Dilute 1.0 ml of the solution to 10.0 ml with mobile phase.

Reference solution. Dissolve 36 mg of *darifenacin hydrobromide IPRS* in 70 ml of *methanol* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 25.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase. a mixture of 700 volumes of a buffer solution prepared by dissolving 1.38 g of *sodium dihydrogen phosphate monohydrate* in 1000.0 ml of *water*, adjusted to pH 2.5 with *orthophosphoric* and 300 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 5 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

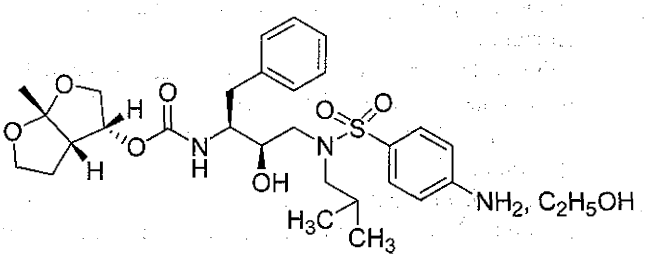
Inject the reference solution and the test solution.

Calculate the content of $C_{28}H_{30}N_2O_2$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of darifenacin.

Darunavir Ethanolate



$C_{27}H_{37}N_3O_7S.C_2H_5OH$ Mol. Wt. 593.7

Darunavir Ethanolate is [(1*S*,2*R*)-3-[[4-aminophenyl) sulfonyl] (2-methylpropyl)amino]-2-hydroxy-1-(phenylmethyl)propyl]-carbamic acid (3*R*, 3a*S*, 6a*R*)-hexahydrofuro [2,3-b] furan-3-yl ester monoethanolate.

Darunavir Ethanolate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{37}N_3O_7S$, calculated on anhydrous and ethanol free basis.

Category. Antiretroviral.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *darunavir ethanolate IPRS* or with the reference spectrum of darunavir ethanolate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

NOTE — After opening the sample, carry out ethanol content, water content and assay simultaneously.

Specific optical rotation (2.4.22). +35° to +41°, on anhydrous and ethanol free basis at 20°, determined in a 1.0 per cent w/v solution in *acetone*, at 365 nm.

Ethanol content. Not less than 5.0 per cent and not more than 8.5 per cent, determined by gas chromatography (2.3.13).

Solvent mixture. Dilute 0.4 g of *isopropyl alcohol* to 500 ml with *dimethylformamide*.

Test solution. Dissolve 50 mg of the substance under examination in 5.0 ml of the solvent mixture.

Reference solution. Dilute 1.6 g of *ethanol* in solvent mixture and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with solvent mixture.

Chromatographic system

- a fused silica column 30 m x 0.53 mm, coated with 94 per cent dimethyl polysiloxane and 6 per cent cyanopropylphenyl (film thickness 3 µm),
- temperature:
  column. 45° for 8 minutes, then raised at the rate of 45° per minute to 230°, for 4 minutes,
  inlet port at 200° and detector at 260°
- split ratio: 1:5,
- flame ionization detector,
- flow rate: 3 ml per minute, using nitrogen as the carrier gas,
- injection volume: 1 µl.

Inject the reference solution. The test is not valid unless the resolution between the peak due to ethanol and isopropyl alcohol is not less than 1.2 and the relative standard deviation for the ratio of the peak areas due to ethanol and isopropyl alcohol for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. Calculate the content of ethanol from the ratio of peak area due to ethanol and isopropyl alcohol in the chromatogram obtained with the reference solution and the test solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of *water* and 50 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 25.0 ml with the same solvent.

Reference solution. A 0.0001 per cent w/v solution of *darunavir ethanolate IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a buffer solution prepared by dissolving 2.4 g of *sodium perchlorate* in 1000 ml of *water*, adjusted to pH 2.5 with *perchloric acid*,
  B. a mixture of equal volumes of *acetonitrile* and *methanol*,
- a gradient program using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
5	60	40
30	30	70
35	30	70
35.1	60	40
45	60	40

The relative retention time with reference to principal peak (retention time is about 13 minutes) for difurofuranyl impurity is about 1.46.

Inject the reference solution. The test is not valid unless, the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to di-furofuranyl impurity is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 7 times the area of the principal peak in the chromatogram with reference solution (0.7 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substance with the following modifcation.

Test Solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with

the same solvent. Further dilute 10.0 ml of the above solution to 20.0 ml with the solvent mixture.

Reference solution. A 0.025 per cent w/v solution of *darunavir ethanolate IPRS* in the solvent mixture.

Mobile phase. A mixture of equal volumes of mobile phase A and mobile phase B.

Retention time of the principal peak is about 5 minutes.

Inject the reference solution. The test is not valid unless, the column efficiency of the principal peak is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution. Run the chromatogram twice the retention time of the principal peak and measure the responses for the principal peak.

Calculate the content of $C_{27}H_{37}N_3O_7S$.

Storage. Preserve in tight, light resistant containers and store at a controlled temperature between 15° to 30°.

Darunavir Tablets

Darunavir Ethanolate Tablets

Darunavir ethanolate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of darunavir, $C_{27}H_{37}N_3O_7S$.

Usual strengths. 600 mg; 800 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution. (2.5.2)

Apparatus No. 2 (Paddle),
Medium: 900 ml of a buffer solution prepared by dissolving 6.9 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, add 20 g of *tween 20*,
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. a mixture of 25 volumes of *water* and 75 volumes of *methanol.*

Test solution. Use the filtrate, dilute if necessary, with the solvent mixture.

Reference solution. A 0.078 per cent w/v solution of *darunavir ethanolate IPRS* in the solvent mixture. Further dilute the solution with the solvent mixture to obtain a solution having a known concentration similar to that of the test solution. Add 4 per cent v/v of dissolution medium before making up the volume with the solvent mixture.

Chromatographic system
- a stainless steel column 5 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 2.8 g of *sodium perchlorate monohydrate* in 1000 ml of *water*, adjusted to pH 2.5 with *perchloric acid,* 25 volumes of *acetonitrile* and 25 volumes of *methanol.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{37}N_3O_7S$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{27}H_{37}N_3O_7S$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture A. Equal volumes of *acetonitrile* and *methanol.*

Solvent mixture B. Equal volumes of *acetonitrile* and *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 100 mg of darunavir in the solvent mixture B, sonicate for 20 minutes with intermittent swirling, cool and dilute to 100.0 ml with the solvent mixture B, mix well and filter.

Reference solution. A solution of *darunavir ethanolate IPRS* in the solvent mixture B containing 0.0002 per cent w/v of darunavir.

Chromatographic system
- a stainless steel column 5 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture of 75 volumes of a buffer solution prepared by dissolving 2.8 g of *sodium perchlorate monohydrate* in 1000 ml of *water* and filter, adjusted to pH 2.5 with *perchloric acid* and 25 volumes of solvent mixture A,
  B. a mixture of 25 volumes of a buffer solution prepared by dissolving 2.8 g of *sodium perchlorate* in 1000 ml of *water* and filter, adjusted to pH 2.5 with *perchloric acid* and 75 volumes of solvent mixture A,

- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
7	60	40
17.5	10	90
25	10	90
25.1	60	40
32	60	40

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any other secondary peak is not more than 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0. 5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Other tests. Complies with the tests stated under Tablets.

Water (2.3.43).Not more than 8.0 per cent, determined on 0.5g of the powdered tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile.*

Test solution. Weigh and transfer 5 intact tablets into a 500-ml volumetric flask. Add 250 ml of *water* and sonicate for 15 minutes with intermittent swirling, cool and add 200 ml of *acetonitrile,* sonicate for 10 minutes, cool and dilute to volume with *acetonitrile* and shake well for 2-3 minutes to mix and filter. Dilute with the solvent mixture to obtain a solution of the same concentration as that of the reference solution.

Reference solution. A solution of *darunavir ethanolate IPRS* in the solvent mixture containing 0.035 per cent w/v of darunavir.

Chromatographic system

- a stainless steel column 5 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3 µm)
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 2.8 g of *sodium perchlorate monohydrate* in 1000 ml of *water*, adjusted to pH 2.5 with *perchloric acid,* 25 volumes of *acetonitrile and* 25 volumes of *methanol.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

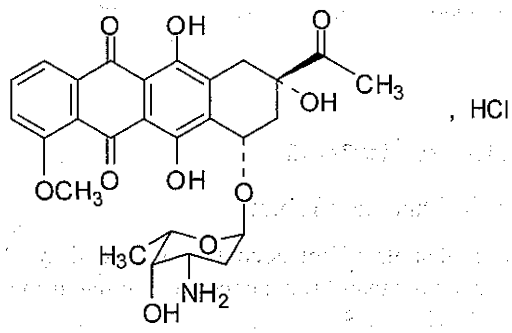
Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{37}N_3O_7S$ in the tablets.

Storage. Store in a cool dry place.

Labelling. The label states the strength in terms of equivalent amount of darunavir.

Daunorubicin Hydrochloride



$C_{27}H_{30}ClNO_{10}$ Mol. Wt. 564.0

Daunorubicin Hydrochloride is (8*S-cis*)-8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-L-*lyxo*-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-1-methoxy-5,12-naphthacenedione hydrochloride.

Daunorubicin Hydrochloride contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{27}H_{30}ClNO_{10}$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A crystalline, orange-red powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *daunorubicin hydrochloride IPRS* or with the reference spectrum of daunorubicin hydrochloride.

B. Dissolve about 10 mg in 0.5 ml of *nitric acid*, add 0.5 ml of *water* and heat over a flame for 2 minutes. Allow to cool and add 0.5 ml of *silver nitrate solution*; a white precipitate is formed.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 0.5 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *daunorubicin hydrochloride IPRS* in the mobile phase.

Reference solution (b). Dissolve 10 mg of *doxorubicin hydrochloride IPRS* and 10 mg of *epirubicin hydrochloride IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *daunorubicinone IPRS* and 5.0 mg of *doxorubicin hydrochloride IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and a solution containing 0.288 per cent w/v of *sodium laurylsulphate* and 0.225 per cent w/v of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to daunorubicin for (8*S*,10*S*)-8-acetyl-6,8,10,11-tetrahydroxy-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicin impurity A) is about 0.4, for doxorubicin (daunorubicin impurity D) is about 0.5, for epirubicin is about 0.6 and for (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-L-*lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-[(1*RS*)-1-hydroxyethyl]-1-methoxy-7,8,9,10-tetrahydrotetracene-5,12-dione (daunorubicin impurity B) is about 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to doxorubicin hydrochloride and epirubicin hydrochloride is not less than 2.0.

Inject reference solution (b), (c),(d) and the test solution. Run the chromatogram twice the retention time of daunorubicin peak. In the chromatogram obtained with test solution, the area of secondary peak corresponding to daunorubicin impurity A is not more than the area of corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of secondary peak corresponding to daunorubicin impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (1.5 per cent), the area of secondary peak corresponding to daunorubicin impurity D is not more than the area of corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent) and sum of areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (2.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Butanol (5.4). Not more than 1.0 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.1 g.

Daunorubicin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 4.3 Endotoxin Units per mg of daunorubicin hydrochloride.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{27}H_{30}ClNO_{10}$.

Storage. Store protected from light and moisture.

Daunorubicin Injection

Daunorubicin Hydrochloride Injection

Daunorubicin Injection is a sterile material consisting of Daunorubicin Hydrochloride and Mannitol, with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirement for the Appearance of solution and Particulate matter stated under Parenteral Preparations (Injections).

Usual strength. 20 mg.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Daunorubicin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of daunorubicin, $C_{27}H_{29}NO_{10}$.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 4.5 to 6.5, determined on the constituted solution.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.1 g.

Bacterial endotoxins (2.2.3). Not more than 4.3 Endotoxin Units per mg of daunorubicin.

Other tests. Comply with the tests stated under Parenteral Preparations (Powder for Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Reconstitute 1 vial with 5 ml of mobile phase and transfer to 200-ml volumetric flask. Wash the vial twice with 5 ml of mobile phase and transfer to the same volumetric flask. Repeat the same procedure for another 9 vials and dilute to volume. Further dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *daunorubicin hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 25 mg of *doxorubicin hydrochloride IPRS* in 100.00 ml of reference solution (a).

Chromatographic system

- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 62 volumes of *water* and 38 volumes of *acetonitrile,* adjusted to pH 2.2 with *orthophosphoric acid,*
- flow rate 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 5 µl.

The relative retention time with reference to *daunorubicin* for *doxorubicin* is about 0.7.

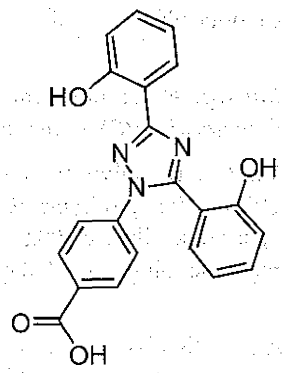
Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to doxorubicin and the daunorubicin is not less than 3.0 in the chromatogram obtain with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtain with reference solution (a).

Inject reference solution (a) and the test solution.

Calculate the content of $C_{27}H_{29}NO_{10}$ in the injection.

Storage. Store protected from light.

Deferasirox



$C_{21}H_{15}N_3O_4$ Mol. Wt. 373.4

Deferasirox is 4-[3,5-Bis (2-hydroxyphenyl)-1*H*-1,2,4-triazol-1-yl]-benzoic acid.

Deferasirox contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{15}N_3O_4$, calculated on the dried basis.

Category. Iron-chelating agent.

Description. A white to slightly yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *deferasirox IPRS* or with the reference spectrum of deferasirox.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

4-Hydrazino benzoic acid. Not more than 0.5 ppm.

Determine by liquid chromatography (2.4.14).

NOTE — Add solvent mixture very slowly with stirring.

Solvent mixture. 10 volumes of *water,* 90 volumes of *acetone* and 2.5 volumes of *orthophosphoric acid.*

Test solution. Dissolve 0.6 g of substance under examination in 2.0 ml of *dimethyl sulphoxide,* with the aid of mechanical shaker. Add slowly 2.0 ml of the solvent mixture with continuous mixing on mechanical shaker. Heat the solution at 45° for 35 minutes, then cool to 2° to 8° and dilute to 5.0 ml with mobile phase A (previously cooled to 2° to 8°). Shake

vigorously with mechanical shaker for about 3 minutes. Centrifuge immediately at 4800 rpm for 5 minutes and filter. Allow the filtrate to stand for 1 hour before injection.

Reference solution (a). Dissolve 6 mg of *4-hydrazino benzoic acid IPRS* in 1 ml of *dimethyl sulphoxide* and dilute to 20.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *dimethyl sulfoxide*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *dimethyl sulphoxide*. Transfer 1.0 ml of the solution to 50-ml volumetric flask, add 4.0 ml of *dimethyl sulphoxide* and 10.0 ml of the solvent mixture. Heat the solution at 45° for 35 minutes, then cool to 2° to 8° and dilute to volume with mobile phase A (previously cooled to 2° to 8°).

Reference solution (c). Transfer 2.0 ml of reference solution (b) to 10-ml volumetric flask, add 1.0 ml of *dimethyl sulphoxide*, 4.0 ml of the solvent mixture and dilute to volume with mobile phase A.

Reference solution (d). Weigh 0.6 g of *deferasirox IPRS* and transfer to 5-ml volumetric flask, add 200 µl of reference solution (a), 2.0 ml of *dimethyl sulphoxide* and shake well to dissolve. Add 2.0 ml of the solvent mixture and mix well using mechanical shaker. Heat the solution at 45° for 35 minutes, then cool to 2° to 8° and dilute to volume with mobile phase A (previously cooled to 2° to 8°). Shake vigorously with mechanical shaker for about 2 minutes. Centrifuge immediately at 4800 rpm for 5 minutes and filter. Allow the filtrate to stand for 1 hour before injection.

Chromatographic system

- a stainless steel column 15 cm × 3 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 90 volumes of *water* and 0.2 volume of *orthophosphoric acid*,

  B. a mixture of 90 volumes of *acetonitrile*, 10 volumes of *water* and 0.2 volume of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 316 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
2	90	10
8	58	42
8.1	0	100
16	0	100
16.1	90	10
20	90	10

The relative retention time with reference to deferasirox for 4-hydrazino benzoic acid is about 0.5.

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to 4-hydrazino benzoic acid and deferasirox is not less than 3.0 in the chromatogram obtained with reference solution (d), the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b) and the signal to noise ratio is not less than 10 in the chromatogram obtained with reference solution (c).

Inject reference solution (b) and the test solution.

Calculate the content of 4-Hydrazino benzoic acid.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of a solution prepared by dissolving 40 mg of *disodium edetate* in 1000 ml of *water*.

Test solution. Dissolve 10 mg of the substance under examination in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). A 0.0025 per cent w/v solution of *deferasirox IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.0005 per cent w/v solution of *deferasirox 1,3-isomer IPRS* in the solvent mixture.

Reference solution (c). Transfer 10 mg of *deferasirox IPRS* in 20-ml volumetric flask, add 10 ml of the solvent mixture, shake well to dissolve, add 1.0 ml of reference solution (b) and dilute to volume with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 20°,
- sample temperature: 5°,
- mobile phase: A. 0.1 per cent v/v solution of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid*,

  B. *acetonitrile*,
- flow rate: 1 ml per minute,
- a gradient programme using the conditions given below,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	55	45
10	55	45
30	50	50
50	20	80
65	20	80
65.1	55	45
75	55	45

Name	Relative retention time	Correction factor
Salicylamide[1]	0.15	0.75
Salicylic acid[2]	0.18	0.79
Cyclised DEF-I compound[3]	0.73	1.49
Deferasirox-1, 2-isomer[4]	0.89	0.76
Deferasirox-1, 3-isomer[5]	0.96	---
Deferasirox (Retention time: about 27 minutes)	1.0	---

[1]2-hydroxybenzamide,

[2] 2-hydroxybenzoic acid,

[3]2-(2-hydroxyphenyl)-4*H* -benzo[e] [1,3]oxazin-4-one; benzoxazinone Analog (DEF-I),

[4]2-[3,5-Bis (2-hydroxyphenyl)-1*H*-1, 2, 4-triazol-1-yl] benzoic acid,

[5]3-[3,5-Bis (2-hydroxyphenyl)-1*H*-1, 2, 4-triazol-1-yl] benzoic acid.

Inject reference solution (a) and (c). The test is not valid unless the resolution between the peaks due to deferasirox and deferasirox-1,3-isomer is not less than 1.3 in the chromatogram obtain with reference solution (c), the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to each of, salicylamide, salicylic acid, cyclized DEF-I compound and deferasirox-1, 2-isomer is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). The sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram with reference solution (a) (0.2 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *acetonitrile* and 20 ml of the mobile phase with the aid of ultrasound and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 10 mg of *deferasirox IPRS* in 2 ml of *acetonitrile* and 10 ml of the mobile phase with the aid of ultrasound and dilute to 20.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of 0.1 per cent v/v solution of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{15}N_3O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Deferasirox Tablets

Deferasirox Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of deferasirox, $C_{21}H_{15}N_3O_4$.

Usual strengths. 90 mg; 180 mg; 360 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.9 g of *sodium hydroxide* in 900 ml of *water*, adjusted to pH 6.8 with *2 M sodium hydroxide* or *2 M hydrochloric acid* and dilute to 1000 ml with *water*, add 5.0 g of *tween 20* and mix.

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 55 volumes of *water* and 45 volumes of *acetonitrile.*

Test solution. Dilute a suitable volume of the filtrate with the solvent mixture to obtain a solution containing 0.001 per cent w/v of Deferasirox.

Reference solution. Weigh 10 mg of *deferasirox IPRS* in 5 ml of *methanol* with the aid of ultrasound for 5 minutes and dilute to 100.0 ml with the dissolution medium. Dilute a suitable volume of the solution with the solvent mixture to obtain a solution having similar concentration to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{15}N_3O_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{21}H_{15}N_3O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. A 0.1 per cent v/v solution of *triethylamine*, adjusted to pH 3.0 with *dilute orthophosphoric acid.*

Solvent mixture. 30 volumes of the buffer solution and 70 volumes of *acetonitrile.*

Test solution. Disperse a quantity of powdered tablets containing 50 mg of Deferasirox in 150 ml of the solvent mixture, with the aid of ultrasound for 20 minutes and dilute to 200.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *deferasirox IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.9 g of *sodium hydroxide* in 1000 ml of *water*, adjusted to pH 7.4 with *2 M sodium hydroxide* or *2 M hydrochloric acid* and 60 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 0.3 g of Deferasirox in the solvent mixture, with the aid of ultrasound for about 30 minutes, and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase and filter.

Reference solution. A 0.3 per cent w/v solution of *deferasirox IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 50°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, add 1 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*, 40 volumes of *acetonitrile* and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 297 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

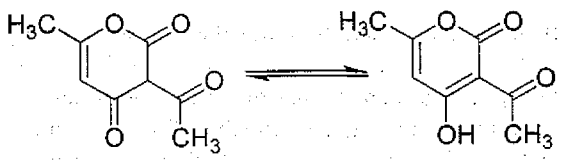
Inject the reference solution and the test solution.

Calculate the content of $C_{21}H_{15}N_3O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states that the tablets should be dispersible in water immediately before use, if the tablets are dispersible.

Dehydroacetic Acid



$C_8H_8O_4$ Mol. Wt. 168.1

Dehydroacetic Acid is a tautomeric mixture of 3-acetyl-6-methyl-*2H*-pyran-2,4(*3H*)-dione and 3-acetyl-4-hydroxy-6-methyl-*2H*-pyran-2-one

Dehydroacetic Acid contains not less than 98.0 per cent and not more than 100.5 per cent of $C_8H_8O_4$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dehydroacetic acid IPRS*.

B. Melts at 109° to 111° (2.4.21).

Tests

Arsenic (2.3.10). Heat gently 3.3 g with 2 ml of *nitric acid* and 0.5 ml of *sulphuric acid* in a long-necked flask until the first reaction has subsided, cool, add carefully and in small portions, 15 ml of *nitric acid* and 6 ml of *sulphuric acid*, taking care to avoid excessive foaming. Continue heating, adding further small portions of *nitric acid*, if necessary, until white fumes are evolved and the solution becomes colourless or almost colourless. Cool, add carefully 10 ml of *water*, evaporate until white fumes are evolved. Repeat the addition of *water* and evaporation until all the *nitric acid* has been removed, cool, dilute to 50 ml with *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Water (2.3.43). Not more than 1.0 per cent, determined on 2.0 g.

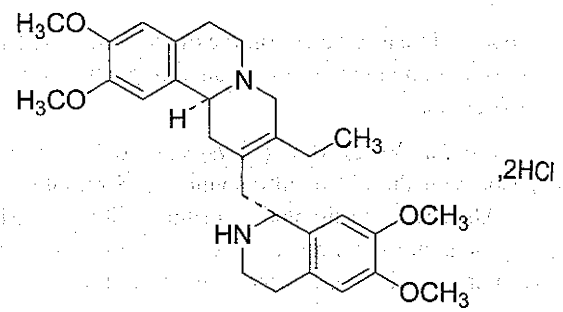
Assay. Dissolve 0.5 g in 75 ml of previously neutralised *ethanol (95 per cent)*, add *phenolphthalein solution* and titrate with *0.1 M sodium hydroxide* to a pink end-point that persists for not less than 30 seconds.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01681 g of $C_8H_8O_4$.

Storage. Preserve in well closed containers.

Dehydroemetine Hydrochloride

Dehydroemetine Dihydrochloride



$C_{29}H_{38}N_2O_4,2HCl$ Mol. Wt. 551.6

Dehydroemetine Hydrochloride is 2,3-didehydro-6′,7′,10, 11-tetramethoxyemetan dihydrochloride

Dehydroemetine Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{29}H_{38}N_2O_4,2HCl$, calculated on the dried basis.

Category. Antiamoebic.

Description. A white to yellowish-white, crystalline powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at 282 nm, about 0.62.

B. Sprinkle 5 mg on the surface of a 5 per cent w/v solution of *ammonium molybdate* in *sulphuric acid*; a green colour develops.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution YS5 or BYS6 (2.4.1).

pH (2.4.24). 3.5 to 5.0, determined in a 3.0 per cent w/v solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Dissolve 0.4 g in 40 ml of *anhydrous glacial acetic acid* and add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02758 g of $C_{29}H_{38}N_2O_4,2HCl$.

Storage. Store protected from light.

Dehydroemetine Injection

Dehydroemetine Hydrochloride Injection

Dehydroemetine Injection is a sterile solution of Dehydroemetine Hydrochloride in Water for Injections.

Dehydroemetine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dehydroemetine hydrochloride, $C_{29}H_{38}N_2O_4,2HCl$.

Usual strength. 30 mg per ml.

Description. A clear solution.

Identification

A. To a volume containing 30 mg of Dehydroemetine Hydrochloride add 1 ml of *0.05 M iodine*; a yellowish-brown precipitate is produced.

B. To a volume containing 15 mg of Dehydroemetine Hydrochloride add 1 ml of *potassium mercuri-iodide solution*; a white precipitate is produced.

Tests

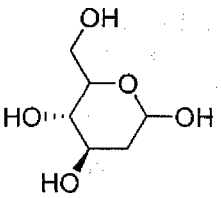
pH (2.4.24). 2.8 to 5.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 60 mg of Dehydroemetine Hydrochloride add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Dilute 5.0 ml to 100.0 ml with *0.1 M hydrochloric acid*, mix and measure the absorbance of the resulting solution at the maximum at 282 nm (2.4.7). Calculate the content of $C_{29}H_{38}N_2O_4,2HCl$ taking 123 as the specific absorbance at the maximum at 282 nm.

Storage. Store protected from light, in single dose container.

2-Deoxy-*D*-Glucose



$C_6H_{12}O_5$ Mol Wt. 164.2

2-Deoxy-D-Glucose is 2-Deoxy Glucose.

2-Deoxy-D-Glucose contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_{12}O_5$, calculated on the anhydrous basis.

Description. A white to off white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *2-deoxy-D-glucose IPRS* or with the reference spectrum of 2-deoxy-D-glucose.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +44.0° to +48.0°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *water*, with the aid of ultrasound, and dilute to 5.0 ml with *water*.

Reference solution (a). A 2.0 per cent w/v solution of *glucose impurity (D- glucose) IPRS* in *water*.

Reference solution (b). Dissolve 100 mg of *2-deoxy-D-glucose IPRS* in 3.0 ml of *water*, with the help of cyclomixer, add 25 µl of reference solution (a) and dilute to 5.0 ml with *water*.

Reference solution (c). A 2.0 per cent w/v solution of *2-deoxy-D-glucose IPRS* in *water*. Dilute 1.0 ml of the solution to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 10.0 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Inert sustain AQ-C18),

- column temperature: 55°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractive index detector,
- detector cell temperature: 50°,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Glucose impurity[1]	0.86	—
2-Deoxy-*D*-glucose	1.0	—
Glucol impurity[2]	2.03	1.3
Furan diol impurity[3]	5.01	—

[1](3*R*,4*S*,5S,6*R*)-6-(hydroxymethyl)tetrahydro-2*H*-pyran-2,3,4,5-tetraol (or) Dextrose anhydrous (or) D-Glucose,

[2] (2*R*,3*S*,4*R*)-2-(hydroxymethyl)-3,4-dihydro-2*H*-pyran-3,4-diol,

[3]1-(furan-2-yl)ethane-1,2-diol.

Inject reference solution (b) and (c). The test is not valid unless the resolution between peaks due to glucose impurity and 2-deoxy-*D*-glucose is not less than 1.5 in the chromatogram obtained with reference solution (b) and the signal-to-noise ratio is not less than 15 in the chromatogram obtained with reference solution (c).

Inject reference solution (c) and the test solution. Run the chromatogram 10 times the retention time of the principal peak for test solution. The area of any peak corresponding to glucose impurity is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any peak corresponding to, each of, glucol impurity, furan diol impurity and any other secondary impurity is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 20 times the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.25 g of the substance under examination in *water,* with the aid of ultrasound, and dilute to 50.0 ml with *water.*

Reference solution. A 0.5 per cent w/v solution of *2-deoxy-D-glucose IPRS* in *water.*

Chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_{12}O_5$.

Storage. Store protected from moisture.

2-Deoxy-*D*-Glucose Sachet

2-Deoxy-*D*-Glucose Sachet contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of 2-Deoxy-*D*-Glucose, $C_6H_{12}O_5$.

Usual strengths. 2.34 g; 5.85 g.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *2-deoxy-D-glucose IPRS* or with the reference spectrum of 2-deoxy-*D*-glucose.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +44.0° to +48.0°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 5 sachets and disperse a quantity of mixed content containing 1.0 g of 2-deoxy-*D*-glucose in *water,* with the aid of vortex for 6 minutes, and dilute to 50.0 ml with *water.* Centrifuge at 10,000 RPM for 10 minutes and filter.

Reference solution. A 0.002 per cent w/v solution of *2-deoxy-D-glucose IPRS* in *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Inert sustain AQ-C18),
- column temperature: 55°,
- mobile phase: *water*,
- flow rate: 0.5 ml per minute,
- refractive index detector,
- detector cell temperature: 50°,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Glucose impurity[1*]	0.8	—
2-Deoxy-*D*-glucose	1.0	—
Glucol impurity[2*]	1.8	1.17
Furan diol impurity[3*]	4.3	—

*These are process impurities and are controlled in drug substances and no need to control in the formulation.

[1](3*R*,4*S*,5*S*,6*R*)-6-(hydroxymethyl)tetrahydro-2*H*-pyran-2,3,4,5-tetraol (or) Dextrose anhydrous (or) D-Glucose,

[2](2*R*,3*S*,4*R*)-2-(hydroxymethyl)-3,4-dihydro-2*H*-pyran-3,4-diol,

[3]1-(furan-2-yl)ethane-1,2-diol.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 20 times the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Granules.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Seal test *(only for sachets)*. Loosely bundle 10 sachets with a rubber band and submerge the bundle under water in a vacuum desiccator maintained at a pressure not exceeding 18 kPa for one minute. Examine the bundle for any fine stream of bubbles. Re-establish normal pressure and open the bundle. No penetration of water is observed in any sachet.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 5 sachets and disperse a quantity of mixed content containing 0.25 g of 2-deoxy-*D*-glucose in *water*, with the aid of vortex for 6 minutes, and dilute to 250.0 ml with *water*. Centrifuge at 10,000 RPM for 10 minutes and filter.

Reference solution. A 0.1 per cent w/v solution of *2-deoxy-D-glucose IPRS* in *water*.

Chromatographic system as described under Related substances.

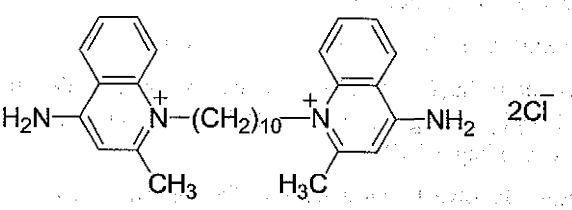
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_6H_{12}O_5$ in sachets.

Storage. Store protected from moisture.

Dequalinium Chloride



$C_{30}H_{40}Cl_2N_4$ Mol. Wt. 527.7

Dequalinium Chloride is 4,4′-diamino-2,2′-dimethyl-*N*,*N*′-decamethylenedi(quinolinium chloride).

Dequalinium Chloride contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{30}H_{40}Cl_2N_4$, calculated on the dried basis.

Category. Antiseptic.

Description. A creamy white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dequalinium chloride IPRS* or with the reference spectrum of dequalinium chloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0008 per cent w/v solution shows absorption maxima at 240 nm, 326 nm and 335 nm; absorbance at 240 nm, about 0.65, at 326 nm, about 0.4 and at 335 nm, about 0.35.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Acidity or alkalinity. Shake 0.1 g for 10 minutes with 100 ml of *carbon dioxide-free water* and add 0.5 ml of *bromocresol purple solution*. Not more than 0.2 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the solution.

Non-quaternised amines. Not more than 1.0 per cent, calculated as 4-aminoquinaldine, $C_{10}H_{10}N_2$, on the dried basis and determined by the following method. Shake 1.0 g with 45 ml of *water* for 5 minutes, add 5 ml of *dilute nitric acid* and shake for 10 minutes. Filter through cotton wool. Transfer 20.0 ml of the filtrate to a separator, add 20 ml of *1 M sodium hydroxide*, extract with two quantities, each of 50 ml, of *ether*, washing each extract in turn with the same 5 ml of *water*, and

then extract each ether extract successively with 20 ml, 20 ml and 5 ml of *1 M hydrochloric acid*. Combine the acid extracts, dilute to 50.0 ml with *1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 319 nm and 326.5 nm (2.4.7). The ratio of the absorbance at 319 nm to that at 326.5 nm is not less than 1.0. Calculate the percentage of $C_{10}H_{10}N_2$ from the expression 0.387a - 0.306b, where a and b are the specific absorbances at about 319 nm and 326.5 nm respectively.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

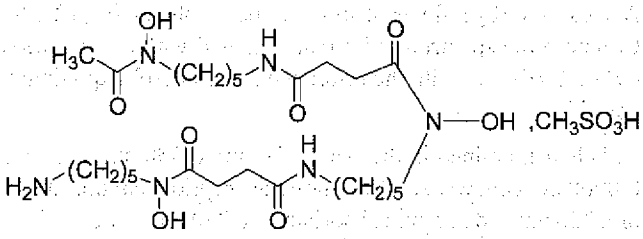
Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.5 g in a mixture of 80 ml of *anhydrous glacial acetic acid* and 20 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02638 g of $C_{30}H_{40}Cl_2N_4$.

Desferrioxamine Mesylate

Deferoxamine Mesylate; Deferoxamine Mesilate; Desferrioxamine Mesilate



$C_{25}H_{48}N_6O_8,CH_4SO_3$ Mol. Wt. 656.8

Desferrioxamine Mesylate is 30-amino-3,14,25-trihydroxy-3,9,14,20,25-pentaazatriacontane-2,10,13,21,24-pentaone methanesulphonate.

Desferrioxamine Mesylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{25}H_{48}N_6O_8,CH_4SO_3$, calculated on the anhydrous basis.

Category. Iron-chelating agent.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *desferrioxamine mesylate IPRS* or with the reference spectrum of desferrioxamine mesylate. If the spectra obtained show differences, dissolve the substance under examination and the reference substance separately in *ethanol (95 per cent)*, evaporate to dryness and record new spectra using the residues.

B. Dissolve 5 mg in 5 ml of *water*, add 2 ml of a 0.5 per cent w/v solution of *tribasic sodium phosphate*, mix and then add 0.5 ml of a 2.5 per cent w/v solution of *sodium1,2-naphthoquinone-4-sulphonate*; a blackish brown colour is produced.

C. Dissolve 0.1 g in 5 ml of *2 M hydrochloric acid* and add 1 ml of *barium chloride solution*; the solution remains clear. In a porcelain crucible mix 0.1 g with 1 g of *anhydrous sodium carbonate*, heat and ignite over a Bunsen flame. Allow to cool, dissolve the residue in 10 ml of *water* by heating if necessary and filter; the filtrate gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1), and the absorbance of the solution at about 425 nm is not more than 0.10 (2.4.7).

pH (2.4.24). 3.7 to 5.5, determined in a freshly prepared 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). Dissolve 10 mg of *deferoxamine mesilate IPRS* in 10.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution in 25.0 ml of the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: dissolve 1.32 g of *ammonium phosphate* and 0.37 g of *sodium edetate* in 950 ml of *water*, adjusted to pH 2.8 with *orthophosphoric acid* and 55 volumes of *tetrahydrofuran*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks with the relative retention time of about 0.8 and the principal peak is not less than 1.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to deferoxamine mesilate impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent), the sum of all the secondary peaks is not more than 1.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (7.0 per cent). Ignore any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.08 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Chlorides (2.3.12). 0.75 g complies with the limit test for chlorides (330 ppm).

Sulphates (2.3.17). 0.25 g complies with the limit test for sulphates (600 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Weigh 50 mg of the substance under examination in 50.0 ml of *water*. To 2 ml of the solution, add 3 ml of *ferric chloride* solution prepared by dissolving 6.7 g of *ferric chloride* in 100 ml of 1 per cent v/v solution of *hydrochloric acid* and dilute to 25 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 485 nm (2.4.7). Calculate the content of $C_{25}H_{48}N_6O_8,CH_4O_3S$ from the absorbance obtained from a solution of known concentration of *deferoxamine mesylate IPRS*.

Desferrioxamine Mesylate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.025 Endotoxin Unit per mg of desferrioxamine.

Desferrioxamine Mesylate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light in a refrigerator (2° to 8°). Do not freeze. If the substance is sterile, store in sterile, air-tight, tamper-evident containers sealed so as to exclude micro-organisms.

Labelling. The label states where applicable, that the substance is sterile.

Desferrioxamine Injection

Desferrioxamine Mesylate Injection; Desferrioxamine Mesilate Injection

Desferrioxamine Injection is a sterile material consisting of Desferrioxamine Mesylate with or without excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Desferrioxamine Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of desferrioxamine mesylate, $C_{25}H_{48}N_6O_8,CH_4SO_3$.

Usual strength. 0.5 g.

Description. A white or almost white powder; very hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

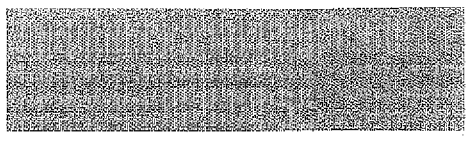
A. Dissolve 40 mg of the contents of the sealed container in 2 ml of *absolute ethanol* by heating on a water-bath at 60°, cool in ice until the substance begins to crystallise and evaporate to dryness at room temperature under a gentle current of nitrogen. Determine by infrared absorption spectrophotometry (2.4.6) on the residue. Compare the spectrum with that obtained with *desferrioxamine mesylate IPRS* or with the reference spectrum of desferrioxamine mesylate.

B. In the test for related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (b).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.



Test solution. Dissolve a quantity of injection containing 75 mg of Desferrioxamine Mesilate in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 25.0 ml with the mobile phase.

Reference solution (b). A 0.15 per cent w/v solution of *desferrioxamine mesilate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (10 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 95 volumes of solution containing 0.039 per cent w/v of *disodium edetate* and 0.139 per cent w/v of *ammonium phosphate*, adjusted to pH 2.8 with *orthophosphoric acid* and 5.5 volumes of *tetrahydrofuran*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks with the relative retention time of about 0.8 and the principal peak is not less than 1.0.

Inject the test solution and reference solution (a). Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent) and the sum of all secondary peaks is not more than 1.75 times the area of the principal peak in the chromatogram obtained with reference solution (a) (7.0 per cent). Ignore any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.08 per cent).

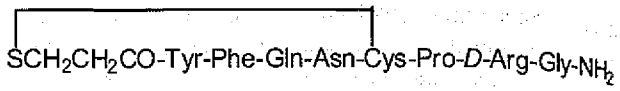
Bacterial endotoxins (2.2.3). Not more than 0.025 Endotoxin Unit per mg of desferrioxamine.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Dissolve a quantity of powder containing 50 mg of desferrioxamine mesylate in *water* and dilute to 50.0 ml with *water*. To 2 ml of the solution, add 3 ml of *ferric chloride solution* prepared by dissolving 6.7 g of *ferric chloride* in 100 ml of 1 per cent v/v solution of *hydrochloric acid* and dilute to 25.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at 485 nm (2.4.7). Calculate the content of $C_{25}H_{48}N_6O_8,CH_4O_3S$ in the injection from the absorbance obtained from a solution of known concentration of *desferrioxamine mesylate IPRS*.

Storage. Store protected from light at a temperature not exceeding 30°.

Desmopressin



$C_{46}H_{64}N_{14}O_{12}S_2$ Mol. Wt. 1069.2

Desmopressin is 1-Desamino,8-*D*-arginine vasopressin.

Desmopressin contains not less than 95.0 per cent and not more than 105.0 per cent of $C_{46}H_{64}N_{14}O_{12}S_2$, calculated on the anhydrous and acetic acid free basis.

Category. Antidiuretic hormone.

Description. A white to off-white, fluffy powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

B. Amino acid analysis (2.2.19).

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking 1/6 of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, arginine and phenylalanine as equal to 1. The values fall within the following limits: aspartic acid: 0.90 to 1.10; glutamic acid: 0.90 to 1.10; proline: 0.90 to 1.10; glycine: 0.90 to 1.10; arginine: 0.90 to 1.10; phenylalanine: 0.90 to 1.10; tyrosine: 0.70 to 1.05; half-cystine: 0.30 to 1.05. Lysine, isoleucine and leucine are absent; not more than traces of other amino acids are present.

Tests

Specific optical rotation (2.4.22). –82.0° to –72.0°, determined in a 0.2 per cent w/v solution in 1.0 per cent v/v solution of *glacial acetic acid*, calculated on anhydrous and acetic acid free basis.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1 mg of the substance under examination in 2.0 ml of *water*.

Reference solution. Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture IPRS* in 500 µl of *water*.

Chromatographic system

- a stainless steel column 12 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a *0.067 M phosphate buffer solution pH 7.0*,
  B. a mixture of equal volumes of *acetonitrile* and mobile phase A,
- a gradient programme using the conditions given below,

- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	76	24
4	76	24
18	58	42
35	48	52
40	76	24
45	76	24

The retention time of Desmopressin peak is about 16 minutes and of oxytocin peak is about 17 minutes.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to desmopressin and oxytoxin is not less than 1.5.

Inject the test solution, the area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.5 per cent. Ignore any peak with an area less than 0.05 per cent, calculated by area normalization.

Acetic acid. 3.0 to 8.0 per cent.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 5 volumes of mobile phase B and 95 volumes of mobile phase A.

Test solution. Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *glacial acetic acid* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: A. dilute 0.7 ml of *orthophosphoric acid* to 1000 ml with *water*, adjusted to pH 3.0 with *sodium hydroxide solution*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
10	50	50
20	50	50
22	95	5
30	95	5

The retention time of the peak corresponding to acetic acid is about 3 to 4 minutes.

Inject the reference solution and the test solution.

Calculate the content of acetic acid in the peptide.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.02 g.

Assay. Determine by liquid chromatography (2.4.14), as described under test for Related substances with the following modifications.

Reference solution. A 0.05 per cent w/v solution of *desmopressin IPRS* in *water.*

Chromatographic system

- mobile phase: a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A,
- flow rate: 2 ml per minute,

The retention time of desmopressin is about 5 minutes.

Calculate the content of $C_{46}H_{64}N_{14}O_{12}S_2$.

Desmopressin intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirements.

Bacterial endotoxins (2.2.3). Not more than 500 Endotoxin Units per mg of desmopressin.

Storage. Store protected from light and moisture at a temperature of 2° to 8°. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

Labelling. The label states: the mass of peptide per container; where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

Desmopressin Intranasal Solution

Desmopressin Intranasal Solution is a solution of Desmopressin containing suitable buffering agents and preservatives.

Desmopressin Intranasal Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the desmopressin, $C_{46}H_{64}N_{14}O_{12}S_2$.

Usual strength. 10 µg per ml.

Description. A colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.5 to 5.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the intranasal solution in *water* to produce a final concentration of 0.0025 per cent w/v of the peptide.

Reference solution. Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture IPRS* in 10 ml of *water*.

Chromatographic system
- a stainless steel column 12 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. *0.067 M mixed phosphate buffer pH 7.0*,
  B. a mixture of 10 volumes of *acetonitrile* and 10 volumes of mobile phase A,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	76	24
4	76	24
18	58	42
35	48	52
40	76	24
50	76	24

The retention time of desmopressin peak is about 16 minutes and of oxytocin is about 17 minutes.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 1.5 and the peak due to desmopressin is clearly separated from the peak due to the antimicrobial preservative stated on the label.

Inject the test solution. The area of any secondary peak is not more than 4.0 per cent and the sum of areas of all the secondary peaks is not more than 5.0 per cent. Ignore any peak with an area less than 0.3 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the intranasal solution in *water* to give a final concentration of 0.0025 per cent w/v of the peptide.

Reference solution (a). A 0.0025 per cent w/v solution of *desmopressin IPRS* in *water*.

Reference solution (b). Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture IPRS* in 1.0 ml of *water*.

Chromatographic system
- a stainless steel column 12 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 80 volumes of *0.067 M mixed phosphate buffer pH 7.0*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 200 µl.

The retention time of desmopressin peak is about 5 minutes.

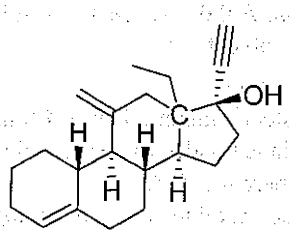
Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 1.5 and the peak due to desmopressin is clearly separated from the peak due to the antimicrobial preservative stated on the label.

Inject the reference solution and the test solution.

Calculate the content of $C_{46}H_{64}N_{14}O_{12}S_2$ in the intranasal solution.

Storage. Store protected from light, at a temperature of 2° to 8°.

Desogestrel



$C_{22}H_{30}O$ Mol. Wt. 310.5

Desogestrel is 18,19-Dinorpregn-4-en-20-yn-17-ol,13-ethyl-11-methylene-,(17α).

Desogestrel contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{30}O$, calculated on the dried basis.

Category. Steroidal hormone.

Description. A white or almost-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *desogestrel IPRS* or with the reference spectrum of desogestrel.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (d).

Tests

Specific optical rotation (2.4.22). + 53.0° to + 57.0°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Dissolve 40 mg of the substance under examination in 50 ml of *acetonitrile* and dilute to 100.0 ml with *water*.

Reference solution (a). Dissolve 4 mg, each of, *desogestrel related compound A IPRS* and *desogestrel related compound D IPRS* in 50 ml of *acetonitrile*, and dilute to 100.0 ml with *water*.

Reference solution (b). Dissolve 40 mg of *desogestrel IPRS* in 50 ml of *acetonitrile*, add 1.0 ml of reference solution (a) and dilute to 100.0 ml with *water*.

Reference solution (c). Dissolve 4 mg, each of, *desogestrel IPRS, desogestrel related compound B IPRS* and *desogestrel related compound C IPRS* and 8 mg, each of, *desogestrel related compound A IPRS* and *desogestrel related compound D IPRS* in 50 ml of *acetonitrile*, dilute to 100.0 ml with *water*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (d). Dissolve 40 mg of *desogestrel IPRS* in 50 ml of *acetonitrile* and dilute to 100.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 73 volumes of *acetonitrile* and 27 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume: 15 µl.

Name	Relative retention time
Desogestrel related compound B[1]	0.16
Desogestrel related compound C[2]	0.19
11-Methylene lynestrenol[3]	0.71
Desogestrel related compound A[4]	0.96
Desogestrel	1.0
Desogestrel related compound D[5]	1.06

[1]13-Ethyl-3-hydroxy-11-methylene-18,19-dinor-17α-pregn-4-en-20-yn-17-ol,

[2]13-Ethyl-11-methylene-18,19-dinor-17α-pregn-4-en-20-yn-17-ol-3-one,

[3]11-Methylene-19-nor-17α-pregn-4-en-20-yn-17-ol,

[4]13-Ethyl-11-methylene-18,19-dinor-5α,17α-pregn-3-en-20-yn-17-ol,

[5]13-Ethyl-11-methylenegon-4-en-17-one.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to desogestrel and desogestrel related compound A is not less than 1.3, the peak to valley ratio between the peaks due to desogestrel and desogestrel related compound D is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 5.0 per cent, for all peaks in the chromatogram obtained with reference solution (c).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to desogestrel related compound B and desogestrel related compound C, each of, is not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (c) (0.1 per cent), the area of any peak corresponding to desogestrel related compound A and desogestrel related compound D, each of, is not more than the area of the corresponding peaks in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of any peak corresponding to 11-methylene lynestrenol is not more than twice the area of desogestrel peak in the chromatogram obtained with reference solution (c) (0.2 per cent), the area of any other secondary peak is not more than the area of the desogestrel peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the desogestrel peak in the chromatogram obtained with reference solution (c) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the desogestrel peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent. Dry under vacuum at a pressure not exceeding 15 mm of mercury.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (b) and (d). The test is not valid unless the resolution between the peaks due to desogestrel and desogestrel related compound A is not less than 1.3, the peak-to-valley ratio between the peaks due to desogestrel and desogestrel related compound D is not less than 2.0 in the chromatogram obtained with reference solution (b), the tailing

factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtained with reference solution (d).

Inject reference solution (d) and the test solution.

Calculate the content of the $C_{22}H_{30}O$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Desogestrel and Ethinyl Estradiol Tablets

Desogestrel and Ethinyl Estradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of desogestrel, $C_{22}H_{30}O$ and ethinyl estradiol, $C_{20}H_{24}O_2$.

Usual strengths. Desogestrel, 0.025 mg and Ethinyl Estradiol, 0.04 mg; Desogestrel, 0.1 mg and Ethinyl Estradiol, 0.03 mg; Desogestrel, 0.125 mg and Ethinyl Estradiol, 0.03 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with reference solution (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of 0.05 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and centrifuge.

Determine by liquid chromatography (2.4.14).

Test solution. Use the clear supernatant liquid.

Reference solution (a). A 0.025 per cent w/v solution of *desogestrel IPRS* in *methanol*. Dilute 1.0 ml of the solution to 50.0 ml with the dissolution medium.

Reference solution (b). A 0.025 per cent w/v solution of *ethinyl estradiol IPRS* in *methanol*. Dilute 1.0 ml of the solution to 50.0 ml with the dissolution medium.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with dissolution medium to obtain a solution having similar concentration to the test solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with phenyl groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 6.0 with *2M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer, set at 210 nm for desogestrel and fluorescence detector excitation at 285 nm and emission at 310 nm for ethinyl estradiol,
- injection volume: 200 µl.

The relative retention time with reference to desogestrel for ethinyl estradiol is about 0.2.

Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections is not more than 3.0 per cent for both the peaks.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$, in the medium.

Q. Not less than 80 per cent of the stated amounts of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one intact tablet in the solvent mixture, with the aid of mechanical shaker for 30 minutes and dilute to 25.0 ml with the solvent mixture. Dilute a suitable volume of the solution to obtain a solution containing 0.00005 per cent w/v of Desogestrel.

Inject reference solution (c) and the test solution.

Calculate the contents of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

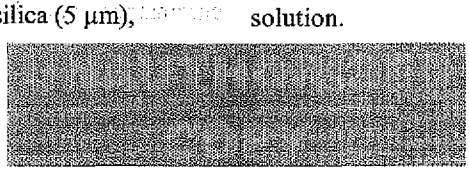
Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse 10 intact tablets in 60 ml of the solvent mixture, with the aid of mechanical shaker for 30 minutes, and dilute to 100.0 with the solvent mixture, centrifuge and dilute clear supernatant liquid with the solvent mixture to obtain a solution containing 0.00005 per cent w/v of desogestrel.

Reference solution (a). A 0.025 per cent w/v solution of *desogestrel IPRS* in *methanol*.

Reference solution (b). A 0.03 per cent w/v solution of *ethinyl estradiol IPRS* in *methanol*.

Reference solution (c). Dilute a suitable volume of reference solution (a) and reference solution (b) with the solvent mixture to obtain a solution having similar concentration to the test solution.



Use chromatographic system as described under Dissolution.

Inject reference solution (c). The test is not valid unless the tailing factor is not more than 2.0 per cent and relative standard deviation for replicate injections is not more than 2.0 per cent for both the peaks.

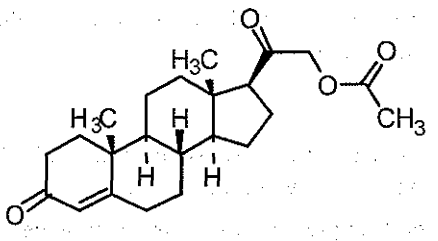
Inject reference solution (c) and the test solution.

Calculate the content of $C_{22}H_{30}O$ and $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Desoxycortone Acetate

Desoxycorticosterone Acetate; Deoxycorticosterone Acetate; Deoxycortone Acetate



$C_{23}H_{32}O_4$ Mol. Wt. 372.5

Desoxycortone Acetate is 3,20-dioxo-4-pregnen-21-yl acetate.

Desoxycortone Acetate contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{23}H_{32}O_4$, calculated on the dried basis.

Category. Adrenocortical steroid.

Description. A white or creamy-white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, D and E may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *desoxycortone acetate IPRS* or with the reference spectrum of desoxycortone acetate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum at 240 nm; absorbance at 240 nm, 0.43 to 0.46.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of equal volumes of *cyclohexane* and *light petroleum (40° to 60°)*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *desoxycortone acetate IPRS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the liquid to ascend to the top, remove the plate from the tank and allow the solvents to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

D. Dissolve 40 mg in 1 ml of *methanol*, warm and add 1 ml of *alkaline cupritartrate solution*; a red precipitate is formed.

E. Dissolve 5 mg in 0.5 ml of *methanol*, add 0.5 ml of *ammoniacal silver nitrate solution*; a black precipitate is slowly produced in the cold but is rapidly produced on warming.

Tests

Specific optical rotation (2.4.22). +171.0° to +179.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *desoxycortone acetate IPRS* and 2 mg of *betamethasone 17-valerate IPRS* in the mobile phase and dilute to 200 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 200 ml with the mobile phase.

Chromatographic system

– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 350 ml of *water* and 600 ml of *acetonitrile*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: betamethasone 17-valerate, about 7.5 minutes and desoxycortone acetate about 9.5 minutes. The test is not valid unless the resolution between the peaks corresponding to betamethasone 17-valerate and desoxycortone acetate is at least 4.5. If necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject reference solution (b) and the test solution. Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution at the maximum at 240 nm (2.4.7). Calculate the content of $C_{23}H_{32}O_4$ taking 450 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Desoxycortone Acetate Injection

Desoxycorticosterone Acetate Injection; Deoxycortone Acetate Injection

Desoxycortone Acetate Injection is a sterile solution of Desoxycortone Acetate in Ethyl Oleate or other suitable ester, in a suitable fixed oil, or in any mixture of these. It may contain suitable alcohols.

Desoxycortone Acetate Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of desoxycortone acetate, $C_{23}H_{32}O_4$.

Usual strength. 5 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *n-heptane* and 30 volumes of *acetone*.

Test solution. Dilute the injection with *carbon tetrachloride* to give a solution containing 0.25 per cent w/v of Desoxycortone Acetate.

Reference solution. A 0.25 per cent w/v solution of *desoxycortone acetate IPRS* in *carbon tetrachloride*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable, spray with *ethanolic sulphuric acid (10 per cent v/v)*, heat at 105° for 30 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Ignore any spots due to the vehicle.

Tests

Bacterial endotoxins (2.2.3). Not more than 71.4 Endotoxin Units per mg of desoxycortone acetate.

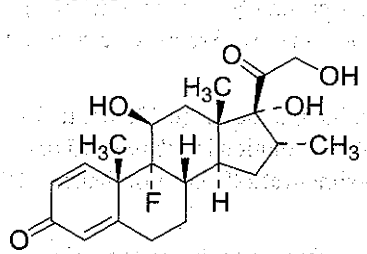
Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 10 mg of Desoxycortone Acetate add sufficient *ethanol* to produce 100.0 ml. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol* and mix. Measure the absorbance of the resulting solution (2.4.7) at the maximum at about 240 nm. Calculate the content of $C_{23}H_{32}O_4$ taking 450 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Labelling. The label states (1) the composition of the solvent; (2) that it is meant for intramuscular injection only; (3) that any sediment should be dissolved by warming before use.

Dexamethasone



$C_{22}H_{29}FO_5$ Mol. Wt. 392.5

Dexamethasone is 9α-fluoro-11β,17α,21-trihydroxy-16α-methyl-1,4-pregnadiene-3,20-dione.

Dexamethasone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{22}H_{29}FO_5$, calculated on the dried basis.

Category. Adrenocortical steroid (anti-inflammatory).

Description. White or almost white crystals or a crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexamethasone IPRS* or with the reference spectrum of dexamethasone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with a suitable silica gel containing a fluorescent indicator with an optimal intensity at about 254 nm.

Solvent mixture. 9 volumes of *chloroform* and 1 volume of *methanol*.

Mobile phase. A mixture of 85 volumes of *ether*, 10 volumes of *toluene* and 5 volumes of *1-butanol* saturated with *water*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *dexamethasone IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.125 per cent w/v each of the substance under examination and *dexamethasone IPRS* in the solvent mixture.

Reference solution (c). A solution containing 0.125 per cent w/v each of *dexamethasone IPRS* and *betamethasone IPRS* in the solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent v/v)*, heat at 120° for 10 minutes or until spots appear, allow to cool and examine in daylight and under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in colour in day-light, fluorescence under ultraviolet light at 365 nm, in position and size to that in the chromatogram obtained with reference solution (a) and the chromatogram obtained with reference solution (b) shows only one spot. The test is not valid unless the chromatogram obtained with reference solution (c) shows two spots that are close to one another but separated.

C. Place 2 ml of a 0.01 per cent w/v solution in *ethanol* in a stoppered tube, add 10 ml of *phenylhydrazine-sulphuric acid solution*, mix, place in a water-bath at 60° for 20 minutes and cool immediately. Absorbance of the resulting solution at the maximum at about 419 nm, not less than 0.4 (2.4.7).

D. To 2 ml of *sulphuric acid* add 2 mg and shake to dissolve; a faint reddish brown colour is produced within 5 minutes. Add 10 ml of *water* and mix; the colour is discharged.

Tests

Specific optical rotation (2.4.22). +75.0° to +80.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 240 nm, 0.38 to 0.41.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. To 25 mg of the substance under examination add 1.5 ml of *acetonitrile* and 5 ml of mobile phase A. Mix with the aid of ultrasonic bath until the solids are completely dissolved and add sufficient of mobile phase A to produce 10 ml and mix well.

Reference solution (a). Dissolve 2 mg of *dexamethasone IPRS* and 2 mg of *methylprednisolone IPRS* in sufficient of mobile phase A to produce 100 ml.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. 25 volumes of *acetonitrile* and 70 volumes of *water* mixed, allowed to equilibrate and adjusted to 100 volumes with *water* and mixed,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
40	0	100
41	100	0

Equilibrate the column for at least 30 minutes with mobile phase B and then with mobile phase A for 5 minutes. For subsequent operations use the conditions described from 40 to 46 minutes.

Inject reference solution (a). The retention times are; methylprednisolone about 11.5 minutes, and dexamethasone about 13 minutes. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and

dexamethasone is at least 2.8; if necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject mobile phase A as the blank, the test solution and reference solution (b). Record the chromatogram of the test solution for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak, is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Ignore any peak due to the blank and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Dissolve 0.1 g in sufficient *ethanol* to produce 100.0 ml and mix. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol* and mix well. Determine the absorbance of the resulting solution (2.4.7) at the maximum at about 238 nm. Calculate the content of $C_{22}H_{29}FO_5$ taking 394 as the specific absorbance at 238 nm.

Storage. Store protected from light.

Dexamethasone Tablets

Dexamethasone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dexamethasone, $C_{22}H_{29}FO_5$.

Usual strength. 0.5 mg.

Identification

Shake a quantity of the powdered tablets containing 20 mg of Dexamethasone with 50 ml of *chloroform* for 30 minutes, filter and evaporate the filtrate to dryness at 105° for 2 hours. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexamethasone IPRS* or with the reference spectrum of dexamethasone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. To 2 ml of *sulphuric acid* add 2 mg and shake to dissolve; a faint reddish brown colour is produced within 5 minutes. Add 10 ml of *water* and mix; the colour is discharged.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. To a weighed quantity of the tablets containing 2.5 mg of Dexamethasone add 10 ml of *acetonitrile*, mix with the aid of ultrasound and filter through a 0.45 µm filter. Dilute 4 ml of the filtrate to 10 ml with *water*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 2 mg of *dexamethasone IPRS* and 2 mg of *methylprednisolone IPRS* in mobile phase A and dilute to 100.0 ml with the same solvent.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- column temperature. 45°,
- mobile phase: A. 15 per cent v/v of *acetonitrile*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
40	0	100
41	100	0

Inject reference solution (b). When the chromatograms are recorded, the retention times are; methylprednisolone about 13 minutes, and dexamethasone about 16 minutes. The test is not valid unless the resolution between the peaks corresponding to methylprednisolone and dexamethasone is at least 2.8; if necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all secondary peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak due to mobile phase A and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Test solution. To one tablet, add sufficient *methanol (50 per cent)* to produce a solution containing 0.0025 per cent w/v of Dexamethasone, shake for 10 minutes and filter through glass-fibre filter.

Reference solution. A solution containing 0.0025 per cent w/v of *dexamethasone IPRS* in *methanol (50 per cent)*.

Use chromatographic system as described under Assay.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), protected from light.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 2.5 mg of Dexamethasone add 20.0 ml of *methanol (50 per cent)*, shake for 20 minutes and filter through a glass-fibre filter paper (Such as Whatman GF/C).

Reference solution. A solution containing 0.0125 per cent w/v of *dexamethasone IPRS* in *methanol (50 per cent)*.

Chromatographic system

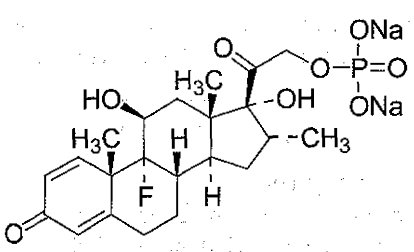
- a stainless steel column 20 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as (Spherisorb ODS 1),
- mobile phase: a mixture of 53 volumes of *water* and 47 volumes of *methanol*,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets.

Storage. Store protected from light.

Dexamethasone Sodium Phosphate



$C_{22}H_{28}FNa_2O_8P$ Mol. Wt. 516.4

Dexamethasone Sodium Phosphate is disodium 9α-fluoro-11β,17α-dihydroxy-16α-methyl-3,20-dioxo-1,4-pregnadien-21-yl phosphate.

Dexamethasone Sodium Phosphate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{22}H_{28}FNa_2O_8P$, calculated on the anhydrous, and ethanol-free or solvent-free basis.

Category. Adrenocortical steroid (anti-inflammatory).

Description. A white or slightly yellow, crystalline powder; very hygroscopic. It shows polymorphism (2.5.11).

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if Tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexamethasone sodium phosphate IPRS* or with the reference spectrum of dexamethasone sodium phosphate.

B. Dissolve 10 mg in 5 ml of *water* and dilute to 100 ml with *ethanol*. To 2 ml of the resulting solution in a glass-stoppered tube add 10 ml of *phenylhydrazine- sulphuric acid solution*, mix, heat in a water-bath at 60° for 20 minutes and cool immediately. Absorbance of the resulting solution at the maximum at about 419 nm, not less than 0.20 (2.4.7).

C. In the test for Related substances, the principal peak in the chromatogram obtained with reference solution (b) corresponds to the peak in the chromatogram obtained with reference solution (c).

D. Heat gently 40 mg with 2 ml of *sulphuric acid* until white fumes are evolved, add *nitric acid* dropwise until oxidation is complete and cool. Add 2 ml of *water*, heat until white fumes are evolved again, cool, add 10 ml of *water* and neutralise to *litmus paper* with *5 M ammonia*. The solution gives reaction (A) of sodium salts and reaction (B) of phosphates (2.3.1).

Tests

pH (2.4.24). 7.5 to 9.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +75.0° to +83.0°, determined in a 1.0 per cent w/v solution.

Inorganic phosphates. Not more than 0.5 per cent, calculated as PO_4, determined by the following method. Weigh 25 mg, dissolve in 10 ml of *water*, add 4 ml of *dilute sulphuric acid*, 1 ml of *ammonium molybdate solution* and 2 ml of *methylaminophenol* with *sulphite solution* and allow to stand for 15 minutes. Add sufficient *water* to produce 25.0 ml, allow to stand for further 15 minutes and measure the absorbance of the resulting solution at the maximum at 730 nm (2.4.7). Calculate the content of phosphate from a calibration curve prepared by treating suitable aliquots of a 0.00143 per cent w/v solution of *potassium dihydrogen phosphate* in a similar manner.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *dexamethasone sodium phosphate IPRS* and 2 mg of *betamethasone sodium phosphate IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). A 0.0025 per cent w/v solution of *dexamethasone sodium phosphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1.360 g of *potassium dihydrogen phosphate* and 0.60 g of *hexylamine* allowed to stand for 10 minutes and then dissolved in 182.5 ml of *water* and 67.5 ml of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 45 minutes.

The retention times of betamethasone sodium phosphate is about 12.5 minutes and dexamethasone sodium phosphate is about 14 minutes.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to betamethasone sodium phosphate and dexamethasone sodium phosphate is at least 2.2. If necessary, adjust the concentration of acetonitrile or increase the concentration of water in the mobile phase.

Inject reference solution (b) and the test solution. Run the chromatogram for twice the retention time of the principal peak for the test solution, the area of any peak other than the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Ethanol. Not more than 8.0 per cent w/w, determined by gas chromatography (2.4.13).

Internal Standard. A 1.0 per cent v/v solution of *1-propanol* in *water*.

Test solution. A 10.0 per cent w/v solution of the substance under examination in the internal standard solution.

Reference solution. A solution containing 1.0 per cent w/v of *ethanol* in the internal standard solution.

Chromatographic system.

- a capillary column 30 m x 0.25 mm packed with 6.0 per cent polycyanopropylphenyl siloxane and 94.0 per cent of polydimethyl siloxane (1.4 µm) (Such as DB-624),
- temperature:
  column 50° for 2 minutes, 50° to 240° @ 20° per minute and hold at 240° for 2 minutes,
- inlet port at 250° and detector at 280°,
- flow rate: 0.5 ml per minute, using nitrogen as carrier gas,
- flame ionization detector,
- split ratio: 25:1.

Inject 1 µl of each solution.

The resolution between the peaks due to ethanol and 1-propanol is not less than 2.0. The test is not valid unless the relative standard deviation of peak area ratio of ethanol and internal standard from replicate injections of reference solution is not more than 2.0 per cent.

Calculate the percentage w/w of ethanol assuming the weight per ml at 25° to be 0.787 g.

Total ethanol and water. Determine the content of water (2.3.43), using 0.2 g. Not more than 16.0 per cent w/w, calculated from the sum of the percentage of ethanol determined by the method described above and the percentage of water.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg each of *dexamethasone IPRS* (dexamethasone sodium phosphate impurity A) and *dexamethasone sodium phosphate IPRS* in 2 ml of *tetrahydrofuran*, then dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). A 0.006 per cent w/v solution of *dexamethasone sodium phosphate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (7 µm),
- mobile phase: mix 520 ml of *water* with 2 ml of *orthophosphoric acid*, adjusted to pH 2.6 with *sodium hydroxide*. Mix this solution with 36 ml of *tetrahydrofuran* and 364 ml of *methanol*,

– flow rate: 1.5 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

The relative retention time with reference to dexamethasone sodium phosphate (retention time: about 8 minutes) for dexamethasone sodium phosphate impurity A is about 2.0.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to dexamethasone sodium phosphate and dexamethasone sodium phosphate impurity A is not less than 6.0.

Inject reference solution (b) and the test solution. Run the chromatogram 3 times the retention time of the principal peak.

Calculate the content of $C_{22}H_{28}FNa_2O_8P$.

Storage. Store protected from light.

Dexamethasone Injection

Dexamethasone Sodium Phosphate Injection

Dexamethasone Injection is a sterile solution of Dexamethasone Sodium Phosphate in Water for Injections.

Dexamethasone Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dexamethasone phosphate, $C_{22}H_{30}FO_8P$.

Usual strength. The equivalent of 4 mg of dexamethasone phosphate per ml. (4.4 mg of dexamethasone sodium phosphate is approximately equivalent to 4 mg of dexamethasone phosphate).

Description. A clear solution.

Identification

In the assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to dexamethasone sodium phosphate in the chromatogram obtained with the reference solution (a).

Tests

pH (2.4.24). 7.0 to 8.5.

Free dexamethasone. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection with the mobile phase to produce a solution containing the equivalent of 0.25 per cent w/v of dexamethasone phosphate.

Reference solution (a). A 0.00125 per cent w/v solution of *dexamethasone IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.25 per cent w/v of *dexamethasone sodium phosphate IPRS*, 0.01 per cent w/v of *propyl hydroxybenzoate* and 0.001 per cent w/v of *dexamethasone IPRS* in the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *propyl hydroxybenzoate* in the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
– mobile phase: a mixture of 1.360 g of *potassium dihydrogen phosphate* and 0.60 g of *hexylamine* allowed to stand for 10 minutes and then dissolved in 182.5 ml of *water* and 67.5 ml of *acetonitrile*, mixed and filtered,
– flow rate: 1 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

Equilibrate the column with the mobile phase for about 45 minutes.

Inject reference solution (b). The test is not valid unless the peak corresponding to dexamethasone is completely separated from the peaks due to dexamethasone sodium phosphate and propyl hydroxybenzoate. If necessary, adjust the concentration of *acetonitrile* or increase the concentration of *water* in the mobile phase.

Inject the test solution and reference solution (a). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak corresponding to dexamethasone is not greater than that of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 31.3 Endotoxin Units per mg of dexamethasone phosphate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a measured volume of the injection containing about 8 mg of dexamethasone phosphate to 100.0 ml with the mobile phase and mix.

Reference solution (a). A 0.008 per cent w/v solution of *dexamethasone sodium phosphate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v each of *dexamethasone sodium phosphate IPRS* and *betamethasone sodium phosphate IPRS* in the mobile phase.

Chromatographic system
– a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),

- mobile phase: a mixture of 1.360 g of *potassium dihydrogen phosphate* and 0.6 g of *hexylamine* allowed to stand for 10 minutes and then dissolved in 182.5 ml of *water* and 67.5 ml of *acetonitrile*, mixed and filtered,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to betamethasone sodium phosphate and dexamethasone sodium phosphate is at least 2.2. If necessary, adjust the concentration of acetonitrile or increase the concentration of *water* in the mobile phase.

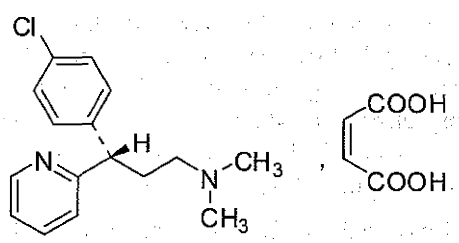
Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{30}FO_8P$ in the injection.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of dexamethasone phosphate in a suitable dose-volume.

Dexchlorpheniramine Maleate



$C_{16}H_{19}ClN_2,C_4H_4O_4$ Mol. Wt. 390.9

Dexchlorpheniramine Maleate is (3*S*)-3-(4-chlorophenyl)-*N*,*N*-dimethyl-3-(pyridin-2-yl)propan-1-amine maleate.

Dexchlorpheniramine Maleate contains not less than 98.0 per cent and not more than 100.5 per cent of $C_{16}H_{19}ClN_2,C_4H_4O_4$, calculated on the dried basis.

Category. Antihistaminic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexchlorpheniramine maleate IPRS* or with the reference spectrum of dexchlorpheniramine maleate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* (solution A) is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.5 to 5.5, determined in a 1 per cent w/v solution in *water*.

Specific optical rotation (2.4.22). +22° to +23°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 95 volumes of mobile phase A and 5 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *dexchlorpheniramine maleate IPRS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). A 0.0002 per cent w/v solution of *chlorpheniramine related compound C IPRS* in reference solution (a).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a buffer solution prepared by dissolving 5.4 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*;
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate:1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
1	95	5
20	70	30
30	70	30

Name		Relative retention time
Maleic acid	0.18	---
Chlorpheniramine related compound B[1]	0.49	---
Pheniramine	0.57	2.5
Chlorpheniramine related compound C[2]	0.97	---
Dexchlorpheniramine	1.0	---

[1]Di (pyridin-2-yl) amine. (for information purpose),
[2]3-(4-Chlorophenyl-*N*-methyl-3-(pyridin-2-yl) propan-1-amine. (used to establish system suitability only).

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to chlorpheniramine related compound C and dexchlorpheniramine is not less than 1.5 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to pheniramine is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore the peak due to maleic acid and any peak with on area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 3 ml of *water*. Add a few drops of *ammonia* until an alkaline reaction is produced. Shake with 5 ml of *dichloromethane*. Separate the layers. Evaporate the lower, dichloromethane layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *dexchlorpheniramine maleate IPRS* in 3 ml of *water*. Add a few drops of *ammonia* until an alkaline reaction is produced. Shake with 5 ml of *dichloromethane*. Separate the layers. Evaporate the lower, dichloromethane layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *chlorpheniramine maleate IPRS* in 3 ml of *water*. Add a few drops of *ammonia* until an alkaline reaction is produced. Shake with 5 ml of *dichloromethane*. Separate the layers. Evaporate the lower, dichloromethane layer to an oily residue on a water-bath. Dissolve the oily residue in *2-propanol* and dilute to 10.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with *2-propanol*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with amylose derivative of silica,
- column temperature: 40°,
- mobile phase: a mixture of 0.3 volumes of *diethylamine*, 2.0 volumes of *2-propanol* and 98 volumes of *hexane*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to (R)-enantiomer and (*S*)-enantiomer is not less than 1.5.

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of the peak corresponding to the (R)-enantiomer is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent); the area of any other secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum oven at 65° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Storage. Store protected from light.

Dexchlorpheniramine Oral Solution

Dexchlorpheniramine Maleate Oral Solution

Dexchlorpheniramine Oral Solution is a mixture consisting of Dexchlorpheniramine Maleate with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The oral solution is constituted by dispersing the contents of the sealed container in the specific volume of water just before use.

Dexchlorpheniramine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dexchlorpheniramine maleate, $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Usual strength. 2 mg per 5 ml.

Storage. Store the constituted solution in a refrigerator (2° to 8°). Discard any unused portion after 30 days of reconstitution.

The contents of the sealed container comply with the test requirements stated under Oral Liquids and with the following requirements.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the test solution and the reference solution prepared in the Assay, shows an absorption maximum only at 264 nm.

B. Evaporate the remaining extract from the Assay on a steam bath to a small volume, then transfer it to a smaller, more suitable vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3 ml portions of *dimethylformamide*, to a suitable glass-stoppered graduated cylinder, dilute with *dimethylformamide* to 15.0 ml, and mix, the optical rotation (2.4.22) of the solution is between +0.06° and +0.11°.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh a measured volume of oral solution, containing about 40 mg of Dexchlorpheniramine Maleate, in 250 ml of *water*, adjusted to pH 11.0 with *1 M sodium hydroxide*, cool. Extract with five 70 ml portions of *hexane*, combine the *hexane* extracts in a 500-ml separator, and wash the *hexane* with two 10 ml portions of *sodium hydroxide* (1 in 250). Extract the combined alkaline washings with two 20 ml portions of *hexane*, and add these extracts to the bulk of the alkali-washed *hexane*. Filter the hexane through a pledged of cotton that previously has been saturated with *hexane* into a 500-ml volumetric flask, rinse the separator with portions of solvent hexane, pass the rinsing through the filter to add to volume, and mix. Transfer 50.0 ml of the solution to a separator. Extract the *hexane* with two 40 ml portions of *dilute hydrochloric acid* (1 in 120), combine the acid extracts in a 100-ml volumetric flask, add *dilute hydrochloric acid* (1 in 120) to volume, and mix. Filter the solution into a glass-stoppered conical flask, discarding the first few ml of the filtrate. The concentration of dexchlorpheniramine maleate is about 40 µg per ml. Measure the absorbance of the resulting solution at the maximum at about 264 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ from the absorbance obtained by repeating the procedure, using 40 mg of *dexchlorpheniramine maleate IPRS* in place of the substance under examination.

Determine the weight per ml (2.4.29) of the oral solution and calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$, weight in volume.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Dexchlorpheniramine Tablets

Dexchlorpheniramine Maleate Tablets

Dexchlorpheniramine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dexchlorpheniramine maleate, $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Usual strength. 2 mg.

Identification

A. Shake a quantity of powdered tablets containing about 50 mg of Dexchlorpheniramine Maleate with 25 ml of *0.01 M hydrochloric acid* for 10 minutes. Transfer the liquid to a separator, if necessary filter it and wash the filter and the residue with several small portions of *water*. In a second separator dissolve 50 mg of *dexchlorpheniramine maleate IPRS* in 25 ml of *0.01 M hydrochloric acid*. Treat each solution as follows. Add 2 ml of *1 M sodium hydroxide* and 4 ml of *carbon disulphide*, and shake for 2 minutes. Centrifuge if necessary to clarify the lower phase, and filter it through a dry filter, collecting the filtrate in a small flask provided with a glass stopper. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexchlorpheniramine maleate IPRS* treated in the same manner or with the reference spectrum of dexchlorpheniramine.

B. Shake a quantity of finely powdered tablets containing about 150 mg of Dexchlorpheniramine Maleate with 100 ml of *1 M acetic acid* for 10 minutes, filter through a sintered-glass funnel into a suitable vessel, adjust the filtrate with 10 per cent w/v *sodium hydroxide solution* to a pH of 11, and extract the solution with six 100-ml portions of hexane, filtering each hexane extract using suitable means to effect separation of the hexane layer from the aqueous layer. Concentrate the combined extracts on a steam bath to a small volume, transfer to a smaller, more suitable vessel, and evaporate just to the point where hexane vapours are no longer perceptible. Transfer the oily residue, with the aid of four 3 ml portions of *dimethylformamide*, to a suitable glass-stoppered graduated cylinder, dilute with *dimethylformamide* to 15.0 ml, mix, and centrifuge if necessary: the optical rotation of the solution is between +0.24° and +0.35°.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 500 ml of *water,*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 9 mg of the *dexbrompheniramine maleate IPRS* in 100 ml of *water.*

Test solution. Dilute 15.0 ml of the dissolution medium to 50 ml with *water,* add 1.0 ml of internal standard solution and mix. Adjust to pH 11.0 with 50 per cent w/v solution of *sodium hydroxide,* add 3.0 ml of *hexane* and sonicate for 3 minutes, centrifuge, and use the clear supernatant hexane layer.

Reference solution. A 0.00125 per cent w/v solution of *dexchlorpheniramine maleate IPRS* in *water.* Dilute 5.0 ml of the solution to 10.0 ml with *water,* add 1.0 ml of internal standard solution and mix. Adjust to pH 11.0 with 50 per cent w/v solution of *sodium hydroxide,* add 3.0 ml of *hexane* and sonicate for 3 minutes, centrifuge, and use the clear supernatant hexane layer.

Chromatographic system

- a glass column 1.8 m x 2 mm, packed with 1.2 per cent phase G16 and 0.5 per cent potassium hydroxide support with S1AB,
- temperature:
  column. 205°,
  inlet port and detector at 250°,
- flow rate: 60 ml per minute using nitrogen as carrier gas.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to dexchlorpheniramine and dexbrompheniramine is not less than 1.9 and the relative standard deviation for replicate injections is not more than 2 per cent. The relative retention time with reference to dexbrompheniramine for dexchlorpheniramine is about 0.7.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ in the tablet.

Q. Not less than 75 per cent of the stated amount of $C_{16}H_{19}ClN_2,C_4H_4O_4$.

Uniformity of content. Complies with the test stated under Tablets.

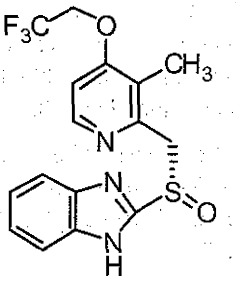
To 1 tablet, add 10 ml of *water* and shake, adjust to pH 11.0 with 10 per cent w/v solution of *sodium hydroxide,* Extract the mixture with two 7.5 ml portions of *hexane,* and combine the extracts in a separator. Extract the *hexane* with three 5.0 ml portions of *dilute hydrochloric acid* (1 in 120), combining the acid extracts in a 25-ml volumetric flask. Add dilute *hydrochloric acid* (1 in 120) to volume, and mix. Measure the absorbance of the resulting solution at the maximum at about 264 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ from the absorbance obtained by repeating the procedure, using 10 ml of 0.02 per cent w/v solution of *dexchlorpheniramine maleate IPRS* in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 8.0 mg of Dexchlorpheniramine Maleate in 50 ml of *water,* adjusted to pH 11.0 with *sodium hydroxide* (1 in 10). Extract the mixture with two 75 ml portions of *hexane,* and combine the extracts in a separator. Extract the *hexane* with three 50 ml portions of *dilute hydrochloric acid* (1 in 120), combining the acid extracts in a 200-ml volumetric flask. Add dilute *hydrochloric acid* (1 in 120) to volume, and mix. Measure the absorbance of the resulting solution at the maximum at 264 nm (2.4.7). Calculate the content of $C_{16}H_{19}ClN_2,C_4H_4O_4$ from the absorbance obtained by repeating the procedure, using 10 ml of 0.08 per cent w/v solution of *dexchlorpheniramine maleate IPRS* in place of the substance under examination.

Storage. Store protected from moisture.

Dexlansoprazole



$C_{16}H_{14}F_3N_3O_2S$ Mol wt. 369.4 (anhydrous)

$C_{16}H_{14}F_3N_3O_2S,1½\,H_2O$ Mol wt. 396.4 (sesquihydrate)

Dexlansoprazole is (+)-2-[[4-(2,2,2-Trifluoroethoxy)-3-methylpyridin-2-yl]methylsulfinyl]-1*H*-benzo[d]imidazole or its sesquihydrate.

Dexlansoprazole contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{14}F_3N_3O_2S$, calculated on the anhydrous basis.

Category. Antiulcerative.

Description. A white to brownish white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dexlansoprazole IPRS* or with the reference spectrum of dexlansoprazole.

B. In the test for Related substances, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

S-isomer. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution(a). Weigh 25 mg of *S-isomer IPRS* and dissolve in mobile phase and diluted to50.0 ml with mobile phase.

Reference solution(b). Dissolve 25 mg of *dexlansoprazole IPRS* in mobile phase , add 75 µl of reference solution (a) and dilute to 50.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, such as chiral Pack- IC, (5 µm)
- column temperature 30°,
- mobile phase: a mixture of 1 volume of *trifluoro acetic acid* , 0.5 volume of *diethylamine* and 1000 volumes of *acetonitrile.*
- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

The test is not valid unless. The resolution between the dexlansoprazole and S -isomer (-)-2-[(*S*)-{[3-methyl-4-(2,2,2-trifluoroethoxy) pyridine-2-yl]methyl}sulfinyl]-1*H*-benzimidazole is not less than 2.0.

Inject the test solution, the area of any peak due to S-isomer is not mre than 0.15 per cent, calculated by area normalisation.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in *0.01 M methanolic sodium hydroxide* and diluted to 10.0 ml with *0.01 M methanolic sodium hydroxide* in amber coloured volumetric flask.

Reference solution. A 0.0001 per cent w/v solution of *dexlansoprazole IPRS* in *0.01 M methanolic sodium hydroxide* in amber coloured volumetric flask.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature 30°,
- mobile phase: A. *water*,

B. a mixture of 160 volumes of *acetonitrile*, 40 volumes of *water* and 1 volume of *triethylamine*, adjusted to pH 7.0 with *orthophosphoric acid*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
10	60	40
25	45	55
35	35	65
45	35	65
47	60	40
55	60	40

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0.

Inject the test solution, the area of any secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent (for the anhydrous form) and 6.0 to 8.0 per cent (for the sesquihydrate form), determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

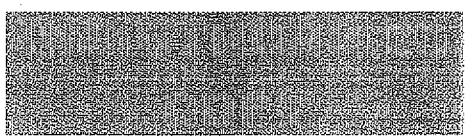
Solvent mixture. 1 volume of *triethylamine* with 60 volumes of *water* and adjusted to pH 10.5 using dilute *orthophosphoric acid.* Filter this solution through 0.45 µm nylon filter paper.

Test solution. Dissolve 0.1 g of the substance under examination in 50 ml of solvent mixture in 100-ml amber coloured volumetric flask and dilute to 100.0 ml with solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml in amber coloured volumetric flask with mobile phase.

Reference solution. A 0.01 per cent w/v solution of *dexlansoprazole IPRS* using amber coloured volumetric flask in the mobile phase.

Chromatographic system

- a stainless steel column 150 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 30°,
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile*, and 0.5 volume of *triethylamine* and adjusted to pH 7.0 with *orthophosphoric acid.*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume: 10 µl.



Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{14}F_3N_3O_2S$.

Dextran 1

Dextran 1 is a low molecular weight fraction of dextran, consisting of a mixture of isomaltooligosaccharide.It is obtained by controlled hydrolysis and fractionation of dextrans produced by fermentation of *Leuconostoc mesenteroides* in the presence of sucrose. It is a glucose polymer in which the linkages between glucose units are almost exclusively α-1,6. Its weight-average molecular weight is about 1000.

Category. Plasma substitute.

Description. A white to off white hygroscopic powder.

Identification

A. To 2 mg of substance under examination, add 2 drops of *water*, grind in an agate mortar for 2 minutes, add 0.3 g of *potassium bromide* and mix to slurry. (*NOTE — Do not grind).* Dry under vaccum at 40°. On the residue, determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *dextran 1 IPRS* treated in the same manner or with the reference spectrum of dextran 1.

B. Specific optical rotation (see Test).

C. Molecular mass distribution (See Test), the peaks in the chromatogram obtained with the test solution corresponds to peaks in the chromatogram obtained with reference solution.

Tests

pH(2.4.24). 4.5 to 7.0,determined in a15 per cent w/v solution.

Specific optical rotation (2.4.22). +148.0° to +164.0°, determined on 1.0 per cent w/v solution at 20°.

Light absorbance. A 15 per cent w/v solution, determined at 375 nm (2.4.7), shows absorbance not more than 0.12.

Molecular-mass distribution. Determined by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 6 mg of the substance under examination in 1.0 ml of the mobile phase.

Reference solution (a). Dissolve 6 mg of *dextran 1 IPRS* in 1.0 ml of the mobile phase.

Reference solution (b). A solution containing 0.045 per cent w/v of isomaltotriose (3 glucose units), isomaltononaose (9 glucose units) and 0.060 per cent w/v of sodium chloride in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 10 mm, dextran covalently bound to highly cross-linked porous agarose beads, allowing resolution of oligosaccharides in the molecular mass range of 180 to 3000 (two columns coupled in series),
- temperature: 20-25°,
- mobile phase: a 0.292 per cent w/v solution of *sodium chloride*,
- flow rate: 0.07-0.08 ml per minute,
- differential refractometer,
- injection volume: 100 µl.

Identification of peaks, use the chromatogram obtained with reference solution (b) to identify the peaks due to isomaltotriose, isomaltononaose and sodium chloride.

Determine the peak areas. Disregard any peak due to sodium chloride. Calculate the average relative molecular mass M_w and the amount of the fraction with less than 3 and more than 9 glucose units, of *dextran 1 IPRS* and of the substance under examination, using the following expression:

$$M_w = \sum w_i \times m_i$$

where, M_w = average molecular mass of the dextran 1;
m_i = molecular mass of oligosaccharide *i*;
w_i = weight proportion of oligosaccharide *i*.

Use the following m_i values for the calculation:

Oligosaccharide *i*	m_i
glucose	180
isomaltose	342
isomaltotriose	504
isomaltotetraose	666
isomaltopentaose	828
isomaltohexaose	990
isomaltoheptaose	1152
isomaltooctaose	1314
isomaltononaose	1476
isomaltodecaose	1638
isomaltoundecaose	1800
isomaltododecaose	1962
isomaltotridecaose	2124
isomaltotetradecaose	2286
isomaltopentadecaose	2448
isomaltohexadecaose	2610
isomaltoheptadecaose	2772
isomaltooctadecaose	2934
isomaltononadecaose	3096

Inject reference solution (a). The test is not valid unless the values obtained for *dextran 1 IPRS* are within the values stated on the label.

The average molecular mass range between 850 and 1150; fraction with less than 3 glucose units less than 15.0 per cent and fraction with more than 9 glucose units less than 20.0 per cent.

Nitrogen-containing substances. Not more than 110 ppm of N.

Determine the content of nitrogen, method A (2.3.30), using 0.2 g and heating for 2 hours. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution*, 0.5 ml of *methyl red solution* and 20 ml of *water*. Titrate with *0.01 M hydrochloric acid*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Sodium chloride. Not more than 1.5 per cent.

Dissolve 5 g of the substance under examination in 100 ml of *water*. Titrate with *0.1 M silver nitrate*, using 0.2 ml of *potassium chromate* solution as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Residual solvents (5.4). Not more than 0.5 per cent *ethanol*, 0.05 per cent *methanol* and sum of solvents other than *ethanol*, *methanol* and *propanol* is not more than 0.5 per cent calculated as *propanol*.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Dextran 1 intended for use in the manufacture of parenteral preparations without a further appropriate sterilization procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Dextran 1 intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 25 Endotoxin Unit per g of dextran.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 10^2 CFU per g and the total combined moulds and yeasts count is not more than 10 CFU per g.

Storage. Store protected from moisture, at a temperature between 4° and 30°.

Labelling. Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

Dextran 40

Dextran 40 is a mixture of polysaccharides, principally of the α-1, 6-glucan type. Average relative molecular mass is about 40,000. It is obtained by hydrolysis and fractionation of dextran produced by fermentation of sucrose using strain of *Leuconostoc mesenteroides*.

Category. Plasma substitute.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextran 40 IPRS* or with the reference spectrum of dextran.

B. Specific optical rotation (see Tests).

C. Molecular mass distribution (see Tests) the peaks in the chromatogram obtained with the test solution corresponds to peaks in the chromatogram obtained with reference solution.

Tests

Solution A. Dissolve 5 g in *water*, heating on a water bath and dilute to 50.0 ml with *water*.

Appearance of solution. Solution A is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.1 ml of *phenolphthalein solution*, the solution remains colourless. Add 0.2 ml of *0.01 M sodium hydroxide*, the solution is pink. Add 0.4 ml of *0.01 M hydrochloric acid*, the solution is colourless, add 0.1 ml of *methyl red solution*, the solution is red or orange.

Specific optical rotation (2.4.22). + 195.0° to + 203.0°, determined on 2.0 per cent w/v solution.

Molecular-mass distribution. Determine by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 6 mg of the substance under examination in 1.0 ml of the mobile phase.

Reference solution (a). Dissolve 6 mg of *dextran 40 IPRS* in 1.0 ml of the mobile phase.

Reference solution (b). A solution containing 0.045 per cent w/v of isomaltotriose (3 glucose units), isomaltononaose (9 glucose units) and 0.060 per cent w/v of sodium chloride in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 10 mm, dextran covalently bound to highly cross-linked porous agarose beads, allowing resolution of oligosaccharides in the molecular mass range of 180 to 3000 (two columns coupled in series),

- temperature: 20-25°,
- mobile phase: a 0.292 per cent w/v solution of *sodium chloride*,
- flow rate: 0.07-0.08 ml per minute,
- differential refractometer,
- injection volume: 100 µl.

Identification of peaks, use the chromatogram obtained with reference solution (b) to identify the peaks due to isomaltotriose, isomaltononaose and sodium chloride.

Determine the peak areas. Disregard any peak due to sodium chloride. Calculate the average relative molecular mass M_w and the amount of the fraction with less than 3 and more than 9 glucose units, of *dextran 40 IPRS* and of the substance under examination, using the following expression:

$$M_w = \sum w_i \times m_i$$

where, M_w = average molecular mass of the dextran;
m_i = molecular mass of oligosaccharide *i*;
w_i = weight proportion of oligosaccharide *i*.

Use the following m_i values for the calculation:

Oligosaccharide *i*	m_i
glucose	180
isomaltose	342
isomaltotriose	504
isomaltotetraose	666
isomaltopentaose	828
isomaltohexaose	990
isomaltoheptaose	1152
isomaltooctaose	1314
isomaltononaose	1476
isomaltodecaose	1638
isomaltoundecaose	1800
isomaltododecaose	1962
isomaltotridecaose	2124
isomaltotetradecaose	2286
isomaltopentadecaose	2448
isomaltohexadecaose	2610
isomaltoheptadecaose	2772
isomaltooctadecaose	2934
isomaltononadecaose	3096

Inject reference solution (a). The test is not valid unless the values obtained for *dextran 40 IPRS* are within the values stated on the label.

The average molecular mass is 35,000 to 45,000. The average molecular mass of the 10 per cent high fraction is not more than 1,10,000. The average molecular mass of the 10 per cent low fraction is not less than 7,000.

Nitrogen-containing substances. Not more than 110 ppm of N.

Determine the content of nitrogen, Method A (2.3.30),using 0.2 g and heating for 2 hours. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution*, 0.5 ml of *methyl red solution* and 20 ml of *water*. Titrate with *0.01 M hydrochloric acid*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Residual solvents (5.4). Not more than 0.5 per cent *ethanol*, 0.05 per cent *methanol* and sum of solvents other than *ethanol*, *methanol* and *propanol* is not more than 0.5 per cent calculated as *propanol*.

Sulphated ash (2.3.18). Not more than 0.3 per cent,determined on 0.5 g.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per g of dextran 40.

Microbial contamination (2.2.9).Total aerobic viable count is not more than 100 CFU per g.

Dextran 40 Infusion

Dextran 40 Injection; Dextran 40 Intravenous Infusion

Dextran 40 Infusion is a sterile solution containing Dextran 40 in Dextrose Injection or in Sodium Chloride Injection.

Dextran 40 Infusion contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextran 40.

Description. An almost colourless, slightly viscous solution.

Tests

Acidity. Titrate 25.0 ml of infusion with *0.01 M sodium hydroxide* using *phenol red solution* as indicator. Not more than 2.0 ml of *0.01 M sodium hydroxide* is required to neutralise the solution.

Molecular size. For solutions in Dextrose Injection, before proceeding with tests A, B and C add 4 volumes of *ethanol (95 per cent)*, centrifuge and dissolve the residue in a volume of Sodium Chloride Injection sufficient to restore the original volume.

A. Determine the viscosity (2.4.28) ratios by Method A, using size C U-tube viscometer at 37°, of solutions in *saline solution* containing about 3.5, 2.5, 1.5 and 0.75 per cent w/v of dextrans,

accurately determined. Calculate the viscosity ratio by dividing the time taken for the meniscus to fall from E to F using the liquid being examined by the time taken using *saline solution*. For each solution, plot (viscosity ratio – 1.00)/concentration (in per cent w/v) against concentration (in per cent w/v). The intercept on the viscosity axis of the straight line joining the points represents the intrinsic viscosity. The intrinsic viscosity is 0.16 to 0.20.

B. Place in each of five stoppered flasks 100 ml of a solution in *saline solution* containing 6 per cent w/v of dextrans and add slowly, with continuous stirring, sufficient *ethanol* to produce a faint cloudiness (about 45 ml is usually required). Add 0.5, 1.0, 1.5, 2.0 and 2.5 ml of *ethanol* to the separate flasks, stopper the flasks and immerse in a water-bath at about 35° with occasional shaking until clear solutions are obtained. Transfer the flasks to a water-bath maintained at 25.0° ± 0.1° and allow to stand overnight or until two clear liquid phases are formed.

Reject the supernatant liquids, dissolve separately the syrupy residues in sufficient *saline solution* to produce 25.0 ml, remove the ethanol by evaporation at a pressure of about 2 kPa, dilute to 25.0 ml with *water* and determine the optical rotation (2.4.22). From the optical rotations calculate the amount of dextrans precipitated as described under Assay. Choose that fraction containing as nearly as possible but not more than 10 per cent of the dextrans present in the injection and determine its intrinsic viscosity by the method described under test A; the intrinsic viscosity is not more than 0.27.

C. Place in each of four stoppered flasks 100 ml of a solution in *saline solution* containing 6 per cent w/v of dextrans and add slowly, with continuous stirring, 80, 90, 100 and 110 ml respectively of *ethanol*. Stopper the flasks, transfer to a water-bath maintained at 25.0° ± 0.1° and allow standing overnight or until two clear liquid phases are formed. Separate the supernatant solution from the syrupy residues. Remove the *ethanol* from each supernatant solution separately by evaporation at a pressure of 2 kPa, dialyse in cellophane tubing against *water* to remove sodium chloride, adjust the volume to 25.0 ml with *water*, add sufficient *sodium chloride* to produce solutions containing 0.9 per cent w/v and determine the optical rotation (2.4.22). From the optical rotations, calculate the amounts of dextrans present as described under Assay. Choose that fraction containing as nearly as possible but not more than 10 per cent of the dextrans present in the injection and determine the intrinsic viscosity by the method in test A above; the intrinsic viscosity is not less than 0.08.

Content of dextrose *(if present)*. 4.5 per cent to 5.5 per cent w/v.

Dilute 15.0 ml of infusion to 50.0 ml with *water*. To 5.0 ml in a stoppered flask, add 25 ml of a buffer solution containing 14.3 per cent w/v of *sodium carbonate* and 4.0 per cent w/v of *potassium iodide* and 25.0 ml of *0.05 M iodine*. Stopper the flask and allow to stand for exactly 30 minutes at 20°, add 35 ml of *2 M hydrochloric acid* and titrate immediately with *0.1 M sodium thiosulphate*. Repeat the operation using 5 ml of *water*, beginning at the words "add 25 ml of a buffer solution...". The difference between the titrations represents the amount of the iodine required to oxidise the dextrose.

1 ml of *0.05 M iodine* is equivalent to 0.00901 g of dextrose.

Content of sodium chloride *(if present)*. 0.81 per cent to 0.99 per cent w/v.

To a measured volume containing 0.09 g of *sodium chloride*, titrate with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Infusions).

Assay. *For solutions in Dextrose Injection* — Add 0.05 ml of *5 M ammonia* to the required volume and measure the optical rotation (2.4.22). Calculate the content of dextrans from the following expression,

$$0.5076(\alpha - 0.528D)$$

where α is the observed angular rotation and D the content of dextrose per cent w/v, determined in the test for Content of dextrose.

For solutions in Sodium Chloride Injection — Measure the optical rotation (2.4.22), and multiply the value obtained, by 0.5076.

Storage. Store at a temperature not exceeding 30°. The injection should not be exposed to undue fluctuations of temperature.

Labelling. The label states (1) the strength as the per cent w/v of dextrans; (2) the name of the solvent; (3) that the injection should not be used if it is cloudy or if a deposit is present.

Dextran 70

Dextran 70 is a mixture of polysaccharides, principally of the α-1, 6-glucan type. Average relative molecular mass is about 70,000. It is obtained by hydrolysis and fractionation of dextran produced by fermentation of sucrose using strain of *Leuconostoc mesenteroides*.

Category. Plasma substitute.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextran 70 IPRS* or with the reference spectrum of dextran.

B. Specific optical rotation (see Test).

C. Molecular mass distribution (see Test) the peaks in the chromatogram obtained with the test solution corresponds to peaks in the chromatogram obtained with reference solution.

Tests

Solution A. Dissolve 5 g in *water*, heating on a water-bath and dilute to 50.0 ml with *water*.

Appearance of solution. Solution A is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.1 ml of *phenolphthalein solution*, the solution remains colourless. Add 0.2 ml of *0.01 M sodium hydroxide*, the solution is pink. Add 0.4 ml of *0.01 M hydrochloric acid*, the solution is colourless, add 0.1 ml of *methyl red solution*, the solution is red or orange.

Specific optical rotation (2.4.22). + 195.0° to + 201.0°, determined on 2.0 per cent w/v solution.

Molecular-mass distribution. Determine by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 6 mg of the substance under examination in 1.0 ml of the mobile phase.

Reference solution (a). Dissolve 6mg of *dextran 70 IPRS* in 1.0 ml of the mobile phase.

Reference solution (b). A solution containing 0.045 per cent w/v of isomaltotriose (3 glucose units), isomaltononaose (9 glucose units) and 0.060 per cent w/v of sodium chloride in the mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 10 mm, dextran covalently bound to highly cross-linked porous agarose beads, allowing resolution of oligosaccharides in the molecular mass range of 180 to 3000 (two columns coupled in series),
- temperature: 20-25°,
- mobile phase: a 0.292 per cent w/v solution of *sodium chloride*,
- flow rate: 0.07-0.08 ml per minute,
- differential refractometer,
- injection volume: 100 µl.

Identification of peaks, use the chromatogram obtained with reference solution (b) to identify the peaks due to isomaltotriose, isomaltononaose and sodium chloride.

Determine the peak areas. Disregard any peak due to sodium chloride. Calculate the average relative molecular mass M_w and the amount of the fraction with less than 3 and more than 9 glucose units, of *dextran 70 IPRS* and of the substance under examination, using the following expression:

$$M_w = \sum w_i \times m_i$$

where, M_w = average molecular mass of the dextran 1;
m_i = molecular mass of oligosaccharide i;
w_i = weight proportion of oligosaccharide i.

Use the following m_i values for the calculation:

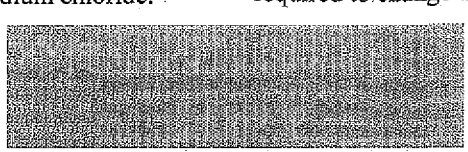
Oligosaccharide i	m_i
glucose	180
isomaltose	342
isomaltotriose	504
isomaltotetraose	666
isomaltopentaose	828
isomaltohexaose	990
isomaltoheptaose	1152
isomaltooctaose	1314
isomaltononaose	1476
isomaltodecaose	1638
isomaltoundecaose	1800
isomaltododecaose	1962
isomaltotridecaose	2124
isomaltotetradecaose	2286
isomaltopentadecaose	2448
isomaltohexadecaose	2610
isomaltoheptadecaose	2772
isomaltooctadecaose	2934
isomaltononadecaose	3096

Inject reference solution (a). The test is not valid unless the values obtained for *dextran 70 IPRS* are within the values stated on the label.

The average molecular mass is 64,000 to76,000. The average molecular mass of the 10 per cent high fraction is not more than 1,85,000. The average molecular mass of the 10 per cent low fraction is not less than 15,000.

Nitrogen-containing substances. Not more than 110 ppm of N.

Determine the content of nitrogen, Method A (2.3.30),using 0.2 g and heating for 2 hours. Collect the distillate in a mixture of 0.5 ml of *bromocresol green solution*, 0.5 ml of *methyl red solution* and 20 ml of *water*. Titrate with *0.01 M hydrochloric acid*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.



Residual solvents (5.4). Not more than 0.5 per cent *ethanol*, 0.05 per cent *methanol* and sum of solvents other than *ethanol*, *methanol* and *propanol* is not more than 0.5 per cent calculated as *propanol*.

Sulphated ash (2.3.18). Not more than 0.3 per cent,determined on 0.5 g.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Bacterial endotoxins (2.2.3). Not more than 16 Endotoxin Units per g of dextran70.

Microbial contamination (2.2.9). Total aerobic viable count is not more than 100 CFU per g.

Dextran 70 Infusion

Dextran 70 Injection; Dextran 70 Intravenous Infusion

Dextran 70 Infusion is a sterile solution containing Dextran 70 in Dextrose Injection or in Sodium Chloride Injection.

Dextran 70 Infusion contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dextran 70.

Description. An almost colourless, slightly viscous solution.

Tests

Acidity. Titrate 25.0 ml of infusion with *0.01 M sodium hydroxide* using *phenol red solution* as indicator. Not more than 1.25 ml of *0.01 M sodium hydroxide* is required to neutralise the solution.

Molecular size. For solutions in Dextrose Injection, before proceeding with tests A, B and C add 4 volumes of *ethanol (95 per cent)*, centrifuge and dissolve the residue in a volume of Sodium Chloride Injection sufficient to restore the original volume.

A. Determine the viscosity (2.4.28) ratios by Method A, using size C U-tube viscometer at 37°, of solutions in *saline solution* containing about 3.5, 2.5, 1.5 and 0.75 per cent w/v of dextrans, accurately determined. Calculate the viscosity ratio by dividing the time taken for the meniscus to fall from E to F using the liquid being examined by the time taken using *saline solution*.For each solution, plot (viscosity ratio – 1.00)/ concentration (in per cent w/v) against concentration (in per cent w/v). The intercept on the viscosity axis of the straight line joining the points represents the intrinsic viscosity.The intrinsic viscosity is 0.22 to 0.27.

B. Place in each of five stoppered flasks 100 ml of a solution in *saline solution* containing 6 per cent w/v of dextrans and add slowly, with continuous stirring, sufficient *ethanol* to produce a faint cloudiness (about 45 ml is usually required). Add 0.5, 1.0, 1.5, 2.0 and 2.5 ml of *ethanol* to the separate flasks, stopper the flasks and immerse in a water-bath at about 35° with occasional shaking until clear solutions are obtained. Transfer the flasks to a water-bath maintained at 25.0° ± 0.1° and allow to stand overnight or until two clear liquid phases are formed.

Reject the supernatant liquids, dissolve separately the syrupy residues in sufficient *saline solution* to produce 25.0 ml, remove the ethanol by evaporation at a pressure of about 2 kPa, dilute to 25.0 mlwith *water* and determine the optical rotation (2.4.22). From the optical rotations calculate the amount of dextrans precipitated as described under Assay. Choose that fraction containing as nearly as possible but not more than 10 per cent of the dextrans present in the injection and determine its intrinsic viscosity by the method described under test A; the intrinsic viscosity is not more than 0.36.

C. Place in each of four stoppered flasks 100 ml of a solution in *saline solution* containing 6 per cent w/v of dextrans and add slowly, with continuous stirring, 80, 90, 100 and 110 ml respectively of *ethanol*. Stopper the flasks, transfer to a water 'bath maintained at 25.0° ± 0.1° and allow standing overnight or until two clear liquid phases are formed. Separate the supernatant solution from the syrupy residues. Remove the *ethanol* from each supernatant solution separately by evaporation at a pressure of 2 kPa, dialyse in cellophane tubing against *water* to remove sodium chloride, adjust the volume to 25.0 ml with *water*, add sufficient *sodium chloride* to produce solutions containing 0.9 per cent w/v and determine the optical rotation (2.4.22). From the optical rotations, calculate the amounts of dextrans present as described under Assay. Choose that fraction containing as nearly as possible but not more than 10 per cent of the dextrans present in the injection and determine the intrinsic viscosity by the method in test A above; the intrinsic viscosity is not less than 0.13.

Content of dextrose *(if present)*. 4.5 per cent to 5.5 per cent w/v.

Dilute 15.0 ml of infusion to 50.0 ml with *water*. To 5.0 ml in a stoppered flask, add 25 ml of a buffer solution containing 14.3 per cent w/v of *sodium carbonate* and 4.0 per cent w/v of *potassium iodide* and 25.0 ml of *0.05 M iodine*. Stopper the flask and allow to stand for exactly 30 minutes at 20°, add 35 ml of *2 M hydrochloric acid* and titrate immediately with *0.1 M sodium thiosulphate*. Repeat the operation using 5 ml of *water*, beginning at the words "add 25 ml of a buffer solution...". The difference between the titrations represents the amount of the iodine required to oxidise the dextrose.

1 ml of *0.05 M iodine* is equivalent to a 0.00901 g of dextrose.

Content of sodium chloride *(if present)*. 0.81 per cent to 0.99 per cent w/v.

To a measured volume containing 0.09 g of *sodium chloride*, titrate with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Bacterial endotoxins (2.2.3). Not more than 1.21 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Infusions).

Assay. *For solutions in Dextrose Injection* — Add 0.05 ml of *5 M ammonia* to the required volume and measure the optical rotation (2.4.22). Calculate the content of dextrans from the following expression,

$$0.5076(\alpha - 0.528D)$$

where α is the observed angular rotation and D the content of dextrose per cent w/v, determined in the test for Content of dextrose.

For solutions in Sodium Chloride Injection — Measure the optical rotation (2.4.22), and multiply the value obtained, by 0.5076.

Storage. Store at a temperature not exceeding 30°. The injection should not be exposed to undue fluctuations of temperature.

Labelling. The label states (1) the strength as the per cent w/v of dextrans; (2) the name of the solvent; (3) that the injection should not be used if it is cloudy or if a deposit is present.

Dextran 110 Injection

Dextran 110 Intravenous Infusion

Dextran 110 Injection is a sterile solution, in Dextrose Injection or in Sodium Chloride Injection, of dextrans of average molecular weight of about 110,000, derived from the dextrans produced by the fermentation of sucrose by means of a certain strain of *Leuconostoc mesenteroides*. The dextrans are polymers of dextrose in which the linkages between the dextrose units are almost entirely of the α-1→6 type.

Dextran 110 Injection contains not less than 5.5 per cent and not more than 6.5 per cent w/v of dextrans.

Category. Plasma substitute.

Description. An almost colourless, slightly viscous solution.

Tests

pH (2.4.24). 3.5 to 6.5 for solutions in Dextrose Injection; 5.0 to 7.0 for solutions in Sodium Chloride Injection.

Molecular size. For solutions in Dextrose Injection, before proceeding with tests A and B, add 4 volumes of *ethanol (95 per cent)*, centrifuge and dissolve the residue in a volume of *Sodium Chloride Injection* sufficient to restore the original volume.

A. Determine the viscosity (2.4.28) ratios by Method A, using size C U-tube viscometer at 37°, of solutions in *saline solution* containing about 2.0, 1.0, 0.5 and 0.25 per cent w/v of dextrans, accurately determined. For each solution, plot (viscosity ratio - 1.00)/concentration (in per cent w/v) against concentration (in per cent w/v). The intercept on the viscosity ratio axis of the straight line joining the points represents the intrinsic viscosity; the intrinsic viscosity is 0.27 to 0.32.

B. Place 100 ml in each of five stoppered flasks and adjust the temperature to 25.0° ± 0.1°. With precautions to maintain this temperature, add slowly with continuous stirring sufficient *ethanol* to produce a faint cloudiness (about 45 ml is usually required). Add 0.5, 1.0, 1.5, 2.0 and 2.5 ml of *ethanol* to the separate flasks, stopper the flasks and immerse in a water-bath at about 35° with occasional shaking until clear solutions are obtained. Transfer the flasks to a water-bath maintained at 25.0° ± 0.1° and allow to stand overnight or until two clear liquid phases are formed. Reject the supernatant liquids, dissolve separately the syrupy residues in sufficient *saline solution* to produce 25.0 ml, remove the *ethanol* by evaporation at a pressure of about 2 kPa, dilute to 25.0 ml with *water* and determine the optical rotation (2.4.22). From the optical rotations calculate the amount of dextrans precipitated as described under Assay. Choose that fraction containing as nearly as possible but not more than 10 per cent of the dextrans present in the injection and determine its intrinsic viscosity by the method described under test A; the intrinsic viscosity is not more than 0.40.

Content of dextrose. For solutions in Dextrose Injection, between 4.5 and 5.5 per cent w/v determined by the following method. Dilute 15.0 ml to 50.0 ml with *water*. To 5.0 ml in a stoppered flask add 25 ml of a buffer solution containing 14.3 per cent *w/v of sodium carbonate* and 4.0 per cent *w/v* of *potassium iodide* and 25.0 ml of *0.05 M iodine*. Stopper the flask and allow to stand for exactly 30 minutes at 20°, add 30 ml of *dilute hydrochloric acid* and titrate immediately with *0.1 M sodium thiosulphate*. Repeat the operation beginning at the words "add 25 ml of a buffer solution..." but using 5 ml of *water* in place of 5 ml of the preparation under examination. The difference between the titrations represents the amount of iodine required to oxidise the dextrose.

1 ml of *0.05 M iodine* is equivalent to a 0.00901 g of dextrose.

Acetone. To 10 ml add sufficient *ammonium sulphate* to give a saturated solution, add 1 ml of *sodium nitroprusside solution* and 5 ml of *strong ammonia solution*, and allow to stand for 10 minutes. Any purple colour produced is not more intense than that produced by treating in the same manner 10 ml of a 0.02 per cent v/v solution of *acetone*.

Content of sodium chloride (*if present*). For solutions in Sodium Chloride Injection, 0.81 to 0.99 per cent w/v, determined by the following method. Titrate a measured volume containing 0.1 g of sodium chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Ethanol. Distil 100 ml, collect the first 45 ml of distillate and dilute to 50 ml with *water*. Mix 10 ml of *0.0167 M potassium dichromate* and 10 ml of *sulphuric acid* in a stoppered boiling tube, immediately add 5 ml of the distillate, mix, stopper the tube, and allow to stand for 5 minutes. Transfer to a 500-ml flask, dilute to about 300 ml with *carbon dioxide-free water*, add 2 g of *potassium iodide* and 1 ml of a 10 per cent w/v solution of *potassium thiocyanate*, allow to stand for 5 minutes and titrate the liberated iodine with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the determination beginning at the words "Mix 10 ml of *0.0167 M potassium dichromate*.." but using 5 ml of *water* in place of 5 ml of the distillate. The difference between the titrations is not more than 4.2 ml.

Heavy metals (2.3.13). To 4.0 ml add 5 ml of *dilute acetic acid* and sufficient *water* to produce 25.0 ml. The resulting solution complies with the limit test for heavy metals, Method A (5 ppm).

Nitrogen (2.3.30). Determine by Method B, using 50 ml. For solutions in Dextrose Injection, use 30 ml of *nitrogen-free sulphuric acid*. For solutions in Sodium Chloride Injection use 20 ml of *nitrogen-free sulphuric acid*.

Not more than 0.35 ml of *0.05 M sulphuric acid* is required.

Sulphated ash. Titrate 25 ml with *0.1 M silver nitrate* using *potassium chromate solution* as indicator. Deduct the theoretical value of the sulphated ash due to the sodium chloride present.

1 ml of *0.1 M silver nitrate* is equivalent to 0.007102 g of sulphated ash (0.05 per cent w/v).

Foreign protein. Inject 0.5 ml on three occasions at intervals of 2 days into the peritoneal cavity of each of six healthy guinea-pigs weighing not less than 250 g that have not previously been treated with any material that will interfere with the test. Inject 0.2 ml intravenously into each of the three guinea-pigs 14 days after the first intra-peritoneal injection, and into each of the other three guinea-pigs 21 days after the first intra-peritoneal injection. Observe the guinea-pigs for 30 minutes after each intravenous injection and again 24 hours later; the animals exhibit no signs of anaphylaxis such as coughing, bristling of hair or respiratory distress.

Bacterial endotoxins (2.2.3). Not more than 1.25 Endotoxin Units per ml.

Other tests. Comply with the tests stated under Parenteral Preparations (Infusions).

Assay. *For solutions in Dextrose Injection* — Add a drop of *dilute ammonia solution* to the required volume and determine the optical rotation (2.4.22). Calculate the content of dextrans from the following expression $0.5076(\alpha - 0.528D)$, where α is the observed angular rotation and D the content of dextrose per cent w/v, determined in the test for Content of dextrose.

For solutions in Sodium Chloride Injection — Measure the optical rotation (2.4.22), and multiply the value obtained by 0.5076.

Storage. Store at a temperature not exceeding 30°. The injection should not be exposed to undue fluctuations of temperature.

Labelling. The label states (1) the strength as the percentage w/v of dextrans; (2) the name of the solvent; (3) the strain of *Leuconostoc mesenteroides* used; (4) that the injection should not be used if it is cloudy or if a deposit is present.

Dextrin

Dextrin is starch partially hydrolysed by heat with or without the aid of suitable acids and buffers.

Category. Pharmaceutical aid (tablet excipient).

Description. A white or pale yellow powder.

Identification

A. *Microscopic characteristics* — Granules have similar appearance to the starch from which the dextrin has been prepared. In dextrin prepared from maize starch many of the granules show concentric striations and in dextrin prepared from potato starch concentric striations are not clearly visible; the hilum may be bicleft and some of the granules may be distorted.

B. Boil 1 g in 50 ml of *water*, cool. To 5 ml of the cloudy suspension, add a drop of *iodine solution* and mix; a purple colour is produced.

C. To 5 ml of the suspension produced in test B add 2 ml of *2 M sodium hydroxide*, mix, add dropwise with shaking 0.5 ml of *cupric sulphate solution* and boil; a red precipitate is produced.

Tests

Acidity. Add 10 g to 100 ml of *ethanol (70 per cent)*, previously neutralised to *phenolphthalein solution*, shake for 1 hour, filter and titrate 50 ml of the filtrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Not more than 1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method A (40 ppm).

Chlorides (2.3.12). Dissolve 2.5 g in 50 ml of boiling *water*, cool, dilute to 100 ml with *water* and filter. 5 ml of the filtrate diluted to 15 ml complies with the limit test for chlorides (0.2 per cent).

Ethanol-soluble substances. Not more than 1 per cent, determined by the following method. Boil under a reflux condenser 1 g with 20 ml of *ethanol (95 per cent)* for 5 minutes and filter while hot. Evaporate 10 ml of the filtrate on a water-bath, dry the residue at 105° and weigh.

Protein. Not more than 0.5 per cent, determined by the following method. Carry out Method A for the determination of nitrogen (2.3.30), using 5 g, weighed, and 30 ml of *nitrogen-free sulphuric acid*. Calculate the content of protein by multiplying the percentage of nitrogen in the substance under examination by 6.25.

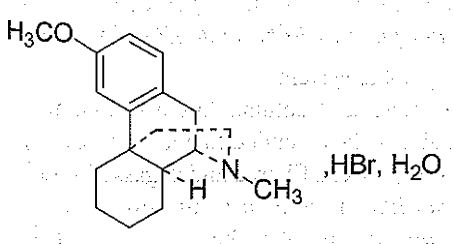
Reducing substances. Not more than 10 per cent, calculated as dextrose, $C_6H_{12}O_6$, determined by the following method. Weigh a quantity containing 2 g of the dried substance, add 100 ml of *water*, shake for 30 minutes, dilute to 200.0 ml with *water* and filter. To 10 ml of *cupri-tartaric solution* add 20.0 ml of the filtrate, mix and heat at a rate such that the solution is brought to boil in 3 minutes. Boil for a further 2 minutes and cool quickly. Add 5 ml of a 30 per cent w/v solution of *potassium iodide* and 10 ml of *1 M sulphuric acid*, mix and titrate immediately with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the procedure using 20.0 ml of a 0.1 per cent w/v solution of *dextrose* in place of the filtrate beginning at the words "To 10 ml of...". Carry out a blank titration using 20 ml of *water* in place of 20.0 ml of the sample filtrate. The titre obtained with the sample filtrate is not greater than the titre obtained with the dextrose solution.

Ash (2.3.19). Not more than 1 per cent.

Loss on drying (2.4.19). Not more than 12 per cent, determined on 1.0 g by drying in an oven at 110°.

Storage. Store protected from moisture.

Dextromethorphan Hydrobromide



$C_{18}H_{25}NO,HBr,H_2O$ Mol. Wt. 370.3

Dextromethorphan Hydrobromide is *ent*-3-methoxy-9a-methylmorphinan hydrobromide monohydrate.

Dextromethorphan Hydrobromide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{25}NO,HBr$ calculated on the anhydrous basis.

Category. Cough suppressant.

Description. An almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextromethorphan hydrobromide IPRS* or with the reference spectrum of dextromethorphan hydrobromide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at 278 nm.

C. It gives the reaction of bromides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 0.4 g in *carbon dioxide-free water* with gentle heat, cool and dilute to 20 ml with the same solvent. Add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour to red.

Specific optical rotation (2.4.22). +28.0° to +30.0°, determined in a 2.0 per cent w/v solution in *0.1 M hydrochloric acid*.

***N,N*-Dimethylaniline**. Dissolve 0.5 g in 20 ml *water* with the help of gentle heat on a water-bath, cool and add 2 ml of *2 M acetic acid*, 1 ml of a 1 per cent w/v solution of *sodium nitrite* and sufficient *water* to produce 25 ml. The resulting solution is not more intensely coloured than that obtained by treating at the same time and in the same manner a solution containing 5 µg of *N,N-dimethylaniline* in 20 ml of *water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *dextromethorphan impurity A IPRS* in 2 ml of the test solution and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 3.11 g of *docusate sodium* in a mixture of 400 ml of *water* and 600 ml of *acetonitrile*. Add 0.56 g of *sodium nitrate*, adjusted to pH 2.0 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Dextromethorphan impurity B[1]	0.4	—
Dextromethorphan impurity C[2]	0.8	0.2
Dextromethorphan impurity D[3]	0.9	—
Dextromethorphan (Retention time is about 22 minutes)	1.0	—
Dextromethorphan impurity A[4]	1.1	—

[1]*ent*-17-methylmorphinan-3-ol,

[2]*ent*-3-methoxy-17-methylmorphinan-10-one,

[3]*ent*-(14*S*)-3-methoxy-17-methylmorphinan,

[4]*ent*-3-methoxymorphinan.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to dextromethorphan and dextromethorphan impurity A is not less than 1.5.

Inject reference solution (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak due to dextromethorphan impurities A, B, C and D, each of, is not more than the area of the principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the area of not more than one such peak has an area greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.0 to 5.5 per cent, determined on 0.2 g.

Assay. Dissolve 0.3 g in 20 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03523 g of $C_{18}H_{25}NO,HBr$.

Storage. Store protected from light.

Dextromethorphan Hydrobromide Syrup

Dextromethorphan Hydrobromide Syrup is a solution of Dextromethorphan Hydrobromide in a suitable flavoured vehicle.

Dextromethorphan Hydrobromide Syrup contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextromethorphan hydrobromide, $C_{18}H_{25}NO,HBr,H_2O$.

Usual strength. 13.5 mg in 5 ml.

Identification

A. To 50 ml, add 20 ml of *water*, 5 ml of *2.5 M sodium hydroxide* and extract with three quantities, each of 40 ml of *hexane*, collect the *hexane layer* and filter through *anhydrous sodium sulphate* placed over absorbent cotton wetted with *hexane*. Evaporate the combined extracts at 50° under nitrogen to dryness, dissolve and dilute the residue in 10 ml of *chloroform*; the solution is dextrorotatory (2.4.22). Retain the chloroform solution for test B.

B. Evaporate the chloroform solution obtained from test A on a water-bath to dryness, dissolve the residue in 2 ml of *1 M sulphuric acid* and add 1 ml of a solution prepared freshly by dissolving 700 mg of *mercuric nitrate* in 4 ml of *water*, adding 100 mg of *sodium nitrate*, mixing and filtering; the solution gives no colour, but after heating, a yellow to red colour develops in about 15 minutes.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the syrup containing about 10 mg of Dextromethorphan Hydrobromide to 100.0 ml with *water*.

Reference solution. A 0.01 per cent w/v solution of *dextromethorphan hydrobromide IPRS* in *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed solution of *0.007 M sodium nitrate* in a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*, adjusted to pH 3.4 with *glacial acetic acid*,

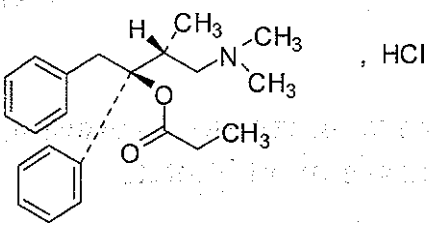
– flow rate: 1 ml per minute,
– spectrophotometer set at 280 nm,
– injection volume: 20 µl.

Calculate the content of $C_{18}H_{25}NO,HBr,H_2O$ in the syrup.

Storage. Store protected from light.

Dextropropoxyphene Hydrochloride

Propoxyphene Hydrochloride



$C_{22}H_{29}NO_2,HCl$ Mol. Wt. 375.9

Dextropropoxyphene Hydrochloride is (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl propionate hydrochloride.

Dextropropoxyphene Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{22}H_{29}NO_2,HCl$, calculated on the dried basis.

Category. Analgesic.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextropropoxyphene hydrochloride IPRS* or with the reference spectrum of dextropropoxyphene hydrochloride.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.05 per cent w/v solution in *0.01 M hydrochloric acid*, shows three absorption maxima, at 252 nm, 257 nm and 263 nm and two shoulders, at 240 nm and 246 nm. The ratio of the absorbance at the maximum at 257 nm to that at 252 nm is 1.22 to 1.28. The ratio of the absorbance at the maximum at 257 nm to that at 263 nm is 1.29 to 1.35.

C. Solution A gives the reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. Dilute 10 ml of solution A to 25 ml with *carbon dioxide-free water*. To 10 ml of the solution, add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*, the solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*, the solution is red.

Specific optical rotation (2.4.22). + 52° to + 57°, determined in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 50 mg of the substance under examination in 2.5 ml of *2 M ethanolic potassium hydroxide*. Add 2.5 ml of *water* and boil under a reflux condenser for 30 minutes. Add 2.5 ml of *dilute hydrochloric acid* and dilute to 50.0 ml with the mobile phase.

Chromatographic system
– a stainless steel column 12.5 cm x 4.6 mm, packed with silica gel (5 µm),
– mobile phase: a mixture of 5 volumes of *0.2 M phosphate buffer solution pH 7.5*, 8.4 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 51.6 volumes of 0.09 per cent w/v solution of *cetyltrimethylammonium bromide* in *water*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume: 20 µl.

Equilibrate the chromatographic system by passage of the mobile phase for 16 hours.

Inject reference solution (a) and (b). Run the chromatogram twice the retention time of the principal peak. The test is not valid unless the chromatogram obtained with reference solution (a) shows signal-to-noise ratio of the principal peak is not less than 5 and the chromatogram obtained with reference solution (b) shows two peaks with a resolution of not less than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (20 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.27 g in 60 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03759 g of $C_{22}H_{30}ClNO_2$.

Storage. Store protected from light.

Dextropropoxyphene Capsules

Dextropropoxyphene Hydrochloride Capsules

Dextropropoxyphene Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of dextropropoxyphene, $C_{22}H_{29}NO_2$.

Usual strength. 65 mg.

Identification

Shake a quantity of the content of capsules containing about 0.15 g of Dextropropoxyphene with 5 ml of *chloroform* and filter. The filtrate complies with the following tests.

A. Evaporate 3 ml to dryness and dry the residue at 105° for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextropropoxyphene napsilate IPRS* or with the reference spectrum of dextropropoxyphene napsilate.

B. Evaporate 0.05 ml in a porcelain dish and streak the spot with 5 per cent v/v solution of *formaldehyde* in *sulphuric acid;* a purple colour is produced.

C. Evaporate 0.4 ml on a piece of filter paper and burn the residue by the method for oxygen-flask combustion (2.3.34), using 5 ml of *1.25 M sodium hydroxide* as the absorbing liquid. When the process is complete, dilute the liquid to 25 ml with *water*. To 5 ml of the solution, add 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *1 M hydrochloric acid*, mix and add 0.05 ml of *barium chloride solution*. The solution becomes turbid.

Tests

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 0.5 g of dextropropoxyphene with 25 ml of *chloroform* and filter through absorbent cotton, washing the flask and filter with small quantities of *chloroform*. Add to the combined filtrates a mixture of 50 ml of *water* and 5 ml of *5 M sodium hydroxide*. Shake, allow the layers to separate and wash the chloroform extract with 25 ml of *water*. Extract the aqueous layer with five 25 ml quantities of *chloroform*, washing each extract with the 25 ml of *water* and adding it to the original extract. Dry the combined extracts with *anhydrous sodium sulphate*, evaporate to about 3 ml on a water-bath in a current of air, remove from the water-bath and allow to evaporate to dryness at room temperature. Titrate with *0.1 M perchloric acid*, using a few drops of *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03395 g of $C_{22}H_{29}NO_2$.

Labelling. The lable states the quantity of active ingredient in terms of the equivalent amount of dextropropoxyphene.

Dextropropoxyphene Hydrochloride and Paracetamol Tablets

Co-proxamol Tablets

Dextropropoxyphene Hydrochloride and Paracetamol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of dextropropoxyphene hydrochloride, $C_{22}H_{29}NO_2$,HCl and paracetamol, $C_8H_9NO_2$.

Usual strength. Paracetamol, 300 mg and Dextropropoxyphene Hydrochloride, 25 mg.

Identification

A. Disperse a quantity of the powdered tablets containing 0.1 g of Dextropropoxyphene Hydrochloride in 20 ml of *0.1M hydrochloric acid*, with the aid of ultrasound for 5 minutes and filter. To the filtrate, add 5 ml of *2 M sodium hydroxide*, extract twice with 25 ml quantities of *dichloromethane*, wash the combined extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of *dichloromethane* and add 50 µl of the solution, drop wise, onto the surface of a disc prepared from about 0.3 g of *potassium bromide*, evaporate the solvent, dry the disc at 50° for 2 minutes. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextropropoxyphene hydrochloride IPRS* treated in the same manner or with the reference spectrum of dextropropoxyphene.

B. Disperse a quantity of the powdered tablets containing 0.325 g of Paracetamol in 10 ml of *acetone*, with the aid of ultrasound for 5 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paracetamol IPRS* or with the reference spectrum of paracetamol.

Tests

For Paracetamol —

Dissolution (2.5.2).

Apparatus. No 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 5.8*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium, filter and dilute a suitable volume of the filtrate with *0.1M sodium hydroxide*, if necessary, to obtain a solution containing 0.00075 per cent w/v of paracetamol. Measure the absorbance of the resulting solution at the maximum at about 257 nm (2.4.7). Calculate the content of $C_8H_9NO_2$ taking 715 as the specific absorbance at 257 nm.

Q. Not less than 70 per cent of the stated amount of $C_8H_9NO_2$.

4-Aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.5 g of Paracetamol in the mobile phase, with the aid of ultrasound and dilute to 50.0 ml with the mobile phase.

Reference solution. A 0.001 per cent w/v solution of *4-aminophenol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Nucleosil C18),
- mobile phase: *0.01M sodium butane sulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-aminophenol is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances.

For Dextropropoxyphene Hydrochloride —

Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of Dextropropoxyphene Hydrochloride in 5 ml of *acetonitrile* by shaking for 2 minutes, add 5 ml of *water* and further shake for 5 minutes, dilute to 25.0 ml with *water* and filter.

Reference solution. A solution containing 0.0005 per cent w/v, each of, *4-dimethylamino-3-methyl-1, 2-diphenylbutan-2-ol hydrochloride IPRS* and *(1S,2R)-1-benzyl-3-dimethyl-amino-2-methyl-1-phenylpropyl acetate IPRS* in a mixture of 1 volume of *acetonitrile* and 4 volumes of *water*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *0.2M sodium perchlorate*, previously adjusted to pH 2.0 with *7M hydrochloric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to 4-dimethylamino-3-methyl-1, 2-diphenylbutan-2-ol hydrochloride and (1*S*, 2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate is not less than 1.5.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peaks corresponding to 4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride and (1*S*, 2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate, each of, is not more than the area of the corresponding peaks in the chromatogram obtained with the reference solution (0.5 per cent).

For Paracetamol —

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform*.

Test solution (a). Disperse a quantity of powdered tablets containing 1.0 g of Paracetamol in 5 ml of *peroxide free ether*, shake for 30 minutes, centrifuge at 1000 revolution per minute for 15 minutes or until a clear supernatant liquid is obtained and use the supernatant liquid.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *ethanol (95 per cent)*.

Reference solution (a). A 0.005 per cent w/v solution of *4-chloroacetanilide IPRS* in *ethanol (95 per cent)*.

Reference solution (b). A solution containing 0.25 per cent w/v of *4-chloroacetanilide IPRS* and 0.1 per cent w/v of *paracetamol IPRS* in 100.0 ml *ethanol (95 per cent)*.

Apply to the plate 200 µl of test solution (a) and 40 µl, each of test solution (b), reference solution (a) and reference solution (b). Allow the mobile phase to rise 14 cm. Dry the plate in hot air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a), any spot corresponding to 4-chloroacetanilide is not more intense than the principal spot in the chromatogram obtained with the

reference solution (a) (0.005 per cent). In the chromatogram obtained with test solution (b), any secondary spot with an Rf value lower than that of 4-chloroacetanilide is not more intense than the principal spot in the chromatogram obtained with the reference solution (b) (0.25 per cent). The test is not valid unless two clearly separated spots are seen in the chromatogram obtained with reference solution (b), the spot corresponding to 4-chloroacetanilide having the higher Rf value.

Other tests. Comply with the tests stated under Tablets

Assay.

For Dextropropoxyphene Hydrochloride —

Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 32.5 mg of Dextroprpoxyphene Hydrochloride in 100 ml of *0.02 M hydrochloric acid*, with aid of ultrasound for 15 minutes, dilute to 500.0 ml with a mixture of equal volume of *acetonitrile* and *0.02 M hydrochloric acid* and filter.

Reference solution (a). A 0.0065 per cent w/v solution of *dextropropoxyphene hydrochloride IPRS* in a mixture of 40 volumes of *acetonitrile* and 60 volumes of *0.02 M hydrochloric acid.*

Reference solution (b). A solution containing 0.0005 per cent w/v solution, each of, *4-dimethylamino-3-methyl-1, 2-diphenylbutan-2-ol hydrochloride IPRS* and *(1S, 2R)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate IPRS* in a mixture of 1 volume of *acetonitrile* and 4 volumes of *water.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *0.2 M sodium perchlorate*, previously adjusted to pH 2.0 with *7 M hydrochloric acid.*
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to 4-dimethylamino-3-methyl-1, 2-diphenylbutan-2-ol hydrochloride and *(1S, 2R)*-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate is not more than 1.5

Inject reference solution (a) and the test solution.

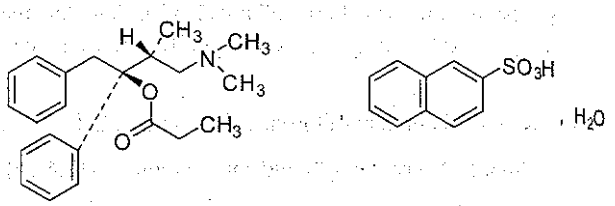
Calculate the content of $C_{22}H_{29}NO_2$.HCl in the tablets.

For Paracetamol —

Disperse a quantity of powdered tablets containing 325 mg of Paracetamol in 5 ml of *water*, add 100 ml of *methanol* and shake. Add 300 ml of *water*, shake for 5 minutes and dilute to 500.0 ml with *water*, mix and filter. Dilute 5.0 ml of the filtrate to 250.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 257 nm (2.4.7). Calculate the content of $C_8H_9NO_2$ in the tablets taking 715 as the specific absorbance at 257 nm.

Storage. Store protected from light.

Dextropropoxyphene Napsilate



$C_{22}H_{29}NO_2,C_{10}H_8O_3S,H_2O$ Mol. Wt. 565.8

Dextropropoxyphene Napsylate is (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl propionate naphthalene-2-sulphonate monohydrate.

Dextropropoxyphene Napsilate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{22}H_{29}NO_2,C_{10}H_8O_3S$, calculated on the anhydrous basis.

Category. Analgesic.

Description. A white powder. It shows polymorphism (2.5.11).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dextropropoxyphene napsilate IPRS* or with the reference spectrum of dextropropoxyphene napsilate.

B. Dissolve 25 mg in 5 ml of *dichloromethane*, evaporate 0.05 ml of the solution in a porcelain dish and streak the spot with 5 per cent v/v solution of *formaldehyde solution* in *sulphuric acid*; a purple colour is produced.

C. Determine by the oxygen-flask method (2.3.34), burning 0.02 g, using 5 ml of *1.25 M sodium hydroxide* as the absorbing liquid. When the process is complete, dilute the liquid to 25 ml with *water*. To 5 ml of the solution so obtained add 1 ml of *hydrogen peroxide solution (100 vol)* and 1 ml of *1 M hydrochloric acid*, mix and add 0.05 ml of *barium chloride solution*. The solution becomes turbid.

Tests

Specific optical rotation (2.4.22). +26.0° to +31.0°, determined in a 5.0 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by gas chromatography (2.4.13).

Solution A. Dissolve 10 mg of *triphenylamine* (internal standard) in 50 ml of *dichloromethane*.

Test solution (a). Dissolve 0.3 g of the substance under examination in 5 ml of *dichloromethane*, add 10 ml of *water*, 2 ml of *1.25 M sodium hydroxide* and 15 ml of *dichloromethane* and shake. Extract the aqueous layer with two 20 ml quantities of *dichloromethane*. Shake the combined dichloromethane extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate to dryness at a temperature not exceeding 40° using a rotary evaporator. Dissolve the residue in 10 ml of *dichloromethane*.

Test solution (b). Prepare in the same manner as test solution (a) but add 5 ml of solution A to the initial solution of the substance under examination.

Reference solution. Add 5 ml of solution A, 10 ml of *water*, 2 ml of *1.25 M sodium hydroxide* and 15 ml of *dichloromethane* to 5 ml of a solution in *dichloromethane* containing 0.022 per cent w/v of *(1S,2R)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate IPRS* and 0.02 per cent w/v of *4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride IPRS* and shake. Extract the aqueous layer with two 20 ml quantities of *dichloromethane*. Shake the combined dichloromethane extracts with 5 g of *anhydrous sodium sulphate*, filter and evaporate to dryness at a temperature not exceeding 40° using a rotary evaporator. Dissolve the residue in 10 ml of *dichloromethane*.

Chromatographic system

- a glass column 0.6 m x 3 mm, packed with acid-washed, silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of dimethyl silicone fluid,
- temperature:
  column 160°,
  inlet port and detector at 150°,
- flow rate: 60 ml per minute, using nitrogen as the carrier gas.

The peaks, other than the solvent peak, in the chromatogram obtained with the reference solution are due, in order of emergence, to (a) the internal standard, (b) (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate and (c) 4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride. In the chromatogram obtained with test solution (b) the ratio of the area of any peak corresponding to (b) to that of the peak due to (a) and the ratio of the area of any peak corresponding to (c) to that of the peak due to (a) are not more than the corresponding ratios in the chromatogram obtained with reference solution (0.67 per cent each).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

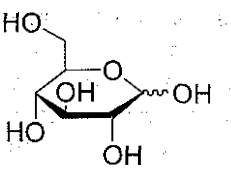
Water (2.3.43). 3.0 to 5.0 per cent, determined on 0.5 g.

Assay. Weigh 0.75 g add 50 ml of *water*, swirl to disperse, add 5 ml of *5 M sodium hydroxide* and extract with five 25 ml quantities of *dichloromethane*, washing each extract with the same 20 ml of *water*. Dry the combined extracts with *anhydrous sodium sulphate*, evaporate on water-bath in a current of air and allow to evaporate to dryness at room temperature. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05478 g of $C_{22}H_{29}NO_2,C_{10}H_8O_3S$.

Dextrose

Glucose; D-Glucose



$C_6H_{12}O_6$ Mol. Wt. 180.2 (anhydrous)

$C_6H_{12}O_6,H_2O$ Mol. Wt. 198.2 (monohydrate)

Dextrose is D-(+)-glucopyranose or D-(+)-glucopyranose monohydrate.

Category. Nutrient; fluid replenisher.

Description. A white crystalline powder.

Identification

A. When heated, it melts, swells up and burns, and an odour of burnt sugar is perceptible.

B. Dissolve 0.1 g in 10 ml of *water*, add 3 ml of *potassium cupri-tartrate solution*; the solution is blue and clear. Heat to boiling; a copious red precipitate is formed.

Tests

Appearance and odour of solution. Dissolve 10.0 g in 15 ml of *water*. The solution is clear (2.4.1), not more intensely coloured than reference solution BYS7 (2.4.1), and is odourless.

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water* and add 0.3 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.15 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). + 52.5° to + 53.3°, determined in a solution prepared by dissolving 10.0 g in 80 ml of *water*,

adding 0.2 ml of *5 M ammonia*, mixing well, allowing to stand for 30 minutes and diluting to 100.0 ml with *water*.

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (1 ppm).

Heavy metals (2.3.13). A solution prepared by dissolving 4.0 g in 10 ml of *water*, 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml, complies with the limit test for heavy metals, Method A (5 ppm).

Chlorides (2.3.12). 20 ml of a 10.0 per cent w/v solution (solution A) complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 7.5 ml of solution A diluted to 15 ml with *distill water* complies with the limit test for sulphates (200 ppm).

Sulphite. Dissolve 5.0 g in 40 ml of *water*, add 2.0 ml of *0.1 M sodium hydroxide* and dilute to 50.0 ml with *water*. To 10.0 ml of the solution add 1 ml of a 31 per cent w/v solution of *hydrochloric acid*, 2.0 ml of *decolourised magenta reagent* and 2.0 ml of a 0.5 per cent v/v solution of *formaldehyde solution*. Allow to stand for 30 minutes and measure the absorbance of the resulting solution at the maximum at about 583 nm (2.4.7). The absorbance is not more than that of a standard prepared in the following manner. Dissolve 76 mg of *sodium metabisulphite* in sufficient *water* to produce 50.0 ml, dilute 5.0 ml of the solution to 100.0 ml and to 3.0 ml of resulting solution add 4.0 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water*. Immediately treat 10.0 ml of the resulting solution in the same manner as the test solution beginning at the words "add 1 ml of a 31 per cent w/v solution.....". Use as the blank for both measurements a solution prepared in the same manner using 10 ml of *water*.

Barium. To 10 ml of solution A add 1 ml of *1 M sulphuric acid*. Examine exactly after 1 hour; any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution A and 1 ml of *water*.

Foreign sugars, soluble starch and dextrins. Boil 1.0 g in 30 ml of *ethanol (90 per cent)* to dissolve. The appearance of the solution does not change on cooling.

Sulphated ash (2.3.18). Not more than 0.1 per cent determined by the following method. Dissolve 5.0 g in 5 ml of *water*, add 2 ml of *sulphuric acid*, evaporate to dryness and ignite to constant weight. If necessary, repeat the heating with the *sulphuric acid*.

Water (2.3.43). Not more than 1.0 per cent (anhydrous form) and 7.0 to 9.5 per cent (monohydrate), determined on 0.5 g.

Dextrose intended for use in the manufacture of parenteral preparations complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Units per ml of a 5 per cent w/v solution in *water for injections*.

Storage. Store protected from moisture.

Labelling. The label states (1) whether the material is monohydrate or is in the anhydrous form; (2) whether or not the contents are intended for use in the manufacture of parenteral preparations.

Dextrose Injection

Dextrose Intravenous Infusion; Glucose Intravenous Infusion

Dextrose Injection is a sterile solution of Dextrose in Water for Injections.

Dextrose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of anhydrous dextrose, $C_6H_{12}O_6$.

Usual strengths. 5, 10, 25, and 50 per cent w/v.

Description. A clear, colourless solution. Solutions containing 20.0 per cent w/v or more of Dextrose may be not more than faintly straw-coloured.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution is blue and clear. Heat to boiling; a copious red precipitate is formed.

B. The solution prepared as directed in the Assay is dextrorotatory.

Tests

pH (2.4.24). 3.5 to 6.5, determined in a solution diluted, if necessary, with *water for injections* to contain not more than the equivalent of 5 per cent w/v of Dextrose and to which 0.30 ml of a saturated solution of *potassium chloride* has been added for each 100 ml of solution.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of Dextrose to 250.0 ml with *water*. Absorbance of the resulting solution at the maximum at about 284 nm (2.4.7), not more than 0.25.

Heavy metals (2.3.13). A solution prepared by evaporating a volume containing 4 g of Dextrose to 10 ml and adding 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Units per ml for preparations containing 5 per cent w/v or less of

Dextrose. Dilute injections containing more than 5 per cent w/v of Dextrose with sufficient *water BET* so as to contain 5 per cent w/v of Dextose.

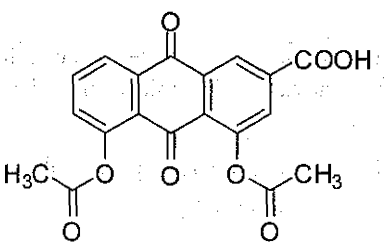
Other tests. Comply with the tests stated under Parenteral Preparations (Infusions).

Assay. To a measured volume containing between 2 g and 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers at a temperature not exceeding 30°.

Labelling. The label states (1) the strength as the percentage w/v of anhydrous dextrose, $C_6H_{12}O_6$; (2) that the injection should not be used if it contains visible solid particles.

Diacerein



$C_{19}H_{12}O_8$ Mol. Wt. 368.3

Diacerein is 9,10-dihydro-4,5-dihydroxy-9,10-dioxo-2-anthranoic acid diacetate.

Diacerein contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{12}O_8$, calculated on the anhydrous basis.

Category. Antirheumatic.

Description. A fine yellow powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diacerein IPRS* or with the reference spectrum of diacerein.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel *GF254*.

Mobile phase. A mixture of 60 volumes of *2-propanol*, 30 volumes of *ethyl acetate* and 2 volumes of *water*.

Test solution. Dissolve about 10 mg of the substance under examination in 100.0 ml of *acetone*.

Reference solution. A 0.01 per cent w/v solution of *diacerein IPRS* in *acetone*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v suspension.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Dissolve about 25 mg of the substance under examination in 10 ml of *N,N-dimethylacetamide* and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *triacetyl aloe-emodin IPRS* in 5 ml of *N,N-dimethylacetamide* and dilute to 25 ml with the solvent mixture. Dilute 5.0 ml of the solution to 200.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Thermo BDS C18),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of 0.1 per cent v/v solution of *triethylamine* in *water*, adjusted to pH 2.5 with *trifluroacetic acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of the

peak due to triacetyl aloe-emodin is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with reference solution (a) (1.5 per cent).

Aloe-emodin content. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 100 mg of the substance under examination into a 250-ml conical flask. Add 25.3 ml of *0.5 M sodium hydroxide.* Stir well for atleast 10 minutes and add 74.7 ml of *glycine solution.* Adjusted to pH 9.5 with *0.5 M sodium hydroxide.* Transfer this solution in 150 ml separating funnel. Extract the solution three times with 8.5 ml of *chloroform.* Collect the extracts and wash with 10 ml of buffer pH 9.5 and then with 10 ml of *0.01 M sulphuric acid.* Filter well through *anhydrous sodium sulphate.* Evaporate at 40° to dryness on water-bath. Dissolve the residue in 1 ml of *methanol* and 1 ml of the mobile phase, filter.

Reference solution. Dissolve 100 mg of *aloe-emodin IPRS* in 20 ml of *N, N-Dimethylacetamide* and dilute to 100 ml with *methanol.* Dilute 5 ml of the solution to 100 ml with *methanol.* Further dilute 5.0 ml of the solution to 50 ml with *methanol.* Transfer 1.0 ml of the solution into a 250-ml conical flask and add 25.3 ml of *0.5 M sodium hydroxide.* Mix well for atleast 10 minutes and add 74.7 ml of *glycine solution.* Adjusted to pH 9.5 with *0.5 M sodium hydroxide* and transfer this solution to 150-ml separating funnel. Extract the solution three times with 8.5 ml of *chloroform.* Collect the extracts and wash with 10 ml of buffer pH 9.5 and then with 10 ml of *0.005 M sulphuric acid.* Filter well through *anhydrous sodium sulphate.* Evaporate at 40° to dryness on water-bath. Dissolve the residue in 1 ml of *methanol* and 1 ml of the mobile phase, filter.

Use chromatographic system as described under Related substances using injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 20.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of peak corresponding to aloe-emodin is not more than the area of the principal peak in the chromatogram obtained with the reference solution (50 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals Method B, (10 ppm).

Chromium. Not more than 5 ppm.

Determine by atomic absorption spectrophotometry (2.4.2), Method A, using a solution prepared by dissolving 0.5 g of the substance under examination in *1 M nitric acid.* Measure the absorbance at 357.9 nm using chromium hollow cathode lamp and an air-acetylene flame. For the standard solutions dissolve 2.82 g of dried *potassium dichromate* at 120° for 4 hours in 1000 ml of *water* and dilute suitably with *1 M nitric acid* for standard solutions.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile.*

Test solution. Dissolve about 50 mg of the substance under examination in 100 ml of *N, N-dimethylacetamide.* Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. Dissolve 50 mg of *diacerein IPRS* in 100 ml of *N, N-dimethylacetamide.* Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{12}O_8$.

Storage. Store protected from light.

Diacerein Capsules

Diacerein Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diacerein, $C_{19}H_{12}O_8$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of citrate buffer pH 6.0, prepared by dissolving 1.816 g of *citric acid* and 11.91 g of *trisodium citrate* in

1000 ml of *water*, adjusted to pH 6.0 with *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary with dissolution medium at 340 nm (2.4.7). Calculate the content of diacerein, $C_{19}H_{12}O_8$ in the medium from the absorbance obtained from a solution prepared by dissolving 25 mg of *diacerein IPRS* in 10.0 ml of *acetonitrile* and dilute to 100 ml with dissolution medium. Dilute 5.0 ml of the solution to 50 ml with the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{12}O_8$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Store and inject the solutions at 4°.

Solvent mixture (a). 60 volumes of *acetonitrile* and 20 volumes of *water*.

Solvent mixture (b). 20 volumes of *tetrahydrofuran*, 60 volumes of *acetonitrile* and 20 volumes of *water*.

Test solution. Disperse the contents of capsules containing about 25 mg of Diacerein in 10 ml of *tetrahydrofuran*, sonicate and dilute to 50.0 ml with solvent mixture (a), filter.

Reference solution (a). Dissolve about 25 mg of the *diacerein IPRS* in 10.0 ml of *tetrahydrofuran*, sonicate and dilute to 50.0 ml with solvent mixture (a).

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with solvent mixture (b). Dilute 5.0 ml of the solution to 50.0 ml with the same solvent.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm) (Such as Waters X-terra RP18),
- mobile phase: a mixture of 62 volumes of a buffer solution prepared by diluting 2 ml of *orthophosphoric acid* in 1000 ml of *water* and 38 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of buffer pH 3.0 prepared by diluting 1.4 ml of *triethylamine* in 100 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*.

Test solution. Disperse the contents of capsules containing about 50 mg of Diacerein in 200 ml of solvent mixture, sonicate for 10 minutes and dilute to 250.0 ml with the solvent mixture, filter. Dilute 5.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *diacerein IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 75 volumes of buffer solution prepared by diluting 1.4 ml of *triethylamine* in 100 ml of *water*, adjusted to pH 7.0 with *orthophosphoric acid* and 25 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

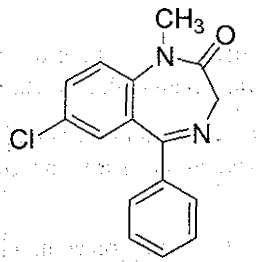
Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{12}O_8$ in the capsules.

Storage. Store protected from moisture.

Diazepam



$C_{16}H_{13}ClN_2O$ Mol. Wt. 284.7

Diazepam is 7-chloro-1,3-dihydro-1-methyl-5-phenyl-1,4- benzodiazepin-2-one.

Diazepam contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{16}H_{13}ClN_2O$, calculated on the dried basis.

Category. Anxiolytic; sedative; anticonvulsant.

Description. A white or almost white to pale yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diazepam IPRS* or with the reference spectrum of diazepam.

B. *Measure the absorbances in subdued light immediately after preparation of the solution.*

When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.05 M methanolic sulphuric acid* shows absorption maxima at 241 nm and 284 nm; absorbance at 241 nm, about 0.5 and at 284 nm, about 0.23.

C. *Measure the absorbance in subdued light immediately after preparation of the solution.*

When examined in the range 325 nm to 400 nm (2.4.7), a 0.0025 per cent w/v solution in *0.05 M methanolic sulphuric acid* shows an absorption maximum only at 366 nm, between 0.35 and 0.39.

D. Determine by the oxygen-flask method (2.3.34), using 20 mg of the substance under examination and 5 ml of *dilute sodium hydroxide solution* as the absorbing liquid. When the process is complete, acidify the solution with *dilute sulphuric acid* and boil gently for 2 minutes; the solution gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 10 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol.*

Reference solution (a). A solution containing 0.01 per cent w/v each of *nordazepam IPRS* and *diazepam IPRS* in *methanol.*

Reference solution (b). A solution containing 0.0001 per cent w/v of *diazepam impurity B IPRS (3-amino-6-chloro-1-methyl-4-phenylcarbostyril IPRS)*, 0.00001 per cent w/v of *diazepam impurity A IPRS (2-methylamino-5-chlorobenzophenone IPRS)* and 0.0003 per cent w/v of *nordazepam IPRS* in *methanol.*

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile*, 40 volumes of *water* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 10 µl.

The relative retention time with reference to diazepam for nordazepam is about 0.76.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to nordazepam and diazepam is not less than 4.0, the column efficiency is not less than 5000 theoretical plates for the principal peak and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to diazepam impurity A is not more than 0.01 per cent, the area of peak corresponding to diazepam impurity B is not more than 0.1 per cent and the area of peak corresponding to nordazepam is not more than 0.3 per cent, the area of any other secondary peak is not more than 0.1 per cent and the sum of the areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. Dissolve 0.25 g in 80 ml of *anhydrous glacial acetic acid* with the aid of heat, if necessary and cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02847 g of $C_{16}H_{13}ClN_2O$.

Storage. Store protected from light.

Diazepam Capsules

Diazepam Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of diazepam, $C_{16}H_{13}ClN_2O$.

Usual strengths. 2 mg; 5 mg; 10 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 100 volumes of *chloroform* and 10 volumes of *methanol.*

Test solution. Shake a quantity of the contents of the capsules with sufficient *methanol* to produce a solution containing 0.5 per cent w/v of Diazepam, allow to settle and decant the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *diazepam IPRS* in *methanol.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows two absorption maxima at 242 nm 284 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid.* Measure the absorbance of the resulting solution at the maximum at about 242 nm (2.4.7). Calculate the content of diazepam, $C_{16}H_{13}ClN_2O$ in the medium from the absorbance obtained from a solution of known concentration of *diazepam IPRS.*

Q. Not less than 85 per cent of the stated amount of $C_{16}H_{13}ClN_2O$.

Related substances and decomposition products. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of equal volumes of *hexane* and *ethyl acetate.*

NOTE— Prepare the following solutions freshly.

Test solution. Shake a quantity of the contents of the capsules containing 50 mg of Diazepam with 5 ml of *acetone* and filter.

Reference solution. Dilute 1 volume of the test solution to 50 volumes with *acetone.*

Apply to the plate 20 µl of the test solution and 5 µl of the reference solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Capsules using the following method of analysis. Weigh an intact capsule. Open the capsule without losing any part of the shell and transfer the contents as completely as possible to a 100-ml volumetric flask. Weigh the shell, remove any retained contents and reweigh the shell. To the flask add 1 ml of *water*, mix and allow to stand for 15 minutes. Add 80 ml of a 0.5 per cent w/v solution of *sulphuric acid* in *methanol*, shake for 15 minutes, add sufficient of the *methanolic sulphuric acid* to produce 100.0 ml and filter. Dilute suitably, if necessary and measure the absorbance at the maximum at 284 nm (2.4.7). Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the specific absorbance at 284 nm, making an appropriate adjustment for any retained capsule content.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 10 mg of Diazepam, add 5 ml of *water* and complete the test as described under Uniformity of content beginning at the words "mix and allow to stand for 15 minutes....". Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the specific absorbance at 284 nm.

Storage. Store protected from light.

Diazepam Injection

Diazepam Injection is a sterile solution of Diazepam in Water for Injections or other suitable solvent.

Diazepam Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diazepam, $C_{16}H_{13}ClN_2O$.

Usual strengths. 5 mg per ml; 10 mg per ml.

Description. A clear, colourless or almost colourless solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 100 volumes of *chloroform* and 10 volumes of *methanol.*

Test solution. Dilute if necessary, a measured volume of the injection with *water* to produce a solution containing 5 mg of Diazepam per ml.

Reference solution. A 0.5 per cent w/v solution of *diazepam IPRS* in *methanol.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 242 and at about 284 nm.

Tests

pH (2.4.24). 6.2 to 6.9.

Bacterial endotoxins (2.2.3). Not more than 11.6 Endotoxin Units per mg of diazepam.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. To a measured volume containing 10 mg of Diazepam, add 20 ml of *buffer solution pH 7.0* and extract with four quantities, each of 20 ml, of *chloroform*, passing each extract through about 5 g of *anhydrous sodium sulphate* and dilute the combined chloroform extracts to 100.0 ml with *chloroform*. Evaporate 10.0 ml of the solution to dryness under nitrogen, add sufficient volume of a 0.5 per cent w/v solution of *sulphuric acid* in *methanol* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7). Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the specific absorbance at 284 nm.

Storage. Store in single dose or multiple dose containers protected from light.

Diazepam Tablets

Diazepam Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of diazepam, $C_{16}H_{13}ClN_2O$.

Usual strengths. 2 mg; 5 mg; 10 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 0.5 per cent w/v of Diazepam, allow to settle and decant the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *diazepam IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol*, heat at 105° for 10 minutes and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 230 to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 242 and at about 284 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 242 nm (2.4.7). Calculate the content of diazepam, $C_{16}H_{13}ClN_2O$ in the medium from the absorbance obtained from a solution of known concentration of *diazepam IPRS*.

Q. Not less than 85 per cent of the stated amount of $C_{16}H_{13}ClN_2O$.

Related substances and decomposition products. Determine in subdued light by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of equal volumes of *hexane* and *ethyl acetate*.

Test solution. Prepare freshly by shaking a quantity of the powdered tablets containing 50 mg of Diazepam with 5 ml of *ethanol (95 per cent)* and filtering.

Reference solution. Dilute 1.0 ml of the test solution to 50.0 ml with *ethanol (95 per cent)*.

Apply to the plate 20 µl of the test solution and 5 µl of the reference solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Complies with the test stated under Tablets.

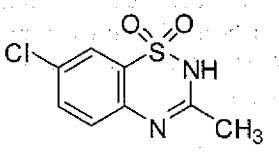
Powder one tablet, add 1 ml of *water*, mix and allow to stand for 15 minutes. Add 80 ml of a 0.5 per cent w/v solution of *sulphuric acid* in *methanol*, shake for 15 minutes, add sufficient of the *methanolic sulphuric acid* to produce 100.0 ml and filter. Dilute suitably, if necessary and measure the absorbance at the maximum at 284 nm (2.4.7). Calculate the content of $C_{16}H_{13}ClN_2O$ in the tablet taking 450 as the specific absorbance at 284 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of Diazepam, add 5 ml of *water* and complete the test as described under Uniformity of content beginning at the words "mix and allow to stand for 15 minutes....". Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the specific absorbance at 284 nm.

Storage. Store protected from light.

Diazoxide



$C_8H_7ClN_2O_2S$ Mol. Wt. 230.7

Diazoxide is 7-chloro-3-methyl-2*H*-1,2,4-benzothiadiazine 1,1-dioxide.

Diazoxide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_8H_7ClN_2O_2S$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, fine or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diazoxide IPRS* or with the reference spectrum of diazoxide.

B. Dissolve 0.05 g in 5 ml of *1 M sodium hydroxide*, dilute to 50 ml with *water*. Dilute 1.0 ml of the solution to 100 ml with *0.1 M sodium hydroxide*. When examined in the range 230 nm to 350 nm (2.4.7), the resulting solution shows an absorption maximum at 280 nm and a shoulder at 304 nm. The specific absorbance is 570 to 610.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (b).

D. Dissolve about 20 mg in a mixture of 5 ml of *hydrochloric acid* and 10 ml of *water*. Add 0.1 g of *zinc powder*. Boil for 5 minutes, cool and filter. To the filtrate add 2 ml of a 0.1 per cent w/v solution of *sodium nitrite* and mix. Allow to stand for 1 minute and add 1 ml of a 0.5 per cent solution of *naphthylethylenediamine dihydrochloride*. A red or violet-red colour develops.

Tests

Appearance of solution. Dissolve 0.4 g in 2 ml of *1 M sodium hydroxide* and dilute to 20 ml with *water*. The solution is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Acidity or alkalinity. To 0.5 g of the substance under examination, add 30 ml of *carbon dioxide-free water*, shake for 2 minutes and filter. To 10 ml of the filtrate add 0.2 ml of *0.01 M sodium hydroxide* and 0.15 ml of *methyl red solution*, the solution is yellow. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Related substance. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 7 volumes of *ammonia*, 25 volumes of *methanol* and 68 volumes of *chloroform*.

Test solution (a). Dissolve 0.1 g of the substance under examination in a mixture of 0.5 ml of *1 M sodium hydroxide* and 1 ml of *methanol* and dilute to 5 ml with *methanol*.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 1 volume of *1 M sodium hydroxide* and 9 volumes of *methanol*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with a mixture of 1 volume of *1 M sodium hydroxide* and 9 volumes of *methanol*.

Reference solution (b). Dissolve 20 mg of *diazoxide IPRS* in a mixture of 0.5 ml of *1M sodium hydroxide* and 1 ml of *methanol* and dilute to 5 ml with *methanol* .

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g with gentle heating in 50 ml of a mixture of 1 volume of *water* and 2 volumes of *dimethylformamide*.

Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02307 g of $C_8H_7ClN_2O_2S$.

Diazoxide Tablets

Diazoxide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of diazoxide, $C_8H_7ClN_2O_2S$.

Usual strength. 50 mg.

Identification

Shake a quantity of the powdered tablets containing 0.2 g of Diazoxide with 50 ml of *absolute ethanol*, filter and evaporate the filtrate to dryness at a pressure of 2 kPa. The residue complies with the following tests.

A. When examined in the range 230 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorbance maximum only at 280 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *toluene*, 30 volumes of *ether* and 20 volumes of *acetone*.

Test solution. A 0.02 per cent w/v solution of the residue in *methanol*.

Reference solution. A 0.02 per cent w/v solution of *diazoxide IPRS* in *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the solvent has evaporated, examine under ultraviolet light at 254 nm and then spray the dried plate with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 30 minutes and immediately expose to nitrous fumes in a closed glass tank for 15 minutes (the nitrous fumes may be generated by adding *7 M sulphuric acid* dropwise to a solution containing 10 per cent w/v of *sodium nitrite* and 3 per cent w/v of *potassium iodide*. Place the plate in a current of warm air for 15 minutes and spray with a 0.5 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *ethanol (95 per cent)*. If necessary allow to dry and repeat the spraying. The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 7 volumes of *18 M ammonia*, 25 volumes of *methanol* and 68 volumes of *chloroform*.

Test solution. Shake a quantity of the powdered tablets containing 0.75 g of Diazoxide with 40 ml of *0.1 M sodium hydroxide* for 30 minutes, filter and dilute the filtrate to 50 ml with *0.1 M sodium hydroxide*.

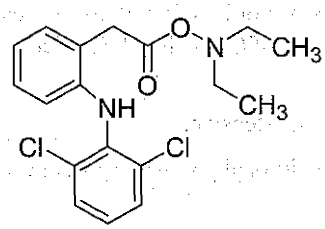
Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with *0.1 M sodium hydroxide*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.05 g of Diazoxide, add 70 ml of *methanol*, shake for 1 hour, add sufficient *methanol* to produce 100 ml, mix and filter. Dilute 5 ml of the filtrate to 250 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at 280 nm (2.4.7). Calculate the content of $C_8H_7ClN_2O_2S$ taking 585 as the specific absorbance at 280 nm.

Diclofenac Diethylamine



$C_{18}H_{22}Cl_2N_2O_2$ Mol. Wt. 369.3

Diclofenac Diethylamine is diethylammonium 2-[(2,6-dichloroanilino)phenyl]acetate.

Diclofenac Diethylamine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{18}H_{22}Cl_2N_2O_2$, calculated on the dried basis.

Category. Analgesic; antiinflammatory.

Description. A white to light beige, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diclofenac diethylamine IPRS* or with the reference spectrum of diclofenac diethylamine.

B. Determine by thin-layer chromatography (2.4.17), using the plate coated with *silica gel GF254*.

Mobile phase. A mixture of 0.1 volume of *hydrochloric acid*, 1 volume of *water*, 6 volumes of *glacial acetic acid* and 11 volumes of *ethyl acetate*.

Test solution. Dissolve 1.0 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 1.0 per cent w/v solution of *diclofenac diethylamine IPRS* in a *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 15 minutes, the chromatogram obtained with the reference solution shows two clearly separated spots.The two principal spots in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with the reference solution.

C. Melting point (2.4.21). About 154° with decomposition.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1), The absorption of the solution measured at 440 nm (2.4.7) is not more than 0.05.

pH (2.4.24). 6.4 to 8.4, determined in a 1.0 per cent w/v solution in *ethanol* (10 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v of *diclofenac impurity A (1(2,6 dichlorophenyl)-1,3-dihydro-2H-indol-2-one) IPRS* and add 1.0 ml of test solution in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane silica gel (5 µm),
- mobile phase: 34 volumes of a mixture of equal volumes of a 0.1 per cent w/v solution of *orthophosphoric acid* and a 0.16 per cent w/v solution of *sodium dihydrogen orthophosphate dihydrate*, adjusted to pH 2.5 and 66 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention times are about 25 minutes for diclofenac and about 12 minutes for diclofenac impurity A.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at a pressure not exceeding 1 kPa for 24 hours.

Assay. Dissolve 0.5 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03693 g of $C_{18}H_{22}Cl_2N_2O_2$.

Storage. Store protected from light and moisture.

Diclofenac Gel

Diclofenac Gel is a Diclofenac Diethylamine in a suitable base.

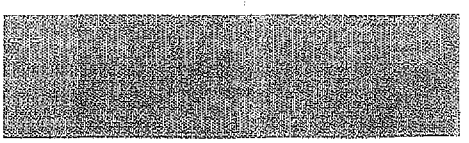
Diclofenac Gel contains not less than 90.0 per cent and not more than 110.0 per cent of the stated equivalent amount of diclofenac diethylamine, $C_{18}H_{22}Cl_2N_2O_2$.

Usual strength. 1.16 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), using the plate coated with *silica gel GF254*.

Mobile phase. A mixture of 0.1 volume of *hydrochloric acid*, 1 volume of *water*, 6 volumes of *glacial acetic acid* and 11 volumes of *ethyl acetate*.



Test solution. Disperse a quantity of the gel containing 50 mg of Diclofenac Diethylamine in 12.5 ml of *0.5M sodium chloride* and shake until a homogeneous suspension is obtained. Add 12.5 ml of *chloroform*, shake well and mix with the aid of ultrasound for 5 minutes. Allow the layers to separate, filter the chloroform layer through a suitable glass fibre filter and use the filtrate.

Reference solution. A 0.2 per cent w/v solution of *diclofenac diethylamine IPRS* in *chloroform*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 15 cm. After development, dry the plate at 105°, spray with *ninhydrin solution* and heat at 110° for 15 minutes. The two principal spots in the chromatogram obtained with the test solution correspond to that in the chromatogram obtained with the reference solution

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the gel containing 50 mg of Diclofenac Diethylamine with 50 ml of *acetone* for 10 minutes, filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 10.0 ml of a mixture of 40 volumes of *water* and 60 volumes of *methanol* , dilute 1.0 ml of the solution to 5.0 ml with the mobile phase and filter through a suitable glass fibre filter.

Reference solution (a). Dilute 1.0 ml of test solution to 100.0 ml with *methanol.*

Reference solution (b). A 0.01 per cent w/v solution each of *diclofenac sodium IPRS* and *diclofenac impurity A IPRS [1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one IPRS]* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane silica gel (5 µm),
- mobile phase: 34 volumes of a mixture of equal volumes of a 0.1 per cent w/v solution of *orthophosphoric acid* and a 0.16 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5 and 66 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention times are about 25 minutes for diclofenac and about 12 minutes for diclofenac impurity A.

Inject reference solution (b). The test is not valid unless the resolution between the peak due to diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of principal peak. In the chromatogram obtained with test solution, the area of any secondary peak is not more than 0.5 times the areas of principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of all the secondary peaks is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Gels.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the gel containing 50 mg of Diclofenac Diethylamine with 50 ml of *acetone* for 10 minutes, filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 100.0 ml of a mixture of 40 volumes of *water* and 60 volumes of *methanol.* Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase and filter through a glass fibre filter (Whatman GF/C is suitable).

Reference solution (a). A 0.005 per cent w/v solution of *diclofenac sodium IPRS* in *methanol.*

Reference solution (b). A 0.01 per cent w/v solution each of *diclofenac sodium IPRS* and *diclofenac impurity A IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane silica gel (5 µm),
- mobile phase: 20 volumes of a mixture of equal volumes of a 0.1 per cent w/v solution of *orthophosphoric acid* and a 0.16 per cent w/v solution of *sodium dihydrogen orthophosphate dihydrate*, adjusted to pH 2.5 and 80 volumes of *methanol,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention times are about 5 minutes for diclofenac and about 4 minutes for diclofenac impurity A.

Inject reference solution (b). The test is not valid unless the resolution between the diclofenac peak and diclofenac impurity A peak is not less than 2.0.

Inject reference solution (a) and the test solution.

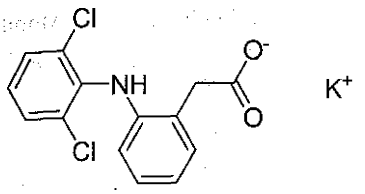
Calculate the content of $C_{18}H_{22}Cl_2N_2O_2$ in the gel.

1 mg of $C_{14}H_{10}Cl_2NNaO_2$ is equivalent to 1.1609 mg of $C_{18}H_{22}Cl_2N_2O_2$.

Storage. Store in a cool, dry place, at a temperature not exceeding 30°.

Labelling. The label states the quantity in terms of diclofenac diethylamine as well as the equivalent amount of diclofenac sodium.

Diclofenac Potassium



$C_{14}H_{10}Cl_2KNO_2$ Mol. Wt. 334.2

Diclofenac Potassium is benzene acetic acid, 2-[(2,6-dichlorophenyl)amino]-,monopotassium salt.

Diclofenac Potassium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{10}Cl_2KNO_2$, calculated on the dried basis.

Category. Analgesic, anti-inflammatory.

Description. A white to off white or slightly yellowish crystalline powder, slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diclofenac potassium IPRS* or with the reference spectrum of diclofenac potassium.

B. When examined in the range 230 nm to 360 nm (2.4.7). A 0.001 per cent w/v solution in *methanol* shows an absorption maximum as obtained with *diclofenac potassium IPRS* of the same concentration.

C. To 0.5 g, add 10 ml of *water*, stir and add water until the substance is dissolved. Add 2 ml of *7M hydrochloride acid*, stir for 60 minutes, and filter with the aid of a vacuum. Neutralize with *5M sodium hydroxide*. Take 1 ml of the solution, add 1 ml of *2 M acetic acid* and 1ml of freshly prepared 10 per cent w/v solution of *sodium cobaltinitrite*. A yellow or orange yellow precipitate is formed immediately.

Tests

pH (2.4.24). 7.0 to 8.5, determined in 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14)

Buffer solution. A mixture of equal volumes of *0.01M orthophosphoric acid* and *0.01M sodium dihydrogen orthophosphate*, adjusted to pH 2.5, with additional portions of the appropriate components.

Solvent mixture. 70 volumes of *methanol* and 30 volumes of *water*.

Test solution. Dissolve 75 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.004 per cent w/v of *diehtyl phthalate*, 0.05 per cent w/v of *diclofenac potassium IPRS* and 0.00225 per cent w/v of *diclofenac related compound A IPRS {N-(2,6-dichlorophenyl)indolin-2-one}* in the solvent mixture.

Reference solution (b). A 0.015 per cent w/v solution of *diclofenac related compound A IPRS* in *methanol*. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *methanol* and 30 volumes of the buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 30 µl.

The relative retention time with reference to diclofenac potassium for diethyl phthalate and diclofenac related compound A is about 0.5 and 0.7 respectively.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to diethyl phthalate and diclofenac related compound A is not less than 4.0 in the chromatogram obtained with reference solution (a). The relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to diclofenac related compound A is not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 105° under vacuum for 3 hours.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03342 g of $C_{14}H_{10}Cl_2KNO_2$.

Storage. Store protected from light and moisture, at temperature not exceeding 30°.

Diclofenac Potassium Tablets

Diclofenac Potassium Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diclofenac potassium, $C_{14}H_{10}Cl_2KNO_2$.

Usual strengths. 25 mg; 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *intestinal fluid, simulated* (without enzyme),
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with medium, if necessary, at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{14}H_{10}Cl_2KNO_2$ in the medium from the absorbance obtained from a solution of known concentration of *diclofenac potassium IPRS* in the dissolution medium.

Q. Not less than 75 per cent of the stated amount of $C_{14}H_{10}Cl_2KNO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions, protected from light.

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Diclofenac Potassium in 80 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.0001 per cent w/v, each of, *diclofenac potassium IPRS* and *diclofenac related compound A IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 2.0 mm, packed with octadecylsilane bonded to porous silica (1.9 µm).
- column temperature: 35°,
- mobile phase: A. *0.01 M ammonium acetate*, adjusted to pH 5.3 with *glacial acetic acid*,
  B. *acetonitrile*,
- flow rate: 0.3 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 1 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
0.5	70	30
8.5	5	95
10	5	95
10.1	70	30
15	70	30

Name	Relative retention time
Oxindole[1]*	0.4
Diclofenac	1.0
Diclofenac related compound D[2]*	1.04
Diclofenac related compound A[3]	1.48
Diclofenac alcohol analog[4]*	1.55
Diclofenac benzaldehyde analog[5]*	1.81

*Process-related impurities, included for identification only, not to be included in total impurities.

[1]1,3-Dihydro-2*H*-indol-2-one,

[2]2-{2[(2-Bromo-6-chlorophenyl)amino]phenyl}acetic acid,

[3]*N*-(2,6-Dichlorophenyl)indolin-2-one (diclofenac lactum),

[4]{2-[(2,6-Dichlorophenyl)amino]phenyl}methanol,

[5]2-[(2,6-Dichlorophenyl)amino]benzaldehyde.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent and the signal-to-noise ratio for the principal peak is not less than 10.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to diclofenac related compound A is not more than 5 times the area of diclofenac related compound A peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any other secondary peak is not more than 5 times of the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 15 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Diclofenac Potassium in 80 ml of the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.02 per cent w/v solution of *diclofenac potassium IPRS* in the solvent mixture.

– spectrophotometer set at 280 nm,

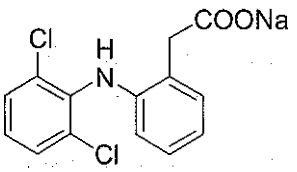
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.2 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{10}Cl_2KNO_2$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Diclofenac Sodium



$C_{14}H_{10}Cl_2NNaO_2$ Mol. Wt. 318.1

Diclofenac Sodium is sodium 2-[(2,6-dichlorophenyl)-amino]phenylacetate.

Diclofenac Sodium contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{14}H_{10}Cl_2NNaO_2$, calculated on the dried basis.

Category. Analgesic; anti-inflammatory.

Description. A white to slightly yellowish crystalline powder; slightly hygroscopic.

Identification

Test A may be omitted if tests B, C, and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diclofenac sodium IPRS* or with the reference spectrum of diclofenac sodium.

B. To 1 ml of a 0.4 per cent w/v solution in *methanol* add 1 ml of *nitric acid;* a dark red colour develops.

C. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution(a).

D. A 1.0 per cent w/v solution gives the reaction of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 6.5 to 8.5, determined on a 1.0 per cent w/v solution.

Light absorption (2.4.7). Absorbance of a 5.0 per cent w/v solution in *methanol* at 440 nm, not more than 0.050.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 50 ml with the same solvent.

Reference solution (a). A 0.0002 per cent w/v solution of *diclofenac sodium IPRS* in *methanol.*

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one IPRS (diclofenac impurity A IPRS)* in the mobile phase.

Chromatographic system

– a stainless steel column 25 cm x 4.6 mm, packed with end-capped octylsilane bonded to porous silica (5 µm),
– mobile phase: a mixture of 34 volumes of a solution containing 0.5 g per litre of *phosphoric acid* and 0.8 g per litre of *sodium dihydrogen phosphate* adjusted to pH 2.5 with *phosphoric acid*, and 66 volumes of *methanol*,
– flow rate: 1 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution: the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the secondary peaks is not more than 2.5 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (a).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Dissolve 0.2 g in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03181 g of $C_{14}H_{10}Cl_2NNaO_2$.

Storage. Store protected from light.

Diclofenac Injection

Diclofenac Sodium Injection

Diclofenac Injection is a sterile solution of Diclofenac Sodium in Water for Injections. It may contain Propylene Glycol, Benzyl Alcohol and sufficient Sodium Hydroxide to adjust the pH of the solution.

Diclofenac Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$.

Usual strength. 25 mg per ml.

Description. A clear, colourless to yellowish liquid.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 5 volumes of *acetone* and 5 volumes of *formic acid* in a saturated chamber.

Test solution. Dilute a suitable volume of the injection containing 25 mg of Diclofenac Sodium to 10 ml with *methanol*.

Reference solution. A 0.25 per cent w/v solution of *diclofenac sodium IPRS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Alternatively, spray with a 0.5 per cent w/v solution of *potassium dichromate* in *sulphuric acid (20 per cent)*. By both methods of visualisation, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 8.1 to 9.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the injection containing 50 mg of Diclofenac Sodium to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). A 0.005 per cent w/v solution of *diclofenac sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one IPRS (diclofenac impurity A IPRS)* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 34 volumes of a mixture of equal volumes of a 0.1 per cent w/v solution of *orthophosphoric acid* and a 0.16 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 66 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ in the injection.

Diclofenac Gastro-resistant Tablets

Diclofenac Tablets; Diclofenac Sodium Gastro-resistant Tablets; Diclofenac Sodium Tablets

Diclofenac Gastro-resistant Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$. They are made gastro-resistant by enteric-coating or by other means.

Usual strengths. 25 mg; 50 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel 60 F254* or using a precoated *silica gel 60 F254* plate.

Mobile phase. A mixture of 100 volumes of *toluene*, 10 volumes of *hexane* and 10 volumes of *anhydrous formic acid*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Diclofenac Sodium with 5 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution. A 1 per cent w/v solution of *diclofenac sodium IPRS* in *methanol*.

Apply separately to the plate 1 µl of each solution. After development, dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Alternatively, spray the plate with a 0.5 per cent w/v solution of *potassium dichromate* in *sulphuric acid (20 per cent)*. By both methods of visualisation, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing about 50 mg of Diclofenac Sodium with 70 ml of the mobile phase for 30 minutes and dilute to 100.0 ml with the mobile phase, centrifuge and filter the supernatant liquid.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 5.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *diclofenac impurity A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one) IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Zorbax C8),
- mobile phase: a mixture of 34 volumes of a solution containing a mixture of equal volumes of a 0.1 per cent w/v of *orthophosphoric acid* and a 0.16 per cent w/v of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5 and 66 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

The retention time of diclofenac is about 25 minutes and that of diclofenac impurity A is about 12 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of diclofenac. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and any peak with relative retention times of 0.67 and 0.1 with reference to the principal peak.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Diclofenac Sodium in the mobile phase, dilute to100.0 ml with the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.005 per cent w/v solution of *diclofenac sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *diclofenac impurity A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one) IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{10}C_{l2}NNaO_2$ in the tablet.

Storage. Store protected from light.

Diclofenac Prolonged-release Tablets

Diclofenac Sodium Prolonged-release Tablets

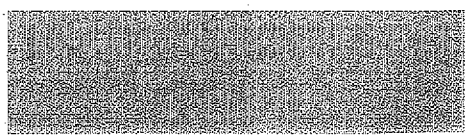
Diclofenac Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Diclofenac Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$.

Usual strength. 100 mg.

Identification

Disperse a quantity of powdered tablets containing 0.15 g of Diclofenac Sodium with 0.5 ml of *glacial acetic acid* and 15 ml of *methanol* with the aid of ultrasound, filter and collect the filtrate in 15 ml of *water*. Filter the precipitate under reduced pressure, wash with four 5-ml quantities of *water* and dry the residue at 105° for 2 to 3 hours. Determine by infrared absorption spectrophotometry (2.4.6) on the residue. Compare



the spectrum with that obtained with *diclofenac sodium IPRS* treated in the same manner or with the reference spectrum of diclofenac.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Diclofenac Sodium with 70 ml of the mobile phase with the aid of ultrasound for 30 minutes and dilute to 100.0 ml with the mobile phase, centrifuge and filter.

Reference solution (a). A 0.0001 per cent w/v solution of *diclofenac sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *diclofenac impurity A (1-(2,6-dichlorophenyl)-1,3-dihydro-2H-indol-2-one) IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 34 volumes of a solution containing a mixture of equal volumes of 0.1 per cent w/v of *orthophosphoric acid* and 0.16 per cent w/v of *sodium dihydrogen orthophosphate dihydrate*, adjusted to pH 2.5 and 66 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to diclofenac and diclofenac impurity A is not less than 6.5.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.5 g of Diclofenac Sodium in *methanol* with the aid of ultrasound and dilute with the mobile phase to obtain 0.005 per cent w/v of diclofenac sodium.

Reference solution (a). A 0.005 per cent w/v solution of *diclofenac sodium IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.0005 per cent w/v each of *diclofenac sodium IPRS* and *diclofenac impurity A IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of equal volumes of 0.1 per cent w/v solution of *orthophosphoric acid* and 0.16 per cent w/v solution of *sodium dihydrogen orthophosphate dihydrate*, adjusted to pH 2.5 and 80 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between diclofenac and diclofenac impurity A is not less than 2.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ in the tablet.

Storage. Store protected from light and moisture.

Diclofenac Sodium and Paracetamol Tablets

Diclofenac Sodium and Paracetamol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diclofenac sodium $C_{14}H_{10}Cl_2NNaO_2$ and paracetamol $C_8H_9NO_2$.

Usual strength. Diclofenac sodium 50 mg and Paracetamol 325 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *phosphate buffer pH 6.8*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the mobile phase to obtain a solution having similar concentration to the reference solution.

Reference solution. A solution containing 0.0032 per cent w/v of *paracetamol IPRS* and 0.0005 per cent w/v of *diclofenac sodium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *water*, 75 volumes of *methanol* and 1.0 volume of *glacial acetic acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ and $C_8H_9NO_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_{10}Cl_2NNaO_2$ and $C_8H_9NO_2$.

4-Aminophenol. Determine by liquid chromatography (2.4.14).

Solvent mixture A. Dissolve 4.6 g of *tetrabutylammonium hydroxide (40 per cent)* in 1000 ml of *methanol.*

Solvent mixture B. A *0.05 M disodium hydrogen orthophosphate dodecahydrate solution* .

Solvent mixture C. A *0.05 M sodium dihydrogen orthophosphate dihydrate solution.*

Test solution. Disperse a quantity of powdered tablets containing 25 mg of paracetamol in 6.3 ml of solvent mixture A, with the aid of ultrasound for 10 minutes and dilute to 25.0 ml with a mixture of equal volumes of solvent mixture B and solvent mixture C.

Reference solution. A solution containing 0.00015 per cent w/v solution, each of *4-aminophenol IPRS* and *paracetamol IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture of 325 volumes of solvent mixture A, 335 volumes of solvent mixture B and 340 volumes of solvent mixture C.
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 20 µl.

The relative retention times are 0.75 for the peaks due to 4-aminophenol and 1.0 for paracetamol.

Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to 4-aminophenol is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (0.15 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 325 mg of Paracetamol to a 50-ml volumetric flask, add 30 ml of mobile phase and disperse with the aid of ultrasound for about 10 minutes, cool and dilute to 50.0 ml with the mobile phase, filter. Dilute 1.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A solution containing each of 0.013 per cent w/v of *paracetamol IPRS and* 0.002 per cent of *diclofenac sodium IPRS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *water*, 75 volumes of *methanol* and 1.0 volume of *glacial acetic acid*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

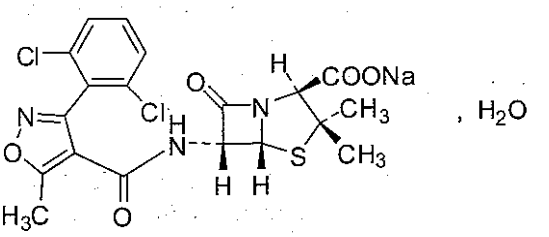
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ and $C_8H_9NO_2$ in the tablets.

Storage. Store protected from light and moisture at a temperature below 30°.

Dicloxacillin Sodium



$C_{19}H_{16}Cl_2N_3NaO_5S,H_2O$ Mol. Wt. 510.3

Dicloxacillin Sodium is sodium (6*R*)-6-[3-(2,6-dichlorophenyl)-5-methylisoxazole-4-carboxamido] penicillanate monohydrate.

Dicloxacillin Sodium contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{19}H_{16}Cl_2N_3NaO_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or almost white crystalline powder, hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dicloxacillin sodium IPRS* or with the reference spectrum of dicloxacillin sodium.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 30 volumes of *acetone* and 70 volumes of a 15.4 per cent w/v solution of *ammonium acetate*, adjusted to pH 5.0 with *glacial acetic acid*.

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *water*.

Reference solution (a). A 0.5 per cent w/v solution of *dicloxacillin sodium IPRS* in *water*.

Reference solution (b). A solution containing 0.5 per cent w/v each of *cloxacillin sodium IPRS*, *dicloxacillin sodium IPRS* and *flucloxacillin sodium IPRS* in *water*.

Apply to the plate 1 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air. Expose to iodine vapour until the spots appear and examine in daylight, the chromatogram obtained with reference solution (b) shows three clearly separated spots. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 150 mm long and about 15 mm in diameter. Moisten with 0.05 ml of *water* and add 2 ml of *sulphuric acid-formaldehyde reagent*. Mix the contents of the tube by swirling; the colour of the solution is slightly greenish-yellow. Place the test-tube in a water-bath for 1 minute; a yellow colour develops.

D. It gives reaction (A) of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and its absorbance at 430 nm (2.4.7) is not more than 0.04.

pH (2.4.24). 5.0 to 7.0, determined in solution A.

Specific optical rotation (2.4.22). + 128° to + 143°, determined in a 1 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *dicloxacillin sodium IPRS* in the mobile phase.

Reference solution (b). Dilute 5.0 ml of test solution (b) to 50.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v each of *flucloxacillin sodium IPRS* and *dicloxacillin sodium IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 5.0 with *dilute sodium hydroxide solution*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to flucloxacillin and dicloxacillin is not less than 2.5.

Inject reference solution (b) and test solution (a). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm, determined by Method A.

2-Ethylhexanoic acid. Not more than 0.8 per cent.

Determine by gas chromatography (2.4.13).

Test solution. Prepare a 0.1 per cent w/v solution of *3-cyclopropionic acid* (Internal standard) in *cyclohexane* (solution A). To 0.3 g of the substance under examination add 4.0 ml of 33 per cent v/v solution of *hydrochloric acid* and 1.0 ml of solution (A). Shake vigorously for 1 minute, centrifuge if necessary and use the clear supernatant layer.

Reference solution. Dissolve 75 mg of *2-ethylhexanoic acid* in solution A and dilute to 50 ml with solution A. To 1 ml of the solution add 4.0 ml of a 33 per cent v/v solution of *hydrochloric acid*, shake vigorously for 1 minute, centrifuge if necessary and use the clear supernatant layer.

Chromatographic system
- a wide-bore fused silica column 10 m x 0.53 mm coated with *macrogol* 20,000 *2-nitrophthalate* (film thickness 1.0 µm),
- temperature:
  column 40° from 0 to 2 minutes, 40°-200° from 2 to 7.3 minutes and 200° from 7.3 to 10.3 minutes,
  inlet port 200°and detector 300°,
- flow rate: 10 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks of *2-ethylhexanoic acid* and *3-cyclohexylpropionic acid* is not less than 2.0.

Inject 1 µl of the reference solution and the test solution.

Calculate the content of 2-ethylhexanoic acid.

Water (2.3.43). 3.0 to 4.5 per cent, determined on 0.3 g.

Dicloxacillin Sodium intended for use in the manufacture of parenteral preparations complies with the following additional tests.

Pyrogens. Complies with the test for pyrogens (2.2.8), using not less than 20 mg per kg of the rabbit's weight, dissolved in 1 ml of *water for injection.*

Assay. Determine by liquid chromatography (2.4.14), using test solution (b), reference solution (a) and chromatographic system as described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{19}H_{16}Cl_2N_3NaO_5S$.

Storage. Store protected from moisture, at a temperature not exceeding 25°. If it is intended for use in manufacture of parenteral preparation, the container should be sterile, airtight and temper-proof.

Dicloxacillin Capsules

Dicloxacillin Sodium Capsules

Dicloxacillin Capsules contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of dicloxacillin, $C_{19}H_{17}Cl_2N_3O_5S$.

Usual strengths. 250 mg; 500 mg.

Identification

In the Assay, the principle peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *water,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with buffer solution and filter.

Reference solution. A 0.11 per cent w/v solution of *dicloxacillin sodium IPRS* in the buffer solution. Dilute suitably with buffer solution.

Use the chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{17}Cl_2N_3O_5S$.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{17}Cl_2N_3O_5S$.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.1 g.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Buffer solution. Dissolve 5.44 g of *monobasic potassium phosphate* in 2000 ml of *water*, adjusted to pH 5.0 with *8 M potassium hydroxide.*

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 100 mg of dicloxacillin, dissolve in about 70 ml of buffer solution by stirring for 10 minutes, dilute to 100.0 ml with the buffer solution and filter.

Reference solution. A 0.11 per cent w/v solution of *dicloxacillin sodium IPRS* in the buffer solution.

Chromatographic system
- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of the buffer solution and 25 volumes of *acetonitrile,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{17}Cl_2N_3O_5S$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Dicloxacillin Oral Suspension

Dicloxacillin Sodium Oral Suspension

Dicloxacillin Oral Suspension is a dry mixture of Dicloxacillin with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of sealed container in the specified volume of water just before use.

Dicloxacillin Oral Suspension contains not less than 90.0 per cent and not more than 120.0 per cent of the labeled amount of dicloxacillin, $C_{19}H_{17}Cl_2N_3O_5S$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of dicloxacillin, $C_{19}H_{17}Cl_2N_3O_5S$.

Usual strength. 12.5 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.7 to 7.5, of the constituted oral suspension.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.1 g.

Other tests. Comply with the tests stated under Oral Suspension.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Buffer solution. Dissolve 5.44 g of *monobasic potassium phosphate* in 2000 ml of *water*, adjusted to pH 5.0 with *8 M potassium hydroxide*.

Test solution. Transfer an acurately weighted quantity containing about 125 mg of dicloxacillin to a 200-ml flask. Add 20.0 ml of *dimethylformamide* and 5.0 ml of *ethanol*, and stir for 15 minutes. Add another 50.0 ml of buffer, sonicate this mixture for 15 minutes, dilute to 200.0 ml with the buffer solution and filter.

Reference solution. Weigh a 65 mg of *dicloxacillin sodium IPRS* in 100-ml volumetric flask, add 20.0 ml of *dimethylformamide*, 5.0 ml of *ethanol (95 per cent)*, and 20.0 ml of buffer solution, and stir for 5.0 minutes, dilute to volume with the buffer solution.

Chromatographic system

- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 75 volumes of the buffer solution and 25 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Inject the reference solution The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

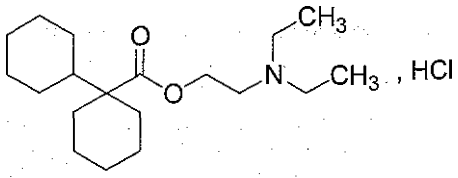
Inject the reference solution and the test solution.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{19}H_{17}Cl_2N_3O_5S$ in suspension.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Dicyclomine Hydrochloride

Dicycloverine Hydrochloride



$C_{19}H_{35}NO_2,HCl$ Mol. Wt. 346.0

Dicyclomine Hydrochloride is 2-diethylaminoethyl bicyclohexyl-1-carboxylate hydrochloride.

Dicyclomine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{35}NO_2,HCl$, calculated on the dried basis.

Category. Antispasmodic.

Description. A white or almost white, crystalline powder.

Identification

A. Dissolve a suitable quantity in *acetone* and evaporate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dicyclomine hydrochloride IPRS* or with the reference spectrum of dicyclomine hydrochloride.

B. To 3 ml of a 0.1 per cent w/v solution of *sodium dodecyl sulphate*, add 5 ml of *chloroform* and 0.05 ml of a 0.25 per cent w/v solution of *methylene blue*, mix gently and allow to separate; the chloroform layer is blue. Add 20 mg of the substance under examination dissolved in 2 ml of *water*, mix gently and allow to separate; the aqueous layer is blue and the chloroform layer is colourless.

C. Dissolve 10 mg in 5 ml of *water* and add 0.2 ml of *2 M nitric acid* and 0.5 ml of *silver nitrate solution*; a white precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *1-propanol*, 30 volumes of *ethyl acetate*, 15 volumes of *water* and 5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.5 g of the substance under examination in 10 ml of *methanol*.

Reference solution. Dilute 5.0 ml of the test solution to 50.0 ml with *methanol* and mix. To 2.0 ml of the solution add sufficient *methanol* to produce 100.0 ml.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.6 g in 20 ml of *anhydrous glacial acetic acid* and add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03460 g of $C_{19}H_{35}NO_2,HCl$.

Storage. Store protected from moisture.

Dicyclomine Injection

Dicyclomine Hydrochloride Injection; Dicycloverine Hydrochloride Injection

Dicyclomine Injection is a sterile, isotonic solution of Dicyclomine Hydrochloride in Water for Injections.

Dicyclomine Injection contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of dicyclomine hydrochloride, $C_{19}H_{35}NO_2,HCl$.

Usual strength. 10 mg per ml.

Identification

A. To a volume containing 0.1 g of Dicyclomine Hydrochloride add 10 ml of *water* and 1 ml of *hydrochloric acid*, shake with 25 ml of *ether* and allow to separate. Extract the aqueous layer with 30 ml of *chloroform*, wash the extract with two quantities, each of 10 ml, of *water* and filter the chloroform solution through *anhydrous sodium sulphate*. Evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dicyclomine hydrochloride IPRS* treated in the same manner or with the reference spectrum of dicyclomine hydrochloride.

B. In the Assay the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Bacterial endotoxins (2.2.3). Not more than 17.2 Endotoxin Unit per mg of Dicyclomine Hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *0.04 M phosphate buffer, pH 7.5* and 1 volume of *acetonitrile*.

Test solution. Dilute a volume containing about 20 mg of Dicyclomine Hydrochloride to 50.0 ml with the solvent mixture.

Reference solution. A 0.04 per cent w/v solution of *dicyclomine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *0.02 M phosphate buffer pH 7.5* prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 7.5 with 10 per cent w/v solution of *sodium hydroxide*, diluting to 1000 ml with *water* and 70 volumes of *acetonitrile*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{35}NO_2$,HCl in the injection.

Storage. Store protected from light, in single dose or multiple-dose containers.

Dicyclomine Oral Solution

Dicyclomine Hydrochloride Oral Solution; Dicycloverine Hydrochloride Oral Solution

Dicyclomine Oral Solution is a solution of Dicyclomine Hydrochloride in a suitable flavoured vehicle.

Dicyclomine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dicyclomine hydrochloride, $C_{19}H_{35}NO_2$,HCl.

Usual strength. 10 mg in 5 ml.

Identification

A. To a volume containing 0.1 g of Dicyclomine Hydrochloride add 10 ml of *water* and 1 ml of *hydrochloric acid*, shake with 30 ml of *ether* and allow to separate. Extract the aqueous layer with 30 ml of *chloroform*, wash the extract with two quantities, each of 10 ml, of *water* and filter the chloroform solution through *anhydrous sodium sulphate*. Evaporate the filtrate to dryness, recrystallise the residue from hot *acetone* and dry at 105° for 30 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dicyclomine hydrochloride IPRS* or with the reference spectrum of dicyclomine hydrochloride.

B. Acidify the oral solution with *2 M nitric acid* and add *silver nitrate solution*; a white precipitate is produced.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Weigh a quantity containing about 5 mg of Dicyclomine Hydrochloride add 5 ml of *sulphuric acid (10 per cent v/v)* and 2 ml of *0.02 M potassium permanganate*, mix, allow to stand, add 20 ml of *water* and 20 ml of *chloroform* to the decolorised solution and titrate with *0.001 M sodium dodecyl sulphate*, using 1 ml of *dimethyl yellow solution* as indicator. 1 ml of *0.001 M sodium dodecyl sulphate* is equivalent to 0.0003460 g of $C_{19}H_{35}NO_2$,HCl.

Determine the weight per ml of the oral solution (2.4.29), and calculate the content of $C_{19}H_{35}NO_2$,HCl, weight in volume.

Storage. Store protected from light.

Dicyclomine Tablets

Dicyclomine Hydrochloride Tablets; Dicycloverine Hydrochloride Tablets

Dicyclomine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of dicyclomine hydrochloride, $C_{19}H_{35}NO_2$,HCl.

Usual strength. 20 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.2 g of Dicyclomine Hydrochloride with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness, recrystallise the residue from hot *acetone* and dry at 105° for 4 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dicyclomine hydrochloride IPRS* or with the reference spectrum of dicyclomine hydrochloride.

B. To 3 ml of a 0.1 per cent w/v solution of *sodium dodecyl sulphate*, add 5 ml of *chloroform* and 0.05 ml of a 0.25 per cent w/v solution of *methylene blue*, mix gently and allow to separate; the chloroform layer is blue. Add about 20 mg of extracted powder obtained in identification test A, dispersed in 2 ml of *water*, mix gently and allow to separate; the aqueous layer is blue and the chloroform layer is colourless.

C. Shake a quantity of the powdered tablets containing 10 mg of Dicyclomine Hydrochloride with 5 ml of *water* and 0.2 ml of *2 M nitric acid*, filter and add 0.5 ml of *silver nitrate solution* to the filtrate; a white precipitate is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 500 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of buffer solution.

Test solution. Use the filtrate, dilute if necessary, with the solvent mixture.

Reference solution. Dissolve a quantity of *dicyclomine hydrochloride IPRS* in the solvent mixture, and dilute with the solvent mixture to obtain a solution having similar concentration to the test solution.

- injection volume: 250 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{35}NO_2.HCl$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{19}H_{35}NO_2.HCl$.

Limit of Dicyclomine related compound A. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2.72 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Disperse a quantity of powdered tablets containing 200 mg of Dicyclomine Hydrochloride in 10 ml of *water*, with the aid of ultrasound, add 70 ml of *acetonitrile*, sonicate for at least 5 minutes, and shake by mechanical means for at least 30 minutes and dilute to 100.0 ml with *water*. Centrifuge and use the clear supernatant.

Reference solution (a). A 0.0004 per cent w/v solution of *dicyclomine related compound A ([1,12 -Bi(cyclohexane)]-1-carboxylic acid) IPRS* in the solvent mixture.

Reference solution (b). Dilute 5.0 of reference solution (a) to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (3.5µm),
- mobile phase: A. 55 volumes of *acetonitrile* and 45 volumes of the buffer solution,
  B. 80 volumes of *acetonitrile* and 20 volumes of the buffer solution,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
20.1	0	100
40	0	100
40.1	100	0
50	100	0

Inject reference solution (a) and (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent in the chromatogram obtained with reference solution (a) and signal-to-noise ratio is not less than 10 in the chromatogram obtained with reference solution (b).

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to dicyclomine related compound A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2.72 g of *monobasic potassium phosphate* in 900 ml of *water*, adjusted to pH 7.5 with 10 per cent w/v solution of *sodium hydroxide* and dilute to 1000 ml with *water*.

Solvent mixture. 70 volumes of *acetonitrile* and 30 volumes of *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 20 mg of Dicyclomine Hydrochloride in 2 ml of *water*, with the aid of ultrasound, add 35 ml of *acetonitrile*, sonicate for at least 5 minutes, and shake by mechanical means for at least 30 minutes and dilute to 50.0 ml with *water*. Centrifuge and use the clear supernatant.

Reference solution. A 0.04 per cent w/v solution of *dicyclomine hydrochloride IPRS* in the solvent mixture

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (3.5µm),
- mobile phase: a mixture of 70 volumes of *acetonitrile* and 30 volumes of buffer solution,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

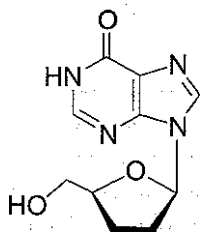
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{19}H_{35}NO_2$,HCl in the tablets.

Storage. Store protected from light.

Didanosine



$C_{10}H_{12}N_4O_3$ Mol. Wt. 236.2

Didanosine is 2′,3′–dideoxyinosine.

Didanosine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}N_4O_3$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *didanosine IPRS* or with the reference spectrum of didanosine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). –28.0° to –24.0°, determined in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.001 per cent w/v solution of the substance under examination in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 6 volumes of *acetonitrile* and 94 volumes of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than half of the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) as given under the test for Related substances using the following solutions.

Test solution. Dilute 5.0 ml of a 0.1 per cent w/v solution of the substance under examination in *water* to 100.0 ml with the mobile phase.

Reference solution. Dilute 5.0 ml of a 0.1 per cent w/v solution of *didanosine IPRS* in *water* to 100.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the column efficiency determined from the didanosine peak is not less than 5000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_3$.

Storage. Store protected from light.

Didanosine Gastro-resistant Capsules

Didanosine Capsules

Didanosine Gastro-resistant Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of didanosine, $C_{10}H_{12}N_4O_3$. They are made gastro-resistant by enteric coating or by other means.

Usual strengths. 125 mg; 200 mg; 250 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1 (Basket),

Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 120 minutes.

Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 1.41 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, adjusted to pH 7.5 with *orthophosphoric acid* and filter.

Test solution. Withdraw the medium completely without any loss of residue. Transfer the residue into 1000-ml volumetric flask, add 750 ml of the buffer solution, dissolve and make up the volume with the buffer solution. Dilute suitably with the buffer solution to get a solution containing 0.005 per cent w/v solution of Didanosine.

Reference solution. A 0.005 per cent w/v solution of *didanosine IPRS* in the buffer solution.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 95 volumes of the buffer solution and 5 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 249 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_3$ released in the acid medium by subtracting the content of $C_{10}H_{12}N_4O_3$ in the test solution from the total content of Didanosine, $C_{10}H_{12}N_4O_3$ determined in the Assay.

Complies with the acceptance criteria given under acid stage.

B. Apparatus No. 1 (Basket),

Medium. 1000 ml of a buffer solution pH 6.8 prepared by mixing 25 volumes of *0.2 M tribasic sodium phosphate buffer* and 75 volumes of *0.1 M hydrochloric acid,* adjusted to pH 6.8 with *2 M hydrochloric acid* or *2 M sodium hydroxide,*

Speed and time. 100 rpm and 45 minutes.

Determine by liquid chromatography (2.4.14).

Transfer another 6 capsules and run the apparatus for 2 hours in *0.1 M hydrochloric acid*. Decant the medium without losing the residue, add buffer solution pH 6.8 and run the apparatus for 45 minutes. Withdraw a suitable volume of the medium and filter.

Test solution. Use the filtrate, dilute if necessary, to get a concentration of 0.005 per cent w/v of Didanosine in the dissolution medium.

Reference solution. A 0.005 per cent w/v solution of *didanosine IPRS* in the dissolution medium.

Use chromatographic system as described under Acid stage dissolution.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_3$ in the medium

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{12}N_4O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh a quantity of the contents of the capsules containing 100 mg of Didanosine, dissolve in 100.0 ml of mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *didanosine IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5µm), (Such as Lichrospher RP18e),
- mobile phase: a mixture of 95 volumes of a buffer solution prepared by dissolving 1.15 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water*, and 5 volumes of *acetonitrile*, adjusted to pH 6.8 with *triethylamine* and filter,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 4500 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 4 times the area of the peak in the chromatogram obtained with the reference solution (b) (4.0 per cent) and the sum of all the secondary peaks is not more than 5.5 times the area of the peak in the chromatogram obtained with the reference solution (5.5 per cent),

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the contents of the capsules containing 50 mg of Didanosine, dissolve in 100.0 ml of the *buffer solution pH 7.5* and filter. Dilute 5.0 ml of the solution to 50.0 ml with the *buffer solution pH 7.5*.

Reference solution. A 0.005 per cent w/v solution of *didanosine IPRS* in *buffer solution pH 7.5*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 950 volumes of *buffer solution pH 7.5* and 50 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 249 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates the tailing factor is not more than 1.5 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_3$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Didanosine Tablets

Didanosine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of didanosine, $C_{10}H_{12}N_4O_3$. The tablets may contain permitted flavouring agents.

Usual strengths. 25 mg; 50 mg;100 mg; 150 mg; 200 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Didanosine with 80 ml of *water*, dilute to 100 ml with *water* and filter. Dilute 5 ml of the filtrate to 100 ml with *water*. When examined in the range 220 nm to 350 nm (2.4.7), the resulting solution shows an absorption maximum only at about 250 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *didanosine IPRS* in dissolution medium to obtain a solution having a concentration similar to that of the test solution.

Chromatographic system
- a stainless steel column 12.5 cm × 4 mm, packed with octylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 95 volumes of 0.077 per cent w/v solution of *ammonium acetate* and 5 volumes of *methanol*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume: equivalent of 2 µg of didanosine.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injection is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{12}N_4O_3$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{10}H_{12}N_4O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the powdered tablets containing about 50 mg of Didanosine and transfer to a 50-ml volumetric flask. Add about 25 ml of *buffer solution pH 7.0*, and mix with the aid of ultrasound for 5 minutes, dilute to volume with the same solvent, mix and filter.

Reference solution. Weigh 50 mg *didanosine IPRS* and transfer to a 50-ml volumetric flask. Dissolve in about 25 ml of *buffer solution pH 7.0* and dilute to volume with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with the same solvent. Dilute further 5.0 ml to 50.0 ml with the same solvent and filter through a membrane filter disc with an average pore diameter not greater than 0.45 µm.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),
- mobile phase: A. buffer solution pH 7.0 prepared by dissolving 1.42 g of *disodium hydrogen phosphate* and 6.8 g of *tetrabutylammonium hydrogen sulphate* in 1000 ml of *water*, adjusted to pH 7.0 with *sodium hydroxide solution*,

  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
8	0	100
20	70	30
25	30	70
26	100	0
35	0	100
37	100	0

Inject the reference solution. The test is not valid unless the column efficiency determined from the didanosine peak is not less than 3000 theoretical plates and the tailing factor is not more than 1.5.

Inject separately the buffer and test solution. Examine the chromatogram obtained with the buffer solution for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 5.0 per cent and the sum of the areas of all the secondary peaks should not be more than 6.0 per cent when calculated by percentage area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powdered tablets containing about 100 mg of Didanosine and transfer to a 100-ml volumetric flask. Add about 50 ml of *buffer solution pH 7.0*, mix with the aid of ultrasound for 10 minutes, dilute to volume with the same solvent, mix and filter through a membrane filter disc with an average pore diameter not greater than 0.45 µm.

Reference solution. A 0.1 per cent w/v solution of *didanosine IPRS* in *buffer solution pH 7.0*. Filter through a membrane filter disc with an average pore diameter not greater than 0.45 µm.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),
- mobile phase: a filtered and degassed mixture of 5 volumes of *acetonitrile* and 95 volumes of a buffer solution prepared by dissolving 1.42 g of *disodium hydrogen phosphate* in 1000 ml of *water*, adjusted to pH 7.5 ± 0.05 with *dilute phosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 5 µl.

Inject the reference solution and run the chromatogram twice the retention time of didanosine. The test is not valid unless the column efficiency is not less than 4500 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

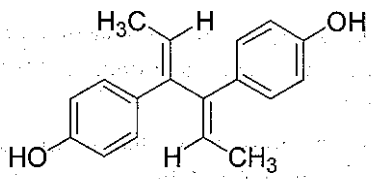
Calculate the content of $C_{10}H_{12}N_4O_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states that the tablets should be chewed before swallowing.

Dienoestrol

Dienestrol



$C_{18}H_{18}O_2$ Mol. Wt. 266.3

Dienoestrol is *(E,E)*-4,4'-[bis(ethylidene)ethylene]diphenol.

Dienoestrol contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{18}H_{18}O_2$, calculated on the dried basis.

Category. Oestrogen.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dienoestrol IPRS* or with the reference spectrum of dienoestrol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Heat a mixture of about 1 mg in 5 ml of *glacial acetic acid* and 1 ml of a 1 per cent w/v solution of *bromine* in *glacial acetic acid* in a water-bath for 2 minutes. To 0.5 ml of the solution in a dry test tube add 0.5 ml of *ethanol*, mix and add 10 ml of *water*; a reddish-violet colour is produced. Add 5 ml of *chloroform*, shake vigorously and allow to separate; the chloroform layer is red and the aqueous layer is almost colourless.

D. Dissolve 0.5 mg in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat on a water-bath for 3 minutes; a reddish-violet colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *diethylamine*.

Test solution (a). Dissolve 0.5 g of the substance under examination in 5 ml of *ethanol (95 per cent)*.

Test solution (b). Dilute 5 ml of test solution (a) to 100 ml with *ethanol (95 per cent)*.

Reference solution (a). A 0.5 per cent w/v solution of *dienoestrol IPRS* in *ethanol (95 per cent)*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 50 ml with *ethanol (95 per cent)*.

Reference solution (c). A solution containing 0.25 per cent w/v each of *dienoestrol IPRS* and *stilbestrol IPRS* in *ethanol (95 per cent)*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent v/v)* and heat at 120° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows at least two clearly separated spots having approximately the same intensity.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 25 mg in sufficient *ethanol* to produce 100.0 ml. To 5.0 ml of the solution add 10 ml of *ethanol*, dilute with *0.1 M sodium hydroxide* to 250.0 ml and measure the absorbance of the resulting solution at the maximum at about 245 nm (2.4.7). Calculate the content of $C_{18}H_{18}O_2$ from the absorbance obtained by repeating the procedure using *dienoestrol IPRS* in place of the substance under examination.

Storage. Store protected from light.

Dienoestrol Tablets

Dienestrol Tablets

Dienoestrol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dienoestrol, $C_{18}H_{18}O_2$.

Usual strength. 1 mg.

Identification

A. Extract a quantity of the powdered tablets containing about 15 mg of Dienoestrol with *ether* and filter; evaporate the filtrate to dryness. Reserve a portion of the residue for test C. Heat a mixture of about 1 mg of the residue in 5 ml of *glacial acetic acid* and 1 ml of a 1 per cent w/v solution of *bromine* in *glacial acetic acid* in a water-bath for 2 minutes. To 0.5 ml of the solution in a dry test tube add 0.5 ml of *ethanol*, mix and add 10 ml of *water*; a reddish-violet colour is produced. Add 5 ml of *chloroform*, shake vigorously and allow to separate; the chloroform layer is red and the aqueous layer is almost colourless.

B. Dissolve 0.5 mg of the residue in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat on a water-bath for 3 minutes; a reddish-violet colour is produced.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets containing 2 mg of Dienoestrol with 4 ml of *acetone*, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *dienoestrol IPRS* in *acetone*.

Reference solution (b). A solution containing 0.1 per cent w/v each of *dienoestrol IPRS* and *stilbestrol IPRS* in *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent v/v)* and heat at 120° for 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots having approximately the same intensity.

Tests

Uniformity of content. Complies with test stated under Tablets.

Powder one tablet and extract with successive quantities of *ether* until complete extraction is effected. Filter the ether solution and wash the filter paper with small quantities of *ether*. Evaporate the *ether* and dissolve the residue in 10 ml of *ethanol* and add sufficient *0.1 M sodium hydroxide* to produce a solution containing 0.0005 per cent w/v of Dienoestrol. Complete the test as described under Assay beginning at the words "Measure the absorbance....".

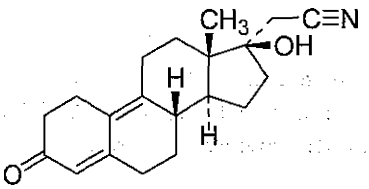
Calculate the content of $C_{18}H_{18}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 10 mg of Dienoestrol and triturate with successive quantities of *ether* until complete extraction is effected. Filter the ether extracts and wash the filter with small quantities of *ether*. Combine the filtrate and washings and remove the *ether*; dissolve the residue in sufficient *ethanol* to produce 50.0 ml. To 5.0 ml of the solution add 10 ml of *ethanol* and sufficient *0.1 M sodium hydroxide* to produce 200.0 ml. Measure the absorbance of the resulting solution at the maximum at 245 nm (2.4.7). Calculate the content of $C_{18}H_{18}O_2$ from the absorbance obtained by repeating the operation using a solution obtained by dissolving 2.5 mg, weighed, of *dienoestrol IPRS* in 20 ml of *ethanol* and diluting with sufficient *0.1 M sodium hydroxide* to produce 500.0 ml.

Storage. Store protected from light.

Dienogest



$C_{20}H_{25}NO_2$ Mol Wt. 311.4

Dienogest is 2-[(8*S*, 13 *S*, 14 *S*, 17*R*)-17-hydroxy-13-methyl-3-oxo-1,2,6,7,8,11,12,14,15,16-decahydrocyclopenta phenanthren-17-yl]acetonitrile.

Dienogest contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{25}NO_2$, calculated on the dried basis.

Category. Antiandrogenic.

Description. An off-white to slightly yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dienogest IPRS* or with the reference spectrum of dienogest.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 60 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *dienogest IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 300 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.2 per cent and the sum of the area of all secondary peaks is not more than 0.5 per cent, calculated by area normalization.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 60 ml of the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *dienogest IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

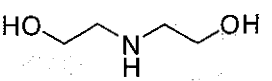
Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{25}NO_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Diethanolamine



$C_4H_{11}NO_2$ Mol. Wt. 105.14

Diethanolamine is bis(hydroxyethyl)amine.

Diethanolamine is a mixture of ethanolamines, consisting largely of diethanolamine.

Diethanolamine contains not less than 98.5 per cent and not more than 101.0 per cent of ethanolamines, $NH(C_2H_4OH)_2$, calculated on the anhydrous basis.

Category. Pharmaceutical aid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethanolamine IPRS* or with the reference spectrum of diethanolamine.

Tests

Refractive index (2.4.27). 1.473 to 1.476, determined at 30°.

Triethanolamine. Not more than 1.0 per cent.

To 100 ml of *methanol*, add 6 to 8 drops of mixed indicator of 0.15 g of *methyl orange* and 0.08 g of *xylene cyanole* in 100 ml of *water* in a 500-ml glass-stoppered conical flask and neutralize with *0.1 M ethanolic sulphuric acid* or *0.1 M ethanolic potassium hydroxide*. The neutral solution is amber when viewed by transmitted light and is red-brown when viewed by reflected light, add 20 g of the substance under examination, add into 500-ml glass-stoppered conical flask, cautiously add 75 ml of *acetic anhydride*, and swirl to effect complete solution. Allow to stand at room temperature for 30 minutes, cool. Titrate with *0.5 M ethanolic sulphuric acid solution*. Carry out a blank titration.

1 ml of *0.5 M ethanolic sulphuric acid* is equivalent to 0.0746 g of triethanolamine.

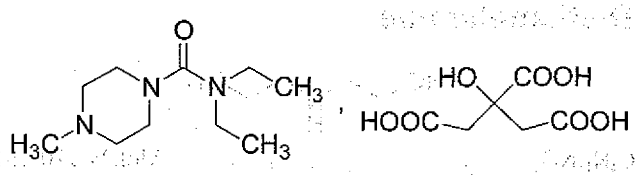
Water (2.3.43). Not more than 0.15 per cent, determined on a 20.0 g of substance under examination in a mixture of 25 volumes of *glacial acetic acid* and 40 volumes of *methanol*.

Assay. Dissolve 2.0 g in 50.0 ml of *water*. Titrate with *0.5 M hydrochloric acid* using *bromocresol green solution* as indicator. Carry out a blank titration.

1 ml of *0.5 M hydrochloric acid* is equivalent to 0.05257 g of $NH(C_2H_4OH)_2$.

Storage. Store protected from light and moisture.

Diethylcarbamazine Citrate



$C_{10}H_{21}N_3O,C_6H_8O_7$ Mol. Wt. 391.4

Diethylcarbamazine Citrate is *N,N*-diethyl-4- methylpiperazine-1-carboxamide dihydrogen citrate.

Diethylcarbamazine Citrate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{10}H_{21}N_3O,C_6H_8O_7$, calculated on the dried basis.

Category. Anthelmintic; antifilarial.

Description. A white, crystalline powder; slightly hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethylcarbamazine citrate IPRS* or with the reference spectrum of diethylcarbamazine citrate.

B. In the test for *N,N'*-Dimethylpiperazine and *N*-methylpiperazine, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a).

C. A 2 per cent w/v solution gives reactions of citrates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

***N,N'*-Dimethylpiperazine and *N*-methylpiperazine**. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *methanol*, 30 volumes of *2-butanone* and 5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.5 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 5 per cent w/v solution of *diethylcarbamazine citrate IPRS* in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *N,N'- dimethylpiperazine* in *methanol*.

Reference solution (c). A 0.01 per cent w/v solution of *N-methylpiperazine* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 105° and expose it to iodine vapour for 30 minutes. Any spots corresponding to *N,N'*-dimethylpiperazine and *N*-methylpiperazine in the chromatogram obtained with the test solution are not more intense than the spots in the chromatogram obtained with reference solution (b) and (c) respectively.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 31.2 g of *potassium dihydrogen phosphate* in *water* and dilute to 1000 ml with the same solvent.

Test solution. Suspend 0.3 g of the substance under examination in the solvent mixture and dilute to 100 ml with the same solvent, filter and use the supernatant.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with solvent mixture.

Reference solution (b). To 3.0 ml of the test solution, add 0.5 ml of *strong hydrogen peroxide solution* and maintain at 80° for 3 hours. Dilute to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol* and 90 volumes of a 1.0 per cent w/v solution of *potassium dihydrogen phosphate,*
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

The relative retention time with reference to diethylcarbamazine for citrate is about 0.2 and for degradation product is about 1.6 and the retention time of diethylcarbamazine is about 7 minutes.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to diethylcarbamazine and the degradation product is not less than 5.0.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). Ignore the peak due to citrate.

Heavy metals (2.3.13). 1.0 g dissolved in 20 ml of *water*, 0.5 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 25 ml complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 25 mg of the substance under examination, dissolve in 20 ml of a 3.124 per cent w/v solution of *potassium dihydrogen phosphate*, dilute to 25.0 ml with the same solvent, mix well and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the potassium dihydrogen phosphate solution.

Reference solution. A 0.01 per cent w/v solution of *diethylcarbamazine citrate IPRS* in a 3.124 per cent w/v solution of *potassium dihydrogen phosphate.*

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol* and 90 volumes of a 1 per cent solution of *potassium dihydrogen phosphate,*
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{21}N_3O,C_6H_8O_7$.

Storage. Store protected from moisture.

Diethylcarbamazine Tablets

Diethylcarbamazine Citrate Tablets

Diethylcarbamazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of diethylcarbamazine citrate, $C_{10}H_{21}N_3O,C_6H_8O_7$.

Usual strengths. 50 mg; 100 mg.

Identification

To a quantity of the powdered tablets containing 0.15 g of Diethylcarbamazine Citrate add 15 ml of *ethanol (95 per cent)*, shake for 5 minutes, filter and evaporate the filtrate to dryness. To the residue add 10 ml of *2 M sodium hydroxide* and extract with three quantities, each of 10 ml, of *chloroform.* Dry the combined extracts over *anhydrous sodium sulphate*, filter and evaporate the *chloroform.* The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethylcarbamazine citrate IPRS* treated in the same manner or with the reference spectrum of diethylcarbamazine.

Tests

***N,N'*-Dimethylpiperazine and *N*-methylpiperazine.** Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *methanol*, 30 volumes of *2-butanone* and 5 volumes of *strong ammonia solution*.

Test solution. Disperse a quantity of powdered tablets containing 0.5 g of the diethylcarbamazine citrate in *methanol* and dilute to 10.0 ml with *methanol*, filter.

Reference solution (a). A 0.01 per cent w/v solution of *N,N'-dimethylpiperazine* in *methanol*.

Reference solution (b). A 0.01 per cent w/v solution of *N-methylpiperazine* in *methanol*.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate at 105° and expose it to iodine vapour for 30 minutes. Any spots corresponding to *N,N'*-dimethylpiperazine and *N*-methylpiperazine in the chromatogram obtained with the test solution are not more intense than the spots in the chromatogram obtained with reference solution (a) and (b) respectively.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute the filtrate, if necessary, with an equal volume of a 6.248 per cent w/v solution of *potassium dihydrogen phosphate*. Carry out the determination as described under Assay. Calculate the content of $C_{10}H_{21}N_3O,C_6H_8O_7$ using a solution of known concentration of *diethylcarbamazine citrate IPRS* in a 3.124 per cent w/v solution of *potassium dihydrogen phosphate*.

Q. Not less than 75 per cent of the stated amount of $C_{10}H_{21}N_3O,C_6H_8O_7$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 25 mg of Diethylcarbamazine Citrate, add 20 ml of a 3.124 per cent w/v solution of *potassium dihydrogen phosphate* and place in an ultrasonic bath for 5 minutes. Cool, dilute to 25.0 ml with the same solvent and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the same solvent.

Reference solution. A 0.01 per cent w/v solution of *diethylcarbamazine citrate IPRS* in a 3.124 per cent w/v solution of *potassium dihydrogen phosphate*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol* and 90 volumes of a 1 per cent w/v solution of *potassium dihydrogen phosphate*,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

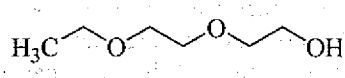
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{21}N_3O,C_6H_8O_7$ in the tablets.

Storage. Store protected from moisture.

Diethylene Glycol Monoethyl Ether



$C_6H_{14}O_3$ Mol. Wt. 134.2

Diethylene Glycol Monoethyl Ether contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_{14}O_3$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (humectant; solvent).

Description. A clear, colourless liquid , hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethylene glycol monoethyl ether IPRS* or with the reference spectrum of diethylene glycol monoethyl ether.

B. In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Acid value (2.3.23). Not more than 0.1.

Peroxide value (2.3.35). Not more than 8.0.

Refractive index (2.4.27). 1.426 to 1.428 at 20°.

Related substances. Determine by gas chromatography (2.4.13).

Free ethylene oxide. Not more than 1µg per g.

CAUTION— Ethylene oxide is toxic and flammable. Prepare these solutions in a well ventilled fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask.

NOTE— Prepare the solutions immediately before use.

Acetaldehyde solution. A 0.001 per cent v/v solution of *acetaldehyde* in *water*.

Test solution (a). Fill a chilled pressure bottle with liquid *ethylene oxide*, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glass stoppered conical flask, add 50 ml of *polyethylene glycol 200* and reweigh the flask. Transfer 5 ml of the liquid *ethylene oxide* into a 100 ml beaker chilled in a mixture of one volume *sodium chloride* and three volumes wet ice. Using a syringe that has been previously cooled to -10°, transfer 300 µl (equivalent to about 250 mg) of liquid *ethylene oxide* to the *polyethylene glycol 200*, and swirl gently to mix. Replace the stopper, reweigh the flask and determine the amount of *ethylene oxide* absorbed by weigh difference. Adjust the weight of the mixture with *polyethylene glycol 200* to 100 g, replace the stopper and swirl gently to mix. This solution containing 2.5 mg/g of *ethylene oxide*.

Test solution (b). Transfer 1 g *diethylene glycol monoethyl ether* to 10.0 ml pressure headspace vial add 1ml of *water*, seal the vial and mix. Heat the mixture at 70° for 45 minutes.

Reference solution (a). Tare a glass stoppered conical flask and chill it in a refrigerator. Add 35 ml of *polyethylene glycol 200* and reweigh the flask. Use a syringe that has been chilled in a refrigerator and transfer 1g of the chilled test solution (a) to the tared, conical flask. Adjust the weight of the solution with *polyethylene glycol 200* to 50 g, replace the stopper and swirl gently to mix. Transfer 10 g of the solution to a 50-ml volumetric flask. Add 30 ml of *water* and mix. Dilute with *water* to volume and mix to obtain a 0.001 per cent w/v solution of *ethylene oxide*.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 50.0 ml with *water* to produce 0.0002 per cent w/v solution of *ethylene oxide*.

Reference solution (c). Dilute 0.5 ml of reference solution (b) to 10.0 ml pressure headspace vial add 0.1 ml of *acetaldehyde solution* and 0.1 ml of *water*, seal the vial and mix. Heat the mixture at 70° for 45 minutes.

Reference solution (d). Transfer 1 g *diethylene glycol monoethyl ether* to 10.0 ml pressure headspace vial add 0.5 ml of reference solution (b) and 0.5 ml of *water*, seal the vial and mix. Heat the mixture at 70° for 45 minutes.

Chromatographic system

- a glass or quartz capillary column 30 m x 0.32 mm, bonded with a 1.0 µm layer of phase G1,
- temperature:

Column	Intial temperature (°)	Ramp temperature (°/min.)	Final temperature (°)	Hold time at final temperature (min.)
	50	—	50	5
	50	5	180	—
	180	30	230	5

- inlet port at 150° and detector at 250°,
- flame ionization detector,
- flow rate: 1.0 ml per minute, using helium or nitrogen as the carrier gas,
- injection volume: 1 ml.

Name	Relative retention time
acetaldehyde	0.94
ethylene oxide	1.0

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to acetaldehyde and ethylene oxide is not less than 2.0 and relative standard deviation for replicate injections is not more than 15 per cent.

Inject reference solution (d) and test solution (b). Calculate the amount of ethylene oxide in diethylene glycol monoethyl ether using the following equation.

$$\frac{r_u}{(r_s \times w_u) - (r_u \times w_s)}$$

where, r_u = ethylene oxide peak area from the test solution (b),

r_s = ethylene oxide peak area from the reference solution (d),

w_u = weigh of diethylene glycol monoethyl ether to prepare the test solution (b),

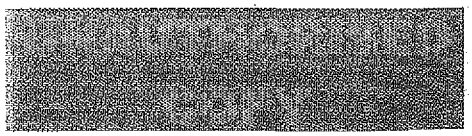
w_s = weigh of diethylene glycol monoethyl ether to prepare the reference solution (d).

Limit of 2-methoxyethanol, 2-ethoxyethanol, ethylene glycol and diethylene glycol

Name	Not more than (ppm)
2-methoxyethanol	50
2-ethoxyethanol	160
ethylene glycol	620
diethylene glycol	150

Use the test solution, reference solution, chromatographic system and system suitability requirements as described under Assay.

Inject the test solution.



Calculate the percentage of 2-methoxyethanol in diethylene glycol monoethyl ether using the following equation.

$$\frac{r_U}{r_T} \times 100$$

where, r_U = peak response for 2-methoxyethanol,
r_T = sum of the responses of all the peaks.

Calculate the percentage of 2-ethoxyethanol in diethylene glycol monoethyl ether using the following equation.

$$\frac{r_U}{r_T} \times 100$$

where, r_U = peak response for 2-ethoxyethanol,
r_T = sum of the responses of all the peaks.

Calculate the percentage of ethylene glycol in diethylene glycol monoethyl ether using the following equation.

$$\frac{r_U}{r_T} \times 100$$

where, r_U = peak response for ethylene glycol,
r_T = sum of the responses of all the peaks.

Calculate the percentage of diethylene glycol in the portion of diethylene glycol monoethyl ether using following equation.

$$\frac{r_U}{r_T} \times 100$$

where, r_U = peak response for diethylene glycol,
r_T = sum of the responses of all the peaks.

Water (2.3.43). Not more than 0.1 per cent, determined on 10.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Use the substance under examination .

Reference solution. Dissolve 100 mg of each of *2-methoxyethanol*, *2- ethoxyethanol*, *ethylene glycol*, *diethylene glycol* and *diethylene glycol monoethyl ether IPRS* in 100.0 ml of *methanol*.

Chromatographic system

- a fused silica column 30 m x 0.32 mm, bonded with a 1.0 µm layer of phase G 46,
- temperature:

Column	Intial temperature (°)	Ramp temperature (°/min.)	Final temperature (°)	Hold time at final temperature (min.)
	120	—	120	1
	120	12	225	2

- inlet port at 250° and detector at 275°,
- flame ionization detector,
- flow rate: 2.2 ml per minute, using helium or nitrogen as the carrier gas,
- injection volume: 0.5µl.

Name	Relative retention time
2- methoxyethanol	0.40
2- ethoxyethanol	0.43
ethylene glycol	0.50
diethylene glycol monoethyl ether	0.93
diethylene glycol	1.0

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to 2-ethoxyethanol and ethylene glycol is not less than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

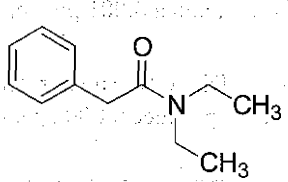
Inject the test solution. Calculate the percentage of diethylene glycol monoethyl ether using following equation.

$$\frac{r_U}{r_T} \times 100$$

where, r_U = peak response for diethylene glycol monoethyl ether,
r_T = sum of the responses of all the peaks

Storage. Store in well-closed containers under an atmosphere of inert gas, at a temperature not exceeding 35°.

Diethylphenylacetamide



$C_{12}H_{17}NO$ Mol. Wt. 191.3

Diethylphenylacetamide is *N,N*-diethylbenzeneacetamide

Diethylphenylacetamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{17}NO$, calculated on the anhydrous basis.

Category. Insect repellent.

Description. A clear to faintly yellow liquid. It shall be free from suspended matter.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Boiling point (2.4.8). About 290°.

Relative density (2.4.29). About 1.01 at 25°.

Refractive index (2.4.27). 1.520 to 1.521 at 20° sodium D lines.

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 3 per cent w/v solution of *diethyl sebacate* in *acetone*.

Test solution. To 0.2 g of the substance under examination, add 10 ml of internal standard solution and dilute to the 100.0 ml with *acetone*.

Reference solution. To 50 mg of *diethylphenylacetamide IPRS*, add 2.5 ml of internal standard solution and dilute to the 25.0 ml with *acetone*.

Chromatographic system

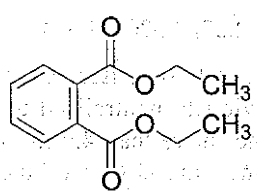
- a glass column 1.2 m x 2 mm packed with 10.0 per cent OV-101 on chromosorb WHP (100-120 mesh),
- temperature :
  column 150°,
  inlet port and detector at 300°,
- flow rate 30 ml per minute of the Nitrogen, 30 ml per minute of the Hydrogen, 210 ml per minute of the Air.

Inject 2 µl of the test solution and the reference solution.

Calculate the content of $C_{12}H_{17}NO$.

Storage. Store protected from light and moisture.

Diethyl Phthalate



$C_{12}H_{14}O_4$ Mol. Wt. 222.2

Diethyl phthalate is diethyl benzene-1,2-dicarboxylate.

Diethyl phthalate contains not less than 99.0 per cent and not more than 101.0 per cent of diethyl phthalate, $C_{12}H_{14}O_4$.

Category. Pharmaceutical aid.

Description. A clear, oily liquid, colourless or very slightly yellow.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethyl phthalate IPRS* or with the reference spectrum of diethyl phthalate.

B. Relative density (2.4.29). 1.117 to 1.121.

C. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF 254*.

Mobile phase. A mixture of 30 volumes of *heptane* and 70 volumes of *ether*.

Test solution. Dissolve 50 mg of the substance under examination in 10 ml of *ether*.

Reference solution. Dissolve 50 mg of *diethyl phthalate IPRS* in 10 ml of *ether*.

Apply to the plate 10 µl of each solution. After development dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution.

D. To about 0.1 ml, add 0.25 ml of *sulphuric acid* and 50 mg of *resorcinol*. Heat on a water-bath for 5 minutes. Allow to cool. Add 10 ml of *water* and 1 ml of *strong sodium hydroxide solution*. The solution becomes yellow or brownish-yellow and shows green fluorescence.

Tests

Appearance. The substance under examination is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity. Dissolve 20.0 g in 50 ml of *alcohol* previously neutralised to *phenolphthalein solution*. Add 0.2 ml of *phenolphthalein solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 60 mg of *naphthalene* in 20 ml of *methylene chloride*.

Test solution (a). Dissolve 1 g of the substance under examination in 20 ml of *methylene chloride*.

Test solution (b). Dissolve 1 g of the substance under examination in *methylene chloride*, add 2.0 ml of the internal standard solution and dilute to 20 ml with *methylene chloride*.

Reference solution. To 1 ml of test solution (a) add 10 ml of the internal standard solution and dilute to 100 ml with *methylene chloride*.

Chromatographic system
- a glass column 2.0 m x 2 mm, packed with silanised diatomaceous earth for gas chromatography (150 µm to 180 µm) impregnated with 3.0 per cent m/m of *polymethylphenylsiloxane*,
- temperature :
  column 150°,
  inlet port and detector at 225°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks corresponding to naphthalene and diethyl phthalate is at least 10.

Inject 1 µl of test solution (a). In the chromatogram obtained, verify that there is no peak with the same retention time as the internal standard.

Inject separately 1 µl of test solution (b) and the reference solution. Continue the chromatography for three times the retention time of diethyl phthalate. From the chromatogram obtained with the reference solution, calculate the ratio (*R*) of the area of the peak due to diethyl phthalate to the area of the peak due to the internal standard. From the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of all peaks, other than the principal peak and the peaks due to the internal standard and the solvent, to the area of the peak due to the internal standard; this ratio is not greater than *R* (1.0 per cent).

Water (2.3.43). Not more than 0.2 per cent, determined on 5.0 g.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 1.0 g.

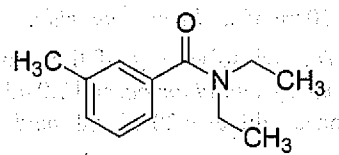
Assay. Dissolve 0.75 g in 25.0 ml of *0.5 M alcoholic potassium hydroxide* and add few glass beads. Boil on a water-bath under a reflux condenser for 1 hour. Add 1 ml of *phenolphthalein solution* and titrate immediately with *0.5 M hydrochloric acid*. Carry out a blank titration.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 0.05556 g of $C_{12}H_{14}O_4$.

Storage. Store protected from moisture.

Diethyltoluamide

Deet



$C_{12}H_{17}NO$ Mol. Wt. 191.3

Diethyltoluamide is *N,N*-diethyl-*3*-toluamide.

Diethyltoluamide contains not less than 95.0 per cent and not more than 103.0 per cent of $C_{12}H_{17}NO$, calculated on the anhydrous basis.

Category. Insect repellent.

Description. A colourless or faintly yellow liquid.

CAUTION — Diethyltoluamide is irritant to the eyes and mucous membranes.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diethyltoluamide IPRS*.

B. Heat 2 ml with 25 ml of a 50 per cent v/v solution of *hydrochloric acid* under a reflux condenser for 1 hour. Make the mixture alkaline with *sodium hydroxide solution*, cool and extract with three quantities, each of 30 ml, of *ether*. Reserve the aqueous layer. Evaporate the ether, dissolve the residue in 5 ml of *dilute hydrochloric acid*, cool to 5°, add 5 ml of *sodium nitrite solution* and allow to stand for 10 minutes at 5°. Add 10 ml of *water* and extract with two quantities, each of 20 ml, of *ether*. Evaporate the ether, add 1 g of *phenol* to the residue, cool and add 1 ml of *sulphuric acid*; an intense green colour is produced, which becomes red on pouring into *water* and green on making alkaline with *dilute sodium hydroxide solution*.

C. Acidify the aqueous layer reserved in test B with *dilute hydrochloric acid*, extract with two quantities, each of 20 ml, of *ether* and evaporate the ether from the combined extracts. The residue, after drying at 60°, melts at about 108° (2.4.21).

Tests

Weight per ml (2.4.29). 0.997g to 1.000 g, determined at 20°.

Refractive index (2.4.27). 1.520 to 1.524.

Acidity. A solution of 10.0 g dissolved in 50 ml of *ethanol (95 per cent)* previously neutralised to *phenolphthalein solution* requires not more than 4.0 ml of *0.01 M sodium hydroxide* to change the colour of the solution, using *phenolphthalein solution* as indicator.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

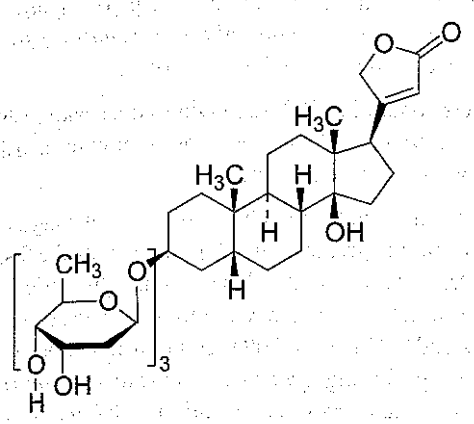
Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Weigh 0.3 g, add 7 ml of *nitrogen-free sulphuric acid* and carry out the determination of nitrogen (2.3.30), using *0.05 M sulphuric acid* as an absorbent solution or distill the liberated ammonia in 25 ml of *0.05 M sulphuric acid*.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.01913 g of $C_{12}H_{17}NO_5$.

Storage. Store protected from moisture in dry containers.

Digitoxin



$C_{41}H_{64}O_{13}$ Mol. Wt. 764.9

Digitoxin is 3β-[(*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-14β-hydroxy-5β-card-20(22)-enolide.

Digitoxin contains not less than 95.0 per cent and not more than 103.0 per cent of $C_{41}H_{64}O_{13}$, calculated on the dried basis.

Category. Cardiotonic.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry 2.4.6). Compare the spectrum with that obtained with *digitoxin IPRS* or with the reference spectrum of digitoxin.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Dissolve about 1 mg in 2 ml of *glacial acetic acid* with the aid of gentle heat, cool and add 0.05 ml of *ferric chloride test solution*. Cautiously add 1 ml of *sulphuric acid* under the two liquids without mixing; a brown ring develops at the interface which gradually becomes blue and a green colour, finally passes to the upper layer.

D. Suspend about 0.5 mg in 0.2 ml of *ethanol (60 per cent)* and add 0.1 ml *dinitrobenzoic acid solution* and 0.1 ml of *2 M sodium hydroxide*; a violet colour develops.

Tests

Appearance of solution. A 0.5 per cent w/v solution in a mixture of equal volumes of *chloroform* and *methanol* is clear (2.4.1), and colourless (2.4.1).

Specific optical rotation (2.4.22). +16.0° to +18.5°, determined at 20° in a 2.5 per cent w/v solution in *chloroform*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 40 volumes of *cyclohexane* and 15 volumes of *methanol*.

Solvent mixture. A mixture of equal volumes of *chloroform* and *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml with solvent mixture.

Reference solution (a). A 1.0 per cent w/v solution of *digitoxin IPRS* in the same solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the same solvent mixture.

Reference solution (c). A 0.02 per cent w/v solution of *gitoxin IPRS* in the same solvent mixture.

Reference solution (d). Dilute 5 ml of reference solution (b) to 10 ml with the same solvent mixture.

Reference solution (e). A solution containing 0.5 per cent w/v of *digitoxin IPRS* and 0.01 per cent w/v of *gitoxin IPRS* in the same solvent mixture.

Apply to the plate 5 µl of each solution and develop the chromatograms immediately after applying the solutions. After development, dry the plate in a current of cold air for 5 minutes. Repeat the development and again dry the plate in a current of cold air for 5 minutes. Spray with *ethanolic sulphuric acid (10 per cent)* and heat at 130° for 15 minutes. Examine the chromatograms in daylight. Any spot in the chromatogram obtained with the test solution corresponding to gitoxin is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b). The test is not valid unless the chromatogram obtained with reference solution (e) shows clearly separated spots corresponds to digitoxin and gitoxin and the spot in the chromatogram obtained with reference solution (d) is clearly visible.

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on the residue obtained from the test for Loss on drying.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 0.5 g by drying in an oven at 105° for 2 hours.

Assay. Dissolve 40 mg in sufficient *ethanol (95 per cent)* to produce 50.0 ml and dilute 5.0 ml of the solution to 100.0 ml with the same solvent. To 5.0 ml of the solution add 3.0 ml of *alkaline picric acid solution*, allow to stand in subdued light for 30 minutes and measure the absorbance of the resulting solution at the maximum at 495 nm (2.4.7), using as the blank a mixture of 5.0 ml of *ethanol (95 per cent)* and 3.0 ml of *alkaline picric acid solution*. Calculate the content of $C_{41}H_{64}O_{13}$ from the absorbance obtained by repeating the operation using *digitoxin IPRS* in place of the substance under examination.

Storage. Store protected from moisture and light in a refrigerator (2° to 8°).

Digitoxin Tablets

Digitoxin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of digitoxin, $C_{41}H_{64}O_{13}$.

Usual strengths. 100 µg; 200 µg.

Identification

To a quantity of the powdered tablets containing 250 µg of Digitoxin add 1 ml of *glacial acetic acid* containing 0.01 per cent w/v of *ferric chloride*, shake for a few minutes, filter through sintered-glass and add cautiously 1 ml of *sulphuric acid* to the filtrate without mixing; a brown ring free from red colour is produced at the interface which gradually becomes blue and finally the upper layer acquires an indigo colour.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 600 ml of freshly distilled *water*,
Speed and time. 120 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 0.8 µm, rejecting the first 1 ml of the filtrate. Transfer 1.0 ml to a 10-ml volumetric flask, add 3.0 ml of a 0.1 per cent w/v solution of *L-ascorbic acid* in *methanol* and 0.2 ml of a 0.009M solution of hydrogen peroxide [prepared by accurately diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with *0.02 M potassium permanganate*], mix and dilute to volume with *hydrochloric acid*. After exactly 30 minutes measure the fluorescence of the solution (2.4.5), using an excitation wavelength of about 400 nm and an emission wavelength of about 570 nm and setting the spectrophotofluorimeter to zero with *water* and to 100 with a solution of suitable concentration of *digitoxin IPRS* prepared at the same time and treated in the same manner as the test solution.

Q. Not less than 75 per cent of the stated amount of digitoxin, $C_{41}H_{64}O_{13}$.

Uniformity of content. Complies with test stated under Tablets.

Test solution. For tablets containing 100 µg of Digitoxin, shake 1 tablet with 15 ml of *methanol (50 per cent)* for 30 minutes and dilute to 25.0 ml with the same solvent.

For tablets containing 200 µg of Digitoxin, shake 1 tablet with 30 ml of *methanol (50 per cent)* for 30 minutes and dilute to 50.0 ml with the same solvent.

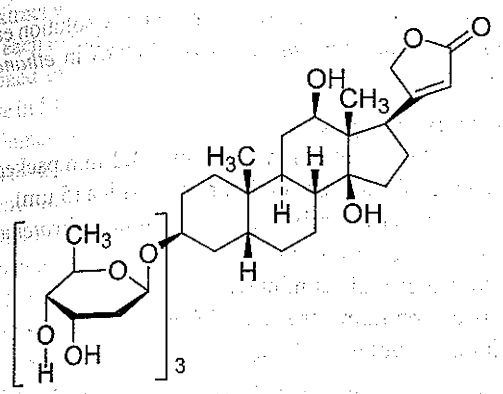
Filter through a suitable membrane filter disc having an average pore diameter not greater than 0.8 µm, rejecting the first few ml of the filtrate. Transfer 1.0 ml to a 10-ml volumetric flask, add 3.0 ml of a 0.1 per cent w/v solution of *L-ascorbic acid* in *methanol* and 0.2 ml of a 0.009M solution of hydrogen peroxide [prepared by diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with *0.02 M potassium permanganate*], mix and dilute to volume with *hydrochloric acid*. After exactly 30 minutes measure the fluorescence of the solution (2.4.5), using an excitation wavelength of about 400 nm and an emission wavelength of about 570 nm and setting the spectrophotofluorimeter to zero with *water*. Calculate the content of digitoxin, $C_{41}H_{64}O_{13}$, from the *fluorescence* obtained by carrying out the operation described above at the same time using a 0.0004 per cent w/v solution of *digitoxin IPRS* in *methanol (50 per cent)* and beginning at the words "Transfer 1.0 ml to a 10-ml volumetric flask....".

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 1.25 mg of Digitoxin, add 3.0 ml of *water*, swirl to disperse the powder and allow to stand for 10 minutes, swirling occasionally. Add 25.0 ml of *glacial acetic acid*, shake for 1 hour and filter, discarding the first few ml of the filtrate. To 4.0 ml of the filtrate add 1.0 ml of *dimethyl sulphoxide, dilute* to 25.0 ml with *xanthydrol reagent*, mix well and allow to stand in the dark for 4 ½ hours (solution A). At the same time prepare two further solutions in the same manner but using for solution B 4.0 ml of *digitoxin standard solution* and for solution C 4.0 ml of a mixture of 25 volumes of *glacial acetic acid* and 3 volumes of *water* and beginning at the words "add 1.0 ml of *dimethyl sulphoxide*.....". Measure the absorbances of solutions A and B at the maximum at 550 nm (2.4.7), using solution C as the blank. Calculate the content of $C_{41}H_{64}O_{13}$ from the absorbances obtained.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Digoxin



$C_{41}H_{64}O_{14}$ Mol. Wt. 780.9

Digoxin is 3β-[(*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1128W1Ä4)-2, 6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12b,1428β-dihydroxy-5β-card-20(22)-enolide.

Digoxin contains not less than 95.0 per cent and not more than 103.0 per cent of $C_{41}H_{64}O_{14}$, calculated on the dried basis.

Category. Cardiotonic.

Description. Colourless crystals or a white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *digoxin IPRS* or with the reference spectrum of digoxin.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve about 1 mg in 2 ml of *glacial acetic acid* with the aid of gentle heat, cool and add 0.05 ml of *ferric chloride test solution*. Cautiously add 1 ml of *sulphuric acid* under the two liquids without mixing; a brown ring develops at the interface which gradually becomes blue and a green colour, finally passes to the upper layer.

D. Suspend about 0.5 mg in 0.2 ml of *ethanol (60 per cent)* and add 0.1 ml *dinitrobenzoic acid solution* and 0.1 ml of *2 M sodium hydroxide*; a violet colour develops.

Tests

Appearance of solution. A 0.5 per cent w/v solution in a mixture of equal volumes of *dichloromethane* and *methanol* is clear (2.4.1), and colourless (2.4.1).

Specific optical rotation (2.4.22). +10.0° to +13.0°, determined in a 2.0 per cent w/v solution in *anhydrous pyridine*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in the *methanol* and dilute to 100.0 ml with the *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *digoxin IPRS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*.

Reference solution (c). A 0.0001 per cent w/v solution of *digoxin impurity C IPRS* in *methanol*.

Reference solution (d). A 0.05 per cent w/v solution of *digoxin impurity H IPRS* in *methanol*. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 20.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile* and 90 volumes of *water*,
  B. a mixture of 10 volumes of *water* and 90 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	78	22
5	78	22
15	30	70
18	78	22

Name	Relative retention time

[4]neodigoxin,

[5]unknown strucuture,

[6]digoxigenin tetrakisdigitoxoside,

[7]gitoxin,

[8]digitoxin,

[9]lanatoside C.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to digoxin impurity H and digoxin is not less than 1.5.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to digoxin impurity F is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent), the area of peak corresponding to digoxin impurity C is not more than 5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of peak corresponding to digoxin impurities E and K is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of peak corresponding to digoxin impurity G is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent), the area of peak corresponding to digoxin impurities A and B is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of peak corresponding to digoxin impurity L is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks other than digoxin impurities A, B, C, E, F, G, K and L is not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent) and the sum of areas of all the secondary peaks is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on the residue obtained from the test for Loss on drying.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying over *phosphorus pentoxide* at a pressure not exceeding 2.7 kPa.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 200.0 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.025 per cent w/v solution of *digoxin IPRS* in *ethanol (95 per cent)*.

Reference solution (b). A 0.004 per cent w/v solution each of *digoxin IPRS* and *digoxin impurity C IPRS* in *ethanol (95 per cent)*.

Chromatographic system

- a stainless steel column 25 cm x 4.2 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 37 volumes of *water* and 13 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 218 nm,
- injection volume: 10 µl.

Inject reference solution (b). The resolution between the peaks due to digoxin and digoxin impurity C is not less than 4.0.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 1200 theoretical plates and tailing factor for the principal peak is not more than 2.0 and the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{41}H_{64}O_{14}$.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Digoxin Injection

Digoxin Injection is a sterile solution of Digoxin in Water for Injections and Ethanol or other suitable solvents.

Digoxin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of digoxin, $C_{41}H_{64}O_{14}$.

Usual strength. 250 µg per ml.

Identification

Evaporate 2 ml to dryness, dissolve the residue in 1 ml of *glacial acetic acid* containing 0.01 per cent w/v of *ferric chloride* and cautiously add 1 ml of *sulphuric acid* without mixing; a brown ring develops at the interface which gradually becomes blue and finally the upper layer acquires a blue colour.

Tests

pH (2.4.24). 6.7 to 7.3.

Bacterial endotoxins (2.2.3). Not more than 200.0 Endotoxin Units per mg of digoxin.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer 20.0 ml, measured, to a separating funnel containing 10 ml of *water*. Make alkaline with *5 M ammonia* and extract with four quantities, each of 25 ml, of *chloroform*. Wash each extract with the same 10 ml of *water*. Evaporate the combined extracts to dryness on a water-bath, dissolve the residue in 5.0 ml of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol* and add 20.0 ml of *glacial acetic acid* (solution A). To 5.0 ml of a 0.2 per cent w/v solution of *digoxin IPRS* in *glacial acetic acid* add 10.0 ml of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol* and sufficient *glacial acetic acid* to produce 50.0 ml (solution B). Dilute 5.0 ml of solution A to 25.0 ml with *digoxin reagent*, mix, allow to stand for 1 hour and measure the absorbance of the resulting solution at 590 nm, using *water* as the blank (2.4.7). Calculate the content of $C_{41}H_{64}O_{14}$ from the absorbance obtained by treating 5.0 ml of solution B at the same time and in the same manner.

Storage. Store protected from light in single dose containers.

Digoxin Paediatric Solution

Paediatric Digoxin Elixir

Digoxin Paediatric Solution is a solution of Digoxin in a suitable flavoured vehicle.

Digoxin Paediatric Solution contains not less than 90.0 per cent and not more than 110.0 per cent w/v of the stated amount of digoxin, $C_{41}H_{64}O_{14}$.

Usual strength. 50 µg per ml.

Identification

Digoxin Paediatric Solution should not be diluted before use and should be measured with a pipette.

Extract a quantity of the solution containing 250 µg of Digoxin with four quantities, each of 20 ml, of *chloroform*, washing each extract with the same 10 ml of *water*, evaporate the combined extracts to dryness and dissolve the residue in 1 ml of *glacial acetic acid* containing 0.01 per cent w/v of *ferric chloride*. Add cautiously 1 ml of *sulphuric acid* without mixing; a brown ring develops at the interface which gradually becomes blue and finally the upper layer acquires a blue colour.

Tests

pH (2.4.24). 6.8 to 7.2.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Extract a measured volume containing about 5 mg of Digoxin with four quantities, each of 25 ml, of *chloroform*, washing each extract with the same 5 ml of *water*, and evaporate the combined extracts to dryness. To the residue add 3 ml of *ethanol* and carefully evaporate to dryness on a water-bath with the aid of a gentle current of air. Repeat the evaporation using a further 3 ml of *ethanol* and cool. Dissolve the residue in 5.0 ml of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol*, add 20.0 ml of *glacial acetic acid* and filter if necessary. Dilute 5.0 ml of the filtrate to 25.0 ml with digoxin reagent, allow to stand for 1 hour and measure the absorbance of the resulting solution at the maximum at 590 nm (2.4.7). Calculate the content of $C_{41}H_{64}O_{14}$ from the absorbance obtained by carrying out the operation described above at the same time but using a solution prepared by mixing 5.0 ml of a 0.2 per cent w/v solution of *digoxin IPRS* in *glacial acetic acid* with 10.0 ml of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol* and adding sufficient *glacial acetic acid* to produce 50.0 ml beginning at the words "Dilute 5.0 ml of the filtrate....." and using *water* as the blank.

Storage. Store protected from light at a temperature not exceeding 30°.

Digoxin Tablets

Digoxin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of digoxin, $C_{41}H_{64}O_{14}$.

Usual strengths. 62.5 µg; 125 µg; 250 µg.

Identification

To a quantity of the powdered tablets containing 250 µg of Digoxin add 1 ml of *glacial acetic acid* containing 0.01 per cent w/v of *ferric chloride*, shake for a few minutes, filter through sintered-glass and add cautiously 1 ml of *sulphuric acid* to the filtrate without mixing; a brown ring free from red colour is produced at the interface which gradually becomes blue and finally the upper layer acquires an indigo colour.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 600 ml of freshly distilled *water*,
Speed and time. 120 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 0.8 µm, rejecting the first 1 ml of the filtrate. Transfer 1.0 ml to a 10-ml volumetric flask, add 3.0 ml of a 0.1 per cent w/v solution of *L-ascorbic acid* in *methanol* and 0.2 ml of a 0.009M solution of hydrogen peroxide (prepared by diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with *0.02 M potassium*

permanganate), mix and dilute to volume with *hydrochloric acid*. After exactly 2 hours measure the fluorescence of the solution (2.4.5), using an excitation wavelength of about 360 nm and an emission wavelength of 490 nm and setting the spectrophotofluorimeter to zero with *water* and to 100 with a solution prepared at the same time as the test solution in the following manner. Dilute 2.5 ml of a 0.1 per cent w/v solution of *digoxin IPRS* in *ethanol (80 per cent)* to 100.0 ml with *water*, dilute the resulting solution further with *water* to produce a solution containing in 1 ml an amount of digoxin equal to one-hundredth of the strength of the tablets under examination, transfer 1.0 ml of the solution to a 10-ml volumetric flask and carry out the operation described above, beginning at the words "add 3.0 ml....".

Q. Not less than 75 per cent of the stated amount of digoxin, $C_{41}H_{64}O_{14}$.

Uniformity of content. Complies with the test stated under Tablets.

Test solution. For tablets containing 250 µg of Digoxin, place 1 tablet with 10 ml of *water* at 37°, agitate to disintegrate, add 56 ml of *ethanol (95 per cent)*, shake for 60 minutes and add sufficient *ethanol (80 per cent)* to produce 100.0 ml.

For tablets containing 125 µg and 62.5 µg of Digoxin, repeat the above procedure by using proportionately smaller quantities of *water*, *ethanol (95 per cent)* and *ethanol (80 per cent)*.

Filter through a suitable membrane filter disc having an average pore diameter not greater than 0.8 µm, rejecting the first few ml of the filtrate. Transfer 1.0 ml to a 10-ml volumetric flask, add 3.0 ml of a 0.1 per cent w/v solution of *L-ascorbic acid* in *methanol* and 0.2 ml of a 0.009M solution of hydrogen peroxide [prepared by diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with *0.02 M potassium permanganate*], mix and dilute to volume with *hydrochloric acid*. After exactly 2 hours measure the fluorescence of the solution (2.4.5), using an excitation wavelength of about 360 nm and an emission wavelength of about 490 nm and setting the spectrophotofluorimeter to zero with *water*. Calculate the content of digoxin, $C_{41}H_{64}O_{14}$, from the fluorescence obtained by carrying out the operation described above at the same time using a 0.00025 per cent w/v solution of *digoxin IPRS* in *ethanol (80 per cent)* and beginning at the words "Transfer 1.0 ml to a 10-ml volumetric flask...."

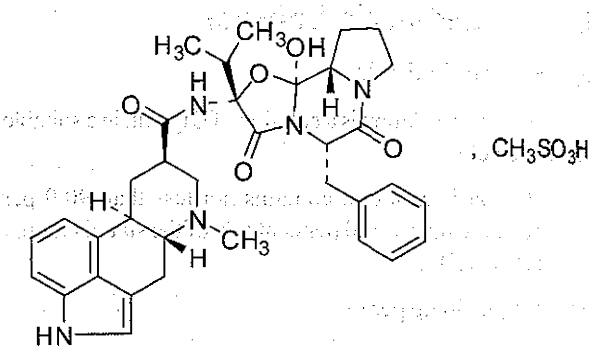
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 1.25 mg of Digoxin, add 3.0 ml of *water*, swirl to disperse the powder and allow to stand for 10 minutes, swirling occasionally. Add 25.0 ml of *glacial acetic acid*, shake for 1 hour and filter, discarding the first few ml of the filtrate. To 4.0 ml of the filtrate add 1.0 ml of *dimethyl sulphoxide*, *dilute* to 25.0 ml with *xanthydrol reagent*, mix well and allow to stand in the dark for 4½ hours (solution A). At the same time prepare two further solutions in the same manner but using for solution B 4.0 ml of *digoxin standard solution* and for solution C 4.0 ml of a mixture of 25 volumes of *glacial acetic acid* and 3 volumes of *water* and beginning at the words "add 1.0 ml of *dimethyl sulphoxide*.....". Measure the absorbances of solutions A and B at the maximum at 545 nm (2.4.7), using solution C as the blank. Calculate the content of $C_{41}H_{64}O_{14}$ from the absorbances obtained.

Storage. Store protected from light.

Dihydroergocristine Mesylate

Dihydroergocristine Mesilate



$C_{36}H_{45}N_5O_8S$ Mol. Wt. 708

Dihydroergocristine Mesylate is (5′α)-12′-hydroxy-2′-(1-methylethyl)-5′-(phenylmethyl)dihyroergotaman-3′,6′,18-trione methanesulphonate.

Dihydroergocristine Mesylate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{36}H_{45}N_5O_8S$, calculated on the dried basis.

Category. Antimigraine.

Production

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

Description. A white or almost white, fine crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dihydroergocristine mesylate IPRS* or with the reference spectrum of dihydroergocristine mesylate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Mobile phase. A mixture of 2 volumes of *ammonia*, 15 volumes of *dimethylformamide* and 85 volumes of *ether*.

Test solution. Dissolve 0.1 g of the substance under examination in 5 ml of the same solvent mixture.

Reference solution. A 2.0 per cent w/v solution of *dihydroergocristine mesylate IPRS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 8 cm, protected from light. Dry the plate in current of cold air for 5 minutes. Spray with *dimethylaminobenzaldehyde solution* and dry in a current of hot air for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Mobile phase. A mixture of 5 volumes of *water*, 10 volumes of *ammonia*, 20 volumes of *butanol* and 65 volumes of *acetone*.

Test solution. Dissolve 0.2 g of the substance under examination in 5 ml of the solvent mixture.

Reference solution. A 0.4 per cent w/v solution of *methanesulphonic acid* in the solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm, protected from light. Dry the plate in current of cold air for not more than 1 minute. Spray with a 0.1 per cent w/v solution of *bromocresol purple* in *methanol*, adjusting the colour to violet-red with one drop of *dilute ammonia solution* and dry the plate in a current of hot air at 100°. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BS7 (2.4.1).

pH (2.4.24). 4.0 to 5.0, determined in a 0.5 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). −43.0° to −37.0°, determined in a 1.0 per cent w/v solution in *anhydrous pyridine*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light.

Solvent mixture. 50 volumes of *acetonitrile* and 50 volumes of 0.1 per cent w/v solution of *orthophosphoric acid*.

Test solution. Dissolve 75 mg of the substance under examination in solvent mixture and dilute to 50.0 ml with *water*.

Reference solution. Dissolve 20 mg of *codergocrine mesilate IPRS* in solvent mixture and dilute to 50.0 ml with *water*. Dilute 6.0 ml of the solution to 50.0 ml with a mixture of 20 volumes of *acetonitrile*, 20 volumes of 0.1 per cent w/v solution of *orthophosphoric acid* and 60 volumes of *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 10 volumes of *acetonitrile*, 90 volumes of *water* and 1 volume of *triethylamine*,
  B. a mixture of 10 volumes of *water*, 90 volumes of *acetonitrile* and 1 volume of *triethylamine*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
5	75	25
20	25	75
22	75	25
30	75	25

Inject the reference solution. The relative retention time with reference to dihydroergocristine for dihydroergocornine (dihydroergocristine impurity F) is about 0.8; for α-dihydroergocryptine (dihydroergocristine impurity H) is about 0.9; for α-dihydroergocryptine or epicriptine (dihydroergocristine impurity I) is about 1.02. In the chromatogram shows 4 peaks, the resolution between the peaks corresponding to dihydroergocristine and dihydroergocristine impurity I is not less than 1.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent), the sum of the areas of all the secondary peaks

is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent).

Loss on drying (2.4.19). Not more than 3 per cent, determined on 0.5 g by drying under vacuum, in an oven at 80°.

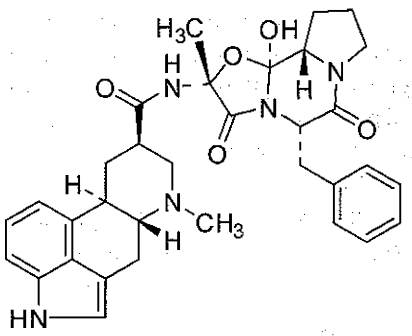
Assay. Dissolve 0.3 g in 60 ml of *pyridine*. Pass a stream of nitrogen over the surface of the solution. Titrate with *0.1 M tetrabutylammonium hydroxide* to the second point of inflexion, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03539 g of $C_{36}H_{45}N_5O_8S$.

Storage. Store protected from light.

Dihydroergotamine Mesylate

Dihydroergotamine Mesilate



, CH_3SO_3H

$C_{33}H_{37}N_5O_5,CH_4SO_3$ Mol. Wt. 680.0

Dihydroergotamine Mesylate is (5′α)-12′-hydroxy-2′-methyl-5′-(phenylmethyl)dihyroergotaman-3′,6′,18-trione methanesulphonate.

Dihydroergotamine Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{33}H_{37}N_5O_5,CH_4SO_3$, calculated on the dried basis.

Category. Antimigraine.

Production

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

Description. A white or almost white, crystalline powder or crystals.

Identification

Tests A and C may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dihydroergotamine mesylate IPRS* or with the reference spectrum of dihydroergotamine mesylate.

B. When examined in the range 250 nm to 350 nm (2.4.7), a 0.005 per cent w/v solution in *methanol*, shows absorption maxima, at about 281 nm and 291 nm and a shoulder at 275 nm; specific absorbance at about 281 nm is 95 to 105.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to the principal spot in the chromatogram obtained with reference solution (a).

D. To 0.1 g of the substance under examination, add 5 ml of *dilute hydrochloric acid*, shake for about 5 minutes and filter. Add 1 ml of *barium chloride solution*. The filtrate remains clear. Mix 0.1 g of the substance under examination with 0.4 g of powdered *sodium hydroxide*, heat to fusion and continue to heat for 1 minute. Cool, add 5 ml of *water*, boil and filter. Acidify the filtrate with *hydrochloric acid* and filter again. The filtrate gives reaction (A) of sulphates (2.3.1).

Tests

Appearance of solution. Dissolve 0.1 g in a mixture of 0.1 ml of a 7.0 per cent w/v solution of *methanesulphonic acid* and 50 ml of *water*. The solution is clear (2.4.1) and not more intensely coloured than reference solution YS7 or BYS7 (2.4.1).

pH (2.4.24). 4.4 to 5.4, determined on 0.1 per cent w/v solution in *carbon dioxide- free water*.

Specific optical rotation (2.4.22). −47.0° to −42.0°, determined in a 1.0 per cent w/v solution in *anhydrous pyridine*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Mobile phase. A mixture of 1 volume of *ammonia*, 6 volumes of *methanol*, 50 volumes of *ethyl acetate* and 50 volumes of *dichloromethane*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 5 ml of the solvent mixture.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *dihydroergotamine mesilate IPRS* in the solvent mixture.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 5.0 ml with the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm, protected from light. Dry the plate in current of cold air for not more than 1 minute and repeat the development, allow the freshly prepared mobile phase to rise 15 cm. Spray abundantly with *dimethylaminobenzaldehyde solution* and dry in a current of hot air for about 2 minutes. In the chromatogram obtained with test solution (a), any secondary spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than 2 such spots are more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 0.5 g by drying in an oven at 105° at a pressure not exceeding 0.1 kPa for 5 hours.

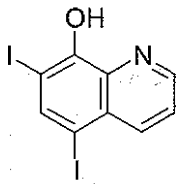
Assay. Dissolve 0.5 g in a mixture of 10 ml of *anhydrous acetic acid* and 70 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid is* equivalent to 0.068 g of $C_{34}H_{41}N_5O_8S$.

Storage. Store protected from light.

Diiodohydroxyquinoline

Iodoquinol



$C_9H_5I_2NO$ Mol. Wt. 396.9

Diiodohydroxyquinoline is 5,7-diiodoquinolin-8-ol.

Diiodohydroxyquinoline contains not less than 97.0 per cent and not more than 100.5 per cent of $C_9H_5I_2NO$, calculated on the dried basis.

Category. Antiamoebic.

Description. A light yellowish to yellowish-brown, microcrystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diiodohydroxyquinoline IPRS* or with the reference spectrum of diiodohydroxyquinoline.

B. Dissolve 10 mg in 100 ml of *dioxan* and dilute 5 ml to 100 ml with *ethanol*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 258 nm; absorbance at about 258 nm, about 0.53.

C. Heat a few crystals with about 1 ml of *sulphuric acid;* violet vapours of iodine are evolved.

Tests

Acidity or alkalinity. Shake 0.5 g with 10 ml of *water* previously neutralised to *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Free iodine and iodide. Shake 1.0 g with 20 ml of *water* for 30 seconds, allow to stand for 5 minutes and filter. To 10 ml of the filtrate add 1 ml of *1 M sulphuric acid* and 2 ml of *chloroform* and shake; the chloroform layer does not become violet. To the mixture add 5 ml of *1 M sulphuric acid* and 1 ml of *potassium dichromate solution* and shake for 15 seconds; the colour of the chloroform layer does not become more intense than that produced by diluting 2 ml of a 0.016 per cent w/v solution of *potassium iodide* to 10 ml with *water*, adding 6 ml of *1 M sulphuric acid*, 1 ml of *potassium dichromate solution* and 2 ml of *chloroform* and shaking for 15 seconds.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Add 0.5 ml of *N,O-bis (trimethylsilyl)acetamide* to 0.5 ml of a solution in *pyridine* containing 0.4 per cent w/v of each of *5-chloro-8-hydroxyquinoline, 5,7-dichloro-8-hydroxy-quinoline* and *5-chloro-7-iodo-8-hydroxy-quinoline* and 0.04 per cent w/v of the substance under examination, mix, allow to stand for 15 minutes and add 5 ml of a 0.05 per cent w/v solution of *dibutylphthalate* (internal standard) in *hexane*.

Reference solution (a). Add 0.5 ml of *N,O-bis (trimethylsilyl) acetamide* to a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine,* mix, allow to stand for 15 minutes and add 5 ml of *hexane*.

Reference solution (b). Treat a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine* as described for the test solution.

Chromatographic system
- a glass column 1.5 m x 4 mm, packed with silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of methyl silicone gum,
- temperature:
  column 190°,
  inlet port and detector 240°,
- flame ionisation detector,
- nitrogen as the carrier gas.

In the chromatogram obtained with the test solution the peaks following the solvent peak, in order of emergence, are due to (a) 5-chloro-8-hydroxyquinoline, (b) 5,7-dichloro-8-hydroxyquinoline, (c) the internal standard, (d) 5-chloro-7-iodo-8-hydroxyquinoline and (e) diiodohydroxyquinoline. In the chromatogram obtained with reference solution (b) calculate the content of 5-chloro-8-hydroxy-quinoline, 5,7-dichloro-8-hydroxyquinoline and 5-chloro-7-iodo-8-hydroxyquinoline by reference to the corresponding peaks in the chromatogram obtained with the test solution. The total content of the named impurities and any other impurities does not exceed 4.0 per cent w/w.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03969 g of $C_9H_5I_2NO$.

Storage. Store protected from light.

Diiodohydroxyquinoline Tablets

Iodoquinol Tablets

Diiodohydroxyquinoline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diiodohydroxyquinoline, $C_9H_5I_2NO$.

Usual strengths. 300 mg; 600 mg.

Identification

A. Triturate a quantity of the powdered tablets containing about 50 mg of Diiodohydroxyquinoline with 10 ml of *carbon disulphide*, filter and evaporate the solvent. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diiodohydroxyquinoline IPRS* or with the reference spectrum of diiodohydroxyquinoline.

B. Shake a quantity of the powdered tablets containing about 10 mg of Diiodohydroxyquinoline with 100 ml of *dioxan*, filter and dilute 5 ml of the filtrate to 100 ml with *ethanol*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 258 nm; absorbance at about 258 nm, about 0.53 (2.4.7).

Tests

Soluble iodides. Digest a quantity of the powdered tablets containing 0.1 g of Diiodohydroxyquinoline with 5 ml of *water* for 10 minutes, cool and filter. To the filtrate add 1 ml of *3 M hydrochloric acid*, 0.1 ml of *ferric chloride test solution* and 2 ml of *chloroform*, shake gently and allow to separate; any violet colour in the chloroform is not more intense than that in a blank to which 1 ml of a 0.02 per cent w/v solution of *potassium iodide* has been added.

Disintegration (2.5.1). Not more than 30 minutes.

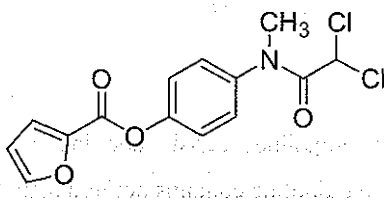
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 12 mg of Diiodohydroxyquinoline and determine by the oxygen-flask method (2.3.34), using a mixture of 10 ml of *water* and 2 ml of *1 M sodium hydroxide* as the absorbing liquid. When the process is complete, add to the flask an excess (5 ml to 10 ml) of *acetic bromine solution* and allow to stand for 2 minutes. Remove the excess of bromine by the addition of *formic acid* (about 0.5 ml to 1 ml). Rinse the sides of the flask with *water* and sweep out any bromine vapour above the liquid with a current of air. Add 1 g of *potassium iodide* and titrate with *0.02 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as the indicator.

1 ml of *0.02 M sodium thiosulphate* is equivalent to 0.0006616 g of $C_9H_5I_2NO$.

Storage. Store protected from light.

Diloxanide Furoate



$C_{14}H_{11}Cl_2NO_4$ Mol. Wt. 328.2

Diloxanide Furoate is 4-(*N*-methyl-2,2-dichloroacetamido) phenyl 2-furoate.

Diloxanide Furoate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_{11}Cl_2NO_4$, calculated on the dried basis.

Category. Antiamoebic.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diloxanide furoate IPRS* or with the reference spectrum of diloxanide furoate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 258 nm; absorbance at about 258 nm, about 0.70.

C. On 20 mg determine by the oxygen-flask method (2.3.34), using 10 ml of *1 M sodium hydroxide* as the absorbing liquid. When the process is complete, acidify the liquid with *nitric acid* and add *silver nitrate solution*; a white precipitate is produced.

Tests

Free acidity. Shake 3.0 g with 50 ml of *water*, filter and wash the residue with three quantities, each of 20 ml, of *water*. Titrate the combined filtrate and washings with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator; not more than 1.3 ml is required.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 96 volumes of *dichloromethane* and 4 volumes of *methanol*.

Test solution. Dissolve 0.5 g of the substance under examination in 5 ml of *chloroform*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform* and mix. Dilute 5.0 ml of the resulting solution to 20.0 ml with *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03282 g of $C_{14}H_{11}Cl_2NO_4$.

Storage. Store protected from light.

Diloxanide Tablets

Diloxanide Furoate Tablets

Diloxanide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of diloxanide furoate, $C_{14}H_{11}Cl_2NO_4$.

Usual strength. 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.2 g of Diloxanide Furoate with 20 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diloxanide furoate IPRS* or with the reference spectrum of diloxanide furoate.

B. On 20 mg of the residue obtained in test A determine by the oxygen-flask method (2.3.34), using 10 ml of *1 M sodium hydroxide* as the absorbing liquid. When the process is complete, acidify the liquid with *nitric acid* and add *silver nitrate solution*; a white precipitate is produced.

C. The residue obtained in test A melts at 114° to 116° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 96 volumes of *dichloromethane* and 4 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets containing 0.5 g of Diloxanide Furoate with 5 ml of *chloroform*, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform* and mix. Dilute 5.0 ml of the resulting solution to 20.0 ml with *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

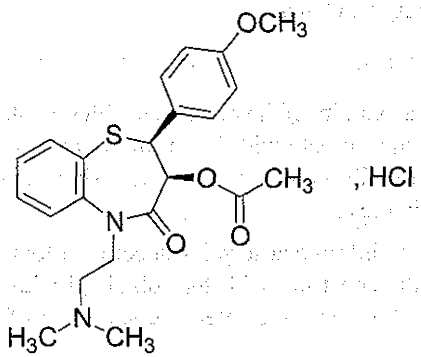
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 40 mg of Diloxanide Furoate, shake with 150 ml of *ethanol (95 per cent)* for 30 minutes, add

sufficient *ethanol (95 per cent)* to produce 200.0 ml, mix and filter. Dilute 10.0 ml of the filtrate to 250.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{14}H_{11}Cl_2NO_4$ taking 705 as the specific absorbance at 258 nm.

Storage. Store protected from light.

Diltiazem Hydrochloride



$C_{22}H_{26}N_2O_4S,HCl$ Mol. Wt. 451.0

Diltiazem Hydrochloride is (*2S,3S*)-2,3,4,5-tetrahydro-5-(2-dimethylaminoethyl)-2-(4-methoxyphenyl)-4-oxobenzo[*b*] thiazepin-3-yl acetate hydrochloride.

Diltiazem Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{22}H_{26}N_2O_4S,HCl$, calculated on the dried basis.

Category. Antianginal; (calcium-channel blocker).

Description. A white, crystalline powder or small crystals.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diltiazem hydrochloride IPRS* or with the reference spectrum of diltiazem hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). +110.0° to +116.0°, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.12 g of the substance under examination in *methanol* and dilute 100.0 ml with *methanol*.

Reference solution (a). A 0.12 per cent w/v solution of *diltiazem hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.0012 per cent w/v each of *diltiazem hydrochloride IPRS* and *desacetyl diltiazem hydrochloride IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution containing 0.116 per cent w/v of *d-10-camphorsulphonic acid* in *0.1 M sodium acetate*, adjusted to pH 6.2 with *0.1 M sodium hydroxide*, 25 volumes of *acetonitrile* and 25 volumes of *methanol*,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

The relative retention time with reference to diltiazem for desacetyl diltiazem is about 0.65.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to desacetyl diltiazem and diltiazem is not less than 3, the column efficiency is not less than 1200 theoretical plates and the relative standard deviation for replicate injections is not more than 10.0 per cent for diltiazem peak.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to desacetyl diltiazem is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals. Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances using the following modifications.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{22}H_{26}N_2O_4S,HCl$.

Storage. Store protected from light.

Diltiazem Injection

Diltiazem Hydrochloride Injection

Diltiazem Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diltiazem hydrochloride, $C_{22}H_{26}N_2O_4S$, HCl.

Usual strength. 25 mg per 5 ml; 50 mg per 5 ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.7 to 4.2.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing 0.12 g of Diltiazem hydrochloride to 100.0 ml with *methanol.*

Reference solution. A solution containing 0.0012 per cent w/v each of *diltiazem hydrochloride IPRS* and *desacetyl diltiazem hydrochloride IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution containing 0.116 per cent w/v of *d-10-camphorsulphonic acid* in *0.1 M sodium acetate*, adjusted to pH 6.2 with *0.1 M sodium hydroxide*, 25 volumes of *acetonitrile* and 25 volumes of *methanol,*
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

The relative retention time with reference to diltiazem for desacetyl diltiazem is about 0.65.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to desacetyl diltiazem and diltiazem is not less than 3, the column efficiency is not less than 1200 theoretical plates and the relative standard deviation for replicate injections is not more than 10.0 per cent for diltiazem peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to desacetyl diltiazem is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 1.4 Endotoxin Units per mg of diltiazem hydrochloride.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 50 mg of Diltiazem Hydrochloride to 50.0 ml with *methanol.* Dilute 5.0 ml of the solution to 50.0 ml with *methanol.*

Reference solution. A 0.01 per cent w/v solution of *diltiazem hydrochloride IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 30 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a 0.005 per cent w/v solution of *heptane sulphonic acid* in a mixture of 35 volumes of *acetonitrile*, 5 volumes of *methanol* and 60 volumes of 0.46 per cent w/v of *ammonium acetate*, adjusted to pH 6.0 with *glacial acetic acid,*
- spectrophotometer set at 240 nm,
- flow rate: 1.6 ml per minute,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{26}N_2O_4S$, HCl in the injection.

Storage. Store under refrigeration between 2° to 8°. Do not allow to freeze.

Labelling. Label as for direct intravenous bolus injection and continuous intravenous infusion. Single use container, discard unused portion.

Diltiazem Tablets

Diltiazem Hydrochloride Tablets

Diltiazem Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diltiazem hydrochloride, $C_{22}H_{26}N_2O_4S$, HCl. They may be Modified-release Tablets.

Usual strengths. 30 mg; 60 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to diltiazem hydrochloride in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2).

A. *For Modified-release Tablets*

Apparatus No. 2 (Paddle),

Medium. 900 ml of freshly distilled *water,*

Speed and time. 100 rpm and 30 minutes and 3 hours.

Withdraw a suitable volume of the medium after 30 minutes and 3 hours. Filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute a suitable volume of the filtrate with the same solvent and measure the absorbance of the resulting solution at the maximum at 240 nm (2.4.7). Calculate the content of $C_{22}H_{26}N_2O_4S$,HCl from the absorbance obtained from a solution of known concentration of *diltiazem hydrochloride IPRS*.

Use the following acceptance criteria for the 30-minute time interval. At S_1: no unit is more than Q; at S_2, the average value is equal to or less than Q, and no unit is greater than Q + 10 per cent; at S_3, the average value is equal to or less than Q, not more than 2 units are more than Q + 10 per cent and no unit is more than Q + 25 per cent. Use the acceptance criteria in Acceptance Table 1(2.5.2) for the 3-hour time interval.

Q. Not more than 60 per cent of the stated amount of $C_{22}H_{26}N_2O_4S$,HCl is dissolved in 30 minutes and not less than 80 per cent is dissolved in 3 hours.

B. *For Conventional-release Tablets*

Apparatus No. 2 (Paddle),

Medium. 900 ml of freshly distilled *water,*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium. Filter promptly, rejecting the first few ml of the filtrate. Dilute a suitable volume of the filtrate with the same solvent and measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{22}H_{26}N_2O_4S$,HCl from the absorbance obtained from a solution of known concentration of *diltiazem hydrochloride IPRS*.

Q. Not less than 75 per cent of the stated amount of $C_{22}H_{26}N_2O_4S$,HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 0.12 g of Diltiazem Hydrochloride in *methanol* with the aid of ultrasound for 60 minutes and dilute to 100.0 ml with *methanol*. Centrifuge the solution for 20 minutes and use the supernatant.

Reference solution. A solution containing 0.0012 per cent w/v each of *diltiazem hydrochloride IPRS* and *desacetyl diltiazem hydrochloride IPRS* in *methanol*.

Chromatographic system

- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution containing 0.116 per cent w/v of *d-10-camphorsulphonic acid* in *0.1 M sodium acetate*, adjusted to pH 6.2 with *0.1 M sodium hydroxide*, 25 volumes of *acetonitrile* and 25 volumes of *methanol,*
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

The relative retention time with reference to diltiazem for desacetyl diltiazem is about 0.65.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to desacetyl diltiazem and diltiazem is not less than 3, the column efficiency is not less than 1200 theoretical plates and the relative standard deviation for replicate injections is not more than 10.0 per cent for diltiazem peak.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to desacetyl diltiazem is not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 0.6 g of Diltiazem Hydrochloride, add 200 ml of *methanol*, mix with the aid of ultrasound for 1 hour, cool and dilute to 500.0 ml with *methanol*; centrifuge 25 ml at 3500 rpm for 15 minutes and use the clear, supernatant liquid.

Reference solution (a). A solution containing 0.0012 per cent w/v each of *diltiazem hydrochloride IPRS* and *desacetyl diltiazem hydrochloride IPRS* in *methanol.*

Reference solution (b). Dissolve 60 mg of *diltiazem hydrochloride IPRS* in 50 ml of *methanol.*

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a buffer solution containing 0.116 per cent w/v of d-*10-camphorsulphonic acid* in *0.1 M sodium acetate*, adjusted to pH 6.2 with *0.1 M sodium hydroxide*, 25 volumes of *acetonitrile* and 25 volumes of *methanol,* filtered and degassed,
- flow rate: 1.6 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 10 µl.

Inject reference solution (a) and measure the peak responses of all the peaks. The relative retention times for desacetyl diltiazem and diltiazem are about 0.65 and 1.0 respectively. The resolution between desacetyl diltiazem and diltiazem is not less than 3, and the theoretical plates for the diltiazem peak is not less than 1200.

Inject reference solution (b).The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

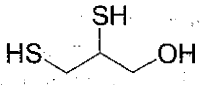
Inject reference solution (b) and the test solution.

Calculate the content of $C_{22}H_{26}N_2O_4S,HCl$ in the tablets..

Storage. Store protected from light.

Dimercaprol

B.A.L.



$C_3H_8OS_2$ Mol. Wt. 124.2

Dimercaprol is (*RS*)-2,3-dimercaptopropanol.

Dimercaprol contains not less than 98.5 per cent w/w and not more than 101.5 per cent w/w of $C_3H_8OS_2$.

Category. Antidote in heavy metal poisoning; metal complexing agent.

Description. A clear, colourless or slightly yellow liquid.

Identification

A. Dissolve 0.1 ml in 4 ml of *water* and to 2 ml of the solution add *lead acetate solution*; a yellow precipitate is obtained.

B. To 2 ml of the solution prepared for test A add 1 ml of *0.05 M iodine*; the colour of iodine is immediately discharged.

C. In a ground-glass-stoppered tube suspend 0.6 g of *sodium bismuthate*, previously heated to 200° for 2 hours, in a mixture of 6 ml of *water* and 2.8 ml of a 10 per cent w/w solution of *phosphoric acid*. Add 0.2 ml of the substance under examination, mix and allow to stand for 10 minutes shaking frequently. To 1 ml of the supernatant liquid add 5 ml of a 0.4 per cent w/v solution of *chromotropic acid sodium salt* in *sulphuric acid*, mix and heat for 15 minutes in a water-bath; a violet-red colour is produced.

Tests

Appearance of solution. The substance under examination is clear (2.4.1), and not more intensely coloured than reference solution BS6 or BYS6 (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a saturated solution.

Refractive index (2.4.27). 1.568 to 1.574, determined at 20°.

Weight per ml (2.4.29). 1.238 g to 1.240 g.

Iron (2.3.14). Ignite 2.0 g with 1 g of *anhydrous sodium carbonate*, cool, dissolve the residue in 15 ml of *dilute hydrochloric acid* and dilute to 45 ml with *water*; the resulting solution complies with the limit test for iron (20 ppm).

Halides. To 2.0 g add 25 ml of *0.5 M ethanolic potassium hydroxide* and heat under a reflux condenser for 2 hours. Remove the ethanol by evaporation in a current of warm air, add 20 ml of *water* and cool. Add a mixture of 10 ml of *strong hydrogen peroxide solution* and 40 ml of *water*. Boil gently for 10 minutes; cool and filter rapidly. Add 10 ml of *dilute nitric acid* and 5 ml of *0.1 M silver nitrate* and titrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator. Repeat the operation without the substance under examination. The difference in the volumes of *0.1 M ammonium thiocyanate* used in the two titrations is not more than 1.0 ml.

Assay. Dissolve 0.1 g in 40 ml of *methanol* and add 20 ml of *0.1 M hydrochloric acid* and 50.0 ml of *0.05 M iodine*. Allow to stand for 10 minutes and titrate with *0.1 M sodium thiosulphate*. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of iodine required.

1 ml of *0.05 M iodine* is equivalent to 0.00621 g of $C_3H_8OS_2$.

Storage. Store protected from light in well-filled containers in a refrigerator (2° to 8°).

Dimercaprol Injection

B.A.L. Injection

Dimercaprol injection is a sterile solution of Dimercaprol in a mixture of Benzyl Benzoate and Arachis Oil.

Dimercaprol Injection contains not less than 90.0 per cent and more than 110.0 per cent of the stated amount of dimercaprol, $C_3H_8OS_2$.

Usual strength. 50 mg per ml.

Description. A clear, yellow, viscous solution, having a pungent.

Tests

Acidity. Shake with an equal volume of *water* for 2 minutes and set aside for separation; pH of the aqueous layer after filtration through a neutral filter is 4.5 to 6.5 (2.4.24).

Refractive index (2.4.27). 1.481 to 1.486, determined at 20°.

Weight per ml (2.4.29). About 0.95 g.

Bacterial endotoxins (2.2.3). Not more than 1.0 Endotoxin Unit per mg of dimercaprol.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Weigh 1.0 g, add 20 ml of *0.1 M hydrochloric acid* and titrate with *0.05 M iodine*.

1 ml of *0.05 M iodine* is equivalent to 0.00621 g of $C_3H_8OS_2$.

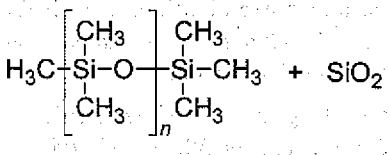
Determine the weight per ml of the injection (2.4.29), and calculate the content of $C_3H_8OS_2$.

Storage. Store protected from light.

Labelling. The label states (1) the nature of the solvent; (2) that the injection is meant for intramuscular use only.

Activated Dimethicone

Simethicone; Activated Polydimethylsiloxane



$(CH_3)_3Si[OSi(CH_3)_2]_nCH_3+SiO_2$

Activated Dimethicone is a mixture of fully methylated linear siloxane polymers containing repeating $-(CH_3)_2SiO-$ units stabilised with trimethylsiloxy, $(CH_3)_3SiO-$, end-blocking units and finely divided silicon dioxide.

Activated Dimethicone contains not less than 90.0 per cent and not more than 99.0 per cent of polydimethylsiloxane, $[-(CH_3)_2SiO-]_n$ and not less than 4.0 per cent and not more than 7.0 per cent of silicon dioxide, SiO_2.

Category. Defoaming agent.

Description. A translucent, grey viscous liquid.

Identification

A. To 50 mg add 25 ml of *toluene* and swirl to disperse. Add 50 ml of *dilute hydrochloric acid* and shake for 5 minutes. Transfer to a separating funnel and remove about 5 ml of the upper layer to a stoppered tube containing 0.5 g of *anhydrous sodium sulphate*. Shake vigorously and centrifuge the mixture until a clear supernatant liquid is obtained. The resulting liquid complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dimethicone IPRS*. Ignore the region of the spectrum from 850 to 750 cm^{-1} since slight differences may be observed depending on the degree of polymerisation.

B. Heat 0.5 g in a test-tube over a small flame until white fumes are evolved. Invert the test-tube over a second tube containing 1 ml of a 0.1 per cent w/v solution of *chromotropic acid sodium salt* in *sulphuric acid* so that the fumes reach the solution. Shake the second tube for about 10 seconds and heat on a water-bath for 5 minutes; the solution is violet.

C. To 50 mg in a platinum crucible add 0.15 ml of *sulphuric acid* and ignite until a white residue is obtained; the residue gives the reaction of silicates (2.3.1).

Tests

Acidity. To 2.0 g add 25 ml of a mixture of equal volumes of *ethanol* and *ether* previously neutralised to 0.2 ml of *bromothymol blue solution* and shake; not more than 3.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to blue.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Defoaming activity. Weigh 0.2 g, transfer to a 100-ml bottle, add 50 ml of *2-methylpropanol* and shake vigorously, warming, if necessary, to effect solution. Add dropwise, 0.5 ml of the solution to a clean, unused, cylindrical 250-ml glass jar, fitted with a 50-mm cap, containing 100 ml of a 1.0 per cent w/v solution of *octoxinol*. Cap the jar and clamp it in an upright position in a wrist-action shaker capable of moving the jar through a radius of 13.3 ± 0.4 cm (measured from the centre of the shaft to the centre of the jar) and an arc of 10 degrees at a frequency of 300 ± 30 strokes per minute. Shake for 10 seconds and record the time required in seconds for the foam to collapse. The time for foam collapse is determined at the instant the first portion of foam-free liquid surface appears, measured from the end of the shaking period. The defoaming activity time is not more than 15 seconds.

Assay. *For polydimethylsiloxane* — Weigh 50 mg, transfer to a narrow-mouthed glass bottle and add 25 ml of *toluene*. Swirl to disperse, add 50 ml of *dilute hydrochloric acid*, close the bottle securely with a cap having an inert liner and shake for exactly 5 minutes. Transfer the mixture to a 125-ml separating funnel and remove about 5 ml of the upper layer to a stoppered test-tube containing 0.5 g of *anhydrous sodium sulphate*. Close the test-tube, agitate vigorously and centrifuge the mixture until a clear supernatant liquid is obtained. Prepare a blank by mixing 10 ml of *toluene* with 0.5 g of *anhydrous sodium sulphate* and centrifuging to obtain a clear supernatant liquid. Determine the absorbance of a 0.5-mm layer of the solution at the maximum at about 7.9 µm in a suitable infra-red spectrophotometer (2.4.6), using the blank to set the instrument. Calculate the content of $[-(CH_3)_2SiO-]_n$ from the absorbance obtained by repeating the Assay on a 0.2 per cent w/v solution of *dimethicone IPRS* in place of the substance under examination.

For silicon dioxide — Mix thoroughly and Weigh 1.0 g; transfer to a tared, sintered-glass filtering crucible (porosity No. 4) and pass through the filter, with suction, 200 ml of *toluene*, added with stirring in small portions, followed by similar washing of the material on the filter with 200 ml of *toluene*, and discard the filtrates. Place the filtering crucible in a muffle furnace at room temperature, raise the temperature of the furnace to 550°. Heat at 550° ± 25° for 2 hours. Cool the filtering crucible with its contents in a desiccator, weigh and calculate the content of silicon dioxide, SiO_2, in the sample taken.

Dimethicone

Dimethicone is α-(Trimethylsilyl)-ω-methylpoly[oxy (dimethylsilylene).

Dimethicone is a mixture of fully methylated linear siloxane polymers containing repeating units of the formula; $[-(CH_3)_2SiO-]_n$ stabilized with trimethylsiloxy end-blocking units of the formula; $[(CH_3)_3SiO-]$ where in *n* has an average value such that the corresponding nominal viscosity is in a discrete range between 20 and 30,000 centistokes.

Dimethicone contains not less than 97.0 per cent and not more than 103.0 per cent of polydimethylsiloxane, $([-(CH_3)_2SiO-]_n)$.

Description. A Clear, colourless liquid of various viscosities.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polydimethylsiloxane IPRS* or with the reference spectrum of polydimethylsiloxane.

Tests

Specific gravity (2.4.29). Within the limits specified in the accompanying table.

Viscosity (2.4.28). Determine the viscosity of Dimethicone having a nominal viscosity of less than 1000 centistokes at 25° ± 0.1°, using a capillary viscometer. Determine the viscosity of Dimethicone having a nominal viscosity of 1000 centistokes or more at 25° ± 0.1°, using a rotational viscometer. The viscosity is within the limits specified in the accompanying table.

Refractive Index (2.4.27). Within the limits specified in the accompanying table, determined at 25°.

Acidity. Dissolve 15.0 g in a mixture of 15 ml of *toluene* and 15 ml of *butyl alcohol*, previously neutralized to *bromophenol blue*, and titrate with *0.050 M alcoholic potassium hydroxide* to a bromophenol blue endpoint. Not more than 0.1 ml is required.

Loss on heating. Preheat an open aluminium vessel (60 mm in diameter and 10 mm high) at 150° for 30 minutes, and allow to cool to room temperature and weigh. Transfer to it about 1 g of Dimethicone, weighed, heat at 150° in a circulating air oven for 2 hours, and allow to come to room temperature in a desiccator before weighing: it loses not more than the maximum percentage of its weight specified in the accompanying table.

Heavy metals (2.3.13). Mix 1.0 g of Dimethicone with 20 ml of *chloroform*. Add 1.0 ml of a freshly prepared 0.002 per cent w/v solution of *dithizone* in *chloroform*, 0.5 ml of *water*, and 0.5 ml of a mixture of 1 ml of *ammonia* and 9 ml of a 0.2 per cent solution of *hydroxylamine hydrochloride*. Prepare reference solution by adding 1.0 ml of a freshly prepared 0.002 per cent w/v solution of dithizone in *chloroform* to 20 ml of *chloroform*; add 0.5 ml of *lead standard solution (10 ppm pb)* and 0.5 ml of a mixture of 1 ml of *ammonia* and 9 ml of a 0.2 per cent solution of *hydroxylamine hydrochloride*. Immediately shake both solutions vigorously for 1 minute. Any red color in the test solution is not more intense than that in the reference solution (5 µg per g).

Assay. Determine by infra red spectrophotometery (2.4.6), with a resolution of 4 cm^{-1} and fitted with an accessory for attenuated total reflectance and a germanium sample trough (45° or 60°). Fill the trough of the accessory with Dimethicone, and record the spectrum between 4000 cm^{-1} and 700 cm^{-1}. Clean the trough, fill it with *polydimethylsiloxane IPRS* and record the spectrum as above. Clean the trough, and record the spectrum as above to obtain a background spectrum. Examine the spectra in the range between 1300 cm^{-1} and 1200 cm^{-1}, and calculate the absorbance of the peak in each spectrum at about 1259 cm^{-1}.

Calculate the content of $[-(CH_3)_2SiO-]_n$ in the Dimethicone taken by the formula:

$$100(A_U / A_S)(D_S / D_U)$$

in which A_U is the absorbance of the Dimethicone; A_S is the absorbance of *polydimethylsiloxane IPRS*; and D_S and D_U are the specific gravities of *polydimethylsiloxane IPRS* and Dimethicone, respectively.

Nominal Viscosity (centistokes)	Viscosity (centistokes)		Specific gravity		Refractive index		Loss on heating
	Min.	Max.	Min.	Max.	Min.	Max.	Max.
20	18	22	0.946	0.954	1.3980	1.4020	20.0
50	47.5	52.5	0.955	0.965	1.4005	1.4045	2.0
100	95	105	0.962	0.970	1.4005	1.4045	0.3
200	190	220	0.964	0.972	1.4013	1.4053	0.3

30000	27000	33000	0.969	0.977	1.4010	1.4100	2.0

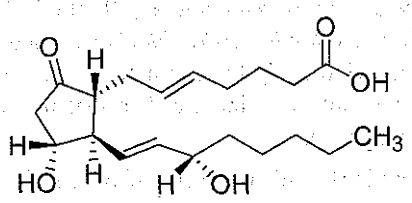
Dimethicone intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial Endotoxin (2.2.3). Not more than 10 Endotoxin Units per ml of the Dimethicone.

Storage. Store protected from moisture.

Labeling. Label it to indicate its nominal viscosity value. Dimethicone intended for use in coating containers that come in contact with articles for parenteral use is so labelled.

Dinoprostone



$C_{20}H_{32}O_5$ Mol Wt. 352.5

Dinoprostone is (Z)-7-[(1R,2R,3R)-3-hydroxy-2-[(E)-(3S)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid (PGE_2).

Dinoprostone contains not less than 95.0 per cent and not more than 102.0 per cent of $C_{20}H_{32}O_5$, calculated on the anhydrous basis.

Category. Prostaglandin E_2(PGE_2); Abortifacient; uterine stimulant.

Description. A white or almost white, crystalline powder or colourless crystals.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dinoprostone IPRS* or with the reference spectrum of dinoprostone.

Tests

Specific optical rotation (2.4.22). −90° to −82°, determined in a 0.5 per cent w/v solution in *ethanol (95 per cent)*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution (a). Dissolve 10 mg of the substance under examination in 2.0 ml of *methanol (58 per cent)*.

Test solution (b). Dissolve 20 mg of the substance under examination in 20.0 ml of *methanol (58 per cent)*.

Reference solution (a). A solution containing each of 0.004 per cent w/v each of *dinoprostone IPRS* and *dinoprostone impurity C IPRS* in *methanol (58 per cent)*.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 200.0 ml with *methanol (58 per cent)*.

Reference solution (c). Prepare *in situ* degradation compounds (dinoprostone impurity D and dinoprostone impurity E) by dissolving 1 mg of the substance under examination in 100 µl of *1M sodium hydroxide* (solution becomes brownish-red), wait for 4 minutes, add 150 µl of *1 M acetic acid* (yellowish-white opalescent solution) and dilute to 5.0 ml with *methanol (58 per cent)*.

Reference solution (d). A 0.1 per cent w/v solution of *dinoprostone IPRS* in *methanol (58 per cent)*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica,
- mobile phase: a mixture of 42 volumes of a 0.2 per cent v/v of *acetic acid*, and 58 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Dinoprostone (Retention time: about 18 minutes)	1.0	—
Dinoprostone impurity C[1]	1.2	—
Dinoprostone impurity D[2]	1.8	0.2
Dinoprostone impurity E[3]	2.0	0.7

[1](E)-7-[(1R, 2R, 3R)-3-hydroxy-2-[(E)-(3S)-3-hydroxyoct-1-enyl]-5-oxocyclopentyl]hept-5-enoic acid,

[2](Z)-7-[(1R,2S)-2-[(E,3S)-3-hydroxyoct-1-enyl]-5-oxocyclopent-3-en-1-yl]hept-5-enoic acid (prostaglandin A_2),

[3](Z)-7-[2-[(E,3S)-3-hydroxyoct-1-enyl]-5-oxocyclopenten-1-yl]hept-5-enoic acid (prostaglandin B_2).

Inject reference solution (a). The test is not valid unless the resolution between dinoprostone and dinoprostone impurity C is not less than 3.8

Inject reference solution (b), (c) and test solution (a). In the chromatogram obtained with the test solution (a), the area of any peak corresponding to dinoprostone impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of any peak corresponding to dinoprostone impurity D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak corresponding to dinoprostone impurity E is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than the areas of other than the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

If any peak with a relative retention time to dinoprostone of about 0.8 is more than 0.5 per cent or if the total of other impurities is more than 1.0 per cent, record the chromatogram of the test solution (a) with a detector set at 230 nm. If the area of the peak at 230 nm is twice the area of the peak at 210 nm, multiply the area at 210 nm by 0.2 (correction factor for (*Z*)-7-[(1*R*,2*R*,3*R*)-3-hydroxy-5-oxo-2-[(*E*)-3-oxooct-1-enyl] cyclopentyl]hept-5-enoic acid (dinoprostone impurity F)).

Water (2.3.43). Not more than 0.5 per cent.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (d) and test solution (b).

Calculate the content of $C_{20}H_{32}O_5$.

Storage. Store at a temperature not exceeding -15°.

Dinoprostone Oral Solution

Dinoprostone Oral Solution is a solution of dinoprostone in a suitable aqueous vehicle.

Dinoprostone Oral Solution contains not less than 90.0 per cent and not more than 105.0 per cent of the stated amount of dinoprostone, $C_{20}H_{32}O_5$.

Identification

A. Evaporate about 20.0 ml of the Oral Solution to 15.0 ml under a stream of nitrogen, extract the remaining solution with two 5 ml quantities of *chloroform*, combine the *chloroform* extracts and evaporate almost to dryness using a rotary evaporator or filter the *chloroform* solution through *anhydrous sodium sulphate*. Evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dinoprostone IPRS* or with the reference spectrum of dinoprostone.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dilute a volume of the oral solution containing 10 mg of Dinoprostone to 100.0 ml with *methanol (60 per cent v/v)*.

Reference solution (a). Dilute 1.0 ml of test solution to 10.0 ml with *methanol (60 per cent v/v)* and further dilute 1 ml to 10.0 ml with *methanol (60 per cent. v/v)*

Reference solution (b). Dissolve 1 mg of *dinoprostone IPRS* in 100 µl of *1 M sodium hydroxide* (solution becomes brownish-red), allow to stand for 4 minutes and then add 150 µl of *1 M acetic acid* (a yellowish-white opalescent solution is produced). Dilute the above solution to 5 ml with *methanol (60 per cent v/v)* and further dilute 1.0 ml to 10.0 ml with *methanol (60 per cent v/v)*. The solution contains a mixture of prostaglandin A_2 (dinoprostone impurity D) and prostaglandin B_2 (dinoprostone impurity E).

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),
- mobile phase: a mixture of 40 volumes of 1.0 per cent v/v solution of *triethylamine*, adjusted to pH 2.3 with *orthophosphoric acid*, and 60 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 200 µl.

Name	Relative retention time	Correction factor
Dinoprostone (Retention time: about 22 minutes)	1.0	—
Dinoprostone impurity D[1]	1.7	0.2
Dinoprostone impurity E[2]	1.8	—

[1](Z)-7-[(1R,2S)-2-[(E,3S)-3-hydroxyoct-1-enyl]-5-oxocyclopent-3-en-1-yl]hept-5-enoic acid,

[2] (Z)-7-[2-[(E,3S)-3-hydroxyoct-1-enyl]-5-oxocyclopenten-1-yl]hept-5-enoic acid.

Inject reference solution (b). The test is not valid unless the resolution between dinoprostone impurity D and dinoprostone impurity E is at least 1.5.

Inject reference solution (a) and the test solution. The area of any peak due to dinoprostone impurity D is not more than 5 times the area of the prinicipal peak in the chromatogram obtained with reference solution (a) (5 per cent).

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Use chromatographic system, test solution as described under Related substances with 20 µl as injection volume.

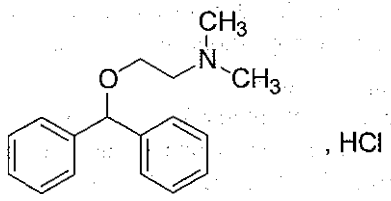
Reference solution. A 0.01 per cent w/v solution of *dinoprostone IPRS* in *methanol (60 per cent v/v)*.

Inject the reference solution and the test solution.

Storage. Store protected from light in a refrigerator (2° to 8°). Do not freeze.

Labelling. The label states the preparation is to be diluted before use and any oral solution not used within 7 days of the date of preparation should be discarded.

Diphenhydramine Hydrochloride



$C_{17}H_{21}NO,HCl$ Mol. Wt. 291.8

Diphenhydramine Hydrochloride is 2-benzhydryloxyethyldimethylamine hydrochloride.

Diphenhydramine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{21}NO,HCl$, calculated on the dried basis.

Category. Histamine H_1-receptor antagonist.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diphenhydramine hydrochloride IPRS* or with the reference spectrum of diphenhydramine hydrochloride. Examine the substances as discs prepared using *potassium chloride IR*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.025 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at about 253 nm, 258 nm and 264 nm; absorbance at about 253 nm, about 0.31, at about 258 nm, about 0.38 and at about 264 nm, about 0.3.

C. To 0.05 ml of a 5 per cent w/v solution add 2 ml of *sulphuric acid*; an intense yellow colour develops which changes to red on the addition of 0.5 ml of *nitric acid*. Add 15 ml of *water*, cool, add 5 ml of *chloroform* and shake; an intense violet colour develops in the chloroform layer.

D. It gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 4.0 to 6.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 70 mg of the substance under examination in 20.0 ml of the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *2-(diphenylmethoxy)-N-methylethanamine IPRS (diphenhydramine impurity A IPRS)* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 2.0 ml of the solution add 1.5 ml of the test solution and dilute to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of 0.54 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

The relative retention time with reference to diphenhydramine (retention time is about 6 minutes) for diphenhydramine impurity A is about 0.9, for 2-[(*RS*)-(4-methylphenyl) phenylmethoxy]-*N,N*- dimethylethanamine (diphenhydramine

impurity B) is about 1.5, for 2-[(*RS*)-(4-bromophenyl) phenylmethoxy]-*N,N*- dimethylethanamine (diphenhydramine impurity C) is about 1.8, for benzhydrol (diphenhydramine impurity D) is about 2.6 and for benzophenone (diphenhydramine impurity E) is about 5.1. The correction factor for diphenhydramine impurity D is 0.7.

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to diphenhydramine and diphenhydramine impurity A is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram seven times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak due to diphenhydramine impurity A is not more than the area the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of any secondary peak is not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.250 g in 50 ml of *ethanol*, add 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining end-point potentiometrically (2.4.25). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02918 g of $C_{17}H_{22}ClNO$.

Storage. Store protected from light.

Diphenhydramine Capsules

Diphenhydramine Hydrochloride Capsules

Diphenhydramine Capsules contain not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of diphenhydramine hydrochloride, $C_{17}H_{21}NO,HCl$.

Usual strengths. 25 mg; 50 mg.

Identification

Extract a quantity of the contents of the capsules containing 0.1 g of Diphenhydramine Hydrochloride with two quantities, each of 15 ml, of *chloroform*. Evaporate the combined extracts to dryness on a water-bath and dry the residue at 80° for 1 hour. The residue melts at about 168° (2.4.21), and complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diphenhydramine hydrochloride IPRS* or with the reference spectrum of diphenhydramine hydrochloride. Examine the substances as discs prepared using *potassium chloride IR*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.025 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at about 253 nm, 258 nm and 264 nm; absorbance at about 253 nm, about 0.31, at about 258 nm, about 0.38 and at about 264 nm, about 0.3.

C. To 0.05 ml of a 5 per cent w/v solution add 2 ml of *sulphuric acid*; an intense yellow colour develops which changes to red on the addition of 0.5 ml of *nitric acid*. Add 15 ml of *water*, cool, add 5 ml of *chloroform* and shake; an intense violet colour develops in the chloroform layer.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *water*,
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14), as described under Assay using the following modifications.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *diphenhydramine hydrochloride IPRS* in dissolution medium to obtain a solution having a concentration similar to that of the test solution.

– injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{17}H_{21}NO,HCl$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{17}H_{21}NO,HCl$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 80 volumes of *chloroform*, 20 volumes of *methanol* and 1 volume of *diethylamine*.

Test solution. Shake a quantity of the contents of the capsules containing 100 mg of Diphenhydramine Hydrochloride with three quantities, each of 10 ml, of *chloroform*, filter and evaporate the combined filtrate almost to dryness; dissolve the residue in 5 ml of *chloroform*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air for 5 minutes, spray with *sulphuric acid* and heat at 120° for 10 minutes until spots appear. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of *acetonitrile* and 65 volumes of mobile phase A.

Test solution. Weigh and mix the contents of 20 capsules. Disperse a quantity of the mixed content containing 70 mg of Diphenhydramine Hydrochloride in *water* and dilute to 100.0 ml with *water*, mix and filter. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (a). A solution containing 0.01 per cent w/v, each of, *diphenhydramine related compound A (2-(Diphenylmethoxy)-N-methylethanamine hydrochloride) IPRS* and *diphenhydramine hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A 0.007 per cent w/v solution of *diphenhydramine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.54 per cent w/v solution of *monobasic potassium phosphate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
4	65	35
7	20	80
9	65	35
13	65	35

The relative retention time with reference to diphenhydramine for diphenhydramine related compound A is about 0.9.

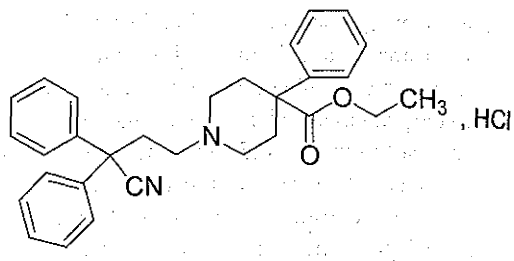
Inject reference solution (a). The test is not valid unless the resolution between the peaks due to diphenhydramine and diphenhydramine related compound A is not less than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{17}H_{21}NO$, HCl in the capsules.

Storage. Store protected from moisture.

Diphenoxylate Hydrochloride



$C_{30}H_{32}N_2O_2,HCl$ Mol. Wt. 489.1

Diphenoxylate Hydrochloride is ethyl 1-(3-cyano-3,3-diphenylpropyl)-4-phenylpiperidine-4-carboxylate hydrochloride.

Diphenoxylate Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{30}H_{32}N_2O_2,HCl$, calculated on the dried basis.

Category. Antidiarrhoeal.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *diphenoxylate hydrochloride IPRS* or with the reference spectrum of diphenoxylate hydrochloride.

B. Dissolve about 30 mg in 5 ml of *methanol*, add 0.25 ml of *nitric acid* and 0.4 ml of *silver nitrate solution*. Shake and allow to stand; a curdled precipitate is formed. Centrifuge and rinse the precipitate with three quantities, each of 2 ml, of *methanol*. Carry out this operation rapidly in subdued light. Suspend the precipitate in 2 ml of *water* and add 1.5 ml of *10 M ammonia*; the precipitate dissolves easily.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *dichloromethane* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and mobile phase A.

Test solution. Dissolve 25 mg of the substance under examination in 20 ml of the solvent mixture with the aid of ultrasound and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 900 ml of *water*, adjusted to pH 2.3 with *orthophosphoric acid* and dilute to 1000.0 ml with *water*,

B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	75	25
5	75	25
40	15	85
45	75	25

The relative retention time with reference to diphenoxylate (retention time: about 16 minutes) for diphenoxylate impurity A (diphenoxylic acid) is about 0.8.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to diphenoxylate impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.4 g in 40 ml of *ethanol (95 per cent)* and add 5 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Read the volume added between the two points of inflection.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.04891 g of $C_{30}H_{32}N_2O_2,HCl$.

Storage. Store protected from light.

Diphenoxylate Hydrochloride and Atropine Sulphate Tablets

Diphenoxylate Hydrochloride and Atropine Sulphate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of diphenoxylate hydrochloride, $C_{30}H_{32}N_2O_2,HCl$ and not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of atropine sulphate, $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Usual strength. Diphenoxylate Hydrochloride, 2.5 mg and Atropine Sulphate, 0.025 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to *atropine* and *diphenoxylate* in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 500 ml of *0.2 M acetic acid*,
Speed and time. 150 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. A 0.025 per cent w/v solution of *diphenoxylate hydrochloride IPRS* in *methanol*. Dilute further with dissolution medium to obtain a solution of known concentration similar to the concentration of the test solution.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with phenyl group (5 µm),
- mobile phase: a mixture of 65 volumes of *acetonitrile* and 35 volumes of a buffer solution prepared by

dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{30}H_{32}N_2O_2,HCl$ in the tablet.

Q. Not less than 75 per cent of the stated amount of $C_{30}H_{32}N_2O_2,HCl$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modification.

Test solution. Disperse one tablet in 15.0 ml of solvent mixture with the aid of ultrasound for about 15 minutes, allow to cool and dilute to 25.0 ml with solvent mixture and filter. Dilute further, if necessary.

Calculate the content of $C_{30}H_{32}N_2O_2,HCl$ and $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Buffer solution A. prepared by dissolving 192 mg of *sodium 1-pentanesulphonate monohydrate* to 200.0 ml with *water*, sonicate to dissolve, add 800 ml of *water* and 1.0 ml of *orthophosphoric acid*.

Buffer solution B. prepared by dissolving 192 mg of *sodium 1-pentanesulphonate monohydrate* to 200.0 ml with *water*, sonicate to dissolve, add 800 ml of *acetonitrile* and add 1.0 ml of *orthophosphoric acid* and mix.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 25 mg of *diphenoxylate hydrochloride* to a 250-ml volumetric flask, add approximately 100.0 ml of solvent mixture, and shake by mechanical means for at least 15 minutes. Sonicate for an additional 15 minutes, cool and dilute with solvent mixture to volume, and mix. Filter the solution, discarding the first few ml of the filtrate.

Reference solution (a). A 0.004 per cent solution of *atropine sulphate IPRS* in solvent mixture.

Reference solution (b). Transfer about 20 mg of *diphenoxylate hydrochloride IPRS* to a 200-ml volumetric flask, add about 100.0 ml of solvent mixture, and sonicate to dissolve. Add accurately measured 5.0 ml of reference solution (a), mix and cool. Then dilute with solvent mixture to volume. This solution contains about 0.1 mg of *diphenoxylate hydrochloride* and about 0.001 mg of *atropine sulphate* per ml.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with nitrile group bonded to porous silica (5 µm),
- mobile phase: a mixture of 34 volumes of buffer solution A and 66 volumes of buffer solution B,
- flow rate: 1.7 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 50 µl.

The relative retention time for atropine peak is about 0.35 with reference to diphenoxylate peak.

Inject reference solution (b). The test is not valid unless the resolution between atropine peak and diphenoxylate peak is not less than 5.0, the tailing factor is not more than 1.5 for atropine peak and the relative standard deviation for replicate injections is not more than 2.0 per cent for diphenoxylate peak and not more than 5.0 per cent for atropine peak.

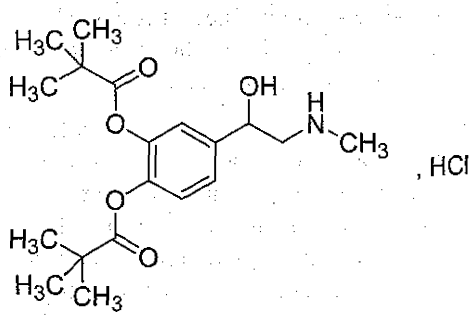
NOTE — If a significant tailing of the diphenoxylate peak is observed more than 2.5, it is recommended to maintain the column temperature at 25°, to stabilize the system.

Inject reference solution (b) and the test solution.

Calculate the content of $C_{30}H_{32}N_2O_2,HCl$ and $(C_{17}H_{23}NO_3)_2,H_2SO_4,H_2O$ in the tablets.

Storage. Store protected from light and moisture.

Dipivefrine Hydrochloride



$C_{19}H_{29}NO_5,HCl$ Mol. Wt. 387.9

Dipivefrine Hydrochloride is (*RS*)-4-[1-Hydroxy-2-(methylamino)ethyl]-*o*-phenylene dipivalate hydrochloride.

Dipivefrine Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{19}H_{29}NO_5,HCl$, calculated on the dried basis.

Category. Miotic.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dipivefrine hydrochloride IPRS* or with the reference spectrum of dipivefrine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

Impurities A and B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in *0.01 M hydrochloric acid* and dilute to 10.0 ml with *0.01 M hydrochloric acid.*

Reference solution. A solution containing 0.001 per cent w/v each of *adrenaline* and *adrenalone hydrochloride* in *0.01 M hydrochloric acid. (NOTE—Protect this solution from light).*

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane amorphous organosilica polymer (5 µm),
- mobile phase: A. a 0.1 per cent v/v solution of *anhydrous formic acid*,
  B: a mixture of 40 volumes of *methanol* and 60 volumes *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
3	100	0
5	40	60
30	40	60
32	100	0

Name	Retention time
Dipivefrine impurity A[1]	2.2
Dipivefrine impurity B[2]	3.2

[1](±)-adrenaline),

[2]adrenalone.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to dipivefrine impurities A and B is not less than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any impurity due to dipivefrine impurities A and B is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *methanol* and 60 volumes of *acetonitrile.* Add 55.0 ml of this mixture and 45.0 ml of *0.01 M hydrochloric acid.*

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.01 per cent w/v solution of *dipivefrine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane amorphous organosilica polymer (5 µm),
- mobile phase: a mixture of 45 volumes of a 0.27 per cent w/v of *ammonia,* adjusted to pH 10.0 with *dilute acetic acid* and 55 volumes of a mixture of 40 volumes of *methanol* and 60 volumes of *acetonitrile,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

Name	Relative retention time	Correction factor
Dipivefrine impurity C[1]	0.4	0.5
Dipivefrine impurity D[2]	0.4	0.5
Dipivefrine (Retention time: about 7 minutes)	1.0	—
Dipivefrine impurity E[3]	1.3	0.06
Dipivefrine impurity F[4]	2.0	—

[1]2-hydroxy-5-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]phenyl 2,2-dimethylpropanoate,

[2]2-hydroxy-4-[(1*RS*)-1-hydroxy-2-(methylamino)ethyl]phenyl 2,2-dimethylpropanoate,

[3]4-[(methylamino)acetyl]-1,2-phenylene bis(2,2-dimethylpropanoate),

[4] 4-[(1*RS*)-2-(ethylmethylamino)-1-hydroxyethyl]-1,2-phenylene bis
(2,2-dimethylpropanoate).

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject referene solution (a) and the test solution. In the chromatogram obtained with the test solution, the sum of areas of the peaks due to dipivefrine impurities C and D is not more than 0.3 times the area of principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), the area of any other secondary peak is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and any peak with a mass distribution ratio less than 0.5.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° for 6 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modification.

- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the tailing factor for the principle peak is not more than 2.0.

Inject reference solution (a) and (b).

Calculate the content of $C_{19}H_{30}ClNO_5$.

Dipivefrine Eye Drops

Dipivefrine Hydrochloride Eye Drops

Dipivefrine Eye Drops are a sterile solution of Dipivefrine Hydrochloride in purified water.

Dipivefrine Eye Drops contains not less than 90.0 per cent and not more than 110.0 per cent of dipivefrine hydrochloride, $C_{19}H_{29}NO_5,HCl$.

Usual strength. 0.1 per cent.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. a mixture of 1 volume of *formic acid*, 10 volumes of *methanol* and 30 volumes of *chloroform*.

Test solution. Dilute the eye drops with *water* to obtain a solution containing 0.1 per cent w/v of Dipivefrine Hydrochloride.

Reference solution. A 0.1 per cent w/v solution of *dipivefrine hydrochloride IPRS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with a mixture of 5 volumes of *ethylenediamine*, 45 volumes of *ethanol (95 per cent)* and 50 volumes of a 0.1 per cent w/v solution of *potassium hexacyanoferrate(III)* until saturated, allow to dry. Heat the plate at 100° for 10 minutes and examine in daylight.The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. The eye drops are clear (2.4.1).

pH (2.4.24). 2.5 to 3.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of eye drops with *water* to obtain a solution containing 0.1 per cent w/v of Dipivefrine Hydrochloride.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *water*.

Chromatographic system

- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 15 volumes of *0.014 M sodium dodecyl sulphate* and 24 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of eye drops with *water* to obtain a solution containing 0.1 per cent w/v of Dipivefrine Hydrochloride.

Reference solution. A 0.1 per cent w/v solution of *dipivefrine hydrochloride IPRS* in *water*.

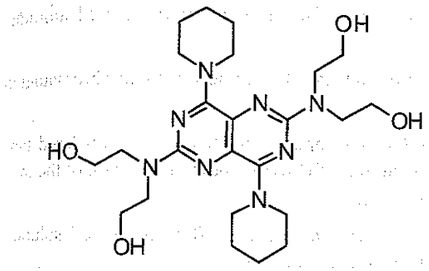
Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solutiona and the test solution.

Calculate the content of $C_{19}H_{29}NO_5,HCl$ in the eye drops.

Dipyridamole



$C_{24}H_{40}N_8O_4$ Mol. Wt. 504.6

Dipyridamole is 2,2',2'',2'''-[[4,8-Di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,6-diyl]dinitrilo]tetraethanol.

Dipyridamole contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{24}H_{40}N_8O_4$, calculated on the dried basis.

Category. Platelet aggregation inhibitor.

Description. A bright yellow, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *dipyridamole IPRS* or with the reference spectrum of dipyridamole.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in *methanol* and dilute to 50.0 ml with *methanol*.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 45°,
- mobile phase: A. dissolve 1.0 g of *potassium dihydrogen phosphate* in 900 ml of *water*, adjusted to pH 7.0 with *0.5 M sodium hydroxide* and dilute to 1000 ml with *water*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 5 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	40	60
5	40	60
19	5	95
24	5	95
29	40	60

Name	Relative retention time	Correction factor
Dipyridamole impurity B[1]	0.2	1.7
Dipyridamole impurity F[2]	0.3	—
Dipyridamole impurity D[3]	0.9	—
Dipyridamole (Retention time: about 8 minutes)	1.0	—
Dipyridamole impurity E[4]	1.3	—
Dipyridamole impurity C[5]	1.6	—
Dipyridamole impurity A[6]	2.2	—

[1]2,2',2'',2''',2'''',2'''''[[8-(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,4,6-triyl]trinitrilo]hexaethanol,

[2]2,2',2'',2'''-[[4-[(2-hydroxyethyl)amino]-8-(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,6-diyl]dinitrilo] tetraethanol,

[3]2,2'-[[6-[(2-hydroxyethyl)amino]-4,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-2-yl]nitrilo]diethanol,

[4]2,2',2'',2'''-[[6,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidine-2,4-diyl]dinitrilo]tetraethanol,

[5]2,2'-[[6-chloro-4,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-2-yl]nitrilo]diethanol,

[6]2,2'-[[4,6,8-tri(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-2-yl]nitrilo]diethanol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to dipyridamole impurities A, B and C is

not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak corresponding to dipyridamole impurities D and E is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). To 1.25 g, add 10 ml of *water* and shake vigorously, filter and dilute to 15 ml with *water*, complies with limit test for chlorides (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.4 g in 70 ml of *methanol*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05046 g of $C_{24}H_{40}N_8O_4$.

Storage. Store protected from light.

Dipyridamole Tablets

Dipyridamole Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of dipyridamole, $C_{24}H_{40}N_8O_4$.

Usual strengths. 25 mg; 75 mg; 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Dipyridamole with 20 ml of *chloroform*, filter and evaporate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6), compare the spectrum with that obtained with *dipyridamole IPRS* or with the reference spectrum of dipyridamole.

B. To a quantity of the powdered tablets containing 10 mg of Dipyridamole add 50 ml of *methanol*, warm slightly, shake for 15 minutes and allow to cool and dilute to 100.0 ml with *methanol*, filter. To 10 ml of the filtrate add 1 ml of *1 M hydrochloric acid* and dilute to 100.0 ml with *methanol*. When examined in the range 220 nm to 450 nm (2.4.7), exhibits three maxima, at 230 nm, 285 nm and 405 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium: 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter, rejecting the first few ml of filtrate. Dilute a suitable volume of the filtrate with the medium. Measure the absorbance of the resulting solution at the maximum at 282 nm (2.4.7). Calculate the content of dipyridamole, $C_{24}H_{40}N_8O_4$ in the medium from the absorbance obtained from a solution of known concentration of *dipyridamole IPRS* in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{24}H_{40}N_8O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 50 mg of Dipyridamole in 100.0 ml of the mobile phase and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of a 0.1 per cent w/v solution of *diltiazem hydrochloride IPRS* to 20.0 ml with reference solution (a).

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 0.504 g of *potassium dihydrogen orthophosphate* in 370 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid*, add 80 ml of *acetonitrile* and 550 ml of *methanol*,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume: 20 µl.

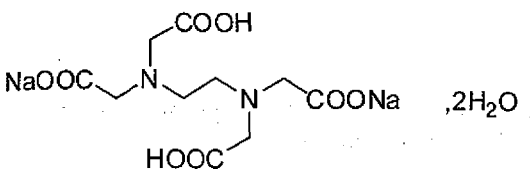
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to diltiazem and dipyridamole is not less than 2.0.

Inject reference solution (a) and the test solution. Run the chromatogram nine times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. To 10 whole tablets add 300 ml of *1 M hydrochloric acid*, heat at 40° for 20 minutes with shaking, allow to cool and dilute to 500 ml with *1 M hydrochloric acid*, filter and dilute, if necessary, with *1 M hydrochloric acid* to obtain a solution containing 0.05 per cent w/v of Dipyridamole. Dilute 1 volume to 50 volumes with *water* and measure the absorbance at the maximum at 283 nm (2.4.7). Dilute 1 volume of a 0.05 per cent w/v solution of *dipyridamole IPRS* in *1 M hydrochloric acid* to 50 volumes with *water*. Calculate the content of $C_{24}H_{40}N_8O_4$ in the tablets.

Disodium Edetate



$C_{10}H_{14}N_2Na_2O_8,2H_2O$ Mol. Wt. 372.2

Disodium Edetate is disodium ethylenediaminetetraacetate dihydrate.

Disodium Edetate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{10}H_{14}N_2Na_2O_8,2H_2O$.

Category. Pharmaceutical aid; chelating agent in metal poisoning.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disodium edetate IPRS* or with the reference spectrum of disodium edetate.

B. Dissolve 2 g in 25 ml of water, add 6 ml of *lead nitrate solution*, shake and add 3 ml of *potassium iodide solution*; no yellow precipitate is produced. Make alkaline to *red litmus paper* with *2 M ammonia* and add 5 ml of *ammonium oxalate solution*; no precipitate is produced.

C. Dissolve 0.5 g in 10 ml of *water*, add 0.5 ml of a 10 per cent w/v solution of *calcium chloride*, make alkaline to *red litmus paper* with *2 M ammonia* and add 3 ml of *ammonium oxalate solution*; no precipitate is produced.

D. It gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.0 to 5.5, determined in a 5.0 per cent w/v solution.

Impurity A. Determine by liquid chromatography (2.4.14).

NOTE—Carry out the test protected from light.

Solvent A. A 1.0 per cent w/v solution of *cupric nitrate* in *water*.

Test solution. Dissolve 100 mg of the substance under examination in 10.0 ml of solvent A with the aid of ultrasound and filter.

Reference solution (a). Transfer 100 mg of *nitrilotriacetic acid* to a 10-ml volumetric flask, add 0.5 ml of *ammonium hydroxide*, mix and dilute with *water* to volume.

Reference solution (b). Transfer 1 g of Disodium Edetate to a 100-ml volumetric flask, add 100 µl of reference solution (a), dilute with solvent A, dissolve with the aid of ultrasound and filter.

Reference solution (c). Transfer 10 mg of disodium edetate to a 100-ml volumetric flask, add 100 µl of reference solution (a), dilute with solvent A, dissolve with the aid of ultrasound and filter.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octylsilane bonded to porous silica (1.5 to 10 µm),
- mobile phase: dilute 10 ml of *1 M tetrabutylammonium hydroxide* in *methanol* to 200.0 ml with *water*, adjusted to pH 7.5 ± 0.1 with *dilute orthophosphoric acid*, add 90 ml of *methanol* and dilute to 1000 ml with *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 50 µl.

The relative retention time with reference to edetate for nitrilotriacetic acid and copper is about 0.35 and 0.65, respectively.

Inject reference solution (b) and (c). The test is not valid unless the resolution between the peaks due to nitrilotriacetic acid and copper is not less than 3.0 in the chromatogram obtained with reference solution (c) and the relative standard deviation for replicate injections is not more than 2.0 per cent in the chromatogram obtained with reference solution (b).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of peak corresponding to nitrilotriacetic acid is not more than difference between the area of nitrilotriacetic acid peak obtained from reference solution (b) and the test solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 20 ml of a 2.5 per cent w/v solution complies with the limit test for iron (80 ppm). Add 0.25 g of *calcium chloride* to each solution before adding mercaptoacetic acid.

Assay. Dissolve 0.5 g in sufficient *water* to produce 300 ml and add 2 g of *hexamine* and 2 ml of *2 M hydrochloric acid*.

Titrate with *0.1 M lead nitrate* using about 50 mg of *xylenol orange triturate* as indicator until the colour of the indicator changes to brick red. Carry out a blank titration.

1 ml of *0.1 M lead nitrate* is equivalent to 0.03722 g of $C_{10}H_{14}N_2Na_2O_8,2H_2O$.

Disodium Edetate Injection

Disodium Edetate Injection is a sterile solution of Disodium Edetate in Water for Injections, containing varying amounts of the disodium and trisodium salts as a result of pH adjustment.

Disodium Edetate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of disodium edetate, $C_{10}H_{14}N_2Na_2O_8$.

Usual strengths. 3 g per 15 ml; 3 g per 20 ml.

Identification

To a volume containing about 3 g of Disodium Edetate add *3 M hydrochloric acid* to adjusted to pH 5.0 and evaporate to dryness on a steam-bath to dryness. The residue so obtained complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disodium edetate IPRS* or with the reference spectrum of disodium edetate.

B. Dissolve 2 g in 25 ml of *water*, add 6 ml of *lead nitrate solution*, shake and add 3 ml of *potassium iodide solution*; no yellow precipitate is produced. Make alkaline to *red litmus paper* with *2 M ammonia* and add 5 ml of *ammonium oxalate solution*; no precipitate is produced.

C. Dissolve 0.5 g in 10 ml of *water*, add 0.5 ml of a 10 per cent w/v solution of *calcium chloride*, make alkaline to *red litmus paper* with *2 M ammonia* and add 3 ml of *ammonium oxalate solution*; no precipitate is produced.

Tests

pH (2.4.24). 6.5 to 7.5.

Bacterial endotoxins (2.2.3). Not more than 0.2 Endotoxin Unit per mg of disodium edetate.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

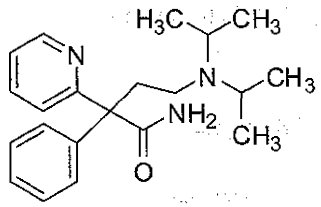
Assay. Dilute a measured volume containing about 0.6 g of Disodium Edetate with *water* to produce 100 ml, mix and add 2 g of *hexamine* and 2 ml of *2 M hydrochloric acid*. Titrate with *0.1 M lead nitrate* using about 50 mg of *xylenol orange triturate* as indicator until the colour of the indicator changes to brick red. Carry out a blank titration.

1 ml of *0.1 M lead nitrate* is equivalent to 0.03362 g of $C_{10}H_{14}N_2Na_2O_8$.

Storage. Store in single dose containers.

Labelling. The label states the strength in terms of anhydrous disodium edetate contained in a suitable dose-volume.

Disopyramide



$C_{21}H_{29}N_3O$ Mol. Wt. 339.5

Disopyramide is (*RS*)-4-(diisopropylamino)-2-phenyl-2-(pyridin-2-yl)butyramide.

Disopyramide contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{21}H_{29}N_3O$, calculated on the dried basis.

Category. Antiarrhythmic.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disopyramide IPRS* or with the reference spectrum of disopyramide. Examine the substances as discs prepared by placing 50 µl of a 5 per cent solution in *dichloromethane* on a disc of *potassium bromide*. Dry the discs at 60° for 1 hour before use.

B. When examined in the range 240 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in 0.5 per cent *methanolic sulphuric acid* shows an absorption maximum at about 269 nm and a shoulder at 263 nm ; specific absorbance at about 269 nm is 190 to 210.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane*.

Test solution (a). Dissolve 0.2 g of the substance under examination in *methanol* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *disopyramide IPRS* in *methanol*.

Reference solution (b). Dilute 0.5 ml of test solution (b) to 20.0 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 80° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. Dissolve 0.13 g in 30 ml of *anhydrous acetic acid*, add 0.2 ml of *naphtholbenzein solution*. Titrate with *0.1 M perchloric acid* until the colour changes from yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01697 g of $C_{21}H_{29}N_3O$.

Storage. Store protected from light.

Disopyramide Capsules

Disopyramide Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of disopyramide, $C_{21}H_{29}N_3O$.

Usual strength. 200 mg.

Identification

A. Shake a quantity of the contents of the capsules containing about 0.2 g of Disopyramide with 50 ml of *chloroform* for 15 minutes, filter, evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 2 ml of *chloroform*. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disopyramide IPRS* or with the reference spectrum of disopyramide.

B. When examined in the range 230 nm to 350 nm (2.4.7), the solution obtained in the assay shows an absorption maximum at about 269 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *18 M ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane*.

Test solution. Shake a quantity of the contents of the capsules containing about 0.2 g of Disopyramide with 20.0 ml of *methanol* for 30 minutes and filter.

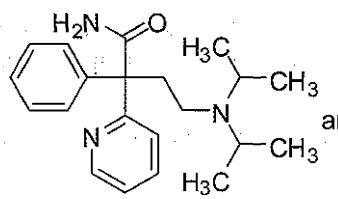
Reference solution. Dilute 1.0 ml of test solution to 400 ml with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in current of air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.25 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing 0.04 g of Disopyramide, add 40 ml of *0.05 M methanolic sulphuric acid*, shake for 15 minutes, dilute to 100.0 ml with the same solvent and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with *0.05 M methanolic sulphuric acid*. Measure the absorbance of the resulting solution at the maximum at about 269 nm (2.4.7). Calculate the content of $C_{21}H_{29}N_3O$ taking 198.5 as the specific absorbance at 269 nm.

Disopyramide Phosphate



and enantiomer, H_3PO_4

$C_{21}H_{32}N_3O_5P$ Mol. Wt. 437.5

Disopyramide Phosphate is (2*RS*)-4-[bis(1-methylethyl) amino]-2-phenyl-2-(pyridin-2-yl)butanamide dihydrogen phosphate.

Disopyramide Phosphate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{32}N_3O_5P$, calculated on the dried basis.

Category. Antiarrhythmic.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disopyramide phosphate IPRS* or with the reference spectrum of disopyramide phosphate.

B. When examined in the range 240 nm to 350 nm (2.4.7), a 0.005 per cent w/v solution in *0.05 M methanolic sulphuric acid* shows absorption maxima at about 269 nm and a shoulder at 263 nm; specific absorbance at the maximum is 147 to 163.

C. In the Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in chromatogram obtained with reference solution (a). Spray with *dilute potassium iodobismuthate solution* and examine in day light. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in chromatogram obtained with reference solution (a).

D. Solution A gives reaction (A) of phosphates (2.3.1).

Tests

Solution A. A 5.0 per cent w/v solution in *carbon dioxide-free water.*

Appearance of solution. Solution A is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 4.0 to 5.0, determined in solution A.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 1 volume of *concentrated ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane.*

Test solution (a). Dissolve 0.2 g of the substance under examination in *methanol* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methanol.*

Reference solution (a). A 0.2 per cent w/v solution of *disopyramide phosphate IPRS* in *methanol.*

Reference solution (b). Dilute 0.5 ml of test solution (b) to 20.0 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.180 g in 30 ml of *anhydrous acetic acid*, add 0.2 ml of *naphtholbenzein solution*. Titrate with *0.1 M perchloric acid* until the colour changes from yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02188 g of $C_{21}H_{32}N_3O_5P$.

Storage. Store protected from light.

Disopyramide Phosphate Prolonged-release Capsules

Disopyramide Phosphate Sustained-release Capsules; Disopyramide Phosphate Extended-release Capsules

Disopyramide Phosphate Prolonged-release Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of disopyramide, $C_{21}H_{29}N_3O$.

Usual strengths. 100 mg; 150 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 85 volumes of *toluene*, 14 volumes of *absolute ethanol* and 1 volume of *ammonium hydroxide.*

Test solution. Transfer a quantity of the contents of the capsules containing about 195 mg of Disopyramide Phosphate to a 25-ml volumetric flask, add 20 ml of *methanol*, and shake for 20 minutes. Dilute with *methanol* to volume, mix, and filter.

Reference solution. A 0.77 per cent w/v solution of *disopyramide phosphate IPRS* in *methanol.*

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 1000 ml of a buffer solution prepared by dissolving 13.6 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 2.5 with *hydrochloric acid*,

Speed and time. 100 rpm and 1 hour, 2 hours, 5 hours, 12 hours.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance (2.4.7) of the

filterate, suitably diluted with the dissolution medium if necessary at 261 nm. Calculate the content of disopyramide phosphate, $C_{21}H_{29}N_3O$ in the medium from the absorbance obtained from a solution of known concentration of *disopyramide phosphate IPRS*.

Q. Not less than 5 per cent and not more than 25 per cent in 1 hour, not less than 17 per cent and not more than 43 per cent in 2 hours, not less than 50 per cent and not more than 80 per cent in 5 hours, and not less than 85 per cent in 12 hours, of the stated amount of $C_{21}H_{29}N_3O$.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 650 mg of Disopyramide Phosphate to a 500-ml volumetric flask, add about 400 ml of *0.1 M sulphuric acid*, and shake for 30 minutes. Dilute with *0.1 M sulphuric acid* to volume, mix, and filter. Dilute further with *0.1 M sulphuric acid* to get a final concentration of about 40 µg per ml and measure the absorbance of the resulting solution at the maximum at about 261 nm (2.4.7).

Calculate the content of $C_{21}H_{29}N_3O$ from the absorbance of a solution of known concentration of *disopyramide phosphate IPRS*.

Disopyramide Phosphate Capsules

Disopyramide Phosphate Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of disopyramide, $C_{21}H_{29}N_3O$.

Usual strength. 150 mg.

Identification

Suspend a quantity of the contents of the capsules containing about 0.2 g of disopyramide in 50 ml of *chloroform*, add 2 ml of *13.5 M ammonia*, shake and filter through *anhydrous sodium sulphate*. Evaporate the filtrate to dryness using a rotary evaporator. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disopyramide IPRS* or with the reference spectrum of disopyramide.

B. When examined in the range 230 nm to 350 nm (2.4.7), the solution obtained in the Assay shows absorption maximum only at about 269 nm and a shoulder at 263 nm.

C. Shake a quantity of the contents of the capsules containing about 0.4 g of disopyramide with 20 ml of *water* and filter. The filtrate gives the reactions of phosphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of *water*;

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 262 nm (2.4.7). Calculate the content of $C_{21}H_{29}N_3O$ in the medium taking 125 as the specific absorbance at 262 nm.

Q. Not less than 70 per cent of the stated amount of $C_{21}H_{29}N_3O$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *18 M ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane*.

Test solution. Shake a quantity of the contents of the capsules containing 0.2 g of disopyramide with 20.0 ml of *methanol* for 30 minutes and filter.

Reference solution. Dilute 1.0 ml of test solution to 200.0 ml with *methanol*.

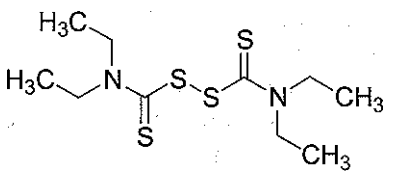
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 0.04 g of Disopyramide, add 40 ml of *0.05 M methanolic sulphuric acid*, shake for 15 minutes, dilute to 100.0 ml with the same solvent and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with *0.05 M methanolic sulphuric acid*. Measure the absorbance of the resulting solution at the maximum at 269 nm (2.4.7). Calculate the content of $C_{21}H_{29}N_3O$ taking 198.5 as the specific absorbance at 269 nm.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of disopyramide.

Disulfiram



$C_{10}H_{20}N_2S_4$ Mol.Wt. 296.5

Disulfiram is thioperoxydicarbonic diamide[$(H_2N)C(S)]_2S_2$, tetraethyl-; Bis(diethylthiocarbamoyl) disulfide.

Disulfiram contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{20}N_2S_4$.

Category. Used in the treatment of alcoholism.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disulfiram IPRS* or with the reference spectrum of disulfiram.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Disperse 0.2 g of Disulfiram in *methanol* and dilute to 100.0 ml with *methanol*. Dilute 10.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *disulfiram IPRS* in *methanol*. Dilute 10.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.005 per cent w/v of *disulfiram IPRS* and 0.001 per cent w/v of *sulfiram IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 4°,
- mobile phase: A. a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with 45 per cent w/v solution of *potassium hydroxide*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
8	30	70
12	30	70
12.1	60	40
16	60	40

Name	Relative retention time	Correction factor
Diethyldithiocarbamic acid	0.18	0.83
Tetraethylthiourea[1]	0.69	0.91
Sulfiram[2]	0.80	1.82
Disulfiram	1.0	—

[1]1,1,3,3-Tetraethylthiourea,

[2]Diethylthiocarbamic thioanhydride.

Inject reference solution (b). The test is not valid unless the resolution between sulfiram and disulfiram is not less than 8.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to diethyldithiocarbamic acid, tetraethylthiourea and sulfiram, each of, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Selenium. Not more than 30 ppm, using 0.2 g. Determine by the Oxygen-Flask method (2.3.34).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Use freshly prepared solutions.

Test solution. Dissolve 50 mg of the substance under examination in 40 ml of *ethanol*, with the aid of ultrasound for 5 minutes and dilute to 50.0 ml with *ethanol*. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *disulfiram IPRS* in *ethanol*. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with 45 per cent w/v solution of *potassium hydroxide* and 70 volumes of *methanol*,

- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1800theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{20}N_2S_4$.

Storage. Store protected from light and moisture.

Disulfiram Tablets

Disulfiram Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of disulfiram $C_{10}H_{20}N_2S_4$.

Usual strengths. 200 mg; 250 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.5 g of Disulfiram with 20 ml of *methanol*, filter, evaporate the filtrate to dryness and dry at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *disulfiram IPRS* or with the reference spectrum of disulfiram.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Disintegration (2.5.1). Not more than 15 minutes, carry out the test without discs.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Disperse a quantity of the powdered tablets containing 0.2 g of Disulfiram in *methanol* and dilute to 100.0 ml with *methanol*. Dilute 10.0 ml of the solution to 20.0 ml with the solvent mixture.

Reference solution (a). A 0.01 per cent w/v solution of *disulfiram IPRS* in *methanol*. Dilute 10.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.005 per cent w/v of *disulfiram IPRS* and 0.001 per cent w/v of *sulfiram IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- sample temperature: 4°,
- mobile phase: A. a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with 45 per cent w/v solution of *potassium hydroxide*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 15 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
8	30	70
12	30	70
12.1	60	40
16	60	40

Name	Relative retention time	Correction factor
Diethyldithiocarbamic acid	0.18	0.83
Tetraethylthiourea[1]	0.69	0.91
Sulfiram[2]	0.80	1.82
Disulfiram	1.0	---

[1]1,1,3,3-Tetraethylthiourea,

[2]Diethylthiocarbamic thioanhydride.

Inject reference solution (b). The test is not valid unless the resolution between sulfiram and disulfiram is not less than 8.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to diethyldithiocarbamic acid, tetraethylthiourea and sulfiram, each of, is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of Disulfiram in 70 ml of *ethanol*, with the aid of ultrasound with intermittent shaking for 30 minutes, dilute to 100.0 ml with *ethanol* and filter. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *disulfiram IPRS* in *ethanol*. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of a buffer solution prepared by dissolving 6.8 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 7.0 with 45 per cent w/v solution of *potassium hydroxide* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 20 µl.

Run the chromatogram 1.5 times the retention time of disulfiram.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

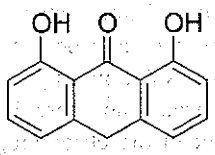
Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{20}N_2S_4$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Dithranol

Anthralin; Dioxyanthranol



$C_{14}H_{10}O_3$ Mol. Wt. 226.2

Dithranol is 1,8-dihydroxyanthrone.

Dithranol contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{14}H_{10}O_3$, calculated on the dried basis.

Category. Topical antipsoriatic.

Description. A yellow or orange-yellow, microcrystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dithranol IPRS* or with the reference spectrum of dithranol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *chloroform* shows absorption maxima at about 255 nm, 287 nm and 354 nm; absorbances at the maxima, about 0.55, 0.5 and 0.45 respectively.

C. Melts at about 178° (2.4.21).

Tests

Dihydroxyanthracene. Dissolve 0.1 g in 5 ml of hot *benzene*; a clear yellow or orange solution is produced.

Dihydroxyanthraquinone. Dissolve 1 mg in a few drops of *sulphuric acid*; a clear orange solution with no trace of violet colour is produced.

Related substances. A. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 20 ml of *dichloromethane*, add 1.0 ml of *glacial acetic acid* and dilute to 100.0 ml with *hexane*.

Reference solution. A solution containing 0.1 per cent w/v each of dithranol impurity A (*anthrone*), dithranol impurity B (*dantron*), *dithranol impurity C IPRS (4,4',5,5'-tetrahydroxy-9,9'-bianthracenyl-10,10'(9H,9'H)-dione IPRS)* and *dithranol IPRS* in *dichloromethane*. To 1.0 ml of the solution, add 19.0 ml of *dichloromethane* and 1.0 ml of *glacial acetic acid* and dilute to 50.0 ml with *hexane*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with silica (5 µm),
- mobile phase: a mixture of 1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of *hexane*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 20 µl.

The elution order of the peaks is dithranol, dithranol impurity B, dithranol impurity A and dithranol impurity C.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to dithranol and dithranol impurity B is not less than 2.0.

Inject the reference solution and the test solution. Run the chromatogram 1.5 times the retention time of dithranol impurity C. In the chromatogram obtained with the test solution, the area of peak corresponding to dithranol impurities A, B and C is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent).

B. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 5 ml of *tetrahydrofuran* and dilute to 25.0 ml with the mobile phase.

Reference solution. Dissolve 5 mg each of *dithranol impurity D IPRS (1-hydroxyanthracen-9(10H)-one IPRS)* and *dithranol IPRS* in 5 ml of *tetrahydrofuran* and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2.5 volumes of *glacial acetic acid,* 40 volumes of *tetrahydrofuran* and 60 volumes of *water,*
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to dithranol impurity D and dithranol is not less than 2.5.

Inject the reference solution and the test solution. Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of peak corresponding to dithranol impurity D is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (2.5 per cent) and the sum of areas of all the secondary peaks of tests A and B is not more than 3.0 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.2 g in 50 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02262 g of $C_{14}H_{10}O_3$.

Storage. Store protected from light.

Dithranol Ointment

Dithranol Ointment contains Dithranol, in fine powder, in a suitable base.

Dithranol Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dithranol, $C_{14}H_{10}O_3$.

Usual strengths. 0.1 to 2 per cent w/w.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Heat a quantity containing 0.5 mg of Dithranol with 5 ml of *1 M sodium hydroxide* on a water-bath with constant stirring; a pink colour is produced in the aqueous layer.

Tests

Dihydroxyanthracene. Dissolve a quantity containing 0.1 g of Dithranol in 5 ml of hot *benzene*; a yellow or orange solution is produced.

Dihydroxyanthraquinone. Dissolve a quantity containing 1 mg of Dithranol in a few drops of *sulphuric acid*; an orange solution with no trace of violet colour is produced.

Other tests. Comply with the tests stated under Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the ointment containing 5 mg of Dithranol, disperse in 20 ml of *dichloromethane,* add 1.0 ml of *glacial acetic acid,* dilute to 100.0 ml with *hexane* and filter.

Reference solution. Add 1.0 ml of *glacial acetic acid* to 20.0 ml of a 0.025 per cent w/v solution of *dithranol IPRS* in *dichloromethane* and add sufficient *hexane* to produce 100.0 ml.

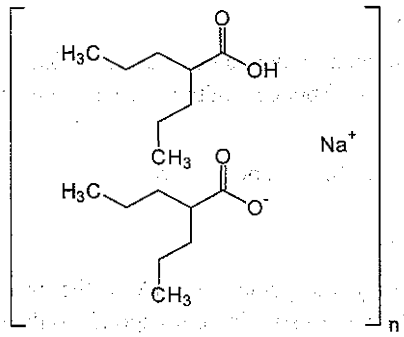
Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5 µm),
- mobile phase: a mixture of 82 volumes of *hexane,* 5 volumes of *dichloromethane* and 1 volume of *glacial acetic acid,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 354 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_{10}O_3$ in the ointment.

Storage. Store protected from light.

Divalproex Sodium



$(C_{16}H_{31}NaO_4)_n$ Mol. Wt. 310.4

Divalproex Sodium is 2-Propyl-pentanoic acid sodium salt (2:1). Sodium hydrogen bis(2-propylvalerate) oligomer.

Category. Anticonvulsant.

Divalproex Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of available valproic acid, $C_8H_{16}O_2$.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *divalproex sodium IPRS* or with the reference spectrum of divalproex sodium.

B. Ignite about 100 mg, the residue gives the reaction of sodium (2.3.1).

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 1.0 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in the mobile phase and dilute to 100 ml with the same solvent.

Reference solution (a). A 0.5 per cent w/v solution of *valproic acid IPRS* in the mobile phase.

Reference solution (b). A 0.05 per cent w/v solution of *valproic acid impurity A IPRS (diallylacetic acid IPRS)* in *acetonitrile.*

Reference solution (c). Mix 10 ml of reference solution (a) and 1 ml of reference solution (b) and dilute to 100 ml with the mobile phase to obtain a solution having concentrations of 0.05 per cent w/v of valproic acid and 0.0005 per cent w/v of valproic acid impurity A.

Reference solution (d). Dilute a volume of reference solution (a) with the mobile phase to obtain a solution having a concentration of about 0.05 per cent w/v of valproic acid.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 3.5 g of *monobasic sodium phosphate monohydrate* in 900 ml of *water*, adjusted to pH 3.5 with *orthophosphoric acid* and diluted to 1000 ml with *water* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

The relative retention time with reference to valproic acid for valproic acid impurity A is about 0.69.

Inject reference solution (c).The test is not valid unless the resolution between the peaks due to valproic acid impurity A and valproic acid is not less than 5.0 and the tailing factor for valproic acid peak is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (d) and the test solution.

Calculate the content of available valproic acid, $C_8H_{16}O_2$ in the divalproex sodium taken by the formula:

$$100\,(C_S / C_U)\,(r_U / r_S)\,(310.41/144.21)\,(½)$$

in which C_S is the concentration, in mg per ml of valproic acid in the reference solution, C_U is the concentration of divalproex sodium in mg per ml in the test solution, r_U *and* r_S are the peak areas for valproic acid obtained from the test solution and the reference solution; 310.4 and 144.2 are the molecular weights for divalproex sodium repeating unit and valproic acid, respectively; and 2 is the number of moles of valproic acid per mole of divalproex sodium repeating unit.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Divalproex Gastro-resistant Tablets

Divalproex Tablets; Divalproex Sodium Gastro-resistant Tablets; Divalproex Sodium Tablets

Divalproex Gastro-resistant Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valproic acid, $C_8H_{16}O_2$. They are made gastro-resistant by enteric-coating or by other means.

Usual strengths. 125 mg; 250 mg; 500 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 2 (Paddle),

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 50 rpm and 2 hours.

Withdraw the dissolution medium completely and transfer the tablets in 900 ml of *phosphate buffer 7.5* for test B.

B. Apparatus No. 2 *(Paddle),*

Medium. 900 ml of *phosphate buffer 7.5,*

Speed and time. 50 rpm and 1 hour.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, to obtain a solution of 0.012 per cent w/v in the dissolution medium.

Reference solution. A 0.012 per cent w/v solution of *valproic acid IPRS* in the dissolution medium.

NOTE—A volume of acetonitrile not exceeding 10 per cent may be used to dissolve.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with phenyl group bonded to porous silica (4 µm),
- mobile phase: a mixture of 35 volumes of *citrate buffer,* 35 volumes of *potassium phosphate buffer and* 30 volumes of *acetonitrile*, adjusted to pH 3.0 with *orthophosphoric acid,*
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 50 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{16}O_2$ in the tablets.

Q. Not less than 80 per cent of the stated amount of $C_8H_{16}O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing about 50 mg of valproic acid, disperse in 100.0 ml of the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *valproic acid IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with phenyl group bonded to porous silica (4 µm),
- mobile phase: a mixture of 70 volumes of *citrate buffer and* 30 volumes of *acetonitrile*, adjusted to pH 3.0 with *orthophosphoric acid,*
- flow rate: 0.9 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{16}O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Divalproex Prolonged-release Tablets

Divalproex Sodium Prolonged-release Tablets; Divalproex Sustained-release Tablets; Divalproex Extended-release Tablets

Divalproex Prolonged-release Tablets manufactured by different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable, as the dissolution profile of the products of different manufacturers may not be the same.

Divalproex Prolonged-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of valproic acid, $C_8H_{16}O_2$.

Usual strengths. 125 mg;250 mg; 500 mg; 750 mg; 1000 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2). Complies with the test stated under Tablets.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution (a). A 0.01 per cent w/v solution of *octanoic acid* in *dichloromethane.*

Internal standard solution (b). A 0.01 per cent w/v solution of *octanoic acid* in *0.1 M sodium hydroxide.*

Test solution (a). Transfer a weighed quantity of powdered tablets containing 500 mg of Divalproex Sodium into a 250-ml separating funnel. Add 20 ml of *water* and shake to form slurry. Acidify with *2 M sulphuric acid* until acidic to litmus. Extract thrice with 20 ml portion of *dichloromethane*. Collect the combined dichloromethane layers in separating funnel. Wash this layer with 15 ml *water*. Collect the dichloromethane layer. Wash the combined dichloromethane extract with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (b). Transfer a weighed quantity of powdered tablets containing 500 mg of Divalproex Sodium into a 250-ml separating funnel and 10 ml of internal standard solution (b) and shake to form slurry. Acidify with *2 M sulphuric acid* until acidic to litmus. Extract thrice with 20-ml portion of *dichloromethane*. Collect the combined dichloromethane layers in separating funnel. Wash this layer with 15 ml *water*. Collect the dichloromethane layer. Wash the combined dichloromethane extract with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Chromatographic system

- a fused-silica column 30 m x 0.53 mm, packed with macrogol 20000 2-nitroterephthalate (0.5 µm),
- temperature:
  column. 130° from 0 to 10 minutes, 130° to 190° at a constant rate of 3° per minute and hold at 190° for 15 minutes,
- inlet port at 220° and detector at 220°,
- a flame ionization detector,
- flow rate: 6.33 ml per minute using nitrogen as carrier gas.

Inject 1 µl of internal standard solution (a) and test solution (b). The test is not valid unless the resolution between the peaks due to valproic acid and internal standard (octanoic acid) is not less than 3.0.

Inject 1 µl of internal standard solution (a), test solution (a) and (b). In the chromatogram obtained with test solution (b) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the peak due to internal standard (octanoic acid) (0.5 per cent) and the area of any secondary peak is not more than the area of the peak due to internal standard (octanoic acid) (0.2 per cent). Ignore any peak due to dichloromethane and any peak coming after retention time 30 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 0.5 g of *citric acid monohydrate* and 0.4 g of *dibasic sodium phosphate* in 1000 ml of *water* adjusted to pH 2.0 with *orthophosphoric acid.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.25 g of valproic acid in 70 ml of *methanol,* with the aid of ultrasound for about 1 hour, dilute to 100.0 ml with *methanol* and filter. Dilute 4.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.25 per cent w/v solution of *valproic acid IPRS* in *methanol.* Dilute 4.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with phenyl group bonded to porous silica (4 µm),
- mobile phase: a mixture of 11 volumes of *methanol* and 9 volumes of buffer solution prepared by dissolving 0.5 g of *citric acid monohydrate* and 0.4 g of *dibasic sodium phosphate* in 1000.0 ml of *water,* adjusted to pH 5.0 with *orthophosphoric acid,*
- flow rate: 0.7 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

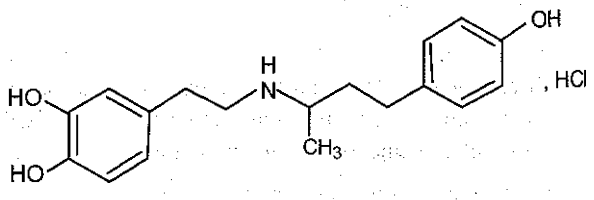
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of valproic acid, $C_8H_{16}O_2$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Dobutamine Hydrochloride



$C_{18}H_{23}NO_3,HCl$ Mol. Wt. 337.9

Dobutamine Hydrochloride is (*RS*)-4-[2-[[3-(4-hydroxyphenyl)-1-methylpropyl]amino]ethyl]benzene-1,2-diol hydrochloride.

Dobutamine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO_3,HCl$, calculated on the dried basis.

Category. Vasopressor.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dobutamine hydrochloride IPRS* or with the reference spectrum of dobutamine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1), using a mixture of equal volumes of *methanol* and *water*.

Tests

Acidity or alkalinity. Dissolve 0.1 g in *water* with gentle heating and dilute to 10 ml with *water*. Add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*, the solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*, the solution is red.

Absorbance (2.4.7). Not more than 0.04 at 480 nm, determined in a 2 per cent w/v solution in a mixture of equal volumes of *methanol* and *water*, measure immediately.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 35 volumes of mobile phase B and 65 volumes of mobile phase A.

Test solution. Dissolve 0.1 g of the substance under examination in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dilute 4.0 ml of the test solution to 100.0 ml with a 0.005 per cent w/v solution of *anisaldehyde* in the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.6 g of *sodium octane sulphonate* in 1000 ml of *water*, add 3 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. a mixture of 18 volumes of *acetonitrile* and 82 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
5	65	35
20	20	80
25	20	80

Name	Relative retention time	Correction factor
Dobutamine impurity A[1]	0.3	1.4
Dobutamine impurity B[2]	0.5	1.4
Dobutamine (Retention time: about 12 minutes)	1.0	—
Dobutamine impurity C[3]	1.4	—

[1]dopamine,

[2]4-(4-hydroxyphenyl)butan-2-one,

[3](2*RS*)-*N*-[2-(3,4-dimethoxyphenyl)ethyl]-4-(4-methoxyphenyl) butan-2-amine.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to dobutamine and anisaldehyde is not less than 4.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to dobutamine impurities A, B and C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.25 g in 10 ml of *anhydrous formic acid*. Add 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.03379 g of $C_{18}H_{24}ClNO_3$.

Storage. Store protected from light.

Dobutamine Injection

Dobutamine Intravenous Infusion

Dobutamine Injection is a sterile solution containing Dobutamine Hydrochloride. It is supplied as a ready-to-use solution or it is prepared by diluting either Sterile Dobutamine

Concentrate or Dobutamine Hydrochloride for Injection with a suitable diluent in accordance with the manufacturer's instructions.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per ml of a 1 per cent w/v solution of Dobutamine in water for injections.

Storage. Dobutamine Injection prepared from Sterile Dobutamine Concentrate or from Dobutamine Hydrochloride for Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

When supplied as ready to use solution, the injection complies with the following requirements

Dobutamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dobutamine, $C_{18}H_{23}NO_3$.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14) as described under test for Related substances for Sterile Dobutamine Concentrate using the following modifications.

Test solution. Dilute a volume of injection with the solvent mixture to obtain a solution of 0.05 per cent w/v of dobutamine.

Assay. Determine by liquid chromatography (2.4.14) as described under Assay for Sterile dobutamine Concentrate with the following modifications.

Test solution. Dilute a volume of injection with the mobile phase to obtain a solution of 0.05 per cent w/v of dobutamine.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of dobutamine.

Sterile Dobutamine Concentrate

Sterile Dobutamine Concentrate is a sterile solution of Dobutamine Hydrochloride in Water for Injections.

Sterile Dobutamine Concentrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dobutamine, $C_{18}H_{23}NO_3$.

The concentrate complies with the requirements for Concentrates for Injections or Injections stated under Parenteral Preparations and with the following requirements.

Description. A colourless or pale yellow solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 2.5 to 4.0, determined in the concentrate diluted, if necessary with *water* to obtain a solution containing 1.25 per cent w/v of dobutamine.

Appearance of solution. A solution of concentrate containing 1.25 per cent w/v of dobutamine in *water* is not more opalescent than opalescence solution (OS2) (2.4.1).

Light absorption. The absorbance of a concentrate containing 1.25 per cent w/v of dobutamine in *water* at 400 nm (2.4.7) is not more than 0.2.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dilute a volume of concentrate to obtain a solution of 0.5 per cent w/v of dobutamine with the solvent mixture.

Reference solution (a). Dilute 4.0 ml of the test solution to 100.0 ml with a 0.005 per cent w/v solution of *anisaldehyde* in the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 2.6 g of *sodium octanesulphonate* in 1000 ml of *water*, add 3 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*,
  B. a mixture of 18 volumes of *acetonitrile* and 82 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	65	35
5	65	35
20	20	80
25	20	80
28	65	35

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to dobutamine hydrochloride and anisaldehyde is not less than 4.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of concentrate with the mobile phase to obtain a solution containing 0.05 per cent w/v of dobutamine.

Reference solution (a). A 0.06 per cent w/v solution of *dobutamine hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.06 per cent w/v of *dobutamine hydrochloride IPRS* and 0.03 per cent w/v of *4-(4- hydroxyphenyl)butan-2-one* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (Such as Supelcosil LC-18-DB),
- mobile phase: a mixture of 14 volumes of *methanol*, 28 volumes of *acetonitrile*, 58 volumes of a solution prepared by dissolving 3.38 g of *sodium octane sulphonate* in 1000 ml of *water* adding 3 ml of *triethylamine*, adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm.
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless, the resolution between the peaks due to dobutamine hydrochloride and 4-(4- hydroxyphenyl)butan-2-one is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{23}NO_3$ in the concentrate.

Labelling. The label states the quantity of active ingredients in terms of the equivalent amount of dobutamine.

Dobutamine Hydrochloride for Injection

Dobutamine Hydrochloride for Injection is a sterile material consisting of Dobutamine Hydrochloride with or without excipients. It is supplied in a sealed container.

Dobutamine Hydrochloride for Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dobutamine, $C_{18}H_{23}NO_3$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 2.5 to 4.5, determined in a solution of injection containing 2.5 per cent w/v of dobutamine in *water*.

Appearance of solution. A solution of injection containing 2.5 per cent w/v of dobutamine in *water* is not more opalescent than opalescence solution (OS2) (2.4.1).

Light absorption. The absorbance of a solution containing 2.5 per cent w/v of dobutamine in *water* at 480 nm (2.4.7) is not more than 0.065.

Related substances. Determine by liquid chromatography (2.4.14) as described under test for Related substances for Sterile Dobutamine Concentrate using the following modifications.

Test solution. Dissolve a quantity of the contents of the sealed container with the solvent mixture to obtain a solution containing 0.5 per cent w/v of dobutamine.

Water (2.3.43). Not more than 2.0 per cent (*NOTE —Use the contents of a single container and add 7 g of salicylic acid and 20 ml of formamide before the determination*).

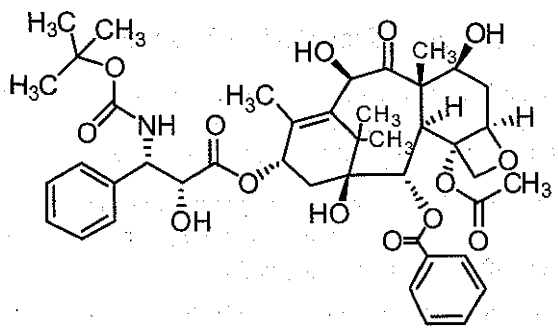
Bacterial endotoxins (2.2.3). Not more than 5.56 Endotoxin Units per mg of dobutamine.

Assay. Determine by liquid chromatography (2.4.14) as described under Assay for Sterile Dobutamine Concentrate using the following modifications.

Test solution. Dissolve sufficient of the mixed contents of 10 containers in the mobile phase to obtain a solution containing 0.05 per cent w/v of Dobutamine.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of dobutamine.

Docetaxel Anhydrous



$C_{43}H_{53}NO_{14}$ Mol. Wt. 807.9

Docetaxel Anhydrous is 1β,7β,10β-trihydroxy-9-oxo-5β,20-epoxytax-11-ene-2α,4α,13α-triyl 4-acetate 2-benzoate 13-{(2*R*,3*S*)-3-[(*tert*-butoxycarbonyl)amino]-2-hydroxy -3-phenylpropanoate}.

Docetaxel Anhydrous contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{43}H_{53}NO_{14}$, Calculated on the anhydrous basis.

Description. A white or almost white, crystalline, hygroscopic powder.

Identification

A. Specific optical rotation (2.4.22). Complies the test.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *docetaxel anhydrous IPRS* or with the reference spectrum of docetaxel anhydrous.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol* is not more opalescent than reference suspension II (2.4.1) and not more intensely coloured than reference solution BS5 (2.4.1).

Specific optical rotaion (2.4.22). −41.5° to −38.5°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A 0.05 volume of *acetic acid*, 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *ethanol* and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 50 mg of *docetaxel trihydrate IPRS* in 2.5 ml of *ethanol* and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5 mg of *docetaxel impurity E IPRS* in 2.5 ml of *ethanol* and dilute to 50.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature. 45°,
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	72	28
9	72	28
39	28	72
42	72	28

Name	Relative retention time	Correction factor
Docetaxel impurity E[1]	0.2	—
Docetaxel impurity A[2]	0.97	1.6
Docetaxel (Retention time is about 27 minutes)	1.0	—
Docetaxel impurity B[3]	1.08	—
Docetaxel impurity C[4]	1.13	—

[1]10-desacetyl-baccatin III,

[2]2-*O*-desbenzoyl-2-*O*-tiglyldocetaxel,

[3]10-deoxy-10-oxodocetaxel,

[4]7-*epi*-docetaxel.

Inject reference solution (b), (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to docetaxel impurity B is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to docetaxel impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any peak due to docetaxel impurity C is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak due to docetaxel impurity E is not more than 1.5 times the area of corresponding peak in the chromatogram obtained with reference solution (c) (0.15 per cent), the area of any other secondary peak is not

more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of a mixture of 15 volumes of *water* and 85 volumes of *dimethylformamide*. 12 ml of the solution complies with the limit test for heavy metals, method D (20 ppm), using 10 ml of *lead standard solution (1 ppm Pb)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14) as described under test for Related substances with the following modification.

Inject reference solution (a) and the test solution.

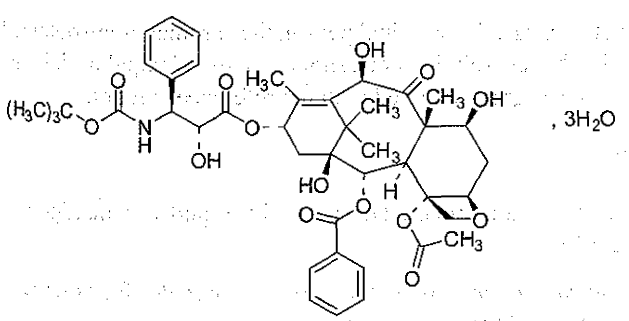
Calculate the content of $C_{43}H_{53}NO_{14}$.

If intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

Bacterial endotoxins (2.2.3). Not more than 0.3 Endotoxin Unit per mg of docetaxel

Storage. Store protected from light and moisture.

Docetaxel Trihydrate



$C_{43}H_{53}NO_{14}, 3H_2O$ Mol. Wt. 861.9

Docetaxel Trihydrate is *N*-debenzoyl-*N*-(*tert*-butoxycarbonyl)-10-deacetyltaxol trihydrate.

Docetaxel Trihydrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{43}H_{53}NO_{14}$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *docetaxel trihydrate IPRS* or with the reference spectrum of docetaxel trihydrate.

B. In the Assay, the retention time of principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −41.5° to −38.5°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.05 volume of *acetic acid*, 50 volumes of *acetonitrile* and 50 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 2.5 ml of *ethanol* and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 50 mg of *docetaxel trihydrate IPRS* in 2.5 ml of *ethanol* and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature: 45°,
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	72	28
9	72	28
39	28	72
42	72	28

Name	Relative retention time	Correction factor
Docetaxel impurity A[1]	0.97	1.6
Docetaxel (Retention time is about 27 minutes)	1.0	---
Docetaxel impurity B[2]	1.08	—
Docetaxel impurity C[3]	1.13	—
Docetaxel impurity D[4]	1.18	—

[1]2-*O*-desbenzoyl-2-*O*-tiglyldocetaxel,

[2]10-deoxy-10-oxodocetaxel,

[3]7-*epi*-docetaxel,

[4]4-*epi*-6-oxodocetaxel.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to docetaxel impurity A is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any peak due to docetaxel impurity B and docetaxel impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to docetaxel impurity D is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g of complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). 5.0 per cent to 7.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modification.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{43}H_{53}NO_{14}$.

Docetaxel Trihydarte intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.3 Endotoxin Unit per mg of docetaxel.

Storage. Store protected from light and moisture, at a temperature not exceeding 8°.

Docetaxel Injection

The injection is constituted by dissolving the contents of the sealed container in accordance with the manufacturer's instructions, immediately before use.

The constituted solution complies with the requirements for clarity of solution and particulate matter stated under Parenteral Preparations (Infusions).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Usual strengths. 20 mg; 80 mg; 120 mg.

Docetaxel Concentrate

Docetaxel Concentrate is a sterile solution of Docetaxel in a suitable vehicle.

The concentrate complies with the requirements stated under Parenteral Preparations (Concentrated solutions for injections) and with the following requirements.

Docetaxel Concentrate contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of docetaxel, $C_{43}H_{53}NO_{14}$.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 100 volumes of *acetonitrile*, 0.1 volume of *acetic acid* and 100 volumes of *water*.

Test solution.

For the injection labeled as one-vial formulation — Dilute a portion of the injection to obtain a solution containing 0.02 per cent w/v of docetaxel (anhydrous) in the solvent mixture.

For the injection labeled as two-vial formulation — Dissolve the content of the vial in an amount of alcohol equivalent to

5.0 per cent of the final volume and dilute with the solvent mixture to obtain a solution containing 0.02 per cent w/v of docetaxel (anhydrous) in the solvent mixture.

Reference solution (a). A 0.02 per cent w/v solution of *docetaxel IPRS* prepared by dissolving in *ethanol (95 per cent)* and diluting with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Further dilute 1.0 ml to 10.0 ml with the solvent mixture.

The alternative chemical name is 5β, 20-epoxy-1,7α-dihydroxy-9,10-dioxotax-11-ene-2α,4,13α-triyl-4-acetate-2-benzoate-13[(2R,3S)-3-[[(1,1-dimethylethoxy)carbonyl]amino]-2-hydroxy-3-phenylpropanoate].

Inject reference solution (a) and (b). The test is not valid unless the signal to noise ratio is not less than 10 for reference solution (b), and relative standard deviation for replicate injections is not more than 1.0 per cent for reference solution (a).

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area of any peak due to 10-deacetyl baccatin is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any peak due to crotonaldehyde analog is not more than 13 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.3 per cent), the area of any peak due to 6-oxodocetaxel is not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent), the area of any peak due to 4-epidocetaxel is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any peak due to 4-epi-6-oxodocetaxel is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any other secondary peak is not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum

of the areas of all the secondary peaks is not more than 35 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1per cent) and any peak with a relative retention time less than 0.2 or more than 1.3.

Bacterial endotoxins (2.2.3). Not more than 1.94 Endotoxin Units per mg of docetaxel (anhydrous).

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances using following modifications.

NOTE—Use the solution within 24 hours when stored at 25°.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject reference solution (a) and the test solution.

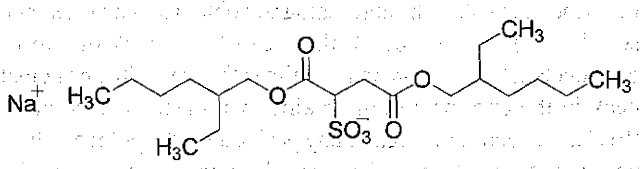
Calculate the content of $C_{43}H_{53}NO_{14}$ in the injection.

Storage. Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store at a temperature not exceeding 25°.

Labelling. The label states (1) The strength in terms of the equivalent amount of Docetaxel anhydrous; (2) Indicate whether it is a one-vial formulation or two-vial formulation (Injection concentrate and diluent), and also label it to indicate that it is to be diluted with a suitable parenteral vehicle before intravenous infusion.

Docusate Sodium

Dioctyl Sodium Sulphosuccinate



$C_{20}H_{37}NaO_7S$ Mol. Wt. 444.6

Docusate Sodium is sodium 1,4-bis[(2-ethylhexyl)oxy]-1,4-dioxobutane-2-sulphonate.

Docusate Sodium contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{37}NaO_7S$, calculated on the anhydrous basis.

Category. Emollient laxative or purgative.

Description. White or almost white, waxy masses or flakes, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *docusate sodium IPRS* or with the reference spectrum of docusate sodium.

B. Ignite 0.75 g in the presence of *dilute sulphuric acid*, until an almost white residue is obtained. Cool and add 5 ml of *water*, filter. 2 ml of the filtrate gives reaction (A) of sodium salts (2.3.1).

Tests

Alkalinity. Dissolve 1.0 g in 100 ml of a mixture of equal volumes of *methanol* and *water*, previously neutralised to *methyl red solution*. Add 0.1 ml of *methyl red solution*. Not more than 0.2 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to red.

Related non-ionic substances. Determine by gas chromatography (2.3.13).

Internal standard solution. Dissolve 10 mg of *methyl behenate* in 50 ml of *hexane*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 2.0 ml of the internal standard solution and dilute to 5.0 ml with *hexane*. Pass the solution, at a rate of about 1.5 ml per minute, through a column 10 mm in internal diameter, packed with 5 g of *basic aluminium oxide* and previously washed with 25 ml of *hexane*. Elute with 5 ml of *hexane* and discard the eluate. Elute with 20 ml of a mixture of equal volumes of *ether* and *hexane*. Evaporate the eluate to dryness and dissolve the residue in 2.0 ml of *hexane*.

Test solution (b). Prepare as described for test solution (a) but dissolving 0.1 g of the substance under examination in 5.0 ml of *hexane* and using a new column.

Reference solution. Dilute 2.0 ml of the internal standard solution to 5.0 ml with *hexane*.

Chromatographic system

- a glass column 2 m x 2 mm, packed with silanised diatomaceous earth for gas chromatography (150 µm to 180 µm) impregnated with 3 per cent m/m of *polymethylphenylsiloxane*,
- temperature :
  column 230°,
  inlet port and detector at 280°,
- flow rate: 30 ml per minute, using nitrogen as the carrier gas.

Inject 1 µl of test solution (a), (b) and the reference solution. There is no peak with the same retention time as the internal

standard in the chromatogram obtained with test solution (b). The area of any impurity peak is not more than the area of the peak due to the internal standard (0.4 per cent).

Chlorides (2.3.12). Dissolve 5.0 g in 50 ml of *alcohol (50 per cent v/v)* and add 0.1 ml of *potassium dichromate solution*. Not more than 0.5 ml of *0.1 M silver nitrate* is required to change the colour of the indicator from yellow to orange (350 ppm).

Sodium sulphate. Not more than 2 per cent.

Dissolve 0.25 g in 40 ml of a mixture of 20 volumes of *water* and 80 volumes of *2-propanol*. Adjust to pH between 2.5 and 4.0 using *perchloric acid solution*. Add 0.4 ml of *naphtharson solution* and 0.1 ml of 0.0125 per cent w/v solution of *methylene blue*. Not more than 1.5 ml of *0.025 M barium perchlorate* is required to change the colour of the indicator from yellowish-green to yellowish-pink.

Heavy metals (2.3.13). Dissolve 4.0 g in 20 ml of *ethanol (80 per cent v/v)*. 12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm), using 10 ml of *lead standard solution (2 ppm Pb)*.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.25 g.

Assay. Dissolve 1.0 g in 25.0 ml of *0.5 M alcoholic potassium hydroxide* and heat on a water-bath under reflux for 45 minutes. Cool, add 0.25 ml of *phenolphthalein solution* and titrate with *0.5 M hydrochloric acid* until the red colour disappears. Carry out a blank titration.

1 ml of *0.5 M hydrochloric acid* is equivalent to 0.1112 g of $C_{20}H_{37}NaO_7S$.

Storage. Store protected from moisture.

Docusate Tablets

Docusate Sodium Tablets

Docusate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of docusate sodium, $C_{20}H_{37}NaO_7S$.

Usual strength. 100 mg.

Identification

Extract the powder of the tablets with solvent hexane, filter, and evaporate the filtrate on a water-bath. Determine by infrared absorption spectrophotometry (2.4.6) on the residue. Compare the spectrum with that obtained with *docusate sodium IPRS* or with the reference spectrum of docusate sodium.

Tests

Disintegration (2.5.1). Not more than 60 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse 10 tablets with 200 ml of *ethanol (95 per cent)* and 300 ml of *water*, shake by mechanical means for about 90 minutes and dilute to 1000 ml with *water*, filter.

Reference solution (a). Dissolve a weighed quantity of *docusate sodium IPRS* in *ethanol (95 per cent)* and dilute with *water* to obtain a solution having a concentration of 0.1 per cent w/v of Docusate Sodium.

Reference solution (b). Dissolve about 15 mg of *methylparaben* in 100 ml of *water*. To 0.1 ml of the solution, add 10 ml of reference solution (a).

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 50 volumes of *7 mM ammonium acetate* and 50 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 40 µl.

The relative retention time with reference to docusate for methylparaben is about 0.74.

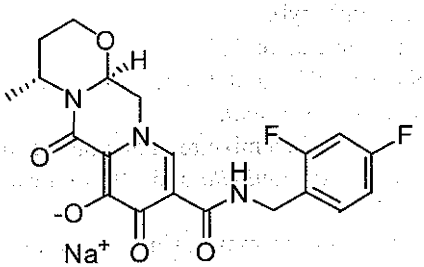
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to methylparaben and docusate is not less than 2.0, the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 1.8 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{37}NaO_7S$ in the tablets.

Storage. Store protected from moisture.

Dolutegravir Sodium



$C_{20}H_{18}F_2N_3NaO_5$ Mol. Wt. 441.4

Dolutegravir Sodium is sodium (4*R*,12a*S*)-9-[(2,4-difluorobenzyl)carbamoyl]-4-methyl-6,8-dioxo-3,4,6,8,12,12a-

hexahydro-2*H*-pyrido[1',2':4,5]pyrazino[2,1-*b*][1,3]oxazin-7-olate.

Dolutegravir Sodium contains not less than 98.0 per cent and not more than 102. 0 per cent of $C_{20}H_{18}F_2N_3NaO_5$, calculated on the anhydrous basis.

Category. Antiretroviral.

Description. A white to light yellow powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dolutegravir sodium IPRS* or with the reference spectrum of dolutegravir sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Ignite 0.1 g of substance under examination and dilute to 2.0 ml with *water*. The solution gives reaction (A) of sodium (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *dolutegravir sodium IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with the solvent mixture. Further, dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Kinetex Biphenyl),
- column temperature: 35°,
- mobile phase: A. a 0.1 per cent v/v solution of *orthophosphoric acid*,
  B. a mixture of 50 volumes of *water*, 40 volumes of *acetonitrile* and 10 volumes of *tertiary butanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hydroxyl impurity, methyl dolutegravir impurity, 2- fluoro impurity and 4- fluoro impurity peak is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.15 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with the

reference solution (1.0 per cent). Ignore the peak due to isomer 1, isomer 2 and the peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.025 per cent w/v solution of *dolutegravir for system suitability IPRS* (containing 4-fluoro impurity, isomer-1, isomer-2 and enantiomer) in the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with Chiralcel (5 µm), (Such as Chiralcel OZ-RH),
- column temperature: 30°,
- mobile phase: a mixture of 94 volumes of *acetonitrile*, 6 volumes of *water* and 0.2 volume of *formic acid*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Name	Relative retention time
Isomer-1	0.82
Enantiomer[1]	0.89
Dolutegravir	1.0
Isomer-2	1.22

[1]Sodium (4*S*,12a*R*)-9-[(2,4-difluorobenzyl) carbamoyl]-4-methyl-6,8-dioxo-3,4,6,8,12,12a-hexahydro-2*H*-pyrido[1',2':4,5]pyrazino[2,1-b][1,3]oxazin-7-olate.

Inject the reference solution. The test is not valid unless the resolution between isomer-1 peak and enantiomer peak is not less than 1.2.

Inject the test solution. The area of dolutegravir isomer-1, isomer-2 and enantiomer peak, each of, is not more than 0.15 per cent, calculated by area normalisation.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.01 per cent w/v solution of *dolutegravir sodium IPRS* in the solvent mixture

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with phenyl group bonded to porous silica (5 µm) (Such as Kinetex Biphenyl),
- column temperature: 50°,
- mobile phase: a mixture of 0.1 volume of *orthophosphoric acid*, 60 volumes of *water*, 20 volumes of *acetonitrile* and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{18}F_2N_3NaO_5$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Dolutegravir Tablets

Dolutegravir Sodium Tablets

Dolutegravir Tablets contain dolutegravir sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dolutegravir, $C_{20}H_{19}F_2N_3O_5$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of 0.25 per cent w/v of *sodium lauryl sulphate* in a buffer solution prepared by dissolving 1.2 g of *anhydrous sodium dihydrogen phosphate* in 1000 ml of *water*, adjusted to pH 6.8 with *0.2 M sodium hydroxide solution*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *dolutegravir sodium IPRS* in the solvent mixture and dilute if necessary with the dissolution medium to obtain a solution of about the same concentration as the test solution.

Chromatographic system
- a stainless steel column 7.5 cm × 4.6 mm, packed with octylsilane bonded to porous silica (2.6 µm) (Such as Kinetex C8, 100 Å),
- mobile phase: a mixture of 65 volumes of 0.1 per cent v/v of *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{19}F_2N_3O_5$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{20}H_{19}F_2N_3O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water*.

Test solution. Disperse a quantity of powdered tablets containing 100 mg of Dolutegravir in 70 ml of the solvent mixture, with the aid of ultrasound for about 30 minutes with intermittent shaking and dilute to 100.0 ml with the solvent mixture. Centrifuge at 5000 rpm for 10 minutes and use supernatant liquid.

Reference solution (a). A 0.0025 per cent w/v solution each of *dolutegravir isomer-1 IPRS* and *isomer-2 IPRS* in the solvent mixture.

Reference solution (b). Dissolve 20 mg of *dolutegravir sodium IPRS* in 4 ml of reference solution (a) and dilute to 20.0 ml with the solvent mixture.

Reference solution (c). A 0.001 per w/v solution of *dolutegravir sodium IPRS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3µm),
- column temperature: 40°,
- sample temperature: 10°,
- mobile phase: A. a mixture of 95 volumes of *0.01 M potassium dihydrogen orthophosphate*, adjusted to pH 2.8 with *dilute orthophosphoric acid* and 5 volumes of *acetonitrile*,

B. a mixture of 20 volumes of *0.01 M potassium dihydrogen orthophosphate*, adjusted to pH 2.8 with *dilute orthophosphoric acid* and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
10	90	10
20	80	20
30	65	35
70	75	25
77	30	70
82	20	80
85	20	80
90	90	10
100	90	10

Name	Relative retention time
Hydroxy impurity	0.65
Methyl dolutegravir impurity*	0.80
2-Fluoro impurity*	0.82
Desfluoro (4-fluoro) impurity*	0.86
Dolutegravir	1.00
Dolutegravir isomer-1* and isomer-2*	1.02

*Process impurity included for identification only and not included in the calculation of total degradation products.

Inject reference solution (b) and (c). The test is not valid unless the peak to valley ratio is not less than 1.5 for reference solution (b) and the tailing factor is not more than 2.0 for reference solution (c).

Inject reference solution (c) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to hydroxy impurity is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *water.*

Test solution. Weigh and transfer 10 intact tablets into 500-ml volumetric flask, add 50 ml of *water* and disperse with the aid of ultrasound for about 30 minutes, add 50 ml of *acetonitrile* and 200 ml of the solvent mixture, sonicate for 45 minutes with occasional shaking and dilute to volume with the solvent mixture. Centrifuge at 5000 rpm for 10 minutes. Dilute 1.0 ml of the supernatant liquid to 25.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *dolutegravir sodium IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Kinetex C18 100 Å),
- sample temperature: 10°,
- mobile phase: a mixture of 65 volumes of 0.1 per cent v/v of *orthophosphoric acid* and 35 volumes of *acetonitrile*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{19}F_2N_3O_5$ in the tablets.

1 mg of dolutegravir sodium is equivalent to 0.950 mg of dolutegravir.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of dolutegravir.

Dolutegravir, Lamivudine and Tenofovir Disoproxil Fumarate Tablets

Dolutegravir Sodium, Lamivudine and Tenofovir Disoproxil Fumarate Tablets

Dolutegravir, Lamivudine and Tenofovir Disoproxil Tablets contain an amount of dolutegravir sodium equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dolutegravir, $C_{20}H_{19}F_2N_3O_5$, lamivudine, $C_8H_{11}N_3O_3S$ and tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$.

Usual strength. Dolutegravir 50 mg, Lamivudine 300 mg and Tenofovir Disoproxil Fumarate 300 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a buffer solution prepared by dissolving 6.9 g of *sodium dihydrogen phosphate,* 0.9 g of *sodium hydroxide* and 2.5 g of *sodium dodecyl sulphate* in 800 ml of *water*, adjusted to pH 6.8 with *2 M sodium hydroxide* and dilute to 1000 ml with *water*,

Speed and time. 60 rpm and 30 minutes, 60 minutes.

Withdraw 10 ml of the medium after 30 minutes, filter (solution A). Add 10 ml of dissolution medium in each dissolution vessel and continue the dissolution for further 30 minutes. After 60 minutes, withdraw again 10 ml of the medium, filter (solution B).

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution (a). Dilute 5.0 ml of solution A to 25.0 ml with solvent mixture (b).

Test solution (b). Dilute 5.0 ml of solution B to 25.0 ml with solvent mixture (b).

Inject the reference solution, test solution (a) and (b).

Calculate the content of $C_8H_{11}N_3O_3S$ in test solution (a) and $C_{19}H_{30}N_5O_{10}P$,$C_4H_4O_4$ and $C_{20}H_{19}F_2N_3O_5$ in test solution (b) in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{19}F_2N_3O_5$, $C_8H_{11}N_3O_3S$ and $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$.

Related substances.

For lamivudine and tenofovir disoproxil fumarate —

Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 225 mg of Tenofovir Disoproxil Fumarate in 150 ml of *water*, with the aid of ultrasound for 30 minutes with intermittent shaking and dilute to 250.0 ml with *water*, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water.*

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with *water.*

Reference solution (c). Dissolve 1 mg of *tenofovir disoproxil for system suitability IPRS* (containing tenofovir disoproxil impurity I and H) in 2.0 ml of *water.*

Reference solution (d). A 0.02 per cent w/v solution of fumaric acid in *water.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with endcapped octadecylsilane bonded to porous silica, (5 µm),
- sample temperature: 6°,
- mobile phase: A. a buffer solution prepared by dissolving 9.64 g of *ammonium acetate* in 900 ml of water, adjusted to pH 4.2 with *glacial acetic acid*, dilute to 1000 ml with *water*,

B. *acetonitrile*,

- flow rate: 1ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 10 µl.

[18]4-amino-1-[(2*RS*,5*RS*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one,

[19]1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidine-2,4(1*H*,3*H*)-dione,

[20]2-hydroxybenzoic acid (salicylic acid).

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to tenofovir disoproxil impurity I and tenofovir disoproxil is not less than 1.5 and the resolution between the peaks due to tenofovir disoproxil and tenofovir disoproxil impurity H is not less than 1.2.

Inject reference solution (d) for identification of peak due to fumaric acid.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak corresponding to tenofovir impurity A is not more than 3 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with reference solution (a) (3.0 per cent), the area of any secondary peak corresponding to each of tenofovir impurity F, impurity I and impurity J is not more than 0.75 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with the reference solution (a) (0.75 per cent), the area of any secondary peak corresponding to each of tenofovir impurity L, impurity E is not more than twice the area of the peak due to tenofovir disoproxil in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak corresponding to, each of lamivudine impurity E, impurity F, impurity G, impurity H or impurity J, is not more than twice the area of the peak due to lamivudine in the chromatogram obtained with reference solution (b) (0.2 per cent), the sum of the areas of secondary peaks corresponding to lamivudine impurity G, impurity H, impurity J, impurity E and impurity F is not more than the area of the peak due to lamivudine peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the peak due to lamivudine in the chromatogram obtained with reference solution (b) (0.05 per cent) and the sum of the areas of secondary peaks corresponding to tenofovir impurity F, impurity E, impurity I, impurity J and impurity L is not more than the area of the peak due to tenofovir disoproxil peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore the peak due to fumaric acid and any peak with an area less than 0.5 times the area of the peak due to tenofovir disoproxil in the chromatogram obtained with reference solution (b) (0.05 per cent). The sum of the lamivudine and tenofovir disoproxil related impurities is not more than 5.0 per cent.

For dolutegravir —

Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light, using low-actinic glassware.

Solvent mixture. 60 volumes of *water* and 40 volumes of *acetonitrile*.

Test solution. Disperse a quantity of powdered tablets containing 87.5 mg of Dolutegravir in 180 ml of the solvent mixture, with the aid of ultrasound for 5 minutes and dilute to 250.0 ml with the solvent mixture, filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water*. Dilute 10.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 0.5 mg of *dolutegravir sodium for system suitability IPRS* (containing dolutegravir sodium and dolutegravir impurity E) in 1.0 ml of the solvent mixture.

Reference solution (c). Dissolve 1 mg of *dolutegravir sodium for peak identification IPRS* (containing dolutegravir sodium and dolutegravir impurity A, B and D) in 1.0 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica, modified with pentafluorophenyl (5µm) (Such as ACE 5 C18-PFP),
- column temperature: 45°,
- mobile phase: A. a buffer solution prepared by dissolving 0.186 g of *disodium edetate* in 900 ml of *water*, adjusted to pH 2.0 with *orthophosphoric acid*, dilute to 1000 ml with *water*,

  B. 90 volumes of *methanol* and 10 volumes of *tetrahydrofuran*.
- flow rate: 1 ml per minute,
- spectrophotometer set at 320 nm,
- injection volume: 30 µl.

[4](4*R*,12α*S*)-*N*-[(4-fluorophenyl)methyl]-7-hydroxy-4-methyl-6,8-dioxo-3,4,6,8,12,12α- hexahydro-2*H*-pyrido[1', 2':4,5]pyrazino-[2,1-b][1,3] oxazine-9-carboxamide, 4-Fluoro dolutegravir (synthesis-related impurity).

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to impurity E and dolutegravir is not less than 3.0.

Inject reference solution (c) for identification of dolutegravir impurity A, impurity B and impurity D.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to each of impurity C, impurity D, impurity E or impurity F is not more than the area of peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light using low-actinic glassware.

Solvent mixture (a). 60 volumes of *water* and 40 volumes of *acetonitrile.*

Solvent mixture (b). 90 volumes of phosphate buffer solution prepared by dissolving 12.3 g of *sodium dihydrogen phosphate* in 900 ml of *water,* adjusted to pH 3.0 with *orthophosphoric acid,* dilute to 1000 ml with *water* and 10 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.34 g of Lamivudine in 400 ml of solvent mixture (a), with the aid of ultrasound for 10 minutes with intermittent shaking and dilute to 500.0 ml with solvent mixture (a), filter. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture (b).

Reference solution. A solution containing 0.0112 per cent w/v of *dolutegravir sodium IPRS*, 0.068 per cent w/v each of *lamivudine IPRS* and *tenofovir disoproxil fumarate IPRS* in solvent mixture (a). Dilute 5.0 ml of the solution to 50.0 ml with solvent mixture (b).

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with endcapped octylsilane bonded to porous silica, (5 µm),
- mobile phase: A. 0.0186 per cent w/v solution of *disodium edetate* in a mixture of 1 volume of *trifluroacetic acid* and 1000 volumes of *water*,
  B. *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	98	2
10	50	50
12	50	50
12.5	98	2
18	98	2

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent of each components.

Inject the reference solution and the test solution.

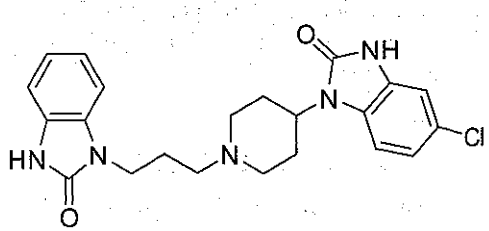
Calculate the content of $C_{20}H_{19}F_2N_3O_5$, $C_8H_{11}N_3O_3S$ and $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$ in the tablets.

1 mg of dolutegravir sodium is equivalent to 0.950 mg of dolutegravir.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the quantity of dolutegravir sodium in terms of the equivalent amount of dolutegravir, and lamivudine and tenofovir disoproxil fumarate.

Domperidone



$C_{22}H_{24}ClN_5O_2$ Mol. Wt. 425.9

Domperidone is 5-chloro-1-[1-[3-(2-oxo-2,3-dihydro-1*H*-benzimidazol-1-ylpropyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one.

Domperidone contains not than 99.0 per cent and more than 101.0 per cent of $C_{22}H_{24}ClN_5O_2$, calculated on the dried basis.

Category. Antiemetic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *domperidone IPRS* or with the reference spectrum of domperidone.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *dimethylformamide* is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in *dimethylformamide* and dilute to 10.0 ml with the same solvent.

Reference solution (a). A solution containing 0.01 per cent w/v of *domperidone IPRS* and 0.015 per cent w/v of *droperidol IPRS* in *dimethylformamide.*

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide.* Dilute 5.0 ml of the solution 20.0 ml with *dimethylformamide.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with base-deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 0.5 per cent w/v solution of *ammonium acetate*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
10	0	100
12	0	100
14	70	30

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to domperidone and droperidol is not less than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

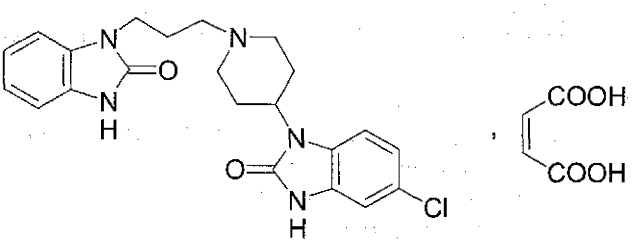
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid* and 7 volumes of *methyl ethyl ketone.* Titrate with *0.1 M perchloric acid* until the colour changes from orange-yellow to green using 0.2 ml of *naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric* acid is equivalent to 0.04259 g of $C_{22}H_{24}ClN_5O_2$.

Storage. Store protected from light.

Domperidone Maleate



$C_{22}H_{24}ClN_5O_2,C_4H_4O_4$ Mol. Wt. 542.0

Domperidone Maleate is 5-chloro-1-[1-[3-(2,3-dihydro-2-oxo-1*H*-benzimidazol-1-yl)propyl]-4-piperidinyl]-1,3-dihydro-2*H*-benzimidazol-2-one maleate.

Domperidone Maleate contains not less than 99.0 per cent and not more than 101.0 per cent of domperidone maleate, $C_{22}H_{24}ClN_5O_2,C_4H_4O_4$, calculated on the dried basis.

Category. Antiemetic.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *domperidone maleate IPRS* or with the reference spectrum of domperidone maleate. If the spectra obtained show differences, dissolve the substance under examination and the reference substance separately in the minimum volume of *2-propanol*, evaporate to dryness on a water-bath and record new spectra using the residues.

Tests

Appearance of solution. Dissolve 0.2 g in *dimethylformamide* and dilute to 20.0 ml with the same solvent. The solution is clear (2.4.1) and not more intensely coloured than reference solution YS6 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE - Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance under examination in *dimethylformamide* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *domperidone maleate IPRS* and 15 mg of *droperidol IPRS* in *dimethylformamide* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *dimethylformamide*. Dilute 5 ml of the solution to 20 ml with *dimethylformamide*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with base-deactivated octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. 0.5 per cent w/v solution of *ammonium acetate*,
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	70	30
10	0	100
12	0	100
14	70	30

Equilibrate the column for at least 30 minutes with *methanol* and then equilibrate with the initial mobile phase.

Inject reference solution (a). The retention times are: domperidone maleate, about 6.5 minutes and droperidol, about 7 minutes. The test is not valid unless the resolution between the peaks due to domperidone maleate and droperidol is at least 2.0. If necessary adjust the concentration of *methanol* in the mobile phase or adjust the time programme for the linear gradient.

Inject dimethylformamide as a blank, the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any peak, other than the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all peaks, other than the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak in the chromatogram obtained with the blank run, any peak due to maleic acid at the beginning of the chromatogram and any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13.). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb)*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° to 105°.

Assay. Dissolve 0.4 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid* using 0.2 ml of *naphtholbenzein solution* as indicator, until the colour changes from orange-yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0542 g of $C_{26}H_{28}ClN_5O_6$.

Storage. Store protected from light.

Domperidone Suspension

Domperidone Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of domperidone, $C_{22}H_{24}ClN_5O_2$.

Usual strength. 1 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *methanol* and *dimethylformamide*.

Test solution. Disperse a quantity of the suspension containing 5 mg of Domperidone with 5 ml of *water* and 50 ml of the solvent mixture with the aid of ultrasound for 10 minutes with intermittent shaking. Cool and dilute to 100.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *domperidone IPRS* in the solvent mixture. Dilute 5.0 ml of the solution to 10.0 ml with *water* and dilute to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of *methanol* and 45 volumes of 0.5 per cent w/v of *ammonium acetate solution*, adjusted to pH 6.15 with *glacial acetic acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_{22}H_{24}ClN_5O_2$.

Domperidone Tablets

Domperidone Maleate Tablets

Domperidone Tablets contain Domperidone Maleate equivalent to not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of domperidone, $C_{22}H_{24}ClN_5O_2$.

Usual strength. 10 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254* or using a precoated plate (such as Merck silica gel 60 F254 plates).

Mobile phase. A mixture of 5 volumes of a solution prepared by dissolving 1.36 g of *sodium acetate* in 50 ml of *water*, adjusted to pH 4.7 with *dilute acetic acid* and adding sufficient *water* to produce 100 ml, 18 volumes of *methanol*, 23 volumes of *dichloromethane* and 54 volumes of *ethyl acetate*.

Test solution. Shake a quantity of the powdered tablets containing 10 mg of domperidone with 10 ml of a mixture of equal volumes of *dichloromethane* and *methanol* and filter through a glass microfibre filter (such as Whatman GF/C).

Reference solution. A 0.127 per cent w/v solution of *domperidone maleate IPRS* in a mixture of equal volumes of *dichloromethane* and *methanol*.

Apply to the plate 10 µl of each solution. After development, allow the plate to dry in air and examine under ultraviolet light at 254 nm. Spray the plate with *potassium iodobismuthate solution* and examine again. With each method of visualisation, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, diluted with the dissolution medium if necessary, at 286 nm (2.4.7), using the dissolution medium as the blank. Calculate the content of $C_{22}H_{24}ClN_5O_2$ in the medium from the absorbance obtained from a solution of known concentration *domperidone maleate IPRS*.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{24}ClN_5O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the following solutions immediately before use.

Test solution. To a quantity of the powdered tablets containing 50 mg of domperidone add 10 ml of a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol*, mix with the aid of ultrasound for 20 minutes and filter through a glass microfibre filter (such as Whatman GF/C).

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol*. Dilute 1.0 ml of the resulting solution to 2.0 ml with a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol*.

Reference solution (b). A solution containing 0.01 per cent w/v of *domperidone maleate IPRS* and 0.015 per cent w/v of *droperidol IPRS* in a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with base-deactivated, end-capped octadecylsilyl silica gel (3 µm) (Such as Hypersil BDS),
- mobile phase: A. *methanol*,
  B. a 0.5 per cent w/v solution of *ammonium acetate*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,

– spectrophotometer set at 280 nm,
– injection volume: 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	30	70
10	100	0
12	100	0
14	30	70

Equilibrate the column for at least 30 minutes with *methanol* and equilibrate with the initial mobile phase for at least 5 minutes.

Inject a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol* as a blank, the test solution and reference solution (a) and (b). The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the two principal peaks is at least 2. If necessary adjust the concentration of *methanol* in the mobile phase or adjust the time programme for the linear gradient.

In the chromatogram obtained with the test solution the area of any secondary peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of any secondary peaks is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (a) (0.5 per cent). Ignore any peak in the chromatogram obtained with the blank solution and any peak with an area less than 0.2 times the area of the peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solution as the test solution.

Test solution. Disperse 1 tablet in a mixture of equal volumes of *0.01 M hydrochloric acid* and *methanol* with the aid of ultrasound to obtain a solution containing 0.01 per cent w/v of domperidone, filter.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *0.01 M hydrochloric acid* and *methanol*.

Test solution. Disperse 10 intact tablets in the solvent mixture to produce a solution containing 0.02 per cent w/v of domperidone, mix with the aid of ultrasound for 30 minutes and filter through a glass microfiber filter (such as Whatman GF/C). Dilute 50.0 ml of the solution to 100.0 ml with the solvent mixture.

Reference solution. A 0.0127 per cent w/v solution of *domperidone maleate IPRS* in the solvent mixture.

Use the chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

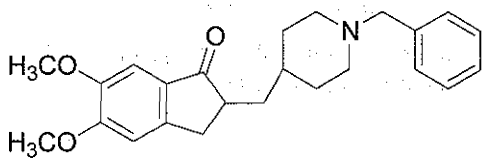
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}ClN_5O_2$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of domperidone.

Donepezil Hydrochloride



$C_{24}H_{29}NO_3,HCl$ Mol. Wt. 416.0

$C_{24}H_{29}NO_3,HCl,H_2O$ Mol. Wt. 434.0

Donepezil Hydrochloride is (*RS*)-2-[(1-benzyl-4-piperidyl) methyl]-5,6-dimethoxy-1-indanone hydrochloride;

(2RS)-2-[(1-Benzylpiperidin-4-yl)methyl]-5,6-dimethoxy-2,3-dihydro-1H-inden-1-one hydrochloride monohydrate.

Donepezil Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{29}NO_3,HCl$, calculated on the anhydrous basis.

Category. Antialzheimer.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *donepezil hydrochloride IPRS* or with the reference spectrum of donepezil hydrochloride.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maximum at about 230 nm, 268 nm and 313 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *donepezil hydrochloride IPRS* in mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 600 volumes of *water*, 400 volumes of *methanol* and 1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophosphoric acid* and filter,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 20 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Heavy metals (2.3.13). 1 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.4 per cent for anhydrous form and not more than 7.0 per cent for monohydrate form, determined on 1.0 g.

Assay. Dissolve 0.4 g in a mixture of 40 ml of *glacial acetic acid* and 10 ml of 5 per cent w/v solution of *mercuric acetate* in *glacial acetic acid*. Titrate with *0.1 M perchloric acid*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0416 g of $C_{24}H_{29}NO_3,HCl$.

Storage. Store protected from moisture.

Donepezil Tablets

Donepezil Hydrochloride Tablets

Donepezil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of donepezil hydrochloride, $C_{24}H_{29}NO_3,HCl$.

Usual strengths. 5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a weighed quantity of *donepezil hydrochloride IPRS* in the dissolution medium, dilute to obtain a solution having a known concentration similar to expected concentration of test solution.

Chromatographic system as described under Assay using 50 µl injection volume:

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_{24}H_{29}NO_3,HCl$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

Test solution. Weigh a quantity of powdered tablets containing about 50 mg of Donepezil Hydrochloride, add 25 ml of solvent mixture, sonicate for 15 minutes and make up the volume to 50.0 ml with solvent mixture and filter.

Reference solution (a). A 0.1 per cent w/v solution of *donepezil hydrochloride IPRS* in solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed octadecylsilane bonded to porous silica (5 µm),
- column temperature. 50°,
- mobile phase: A. a buffer solution pH 6.5 prepared by adding 1 ml of *orthophosphoric acid* in 1000 ml of *water*, adjusted to pH 6.5 with *triethylamine* and filter,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 286 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0	75	25
10	40	60
40	40	60
41	75	25
50	75	25

Inject reference solution (b). The test is not valid unless the column efficiency is not less than 20000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Disperse one tablet in the mobile phase with the aid of the ultrasound and dilute to 50.0 ml with the mobile phase. Dilute a suitable volume with the mobile phase to obtain a concentration similar to the reference solution.

Inject the reference solution the test solution.

Calculate the content of $C_{24}H_{29}NO_3$,HCl in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing 10 mg of Donezepil Hydrochloride in 70 ml of the mobile phase with the aid of ultrasound for 10 minutes with intermittent shaking and dilute to 100.0 ml with the mobile phase, filter.

Reference solution. A 0.01 per cent w/v solution of *donepezil hydrochloride IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 60 volumes of buffer pH 2.2 prepared by dissolving about 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water*. Add 5 ml of *triethylamine* and adjusted to pH 2.2 with *ortho-phosphoric acid*, filter and 40 volumes of *methanol*,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 268 nm,
- injection volume: 20 µl.

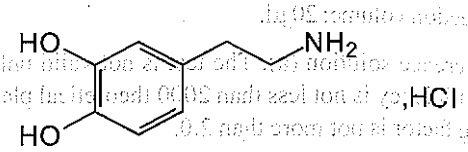
Inject the reference solution. The test is not valid unless the column efficiency is not less than 7000 theoretical plates. The tailing factor is not more than 1.5. The relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution

Calculate the content of $C_{24}H_{29}NO_3$,HCl in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Dopamine Hydrochloride



$C_8H_{11}NO_2$,HCl Mol.Wt. 189.6

Dopamine Hydrochloride is 4-(2-aminoethyl)benzene-1,2-diol hydrochloride.

Dopamine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_{11}NO_2$,HCl, calculated on the dried basis.

Category. Vasopressor.

Description. A white or almost white, crystalline powder.

Identification

Tests A, C and D may be omitted if tests B and E are carried out. Test B may be omitted if tests A, C, D and E are carried out.

A. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *0.1 M hydrochloric acid*, shows absorption maximum at 280 nm and specific absorbance at the absorption maximum is 136 to 150.

B. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dopamine hydrochloride IPRS* or with the reference spectrum of dopamine hydrochloride.

C. Dissolve 5 mg in a mixture of 5 ml of *1 M hydrochloric acid* and 5 ml of *water*. Add 0.1 ml of *sodium nitrite solution* containing 10 per cent w/v solution of *ammonium molybdate*. A yellow colour develops which becomes red on the addition of *strong sodium hydroxide solution*.

D. Dissolve 2 mg in 2 ml of *water* and add 0.2 ml of *ferric chloride solution*. A green colour develops which changes to bluish-violet on the addition of 0.1 g of *hexamethylene-tetramine*.

E. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 4.0 per cent w/v solution in *water* is clear (2.4.1) and not more intensely coloured than reference solution BS6 or YS6 (2.4.1).

Acidity or alkalinity. Dissolve 0.5 g in 10.0 ml of *carbon dioxide-free water*. Add 0.1 ml of *methyl red solution* and 0.75 ml of *0.01 M sodium hydroxide*, the solution becomes yellow. Add 1.5 ml of *0.01 M hydrochloric acid*, the solution becomes red.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Buffer solution. Dissolve 21 g of *citric acid* in 200 ml of *1 M sodium hydroxide* and dilute to 1000 ml with *water*. To 600 ml of the solution, add 400 ml of *0.1 M hydrochloric acid*.

Test solution. Dissolve 50 mg of the substance under examination in mobile phase A and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Further dilute 1.0 ml of the solution to 10.0 ml with mobile phase A.

Reference solution (b). A solution containing 0.0024 per cent w/v each of dopamine impurity B (*3-O-methyldopamine hydrochloride*) and dopamine impurity A (*4-O-methyldopamine hydrochloride*) in mobile phase A.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octadecylsilane bonded to porous silica (4 µm),
- mobile phase: A. dissolve 1.08 g of *sodium octanesulphonate* in 880 ml of the buffer solution, 50 ml of *methanol* and 70 ml of *acetonitrile*,
  B. dissolve 1.08 g of *sodium octanesulphonate* in 700 ml of the buffer solution and add 100 ml of *methanol* and 200 ml of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
5	90	10
20	40	60
25	40	60

Inject reference solution (b). The test is not valid unless the resolution between the peaks corresponding to dopamine impurity B and dopamine impurity A is not less than 5.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. *To avoid overheating, mix thoroughly throughout the titration and stop the titration immediately after the end-point has been reached.*

Dissolve 0.15 g in 10 ml of *anhydrous formic acid*, add 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01896 g of $C_8H_{12}ClNO_2$.

Storage. Store protected from light and in moisture free container, under nitrogen.

Dopamine Injection

Dopamine Hydrochloride Injection

Dopamine Injection is a sterile solution containing Dopamine Hydrochloride. It is supplied as a ready-to-use solution or it is prepared by diluting either Sterile Dopamine Concentrate or Dopamine Hydrochloride for Injection with a suitable diluent in accordance with the manufacturer's instructions.

Dopamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dopamine hydrochloride, $C_8H_{11}NO_2,HCl$.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Description. A colourless liquid.

Identification

A. Saturate a volume containing 0.1 g of Dopamine Hydrochloride with *sodium chloride* and extract with three 20-ml quantities of *butan-1-ol*. Filter the combined extracts through anhydrous sodium sulphate and evaporate the filtrate

to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dopamine hydrochloride IPRS* treated in the same manner or with the reference spectrum of dopamine hydrochloride.

B. To a volume containing 10 mg of Dopamine Hydrochloride, add 0.1 ml of a 10.5 per cent w/v solution of *iron(III) chloride hexahydrate*. An intense green colour is produced.

Tests

pH (2.4.24). 3.0 to 4.5

5-Hydroxymethylfurfural. Determine by liquid chromatography (2.4.14).

Test solution. Use the injection.

Reference solution. A 0.0025 per cent w/v solution of *5-hydroxymethylfurfural* in *water*.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: *0.05M disodium hydrogen orthophosphate*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 284 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to 5-hydroxymethylfurfural is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent, determined with reference to the content of glucose).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection to obtain a solution containing 0.032 per cent w/v of Dopamine Hydrochloride with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution and 1.0 ml of a solution containing 0.03 per cent w/v each of *4-ethylcatechol* and *3,4-dimethoxyphenethylamine* to 50.0 ml with the mobile phase.

Use chromatographic system as described under Assay.

The retention time of dopamine is about 5 minutes, of 4-ethylcatechol is about 3 minutes and of 3,4-dimethoxyphenethylamine, is about 12 minutes.

Inject the reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). The area of not more than one such peak is greater than the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Bacterial endotoxins (2.2.3). Not more than 26.67 Endotoxin Units per ml of a 0.16 per cent w/v solution of Dopamine Hydrochloride in water for injections.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the injection with the mobile phase to produce a solution expected to contain 0.0032 per cent w/v of Dopamine Hydrochloride.

Reference solution. A 0.0032 per cent w/v solution of *dopamine hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with end capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 2 volumes of *0.1M disodium edetate*, 10 volumes of *glacial acetic acid*, 300 volumes of *acetonitrile* and 700 volumes of *0.005M sodium dodecyl sulphate*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 20 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}NO_2$,HCl in the injection.

Sterile Dopamine Concentrate

Sterile Dopamine Concentrate is a sterile solution of Dopamine Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrates for Injections or Injections stated under Parenteral Preparations and with the following requirements.

Sterile Dopamine Concentrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dopamine hydrochloride, $C_8H_{11}NO_2$,HCl.

Description. A colourless or pale yellow solution.

Identification

A. Extract a volume containing 0.1 g of Dopamine Hydrochloride with 10 ml of *butan-1-ol*. Filter the extract through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dopamine hydrochloride IPRS* treated in the

same manner or with the reference spectrum of dopamine hydrochloride.

B. To a volume containing 10 mg of Dopamine Hydrochloride, add 0.05 ml of a 10.5 per cent w/v solution of *iron(III) chloride hexahydrate*. An intense green colour is produced.

Tests

pH (2.4.24). 2.5 to 5.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 2 volumes of *anhydrous formic acid*, 7 volumes of *water*, 36 volumes of *methanol* and 52 volumes of *chloroform*.

Test solution. Dilute a volume of the concentrate containing 0.15 g of Dopamine Hydrochloride to 5 ml with *methanol*.

Reference solution (a). A 0.0075 per cent w/v solution of *4-O-methyldopamine hydrochloride* in *methanol*.

Reference solution (b). A solution containing 0.0075 per cent w/v each of *3-O-methyldopamine hydrochloride* and *4-O-methyldopamine hydrochloride* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for 2 hours. Spray evenly and abundantly with a mixture, prepared immediately before use, of equal volumes of *iron (III) chloride solution* and *potassium hexacyanoferrate(III) solution*. Any secondary spot with a R_f value higher than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Bacterial endotoxins (2.2.3). Not more than 26.67 Endotoxin Units per ml of a 0.16 per cent w/v solution of Dopamine Hydrochloride in water for injections.

Assay. Carry out the method described under requirements for the ready-to-use solution.

Storage. Sterile Dopamine Concentrate should be protected from light.

Dopamine Hydrochloride for Injection

Dopamine Hydrochloride for Injection is a sterile material consisting of Dopamine Hydrochloride with or without excipients. It is supplied in a sealed container.

Dopamine Hydrochloride for Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dopamine hydrochloride, $C_8H_{11}NO_2$,HCl.

The contents of the sealed container comply with the requirements for Powders for Injections or Injections stated under Parenteral Preparations and with the following requirements.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dopamine hydrochloride IPRS* or with the reference spectrum of dopamine hydrochloride.

B. Dissolve 10 mg of the substance under examination in 2 ml of *water* and add 0.05 ml of *iron (III) chloride solution*. An intense green colour is produced.

Tests

pH (2.4.24). 2.5 to 5.5 determined in 4.0 per cent w/v solution in a 1.0 per cent w/v solution of *sodium metabisulphite*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 2 volumes of *anhydrous formic acid*, 7 volumes of *water*, 36 volumes of *methanol* and 52 volumes of *chloroform*.

Test solution. Dissolve a quantity of the contents of the sealed container to produce a solution containing 3.0 per cent w/v of dopamine hydrochloride in *methanol*.

Reference solution (a). A 0.0075 per cent w/v solution of *4-O-methyldopamine hydrochloride* in *methanol*.

Reference solution (b). A solution containing 0.0075 per cent w/v each of *3-O-methyldopamine hydrochloride* and *4-O-methyldopamine hydrochloride* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for 2 hours. Spray evenly and abundantly with a mixture, prepared immediately before use, of equal volumes of *iron(III) chloride solution* and *potassium hexacyanoferrate(III) solution*. Any secondary spot with a R_f value higher than that of the principal spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Bacterial endotoxins (2.2.3). Not more than 26.67 Endotoxin Units per ml of a 0.16 per cent w/v solution of Dopamine hydrochloride in water for injections.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve sufficient quantity of the mixed contents of the 10 containers in the mobile phase to produce a solution containing 0.0032 per cent w/v of Dopamine Hydrochloride

Reference solution. A 0.0032 per cent w/v solution of *dopamine hydrochloride IPRS* in the mobile phase

Use the chromatographic procedure as described under Assay for the ready-to-use solution.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{11}NO_2,HCl$ in a container of average content weight.

Dopamine Hydrochloride and Dextrose Injection

Dopamine Hydrochloride and Dextrose Injection is a sterile solution of Dopamine Hydrochloride and Dextrose in Water for Injection.

Dopamine Hydrochloride and Dextrose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of dopamine hydrochloride, $C_8H_{11}NO_2,HCl$ and dextrose, $C_6H_{12}O_6, H_2O$.

NOTE— Do not use the injection if it is darker than slightly yellow or discoloured in any other way.

Usual strengths. Dopamine Hydrochloride, 80 mg and Dextrose, 5 g per, 100 ml; Dopamine Hydrochloride, 160 mg and Dextrose, 5 g per 100 ml; Dopamine Hydrochloride, 320 mg and Dextrose, 5 g per 100 ml.

Identification

A. Dissolve 0.1 g in 10 ml of *water*, add 3 ml of *potassium cupri-tartrate solution*; the solution is blue and clear. Heat to boiling; a copious red precipitate is formed.

B. In the Assay for dopamine hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 2.5 to 4.5.

5-hydroxymethylfurfural and related substances.

Solvent mixture. 0.022 M *sodium hydroxide* in *water*.

Cation-exchange column. A chromatographic tube having a 0.8 cm x 4 cm bed volume (or about 2 ml) of 100 to 200 mesh, strongly acidic, styrene-divinylbenzene cation-exchange resin. Condition the column by washing with about 30 ml of *water*, discarding the eluate.

Pass a volume of injection containing about 100 mg of *hydrous dextrose* through the resin bed in the cation-exchange column, allowing the sample to flow down the wall of the column so as not to disturb the resin bed, and collect the eluate in a 50-ml volumetric flask. Wash the column with 25.0 ml of *water*, and collect the eluate in the same 50-ml volumetric flask. Dilute the eluate with solvent mixture to volume, and mix to obtain the test solution. In a similar manner, prepare a blank by passing 25.0 ml of *water* through a freshly conditioned cation-exchange column, collecting the eluate in a 50-ml volumetric flask, diluting with solvent mixture to volume, and mix. Determine the absorbance of the test solution against the blank in a 1 cm cell at 284 nm (2.4.7). The absorbance obtained is not more than 0.25.

Bacterial endotoxins (2.2.3). Not more than 16.67 Endotoxin Units per mg of dopamine hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay

For dopamine hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Mix the content of 10 containers. A measured volume containing 16 mg of Dopamine Hydrochloride to 100-ml volumetric flask, dilute with mobile phase to volume and mix.

Reference solution (a). A 0.016 per cent w/v solution of *dopamine hydrochloride IPRS* in mobile phase.

Reference solution (b). A 2.0 per cent w/v solution of *benzoic acid* in *methanol* and finally dilute with mobile phase to obtain 0.5 per cent w/v solution.

Reference solution (c). Dilute 10.0 ml of the reference solution (a) and 10.0 ml of reference solution (b) to 100.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 30 cm x 4 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 87 volumes of a mixture of 0.005 M *sodium 1-octanesulphonate* in 1 per cent v/v *glacial acetic acid* and 13 volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume: 40 µl.

Inject reference solution (c). The test is not valid unless the resolution between benzoic acid and dopamine hydrochloride is not less than 4.0.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 3.0 per cent.

Inject reference solution (a) and the test solution.

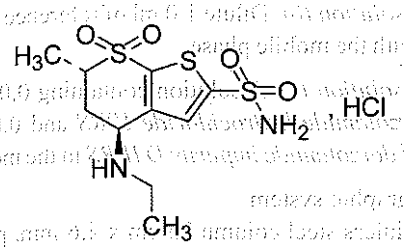
Calculate the content of $C_8H_{11}NO_2,HCl$.

For dextrose — To a measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water*

to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation multiplied by 1.0424 represents the weight, in g, of dextrose, $C_6H_{12}O_6,H_2O$ in the volume taken for assay.

Storage. Store protected from moisture.

Dorzolamide Hydrochloride



$C_{10}H_{16}N_2O_4S_3$, HCl Mol. Wt. 360.9

Dorzolamide Hydrochloride is (4*S*,6*S*)- 4-(ethylamino)-5,6-dihydro-6-methyl-4*H*-thieno[2,3-*b*]thiopyran-2-sulfonamide 7,7-dioxide, monohydrochloride.

Dorzolamide Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{16}N_2O_4S_3$, HCl, calculated on the anhydrous basis.

Category. Antiglaucoma agent.

Description. A white to off-white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dorzolamide hydrochloride IPRS* or with the reference spectrum of dorzolamide hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Dorzolamide impurity A. Determine by liquid chromatography (2.4.14)

Solvent mixture. 87 volumes of *tert-butyl methyl ether*, 10 volumes of *glacial acetic acid* and 3 volumes of *acetonitrile*.

Test solution. Dissolve 20 mg of the substance under examination in 4 ml of *0.5M ammonium hydroxide* in a centrifuge tube, add 4 ml of *ethyl acetate* and mix. Separate the organic layer and transfer it to a separate centrifuge tube. Add 4 ml of *ethyl acetate* to the aqueous layer, mix, separate the organic layer and combine it with the first extract. Evaporate the combined organic layers to dryness on a water-bath at 50° under a stream of nitrogen. Dissolve the residue in 3 ml of *acetonitrile*, add 3 drops of *(S)-(-)-α-methylbenzyl isocyanate*, and heat on a water-bath at 50° for 5 minutes. Evaporate to dryness on a water-bath at 50° under a stream of nitrogen. Dissolve the residue in 10 ml of the solvent mixture.

Reference solution. Dissolve 18 mg of *dorzolamide hydrochloride IPRS* and 2 mg of *dorzolamide impurity A IPRS ((4R,6R)-4-(ethylamino)-6-methyl-5,6-dihydro-4H-thieno[2,3-b]thiopyran-2-sulphonamide7,7-dioxide, monohydrochloride IPRS)* in 4 ml of *0.5M ammonium hydroxide* in a centrifuge tube and proceed as indicated for the test solution beginning with "add 4 ml of *ethyl acetate*".

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5µm),
- mobile phase: a mixture of 63 volumes of *tert-butyl methyl ether*, 35 volumes of *n-heptane*, 2 volumes of *acetonitrile* and 0.2 volume of *water*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

The relative retention time with reference to dorzolamide for dorzolamide impurity A is about 1.5.

Inject the reference solution. The test is not valid unless the resolution between the peaks corresponding to dorzolamide and dorzolamide impurity A is not less than 4.0.

Inject the test solution. The area of the peak corresponding to dorzolamide impurity A is not more than 0.5 per cent, calculated by area normalization method.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Inject the test solution. The area of any secondary peak is not more than 0.1 per cent and the sum of areas of all the secondary peaks is not more than 0.5 per cent, calculated by area normalization method.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 60 mg of the substance under examination in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution. A 0.06 per cent w/v solution of *dorzolamide hydrochloride IPRS* in mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 94 volumes of buffer solution prepared by dissolving 3.7 g of *monobasic potassium phosphate* in 1000 ml of *water* and 6.5 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a gradient program using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
30	50	50
37	100	0
44	100	0

Inject the reference solution. The test is not valid unless the column efficiency is not less than 6500 theoretical plates, the tailing factor is not less than 0.6 and not more than 1.2 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{10}H_{16}N_2O_4S_3$, HCl.

Storage. Store protected from light and moisture, at a temperature 15° to 30°.

Dorzolamide Eye Drops

Dorzolamide Hydrochloride Eye Drops

Dorzolamide Eye Drops are a sterile solution of Dorzolamide Hydrochloride in Purified Water.

Dorzolamide Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dorzolamide, $C_{10}H_{16}N_2O_4S_3$.

Usual strength. 2 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 6.0.

Other tests. Comply with the tests stated under Eye Drops.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of eye drops to obtain a solution containing 0.01 per cent w/v of dorzolamide in the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.011 per cent w/v of *dorzolamide hydrochloride IPRS* and 0.000011 per cent w/v of *dorzolamide impurity D IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 1 volume of *acetonitrile* and 19 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 3.0 with *triethylamine*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 253 nm,
- injection volume: 20 µl.

Name	Relative retention time
Dorzolamide impurity D[1]	0.9
Dorzolamide (retention time: about 11 minutes)	1.0
Dorzolamide impurity B[2]	1.1

[1](4*S*,6*S*)-4-amino-6-methyl-5,6-dihydro-4*H*-thieno[2,3-*b*]thiopyran-2- sulfonamide 7,7-dioxide,

[2](4*RS*,6*SR*)-4-(ethylamino)-6-methyl-5,6-dihydro-4*H*-thieno[2,3-*b*]thiopyran-2- sulfonamide 7,7-dioxide.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to dorzolamide and dorzolamide impurity D is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to dorzolamide impurity B is not more than 1.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.3 per cent). The area of any peak corresponding to dorzolamide impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The sum of the areas of all the secondary peaks is not more than 1.5 times

the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops to obtain a solution containing 0.01 per cent w/v of dorzolamide in the mobile phase.

Reference solution (a). A 0.011 per cent w/v solution of *dorzolamide hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.011 per cent w/v of *dorzolamide hydrochloride IPRS* and 0.000011 per cent w/v of *dorzolamide impurity D IPRS* in the mobile phase.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to dorzolamide and dorzolamide impurity D is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{10}H_{16}N_2O_4S_3$ in the eye drops.

1 mg of $C_{10}H_{16}N_2O_4S_3$,HCl is equivalent to 899 µg of $C_{10}H_{16}N_2O_4S_3$.

Labelling. The quantity of active ingredient is stated in terms of the equivalent amount of dorzolamide.

Dorzolamide and Timolol Eye Drops

Dorzolamide and Timolol Eye Drops are a sterile solution of Dorzolamide Hydrochloride and Timolol Maleate in Purified Water.

Dorzolamide and Timolol Eye Drops contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount each of dorzolamide, $C_{10}H_{16}N_2O_4S_3$ and timolol, $C_{13}H_{24}N_4O_3S$.

Usual strength. Dorzolamide 2 per cent w/v and timolol 0.5 per cent w/v.

Identification

A. In the Assay for dorzolamide, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

B. In the Assay for timolol, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. *For dorzolamide* — Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *acetonitrile* and 19 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid.*

Test solution. Dilute a volume of eye drops to obtain a solution containing 0.01 per cent w/v of dorzolamide with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the solvent mixture.

Reference solution (c). A solution containing 0.011 per cent w/v of *dorzolamide hydrochloride IPRS* and 0.000011 per cent w/v each of *dorzolamide impurity B IPRS* and *drozolamide impurity D IPRS.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *acetonitrile,*
  B. 0.2 per cent v/v *orthophosphoric acid,*
- a gradient programme using the conditions given below,
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 253 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	5	95
15	5	95
15.1	95	5
20	95	5
20.1	5	95
30	5	95

Name	Relative retention time
Dorzolamide impurity D[1]	0.8
Dorzolamide (retention time: about 12 minutes)	1.0
Dorzolamide impurity B[2]	1.2

[1](4*S*,6*S*)-4-amino-6-methyl-5,6-dihydro-4*H*-thieno[2,3-*b*]thiopyran-2- sulfonamide 7,7-dioxide,

[2](4*RS*,6*SR*)-4-(ethylamino)-6-methyl-5,6-dihydro-4*H*-thieno[2,3-*b*]thiopyran-2- sulfonamide 7,7-dioxide.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to dorzolamide and dorzolamide impurity D is not less than 3.0.

Inject reference solution (a), (b) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to dorzolamide impurity B is not more than 1.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.1 per cent), the area of any peak due to dorzolamide impurity D is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and peaks due to timolol and maleic acid.

For timolol — Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of eye drops to obtain a solution containing 0.025 per cent w/v of timolol in the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase. Further dilute 2.0 ml of this solution to 5.0 ml with the mobile phase.

Reference solution (b). Add 8 ml of *0.1 M sodium hydroxide* to 90 mg of *timolol maleate IPRS*, heat at 70° for 15 hours, cool and dilute to 50.0 ml with the mobile phase. Mix 1 volume of the solution with 4 volumes of a 0.14 per cent w/v solution of *dorzolamide hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 2 volumes of *methanol* and 3 volumes of a 1.1 per cent w/v solution of *sodium dihydrogen orthophosphate monohydrate*, adjusted to pH 2.8 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 295 nm,
- injection volume: 20 µl.

Name	Relative retention time
Dorzolamide	0.5
Timolol impurity G[1]	0.6
Timolol impurity B[2]	0.7
Timolol (retention time: about 5.7 minutes)	1.0
Timolol impurity D[3]	1.5

[1]4-(morpholin-4-yl)-1,2,5-thiadiazol-3(2*H*)-one 1-oxide,
[2](2*RS*)-3-[(1,1-dimethylethyl)amino]-2-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3- yl]oxy]propan-1-ol,
[3]4-(morpholin-4-yl)-1,2,5-thiadiazol-3-ol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to timolol impurity G and timolol impurity B is not less than 1.5.

Inject reference solution (a) and the test solution. Run the chromatogram twice the retention time of the timolol peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to timolol impurities B, D or G is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and peaks due to maleic acid.

Other tests. Comply with the tests stated under Eye Drops.

Assay. *For Dorzolamide*—Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *acetonitrile* and 19 volumes of 0.2 per cent v/v solution of *orthophosphoric acid*.

Test solution. Dilute the eye drops to obtain a solution containing 0.01 per cent w/v of dorzolamide in the solvent mixture.

Reference solution (a). A 0.011 per cent w/v solution of *dorzolamide hydrochloride IPRS* in the solvent mixture.

Reference solution (b). A solution containing 0.011 per cent w/v of *dorzolamide hydrochloride IPRS* and 0.000011 per cent w/v of *dorzolamide impurity D IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances for dorzolamide.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to dorzolamide and dorzolamide impurity D is not less than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{10}H_{16}N_2O_4S_3$ in the eye drops.

1 mg of $C_{10}H_{16}N_2O_4S_3$,HCl is equivalent to 899 µg of $C_{10}H_{16}N_2O_4S_3$.

For timolol — Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops to obtain a solution containing 0.025 per cent w/v of timolol in the mobile phase.

Reference solution (a). A 0.0342 per cent w/v solution of *timolol maleate IPRS* in the mobile phase.

Reference solution (b). Add 8 ml of *0.1 M sodium hydroxide* to 90 mg of *timolol maleate IPRS*, heat at 70° for 15 hours, cool and dilute to 50.0 ml with the mobile phase. Mix 1 volume of the solution with 4 volumes of a 0.14 per cent w/v solution of *dorzolamide hydrochloride IPRS*.

Use chromatographic system as described under Related substances for timolol.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to timolol impurity G and timolol impurity B is not less than 1.5.

Inject reference solution (a) and the test solution.

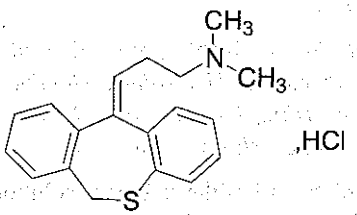
Calculate the content of $C_{13}H_{24}N_4O_3S_3$, in the eye drops.

1 mg of $C_{13}H_{24}N_4O_3S_3,C_4H_4O_4$ is equivalent to 731.6 µg of $C_{13}H_{24}N_4O_3S_3$.

Labelling. The label states the quantity of Dorzolamide Hydrochloride in terms of the equivalent amount of dorzolamide and the quantity of Timolol Maleate in terms of the equivalent amount of timolol.

Dothiepin Hydrochloride

Dosulepin Hydrochloride



$C_{19}H_{21}NS,HCl$ Mol. Wt. 331.9

Dothiepin Hydrochloride is 3-(6*H*-dibenzo[*b,e*]thiepin- 11-ylidene) propyldimethylamine hydrochloride, consisting predominantly of the E-isomer.

Dothiepin Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{21}NS,HCl$, calculated on the dried basis.

Category. Antidepressant

Description. A white to faintly yellow, crystalline powder.

Identification

Tests B and C may be omitted if tests A and D are carried out. Test A may be omitted if tests B, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dothiepinhydrochloride IPRS* or with the reference spectrum of dothiepin hydrochloride.

B. When examined in the range 220 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in 0.1 per cent v/v solution of *methanolic hydrochloric acid* shows absorption maxima at about 231 nm and 306 nm; specific absorbance at 231 nm is 660 to 730.

C. Dissolve 1 mg in 5 ml of *sulphuric acid;* a dark red colour is produced.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1) and not more intensely coloured than reference solution YS5 (2.4.1).

pH (2.4.24). 4.2 to 5.2, determined in a 10.0 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light and use freshly prepared solutions.

Test solution. Dissolve 50 mg of the substance under examination in 5 ml of *methanol* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 12.5 mg of *dothiepin impurity A IPRS* in 5 ml of *methanol* and dilute to 50.0 ml with the mobile phase. Dilute 0.5 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *dothiepin for system suitability IPRS* (containing impurity E) in 5 ml of *methanol* and dilute to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with cyanosilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: a mixture 1 volume of 0.83 per cent v/v solution of *perchloric acid*, 10 volumes of *propanol*, 30 volumes of *methanol* and 60 volumes of *water,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 229 nm,
- injection volume: 5 µl.

Name	Relative retention time
Dothiepin impurity A[1]	0.3
Dothiepin (Retention time: about 14 minutes)	1.0
Dothiepin impurity E[2]	0.92

[1](*E*)-3-(5-oxo-5λ4-dibenzo[*b,e*]thiepin-11(6*H*)-ylidene)-*N,N*-dimethylpropan-1-amine,

[2](*Z*)-3-(dibenzo[*b*,*e*]thiepin-11(6*H*)-ylidene)-*N*,*N*-dimethylpropan-1-amine.

Inject reference solution (b). Adjust the sensitivity of the system so that the peak-to-valley ratio is minimum 4, where H_p is height above the baseline of the peak due to impurity E and H_V is the height above the baseline of the lowest point of the curve separating this peak from the peak due to dothiepin.

Inject reference solution (a) and the test solution. Run the chromatogram 2.5 times the retention time of the principal peak, the area of any secondary peak corresponding to dothiepin impurity E is not more than 5 per cent of the sum of the areas of the peak due to dothiepin impurity E and the principal peak in the chromatogram obtained with the test solution (5 per cent), the area of any peak corresponding to dothiepin impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent), the area of any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of areas of all the secondary peaks other than dothiepin impurity E is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.41 9). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.250 g in a mixture of 5 ml of *anhydrous acetic acid* and 35 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1M perchloric acid* is equivalent to 0.03319 g of $C_{19}H_{21}NS,HCl$

Storage. Store protected from light.

Dothiepin Capsules

Dothiepin Hydrochloride Capsules; Dosulepin Capsules; Dosulepin Hydrochloride Capsules.

Dothiepin Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of dothiepin hydrochloride, $C_{19}H_{21}NS,HCl$.

Usual strength. 25 mg.

Identification

Extract a quantity of the contents of the capsules containing 0.1 g of Dothiepin Hydrochloride with 20 ml of *ethanol*, filter and remove the ethanol from the filtrate by evaporation. The residue complies with the following tests.

A. Dissolve 1 mg in 5 ml of *sulphuric acid*; a dark red colour is produced.

B. On 20 mg determine by the oxygen-flask method (2.3.34), using a mixture of 15 ml of *water* and 1 ml of *hydrogen peroxide solution (20 volume)* as the absorbing liquid. The solution gives the reactions of sulphates (2.3.1).

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 90 volumes of *1,2-dichloroethane*, 10 volumes of *2-propanol* and 1 volume of *strong ammonia solution*.

Test solution (a). Extract a quantity of the contents of the capsules containing about 0.25 g of Dothiepin Hydrochloride by shaking for 2 minutes with 5 ml of *chloroform*, centrifuge and use the supernatant liquid.

Test solution (b). Dilute 2.0 ml of test solution (a) to 5.0 ml with *chloroform*.

Reference solution. A freshly prepared solution containing 0.02 per cent w/v each of *11-(3-dimethylamino-propylidene)-6H-dibenzo[b,e]thiepin-5-oxide IPRS* and *6H-dibenzo-[b,e]thiepin-11-one IPRS* in *chloroform*.

Apply to the plate 5 µl of the reference solution and 10 µl of the test solutions. After development, dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with the reference solution the spot with the lower R_f value is more intense than any corresponding spot in the chromatogram obtained with test solution (b). In the chromatogram obtained with test solution (a) any secondary spot other than any spot corresponding to the spot with the lower R_f value in the chromatogram obtained with the reference solution is not more intense than the proximate spot in the chromatogram obtained with the reference solution.

Z-Isomer. Determine by gas chromatography (2.4.13).

Test solution. Use the supernatant liquid obtained by extracting a quantity of the mixed contents of 20 capsules containing 25 mg of Dothiepin Hydrochloride with 5.0 ml of *methanol* and centrifuging.

Reference solution. A 0.5 per cent w/v solution of *dothiepin hydrochloride IPRS* in *methanol*.

Chromatographic system
- a glass column 1.8 m x 3 mm, packed with acid-washed, silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of cyanopropylmethyl phenyl methyl silicone fluid (Such as OV-225),
- temperature:
  column.200°,
  inlet port. 260°,
- flame ionisation detector,
- nitrogen as the carrier gas.

In the chromatogram obtained with the reference solution a peak due to Z-dothiepin is present with a retention time of approximately 0.83 relative to the retention time of the principal peak which is due to *E*-dothiepin. In the chromatogram obtained with the test solution the area of any peak corresponding to Z-dothiepin is not greater than 7.5 per cent of the sum of the areas of the peaks due to Z-dothiepin and *E*-dothiepin.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 0.5 g of Dothiepin Hydrochloride and extract with 20 ml followed by four quantities, each of 10 ml, of *chloroform*, filtering each extract through the same filter. Evaporate the combined extracts to dryness, dissolve the residue in 100 ml of *acetone* and add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using 3 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03319 g of $C_{19}H_{21}NS,HCl$.

Storage. Store protected from moisture.

Dothiepin Tablets

Dothiepin Hydrochloride Tablets; Dosulepin Tablets; Dosulepin Hydrochloride Tablets

Dothiepin Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dothiepin hydrochloride, $C_{19}H_{21}NS,HCl$.

Usual strengths. 25 mg; 50 mg; 75 mg; 100 mg; 150 mg.

Identification

Extract a quantity of the powdered tablets containing about 0.2 g of Dothiepin Hydrochloride with 20 ml of *dichloromethane*, centrifuge, filter through *anhydrous sodium sulphate* and evaporate the filtrate to dryness. Dissolve the residue in the minimum quantity of *ethanol* and add an excess of *ether*. Filter the precipitate, wash with *ether* and dry. The residue complies with the following tests.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dothiepin hydrochloride IPRS* or with the reference spectrum of dothiepin hydrochloride.

Tests

Related substances. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *13.5 M ammonia*, 10 volumes of *2-propanol* and 90 volumes of *1,2-dichloroethane*

Test solution. Disperse a quantity of the powdered tablets containing 0.25 g of Dothiepin Hydrochloride with 5 ml of *dichloromethane*, centrifuge and use the clear supernatant liquid.

Reference solution (a). Dilute 2.0 ml of the test solution to 5.0 ml with *dichloromethane*.

Reference solution (b). A solution containing 0.010 per cent w/v each of *3-(dibenzo[b,e]thiepin-11(6H)-ylidene)-N,N-dimethylaminopropan-1-amine S-oxide hydrochloride IPRS* and *3-(dinbenzo[b,e]thiepin-11(6H)-one IPRS* in *chloroform*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise about three-fourths of the height of the plate. Dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with reference solution (b) the spot with the lower R_f value is more intense than any corresponding spot in the chromatogram obtained with reference solution (a) (0.5 per cent). In the chromatogram obtained with test solution, any secondary spot other than any spot corresponding to the spot with the lower R_f value in the chromatogram obtained with reference solution (b) is not more intense than the proximate spot in the chromatogram obtained with reference solution (b) (0.2 per cent)

Z-Impurity. Determine by gas chromatography (2.4.13).

Test solution. Disperse a quantity of tablet powder containing 25 mg of the Dothiepin Hydrochloride in 5.0 ml of *methanol* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *dothiepin hydrochloride IPRS* in *methanol*.

Chromatographic system
- a glass column 1.8 m x 3 mm, packed with acid-washed, silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of cyanopropylmethyl phenyl methyl silicone fluid (Such as OV-225),
- temperature:
  column. 200°,
  inlet port. 260°,
- flame ionisation detector,
- nitrogen as the carrier gas,
- injection volume: 1 µl.

In the chromatogram obtained with the reference solution a peak due to Z-dothiepin is present with a retention time of approximately 0.83 relative to the retention time of the principal peak which is due to *E*-dothiepin. In the chromatogram obtained with the test solution the area of any peak corresponding to Z-dothiepin is not more than 7.5 per cent of the sum of the areas of the peaks due to Z-dothiepin and *E*-dothiepin.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Dothiepin Hydrochloride with about 70 ml of *0.1 M hydrochloric acid*, shake for about 30 minutes and dilute to 100.0 ml with *0.1 M hydrochloric acid* and filter, rejecting the first few ml of filtrate. Dilute 25.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*.

Reference solution. A 0.0125 per cent w/v solution of *dothiepin hydrochloride IPRS* in *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *tetrahydrofuran*, 40 volumes of *acetonitrile*, and 50 volumes of 0.5 per cent w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *2M orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 231 nm,
- injection volume: 20 µl.

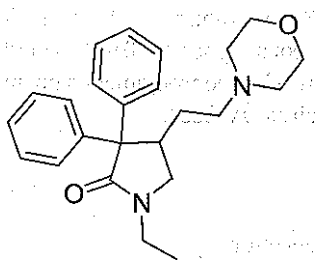
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content, $C_{19}H_{21}NS,HCl$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Doxapram Hydrochloride



, HCl , H_2O

$C_{24}H_{30}N_2O_2,HCl,H_2O$ Mol. Wt. 433.00

Doxapram Hydrochloride is (*RS*)-1-Ethyl-4-(2-morpholinoethyl)-3,3-diphenyl-2-pyrrolidone hydrochloride monohydrate.

Doxapram Hydrochloride contains not less than 98.0 per cent and not more than 100.5 per cent of $C_{24}H_{30}N_2O_2,HCl$, calculated on the dried basis.

Category. Respiratory stimulant.

Description. A white or almost white, crystalline powder.

Identification

Test B may be omitted if tests A and C are carried out. Test A may be omitted if tests B and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *doxapram hydrochloride IPRS* or with the reference spectrum of doxapram hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of 1.7 per cent w/v of *ammonia*, 10 volumes of *2-propanol* and 80 volumes of *2- methylpropanol*.

Test solution. Dissolve 10 mg of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol*.

Reference solution. A 0.1 per cent w/v solution of *doxapram hydrochloride IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and spray with *dilute potassium iodobismuthate solution* and examine immediately. The principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (A) of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 3.5 to 5.0, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water*.

Optical rotation (2.4.22). - 0.1° to + 0.1°, determined on 5.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 10 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 5.0 ml with the mobile phase.

Reference solution (c). A 0.1 per cent w/v solution of *doxapram impurity B IPRS ((4RS)-1-ethyl-4-[2-[(2-hydroxyethyl) amino]ethyl]-3,3-diphenylpyrrolidin-2-one IPRS)* in the mobile phase. To 1.0 ml of the solution, add 1.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.082 per cent w/v solution of *sodium acetate,* adjusted to pH 4.5 with *glacial acetic acid,*
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 214 nm,
- injection volume: 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to doxapram and doxapram impurity B is not less than 3.0.

Inject reference solution (a), (b) and the test solution. Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *methanol* and dilute to 20 ml with the same solvent mixture. 12 ml of the solution complies with limit test for heavy metals, Method D (20 ppm), using 10.0 ml of *lead standard solution (2 ppm Pb).*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.0 per cent to 4.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in a mixture of 10 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent).* Titrate with *0.1 M sodium hydroxide,* determining the end point potentiometrically (2.4.25). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0415 g of $C_{24}H_{31}ClN_2O_2$.

Doxapram Injection

Doxapram Hydrochloride Injection

Doxapram Injection is a sterile solution of Doxapram Hydrochloride in Water for Injections.

Doxapram Injection contains not less than 90.0 per cent and not more than 110.0 per cent of doxapram hydrochloride, $C_{24}H_{30}N_2O_2,HCl,H_2O$.

Usual strength. 20 mg per ml.

Identification

A. To a volume containing 50 mg of Doxapram Hydrochloride, add 10 ml of *water* and 2 ml of *1 M sodium hydroxide* and extract with two 10 ml quantities of *ether.* Wash the combined extracts with 5 ml of *water,* dry over *anhydrous sodium sulphate,* filter and evaporate to dryness. Recrystallise the residue from 10 ml of *0.01M methanolic hydrochloric acid.* On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *doxapram hydrochloride IPRS,* treated in similar manner or with the reference spectrum of doxapram.

B. When examined in the range 230 nm to 350 nm (2.4.7) of the solution obtained in the Assay exhibits maxima at about 253 nm, 258 nm and 265 nm.

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.0, determined in a 1.0 per cent w/v solution of doxapram hydrochloride.

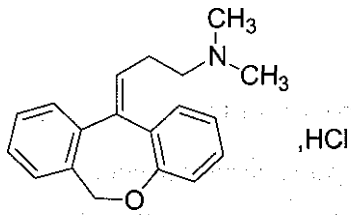
Bacterial endotoxins (2.2.3). Not more than 3.3 Endotoxin Units per mg of doxapram hydrochloride.

Other tests. Comply with the tests stated under Parenteral Preparations (injections).

Assay. Dilute a volume containing 0.2 g of Doxapram Hydrochloride to 250 ml with *water.* Measure the absorbance of the resulting solution at the maximum at 258 nm (2.4.7). Calculate the content of $C_{24}H_{30}N_2O_2,HCl,H_2O$ in the injection from the absorbance of a 0.08 per cent w/v solution of *doxapram hydrochloride IPRS.*

Storage. It should not be allowed to freeze.

Doxepin Hydrochloride



$C_{19}H_{21}NO,HCl$ Mol. Wt. 315.8

Doxepin Hydrochloride is 3-(6*H*-dibenz[*b*,*e*]oxepin-11- ylidene) propyldimethylamine hydrochloride. It consists of a mixture of *Z* and *E* isomers.

Doxepin Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{21}NO,HCl$, calculated on the dried basis.

Category. Antidepressant.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *doxepin hydrochloride IPRS* or with the reference spectrum of doxepin hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows an absorption maximum only at 297 nm, about 0.60.

C. Dissolve 5 mg in 2 ml of *nitric acid*; a red colour is produced.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use and protect them from light.

Solvent mixture. 1 volume of *1 M sodium hydroxide* and 250 volumes of the mobile phase.

Test solution. Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *acetonitrile* and 30 volumes of phosphate buffer solution prepared by dissolving 1.42 g of *anhydrous disodium hydrogen phosphate* in *water*, adjusted to pH 7.7 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 50 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 20 µl.

Name	Relative retention time	Correction factor
Doxepin impurity A[1]	0.5	—
Doxepin impurity C[2]	0.6	—
Doxepin impurity B[3]	0.7	1.7
Doxepin (Retention time: about 18 minutes)	1.0	—

[1]doxepinone,

[2]desmethyldoxepin,

[3]doxepinol.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to doxepin impurities A, B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent), the area of any peak corresponding to doxepin impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

***Z*-Isomer.** Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm) with a specific surface area of 220 m^2/g and a pore size of 80 nm,
- column temperature: 50°,
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of 3.0 per cent w/v solution of *sodium dihydrogen phosphate* previously adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the test solution. The test is not valid unless the resolution between the peaks due to *E*-isomer (1st peak) and to the *Z*-isomer (2nd peak) is not less than 1.5. Calculate the ratio of the area of the peak due to the *E*-isomer to the area of the peak due to the *Z*-isomer: this ratio is 4.4 to 6.7 (13.0 per cent to 18.5 per cent of the *Z*-isomer).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.6 g in 100 ml of *acetone* and add 15 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using 3 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03158 g of $C_{19}H_{21}NO,HCl$.

Storage. Store protected from light.

Doxepin Capsules

Doxepin Hydrochloride Capsules

Doxepin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of doxepin, $C_{19}H_{21}NO$.

Usual strengths. 25 mg; 50 mg and 75 mg.

Identification

Wash a quantity of the contents of the capsules containing 0.1 g of doxepin with 3 quantities, each of 5 ml, of *light petroleum (40° to 60°)*. Dry the residue in air and extract with 3 quantities, each of 10 ml, of *chloroform*, evaporate the combined extracts to dryness and dry the residue at 105°. The dried residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *doxepin hydrochloride IPRS* or with the reference spectrum of doxepin hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.004 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows an absorption maximum only at about 297 nm; absorbance at about 297 nm, about 0.60.

C. Dissolve 5 mg in 2 ml of *nitric acid*; a red colour is produced.

D. It gives reaction (A) of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1(Basket),
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 292 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO$ in the medium from the absorbance obtained from a solution of known concentration of *doxepin hydrochloride IPRS* in the same medium.

Q. Not less than 80 per cent of the stated amount of $C_{19}H_{21}NO$.

***Z*-Isomer**. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 20 mg of doxepin in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm) with a specific surface area of 220 m^2/g and a pore size of 80 nm,
- column temperature: 50°,
- mobile phase: a mixture of 30 volumes of *methanol* and 70 volumes of 3.0 per cent w/v solution of *sodium dihydrogen phosphate* previously adjusted to pH 2.5 with *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the test solution. The test is not valid unless the resolution between the peaks due to *E*-isomer (first peak) and to the *Z*-isomer (second peak) is not less than 1.5. Calculate the ratio of the area of the peak due to the *E*-isomer to the area of the peak due to the *Z*-isomer: this ratio is 4.4 to 6.7 (13.0 per cent to 18.5 per cent of the *Z*-isomer).

Other tests. Comply with the tests stated under Capsules.

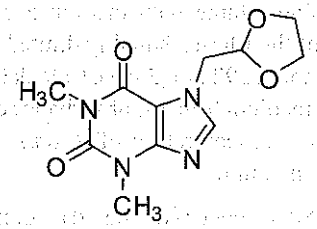
Assay. Weigh a quantity of the mixed contents of 20 capsules containing about 30 mg of doxepin, add 50 ml of *0.1 M methanolic hydrochloric acid*, shake for 30 minutes and add

sufficient *0.01 M methanolic hydrochloric acid* to produce 100.0 ml. Centrifuge 40 ml of the solution and dilute 10.0 ml of the clear supernatant liquid to 100.0 ml with *0.01 M methanolic hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 297 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO$ taking 150 as the specific absorbance at 297 nm.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of doxepin.

Doxofylline



$C_{11}H_{14}N_4O_4$ Mol. Wt. 266.3

Doxofylline is 7-(1,3-dioxolan-2-ylmethyl)-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione.

Doxofylline contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{11}H_{14}N_4O_4$, calculated on the dried basis.

Category. Bronchodilator.

Description. A white to off white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum obtained with *doxofylline IPRS* or with the reference spectrum of doxofylline.

B. When examined in the range of 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *water* shows an absorption maximum at about 274 nm.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.05 per cent w/v each of *doxofylline IPRS* and *theophylline IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Cosmosil C18),
- mobile phase: a mixture of 80 volumes of *water* and 20 volumes of *acetonitrile*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to theophylline and doxofylline is not less than 5.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to theophylline is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the area of any other secondary peak is not more than the area of the peak in the chromatogram obtained reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained reference solution (b) (1.0 per cent).

Heavy Metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 40 mg of substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.004 per cent w/v solution of *doxofylline IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Cosmosil C18),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, and 20 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{11}H_{14}N_4O_4$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Doxofylline Tablets

Doxofylline Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of doxofylline, $C_{11}H_{14}N_4O_4$.

Usual strength. 400 mg.

Identification

A. Extract a quantity of the powdered tablets containing about 0.1 g of Doxofylline with 40 ml of *chloroform*, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained from *doxofylline IPRS* or with the reference spectrum of doxofylline.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter. Measure the absorbance of the filtered solution, suitably diluted if necessary with the medium, at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{11}H_{14}N_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *doxofylline IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{11}H_{14}N_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 25 mg of Doxofylline in 25.0 ml in the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *doxofylline IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Use chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of Doxofylline in 70 ml of *methanol*, sonicate for 15 minutes and dilute to 100.0 ml with *methanol*, filter.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *doxofylline IPRS* in *methanol*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 30 volumes of *water* and 70 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 274 nm,
- injection volume: 20 µl.

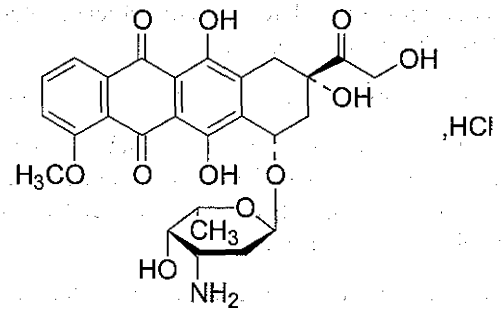
Inject reference solution (b). The test is not valid unless the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject reference solution (b) and test solution (b).

Calculate the content of $C_{11}H_{14}N_4O_4$ in the tablets.

Storage. Store protected from light and moisture.

Doxorubicin Hydrochloride



$C_{27}H_{29}NO_{11},HCl$ Mol. Wt. 580.0

Doxorubicin Hydrochloride is (8*S*,10*S*)-10-[(3-amino-2,3,6-trideoxy-α-*L*-*lyxo*-hexopyranosyl)oxy]-6,8,11-trihydroxy-8-hydroxyacetyl-1-methoxy-7,8,9,10-tetrahydronaphthacene-5,12-dione hydrochloride, a substance produced by the growth of certain strains of *Streptomyces coeruleorubidus* or *S. peucetius* or obtained by any other means.

Doxorubicin Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{29}NO_{11},HCl$, calculated on the anhydrous and solvent-free basis.

Category. Cytotoxic.

Description. An orange-red, crystalline powder; hygroscopic.

CAUTION — Doxorubicin Hydrochloride is poisonous. It must be handled with care avoiding contact with skin and inhalation of airborne particles.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6) Compare the spectrum with that obtained with *doxorubicin hydrochloride IPRS* or with the reference spectrum of doxorubicin hydrochloride.

B. In the test for Related substances, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (c).

C. Dissolve 10 mg in 0.5 ml of *nitric acid,* add 0.5 ml of *water* and heat over a flame for 2 minutes. Allow to cool and add 0.5 ml of *silver nitrate solution;* a white precipitate is produced.

Tests

pH (2.4.24). 4.0 to 5.5, determined in a 0.5 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in sufficient of the mobile phase to produce 50 ml.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *doxorubicin hydrochloride IPRS* and 10 mg of *epirubicin hydrochloride IPRS* in the mobile phase and dilute to 50 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5 ml of reference solution (a) to 20 ml with the mobile phase.

Reference solution (c). Dissolve 50 mg of *doxorubicin hydrochloride IPRS* in the mobile phase and dilute to 50 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of equal volumes of *acetonitrile* and a solution containing 2.88 g per litre of *sodium dodecylsulphate* and 2.25 g per litre of *orthophosphoric acid*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a), (b) and test solution (a). Continue the chromatography for 3.5 times the retention time of doxorubicin of about 8 minutes. The test is not valid unless in the chromatogram obtained with reference solution (a) the resolution factor between the peaks due to doxorubicin and epirubicin is at least 2.0.

In the chromatogram obtained with the test solution the area of any peak other than the principal peak is not more than the area of the peak corresponding to doxorubicin in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the peak corresponding to doxorubicin in the chromatogram obtained with reference solution (b) (0.05 per cent).

Acetone and ethanol. Not more than 2.0 per cent w/w together of which not more than 0.5 per cent w/w is acetone, determined by gas chromatography (2.4.13), injecting 1 µl of each of two solutions

Test solution. A 5.0 per cent w/v solution of the substance under examination and 0.1 per cent w/v of *dioxon* in *water*.

Reference solution. 0.05 per cent w/v of *acetone*, 0.05 per cent w/v of *ethanol* and 0.1 per cent w/v of the internal standard.

Chromatographic system

- a glass column 2 m x 3 mm, packed with acid-washed diatomaceous support (180 to 250 mesh) impregnated with 10 per cent w/w of *polyethylene glycol 20,000* (Such as Carbowax 20M or Chromosorb E/AW),

- temperature:
  column.70°,
  inlet port and detector. 125°,
- flow rate: 30 ml per minute, using helium or nitrogen as the carrier gas.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.1 g.

Assay. Determine by liquid chromatography (2.4.14) by the procedure described under the test for Related substances.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{27}H_{29}NO_{11}$,HCl.

Doxorubicin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 2.2 Endotoxin Units per mg.

Doxorubicin Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture. If the material is sterile, it should be stored in sterile, tamper-evident containers and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Doxorubicin Injection

Doxorubicin Hydrochloride Injection

Doxorubicin Injection is a sterile solution of Doxorubicin Hydrochloride in Water for Injections made isotonic with Sodium Chloride, Dextrose or other suitable added substances. It is either supplied as preformed solution or it is prepared by dissolving the contents of a sealed container containing Doxorubicin Hydrochloride with or without auxiliary substances in the requisite amount of Water for Injections or Sodium Chloride Injection as directed on the label.

Doxorubicin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of doxorubicin hydrochloride, $C_{27}H_{29}NO_{11}$,HCl.

Usual strength. 2 mg per ml.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 2.5 to 4.5 for the preformed solution and 4.5 to 6.5, determined in the injection prepared in accordance with the directions on the label.

Bacterial endotoxins (2.2.3). Not more than 2.2 Endotoxin Units per mg of doxorubicin hydrochloride, determined in a solution prepared by diluting the injection, if necessary, with *water BET* to obtain a concentration of 2.0 mg of doxorubicin hydrochloride per ml.

Sterility. Complies with the test for sterility, Method A, (2.2.11), using the entire contents of all the containers collected aseptically.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A solution containing 0.05 per cent w/v of doxorubicin hydrochloride prepared by diluting a measured volume of the injection containing not less than 2 mg of Doxorubicin Hydrochloride with the mobile phase or by dissolving the contents of the sealed container in sufficient mobile phase to give a solution of the same strength.

Reference solution (a). A 0.05 per cent w/v solution of *doxorubicin hydrochloride IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v each of *doxorubicin hydrochloride IPRS* and *epirubicin hydrochloride IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of a solution containing 0.288 per cent w/v of *sodium dodecyl sulphate* and 0.23 per cent w/v of *phosphoric acid*, 45 volumes of *acetonitrile* and 5 volumes of *methanol*,
- flow rate: 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to doxorubicin and epirubicin is not less than 2.0 in the chromatogram obtain with reference solution (b) and the relative standard deviation for replicate injections is not more than 1.0 per cent in the chromatogram obtain with reference solution (a).

Inject reference solution (a) and test solution.

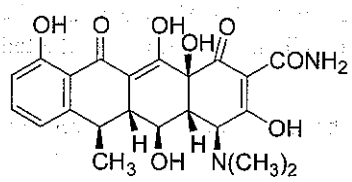
Calculate the content of $C_{27}H_{29}NO_{11}$,HCl in the injection.

Storage. Store the sealed container at a temperature not exceeding 30°. Store the preformed solution protected from light in a refrigerator. Use the solution prepared in the liquid

stated on the label immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the instructions of the manufacturer.

Doxycycline Hydrochloride

Doxycycline Hyclate



,HCl, $^1/_2$ C_2H_5OH, $^1/_2$ H_2O

$C_{22}H_{24}N_2O_8$,HCl,½C_2H_6O,½H_2O Mol. Wt. 513.0

Doxycycline Hydrochloride is (4*S*,4a*R*,5*S*,5a*R*,6*R*,12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12, 12a-pentahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide hydrochloride hemiethanolate hemihydrate, an antimicrobial substance obtained from oxytetracycline or methacycline or by any other means.

Doxocycline Hydrochloride is not less than 95.0 per cent and not more than 102.0 per cent of $C_{22}H_{25}ClN_2O_8$, calculated on anhydrous and ethanol free basis.

Category. Antibacterial.

Description. A yellow, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *doxycycline hydrochloride IPRS* or with the reference spectrum of doxycycline hydrochloride.

B. Determine by thin-layer chromatography (2.4.7), coating the plate with *silica gel H*.

Mobile phase. A mixture of 59 volumes of *dichloromethane*, 35 volumes of *methanol* and 6 volumes of *water*.

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *doxycycline hydrochloride IPRS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *doxycycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol*.

Spray the plate evenly with a 10 per cent w/v solution of *disodium edetate* the pH of which has been adjusted to 9.0 with *10 M sodium hydroxide*. Allow the plate to dry in a horizontal position for at least 1 hour. Immediately before use dry it at 110° for 1 hour. Apply to the plate 1 µl of each solution. After development, dry the plate in a current of air and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. To about 2 mg add 5 ml of *sulphuric acid*; a yellow colour is produced.

D. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). –120° to –105°, calculated on anhydrous and ethanol free basis. Determined within 5 minutes of preparing, in a 1.0 per cent w/v solution in a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol*, measured within 1 hour of preparing the solution, at the maximum at about 349 nm, 0.300 to 0.335, calculated on anhydrous and ethanol free basis.

Light-absorbing impurities. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the solution at about 490 nm (2.4.7), when measured within 1 hour of preparing the solution, not more than 0.07, calculated on anhydrous and ethanol free basis.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 80 mg of the substance under examination in 100 ml of *0.01 M hydrochloric acid*.

Reference solution (a). A 0.08 per cent w/v solution of *doxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Reference solution (b). A 0.08 per cent w/v solution of *6-epidoxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Reference solution (c). A 0.08 per cent w/v solution of *methacycline hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Reference solution (d). A solution containing 0.0016 per cent w/v each of *6-epidoxyccline hydrochloride IPRS* and

methacycline hydrochloride IPRS in *0.01 M hydrochloric acid.*

Reference solution (e). Dilute a mixture of 4 volumes of reference solution (a), 1.5 volumes of reference solution (b) and 1 volume of reference solution (c) to 25 volumes with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8 to10 µm),
- column temperature. 60°,
- mobile phase: a solution prepared by adding 60 g of *2-methyl-2-propanol* to a volumetric flask with the aid of 200 ml of *water*, adding 400 ml of *phosphate buffer pH 8.0*, 50 ml of a 1 per cent w/v solution of *tetrabutyl ammonium hydrogen sulphate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and 10 ml of a 4 per cent w/v solution of *disodium edetate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Using reference solution (e). The test is not valid unless (a) the resolution between the first peak (methacycline) and the second peak (6-epidoxycycline) is at least 1.25, (b) the resolution between the second peak and the third peak (doxycycline) is at least 2.0 (adjust the content of 2-methyl-2-propanol in the mobile phase if necessary) and (c) the tailing factor for the third peak is at most 1.25.

Inject reference solution (a). The test is not valid unless the relative standard deviation of the area of the peak due to doxycycline is not more than1.0 per cent.

Inject the test solution and reference solution (d). In the chromatogram obtained with the test solution the area of any peak corresponding to methacycline or 6-epidoxycycline is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (d); the area of any peak appearing between the solvent peak and the peak corresponding to methacycline and the area of any peak appearing on the tail of the main peak is not greater than 25 per cent of that of the peak corresponding to 6-epidoxycycline in the chromatogram obtained with reference solution (d).

Ethanol. 4.3 to 6.0 per cent w/w of C_2H_6O.

Determine by gas chromatography (2.4.13).

Test solution (a). A 1 per cent w/v solution of the substance under examination in a 0.05 per cent v/v solution of *1-propanol* (internal standard) in *water* (solution A).

Test solution (b). A 1 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.05 per cent v/v solution of *ethanol* in solution A.

Chromatographic system
- a column 1.5m x 4 mm, packed with porous polymer beads (80 to 100 mesh) (Such as Porapak Q),
- temperature:
  column.135°,
  inlet port and detector. 150°,

Calculate the content of C_2H_6O taking 0.790 g as its weight per ml (2.4.29) at 20°.

Heavy metals (2.3.13). 0.4 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.4 per cent.

Water (2.3.43). 1.4 to 2.8 per cent, determined on 1.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 80 mg of the substance under examination and dissolve in 100 ml of *0.01 M hydrochloric acid.*

Reference solution. A 0.08 per cent w/v solution of *doxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8 to 10 µm),
- column temperature: 60°
- mobile phase: a solution prepared by adding 60 g of *2-methyl-2-propanol* to a volumetric flask with the aid of 200 ml of *water*, adding 400 ml of *phosphate buffer pH 8.0*, 50 ml of a 1 per cent w/v solution of *tetrabutyl ammonium hydrogen sulphate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and 10 ml of a 4 per cent w/v solution of *disodium edetate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{25}ClN_2O_8$.

Doxycycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 1.14 Endotoxin Units per mg.

Doxycycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture at a temperature not exceeding 30°. If the substance is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states, where applicable, that the material is sterile.

Doxycycline Capsules

Doxycycline Hydrochloride Capsules

Doxycycline Capsules contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of doxycycline, $C_{22}H_{24}N_2O_8$.

Usual strengths. The equivalent of 50 mg; 100 mg; 200 mg of doxycycline.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 59 volumes of *dichloromethane*, 35 volumes of *methanol* and 6 volumes of *water.*

Test solution. Shake a quantity of the contents of the capsules containing 50 mg of *anhydrous doxycycline* with 100 ml of *methanol* for 1 to 2 minutes, centrifuge and use the supernatant liquid. Prepare freshly.

Reference solution (a). A 0.05 per cent w/v solution of *doxycycline hydrochloride IPRS* in *methanol.*

Reference solution (b). A solution containing 0.05 per cent w/v each of *doxycycline hydrochloride IPRS* and *tetracycline hydrochloride IPRS* in *methanol.*

Spray the plate evenly with a 10 per cent w/v solution of *disodium edetate* the pH of which has been adjusted to 9.0 with *10 M sodium hydroxide.* Allow the plate to dry in a horizontal position for at least 1 hour. Immediately before use dry it at 110° for 1 hour. Apply to the plate 1 µl of each solution. After development, dry the plate in a current of air and examine it under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. To 0.5 mg of the contents of the capsules add 2 ml of *sulphuric acid*; a yellow colour is produced.

C. A 5 per cent w/v solution of the contents of the capsules gives the reactions of chlorides (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate suitably diluted with the medium, if necessary, at the maximum at about 345 nm. (2.4.7). Calculate the content of $C_{22}H_{24}N_2O_8$ in the medium from the absorbance obtained from a solution of known concentration of *doxycycline hydrochloride IPRS* in the dissolution medium.

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{24}N_2O_8$.

Light-absorbing impurities. Dissolve the contents of 5 capsules as completely as possible in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce a solution containing the equivalent of 1.0 per cent w/v of anhydrous doxycycline and filter. Absorbance of the filtrate at about 490 nm, not greater than 0.2 (2.4.7), calculated with reference to the dried contents of the capsules.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the contents of the capsules containing 7 mg of anhydrous doxycycline in 10 ml of *0.01 M hydrochloric acid*, filter and use the filtrate.

Reference solution (a). A 0.08 per cent w/v solution of *doxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Reference solution (b). A 0.08 per cent w/v solution of *6-epidoxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Reference solution (c). A 0.08 per cent w/v solution of *methacycline hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Reference solution (d). A solution containing 0.0016 per cent w/v each of *6-epidoxycycline hydrochiloride IPRS* and *methacycline hydrochloride IPRS* in *0.01 M hydrochloric acid.*

Reference solution (e). Dilute a mixture of 4 volumes of reference solution (a), 1.5 volumes of reference solution (a) and 1 volume of reference solution (c) to 25 volumes with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8 to 10 µm),
- column temperature: 60°,
- mobile phase: a solution prepared by adding 60 g of *2-methyl-2-propanol* to a volumetric flask with the aid of 200 ml of *water*, adding 400 ml of *phosphate buffer pH 8.0*, 50 ml of a 1 per cent w/v solution of *tetrabutyl ammonium hydrogen sulphate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and 10 ml of a 4 per cent w/v solution of *disodium edetate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Using reference solution (e) adjust the attenuation to obtain peaks with a height corresponding to at least 50 per cent of full-scale deflection of the recorder. The test is not valid unless (a) the resolution factor between the first peak (methacycline) and the second peak (6-epidoxycycline) is at least 1.25, (b) the resolution factor between the second peak and the third peak (doxycycline) is at least 2.0 (adjust the content of 2-methylpropan-2-ol in the mobile phase if necessary).

Inject reference solution (a).The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (d) and record the chromatograms. In the chromatogram obtained with the test solution the area of any peak corresponding to methacycline or 6- epidoxycycline is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (2 per cent, with reference to doxycycline hydrochloride), the area of any peak appearing between the solvent peak and the peak corresponding to methacycline and the area of any peak appearing on the tail of the main peak is not greater than 25 per cent of that of the peak corresponding to 6-epidoxycycline in the chromatogram obtained with reference solution (d) (0.5 per cent, with reference to doxycycline hydrochloride).

Loss on drying (2.4.19). Not more than 8.5 per cent, determined on 0.5 g of the contents of the capsules by drying in an oven at 105° for 2 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve the mixed contents of 20 capsules containing about 17.5 mg of anhydrous doxycycline in sufficient *0.01 M hydrochloric acid* to produce 25.0 ml and dilute 4.0 ml of the solution to 25.0 ml with the same solvent.

Reference solution. A 0.0128 per cent w/v solution of *doxycycline hydrochloride IPRS* in *0.01 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8 to 10 µm),
- column temperature: 60°,
- mobile phase: a solution prepared by adding 60 g of *2-methyl-2-propanol* to a volumetric flask with the aid of 200 ml of *water*, adding 400 ml of *phosphate buffer pH 8.0*, 50 ml of a 1 per cent w/v solution of *tetrabutyl ammonium hydrogen sulphate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and 10 ml of a 4 per cent w/v solution of *disodium edetate* previously adjusted to pH 8.0 with *2 M sodium hydroxide* and diluting to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation of the area of the peak due to doxycycline is not more than1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_8$ in the capsules.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of doxycycline.

Doxycycline Dispersible Tablets

Doxycyline Dispersible Tablets contain doxycycline monohydrate in a suitable dispersible base.

Doxycycline Dispersible Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of doxycycline, $C_{22}H_{24}N_2O_8$.

Usual strength. 100 mg.

Identification

A. Determine by thin - layer chromatography (2.4.17), using the plate coated with *silica gel H*.

Mobile phase. A mixture of 6 volume of *water*, 35 volume of *methanol* and 59 volume of *dichloromethane*.

Test solution. Disperse a quantity of powder containing the equivalent of 0.05 g of anhydrous doxycycline in 100.0 ml of *methanol*, centrifuge and filter the supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *doxycycline hyclate IPRS* in *methanol*.

Reference solution (b). A 0.05 per cent w/v each of *doxycycline hyclate IPRS* and *tetracycline hydrochloride IPRS* in *methanol.*

Spray the plate evenly with a 10.0 per cent w/v solution of *disodium edetate*, adjusted to pH 9.0 with *10M sodium hydroxide*. Allow the plate to dry in a horizontal position for at least 1 hour. Immediately before use dry it at 110° for 1 hour.

Apply to the plate 1 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution is same corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a solution prepared by dissolving 2 g of *sodium chloride* in 7 ml of *hydrochloric acid* and sufficient *water* to produce 1000 ml,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium at the maximum at about 276 nm (2.4.7). Calculate the content of anhydrous doxycycline, $C_{22}H_{24}N_2O_8$ in the medium from the absorbance obtained from a solution of known concentration of *doxycycline hyclate IPRS.*

Q. Not less than 70 per cent of the stated amount of $C_{22}H_{24}N_2O_8$.

Light absorbing impurities (2.4.7). Dissolve a quantity of the powdered tablets in sufficient mixture of 1 volume of *1M hydrochloric acid* and 99 volumes of *methanol* to produce a solution containing the equivalent of 1.0 per cent w/v of anhydrous doxycycline, filter. The absorbance of the filtrate at 490 nm is not more than 0.20, calculated with reference to the dried powdered tablets.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 80 mg of anhydrous doxycycline, in 80 ml of *0.01 M hydrochloric acid,* mix with the aid of ultrasound and dilute with *0.01 M hydrochloric acid* to 100 ml with *0.01M hydrochloric acid*, filter use the supernatant liquid.

Reference solution (a). A 0.08 per cent w/v solution of *doxycycline hyclate IPRS* in the *0.01M hydrochloric acid.*

Reference solution (b). A 0.08 per cent w/v solution of *6-epidoxycycline hydrochloride IPRS* in the *0.01M hydrochloric acid.*

Reference solution (c). A 0.08 per cent w/v solution of *metacycline hydrochloride IPRS* in the *0.01M hydrochloric acid.*

Reference solution (d). A 0.0016 per cent w/v each of *6-epidoxycycline hydrochloride IPRS* and *metacycline hydrochloride IPRS* in the *0.01M hydrochloric acid.*

Reference solution (e). A mixture of 4 volumes of reference solution (a), 1.5 volumes of reference solution (b) and 1 volume of reference solution (c), dilute to 25.0 ml with *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8µm),
- column temperature: 60°,
- mobile phase: dilute 76 ml of *2-methylpropane-2-ol* in 200 ml of *water* with the aid of ultrasound, add 400 ml of *phosphate buffer pH 8,* 50 ml of 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate*, adjusted to pH 8 with *2M sodium hydroxide* and 10 ml of 4.0 per cent solution of *disodium edetate*, adjusted to pH 8 with *2M sodium hydroxide*, dilute to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject reference solution (e). The test is not valid unless, the resolution between the peaks corresponding to the metacycline and the 6-epidoxycycline is not less than 1.25 and the resolution between the peaks corresponding to 6-epidoxycycline and doxycycline is not less than 2.0.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution the area of any peak corresponding to metacycline and 6-epidoxycycline is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (2.0 per cent) and the area of any other secondary peak is not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Loss on drying (2.4.19). Not more than 6.0 per cent, determined on 1.0 g of powdered tablets by drying in an oven at 60° at pressure not exceeding 2 kPa for 2 hours.

Other test. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), using the chromatographic conditions as described in Related substances.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.1 g of anhydrous doxycycline in 20ml of *0.1 M hydrochloric acid* with the aid of ultrasound, dilute to 200.0 ml with *water,* mix. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 0.115 g of *doxycycline hyclate IPRS* in 20 ml of *0.1 M hydrochloric acid* and dilute to 200.0 ml with *water.*

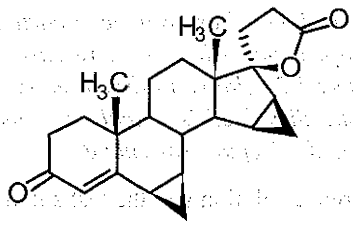
Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{24}N_2O_8$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. (1) The label states the quantity of the active ingredient in terms of the equivalent amount of anhydrous doxycycline; (2) The tablets should be dispersed in *water* immediately before use.

Drospirenone



$C_{24}H_{30}O_3$ Mol. Wt. 366.5

Drospirenone is 3-Oxo-6β, 7β: 15β, 16β -dimethylene-17α-pregn-4-en-21, 17-carbolactone.

Drospirenone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{30}O_3$, calculated on the dried basis.

Category. Aldosterone receptor antagonist.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *drospirenone IPRS* or with the reference spectrum of drospirenone.

B. Specific optical rotation (see Test).

Tests

Specific optical rotation (2.4.22). –193.0° to –187.0°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *water* and *acetonitrile.*

Test solution. Dissolve 30 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture. Dissolve the contents of a vial containing 0.06 mg of *drospirenone impurity E IPRS* [3-oxo-6α,7α,15α,16α-tetrahydro-3...H,3 H-dicyclopropa [6,7:15,16]pregn-4-en-21,17-carbolactone *(17-epidrospirenone)] IPRS* in 1.0 ml of the resulting solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Further dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 30 mg of *drospirenone IPRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: A. *water,*
  B. *acetonitrile,*
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume: 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	63	37
2	63	37
16	52	48
23	52	48
31	20	80
39	20	80
40	63	37
50	63	37

The relative retention time with respect to drospirenone peak for drospirenone impurity E is about 1.1.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to drospirenone impurity E and drospirenone is not less than 5.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

Inject reference solution (c) and the test solution.

Calculate the content of $C_{24}H_{30}O_3$.

Storage. Store protected from light and moisture.

Drospirenone and Ethinylestradiol Tablets

Drospirenone and Ethinyl Estradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of drospirenone, $C_{24}H_{30}O_3$ and ethinyl estradiol, $C_{20}H_{24}O_2$.

Usual strengths. Drospirenone, 3 mg and Ethinyl Estradiol, 0.03 mg; Drospirenone, 3 mg and Ethinyl Estradiol, 0.02 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the principal peaks in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

NOTE — A volume of methanol not to exceed 2.0 per cent of the total volume of standard solution may be used to dissolve drospirenone IPRS and ethinyl estradiol IPRS.

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water,*
Speed and time.50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a cellulose filter having an average pore diameter not greater than 0.45 µm, rejecting the first 10 ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. Dissolve a suitable quantities of *drospirenone IPRS* and *ethinyl estradiol IPRS* in the *water* to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system

- a stainless steel column 6 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- For detection, use UV detector set at 270 nm for drospirenone, in series with a fluorescence detector for ethinyl estradiol, with excitation at 210 nm and detection at 315 nm, or with excitation at 281 nm and detection at 305 nm,
- injection volume: 100 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from drospirenone and ethinyl estradiol peaks is not less than 2000 theoretical plates, the tailing factor is not more than 1.5 for drospirenone and ethinyl estradiol and the relative standard deviation for replicate injections for each peak corresponding to drospirenone and ethinyl estradiol is not more than 3.0 per cent.

NOTE — In medium, drospirenone is partially converted into 17-epidrospirenone, which has a relative retention time of approximately 1.2 relative to drospirenone. The amount of drospirenone dissolved is calculated from the sum of drospirenone and 17-epidrospirenone.

Inject the reference solution and the test solution.

Calculate the contents of $C_{24}H_{30}O_3$ and $C_{20}H_{24}O_2$.

Q. Not less than 80 per cent of the stated amount of $C_{24}H_{30}O_3$ and not less than 75 per cent of the stated amount of $C_{20}H_{24}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Transfer 15 Tablets to a 10-ml glass-stoppered test tube, and add 5.0 ml of mobile phase A, mix with the aid of ultrasound for not less than 5 minutes, and allow to stand in an ice bath for not less 10 minutes. Centrifuge the sample until an almost clear supernatant is obtained. Filter the supernatant, and use the filtrate.

Reference solution (a). A solution containing 0.0045 per cent w/v of *drospirenone IPRS* , 0.00009 per cent w/v of *ethinyl estradiol IPRS* and 0.00009 per cent w/v of Δ 9,11-Ethinyl estradiol.19-Nor-17α-pregna-1,3,5(10),9(11)-tetraen-20-yne-3,17-diol (*ethinyl estradiol impurity B IPRS*) for the tablets containing 0.03 mg of ethinyl estradiol per tablet in mobile

phase A. Or a solution containing 0.0045 per cent w/v of *drospirenone IPRS*, 0.00006 per centw/v of *ethinyl estradiol IPRS* and 0.00006 per cent w/v of Δ 9,11-Ethinyl estradiol.19-Nor-17α-pregna- 1,3,5(10),9 (11)-tetraen-20-yne-3,17-diol (*ethinyl estradiol impurity B IPRS*) for the tablets containing 0.02 mg ofethinyl estradiol per tablet in mobile phase A.

Reference solution (b). Dilute 1 volume of the reference solution (a) to 10 volumes in mobile phase A.

Reference solution (c). Transfer 1.0 ml of 0.054 per cent w/v solution of *drospirenone IPRS* in mobile phase A to a 10-ml volumetric flask, add 1.0 ml of *0.1M hydrochloric acid* heat on water bath for 30 minutes at 40°. Immediately add 1 ml of *0.1M sodium hydroxide* and allow to stand at room temperature. Dilute to 10.0 ml with mobile phase A to obtain a solution containing drospirenone and 17-epidrospirenone.

NOTE— Sodium hydroxide must be added immediately after heating for the reaction to proceed properly. The drospirenone to 17-epidrospirenone ratio must be between 3:1 and 7:1.

Chromatographic system

- a stainless steel column 30 cm x 3.0 mm, packed with octadecylsilane bonded to porous silica (3 µm), in series, by a chromolith column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica,
- column temperature: 40°,
- mobile phase: A.a mixture of 26 volumes of *acetonotrile*, 19 volumes of *methanol* and 55 volumes of *water*,
  B. a mixture of 76 volumes of *acetonotrile*, 19 volumes of *methanol* and 5 volumes of *water*,
- a gradient programme using the conditions given below,
- injection volume: 20 µl.

For detection, use UV detector set at 222 nm, and a fluorescence detector, with excitation at 215 nm, emission at 315 nm. Monitor the signal at 344 nm between 37 and 42 minutes.

NOTE — UV Detector and Fluorescence Detector are connected in series. Use the response at 344 nm to quantify ethinyl estradiol impurity B.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Flow (ml/min.)
0	90	10	0.5
40	90	10	0.5
53	0	100	0.5
59	0	100	1.0
60	90	10	0.5
70	90	10	0.5

FI = Fluorescence Detector

UV= Ultraviolet Detector

Inject reference solution (a) and test solution.

For Ethinyl estradiol Degradation Products —

In the chromatogram obtained with the test solution, identify the ethnyl estradiol degradation product using the relative retention times given in the table. Calculate the percentage of each ethinyl estradiol degradation product, any unspecified degradation products and ethinyl estradiol related compound B by using their respective corrected peak area and the peak area of ethnyl estradiol from reference solution (a) and compare the limits as shown in the table. Disregard the degradation products less than 0.1 percent.

For Drospirenone Degradation Products —

In the chromatogram obtained with the test solution, identify the drospirenone degradation products using the relative retention times given in the table. Calculate the percentage of each drospirenone degradation product, and any unspecified degradation products by using their respective peak area and the peak area of drospirenone from reference solution (a) and compare the limits as shown in the table. Disregard the degradation products less than 0.1 percent.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Transfer one tablet in 25-ml volumetric flask add 23 ml of mobile phase, mix with the aid of ultrasound for not less than 10 minutes and allow to equilibrate to room temperature dilute to volume with the mobile phase. Centrifuge the sample until an almost clear supernatant is obtained. Use supernatant.

Calculate the contents of $C_{24}H_{30}O_3$ and $C_{20}H_{24}O_2$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay.Determine by liquid chromatography (2.4.14).

Solvent mixture. 10 volumes of solution prepared by dissolving 132 g of *dibasic ammonium phosphate* in 800 ml of *water*, adjusted to pH 6.8 with *orthophosphoric acid* and diluted to 1000 ml and 240 volumes of *water*.

Test solution. Transfer 10 tablets to a 250-ml volumetric flask, add 230 ml of the mobile phase, mixwith the aid of ultrasound for not less than 10 minutes, and allow to equilibrate to room temperature and dilute to volume with the mobile phase. Centrifuge until an almost clear supernatant is obtained .Use the supernatant.

Reference solution.A solution containing 0.012 per cent w/v of *drospirenone IPRS*, and 0.00012 per cent w/v of *ethinyl estradiol IPRS* (for the tablets containing 0.03 mg of ethinyl estradiol per tablet) or 0.00008 per cent w/v of *ethinyl estradiol IPRS* (for the tablets containing 0.02 mg of ethinyl estradiol per tablet) in the mobile phase.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A mixture of equal volumes of *acetonitrile* and the solvent mixture, adjusted to pH 6.8 with *orthophosphoric acid*,
- flow rate: 1.2 ml per minute,
- For detection, use UV detector at 270 nm for drospirenone and a series with a fluorescence detector for ethinyl estradiol, with excitation at 285 nm emission at 315 nm connected in series,
- injection volume: 20 µl.

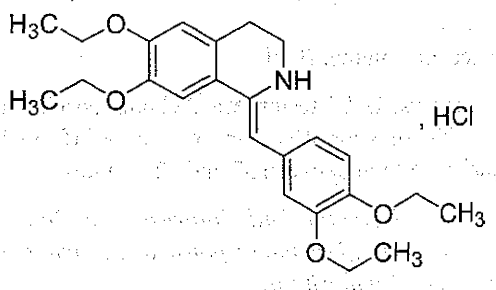
Inject the reference solution. The test is not valid unless the tailing factor for drospirenone and ethinyl estradiol is not more than 1.8 and the relative standard deviation for replicate injections for each of the peaks corresponding to drospirenone and ethinyl estradiol is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the contents of $C_{24}H_{30}O_3$ and $C_{20}H_{24}O_2$ in the tablets using responses of UV detector and flurescence detector.

Storage. Store protected from moisture.

Drotaverine Hydrochloride



$C_{24}H_{31}NO_4,HCl$ Mol.Wt. 434.0

Drotaverine Hydrochloride is (*Z*)-1-(3, 4-Diethoxybenzylidene)-6,7-diethoxy-1,2,3,4-tetrahydroisoquinoline hydrochloride.

Drotaverine Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{24}H_{31}NO_4,HCl$, calculated on the dried basis.

Category. Anticholinergic.

Description. Light yellow to yellow with greenish tinge, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained by *drotaverine hydrochloride IPRS* or with the reference spectrum of drotaverine hydrochloride.

B. It gives reaction (A) of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.0, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column, 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: a mixture of 48 volumes of *acetonitrile*, 8 volumes of *methanol* and 44 volumes of buffer solution prepared by dissolving 21.8 g of *sodium acetate* in about 500 ml of *water*, add 60 ml of *acetic acid* and dilute to 1000.0 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1500 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm)

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Assay. Dissolve 0.4 g in a mixture of 50 ml *glacial acetic acid* and 10 ml of *mercuric acetate solution*. Titrate with *0.1M perchloric acid*, determining the end point potentiometrically (2.4.25) Carry out a blank titration.

1ml of *0.1M perchloric acid* is equivalent to 0.0434 g of $C_{24}H_{31}NO_4.HCl$.

Storage. Store protected from moisture.

Drotaverine Tablets

Drotaverine Hydrochloride Tablets

Drotaverine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of drotaverine hydrochloride, $C_{24}H_{31}NO_4.HCl$.

Usual strengths. 40 mg; 80 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated in the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 80 mg of Drotaverine Hydrochloride in 50 ml of *methanol* with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.08 per cent w/v solution of *drotaverine hydrochloride IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

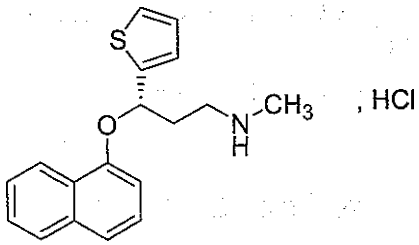
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate* in *water* and dilute to 1000 ml with *water*, adjusted to pH 6.5 with *sodium hydroxide solution*, 40 volumes of *methanol and 35* volumes of *acetonitrile*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 200 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{24}H_{31}NO_4.HCl$ in the tablets.

Duloxetine Hydrochloride



$C_{18}H_{19}NOS,HCl$ Mol. Wt. 333.9

Duloxetine Hydrochloride is (*S*)-*N*-Methyl-3-(1-naphthyloxy)-3-(2-thienyl) propan-1-amine hydrochloride.

Duloxetine Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{18}H_{19}NOS$, HCl, calculated on the dried basis.

Category. Antidepressant.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *duloxetine hydrochloride IPRS* or with reference spectrum of duloxetine hydrochloride.

B. A 0.5 per cent w/v solution gives reaction (A) of chlorides (2.3.1).

C. Enantiomeric purity (see Tests).

Tests

Specific optical rotation (2.4.22). +119.0° to +127.0°, determined in a 1.0 per cent w/v solution in *methanol*, at 20°.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and perform the test protected from light.

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *water*.

Test solution (a). Dissolve 20 mg of the substance under examination in the solvent mixture and dilute to 200.0 ml with the solvent mixture.

Test solution (b). Dissolve 50 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Further dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *duloxetine impurity F IPRS((3S)-N-methyl-3-(naphthalene-1-yloxy)-3-(thiophene-3-yl) propane-1-amine)* in the mobile phase. In order to prepare impurity C and D, in situ, heat the solution at 60° for 1 hour.

Reference solution (c). A 0.005 per cent w/v solution of *duloxetine hydrochloride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3.5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 13 volumes of *acetonitrile*, 17 volumes of *propanol* and 70 volumes of *hexanesulphonate solution* prepared by dissolving 10.3 g of *sodium hexanesulphonate* in a solution prepared by dissolving 1.7 ml *orthophosphoric acid* in 900 ml *water* adjusted to pH 2.5 with *diluted sodium hydroxide solution* and diluted to 1000 ml with *water*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

Name	Relative retention time
Duloxetine impurity C[1]	0.4
Duloxetine impurity D[2]	0.5
Duloxetine (retention time: about 16 minutes)	1.0
Duloxetine impurityF[3]	1.1

[1]4-[(1*RS*)-3-(methylamino)-1-(thiophen-2-yl)propyl]naphthalen-1-ol,
[2] naphthalen-1-ol,
[3](3*S*)-*N*-methyl-3-(naphthalen-1-yloxy)-3-(thiophen-3-yl)propan-1-amine.

Inject reference solution (b). The test is not valid unless the resolution between peaks due to duloxetine impurity C and D is not less than 1.5 and peak to valley ratio is not less than 4.0.

Inject reference solution (a) and test solution (a). In the chromatogram obtained with test solution (a), the area of any peak corresponding to duloxetine impurity F is not more than 4 times the area of principal peak in the chromatogram obtained with the reference solution (a) (0.4 per cent). The area of any other secondary peak is not more than the area of principal peak in the chromatogram obtained with the reference solution (a) (0.1 per cent). The sum of the areas of all the secondary peaks is not more than 5 times the area of principal peak in the chromatogram obtained with the reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of principal peak in the chromatogram obtained with the reference solution (a) (0.05 per cent).

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg each of *duloxetine impurity A IPRS (3R)-N-methyl-3-(naphthalen-1-yloxy)-3-(thiophen-2-yl)propan-1-amine IPRS)* and the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel OD for chiral separation (5 µm),
- column temperature: 40°,
- mobile phase:a mixture of 17 volumes of *isopropanol* and 83 volumes of *hexane,* containing 0.2 per cent v/v of *diethylamine,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume: 20 µl.

The relative retention time with reference to duloxetine (retention time: about 7 minutes) for duloxetine impurity A is 1.3.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to duloxetine and duloxetine impurity A is not less than 3.5.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to duloxetine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) using the chromatographic system, test solution (b) and reference solution (c) as described under Related substances.

Inject reference solution (c) and test solution (b).

Calculate the content of $C_{18}H_{19}NOS$, HCl.

Storage. Store protected from light and moisture.

Duloxetine Gastro-resistant Tablets

Duloxetine Gastro-resistant Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of duloxetine, $C_{18}H_{19}NOS$.

Usual strengths. 20 mg; 30 mg; 40 mg; 60 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1 (Basket),
Medium.750 ml of *0.1 M hydrochloric acid,*
Speed and time.100 rpm and 120 minutes.

Withdraw a suitable volume of the medium, centrifuge at 3500 rpm for 15 minutes, use the supernatant liquid and measure the absorbance of the same, and suitably diluted with the dissolution medium, at the maximum at about 289 nm (2.4.7). Calculate the content of $C_{18}H_{19}NOS$. in the medium from the absorbance obtained from a solution of known concentration of *duloxetine hydrochloride IPRS* in 10 ml *methanol* prepared with the aid of ultrasound and diluted to similar concentration using dissolution medium.

Calculate the content of $C_{18}H_{19}NOS$ in the medium.

Q. Not more than 10 per cent of the stated amount of $C_{18}H_{19}NOS$.

Apparatus No. 1 (Basket),
Medium.1000 ml of *phosphate buffer pH 6.8,*
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium, centrifuge at 3500 rpm for 15 minutes, use the supernatant lquid and measure the absorbance of the same, suitably diluted with the dissolution medium, at the maximum at about 289 nm (2.4.7). Calculate the content of $C_{18}H_{19}NOS$. in the medium from the absorbance obtained from a solution of known concentration of *duloxetine hydrochloride IPRS* in 10 ml *methanol* prepared with the aid of ultrasound and diluted to similar concentration using dissolution medium.

Calculate the content of $C_{18}H_{19}NOS$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{18}H_{19}NOS$.

Other tests. Comply with the tests stated under Tablets (Gastro-resistant tablets).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 60 mg of duloxetine, add 70 ml of the mobile phase, mix with the aid of ultrasound and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.0065 percent w/v solution of *duloxetine hydrochloride IPRS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of a buffer solution prepared by dissolving 3.8 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 5.7 with 10 percent w/v perchloric acid and 60 volumes of *methanol*,
- flow rate: 1.0 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

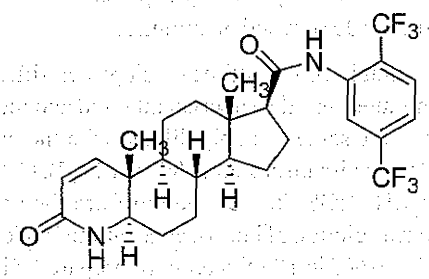
Inject the reference solution and the test solution.

Calculate the content of $C_{18}H_{19}NOS$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of duloxetine.

Dutasteride



$C_{27}H_{30}F_6N_2O_2$ Mol. Wt. 528.5

Dutasteride is 3-oxo-*N*-(2,5-bistrifluoromethyl)phenyl-4-aza-5α-androst-1-ene-17β-carboxamide.

Dutasteride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{27}H_{30}F_6N_2O_2$, calculated on the anhydrous basis.

Category. Benign prostatic hypertrophy agent.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dutasteride IPRS* or with the reference spectrum of dutasteride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. A 0.001 per cent w/v solution of *dutasteride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 80 volumes of buffer solution prepared by dissolving 3.12 g of *sodium dihydrogen orthophosphate dihydrate* in 1000 ml of *water*, adjusted to pH 5.0 with *dilute sodium hydroxide solution* and 20 volumes of *acetonitrile*,
  B. a mixture of 20 volumes of *water* and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent v/v)
0	60	40
6	60	40
10	50	50
25	40	60
35	40	60
40	30	70
45	60	40
50	60	40

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 0.25 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *water* and 80 volumes of *acetonitrile.*

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.05 per cent w/v solution of *dutasteride IPRS* in the solvent mixture.

Use chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 3.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}F_6N_2O_2$.

Dutasteride Capsules

Dutasteride Capsules contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of dutasteride, $C_{27}H_{30}F_6N_2O_2$.

Usual strength. 0.5 mg.

Identification

In the Assay, the retention time of principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 450 ml of medium A for first 25 minutes followed by addition of 450 ml of medium B,

Speed and time. 50 rpm and 60 minutes.

Medium A. To 1000 ml of *0.1 M hydrochloric acid*, add and dissolve 1.6 g of *pepsin* (label activity 1:3,000).

Medium B. To 1000 ml of *0.1 M hydrochloric acid*, add and dissolve 40 g of *sodium lauryl sulphate.*

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of *water.*

Test solution. Use the filtrate, dilute if necessary, with a mixture of equal volumes of medium A and medium B.

Reference solution. A 0.005 per cent w/v solution of *dutasteride IPRS* in the solvent mixture. Dilute 1.0 ml of the solution to 100.0 ml with a mixture of equal volumes of medium A and medium B.

Chromatographic system.

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- column temperature:50°,
- mobile phase: A. 0.1 per cent v/v *orthophosphoric acid*, B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 80 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
14	50	50
15	20	80
20	20	80
22	50	50

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}F_6N_2O_2$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{27}H_{30}F_6N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of *water.*

Test solution. Disperse a quantity of the mixed contents of 20 capsules containing 2 mg of Dutasteride in 2 ml of the solvent mixture with the aid of ultrasound for 10 minutes and dilute to 5.0 ml with the solvent mixture, filter.

Reference solution. A 0.0004 per cent w/v solution of *dutasteride IPRS* in the solvent mixture.

Chromatographic system.

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- column temperature: 40°,
- mobile phase: A. *water*, adjusted to pH 2.5 with 10 per cent v/v *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.3 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 50 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	50	50
55	50	50
57	10	90
62	10	90
65	50	50
70	50	50

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (0.25 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *acetonitrile* and 25 volumes of *water*.

Test solution. Place 5 intact capsules into 50-ml volumetric flask. Disperse in 12.5 ml of *water* with the aid of ultrasound, add 25 ml of *acetonitrile* and again sonicate for 5 minutes and dilute to 50.0 ml with *acetonitrile*, filter.

Reference solution. A 0.005 per cent w/v solution of *dutasteride IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. 0.1 per cent v/v *orthophosphoric acid*,
  B. *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume:20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	45	55
10	45	55
11	20	80
15	20	80
16	45	55
22	45	55

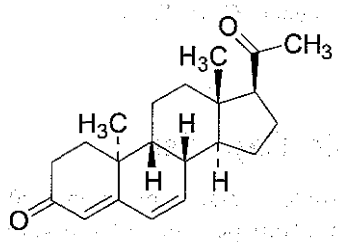
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{27}H_{30}F_6N_2O_2$ in the capsules.

Storage. Store protected from moisture.

Dydrogesterone



$C_{21}H_{28}O_2$ Mol. Wt. 312.5

Dydrogesterone is 9β,10α-pregna-4,6-diene-3,20-dione.

Dydrogesterone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{21}H_{28}O_2$ calculated on the dried basis.

Category. Progestogen

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dydrogesterone IPRS* or with the reference spectrum of dydrogesterone.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Specific optical rotation (2.4.22). – 485° to – 469°, determined in a 0.5 per cent w/v solution in *methylene chloride*.

Light absorption (2.4.7). When examined in the range 230 nm to 360 nm, a 0.0015 per cent w/v solution in *methanol* shows

an absorption maximum only at about 286 nm. The ratio of the absorbance at 240 nm to that at 286 nm is not more than 0.12.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dissolve 20 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg *dydrogesterone IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 3 mg of *dydrogesterone impurity A IPRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve 10 mg of the substance under examination in the 10.0 ml of reference solution (c).

Reference solution (e). Dissolve 10 mg of the substance under examination in the 30 ml of *ethanol (95 per cent)*, add 1 ml of *0.2M sodium hydroxides olution* and heat at 85° for 10 minutes. Cool to room temperature, add 1 ml of *0.24M hydrochloric acid*, add 20 ml of *acetonitrile* and 2 mg of *dydrogesterone impurity B* and dilute to100.0 ml with *water*. This solution contains dydrogesterone and dydrogesterone impurity B and C.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm),
- column temperature: 40°,
- mobile phase: a mixture of 54 volumes of *water* and 25 volumes of *ethanol (95 per cent)* and 21 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm and at 385 nm,
- injection volume: 10 µl.

Name	Relative retention time
Dydrogesterone impurity A[1] at 385 nm	0.9
Dydrogesterone (Retention time: about 13 minutes)	1.0
Dydrogesterone impurity B[2]	1.1
Dydrogesterone impurity C[3]	1.2

[1] *9β,10α-pregna-4,6,8(14)-triene-3,20-dione,*

[2] pregna-4,6-diene-3,20-dione,

[3] 9β,10α,17α-pregna-4,6-diene-3, 20-dione.

Inject reference solution (d) and (e). The test is not valid unless the resolution between the peaks due to dydrogesterone impurity A and dydrogesterone is not less than 1.1 at 385 nm in the chromatogram obtained with reference solution (d), dydrogesterone impurity B and dydrogesterone is not less than 4.5 and dydrogesterone impurity B and dydrogesterone impurity C is not less than 1.5 in the chromatogram obtained with reference solution (e) at 280 nm.

For impurity A —

Inject reference solution (c) and test solution (a) at 385 nm. Run the chromatogram twice the retention time of the principal peak in test solution (a). The area of any peak corresponding to dydrogesterone impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

For impurity B and impurity C —

Inject reference solution (b) and test solution (a) at 280 nm. Run the chromatogram twice the retention time of the principal peak in test solution (a). The area of any peak corresponding to dydrogesterone impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak corresponding to dydrogesterone impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

- spectrophotometer set at 280 nm,

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the trailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0.

Inject reference solution (a) and test solution (b).

Calculate the content of $C_{21}H_{28}O_2$.

Storage. Store protected from light and moisture.

Dydrogesterone Tablets

Dydrogesterone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of dydrogesterone, $C_{21}H_{28}O_2$.

Usual strength. 10 mg.

Identification

Extract a quantity of the powdered tablets containing 60 mg of Dydrogesterone with 20 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *dydrogesterone IPRS* or with the reference spectrum of dydrogesterone.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium: 500 ml of 0.3 per cent w/v solution of *sodium lauryl sulphate*,

Speed and time: 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with dissolution medium, if necessary at the maximum at about 295 nm (2.4.7). Calculate the content of $C_{21}H_{28}O_2$ in the medium from the absorbance obtained from a solution of known concentration of *dydrogesterone IPRS* in the same medium.

Q. Not less than 75 per cent of the stated amount of $C_{21}H_{28}O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Disperse a quantity of powdered tablets containing 50 mg of Dydrogesterone in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Disperse a quantity of powdered tablets containing 20 mg of Dydrogesterone in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg *dydrogesterone IPRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 3 mg of *dydrogesterone impurity A IPRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (d). Disperse a quantity of powdered tablets containing 10 mg of Dydrogesterone in the 10 ml of reference solution (c).

Reference solution (e). Disperse a quantity of powdered tablets containing 10 mg of Dydrogesterone in 30 ml of *ethanol (95 per cent)*, add 1 ml of *0.2M sodium hydroxide solution* and heat at 85° for 10 minutes. Cool to room temperature, add 1 ml of *0.24M hydrochloric acid*, add 20 ml of *acetonitrile* and 2 mg of *dydrogesterone impurity B* and dilute to 100.0 ml with *water*. This solution contains dydrogesterone and dydrogesterone impurity B and C.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm),
- column temperature 40°,
- mobile phase: a mixture of 54 volumes of *water* and 25 volumes of *ethanol (95 per cent)* and 21 volumes of *acetonitrile*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 280 nm and at 385 nm,
- injection volume: 10 µl.

Name	Relative retention time
Dydrogesterone impurity A[1] at 385 nm	0.9
Dydrogesterone (Retention time: about 13 minutes)	1.0
Dydrogesterone impurity B[2]	1.1
Dydrogesterone impurity C[3]	1.2

[1] 9β,10α-pregna-4,6,8(14)-triene-3, 20-dione,

[2] pregna-4,6-diene-3,20-dione,

[3] 9β,10α,17α-pregna-4,6-diene-3, 20-dione.

Inject reference solution (d) and (e). The test is not valid unless the resolution between the peaks due to dydrogesterone impurity A and dydrogesterone is not less than 1.1 at 385 nm in the chromatogram obtained with reference solution (d), dydrogesterone impurity B and dydrogesterone is not less than 4.5 and dydrogesterone impurity B and dydrogesterone impurity C is not less than 1.5 in the chromatogram obtained with reference solution (e) at 280 nm.

For impurity A —

Inject reference solution (c) and test solution (a) at 385 nm. Run the chromatogram twice the retention time of the principal peak in test solution (a). The area of any peak corresponding to dydrogesterone impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

For impurity B and impurity C —

Inject reference solution (b) and test solution (a) at 280 nm. Run the chromatogram twice the retention time of the principal peak in test solution (a). The area of any peak corresponding to dydrogesterone impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent), the area of any peak corresponding to dydrogesterone impurity C is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following test solution.

Test solution. Disperse one tablet in 10 ml of the mobile phase, with the aid of ultrasound and dilute with the mobile phase to obtain 0.02 per cent w/v solution of Dydrogesterone.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14), as described under Related substances with the following modifications.

– spectrophotometer set at 280 nm,

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 5000 theoretical plates, the trailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0.

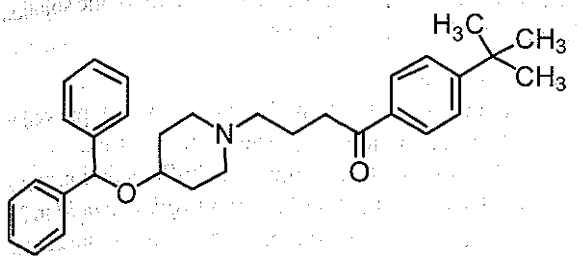
Inject reference solution (a) and test solution (b).

Calculate the content of $C_{21}H_{28}O_2$ in the tablets.

Storage. Store protected from light.

E

Ebastine



$C_{32}H_{39}NO_2$ Mol. Wt. 469.7

Ebastine is 4-(4-Benzhydryloxy-1-piperidyl)-1-(4-*tert*-butylphenyl)butan-1-one.

Ebastine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{32}H_{39}NO_2$, calculated on the anhydrous basis.

Category. Antihistaminic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ebastine IPRS* or with the reference spectrum of ebastine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Protect the solutions from light.

Solution A. A mixture of 65 volumes of *acetonitrile* and 35 volumes of a 0.11 per cent w/v solution of *orthophosphoric acid*, adjusted to pH 5.0 with 4.0 per cent w/v solution of *sodium hydroxide*.

Test solution. Dissolve 0.125 g of the substance under examination in solution A and dilute to 50.0 ml with solution A.

Reference solution (a). A solution containing 0.025 per cent w/v each of *ebastine impurity C IPRS* and *ebastine impurity D IPRS* in solution A. Dilute 1.0 ml of the solution to 100.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with solution A. Dilute 1.0 ml of the solution to 10.0 ml with solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with nitrile groups bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of a 0.11 per cent w/v solution of *orthophosphoric acid*, adjusted to pH 5.0 with 4.0 per cent w/v solution of *sodium hydroxide*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks corresponding to ebastine impurity D and ebastine impurity C is not less than 2.0.

Name	Relative retention time
Ebastine impurity A[1]	0.04
Ebastine impurity B[2]	0.05
Ebastine impurity D[3]	0.2
Ebastine impurity C[4]	0.22
Ebastine impurity F[5]	0.42
Ebastine impurity G[6]	0.57
Ebastine	1.0
Ebastine impurity E[7]	1.14

[1]benzhydrol,

[2]1-[4-(1,1-dimethylethyl)phenyl]ethanone,

[3]1-[4-(1,1-dimethylethyl)phenyl]-4-(4-hydroxypiperidin-1-yl)butan-1-one,

[4]4-(diphenylmethoxy)piperidine,

[5]1-[4-(1,1-dimethylethyl)phenyl]-4-[*cis*-4-(diphenylmethoxy)-1-oxidopiperidin-1-yl]butan-1-one,

[6]1-[4-(1,1-dimethylethyl)phenyl]-4-[*trans*-4-(diphenylmethoxy)-1-oxidopiperidin-1- yi]butan-1-one,

[7]1-[4-(1,1-dimethylpropyl)phenyl]-4-[4-(diphenylmethoxy)piperidin-1-yl]butan-1-one.

Inject reference solution (b) and the test solution. Run the chromatogram 1.4 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphates (2.3.17). Dissolve 2.5 g in 25 ml of *dilute nitric acid*. Boil under a reflux condenser for 10 minutes. Cool and filter. 15 ml of the filtrate complies with the limit test for sulphates (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Dissolve 0.35 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04697 g of $C_{32}H_{39}NO_2$.

Storage. Store protected from light.

Ebastine Tablets

Ebastine Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ebastine, $C_{32}H_{39}NO_2$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that of the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of 0.5 per cent w/v solution of *sodium lauryl sulphate* in *0.1M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. Dissolve a quantity of *ebastine IPRS* in *acetonitrile* and dilute with the dissolution medium to obtain a solution having a concentration similar to that of the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{39}NO_2$ in the medium.

Q. Not less than 70 per cent of the stated amount of $C_{32}H_{39}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing 0.05 g of Ebastine in 35 ml of the solvent mixture with the aid of ultrasound and dilute to 50.0 ml with the mobile phase A. Centrifuge and filter.

Reference solution (a). Dilute 0.5 ml of the test solution to a 100.0 ml with the mobile phase A.

Reference solution (b). A solution containing 0.002 per cent w/v each of *ebastine impurity C IPRS* and *ebastine impurity D IPRS* in the solvent mixture. Dilute 2.5 ml of the solution to 25.0 ml with the mobile phase A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: A. 40 volumes of buffer solution prepared by dissolving 11.9 g of *orthophosphoric acid* in 25 ml *water* and dilute to 50.0 ml with *water*. Dilute 25.0 ml of the solution to 450.0 ml with *water*, add 6 ml *diethylamine* and dilute to 500 ml with *water*, adjusted to pH 6.0 with *diethylamine* and 60 volumes of *acetonitrile*.
  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
40	95	5
55	95	5
57	80	20
65	80	20

Name	Relative retention time
Ebastine impurity C[1]	0.16
Ebastine impurity D[2]	0.17
Ebastine impurity A[3]	0.24
Ebastine impurity B[4]	0.42
Ebastine impurity F[5]	0.5
Ebastine impurity G[6]	0.7
Ebastine (Retention time about 28 minutes)	1.0
Ebastine impurity E[7]	1.35

[1] 4-(diphenylmethoxy)piperidine,

[2] 1-[4-(1,1-dimethylethyl)phenyl]-4-(4-hydroxypiperidin-1-yl)butan-1-one,

[3] benzhydrol,

[4] 1-[4-(1,1-dimethylethyl)phenyl]ethanone,

[5] 1-[4-(1,1-dimethylethyl)phenyl]-4-[*cis*-4-(diphenylmethoxy)-1-oxidopiperidin-1-yl]butan-1-one,

[6] 1-[4-(1,1-dimethylethyl)phenyl]-4-[*trans*-4-(diphenylmethoxy)-1-oxidopiperidin-1- yl]butan-1-one,

[7] 1-[4-(1,1-dimethylpropyl)phenyl]-4-[4-(diphenylmethoxy)piperidin-1-yl]butan-1-one.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to ebastine impurity C

and ebastine impurity D is not less than 1.5 in the chromatogram obtained with reference solution (b) and in the chromatogram obtained with reference solution (a), the tailing factor is not more than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with test solution, the area of any secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Uniformity of content. Complies with the test stated under Tablets as described under Assay with following modifications.

Test solution. Disperse 1 tablet in 1 ml of *water* with intermittent shaking, add 20 ml of the solvent mixture and sonicate for 5 minutes and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution. Dissolve a suitable quantity of *ebastine IPRS* in the solvent mixture and dilute with the solvent mixture in such a manner to get similar concentration to that of test solution.

Calculate the content of $C_{32}H_{39}NO_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of a solution prepared by dissolving 0.3 g of *orthophosphoric acid* in *water* and dilute to 500 ml with *water*, adjusted to pH 5.0 with *1 M sodium hydroxide*, filter and 75 volumes of *acetonitrile*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 0.05 g of Ebastine in 150 ml of the solvent mixture with the aid of ultrasound for 5 minutes and dilute to 250.0 ml with the solvent mixture and filter.

Reference solution. A 0.02 per cent w/v solution of *ebastine IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 25 volumes of *0.01 M potassium dihydrogen phosphate* containing 1 ml of *triethylamine* and 75 volumes of *acetonitrile*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 255 nm,
- injection volume: 20 µl.

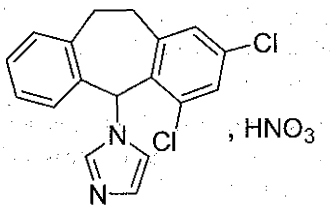
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{32}H_{39}NO_2$ in the tablets.

Storage. Store protected from light and moisture.

Eberconazole Nitrate



$C_{18}H_{14}Cl_2N_2,HNO_3$ Mol. Wt. 392.2

Eberconazole Nitrate is (*RS*)-1-(2,4-Dichloro-10,11-dihydro-5*H*-dibenzo[*a*,*d*]-5-cycloheptenyl)-1*H*-imidazole nitrate.

Eberconazole Nitrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{14}Cl_2N_2.HNO_3$, calculated on the dried basis.

Category. Antifungal.

Description. A white or off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *eberconazole nitrate IPRS* or with the reference spectrum of eberconazole nitrate.

B. It gives reactions for nitrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *dimethylformamide* is clear (2.4.1) and not more intensely coloured than reference solution BYS4 (2.4.1).

Specific optical rotation (2.4.22). –0.2° to + 0.2°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 60 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). A 0.06 per cent w/v solution of *eberconazole nitrate IPRS* in the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v each of *eberconazole nitrate IPRS* and C-transposition compound in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 40°,
- mobile phase: a mixture of 25 volumes of 0.1 per cent v/v solution of *triethylamine* in *water,* adjusted to pH 8.0 with *orthophosphoric acid* and 75 volumes of *methanol*,
- flow rate: 0.7 ml per minute.
- spectrophotometer set at 240 nm,
- injection volume: 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the eberconazole peak and C-transposition compound is not less than 1.2.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak corresponding to C-transposition compound is not more than 0.3 per cent and the area of any other secondary peak is not more than 0.1 per cent. The sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Imidazole. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 90 volumes of *toluene*, 10 volumes of *n-propanol* and 0.5 volume of *ammonia.*

Test solution. Dissolve 100 mg of the substance under examination in 5.0 ml of the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *imidazole* in *methanol.*

Apply to the plate 5 µl of the reference solution and 50 µl of the test solution. Allow the mobile phase to rise 15 cm. Dry the plate in air for 15 minutes and expose to iodine vapor for 30 minutes. Any spot corresponding to imidazole in the chromatogram obtained with the test solution is not more intense than the spot obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

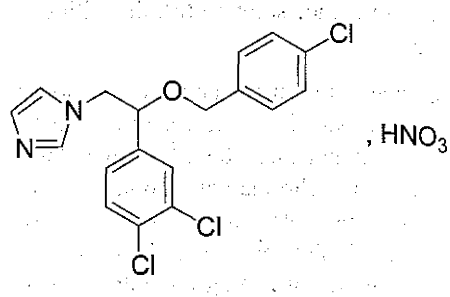
Assay. Determine by liquid chromatography (2.4.14), as described under Related substances.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{14}Cl_2N_2,HNO_3$.

Storage. Store protected from light.

Econazole Nitrate



$C_{18}H_{15}Cl_3N_2O,HNO_3$ Mol. Wt. 444.7

Econazole Nitrate is (*RS*)-1-[2-[(4-chlorophenyl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole nitrate.

Econazole Nitrate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{18}H_{15}Cl_3N_2O,HNO_3$, calculated on the dried basis.

Category. Antifungal.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *econazole nitrate IPRS* or with the reference spectrum of econazole nitrate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.04 per cent w/v solution in a mixture of 1 volume of *0.1 M hydrochloric acid* and 9 volumes of *2-propanol* shows absorption maxima at 265 nm, 271 nm and 280 nm; the ratio of the absorbance at the maximum at 271 nm to that at the maximum at 280 nm is 1.55 to 1.70.

C. It gives reaction (A) of nitrates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1g of the substance under examination in *methanol* and dilute to 10.0 ml with *methanol.*

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *methanol.*

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (3 µm),
- column temperature: 35°,
- mobile phase: A. a mixture of 20 volumes of *methanol* and 80 volumes of 0.077 per cent w/v solution of *ammonium acetate*,
  B. a mixture of 40 volumes of *methanol* and 60 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	60	40
25	10	90
27	10	90
30	60	40

Name	Relative retention time	Correction factor
Econazole impurity A[1]	0.2	1.4
Econazole impurity B[2]	0.6	—
Econazole (Retention time: about 15 minutes)	1.0	—
Econazole impurity C[3]	1.1	—

[1](1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,
[2](2*RS*)-2-[(4-chlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethanamine,
[3]1-(4-chlorobenzyl)-3-[(2*RS*)-2-[(4-chlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]imidazolium.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of peak corresponding to econazole impurities A, B and C is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and the peak corresponding to nitrate ion at the beginning of the chromatogram.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh 0.4 g and dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04447 g of $C_{18}H_{15}Cl_3N_2O,HNO_3$.

Storage. Store protected from light.

Econazole Cream

Econazole Nitrate Cream

Econazole Cream contains Econazole Nitrate in a suitable cream base.

Econazole Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of econazole nitrate, $C_{18}H_{15}Cl_3N_2O, HNO_3$.

Usual strength. 1 per cent w/w.

Identification

A. Mix a quantity of the cream containing 40 mg of Econazole Nitrate with 20 ml of a mixture of 1 volume of *1M sulphuric acid* and 4 volumes of *methanol* and shake with two 50 ml quantities of *carbon tetrachloride* discarding the organic layers. Make the aqueous phase alkaline with *2 M ammonia* and extract with two 40 ml quantities of *chloroform*. Combine the *chloroform* extracts, shake with 5 g of *anhydrous sodium sulphate*, filter and dilute the filtrate to 100 ml with *chloroform*. Evaporate 50 ml to dryness and dissolve the residue in 50 ml of a mixture of 1 volume of *0.1M hydrochloric acid* and 9 volumes of *propan-2-ol*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at 265 nm, 271 nm and 280 nm. The ratio of the absorbance at 271 nm to that at about 280 nm is 1.55 to 1.77.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the econazole peak in the chromatogram obtained with the reference solution.

Tests

Other tests. Comply with the tests stated under Creams.

Assay. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 2.5 g of *potassium dihydrogen orthophosphate* and 2.5 g of *dipotassium hydrogen orthophosphate* in 1000 ml of *water*.

Internal standard solution. A 0.05 per cent w/v solution of *miconazole nitrate IPRS* in *methanol.*

Test solution (a). Mix a quantity of the cream containing 10 mg of Econazole Nitrate with 20 ml of the internal standard solution and 55 ml of *methanol.* Warm on a water-bath for 30 seconds, shake for 1 minute, repeat the process twice and add 25 ml of the buffer solution. Cool in an ice bath for 15 minutes, centrifuge for 10 minutes and use the supernatant liquid, filtered if necessary.

Test solution (b). Prepare in the same manner as test solution (a) but using 20 ml of *methanol* in place of the internal standard solution.

Reference solution. A 0.1per cent w/v solution of *econazole nitrate IPRS* in *methanol.* Transfer 10.0 ml of the solution to 100-ml volumetric flask, add 20 ml of the internal standard solution, 45 ml of *methanol* and 25 ml of the buffer solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 25 volumes of the buffer solution and 75 volumes of *methanol,*
- flow rate: 2 ml per minute,
- spectrophotometer set at 232 nm,
- injection volume: 20 µl.

Inject the reference solution and test solution (a) and (b).

Calculate the content of $C_{18}H_{15}Cl_3N_2O, HNO_3$ in test solution (a) in the cream.

Storage. Store protected from light at a temperature not exceeding 30°. If it is packed in aluminium tubes the inner surfaces of the tubes should be coated with a suitable lacquer.

Econazole Pessaries

Econazole Nitrate Pessaries; Econazole Vaginal Tablets

Econazole Pessaries contain Econazole Nitrate in a suitable base.

Econazole Pessaries contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of econazole nitrate, $C_{18}H_{15}Cl_3N_2O,HNO_3$.

Usual strength. 150 mg.

Identification

A. Mix a quantity of the crushed pessaries containing 40 mg of Econazole Nitrate with 20 ml of a mixture of 1 volume of *1 M sulphuric acid* and 4 volumes of *methanol* and shake with two quantities, each of 50 ml, of *carbon tetrachloride,* discarding the organic layers. Make the aqueous phase alkaline with *2 M ammonia* and extract with two quantities, each of 40 ml, of *chloroform.* Combine the chloroform extracts, shake with 5 g of *anhydrous sodium sulphate,* filter and dilute the filtrate to 100 ml with *chloroform.* Evaporate 50 ml to dryness and dissolve the residue in 50 ml of a mixture of 1 volume of *0.1 M hydrochloric acid* and 9 volumes of *2-propanol.*

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at 265 nm, 271 nm and 280 nm. The ratio of the absorbance at about 271 nm to that at 280 nm is 1.55 to 1.70.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), using a precoated silica gel plate (such as Merck silica gel 60 plates).

Mobile phase. A mixture of 70 volumes of *chloroform,* 20 volumes of *methanol* and 10 volumes of an 85 per cent w/v solution of *formic acid.*

Test solution. Mix a quantity of the crushed pessaries containing 40 mg of Econazole Nitrate with 40 ml of *methanol* and heat under a reflux condenser for 15 minutes. Allow to cool, filter, wash the filter paper with *methanol* and evaporate the filtrate and washings to a volume of about 5 ml. Filter through a filter paper (such as Whatman No. 50 paper), wash the paper with *methanol,* evaporate the filtrate and washings to dryness and dissolve the residue in 2 ml of *methanol.*

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with *methanol.*

Reference solution (b). A 2.0 per cent w/v solution of *econazole nitrate IPRS* in *methanol.*

Apply to the plate 20 µl of each solution. After development, dry the plate in air and expose to iodine vapour for 1 hour. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot with an R_f value higher than 0.9.

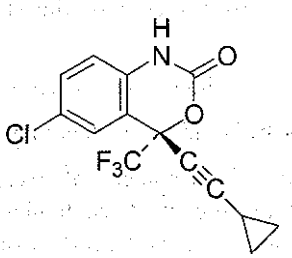
Other tests. Comply with the tests stated under Pessaries.

Assay. Dissolve 5 pessaries in 250.0 ml of *anhydrous glacial acetic acid* with the aid of gentle heat and allow to cool. Titrate 100.0 ml of the solution with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04447 g of $C_{18}H_{15}Cl_3N_2O,HNO_3$.

Storage. Store protected from light.

Efavirenz



$C_{14}H_9ClF_3NO_2$ Mol. Wt. 315.7

Efavirenz is (4*S*)-6-chloro-4-(cyclopropylethynyl)-1,4-dihydro-4-(trifluoromethyl)-2*H*-3,1-benzoxazin-2-one.

Efavirenz contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{14}H_9ClF_3NO_2$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *efavirenz IPRS* or with the reference spectrum of efavirenz.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −100.0° to −90.0°, determined in a 0.3 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. Determine the amount of related substances by area normalisation method. The content of any individual impurity is not more than 0.5 per cent and the sum of all the impurities is not more than 1.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying at 105° in an oven for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.12 g of the substance under examination in 100.0 ml of *methanol*.

Reference solution. A 0.12 per cent w/v solution of *efavirenz IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9ClF_3NO_2$.

Storage. Store protected from light.

Efavirenz Capsules

Efavirenz Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of efavirenz, $C_{14}H_9ClF_3NO_2$.

Usual strengths. 50 mg; 100 mg; 200 mg.

Identification

A. When examined in the range 220 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum as obtained with *efavirenz IPRS* of the same concentration.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix well the contents of 20 capsules and disperse a quantity of the mixed contents containing 50 mg of Efavirenz in *methanol* and dilute to 50.0 ml with *methanol.*

Reference solution. A 0.1 per cent w/v solution of *efavirenz IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. Determine the amount of related substances by the area normalisation method. The content of any individual impurity is not more than 1.0 per cent and the sum of all impurities is not more than 2.0 per cent.

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),

Medium. 900 ml of a 1 per cent w/v solution of *sodium lauryl sulphate,*

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate and dilute a suitable volume of the filtrate if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 247 nm (2.4.7). Calculate the content of efavirenz, $C_{14}H_9ClF_3NO_2$ in the medium from the absorbance obtained from a solution of known concentration of *efavirenz IPRS* in the same solvent.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_9ClF_3NO_2$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix well the contents of 20 capsules and shake a quantity of the mixed contents containing about 60 mg of Efavirenz with sufficient *methanol* to obtain a solution containing 6 mg of Efavirenz per ml. Disperse the mixture with the aid of ultrasound for 20 minutes, filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate, and dilute 10.0 ml of the filtrate to 50.0 ml with *methanol.*

Reference solution. A 0.12 per cent w/v solution of *efavirenz IPRS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilyl silica gel (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9ClF_3NO_2$.

Storage. Store protected from light.

Efavirenz Tablets

Efavirenz Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of efavirenz, $C_{14}H_9ClF_3NO_2$.

Usual strength. 600 mg.

Identification

A. When examined in the range 220 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum as obtained with *efavirenz IPRS* of the same concentration.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of a 2 per cent w/v solution of *sodium lauryl sulphate*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, reject the first few ml of the filtrate and dilute a suitable volume of the filtrate if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 247 nm (2.4.7). Calculate the content of efavirenz, $C_{14}H_9ClF_3NO_2$ in the medium from the absorbance obtained from a solution of known concentration of *efavirenz IPRS* in the same solvent.

Q. Not less than 70 per cent of the stated amount of $C_{14}H_9ClF_3NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets with a suitable quantity of *methanol* to obtain a mixture containing 0.1 per cent w/v of Efavirenz and filter through a membrane filter disc with an average pore diameter not exceeding 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.1 per cent w/v solution of *efavirenz IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any individual impurity is not more than 1.0 per cent and the sum of areas of all impurities is not more than 2.0 per cent, calculated by area normalisation.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 120 mg of Efavirenz in *methanol* with the aid of ultrasound for 20 minutes and dilute to 100.0 ml with *methanol*, filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm.

Reference solution. A 0.12 per cent w/v solution of *efavirenz IPRS* in *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 50 volumes of *acetonitrile* and 50 volumes of a 0.86 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 3.0 ± 0.05 with *orthophosphoric acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 252 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the efavirenz peak is not less than 6000 theoretical plates and the tailing factor is not more than 2.0 and the relative standard deviation is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9ClF_3NO_2$.

Storage. Store protected from light.

Efavirenz, Emtricitabine and Tenofovir Tablets

Efavirenz,Emtricitabine and Tenofovir Disoproxil Fumarate Tablets.

Efavirenz, Emtricitabine and Tenofovir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of efavirenz, $C_{14}H_9ClF_3NO_2$, emtricitabine, $C_8H_{10}FN_3O_3S$ and tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$.

Usual strength. 600 mg Efavirenz, 200 mg Emtricitabine and 300 mg Tenofovir Disoproxil Fumarate.

Identification

A. In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *methyl isobutyl ketone*, 25 volumes of *glacial acetic acid* and 25 volumes of *water* in a separating flask. Mix thoroughly and allow the layers to separate. Use the upper layer.

Test solution. Shake a quantity of the powdered tablets containing about 20 mg of Tenofovir Disoproxil Fumarate, add about 10 ml of *methanol*, sonicate for 10 minutes and dilute to 20.0 ml with *methanol*, filter.

Reference solution (a). A 0.065 per cent w/v solution of *emtricitabine IPRS* in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in *methanol*.

Reference solution (c). A 0.2 per cent w/v solution of *efavirenz IPRS* in *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. The principal spots in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a), (b) and (c).

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 1000 ml of 2.0 per cent w/v *sodium lauryl sulphate*,
Speed and time. 100 rpm and 45 minutes.
Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary, with the dissolution medium.

Reference solution. A solution containing 0.06 per cent w/v of *efavirenz IPRS*, 0.02 per cent w/v of *emtricitabine IPRS* and 0.03 per cent w/v of *tenofovir disoproxil fumarate IPRS* dissolved in minimum amount of *methanol* and diluted with the dissolution medium.

Chromatographic system
- a stainless steel column 5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 µm) (Such as Inertsil C8),
- column temperature: 40°,
- mobile phase: A. a buffer solution prepared by dissolving *0.01 M monobasic potassium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
  B. a mixture of 20 volumes of buffer solution and 80 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 250 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	94	6
3	94	6
5	50	50
13	20	80
14	94	6
17	94	6

The retention time of emtricitabine is about 2 minutes, tenofovir disoproxil is about 6 minutes and efavirenz is about 10 minutes.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9ClF_3NO_2$, $C_8H_{10}FN_3O_3S$ and $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$ in the medium.

Q. Not less than 75 per cent of the stated amount of $C_{14}H_9ClF_3NO_2$, $C_8H_{10}FN_3O_3S$ and $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Store crushed powder of tablets in amber colored glass bottle with appropriate lids.

For emtricitabine—

Test solution. Dissolve a quantity of the powdered tablets containing about 50 mg of Emtricitabine in 5 ml of *methanol*, add 30 ml of mobile phase A and dilute to 50.0 ml with mobile phase A, filter.

Reference solution. A 0.001 per cent w/v solution of *emtricitabine IPRS* in mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm) (Such as Supelco HS Discovery C18),
- mobile phase: A. a mixture of 95 volumes of buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 3.8 with *glacial acetic acid* and 5 volumes of *methanol*,
  B. a mixture of 30 volumes of buffer solution and 70 volumes of *methanol*,
- a gradient programme using the conditions given below,
- flow rate:1 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	100	0
35	0	100
55	0	100
60	100	0
75	100	0

The relative retention time with reference to emtricitabine for (2*R*,5*R*)-5-(4-amino-5-fluoro-2-oxo-2*H*-pyrimidin-1-yl)-(1,3)-oxathiolan-2-carboxylic acid (emtricitabine impurity A) is about 0.25, for 2,3'dideoxy-5-fluoro-3'-thiouridine (emtricitabine impurity B) is about 1.15 and for 4-amino-5-fluoro [2-hydroxymethyl-3-oxo-1,3oxathilane- 5yl]pyrimidine-2(1*H*)-one (emtricitabine impurity C) is about 0.32.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to emtricitabine impurities A and C is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the area of any peak due to emtricitabine impurity B is not more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent).

For tenofovir disoproxil fumarate —

Test solution. Disperse a quantity of the powdered tablets containing about 50 mg of Tenofovir Disoproxil Fumarate in 35 ml of *methanol* with the aid of ultrasound for 15 minutes and dilute to 50.0 ml with *methanol*, filter.

Reference solution (a). A 0.001 per cent w/v solution of *tenofovir disoproxil fumarate IPRS* in *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *fumaric acid* in *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil C18),
- mobile phase: A. dissolve 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 3.8 with *glacial acetic acid*,

  B. *methanol*,
- a gradient programme using the conditions given below,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume: 25 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5
75	95	5

The relative retention time with reference to tenofovir disoproxil fumarate for tenofovir impurity A (2[(isopropoxycarbonyl)oxy]methyl hydrogen {[(1*R*)-2-(6-amino-9*H*-purin-9-yl)-1-methylethoxy]methyl} phosphonate) is about 0.48, for tenofovir impurity B (9-[(*R*)-[(2-[isopropoxy]-2-[((isopropoxycarbonyl)oxy) methoxy]phosphinyl)methoxy] propyl]adenine) is about 0.79, for tenofovir impurity C (9-[2-[[bis[[Isopropoxy carbonyl)oxy]methoxy]phosphinyl] methoxy]ethyl]adenine fumarate) is about 0.87 and for specified unidentified impurity is about 1.05.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of any peak due to tenofovir impurity A, multiplied with the correction factor 0.63 is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent), the area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent). Ignore any peak due to fumaric acid.

For efavirenz —

Solvent mixture. 50 volumes of *water* and 50 volumes of *acetonitrile*.

Test solution. Dissolve a quantity of the powdered tablets containing about 100 mg of Efavirenz in 70 ml of the solvent mixture and dilute to 100.0 ml with the same solvent, filter.

Reference solution. A 0.001 per cent w/v solution of *efavirenz IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),

– mobile phase: A. a mixture of 50 volumes of a buffer solution prepared by dissolving 8.6 g of *ammonium dihydrogen orthophosphate* in 1000 ml of *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 50 volumes of *acetonitrile*

B. a mixture of 25 volumes of buffer solution and 75 volumes of *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 254 nm,
– injection volume: 20 µl

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
15	100	0
25	0	100
35	0	100
37	100	0
45	100	0

The relative retention time with reference to efavirenz for (*S*)-5-chloro-α-(cyclopropylethynyl)-2-amino-α-(trifluoromethyl)-benznemethanol (efavirenz impurity A) is about 0.82.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to efavirenz impurity A is not more than 0.5 per cent. The area of any other secondary peak is not more than 0.5 per cent and the sum of areas of all the secondary peaks is not more than 3.0 per cent. Ignore any peak at relative retention time of about 0.56.

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity containing about 200 mg of Emtricitabine in *water* with the aid of ultrasound, warm at 70° for 10 minutes. Add about 35 ml of *methanol*, sonicate for 30 minutes with intermittent swirling and dilute to 100 ml with *methanol*, filter. Dilute 5.0 ml of the solution to 200.0 ml with the solvent mixture.

Reference solution. A solution containing 0.025 per cent w/v of *emtricitabine IPRS*, 0.04 per cent w/v of *tenofovir disoproxil fumarate IPRS* and 0.08 per cent w/v of *efavirenz IPRS* in *methanol*. Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system
– a stainless steel column 5 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3µm) (Such as Inertsil C8),
– column temperature. 40°,
– mobile phase: A. a *0.01 M monobasic potassium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,

B. a mixture of 20 volumes of mobile phase A and 80 volumes of *acetonitrile*,
– a gradient programme using the conditions given below,
– flow rate: 1.5 ml per minute,
– spectrophotometer set at 250 nm,
– injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	94	6
3	94	6
5	50	50
13	20	80
14	94	6
17	94	6

The retention time of tenofovir disoproxil is about 6 minutes, emtricitabine is about 2 minutes and efavirenz is about 10 minutes.

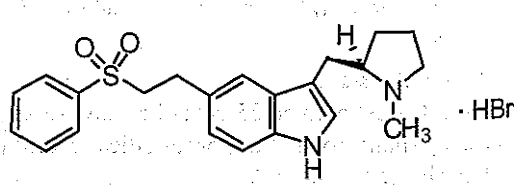
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 for each component and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the reference solution and the test solution.

Calculate the content of $C_{14}H_9ClF_3NO_2$, $C_8H_{10}FN_3O_3S$ and $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Eletriptan Hydrobromide



$C_{22}H_{26}N_2O_2S,HBr$ Mol wt. 463.4

Eletriptan Hydrobromide is (*R*)-3-((1-Methyl-2-pyrrolidinyl) methyl)-5-(2-(phenylsulfonyl)ethyl)-1*H*-indole hydrobromide.

Eletriptan Hydrobromide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{26}N_2O_2S,HBr$, calculated on the dried basis.

Category. Antimigraine.

Description. A cream to pale brown powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *eletriptan hydrobromide IPRS* or with the reference spectrum of eletriptan hydrobromide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.24). +4.5 to +8.5, determined on 0.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

Test solution. Dissolve 25 mg of the substance under examination in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. A 0.00015 per cent w/v solution of *eletriptan hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 35°,
- mobile phase: A. dissolve 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2.0 ml of *triethylamine*, adjusted to pH 3.5 with *orthophosphoric acid*,
  B. a mixture of 80 volumes *acetonitrile* and 20 volumes of *water*,
- a gradient programme using the conditions given below,
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	80	20
25	50	50
33	05	95
38	05	95
42	80	20
50	80	20

Inject the reference solution. The test is not valid unless the column efficiency is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution. The area of any secondary peak is not more than 0.3 per cent and the sum of areas of all the secondary peaks is not more than 1.0 per cent, calculated by area normalization.

Bromide. 16.0 per cent to18.0 per cent.

Dissolve 0.15 g in 100.0 ml of *water*. Titrate with *0.1 M silver nitrate*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.00799 g of bromide.

Heavy metals (2.3.13). 1.0 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of mobile phase A and mobile phase B.

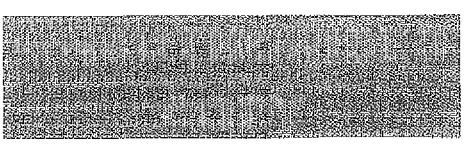
Test solution. Dissolve 25 mg of the substance under examination in 50.0 ml of solvent mixture. Dilute 1.0 ml of the solution to 10.0 ml with the solvent mixture.

Reference solution. A 0.005 per cent w/v solution of *eletriptan hydrobromide IPRS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 2.0 ml of *triethylamine*, adjusted to pH 3.5 with *orthophosphoric acid* ,
  B. a mixture of 80 volumes *acetonitrile* and 20 volumes of *water*,
- a gradient programme using the conditions given below
- flow rate: 1.2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0.01	75	25
16	50	50
20	05	95
25	05	95
28	75	25
35	75	25



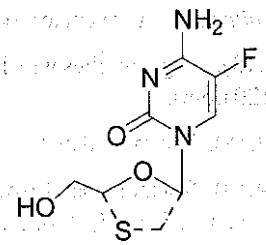
Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{22}H_{26}N_2O_2S,HBr$.

Storage. Store protected from moisture.

Emtricitabine



$C_8H_{10}FN_3O_3S$ Mol. Wt. 247.3

Emtricitabine is 4-amino-5-fluoro-1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]-2-(1*H*)-pyrimidone.

Emtricitabine contain not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{10}FN_3O_3S$, calculated on the dried basis.

Category. Antiretroviral.

Description. A white to off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *emtricitabine IPRS* or with the reference spectrum of emtricitabine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −115.0° to −105.0°, determined in a 0.25 per cent w/v solution in *water*.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 50 ml of the mobile phase.

Reference solution. Dissolve 25 mg of *racemic emtricitabine IPRS* in 25.0 ml of the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with a chiral stationary phase (5 µm) (Such as Chirobiotic V),
- mobile phase: a mixture of 1000 volumes of *methanol*, 2 volumes of *diethyl amine* and 1volume of *glacial acetic acid*,
- flow rate: 0.5 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 10 µl.

Inject the reference solution. The elution order is, the 5-fluoro-1-(2*R*,5*S*)-[2-(hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine isomer followed by the other isomer. The resolution between the two isomers should not be less than 2.0.

Inject the test solution and measure the areas of the two isomers.

Calculate the content of the 5-fluoro-1-(2*S*,5*R*)-[2-(hydroxymethyl)-1,3-oxathiolan-5-yl] cytosine isomer by area normalization, not more than 0.3 per cent.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 25 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *emtricitabine IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with pentaflurophenyl bonded to silica (5 µm) (Such as F-5 Supelco discovery),
- mobile phase: a mixture of 99 volumes of *0.025 M ammonium acetate solution* and adjusted to pH 5.0 with *glacial acetic acid*, and 1 volume of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency in not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the reference solution and test solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak due to reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak due to reference solution (b) (2.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 25.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *emtricitabine IPRS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with pentaflurophenyl bonded to silica (5 µm) (Such as F-5 Supelco discovery),
- mobile phase: a mixture of 95 volumes of *0.025 M ammonium acetate solution* adjusted the pH to 5.0 and 5 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}FN_3O_3S$.

Storage. Store protected from light and moisture.

Emtricitabine Capsules

Emtricitabine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of emtricitabine, $C_8H_{10}FN_3O_3S$.

Usual strength. 200 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Disperse the quantity of contents of the capsules containing about 1 mg of Emtricitabine in 100 ml of *methanol* and filter.

When examined in the range 200 nm to 400 nm (2.4.7), the filtrate shows absorption maxima at the same wavelengths as 0.001 per cent w/v solution of *emtricitabine IPRS* in *methanol*.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not more than 0.5 µm, rejecting the first 2 ml of the filtrate.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. Dissolve 27.5 mg of *emtricitabine IPRS* in 15 ml of *methanol*, dilute to 25 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the reference solution and the test solution.

Q. Not less than 75 per cent of the stated amount of $C_8H_{10}FN_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the contents of the capsules containing 100 mg of Emtricitabine, disperse in 100.0 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *emtricitabine IPRS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with pentaflurophenyl bonded to silica (5 µm) (Such as F-5 Supelco discovery),
- mobile phase: a mixture of 99 volumes of a buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 5.0 with *glacial acetic acid*, and 1 volume of *methanol*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency in not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak due to the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak due to the reference solution (b) (3.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the mixed contents of 20 capsules containing about 100 mg of Emtricitabine, disperse

in 100.0 ml of *methanol* and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 percent w/v solution of *emtricitabine IPRS* in *methanol*. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Intersil ODS 3V),
- mobile phase: a mixture of 80 volumes of a buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusted to pH 3.8 with *glacial acetic acid*, and 20 volumes of *methanol*,
- flow rate: 1 ml per minute,
- spectrophotometer set at 277 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency in not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_8H_{10}FN_3O_3S$ in the capsules.

Storage. Store protected from moisture.

Emulsifying Wax

Anionic Emulsifying Wax

Emulsifying Wax is a waxy solid containing 90 parts of Cetostearyl Alcohol, 10 parts of Sodium Lauryl Sulphate or sodium salts of similar sulphated higher primary aliphatic alcohols, and 4 parts of Purified Water.

Category. Pharmaceutical aid (emulsifying agent).

Description. An almost white or pale yellow, waxy solid or flakes. It becomes soft on warming.

Identification

The residue obtained in the test for Unsaponifiable matter melts at about 52° (2.4.21).

Tests

Acidity. Weigh 20.0 g, add a mixture of 40 ml of *ether* and 75 ml of *ethanol (95 per cent)*, previously neutralised to *phenolphthalein solution*, and warm gently until solution is effected. Titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator until a pink colour which persists for at least 15 seconds is obtained. Not more than 1.0 ml of *0.1 M sodium hydroxide* is required.

Alkalinity. 25 ml of a 20 per cent w/v dispersion in warm *ethanol (95 per cent)*, previously neutralised to *phenolphthalein solution* and cooled, exhibits no colour on the addition of 0.5 ml of *phenolphthalein solution*.

Saponification value (2.3.37). Not more than 2.0, determined on 20.0 g.

Unsaponifiable matter (2.3.39). Not less than 86.0 per cent, calculated on the anhydrous basis, determined on 5 g and omitting the titration of the residue.

Iodine value (2.3.28). Not more than 3.0, determined by the iodine monochloride method.

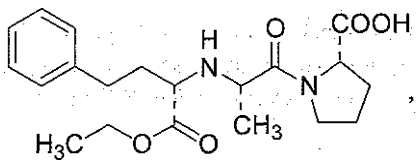
Alcohols. To 3.5 g of the residue obtained in the test for Unsaponifiable matter add 12 g of *stearic anhydride* and 10 ml of *xylene* and heat gently under a reflux condenser for 30 minutes. Cool, add a mixture of 40 ml of *pyridine* and 4 ml of *water*, reflux for a further 30 minutes and titrate the hot solution with *1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Repeat the operation omitting the residue. The difference between the titrations is not less than 12.8 ml and not more than 14.2 ml.

Sodium alkyl sulphates. Not less than 8.7 per cent, calculated as $C_{12}H_{25}O_4SNa$, on the anhydrous basis, determined by the following method. Weigh 0.25 g, dissolve as completely as possible in 15 ml of *chloroform*, add 30 ml of *water*, 10 ml of *1 M sulphuric acid* and 1 ml of *dimethyl yellow-oracet blue B solution* and titrate with *0.004 M benzethonium chloride*, shaking vigorously and allowing the layers to separate after each addition, until the chloroform layer acquires a permanent clear green colour.

1 ml of *0.004 M benzethonium chloride* is equivalent to 0.001154 g of $C_{12}H_{25}O_4SNa$.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.6 g.

Enalapril Maleate



$C_{20}H_{28}N_2O_5,C_4H_4O_4$ Mol. Wt. 492.5

Enalapril Maleate is (2*S*)-1-[(2*S*)-2-[[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]pyrrolidin-2-carboxylic acid hydrogen maleate.

Enalapril Maleate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{28}N_2O_5,C_4H_4O_4$, calculated on the dried basis.

Category. Antihypertensive.

Description. An off-white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *enalapril maleate IPRS* or with the reference spectrum of enalapril maleate.

B. Melts at about 144° (2.4.21).

Tests

Specific optical rotation (2.4.22). −43.5° to −41.0°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 50 volumes of *acetonitrile* and 950 volumes of buffer solution prepared by dissolving 2.8 g of *sodium dihydrogen phosphate monohydrate* in 950 ml of *water*, adjusted to pH 2.5 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Dissolve 30 mg of the substance under examination in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). A 0.0003 per cent w/v solution of *enalapril impurity A ((2S)-1-[(2S)-2-[[(1R)-1-(ethoxycarbonyl)-3- phenylpropyl] amino]propanoyl] pyrrolidine-2-carboxylic acid)IPRS* in the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.1 mm, packed with styrene-divinylbenzene copolymer (5 µm),
- column temperature: 70°,
- mobile phase: A. a mixture of 5 volumes of *acetonitrile* and 95 volumes of buffer solution pH 6.8 prepared by dissolving 2.8 g of *sodium dihydrogen phosphate monohydrate* in 950 ml of *water*. Adjusted to pH 6.8 with *dilute sodium hydroxide solution* and dilute to 1000 ml with *water*,

  B. a mixture of 34 volumes of buffer solution pH 6.8 and 66 volumes of *acetonitrile*,
- a gradient programme using the conditions given below,
- flow rate: 1.4 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
20	40	60
25	40	60
26	95	5
30	95	5

The retention time of enalapril peak is about 11 minutes and of enalapril impurity A is about 12 minutes.

Inject reference solution (b). The test is not valid unless the peak–to–valley ratio is not less than 10, where H_p is the height above the baseline of the peak due to enalapril impurity A and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to enalapril.

Inject reference solution (a) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to enalapril impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of areas of all the secondary peaks other than the peak due to enalapril impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent) and the peak due to maleic acid.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 2 hours.

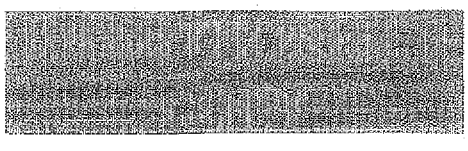
Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh 30 mg of the substance under examination and dissolve in 100.0 ml of the mobile phase.

Reference solution. A freshly prepared 0.03 per cent w/v solution of *enalapril maleate IPRS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with a rigid spherical styrene divinylbenzene copolymer (5 to 10 µm),
- mobile phase: a mixture of 4 volumes of *mixed phosphate buffer pH 6.8* and 1 volume of *acetonitrile*,



- column temperature :70°,
- flow rate: 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume: 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 300 theoretical plates and the relative standard deviation for the area of the peak due to enalapril maleate is not more than 1.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$.

Storage. Store protected from light.

Enalapril Maleate Tablets

Enalapril Maleate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of enalapril maleate, $C_{20}H_{28}N_2O_5,C_4H_4O_4$.

Usual strengths. 2.5 mg; 5 mg; 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. Dissolve an accurately weighted quantity of *enalapril maleate IPRS* in the dissolution medium to obtain a solution having a known concentration similar to the expected concentration of the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature: 50°,
- mobile phase: a mixture of 75 volumes of buffer solution prepared by dissolving 1.38 g of *monobasic sodium phosphate* in 800 ml of *water* adjusted to pH 2.2 with *orthophosphoric acid* and dilute to 1000 ml with *water* and 25 volumes of *acetonitrile*,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in the medium.

Q. Not less than 80 per cent of the stated amount of $C_{20}H_{28}N_2O_5,C_4H_4O_4$.

Uniformity of content. Complies with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet in *phosphate buffer pH 2.0* with the aid of ultrasound and dilute to obtain a concentration of 0.01 per cent w/v solution of Enalapril Maleate.

Reference solution. A 0.01 per cent w/v solution of *enalapril maleate IPRS* in the same buffer solution.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a filtered and degassed mixture of 75 volumes of *phosphate buffer pH 2.0* and 25 volumes of *acetonitrile*,
- column temperature 50°,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 50 mg of Enalapril Maleate, add 150 ml of *phosphate buffer pH 2.0*, disperse with the aid of ultrasound for 15 minutes, shake for another 30 minutes and dilute with the buffer to 250.0 ml, mix and filter.

Reference solution. A 0.02 per cent w/v solution of *enalapril maleate IPRS* in *phosphate buffer pH 2.0*.

Follow the chromatographic procedure described under Uniformity of content.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in the tablets.

Enalapril Maleate and Hydrochlorothiazide Tablets

Enalapril Maleate and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of enalapril maleate $C_{20}H_{28}N_2O_5,C_4H_4O_4$ and hydrochlorothiazide $C_7H_8ClN_3O_4S_2$.

Usual strengths. Enalapril Maleate, 2.5 mg and Hydrochlorothiazide, 12.5 mg; Enalapril Maleate, 5 mg and Hydrochlorothiazide, 12.5 mg; Enalapril Maleate, 10 mg and Hydrochlorothiazide, 25 mg.

Identification

A. In the Assay of enalapril maleate, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. In the Assay of hydrochlorothiazide, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2 (Paddle),
Medium. 900 ml of *water*,
Speed and time. 50 rpm, 30 minutes.

Withdraw a suitable volume of the medium and filter.

For enalapril maleate — Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as obtained above.

Reference solution. Dissolve a quantity of *enalapril maleate IPRS* with the dissolution medium to obtain a solution having a similar concentration to the test solution.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octylsilane bonded to porous silica (10 µm),
- column temperature: 80°,
- mobile phase: a mixture of 30 volumes of *acetonitrile* and 68 volumes of *water* and 2 volumes of a buffer solution prepared by dissolving 136 g of *monobasic potassium phosphate* in 800 ml *water*, adjusted to pH 4.0 with *orthophosphoric acid* and dilute to 1000 ml,
- flow rate: 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$.

For hydrochlorothiazide — Measure the difference in the absorbance of the filtrate, suitably diluted if necessary with the dissolution medium at the maximum at about 320 nm and 360 nm (2.4.7). Calculate the content of $C_7H_8ClN_3O_4S_2$ in the medium from the absorbance, similarly determined, obtained from a solution of *hydrochlorothiazide IPRS* prepared by dissolving in minimum quantity of *methanol* and diluted suitably with the dissolution medium to get similar concentration to the test solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$.

Q. Not less than 80 per cent of the stated amounts of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ and not less than 60 per cent of the stated amounts of $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Buffer solution. Dissolve 136 mg of *monobasic potassium phosphate* in 800 ml *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Enalapril Maleate to a 100.0 ml volumetric flask. Add 25.0 ml of buffer solution, and sonicate for 15 minutes. Add 25.0 ml of *methanol*, sonicate for an additional 15 minutes, dilute with buffer solution to volume, and filter.

Reference solution (a). A 0.04 per cent w/v solution of *enalaprilat IPRS* in *water*.

Reference solution (b). Transfer 20 mg of *enalapril maleate IPRS* in a 100-ml beaker to form a mound on the bottom of the beaker. Place the beaker on a hot plate at about one-half the maximum temperature setting of hot plate. Heat for about 5 to 10 minutes until the solid is melted. Immediately remove the beaker from the hot plate, and allow cooling. To the cooled residue in the beaker add 50.0 ml of *acetonitrile*, and sonicate for a few minutes to dissolve. The solution typically contains between 0.2 and 0.4 mg per ml of enalapril diketopiperazine.

NOTE — Avoid overheating to prevent heat-induced degradation, which gives rise to a brown colour.

Reference solution (c). Transfer 20 mg of *enalapril maleate IPRS* to a 100.0 ml volumetric flask and dissolve with 25.0 ml of *methanol*. Pipettte 1.0 ml each of reference solution (a) and reference solution (b) into the volumetric flask and dilute with buffer solution to volume.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),

- column temperature: 65°,
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of buffer solution,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume: 50 µl.

The relative retention times for enalaprilat, enalapril diketopiperazine and enalapril are 0.3, 0.4 and 1.0 respectively.

Inject reference solution (c). The test is not valid unless the column efficiency is not less than 700 theoretical plates for enalapril, 1500 for enalaprilat and 1500 for enalapril diketopiperazine. The tailing factor is not more than 3.5, the resolution between the peaks due to enalapril and any peak is not less than 1.3. The relative standard deviation for replicate injections is not more than 5.0 per cent for enalaprilat and enalapril diketopiperazine and not more than 2.0 per cent for enalapril.

Inject the test solution, the sum of the areas of all impurities is not more than 5.0 per cent, calculated by area normalization.

Uniformity of content. Complies with the test stated under Tablets.

For Enalapril maleate—Determine by liquid chromatography (2.4.14), using the chromatographic system as described under the dissolution of enalapril maleate.

Buffer solution. A solution prepared by dissolving 136 g of *monobasic potassium phosphate* in 800 ml of *water*, adjusted to pH 4.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Solvent mixture. 2 volumes of buffer solution and 98 volumes of *water*.

Test solution. Disperse 1 tablet in solvent mixture with the aid of ultrasound and dilute suitably to obtain a concentration of 0.01 per cent w/v of enalapril maleate. Filter, rejecting the first few ml of the filtrate.

Reference solution. A 0.01 per cent w/v solution of *enalapril maleate IPRS* in the solvent mixture.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the capacity factor is not less than 2.5. The tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. *For enalapril maleate* — Determine by liquid chromatography (2.4.14), as described under Related substances test with the following modifications.

Reference solution. Dissolve 20 mg of *enalapril maleate IPRS* in about 25.0 ml of *methanol* and dilute to 100.0 ml with buffer solution.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 700 theoretical plates the tailing factor is not more than 3.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in tablets.

For hydrochlorothiazide — Determine by liquid chromatography (2.4.14),

Buffer solution. A solution prepared by dissolving 136 mg of *monobasic potassium phosphate* in 800 ml *water*, adjusted to pH 2.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of the powder containing 20 mg of Hydrochlorothiazide to a 200-ml volumetric flask. Add 50.0 ml of buffer solution and sonicate for 15 minutes. Add 50.0 ml of *methanol*, sonicate for an additional 15 minutes, dilute with buffer solution to volume, and filter.

Reference solution. A solution prepared by dissolving 10 mg of *hydrochlorothiazide IPRS* in 25.0 ml of *methanol* and dilute to 100.0 ml with buffer solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with octaylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of buffer solution,
- flow rate: 2.5 ml per minute,
- spectrophotometer set at 310 nm,
- injection volume: 50 µl.

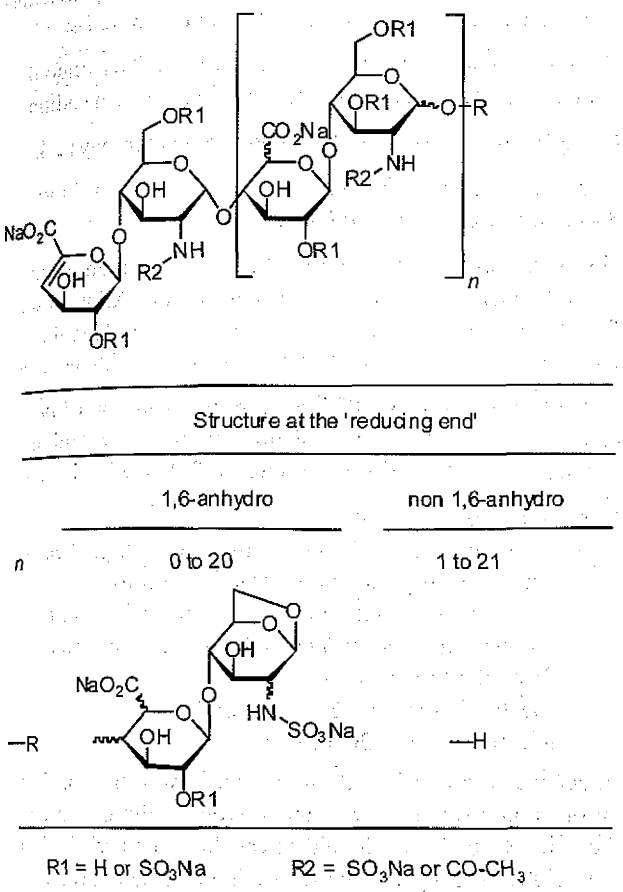
Inject the reference solution. The test is not valid unless the column efficiency is not less than 1000 theoretical plates, the capacity factor is not less than 2.0, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in tablets.

Storage. Store protected from moisture.

Enoxaparin Sodium



Enoxaparin Sodium is the sodium salt of a low-molecular-mass heparin that is obtained by alkaline depolymerisation of the benzyl ester derivative of heparin from porcine intestinal mucosa. Heparin Sodium used for the manufacture of Enoxaparin complexes with the tests under Heparin Sodium. Enoxaparin consists of a complex set of oligosaccharides that have not yet been completely characterised. Based on current knowledge, the majority of the components have a 4-enopyranose uronate structure at the non- reducing end of their chain. 15 per cent to 25 per cent of the components have a 1, 6- anhydro structure at the reducing end of their chain.

The mass-average relative molecular mass ranges is not less than 3800 and not more than 5000, with a characteristic value of about 4500.

The degree of sulphation is about 2 per disaccharide unit.

The potency is not less than 90 IU and not more than 125 IU of anti-factor X_a activity per milligram, calculated with reference to the dried substance. The anti-factor IIa activity is not less than 20.0 IU and not more than 35.0 IU per milligram, calculated with reference to the dried substance. The ratio of anti-factor X_a activity to anti-factor IIa activity is between 3.3 and 5.3.

The mass-average relative molecular mass ranges is not less than 3800 and not more than 5000. The mass percentage of chains lower than 2000 ranges is not less than 12.0 per cent and not more than 20.0 per cent. The mass percentage of chains is not less than 2000 and not more 8000 ranges is not less than 68.0 per cent and not more than 82.0 per cent.

Category. Anticogulant.

Identification

A. Determine by size-exclusion chromatography (2.4.16).

Test solution. Dissolve 100 mg of the substance under examination in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. A 1.0 per cent w/v solution of *enoxaparin sodium IPRS* in the mobile phase.

Chromatographic system

- two stainless steel column 30 cm x 7.8 mm, packed porous silica beads (5 µm) or hybrid packed with a hydrophilic coating in series with a fractionation range for proteins of approximately 5000 to 150000 Da (Such as TSK gel G20000SW_{XL}), and a guard column 4 cm x 6.0 mm, packed with the same column material (7 µm) (Such as TSK gel SW_{XL}),
- mobile phase. *0.5 M lithium nitrate solution*,
- flow rate: 0.6 ml per minute,
- refractive index detector,
- injection volume: 20 µl.

Reconstitute 1 vial each of enoxaparin sodium molecular weight *calibrant A IPRS* and enoxaparin sodium molecular weight *calibrant B IPRS* in 1 ml of mobile phase. Inject enoxaparin sodium molecular weight *calibrant A IPRS*, enoxaparin sodium molecular weight *calibrant B IPRS* and measure the retention times. Inject in duplicate the reference solution, test solution and record the chromatograms for a length of time to ensure complete elution, including salt and solvent peaks. Calculate the total peak areas under each of the reference solution and test solution chromatograms, excluding salt and solvent peaks at the end.

Plot the retention times on the *x*-axis against the peak molecular weights on the *y*-axis for the peaks from enoxaparin sodium molecular weight calibrant A IPRS and enoxaparin sodium molecular weight calibrant B IPRS, and fit the data to a third-order polynomial, using suitable gel permeation chromatography (GPC) software.

Calculate the data, using the same GPC software; determine the weight-average molecular weight, M_w, for each of the duplicate chromatograms of the reference solution, test solution; and take the average for each solution. Correct the mean value of M_w to the nearest 50. The chromatographic system is suitable if M_w for enoxaparin sodium IPRS is within 150 Da of the labeled M_w value. The M_w for the test solution is between 3800 and 5000 Da. Using the same software, determine for each of the duplicate test solution chromatograms the percentage of enoxaparin sodium chains with molecular weights lower than 2000 Da, M_{2000}, the percentage of enoxaparin sodium chains with molecular weights in the range 2000–8000 Da, $M_{2000-8000}$, and the percentage of enoxaparin sodium chains with molecular weights more than 8000 Da, M_{8000}. Average the duplicate values, and express to the nearest 0.5 per cent.

M_{2000} is between 12.0 per cent and 20.0 per cent, $M_{2000-8000}$ is between 68.0 per cent and 82.0 per cent, and M_{8000} is not more than 18.0 per cent.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is between 3.3 and 5.3.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

pH (2.4.24). 6.2 to 7.7, determined in a 10 per cent w/v solution in *carbon dioxide-free water.*

Light absorbance. A 0.05 per cent w/v solution in *0.01 M hydrochloric acid*, determined at 231 nm (2.4.7), shows specific absorbance from 14.0 to 20.0.

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).
